RUC Referrals to CPT Editoral Panel - Outstanding Issues

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
0042T	**Cerebral perfusion analysis using computed tomography with contrast administration, including post-processing of parametric maps with determination of cerebral blood flow, cerebral blood volume, and mean transit time**	High Volume Category III Codes 2022	September 2022	ACR, ASNR	May 2024

Background: In April 2022, the Relativity Assessment Workgroup identified this Category III code with 2020 Medicare utilization over 1,000. The Workgroup requested an action plan for September 2022. In September 2022, the specialty societies indicated and the RUC supports a submission of a coding application for CPT May 2023. The specialty societies submitted a coding application for May 2023, but it was subsequently withdrawn. The specialty socieites should address the CPT Editorial Panel concerns and submit a new CCA for the September 2023 meeting. At the September 2023 CPT meeting, this issue was withdrawn as the Panel determiend that the scope was too large and went beyond the RUC request. The specialty societies should revise and resubmit a CCA for February 2024.

0394T	**High dose rate electronic brachytherapy, skin surface application, per fraction, includes basic dosimetry, when performed**	High Volume Category III Codes 2019	September 2023	ASTRO	Sep 2024

Background: In October 2019, this service was identified via the high volume category III codes based on 2021 Medicare utilization data over 1,000. These services are identified to notify and get feedback from specialty societies whether a Category I code should be created. The Workgroup requests an action plan for September 2023. In September 2023, the Workgroup recommended that this service be referred to CPT May 2024 to create a Category I code.

36557	**Insertion of tunneled centrally inserted central venous catheter, without subcutaneous port or pump; younger than 5 years of age**	Site of Service Anomaly - 2023	January 2024	ACR, ACS, APSA, OEIS, SIR, SVS	Sep 2024

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 36558 via the site of service anomaly screen, for services with Medicare utilization over 10,000 in 2019-2021 that are typically performed in the inpatient hospital setting, yet only include a half discharge day management visit (99238). The RAW reviewed the action plan in September 2023, and agreed with the specialty societies that the entire family of services (36557-36566) be surveyed for the January 2024 RUC meeting. The specialty societies also requested changing the global period from a 010-day to a 000-day to account for variability in site of service based on the patient presentation and specialty performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the codes through the CPT process prior to surveying. The specialty societies noted that the ages listed within some of the current code descriptors do not accurately reflect the variation of physician work (e.g., babies versus infants versus children versus adults). Additionally, some of the code descriptors are antiquated and include outdated practices and techniques technology that no longer exist or are incorrectly described, which may cause incorrect reporting. For example, patients are receiving central lines at multiple points in time with no way to accurately and appropriately capture work based on the current code family structure. Finding an access location in a patient in which access issues have become harder, takes more time, includes more risk, and potentially requires additional interventions. The RUC recommends that CPT codes 36557, 36558, 36560, 36561, 36563, 36565, and 36566 be referred to the May 2024 CPT Editorial Panel meeting for revision.

37220	**Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty**	High Volume Growth1	April 2024	ACC, ACR, OEIS, SCAI, SIR, SVS	Sep 2024

Background: In October 2018, 37225, 37227 and 37229 services were identified by the PE High Cost Supplies screen for services with non-facility Medicare utilization over 10,000, not reviewed in the last five years and include a supply item greater than $500. The RUC requested an action plan for the January 2019 on how to address these services. The Workgroup reviewed the action plan for these services, noting that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing was appropriate. The Workgroup noted that CPT code 37229 was identified on the High Volume Growth screen at this meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies. The specialty societies worked with the CPT Editorial Panel and have submitted multiple coding change proposals. In September 2021, CPT Editorial Panel did not approve of the proposed coding changes suggested unbundling previous bundling efforts. Since this issue were not be addressed via edits at CPT, it was placed back on the Relativity Assessment Workgroup agenda to review. In April 2022, the Relativity Assessment Workgroup discussed the complexity of this issue and determined that coding clarification is still necessary. The Workgroup recommended that a joint CPT/RUC Workgroup be created to develop coding solutions for the endovascular revascularization (37220-37235) code family. In September 2022, CPT indicated the specialty societies should develop a CCA by the May 2024 CPT meeting. The specialty societies had a conference call with the Panel members in April 2023 to review the revised coding structure. The Panel suggested some edits and indicated that specialty societies did not have to have literature for all the “current codes” just the new codes. Next the specialty societies developed the guidelines, but could not do that until mid-Sept 2023 because the app was shut down. In March 2024, the CCA was entered in the smart app and will be submitted for the June 2024 deadline for review by the Panel at the September 2024 meeting.

In September 2022, CPT indicated the specialty societies should develop a CCA by the May 2024 CPT meeting. The specialty societies had a conference call with the Panel members in April 2023 to review the revised coding structure. The Panel suggested some edits and indicated that specialty societies did not have to have literature for all the “current codes” just the new codes. Next the specialty societies developed the guidelines, but could not do that until mid-Sept 2023 because the app was shut down. In March 2024, the CCA was entered in the smart app and will be submitted for the June 2024 deadline for review by the Panel at the September 2024 meeting.

37222	**Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)**	High Volume Growth1	April 2024	ACC, ACR, OEIS, SCAI, SIR, SVS	Sep 2024

Background: In October 2018, 37225, 37227 and 37229 services were identified by the PE High Cost Supplies screen for services with non-facility Medicare utilization over 10,000, not reviewed in the last five years and include a supply item greater than $500. The RUC requested an action plan for the January 2019 on how to address these services. The Workgroup reviewed the action plan for these services, noting that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing was appropriate. The Workgroup noted that CPT code 37229 was identified on the High Volume Growth screen at this meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies. The specialty societies worked with the CPT Editorial Panel and have submitted multiple coding change proposals. In September 2021, CPT Editorial Panel did not approve of the proposed coding changes suggested unbundling previous bundling efforts. Since this issue were not be addressed via edits at CPT, it was placed back on the Relativity Assessment Workgroup agenda to review. In April 2022, the Relativity Assessment Workgroup discussed the complexity of this issue and determined that coding clarification is still necessary. The Workgroup recommended that a joint CPT/RUC Workgroup be created to develop coding solutions for the endovascular revascularization (37220-37235) code family. In September 2022, CPT indicated the specialty societies should develop a CCA by the May 2024 CPT meeting. The RUC requested an action plan for the January 2019 on how to address these services. The Workgroup reviewed the action plan for these services, noting that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing was appropriate. The Workgroup noted that CPT code 37229 was identified on the High Volume Growth screen at this meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies. The specialty societies worked with the CPT Editorial Panel and have submitted multiple coding change proposals. In September 2021, CPT Editorial Panel did not approve of the proposed coding changes suggested unbundling previous bundling efforts. Since this issue were not be addressed via edits at CPT, it was placed back on the Relativity Assessment Workgroup agenda to review. In April 2022, the Relativity Assessment Workgroup discussed the complexity of this issue and determined that coding clarification is still necessary. The Workgroup recommended that a joint CPT/RUC Workgroup be created to develop coding solutions for the endovascular revascularization (37220-37235) code family. In September 2022, CPT indicated the specialty societies should develop a CCA by the May 2024 CPT meeting. The specialty societies had a conference call with the Panel members in April 2023 to review the revised coding structure. The Panel suggested some edits and indicated that specialty societies did not have to have literature for all the “current codes” just the new codes. Next the specialty societies developed the guidelines, but could not do that until mid-Sept 2023 because the app was shut down. In March 2024, the CCA was entered in the smart app and will be submitted for the June 2024 deadline for review by the Panel at the September 2024 meeting.

77014	**Computed tomography guidance for placement of radiation therapy fields**	CMS Request - Practice Expense Review / CMS-Other - Utilization over 500,000 / CMS High Expenditure Procedural Codes1 / High Volume Growth3	September 2023	ASTRO, ACR	Sep 2024

Background: In October 2020, the RUC identified CPT codes G6012-G6015 as CMS/Other source with 2019 estimated Medicare utilization over 20,000. In January 2021, the RUC recommended the RAW review in two years (Sept 2023) after the CMS issued Radiation Oncology Advance Payment Model is initiated including these codes. The specialty society continued to advocate for the RUC recommended values and direct PE inputs for the existing CPT codes. In September 2023, the Workgroup reviewed the action plan for CPT codes G6012-G6015 and noted that in 2022 CMS Innovation Center delayed the RO Model. ASTRO began developing an episode-based alternative payment approach for radiation therapy services called Radiation Oncology Case Rate (ROCR). The proposed approach is site-neutral and expected to save more than $200 million over the next five years while improving quality through increasing accreditation at sites providing these services. The radiation oncology community remains committed to working with CMS and Congress to implement payment reform in the form of an episode-based payment program. In the interest of rate setting and payment stability, maintaining the core components are critical. As such, the specialty societies initially requested maintaining the inputs for all the codes in the radiation treatment delivery family and removing them from this CMS/Other screen. The Workgroup disagreed and noted that the inputs for these services were last reviewed in 2014, CMS did not accept the RUC recommendations and the inputs may not represent the services as they are currently performed. The Workgroup discussed reviewing these services for practice expense at the next meeting. The specialty societies indicated that they would bring the code set back to CPT to correctly define and attempt to address CMS' concerns. The Workgroup recommends that the radiation treatment delivery services (G6001-G6016, 77402, 77407, 77412, 77385, 77386, 77387 and 77014) be referred to CPT for revision.

90901	Biofeedback training by any modality	Screen	RUC Meeting	Specialty Society:	CPT Meeting
		High Volume Growth9	April 2024	ACOG, APTA, AUA	Sep 2024

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 90901 via the high volume growth screen with 2021 Medicare utilization of 10,000 or more than increased by at least 100% from 2016 through 2021. In September 2023, the Workgroup reviewed the action plan for CPT code 90901 and agreed with the specialty societies that 90901, along with the other services in this code family (90912 and 90913) be surveyed for the April 2024 RUC meeting. The specialty society also requested changing the global period from 010-day to a 000-day global period to account for variability in the site of service based on the patient presentation and specialty societies performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the code family through the CPT process before surveying. The specialty societies noted that the current code descriptor for CPT code 90901 is not well understood based on their review of past RUC rationales for valuation, claims data, and the vignettes used for review in 1995 and 1996 by the RUC and HCPAC. In the 1995 RUC rationale, the vignette described 45–60-minute sessions (and brief 30-minute sessions) and included information about psychiatrists and psychologists, though it is unclear who was surveyed. However, the 1996 RUC rationale of the HCPAC review is based on a different vignette, considered a CMD five-year-review comment, and was surveyed by physical therapists, which led to a reduction of the work RVU from 0.89 to 0.41 based on comparison to a time-based therapy code, CPT code 97110. The specialty societies note that although 90901 is not time-based, the comparison for the current value was to a 15-minute time-based code despite the current intra-service time being 45 minutes. In their letter to request a referral to CPT for this code family, the specialty societies proposed revising the code descriptor for CPT code 90901 to be consistent with other physical therapy time-based and modality codes, as well as similar to other biofeedback training codes. Additionally, code descriptor clarification may resolve the continued confusion about the intent and correct coding for 90901. The RUC recommends that CPT codes 90901, 90902 and 90903 be referred to the September 2024 CPT Editorial Panel meeting for revision.

90912	**Biofeedback training, perineal muscles, anorectal or urethral sphincter, including EMG and/or manometry, when performed; initial 15 minutes of one-on-one physician or other qualified health care professional contact with the patient**	Negative IWPUT	April 2024	ACOG, APTA, AUA	Sep 2024; Feb 2019-EC

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 90901 via the high volume growth screen with 2021 Medicare utilization of 10,000 or more than increased by at least 100% from 2016 through 2021. In September 2023, the Workgroup reviewed the action plan for CPT code 90901 and agreed with the specialty societies that 90901, along with the other services in this code family (90912 and 90913) be surveyed for the April 2024 RUC meeting. The specialty society also requested changing the global period from 010-day to a 000-day global period to account for variability in the site of service based on the patient presentation and specialty societies performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the code family through the CPT process before surveying. The specialty societies noted that the current code descriptor for CPT code 90901 is not well understood based on their review of past RUC rationales for valuation, claims data, and the vignettes used for review in 1995 and 1996 by the RUC and HCPAC. In the 1995 RUC rationale, the vignette described 45–60-minute sessions (and brief 30-minute sessions) and included information about psychiatrists and psychologists, though it is unclear who was surveyed. However, the 1996 RUC rationale of the HCPAC review is based on a different vignette, considered a CMD five-year-review comment, and was surveyed by physical therapists, which led to a reduction of the work RVU from 0.89 to 0.41 based on comparison to a time-based therapy code, CPT code 97110. 95921	**Testing of autonomic nervous system function; cardiovagal innervation (parasympathetic function), including 2 or more of the following: heart rate response to deep breathing with recorded R-R interval, Valsalva ratio, and 30:15 ratio**	Different Performing Specialty from Survey / Codes Reported Together 75% or More-Part1 / Different Performing Specialty from Survey3 / Codes Reported Together 75% or More-Part7	September 2023	AAFP, AAN, AANEM, ACNS, ACP	Sep 2024

Background: For code pair 95921/95922, the Relativity Assessment Workgroup acknowledged that the rationale for increased utilization remains unclear. Thus, the dominant specialties for these two codes (Family Medicine and Internal Medicine) were requested to provide the following information regarding 95921 and 95922: What are the clinically appropriate scenarios for reporting each service? What is the description of service? What are the clinically appropriate scenarios when these servic AAFP and ACP indicated that they do not have an explanation for the increased utilization as their physicians indicated that they do not typically perform these services. In 2008, a CPT Assistant article was published to correct inappropriate reporting by clarifying that a tilt table is required in the provision of the service. However, Medicare claims data indicate that the attempted coding education was not effective. In April 2011, the RUC recommended this code be referred to CPT to revise the descriptor to include the use of a tilt table and refer those who do not use a tilt table in autonomic testing to use an unlisted code, which was addressed at the February 2012 (Tab 17) CPT meeting. In January 2020, the RUC recommended to refer codes 95921-95924 to CPT Assistant in 2020 to clarify correct coding on how to report these services. The RAW would review the specialty mix again in 3 years of those reporting the services (Sept 2023). In September 2023, the specialty societies indicated that the article included correct coding for autonomic testing services when a tilt table was used, clarity on terminology used in the code descriptor language of the code set, and clinical examples for each code. The intent of the article was to reduce the occurrence of any miscoding that may be contributing to the total utilization and understand if the shift in dominant specialties was now typical. The Workgroup examined these services and indicated that the decrease in utilization in 2020 may not be attributable to the CPT article but to due to the COVID-19 pandemic. The RUC noted that these services are typically reported with one another and the code family should be referred to CPT to be restructured.

95924	**Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt**	Codes Reported Together 75% or More-Part1	September 2023	AAFP, AAN, AANEM, ACNS, ACP	Sep 2024

Background: CPT Feb 2012 the CPT Editorial Panel established two new codes with instructional guidelines to report autonomic function testing. In April 2012, The RUC determined that the survey results for 95924 was too low (26 responses). There was also confusion about what is described in 95924 which may have resulted in invalid physician time for this service. The RUC recommended an interim value for 95924. In January 2020, the RUC recommended to refer codes 95921-95924 to CPT Assistant in 2020 to clarify correct coding on how to report these services. The RAW would review the specialty mix again in 3 years of those reporting the services (Sept 2023). In September 2023, the specialty societies indicated that the article included correct coding for autonomic testing services when a tilt table was used, clarity on terminology used in the code descriptor language of the code set, and clinical examples for each code. The intent of the article was to reduce the occurrence of any miscoding that may be contributing to the total utilization and understand if the shift in dominant specialties was now typical. The Workgroup examined these services and indicated that the decrease in utilization in 2020 may not be attributable to the CPT article but to due to the COVID-19 pandemic. The Workgroup noted that these services are typically reported with one another and the code family should be referred to CPT to be restructured.

99183	**Physician or other qualified health care professional attendance and supervision of hyperbaric oxygen therapy, per session**	CMS-Other - Utilization over 250,000	January 2024	AAFP, UHMS	Sep 2024

Background: In January 2023, the RUC noted that CMS created G0277 in 2015 to describe the direct practice expense inputs associated with CPT code 99183. In the Final Rule for 2015, CMS commented that CPT code 99183 is used for both professional attendance and supervision and the actual treatment delivery. Stakeholders pointed out that although CMS included the PE inputs for treatment delivery in CPT code 99183, the descriptor describes only attendance and supervision. CMS noted that under the Outpatient Prospective Payment System (OPPS), the treatment is reported using separate treatment code C1300 Hyperbaric oxygen under pressure, full body chamber, per 30 minute interval. Therefore, CMS created code G0277 to report the treatment delivery and to maintain consistency with the OPPS coding. CMS used a timed 30-minute code, which can be used across settings. To value G0277, CMS used the RUC recommended direct PE inputs for 99183 and adjusted them to align with the 30-minute treatment interval. The RUC recommends that CPT code 99183 be referred to CPT by the June 2023 deadline for the September 2023 CPT meeting, for revision to be time-based as well as modified to appropriately describe the treatment delivery, attendance and supervision. Then, subsequently, allow for the deletion of G0277. In September 2023, the specialties indicated they did not intend to submit a CPT code change application (CCA). Therefore, this issue was placed on the January 2024 Relativity Assessment Workgroup agenda to address. In January 2024, the specialty societies indicated that they believe the current separate coding of the G code and the CPT code are clear and work appropriately. The Workgroup indicated that one clear and consistent coding structure should exist and the specialty society should submit a CPT code change application. The specialties should revise 99183 to be time-based well as modified to appropriately describe the treatment delivery, attendance and supervision or develop a coding change creating a practice expense only code to capture the service appropriately and eliminate the need for G0277.

G0396	**Alcohol and/or substance (other than tobacco) misuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes**	CMS-Other - Utilization over 30,000	January 2018	AAFP, ASA, ASAM	Time Uncertain

Background: In October 2017, the RAW requested that AMA staff compile a list of CMS/Other codes with Medicare utilization of 30,000 or more. This list resulted in 34 services and the RAW requested action plans to be reviewed at the January 2018 meeting. In January 2018, the RUC recommended to maintain the physician work and refer to CPT to editorially remove "screening" from 99408 and 99409 to “assessment” to mirror G0396. At the February 2018 CPT meeting, the Panel postponed until time uncertain this request to revise codes 99408-99409 to identify assessment of alcohol and/or substance abuse. As a rationale for postponement, the Panel said that the service described in this application did not meet the General Criteria for Category I because the proposed service is not unique or well defined, and does not describe a service that is clearly identified and distinguished from existing services already described in CPT by other codes. The Panel’s additional rationale for postponement of this item was to allow the relevant specialty societies an opportunity to submit a new code change application to address the differences between assessment and screening services.

		CMS-Other - Utilization over 20,000 Part2	September 2023	AADA, ASTRO	Sep 2024

Background: In October 2020, the RUC identified CPT codes G6012-G6015 as CMS/Other source with 2019 estimated Medicare utilization over 20,000. In January 2021, the RUC recommended the RAW review in two years (Sept 2023) after the CMS issued Radiation Oncology Advance Payment Model is initiated including these codes. The specialty society continued to advocate for the RUC recommended values and direct PE inputs for the existing CPT codes. In September 2023, the Workgroup reviewed the action plan for CPT codes G6012-G6015 and noted that in 2022 CMS Innovation Center delayed the RO Model. ASTRO began developing an episode-based alternative payment approach for radiation therapy services called Radiation Oncology Case Rate (ROCR). The proposed approach is site-neutral and expected to save more than $200 million over the next five years while improving quality through increasing accreditation at sites providing these services.

The radiation oncology community remains committed to working with CMS and Congress to implement payment reform in the form of an episode-based payment program. In the interest of rate setting and payment stability, maintaining the core components are critical. As such, the specialty societies initially requested maintaining the inputs for all the codes in the radiation treatment delivery family and removing them from this CMS/Other screen. The Workgroup disagreed and noted that the inputs for these services were last reviewed in 2014, CMS did not accept the RUC recommendations and the inputs may not represent the services as they are currently performed. The Workgroup discussed reviewing these services for practice expense at the next meeting. The specialty societies indicated that they would bring the code set back to CPT to correctly define and attempt to address CMS' concerns. The Workgroup recommends that the radiation treatment delivery services (G6001-G6016, 77402, 77407, 77412, 77385, 77386, 77387 and 77014) be referred to CPT for revision.

G6005	**Radiation treatment delivery, single treatment area,single port or parallel opposed ports, simple blocks or no blocks: 11-19 mev**	CMS-Other - Utilization over 20,000 Part2	September 2023	ACRO, ASTRO	Sep 2024

Background: In October 2020, the RUC identified CPT codes G6012-G6015 as CMS/Other source with 2019 estimated Medicare utilization over 20,000. In January 2021, the RUC recommended the RAW review in two years (Sept 2023) after the CMS issued Radiation Oncology Advance Payment Model is initiated including these codes. The specialty society continued to advocate for the RUC recommended values and direct PE inputs for the existing CPT codes. In September 2023, the Workgroup reviewed the action plan for CPT codes G6012-G6015 and noted that in 2022 CMS Innovation Center delayed the RO Model. ASTRO began developing an episode-based alternative payment approach for radiation therapy services called Radiation Oncology Case Rate (ROCR). The proposed approach is site-neutral and expected to save more than $200 million over the next five years while improving quality through increasing accreditation at sites providing these services. The radiation oncology community remains committed to working with CMS and Congress to implement payment reform in the form of an episode-based payment program. In the interest of rate setting and payment stability, maintaining the core components are critical. As such, the specialty societies initially requested maintaining the inputs for all the codes in the radiation treatment delivery family and removing them from this CMS/Other screen. The Workgroup disagreed and noted that the inputs for these services were last reviewed in 2014, CMS did not accept the RUC recommendations and the inputs may not represent the services as they are currently performed. The Workgroup discussed reviewing these services for practice expense at the next meeting. The specialty societies indicated that they would bring the code set back to CPT to correctly define and attempt to address CMS' concerns. The Workgroup recommends that the radiation treatment delivery services (G6001-G6016, 77402, 77407, 77412, 77385, 77386, 77387 and 77014) be referred to CPT for revision.

RUC Recommendations to Develop CPT Assistant Articles - Outstanding Issues

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
0509T	**Electroretinography (ERG) with interpretation and report, pattern (PERG)**	Work Neutrality 2019	January 2024	Refer to CPT Assistant	AAO, AOA (optometry), ASRS	

Background: In October 2020, the RUC identified one code family, Electroretinography (CPT codes 92273, 92274 and 0509T) that were reviewed in April 2017, October 2017 and January 2018 and have increased more than 10% in work RVUs from what was projected. In 2015, CPT code 92275 Electroretinography with interpretation and report was identified via the CMS High Expenditure screen. In January 2016, the specialty society noted that they became aware of inappropriate use of CPT code 92275 for a less intensive version of this test for diagnosis and indications that are not clinically proven and for which less expensive and less intensive tests already exist. The utilization of CPT code 92275 was appropriately low until 2013 when it suddenly increased by 300%. CPT changes were necessary to ensure that the service for which 92275 was intended was clearly described as well as an accurate vignette and work descriptor were developed. The RUC recommended CPT code 92275 be referred to the CPT Editorial Panel. In September 2017, the CPT Editorial Panel replaced electroretinography code 92275 with two new codes to describe electroretinography full field and multi focal. A category III code was retained for pattern electroretinography. In January 2018, the RUC reviewed these services and recommended lower work RVUs for the two new codes than code 92275 that was deleted. CMS also assigned a work RVU to code 0509T. However, in reviewing the utilization assumptions and 2019e Medicare utilization, there was a 38% increase in work RVUs. Since both the source volume from deleted code 92275 and the new volume for the three new codes all have assigned RVUs and are Medicare status A, it is a like comparison between previous reporting and current reporting (unlike when category III codes are not assigned an RVU). The Workgroup requests that the specialty societies submit an action plan for January 2021 to address this issue.In January 2021, the RUC recommended that codes 92273, 92274 and 0509T be reviewed in 3 years (January 2024) to review utilization. Despite no work neutrality issues, the Workgroup still had concerns about the volume growth and the unexpected distribution among the three new codes. In January 2024, the Workgroup reviewed the action plan in which the specialty societies note that the increased claims volume is explained by expansion of the use of ffERG (CPT 92273) in disorders other than retinal dystrophies, along with a decrease in 0509T claims. Only 4% of 2021 claims for CPT 92273 were associated with diagnoses consistent with retinal dystrophies, while 31% were associated with a diagnosis of macular degeneration, 20% with optic nerve disorders, 13% with glaucoma, and 13% with diabetes. Although ffERG changes have been described in patients with these disorders, the test is not widely considered to be clinically useful in their management. Published data suggest it is still in development or used as a research tool for the study of macular degeneration, diabetic retinopathy, and glaucoma. Additionally, only two Medicare Administrator Contractors (MACs) cover electroretinography (ERG), but it depends on the diagnosis and what is being treated. Lastly, use of pattern ERG (0509T) for diagnosis and management of glaucoma has some support in the literature, but it has not been widely adopted considering the prevalence of the disease. Likewise, Medicare utilization continues to decrease. The Workgroup discussed how best to address this issue, noting that an immediate resurvey would not address the incorrect reporting of these services. The Relativity Assessment Workgroup recommends referral to CPT Assistant to create an article to address proper reporting of CPT 92273, 92274, and 0509T, accompanied by AAO and AOA educational outreach to providers. In addition, the specialty societies encourage the MACs to develop LCDs and LCAs for these services. The RAW will review after publication of the CPT Assistant article.

27369	**Injection procedure for contrast knee arthrography or contrast enhanced CT/MRI knee arthrography**	Harvard Valued - Utilization Over 30,000-Part2 / High Volume Growth3 / CMS High Expenditure Procedural Codes2 / Different Performing Specialty from Survey4	April 2024	Refer to CPT Assistant. 0.96	AAOS, AAPA, ACS, ANA, SIR	

Background: In June 2017, the CPT Editorial deleted of injection of contrast for knee arthrography code 27370 with new code to report injection procedure for knee arthrography or enhanced CT/MRI knee arthrography. In April 2022, the Workgroup identified code 27369 with 2020 Medicare utilization over 10,000 where a service was performed by one specialty but is now performed by a different specialty. The Workgroup requested an action plans for September 2022. In September 2022, the Workgroup recommended that this service be reviewed in 2 years to allow education on miscoding take effect. In April 2024, the specialty societies recommended removing 27369 from the Different Performing Specialty from Survey screen because a few orthopaedic surgeons are driving the utilization of this service. However, the Workgroup noted that nurse practitioners are the top performers of this service and other providers may also be misreporting 27369 instead of 20610 Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); without ultrasound guidance or 20611 Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); with ultrasound guidance, with permanent recording and reporting. The Workgroup recommends that the nurse practitioners and physician assistants work with AAOS, ACR and SIR to develop a CPT Assistant article on how to correctly report CPT code 27369, especially when to report 27369 versus 20610 and 20611.

51728	**Complex cystometrogram (ie, calibrated electronic equipment); with voiding pressure studies (ie, bladder voiding pressure), any technique**	Codes Reported Together 95% or More / Codes Reported Together 75% or More-Part5	September 2022	Refer to CPT Assistant. 2.11	AUA, ACOG	

Background: Deleted 51772 and 51795 and added three new codes to combine the services. Revised at the February 2009 CPT Meeting. In April 2022, the Workgroup identified services performed by the same physician on the same date of service 75% of the time or more. Only groups that totaled allowed charges of $5 million or more were included. As with previous iterations, any code pairs in which one of the codes was either below 1,000 in 2020 Medicare claims data and/or contained at least one ZZZ global service were removed. The Workgroup requested action plans for September 2022 to determine if specific codes bundling solutions should occur for 51728/51741 and 51728/51784. In September 2022, the Workgroup recommended that this issue be referred to CPT Assistant to educate providers about the coding and use of complex uroflowmetry. Some providers may believe that 51741 is part of the “pressure-flow” study of 51728 or 51729, but it is not. CPT code 51741 should only be reported if done separately from urodynamic studies, on a separate machine and only in certain circumstances or when indicated. Refer to CPT Assistant (51728/51784) to educate how EMG studies should only be used in certain circumstances.

92273	**Electroretinography (ERG), with interpretation and report; full field (ie, ffERG, flash ERG, Ganzfeld ERG)**	CMS High Expenditure Procedural Codes2 / Work Neutrality 2019	January 2024	Refer to CPT Assistant. 0.80	AAO, AOA (optometry), ASRS	

Background: In October 2020, the RUC identified one code family, Electroretinography (CPT codes 92273, 92274 and 0509T) that were reviewed in April 2017, October 2017 and January 2018 and have increased more than 10% in work RVUs from what was projected. In 2015, CPT code 92275 Electroretinography with interpretation and report was identified via the CMS High Expenditure screen. In January 2016, the specialty society noted that they became aware of inappropriate use of CPT code 92275 for a less intensive version of this test for diagnosis and indications that are not clinically proven and for which less expensive and less intensive tests already exist. The utilization of CPT code 92275 was appropriately low until 2013 when it suddenly increased by 300%. CPT changes were necessary to ensure that the service for which 92275 was intended was clearly described as well as an accurate vignette and work descriptor were developed. The RUC recommended CPT code 92275 be referred to the CPT Editorial Panel. In September 2017, the CPT Editorial Panel replaced electroretinography code 92275 with two new codes to describe electroretinography full field and multi focal. A category III code was retained for pattern electroretinography. In January 2018, the RUC reviewed these services and recommended lower work RVUs for the two new codes than code 92275 that was deleted. CMS also assigned a work RVU to code 0509T. However, in reviewing the utilization assumptions and 2019e Medicare utilization, there was a 38% increase in work RVUs. Since both the source volume from deleted code 92275 and the new volume for the three new codes all have assigned RVUs and are Medicare status A, it is a like comparison between previous reporting and current reporting (unlike when category III codes are not assigned an RVU). The Workgroup requests that the specialty societies submit an action plan for January 2021 to address this issue. In January 2021, the RUC recommended that codes 92273, 92274 and 0509T be reviewed in 3 years (January 2024) to review utilization. Despite no work neutrality issues, the Workgroup still had concerns about the volume growth and the unexpected distribution among the three new codes. In January 2024, the Workgroup reviewed the action plan in which the specialty societies note that the increased claims volume is explained by expansion of the use of ffERG (CPT 92273) in disorders other than retinal dystrophies, along with a decrease in 0509T claims. Only 4% of 2021 claims for CPT 92273 were associated with diagnoses consistent with retinal dystrophies, while 31% were associated with a diagnosis of macular degeneration, 20% with optic nerve disorders, 13% with glaucoma, and 13% with diabetes. Although ffERG changes have been described in patients with these disorders, the test is not widely considered to be clinically useful in their management. Published data suggest it is still in development or used as a research tool for the study of macular degeneration, diabetic retinopathy, and glaucoma. Additionally, only two Medicare Administrator Contractors (MACs) cover electroretinography (ERG), but it depends on the diagnosis and what is being treated. Lastly, use of pattern ERG (0509T) for diagnosis and management of glaucoma has some support in the literature, but it has not been widely adopted considering the prevalence of the disease. Likewise, Medicare utilization continues to decrease. The Workgroup discussed how best to address this issue, noting that an immediate resurvey would not address the incorrect reporting of these services. The Relativity Assessment Workgroup recommends referral to CPT Assistant to create an article to address proper reporting of CPT 92273, 92274, and 0509T, accompanied by AAO and AOA educational outreach to providers. In addition, the specialty societies encourage the MACs to develop LCDs and LCAs for these services. The RAW will review after publication of the CPT Assistant article.

90869	Therapeutic repetitive transcranial magnetic stimulation (tms) treatment; subsequent motor threshold re-determination with delivery and management	Feb 2011	Transcranial Magnetic Stimulation	15	CPT 2012	Sept 2024	Remain on the screens in which they were identified (Contractor Priced High Volume and New Technology/New Services) and the Workgroup will review again in 3 years (April 2024). When these codes are moved from contractor priced to the assignment to RVUs the issues around the direct to indirect practice expense ratio specific to codes 90867-90869 should be addressed. In April 2024, the Workgroup recommended to review in September 2024 with an update from the specialty society. The specialties indicated that there are changes in protocol for these services and coding changes are necessary. These codes are also contractor priced. The Workgroup questioned what specific coding changes would be included in a CCA. The specialty society will return at the next meeting to elaborate on the coding changes necessary. The specialty societies should also consider	☐

99492	Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional, initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan, review by the psychiatric consultant with modifications of the plan if recommended, entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant, and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.	Jan 2017	Psychiatric Collaborative Care Management Services	20	CPT 2018	April 2023	In January 2020, the RUC identified Psychiatric Collaborative Care Management Services via the work neutrality process. These codes show a 468% increase in work RVUs for 2018. In reviewing the utilization data for these services, it appears one independent clinic is performing most of these services in the pediatric population. The Workgroup recommended that CMS investigate the reporting of services by this specific independent clinic. The specialty society indicated, and the Workgroup agreed, that a new CPT Assistant article on the appropriate usage of these codes be developed in 2020. However, due to the incorrect reporting of these services by one specific provider, the referral for a CPT Assistant article was removed. This family is on the new technology/new services screen and is scheduled for review at the April 2023	☑

99493	Subsequent psychiatric collaborative care management, first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: tracking patient follow-up and progress using the registry, with appropriate documentation, participation in weekly caseload consultation with the psychiatric consultant, ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers, additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant, provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies, monitoring of patient outcomes using validated rating scales, and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are prepared for discharge from active treatment.	Jan 2017	Psychiatric Collaborative Care Management Services	20	CPT 2018	April 2023	In January 2020, the RUC identified Psychiatric Collaborative Care Management Services (CPT codes 99492, 99493 and 99494) via the work neutrality process. These codes show a 468% increase in work RVUs for 2018. In reviewing the utilization data for these services, it appears one independent clinic is performing most of these services in the pediatric population. The Workgroup recommends that CMS investigate the reporting of services by this specific independent clinic. The specialty society indicated, and the Workgroup agreed, that a new CPT Assistant article on the appropriate usage of these codes be developed in 2020. However, due to the incorrect reporting of these services by one specific provider, the referral for a CPT Assistant article was removed. This family is on the new technology/new services screen and is	☑

G2066	Interrogation device evaluation(s), (remote) up to 30 days; implantable cardiovascular physiologic monitor system, implantable loop recorder system, or subcutaneous cardiac rhythm monitor system, remote data acquisition(s), receipt of transmissions and technician review, technical support and distribution of results	Jan 2023	Remote Interrogation Device Evaluation - Cardiovascular (PE Only)	20		April 2027	Codes 93297 and 93298 were first flagged at the April 2008 meeting, Tab 23 Cardiac Device Monitoring, for CPT 2009 and reviewed at the RAW in September 2012. An Ad Hoc Workgroup was developed to determine how to address the work neutrality failure and establish guidelines for further RAW review of retrospective work neutralilty. In October 2018, 93297 and 93298 were reviewed and placed on the new technology/new services list for April 2024. CMS did not accept the practice expense for these services and instead created G2066 to report the practice expense associated with these services. In January 2023, the RUC affirmed the work RVUs and recommended direct PE inputs for 93297, 93298 and G2066. These services were placed back on the new technology/new services list to assess the work and PE in 3 years (April 2027).	☐

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% or More / CPT Assistant Analysis

April 2024

Endovascular Therapy with Imaging – Tab 04

In April 2022, the Relativity Assessment Workgroup (RAW) identified services performed by the same physician on the same date of service 75% of the time or more. Only groups that totaled allowed charges of $5 million or more were included. As with previous iterations, any code pairs in which one of the codes was either below 1,000 in 2020 Medicare claims data and/or contained at least one ZZZ global service were removed. The RAW requested action plans to determine if specific code bundling solutions should occur for 61624/75894 and 61624/75898. In September 2022, the RUC referred this issue to CPT for a code bundling solution. CPT code 61626 was added to the proposal for bundling. In February 2024, the CPT Editorial Panel revised codes 61624 and 61626 to include all associated radiological supervision and interpretation (RS&I), intra-procedural guidance and road-mapping, and imaging necessary to document completion of the procedure, in addition to instructional parentheticals regarding diagnostic radiology vascular procedures. The code family was surveyed for the April 2024 RUC meeting.

Compelling Evidence
The RUC reviewed and concurred that there is compelling evidence to support a change in physician work for CPT codes 61624 and 61626 based on evidence that (1) incorrect assumptions were made in the previous valuation of the service and (2) physician work has increased due to changes in technique, knowledge/technology, and patient population. CPT codes 61624 and 61626 were created for CPT 1992 and the original physician work value was established by the Centers for Medicare & Medicaid Services (CMS), formerly Health Care Financing Administration (HCFA), and may have been a gap fill for a code for which Harvard did not provide a value, thus flawed methodology was used in the previous valuation.

The RUC discussed compelling evidence about changes in technology and patient population for codes 61624 and 61626. Changes to the devices used for these procedures removes the lower intensity time components of the procedure by providing near-instantaneous deployment of individual coils. This is in contrast to first-generation detachable coils used 20+ years ago that required waiting for the successful detachment, typically several minutes per coil, and increasing time as the case progressed due to the increased dispersion of the electric current in the increasingly dense coil mass. Current technology has resulted in a more intense procedure due to eliminating low intensity time intervals, resulting in less time, but time that is all intense. New technology allows for increasingly complex procedures that would have required an open procedure or no procedure for patients unable to undergo an open procedure and has allowed a higher level of acuity since the codes were established in 1992 for patients undergoing endovascular aneurysm treatment.

The RUC also discussed changes to patients undergoing intracranial aneurysms who are treated in one of two ways: surgical treatments such as microsurgical clipping with or without bypass techniques, and endovascular methods such as coiling, balloon- or stent-assisted coiling, or intravascular flow diversion and intravascular flow disruption. In 1997, about 20% of intracranial aneurysms underwent endovascular embolization and the remainder of aneurysms underwent open surgical clipping due to the challenges involved in performing the service using the endovascular approach. Over the last decade, this proportion has been distinctly reversed with over 75% of intracranial aneurysms undergoing

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

endovascular embolization with many more complex pathologies within reach of this treatment modality (i.e., more complex and intense procedure). Treatment techniques and management guidelines for intracranial aneurysms have been continually developing, and this rapid development has altered treatment decision-making for physicians. The physician must consider several crucial factors including age, past medical history, and comorbidities to determine the patient's ability to tolerate a specific treatment. For example, a young patient with a ruptured intracranial aneurysm may be a good candidate for open surgery with better prospects of a long-term durable result and with lower rates of rebleeding. In contrast, an elderly patient with comorbidities, a ruptured intracranial aneurysm and a diffusely swollen and friable brain, endovascular coil embolization may be favored over open surgery. As surgical indications, techniques, and technology have advanced, more intense and complex endovascular treatments are being performed to save and extend the lives of patients not previously considered candidates for treatment.

In addition, the RUC reviewed and concurred that there is compelling evidence to support a change in physician work for CPT codes 75894 and 75898 based on evidence that (1) incorrect assumptions were made in the previous valuation of the service and (2) physician work has increased due to changes in patient population and dominant specialty. The RUC noted that CPT code 75894 has never been RUC surveyed, thus the current times are CMS/Other and not valid for comparison. Previously, there was no vignette developed for this service, thus it could be contended that the current values do not appropriately reflect the use of this code. CPT code 75898 was included when CPT codes 37211-37214 were reviewed at the April 2012 RUC meeting, however, code 75898 was not surveyed at that time and the RUC recommended contractor pricing for this service (and 75896). *The CMS/Other time source makes it impossible to compare the current numbers to the times and values derived from the survey results.*

Medicare claims data from 2022 indicates that CPT code 75894 was reported 87.7% of the time with CPT code 61624 and 75898 was reported 82.5% with 61624. At the February 2024 CPT meeting, code changes made to codes 61624 and 61626 resulted in the RS&I services (75894 and 75898) now being bundled with codes 61624 and 61626. This bundling will result in a different patient population, one expected to be predominantly serviced by interventional radiology, not neurosurgery.

The RUC concurred that there is compelling evidence that the physician work for these services has changed due to flawed methodology in the initial valuation and due to changes in technique, knowledge/technology, and patient population.

61624 ***Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; central nervous system (intracranial, spinal cord)***
The RUC reviewed the survey results from 93 physicians and determined that the survey 25th percentile work RVU of 20.00 appropriately accounts for the physician work involved in this service and falls below the current total value for 61624 and bundled codes 75894 and 75898. The RUC recommends the following physician time components: 40 minutes pre-service evaluation, 8 minutes pre-service positioning, 15 minutes pre-service scrub/dress/wait time, 150 minutes intra-service time, 33 minutes immediate post-service time, and 246 minutes total time.

The RUC agreed with the selection of pre-service time package 4-FAC *Difficult Patient/Difficult Procedure.* The RUC determined that 40 minutes (standard package 4 time) correctly accounted for pre-service evaluation and that 8 minutes (5 minutes more than package 4 time) accounted for

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the additional supervision of positioning of the patient, imaging equipment, and anesthesia lines to allow physician access to the operative area. The RUC reduced the survey immediate post-service time to match the standard package 9B time of 33 minutes. The RUC clarified that the typical patient is typically treated within 12-72 hours of presenting to the emergency department.

To justify a work RVU of 20.00, the RUC compared the surveyed code to the top key reference service code 33477 *Transcatheter pulmonary valve implantation, percutaneous approach, including pre-stenting of the valve delivery site, when performed* (work RVU = 25.00, 180 minutes intra-service time and 276 minutes total time) and noted that the surveyed code has less intra-service and total time and is therefore appropriately valued lower than the reference service. The RUC also compared CPT code 61624 to the second key reference service code 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU = 15.00, 100 minutes intra-service time and 241 minutes total time) and noted that the surveyed code has more intra-service and total time and is therefore appropriately valued higher than the reference service. The RUC further noted that the reference codes have different patient acuity than the surveyed code.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period that include a similar amount of physician work, so the pool of potential reference codes was severely limited. For additional support, the RUC compared CPT code 61624 to MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75, 90 minutes intra-service time and 166 minutes total time). The RUC noted that although the MPC code requires significantly less intra-service and total time, the intensity (IWPUT) was similar for both codes that represent embolization procedures. The RUC concluded that CPT code 61624 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 20.00 for CPT code 61624.**

61626 ***Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; non-central nervous system, head or neck (extracranial, brachiocephalic branch)***
The RUC reviewed the survey results from 122 physicians and determined that the survey 25th percentile work RVU of 15.31 appropriately accounts for the physician work involved in this service and falls below the current value of the code. The RUC recommends the following physician time components: 40 minutes pre-service evaluation, 8 minutes pre-service positioning, 15 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, and 30 minutes immediate post-service time, 213 minutes total time.

The RUC noted that pre-time package 4-FAC *Difficult Patient/Difficult Procedure* was selected with the following modifications:

- Evaluation time: Standard package time of 40 minutes.
- Positioning time: Standard package time of 3 minutes for supine positioning plus an additional 5 minutes (total = 8 minutes) to account for positioning the patient, imaging equipment, and anesthesia lines to allow physician access to the operative area.
- Scrub, dress, wait time: Reduced by 5 minutes (total time = 15 minutes) to be consistent with the survey median.

Also, immediate post-service time package 9B was reduced by 3 minutes (total time = 30 minutes) to be consistent with the survey median.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To justify a work RVU of 15.31, the RUC compared the surveyed code to the top key reference service MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75, 90 minutes intra-service time and 166 minutes total time) and noted that the surveyed code has more intra-service and total time and is therefore appropriately valued higher than the reference service. The RUC also compared CPT code 61626 to the second key reference service code 33477 *Transcatheter pulmonary valve implantation, percutaneous approach, including pre-stenting of the valve delivery site, when performed* (work RVU = 25.00, 180 minutes intra-service time and 276 minutes total time) and noted that the surveyed code has less intra-service and total time and is therefore appropriately valued lower than the reference service.

For additional support, the RUC compared CPT code 61626 to MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75, 90 minutes intra-service time and 166 minutes total time) and noted again that the comparator code requires significantly less intra-service and total time and is appropriately valued lower than the surveyed code. The RUC reiterated that many other MPC codes have a 000-day global assignment, but none that are clinically similar to the physician work required of 61626.

Finally, the RUC noted that the surveyed code is appropriately bracketed by comparator codes 33901 *Percutaneous pulmonary artery revascularization by stent placement, initial; normal native connections, bilateral* (work RVU = 14.50, 120 minutes intra-service time and 236 minutes total time) and 33903 *Percutaneous pulmonary artery revascularization by stent placement, initial; abnormal connections, bilateral* (work RVU = 16.50, 120 minutes intra-service time and 241 minutes total time). The RUC concluded that CPT code 61626 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 15.31 for CPT code 61626.**

75894 *Transcatheter therapy, embolization, any method, radiological supervision and interpretation*
The RUC reviewed the survey results from 37 radiologists and determined that the survey 25th percentile work RVU of 2.25 appropriately accounts for the physician work involved in this service. The RUC recommends the following physician time components as supported by the survey: 20 minutes pre-service evaluation time, 60 minutes intra-service time, and 20 minutes immediate post-service time, 100 minutes total time. The RUC acknowledged the anticipated low utilization of the surveyed code and recognized the atypical workflow where the surgeon is performing the procedure and the radiologist is performing the RS&I concurrently, but separately, outside of the procedure room.

To justify a work RVU of 2.25, the RUC compared the surveyed code to the top key reference service code 74175 *Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 1.82, 25 minutes intra-service time and 35 minutes total time) and noted that the surveyed code requires significantly more intra-service and total time and is therefore appropriately valued higher than the reference service. The surveyed code was selected as more intense/complex overall than the key reference service code 74175 by 95% of survey respondents. The RUC also compared the surveyed code to the second key reference service code 72191 *Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 1.81, 25 minutes intra-service time and 35 minutes total time) and noted again that the surveyed code has significantly more intra-service and total time and is therefore appropriately valued higher than the key reference service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support, the RUC noted that the surveyed code is appropriately bracketed by MPC codes 96116 *Neurobehavioral status exam (clinical assessment of thinking, reasoning and judgment, [eg, acquired knowledge, attention, language, memory, planning and problem solving, and visual spatial abilities]), by physician or other qualified health care professional, both face-to-face time with the patient and time interpreting test results and preparing the report; first hour* (work RVU = 1.86, 60 minutes intra-service time and 70 minutes total time) and 36455 *Exchange transfusion, blood; other than newborn* (work RVU = 2.43, 60 minutes intra-service time and 120 minutes total time). The RUC concluded that CPT code 75894 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 2.25 for CPT code 75894.**

75898 ***Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion, other than for thrombolysis***
The RUC reviewed the survey results from 37 radiologists and determined that the survey 25th percentile work RVU of 1.85 appropriately accounts for the physician work involved in this service. The RUC recommends the following physician time components as supported by the survey: 15 minutes pre-service evaluation time, 45 minutes intra-service time, and 17 minutes immediate post-service time, 77 minutes total time. The RUC acknowledged the anticipated low utilization of the surveyed code.

To justify a work RVU of 1.85, the RUC compared the surveyed code to both the key reference service codes 74175 *Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 1.82, 25 minutes intra-service time and 35 minutes total time) and 72191 *Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU = 1.81, 25 minutes intra-service time and 35 minutes total time) and noted that the surveyed code requires more intra-service and total time and is therefore appropriately valued slightly higher than the reference services.

For additional support, the RUC noted that the surveyed code is appropriately bracketed by MPC codes 94011 *Measurement of spirometric forced expiratory flows in an infant or child through 2 years of age* (work RVU = 1.75, 30 minutes intra-service and 70 minutes total time) and 99239 *Hospital inpatient or observation discharge day management; more than 30 minutes on the date of the encounter* (work RVU = 2.15, 45 minutes intra-service time and 64 minutes total time). The RUC concluded that CPT code 75898 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 1.85 for CPT code 75898.**

Practice Expense
The Practice Expense (PE) Subcommittee concurred with the specialty societies that there is compelling evidence to support an increase over the aggregate current cost for clinical activities, supplies and equipment. Specifically, based upon evidence that there has been a change in specialties, with a consequent change in the clinical staff types, and a change in technology which now allows for the service to be performed in a non-facility setting. Also, an error in the previous valuation applies because codes 75894 and 75898 were previously contractor-priced and therefore never had direct PE inputs. CPT codes 75894 and 75898 recommend the use of L041A *Vascular Interventional Technologist* rather than L041B *Radiologic Technologist* as it is expected the utilization will transition to radiology services, specifically interventional radiology, thereby supporting clinical staff support from a vascular interventional technologist, rather than the radiologic technologist as defined within the reference codes.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The PE Subcommittee discussed the request for non-facility inputs for CPT code 61626 and noted that the typical patient for the non-facility setting is described in a separate vignette in the PE SOR. Per 2022 claims data, 61624 and 61626 are performed in the facility setting almost 100% of the time, yet the Subcommittee agreed to allocate direct inputs in the non-facility setting for the minority number of anticipated patients, noting that the typical patient is similar to the facility-setting but with less severity. CPT code 61626 recommends use of L041A *Vascular Interventional Technologist* and L037D *RN/LPN/MTA* blend. The Subcommittee made a single amendment to the inputs for 61626 to remove ED032 *printer, laser, paper*.

The PE Subcommittee questioned the existing high-cost supply input, SF058 *LC Beads (2mL vial)*, as recommended with a quantity of two. It was noted that the number of beads is based on stasis of blood flow and even though the patient is not as urgent as in the facility, the tissue level embolization is essentially the same procedure and is a particle embolization which uses beads, not coils. **The RUC continues to call on CMS to separately identify and pay for high-cost disposable supplies using appropriate HCPCS codes.**

For CPT codes 61624 and 61626, the PE Subcommittee accepted the 3 minutes for CA001 *Complete pre-service diagnostic and referral forms* but removed the 3 minutes for CA003 *Schedule space and equipment in facility light, exam*, noting that one 3-minute phone call would be accounted for in the pre-service period. It was acknowledged that this standard 3-minute phone call in the pre-service period would occur as part of the post-service work required for an emergency procedure in the facility setting where work that would typically occur in the pre-service period gets shunted to the post-service period because of the emergent nature of the procedure. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Do Not Use to Validate for Physician Work
The RUC recommends that CPT codes 75894 and 75898 should be flagged as **Do Not Use to Validate for Physician Work** due to the uncertainty regarding the vignette and who would perform the service and in what circumstances. The survey vignette was not found to be typical for 75898 (46%) and the percentage of survey respondents who found the vignette to be typical for 75894 was also low (54%).

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Surgery
Cardiovascular System
Heart and Pericardium
Vascular Embolization and Occlusion

Codes 37241-37244 are used to describe vascular embolization and occlusion procedures, excluding the central nervous system and the head and neck, which are reported using 61624, 61626, and 61710, ~~and 75894,~~ and excluding the ablation/sclerotherapy procedures for venous insufficiency/telangiectasia of the extremities/skin, which are reported using 36468, 36470, and 36471. Embolization and occlusion procedures are performed for a wide variety of clinical indications and in a range of vascular territories. Arteries, veins, and lymphatics may all be the target of embolization.

The embolization codes….

Nervous System
Skull, Meninges, and Brain
Endovascular Therapy

61623 *Endovascular temporary balloon arterial occlusion, head or neck (extracranial/intracranial) including selective catheterization of vessel to be occluded, positioning and inflation of occlusion balloon, concomitant neurological monitoring, and radiologic supervision and interpretation of all angiography required for balloon occlusion and to exclude vascular injury post occlusion*

(If selective catheterization and angiography of arteries other than artery to be occluded is performed, use appropriate catheterization and radiologic supervision and interpretation codes)

(If complete diagnostic angiography of the artery to be occluded is performed immediately prior to temporary occlusion, use appropriate radiologic supervision and interpretation codes only)

Codes 61624, 61626 describe permanent transcatheter vascular occlusion or embolization procedures, excluding non-central nervous system and non-head or neck embolization, which is reported using 37241, 37242, 37243, 37244. Codes 61624, 61626 include all associated radiological supervision and interpretation, intra-procedural guidance and road-mapping, and imaging necessary to document completion of the procedure. These codes do not always include diagnostic angiography and all necessary catheter placement(s). Code(s) for catheter placement(s) may be separately reported using selective catheter placement code(s), if used consistent with guidelines. Code(s) for diagnostic angiography may also be separately reported, when performed according to guidelines for diagnostic angiography during endovascular

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

procedures, using the appropriate diagnostic angiography codes. Report these services with an appropriate modifier (eg, modifier 59). See the guidelines on the reporting of diagnostic angiography preceding 75600 in the Vascular Procedures, Aorta and Arteries subsection.

Code 61624 is used to report endovascular embolization or occlusion procedures performed in the intracranial or spinal cord central nervous system. Examples include embolization for tumor destruction, to achieve hemostasis, to occlude an intracranial aneurysm or vascular malformation. Code 61626 is used to report vascular embolization or occlusion performed in the extracranial non central nervous system branches of the head or neck. Examples include embolization for epistaxis and arterial trauma to the neck.

Code 61624 is used to report embolization of an aneurysm, pseudoaneurysm, or vascular extravasation and includes all intra-aneurysmal or endoluminal devices (eg, balloons, stents, guide catheters etc). Therefore, when embolization is the primary surgical goal, 61624 is reported and not the intracranial stent code. However, if a stent is deployed as the sole management of an aneurysm, pseudoaneurysm or vascular extravasation, the stent deployment code (61635) should be reported and not the embolization code.

Only one embolization code should be reported for each surgical field (ie, the area immediately surrounding and directly involved in a treatment/procedure). Embolization procedures performed at a single setting and including multiple surgical fields (eg, a patient with multiple trauma and both intracranial and extracranial bleeding) may be reported with multiple embolization codes with the appropriate modifier (eg, modifier 59).

▲61624	A1	Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; central nervous system (intracranial, spinal cord) (For non-central nervous system ~~and~~, non-head or neck embolization, see 37241, 37242, 37243, 37244) (For open approach, see 61705, 61708, 61710) ~~(For radiological supervision and interpretation, use 75894)~~	000	20.00
▲61626	A2	non-central nervous system, head or neck (extracranial, brachiocephalic branch) (Do not report 61624, 61626, in conjunction with 75894, 75898) (For non-central nervous system ~~and~~, non-head or neck embolization, see 37241, 37242, 37243, 37244)	000	15.31

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:61624 Tracking Number A1 Original Specialty Recommended RVU: **25.00**
Presented Recommended RVU: **25.00**
Global Period: 000 Current Work RVU: **20.12** RUC Recommended RVU: **20.00**

CPT Descriptor: Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; central nervous system (intracranial, spinal cord)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female who smokes and has hypertension presents to the emergency department with significant headache. She is unable to follow commands (Hunt and Hess grade 3). A computed tomography (CT) scan and CT angiogram demonstrated a diffuse modified Fisher 3 subarachnoid hemorrhage, hydrocephalus, and an anterior communicating artery aneurysm. She undergoes transcatheter intracranial arterial embolization.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 1% , Overnight stay-less than 24 hours 19% , Overnight stay-more than 24 hours 80%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Review pre-operative work-up, with particular attention to imaging for treatment planning. Select and order the appropriate antibiotic(s) and intraoperative anticoagulation and confirm timing and administration, if required. Verification is made that all necessary surgical instruments, supplies, and specialized devices are available. Supporting base catheter, embolization microcatheter, and microwire combinations compatible in inner- and outer diameter as well as working lengths are selected and assembled on the sterile table. In comparison to and in addition to diagnostic arteriography, Tri-Axial systems are typically required to support embolization in the target vessel. Appropriately sized coils, balloons for possible temporary control and assist and microcatheter with pre-shaped tips most likely to succeed are selected. The physician ensures that all technical personnel have been familiarized with the technique and are fully familiar with all required devices. Don radiation protection Position (or supervise proper positioning of) patient. A surgical "time out" is performed with the treatment team.

Description of Intra-Service Work: Using fluoroscopic guidance and roadmapping technique, the embolization system, including parent vessel protection devices and a microcatheter are, advanced over a steerable guide wire to the aneurysm neck with great care aiming to avoid spasm, perforation, or dissection of the typically tortuous parent vessels on the way to the aneurysm. To that end, manual shaping of the microguidewire and the microcatheter tip over shaping mandrels is performed. The embolization microcatheter is advanced to and into the aneurysm dome with particular emphasis on avoiding causing a repeat rupture of the aneurysm by advancing the microcatheter too far. In certain anatomies with wide-neck aneurysms one or even two balloons are used temporarily to protect the parent and branching vessels from coil protrusion and serve as a back stop for intraprocedural rupture situations. Coils are sized according to the size of the aneurysm and prepared, and then serially loaded into the catheter system aiming to form a basket of coils that is then filled towards the inside. Coils are carefully delivered to the end of the catheter using the coil-marker indicators on the microcatheter and deployed by using the coil-specific detachment mechanism. The microcatheter and coils may need to be retracted and redeployed to achieve a tight coil pack and to avoid nontarget embolization. Intermittent control arteriograms

are performed to assess progress toward aneurysm stasis and lack of coil herniation into the parent vessel and need for additional coil deployment. When used, the balloons deployed to assist are temporarily deflated for this purpose. Completion angiography is performed, demonstrating the exclusion of the aneurysm from the arterial circulation and concurrent patency of the parent and branching vessels. When embolization is complete, the catheter system is removed in a sequential fashion.

Description of Post-Service Work: The patient is transferred to the recovery room and postoperative recovery care is discussed with nursing staff. The procedure and outcome are discussed with the family in the waiting area. A brief procedure note is written. A procedure report is dictated that includes the documentation of imaging and treatments. A complete neurological examination is repeated as soon as the patent has emerged from the effects of the anesthesia. The arterial access sites and distal pulses are assessed for hematoma formation and patency and desired limb perfusion. A postoperative progress note is written in the recovery room. The patient is discharged from the recovery room to ICU. Orders for continued monitoring are written and discussed with the nursing staff. Later the same day, a complete neurological examination is repeated and interval notes with an emphasis on neurological and vascular access site monitoring are charted. Patient and family questions are answered. Progress notes are written and discussed with the patient, family and nursing staff.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	2%	20%	78%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	5%	95%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	5%	95%
Physical effort required	0%	27%	73%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	2%	98%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	0%	40%	53%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	7%	86%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	0%	93%
Physical effort required	7%	33%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	0%	93%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Compelling Evidence

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as flawed crosswalk assumptions in a previous evaluation***

Code 61624 has never been surveyed (Harvard or RUC) even though the RUC database indicates the physician time is "RUC":

1. The code was new in CPT 1992 - after Harvard finished it's work - so CMS had to "gap fill" the work RVU and develop a time estimate. Per the 1992 Final Rule, code 61624 indicates: "*Physician work value established by HCFA. It may have been a refinement of a Harvard value, or a gap fill for a code for which Harvard did not provide a value. These include codes reviewed by carrier medical directors."*

2. The CY1992 PFS indicated a ZZZ global for 61624.

3. The CY 1993 PFS changed the global to 000, but no text was included about the change in global. This likely occurred as a result of re-review by CMDs in response to comments.

4. Current RUC database indicates 61624 was reviewed by the RUC in April 2002, but this is not correct. A CPT revision to the code to add the term "permanent" was deemed editorial and no survey was conducted.

5. The RUC database physician time tab indicates time is "RUC," but this is not correct. In February 2007, as part of review of time and visits for the new PE RVU calculation methodology, the total time assigned by CMS for 61624 was divided into time components by SIR, accepted by the RUC Practice Expense Subcommittee, and submitted to CMS. ***Please see information attached at the end of this SOR that was submitted to CMS in 2007***.

6. The RUC database note "DO NOT USE TO VALIDATE FOR PHYSICIAN WORK" was added because the physician time was allocated from the total time assigned by HCFA (CMS) and not surveyed.

- ***Change in patient population and technology***

The treatment of intracranial aneurysm (IA) has undergone very significant paradigm shifts in the recent decades. The introduction of any new device is inevitably accompanied by evolution of the technique. Treatment techniques and management guidelines for IAs have been continually developing and this rapid development has altered treatment decision-making for clinicians. IAs are treated in one of two ways: surgical treatments such as microsurgical clipping with or without bypass techniques, and endovascular methods such as coiling, balloon- or stent-assisted coiling, or intravascular flow diversion and intravascular flow disruption. When making a decision of which treatment, several factors are crucial to consider. Age, past medical history, and comorbidities to help determine the patient's ability to tolerate a specific treatment. A young patient with a ruptured IA may be a good candidate for open surgery with better prospects of a long-term durable result and with lower rates of rebleeding. In contrast, in an elderly patient with comorbidities with a ruptured IA and a diffusely swollen and friable brain, endovascular coil embolization may be favored over open surgery.[1]

As surgical indications, techniques, and technology have advanced, more intense and complex endovascular treatments are being performed to save and extend the lives of patients not previously considered candidates for treatment. In 1997 about 20% of intracranial aneurysms underwent endovascular embolization and the remainder of aneurysms underwent open surgical clipping due to the challenges involved to perform the service using the endovascular approach. This proportion has been distinctly reversed with over 75% of intracranial aneurysms undergoing endovascular embolization over the last decade with many more complex pathologies within reach of this treatment modality (i.e., more complex and intense procedure).

In addition improvement in detachment technology of the devices removes the lower intensity time components of the procedure by providing near-instantaneous deployment of individual coils. This removed components of time for first-generation GDC electrolytically detachable coils were used that required waiting for the successful detachment, typically several minutes per coil and increasing as the case progressed due to the increased dispersion of the electric current in the increasingly dense coil mass. The technology change resulted in a more intense contemporary procedure due to eliminating these low intensity time intervals breaks. This has resulted in less time, but time that is all intense (ie, less lower intensity time for detachment). The new technology also allows for increasingly complex procedures that would have required an open procedure or no procedure for patients unable to undergo an open procedure. These

[1] Lee, K.S., Zhang, J.J.Y., Nguyen, V. *et al.* The evolution of intracranial aneurysm treatment techniques and future directions. *Neurosurg Rev* **45**, 1–25 (2022)

changes provide compelling evidence that technology has changed the intensity of work and has allowed a higher level of acuity of patients undergoing endovascular intracranial aneurysm treatment since code 61624 was established as new in 1992.

Background

An AMA CPT/RUC workgroup screen of services performed together 75% or more identified code pairs 61624/75894 and 61624/75898. Both code pairs were referred to CPT for a code bundling solution. Code 61626 was added to the proposal for bundling.

At the February 2024 CPT meeting, the Panel accepted the request to revise codes 61624 and 61626 to bundle all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention.

Recommendation - 61624

We recommend the survey median work RVU of 25.00.

Pre-time

Package 4 is selected with the following modifications:

Evaluation time: Standard package time of 40 minutes plus an additional 20 minutes (total = 60 minutes) to account for: (1) extensive imaging review for treatment planning, including obtaining measurements to assist with device selection; (2) significant time to verify all necessary specialized devices are available (eg, supporting base catheter, embolization microcatheter, and microwire combinations compatible in inner- and outer diameter as well as working lengths, appropriately sized coils, balloons for possible temporary control and assist, and microcatheter with pre-shaped tips most likely to succeed) and that these devices are assembled on the sterile table; and (3) extensive discussion with the patient/family about the possible intraoperative procedures that may be necessary and the expected postoperative recovery to obtain consent. These activities are not part of the typical preservice evaluation prior to a major procedure.

Positioning time: Standard package time of 3 minutes for supine positioning plus an additional 12 minutes (total = 15 minutes) to account for positioning the patient, imaging equipment, and anesthesia lines to allow physician access to the operative area.

Scrub, dress, wait time: Subtract 5 minutes (total time = 15 minutes) to be consistent with survey median.

Immediate Post-time

The postoperative time includes the time to discuss postoperative recovery care with nursing staff, discussion of the procedure and outcome with the family in the waiting area; writing a brief procedure note; dictating a procedure report that includes the documentation of imaging and treatments; performing a complete neurological examination as soon as the patent has emerged from the effects of the anesthesia; assessing the arterial access sites and distal pulses; writing orders for discharge from recovery to ICU and orders for continued monitoring ICU; later same day complete neurological examination in ICU and review and charting of interval notes with an emphasis on neurological and vascular access site monitoring; and answering patient, family and nursing staff questions. Forty-five minutes is a conservative estimate of physician postoperative time on the day of the procedure.

Key Reference Service Comparison (33477)

The relative intensity of key reference code 33477 is somewhat less than survey code 61624. The work involved in 33477 is a complex multistep procedure, but is substantially different in its nature and intraoperative intensity since it involves the sequential exchange and deployment of multiple balloons and stent-like devices to replace the pulmonary valve over a secure and stable guidewire. In contrast, during the coil embolization of an intracranial aneurysm, the progressive deployment of coils obscures the visibility of the coil currently being pushed. It increases the risk of perforation and intraprocedural rupture as well as microcatheter kick-out and resultant herniation of the coil into the parent vessel with thrombus formation and risk of stroke. The most dangerous coil to place is usually the last one. The intensity of 61624 is not only very high at the beginning and the end of the procedure, but also significantly high at every step.

MPC Code Comparison (37244)

There are many MPC codes that have a 0-day global assignment, but none that approach the work required of 61624. This makes finding appropriate MPC codes with similar total work difficult. MPC code 37244 requires significantly less total time and intra-time and appropriately has a significantly lower RVW. However, the relative intensity (IWPUT) of 37244 is comparable to 61624.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	13.75	0.135	166	23	3	5	90	45
61624	Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; central nervous system (intracranial, spinal cord)	25.00	0.148	285	60	15	15	150	45

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 61624 and sometimes 75894 and 75898

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty radiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
10,270 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 Medicare Part B utilization

Specialty neurosurgery Frequency 5250 Percentage 51.11 %

Specialty radiology Frequency 5000 Percentage 48.68 %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society RVS Update Committee
Practice Expense Subcommittee
Thursday, February 1, 2007

Doctors Katherine Bradley, PhD, RN, (Chair), Joel Brill, MD, Thomas Felger, MD , Douglas M. Leahy, MD, John Gage, MD, Meghan Gerety, MD, William J. Mangold, Jr. MD, Charles Mick, MD, Bill Moran, MD, David Regan, MD, and Robert Zwolak, MD met and discussed the following four issues:

Physician Time Component Allocations
At the request of a specialty society, AMA staff compiled list of codes where there are no time components, only total time. On October 27, 2006 AMA staff emailed the list of codes to RUC participants and requested specialties to review the listing and submit time components to AMA staff. Three specialties submitted time components; the American Academy of Dermatology Association (AAD), the American College of Cardiology (ACC), and the Society for Interventional Radiology (SIR). After discussion of each of the submissions, the subcommittee agreed with all of the specialty physician time components and recommends them to the RUC for approval. These recommendations are attached behind this report.

In addition, since this issue of specialties providing missing physician time components has been an standing agenda item for this subcommittee since at least 2002, the subcommittee **recommends that by the April 2007 agenda book publication date, for codes with total time only, if no specialty recommends physician time components, the total time for the code will be recommended by the RUC as having zero physician time.** AMA staff will send a final listing of codes where physician time components are needed to all RUC participants soon after this meeting.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:61626 Tracking Number A2 Original Specialty Recommended RVU: **20.00**
Presented Recommended RVU: **15.31**
Global Period: 000 Current Work RVU: **16.60** RUC Recommended RVU: **15.31**

CPT Descriptor: Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; non-central nervous system, head or neck (extracranial, brachiocephalic branch)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male presents to the emergency department with recurrent epistaxis. His medical history includes hypertension, atrial fibrillation requiring anticoagulation, and multiple episodes of epistaxis refractory to medical therapy and frequent packing. He undergoes transcatheter embolization of the maxillary artery.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 98% , In the ASC 1%, In the office 2%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 7% , Overnight stay-less than 24 hours 28% , Overnight stay-more than 24 hours 66%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 99%

Description of Pre-Service Work: A targeted H&P is performed obtaining relevant clinical information, including indications, physical examination findings, and important laboratory findings. Careful review of previously acquired imaging studies including multiplanar reformatted images is performed to assess access vessel, variants of anatomy, potential or future postsurgical changes, vessel diameter, and target vessel to be embolized. The proposed procedure is discussed with the patient and/or family. Informed consent is obtained. The examination, procedural plans, and consent are documented in the medical record. Diagnostic images are reviewed to determine appropriate catheter selection, placement, and embolization. Verification is made that all necessary surgical instruments, supplies, and specialized devices are available. Supporting base catheter, embolization catheter, and wire combinations are selected and assembled on the sterile table. In comparison to and in addition to diagnostic arteriography, tri-axial systems are typically required to support embolization in the target vessel. The physician ensures that all technical personnel have been familiarized with the technique and are fully familiar with all required devices. Don radiation protection. Position (or supervise proper positioning of) patient. A surgical "time out" is performed with the treatment team.

Description of Intra-Service Work: A microcatheter and microwire are advanced into the bleeding vessel(s) under roadmapping and fluoroscopic control. Embolic material (particles and/or coils) is delivered onto the sterile field and prepared in a suspension of contrast and saline. Embolization is performed using a combination of embolic particles and/or coils. Embolization is performed using small aliquots of embolic material mixed with contrast. Aliquots are slowly delivered to the target tumor tissue under fluoroscopic guidance until adequate flow arrest in the targeted vessel is achieved. Intermittent control angiograms are performed to assess progress in promoting arterial occlusion and to judge whether there is ongoing hemorrhage and collateral supply. Additional bleeding branches are targeted and embolized using embolic particles and coils, with intermittent control arteriography to assess progress. Completion angiography is performed demonstrating occlusion of the offending vessel(s). When embolization is complete, the catheter system is removed.

Description of Post-Service Work: The patient is transferred to the recovery room and postoperative recovery care is discussed with nursing staff. The procedure and outcome are discussed with the family in the waiting area. A brief procedure note is written. A procedure report is dictated that includes the documentation of imaging and treatments. A complete neurological examination is repeated as soon as the patent has emerged from the effects of the anesthesia. Signs of nontarget embolization are evaluated. A postoperative progress note is written in the recovery room. The patient is discharged from the recovery room to ICU or moderate care. Orders for continued monitoring are written and discussed with the nursing staff.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	27%	47%	20%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	23%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	43%	50%
Physical effort required	7%	57%	37%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	23%	70%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	13%	38%	50%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	19%	81%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	6%	94%
Physical effort required	0%	31%	69%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	6%	94%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Compelling Evidence

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as flawed crosswalk assumptions in a previous evaluation***

Code 61626 has never been surveyed (Harvard or RUC) even though the RUC database indicates the physician time is "RUC":

1. The code was new in CPT 1992 - after Harvard finished it's work - so CMS had to "gap fill" the work RVU and develop a time estimate. Per the 1992 Final Rule, code 61626 indicates: "*Physician work value established by HCFA. It may have been a refinement of a Harvard value, or a gap fill for a code for which Harvard did not provide a value. These include codes reviewed by carrier medical directors."*

2. The CY1992 PFS indicated a ZZZ global for 61626.

3. The CY 1993 PFS changed the global to 000, but no text was included about the change in global. This likely occurred as a result of re-review by CMDs in response to comments.

4. Current RUC database indicates 61626 was reviewed by the RUC in April 2002, but this is not correct. A CPT revision to the code to add the term "permanent" was deemed editorial and no survey was conducted.

5. The RUC database physician time tab indicates time is "RUC," but this is not correct. In February 2007, as part of review of time and visits for the new PE RVU calculation methodology, the total time assigned by CMS for 61626 was divided into time components by SIR, accepted by the RUC Practice Expense Subcommittee, and submitted to CMS. ***Please see information attached at the end of this SOR that was submitted to CMS in 2007.***

6. The RUC database note "DO NOT USE TO VALIDATE FOR PHYSICIAN WORK" was added because the physician time was allocated from the total time assigned by HCFA (CMS) and not surveyed.

- ***Change in patient population and technology***

Improvement in detachment technology of the devices removes the lower intensity time components of the procedure by providing near-instantaneous deployment of individual coils. This removed components of time for first-generation GDC electrolytically detachable coils were used that required waiting for the successful detachment, typically several minutes per coil and increasing as the case progressed due to the increased dispersion of the electric current in the increasingly dense coil mass. The technology change resulted in a more intense contemporary procedure due to eliminating these low intensity time intervals breaks. This has resulted in less time, but time that is all intense (i.e., less lower intensity time for detachment). The new technology also allows for increasingly complex procedures that would have required an open procedure or no procedure for patients unable to undergo an open procedure. These changes provide compelling evidence that technology has changed the intensity of work and has allowed a higher level of acuity of patients undergoing endovascular non-central system aneurysm treatment since code 61626 was established as new in 1992.

Background

An AMA CPT/RUC workgroup screen of services performed together 75% or more identified code pairs 61624/75894 and 61624/75898. Both code pairs were referred to CPT for a code bundling solution. Code 61626 was added to the proposal for bundling.

At the February 2024 CPT meeting, the Panel accepted the request to revise codes 61624 and 61626 to bundle all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention.

Recommendation - 61626

We recommend the survey median work RVU of 20.00.

Pre-time

Package 4 is selected with the following modifications:

Evaluation time: Standard package time of 40 minutes plus an additional 20 minutes (total = 60 minutes) to account for: (1) extensive imaging review for treatment planning, including obtaining measurements to assist with device selection; (2) significant time to verify all necessary specialized devices are available (eg, supporting base catheter, embolization microcatheter, and microwire combinations compatible in inner- and outer diameter as well as working lengths, appropriately sized coils, balloons for possible temporary control and assist, and microcatheter with pre-shaped tips most likely to succeed) and that these devices are assembled on the sterile table; and (3) extensive discussion with the patient/family about the possible intraoperative procedures that may be necessary and the expected postoperative recovery to obtain consent. These activities are not part of the typical preservice evaluation prior to a major procedure.

Positioning time: Standard package time of 3 minutes for supine positioning plus an additional 12 minutes (total = 15 minutes) to account for positioning the patient, imaging equipment, and anesthesia lines to allow physician access to the operative area.

Scrub, dress, wait time: Subtract 5 minutes (total time = 15 minutes) to be consistent with survey median.

Immediate Post-time

The postoperative time includes the time to discuss postoperative recovery care with nursing staff, discussion of the procedure and outcome with the family in the waiting area; writing a brief procedure note; dictating a procedure report that includes the documentation of imaging and treatments; performing a complete neurological examination as soon as the patent has emerged from the effects of the anesthesia; assessing the arterial access sites and distal pulses; later same day patient assessment and review and charting of interval notes with an emphasis on vascular access site monitoring; and answering patient, family and nursing staff questions.

Key Reference Service Comparison (37244)

Code 37244 requires significantly less total time and intra-time and appropriately has a significantly lower RVW. However, the relative intensity (IWPUT) of 37244 is comparable to 61626.

MPC Code Comparison (37244)

There are many MPC codes that have a 0-day global assignment, but none that approach the work required of 61626. This makes finding appropriate MPC codes with similar total work difficult. MPC code 37244 requires significantly less total time and intra-time and appropriately has a significantly lower RVW. However, the relative intensity (IWPUT) of 37244 is comparable to 61626.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	13.75	0.135	166	23	3	5	90	45
61626	Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; non-central nervous system, head or neck (extracranial, brachiocephalic branch)	20.00	0.146	240	60	15	15	120	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society RVS Update Committee
Practice Expense Subcommittee
Thursday, February 1, 2007

Doctors Katherine Bradley, PhD, RN, (Chair), Joel Brill, MD, Thomas Felger, MD , Douglas M. Leahy, MD, John Gage, MD, Meghan Gerety, MD, William J. Mangold, Jr. MD, Charles Mick, MD, Bill Moran, MD, David Regan, MD, and Robert Zwolak, MD met and discussed the following four issues:

Physician Time Component Allocations
At the request of a specialty society, AMA staff compiled list of codes where there are no time components, only total time. On October 27, 2006 AMA staff emailed the list of codes to RUC participants and requested specialties to review the listing and submit time components to AMA staff. Three specialties submitted time components; the American Academy of Dermatology Association (AAD), the American College of Cardiology (ACC), and the Society for Interventional Radiology (SIR). After discussion of each of the submissions, the subcommittee agreed with all of the specialty physician time components and recommends them to the RUC for approval. These recommendations are attached behind this report.

In addition, since this issue of specialties providing missing physician time components has been an standing agenda item for this subcommittee since at least 2002, the subcommittee **recommends that by the April 2007 agenda book publication date, for codes with total time only, if no specialty recommends physician time components, the total time for the code will be recommended by the RUC as having zero physician time.** AMA staff will send a final listing of codes where physician time components are needed to all RUC participants soon after this meeting.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:75894 Tracking Number A3 Original Specialty Recommended RVU: **2.25**
Presented Recommended RVU: **2.25**
Global Period: XXX Current Work RVU: **1.31** RUC Recommended RVU: **2.25**

CPT Descriptor: Transcatheter therapy, embolization, any method, radiological supervision and interpretation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female is diagnosed with subarachnoid hemorrhage after presenting to the emergency department with a severe headache and vomiting. Middle cerebral artery aneurysm was identified, and intervention was performed, including aneurysm coiling. Interpretation of images obtained during the embolization procedure is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 54%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Based on the patient's symptoms, signs, physical findings, and any preprocedural imaging studies, the area of known disease within the intracranial arterial tree is determined. Additionally, full evaluation of the carotid system is planned using angiographic imaging in the interventional suite. In addition, it is ensured that imaging equipment can be rotated to provide complete imaging from multiple angles prior to patient positioning.

Description of Intra-Service Work: Fluoroscopic anatomic landmarks as well as ultrasound imaging is used to determine the best and safest access site. Upon confirmation of successful access, including possible confirmatory angiography, image-guided navigation to the arterial distribution in question is performed. Additional diagnostic imaging with fluoroscopy and digital subtraction angiography is performed for confirmation of expected findings and planning for the necessary intervention. This can include 3D-CT rotational arteriography, as needed. These images may need to be reprocessed in real-time at an independent workstation if time permits based on the clinical condition of the patient. Multiple fluoroscopic imaging angles are also required to ensure complete visualization of the vasculature as this is a two-dimensional representation of a three-dimensional anatomic vascular tree. In addition, overlapping vessels and interference from osseous structures has to be taken into account. This requires prolonged visualization and interpretation due to multiple images. Magnified and filtered imaging is used, as necessary, for best visualization of potential vascular lesions as well as reformatting pixilation due to movement of the head/neck region. Dictate, transcribe, edit, and authenticate a complete report and archive it in the permanent health record.

Description of Post-Service Work: Select pertinent DSA and fluoroscopic imaging for transfer to PACS, including reformatted images adjusting for motion. Perform formal interpretation of the recorded fluoroscopic images, DSA images, and any 3D-CT rotational arteriography that may be present. This is performed in conjunction with review of medical history as well as prior imaging for comparison. Record fluoroscopic dose details.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	5%	5%	90%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	5%	95%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	0%	95%
Physical effort required	0%	5%	95%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	5%	95%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	12%	6%	82%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	12%	88%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	12%	88%
Physical effort required	0%	12%	88%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	12%	88%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Compelling Evidence

Code 75894 has never been surveyed and value was established by CMS/Other for the current wRVU of 1.31. The societies believe there is support for compelling evidence due to incorrect assumptions made in the previous valuation of CPT 75894. Previously there was no vignette developed for this service, due to this the societies believe the current values

do not appropriately reflect the use of this code and support the development of a vignette and values based on input from survey of society members performing this service.

Claims data from 2022 shows that CPT 75894 was billed 87.7% of the time with CPT 61624. At the recent CPT meeting, February 2024, code changes made to codes 61624 and 61626 resulted in the RS&I services (75894 and 75898) now bundled with codes 61624 and 61626. This bundling will result in a different patient population, one expected to be predominantly serviced by interventional radiology and not neurosurgery.

Background

In April 2022, 61624 was identified on the screen for services performed by the same physician on the same date of service 75% of the time or more. The screen only includes code pairs that total allowed charges of $5 million or more. and Any code pairs in which one of the codes was either below 1,000 in 2020 Medicare claims data and/or contained at least one ZZZ global service were removed. The Workgroup requested action plans for September 2022 to determine if specific codes bundling solutions should occur for 61624/75894 and 61624/75898. In September 2022, the Workgroup referred this issue to CPT for a code bundling solution in CPT 2025.The RUC noted that CPT code 75898 has been bundled previously with other services but has not ever been surveyed itself.

Code 61626 was added in 1992 and is a legacy code, resultantly, no history exists for the development of the code. However, Code 61624 was revised for CPT 2003.

The Panel postponed time certain (February 2024) the request to revise codes 61624, 61626 to report inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention. Code 75894 and 75898 were not deleted, as codes no longer billable with 61624 and 61626 and no survey data, the societies were required to survey the RS&I codes (75894 and 75898) to establish values outside of utilization with the endovascular therapy with imaging code set.

CPT 75894 and 75898 have never been surveyed by the RUC. There is no historical information available through the RUC database for code 75894 and why it has never been surveyed. The RUC database does offer insight into CPT 75898. At the April 2012 RUC meeting, CPT codes 37211-37214 were reviewed, and RUC recommendations were forwarded to CMS in May 2012. However, CPT codes 75896 *Transcatheter therapy, infusion other than for thrombolysis, radiological supervision and interpretation* and 75898 *Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion, other than for thrombolysis* were not surveyed and until specialty society recommendations were provided, the RUC recommended carrier pricing for both services.

Methodology

A multi-disciplinary survey conducted by ACR and SIR was distributed to randomly selected members of the representative societies. For code 75894, 37 surveys were completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 75894

We are recommending a value of 2.25 wRVU, the survey 25th percentile for CPT 75894.

Pre- and Post-Service Time Packages

As an XXX global code, there are no pre or post time packages for this code.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 1) 74175 *Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing,* with work RVUs of 1.82 and 2) 72191, *Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing*, with work RVUs of 1.81. Survey data supports 54% of members selected code 74175 and 13.5% selected code 72191. The key reference codes selected for the survey of CPT 75894 are slightly lower in value when applying the 25th percentile of the survey results, 2.25 work RVUs. Due to the greater physician time from the survey data, this results in a much lower IWPUT when compared to the KRSs.

Given CPT 75894 has never been surveyed and this is the first establishment of the code value based on physician input, it was expected the values may not align exactly with current values of 1.31 wRVUs and 25 minutes of total time, there is no intra time for this code; therefore, there is no current IWPUT.

CPT	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
75894 Survey	2.25	0.0226	100	20	60	20
72191 Key Ref	1.81	0.0634	35	5	25	5
74175 Key Ref	1.82	0.0638	35	5	25	5

Our recommendation is work RVU 2.25, the 25th percentile, for 75894.

Comparison to MPC codes

A review of XXX MPC codes, not part of the RSL, identifies two codes which are supportive when valuing CPT 75894. CPT 96116, *Neurobehavioral status exam (clinical assessment of thinking, reasoning and judgment, [eg, acquired knowledge, attention, language, memory, planning and problem solving, and visual spatial abilities]), by physician or other qualified health care professional, both face-to-face time with the patient and time interpreting test results and preparing the report; first hour* with intra time of 60 minutes and wRVUs of 1.86 brackets on the lower end along with 36455, *Exchange transfusion, blood; other than newborn,* with intra time of 60 minutes and wRVUs of 2.43 brackets on the higher end.

CPT	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
96116 MPC	1.86	0.0273	70	5	60	5
75894 Survey	2.25	0.0226	100	20	60	20
36455 MPC	2.43	0.0181	120	30	60	30

Conclusion

The RUC database reflects CPT 75894 has never been surveyed. A multi-disciplinary survey of CPT 75894 was performed. In review of the survey data, the 25th percentile wRVU of 2.25 is recommended.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75898

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Radiology How often? Rarely

Specialty Diagnostic Radiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,345
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 claims data for 75894 was 10,938, and claims data for 61624 was 10,270. With updated coding 75894 is now bundled into 61624. Code 61624 was billed 87.7% of the time with CPT 75894, but the utilization is expected to drastically decrease.

10,938*0.877 = 9593. 10,938 - 9,593 = 1,345 split 50/50 = 673/672

Focusing soley on the specialties of diagnostic radiology and interventional radiology which are believed to be the only specialties who may continue to bill this RS&I code, although it is believed interventional radiology may be the predominant user, because it is not known by how much this may be, a 50/50 split was used for estimation between the specialties. There may be other opportunities for future utilization, but until new claims data of the bundled services is available the exact utilization is not known and can only be estimated based on current patterns and potential opportunities.

Specialty Interventional Radiology Frequency 673 Percentage 50.03 %

Specialty Diagnostic Radiology Frequency 672 Percentage 49.96 %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? No

CPT Descriptor: Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion, other than for thrombolysis

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female is diagnosed with subarachnoid hemorrhage after presenting to the emergency department with a severe headache and vomiting. Middle cerebral artery aneurysm was identified, and an aneurysm coiling was performed, including a follow-up internal carotid angiogram. Interpretation of images of the follow-up angiogram is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 46%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the indication for the examination, any pertinent clinical history, and prior cross-sectional imaging studies to become familiar with the patient's clinical scenario and anatomy. Review digital subtraction angiography and fluoroscopic images prior to transcatheter therapy focusing on the lesion in question. Confirm that adequate pre-treatment angiography imaging of the lesion in question was performed and evaluate which projections adequately characterize the lesion to assess response to transcatheter therapy, embolization, or infusion. Consider additional projections, angiographic catheter position, and injection techniques that may be required in order to further characterize whether lesion is successfully treated.

Description of Intra-Service Work: After treatment of lesion, additional follow-up imaging is performed. Digital subtraction angiography and fluoroscopy is utilized in multiple different projections, again taking into account overlapping vessels and osseous structures. This can include 3D-CT rotational arteriography, as needed. These images may need to be reprocessed in real-time at an independent workstation if time permits based on the clinical condition of the patient. Imaging is obtained in order to confirm adequate lesion treatment, no residual hemorrhage or occlusion. In addition, full and detailed evaluation of the base vessel and adjacent vessel distributions is performed. Magnified and filtered imaging is used, as necessary, for best visualization of potential vascular lesions as well as reformatting pixilation due to movement of the head/neck region. In addition, overlapping vessels and interference from bone prominences has to be taken into account. This requires prolonged visualization and interpretation due to multiple images. Dictate, transcribe, edit, and authenticate a complete report and archive it in the permanent health record.

Description of Post-Service Work: Select pertinent DSA and fluoroscopic imaging for transfer to PACS, including reformatted images adjusting for motion or bowel gas. Perform formal interpretation of the recorded fluoroscopic images, DSA images, and any 3D-CT rotational arteriography that may be present. This is performed in conjunction with review of medical history as well as prior imaging for comparison. Record fluoroscopic dose details.

Technical skill required	0%	20%	80%
Physical effort required	0%	20%	80%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	0%	100%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Compelling Evidence

Code 75898 has never been surveyed and value was established by CMS/Other for the current wRVU of 1.65. The societies believe there is support for compelling evidence due to incorrect assumptions made in the previous valuation of CPT 75898. Previously there was no vignette developed for this service, due to this the societies believe the current values do not appropriately reflect the use of this code and support the development of a vignette and values based on input from survey of society members performing this service.

Claims data from 2022 shows that CPT 75898 was billed 82.5% of the time with CPT 61624. At the recent CPT meeting, February 2024, code changes made to codes 61624 and 61626 resulted in the RS&I services (75894 and 75898) now bundled with codes 61624 and 61626. This bundling will result in a different patient population, one expected to be predominantly serviced by interventional radiology and not neurosurgery.

Background

Due to the coding changes from the RUC survey in April 2012, code 75898 was now an orphan code and the specialty societies reiterated this at the following October 2012 RUC meeting. Code 75898 was expected to be addressed as part of the coding changes expected at that time from the multi-specialty embolization coding revision due for CPT Editorial Panel review in February 2013. A parenthetical was added for 75898 in which it could not be billed in conjunction with 37211-37214, 37241-37244, but the code was not surveyed. According to the RUC database, CPT 75898 has never been surveyed.

In April 2022, 61624 was identified on the screen for services performed by the same physician on the same date of service 75% of the time or more. The screen only includes code pairs that total allowed charges of $5 million or more. and Any code pairs in which one of the codes was either below 1,000 in 2020 Medicare claims data and/or contained at least one ZZZ global service were removed. The Workgroup requested action plans for September 2022 to determine if specific codes bundling solutions should occur for 61624/75894 and 61624/75898. In September 2022, the Workgroup referred this issue to CPT for a code bundling solution in CPT 2025.The RUC noted that CPT code 75898 has been bundled previously with other services but has not ever been surveyed itself.

Code 61626 was added in 1992 and is a legacy code, resultantly, no history exists for the development of the code. However, Code 61624 was revised for CPT 2003.

The Panel postponed time certain (February 2024) the request to revise codes 61624, 61626 to report inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention. Code 75894 and 75898 were not deleted, as codes no longer billable with 61624 and 61626 and no survey data, the societies were required to survey the RS&I codes (75894 and 75898) to establish values outside of utilization with the endovascular therapy with imaging code set.

Methodology

A multi-disciplinary survey conducted by ACR and SIR was distributed to randomly selected members of the representative societies. For code 75898, 37 surveys were completed. It should be noted, this is the first time CPT 75898 has been surveyed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 75898

We are recommending a value of 1.85 wRVU, the survey 25th percentile, for CPT 75898.

Pre- and Post-Service Time Packages

As an XXX global code, there are no pre or post time packages for this code.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 1) 74175 *Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing,* with work RVUs of 1.82 and 2) 72191, *Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing*, with work RVUs of 1.81. Survey data supports 45.9% of members selected code 74175 and 13.5% selected code 72191. The key reference codes selected for the survey of CPT 75898 are within the similar values when applying the 25th percentile of the survey results, 1.85 work RVUs. Due to the greater physician time from the survey data, this results in a much lower IWPUT when compared to the KRSs.

Given CPT 75898 has never been surveyed and this is the first establishment of the code value based on physician input, it was expected the values may not align exactly with current values of 1.65 wRVUs and 31 minutes of total time, there is no intra time for this code; therefore, there is no current IWPUT.

CPT	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
75898 Survey	1.85	0.0252	77	15	45	17
72191 Key Ref	1.81	0.0634	35	5	25	5
74175 Key Ref	1.82	0.0638	35	5	25	5

Our recommendation is work RVU 1.85, the 25th percentile, for 75898.

Comparison to MPC codes

A review of XXX MPC codes, not part of the RSL, identifies a code which is supportive when valuing CPT 75898. CPT 99239, *Hospital inpatient or observation discharge day management; more than 30 minutes on the date of the encounter* with intra time of 45 minutes and wRVUs of 2.15 aligns with the recommended value of the survey code.

CPT	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
75898 Survey	1.85	0.0252	77	15	45	17
99239 MPC	2.15	0.0383	64		45	19

Conclusion

The RUC database reflects CPT 75898 has never been surveyed. A multi-disciplinary survey of CPT 75898 was performed. In review of the survey data, the 25th percentile wRVU of 1.85 is recommended.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75894

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Radiology How often? Rarely

Specialty Diagnostic Radiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,583
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 claims data indicates 75898 was billed a total of 14,757 and 61624 billed 10,270. With the updated coding 75898 is now bundled into 61624. Code 61624 was billed 82.5% of the time with CPT 75898, but the utlization is expected to drastically decrease.

14,757*0.825 = 12,174 14,757 - 12,174 = 2,583 split 50/50 = 1,292/1,291

Focusing soley on the specialties of diagnostic radiology and interventional radiology which are believed to be the only specialties who may continue to bill this RS&I code, although it is believed interventional radiology may be the predominant user, because it is not known by how much this may be, a 50/50 split was used for estimation between the specialties. There may be other opportunities for future utilization, but until new claims data of the bundled services is available the exact utilization is not known and can only be estimated based on current patterns and potential opportunities.

Specialty Interventional Radiology Frequency 1292 Percentage 50.01 %

Specialty Diagnostic Radiology Frequency 1291 Percentage 49.98 %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Other

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37197

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 04/2024

CPT Code	Long Descriptor	Global Period
61624	Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), including all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention, percutaneous, any method; central nervous system (intracranial, spinal cord)	000
61626	non-central nervous system, head or neck (extracranial, brachiocephalic branch)	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
61624	A 55-year-old female who smokes and has hypertension presents to the emergency department with significant headache. She is unable to follow commands (Hunt and Hess grade 3). A computed tomography (CT) scan and CT angiogram demonstrated a diffuse modified Fisher 3 subarachnoid hemorrhage, hydrocephalus, and an anterior communicating artery aneurysm. She undergoes transcatheter intracranial arterial embolization.
61626	A 65-year-old male presents to the emergency department with recurrent epistaxis. His medical history includes hypertension, atrial fibrillation requiring anticoagulation, and multiple episodes of epistaxis refractory to medical therapy and frequent packing. He undergoes transcatheter embolization of the maxillary artery.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The society advisors reviewed the background for the current facility inputs for Harvard-based codes 61624 and 61626 compared with existing facility PE inputs for the RUC reviewed reference codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   Codes 61624 and 61626, when performed in the facility, are comparable to code 37243 which was reviewed by the RUC and Practice Expense Subcommittee in 2013. Therefore, code 37243 has been added as an additional reference for comparison.

   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?

   No

   See the *Billed Together* tab in the RUC Database.

FACILITY DIRECT PE INPUTS

CPT CODE(S): 61624, 61626
SPECIALTY SOCIETY(IES): AANS, CNS, SIR, ACR, ASNR
PRESENTER(S): Henry Woo, MD; Robert Kennedy, MD; Andrew Moriarity, MD; Jacob Ormsby, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

Although the RUC database indicates that 61624 was reviewed in April 2002, no survey was conducted and PE was not reviewed. A new code for endovascular "temporary" balloon occlusion was created and code 61624 was editorially revised to indicate "permanent" occlusion.

In addition, although the RUC database indicates that both codes 61624 and 61626 were reviewed by the PEAC in March 2001, only supplies and equipment were considered in 2001 This was based on a recommendation from CMS that a long list of facility-only codes have no supplies or equipment. Clinical staff time for that list of codes was not considered at that meeting.

In February 2002, the PEAC recommended that by the September 2002 PEAC meeting, those codes with global periods of 0 and 10 days will receive a PEAC recommendation of zero minutes of pre-service time unless a specialty recommends otherwise and is able to provide sufficient data to the PEAC to justify the recommended times. Unfortunately, at that time the tables used by the PEAC indicated 61624 and 61626 were 90-day global codes and were given the standard facility only 90-day global codes pre-times. The times were subsequently zeroed out by CMS prior to final implementation of the PEAC recommendations since they were actually 0-day codes.

However, these procedures, when performed in the facility, are comparable to code 37243 which was reviewed by the RUC and Practice Expense Subcommittee in 2013. We are requesting six minutes as approved for 37243 for both codes. Clinical staff will be involved in transfer of patient information and coordination with insurers and the facility regarding these procedures. Although all the activities for "minimal" use of staff are not appropriate (eg, patient education, patient preop calls), there is still clinical staff time that will always occur. The physician typically uses their own clinical staff to complete preservice diagnostic/referral forms and to work with the insurance companies for authorization – even if after the procedure.

See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

no

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

FACILITY DIRECT PE INPUTS

CPT CODE(S): 61624, 61626
SPECIALTY SOCIETY(IES): AANS, CNS, SIR, ACR, ASNR
PRESENTER(S): Henry Woo, MD; Robert Kennedy, MD; Andrew Moriarity, MD; Jacob Ormsby, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

n/a

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

   n/a

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   A clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the procedure and forward the approved forms to the appropriate personnel including by fax if necessary. This may be done prior to the procedure, contemporaneously with the procedure, or after the procedure, but it is the physician's clinical staff that will do this so that the physician can get paid for performing the procedure. It is work that always must be done and the placement in the pre-service category does not imply it is only done in this component-just that it must be done.

   b. Service period (includes pre, intra and post):

   n/a

   c. Post-service period:

   n/a

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

   n/a

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

    n/a

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

    n/a

14. Are you recommending a PE supply pack for this recommendation? Yes or No.

If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

n/a

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

    n/a

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

    n/a

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

    n/a

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

    n/a

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

    n/a

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

    n/a

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

FACILITY DIRECT PE INPUTS

CPT CODE(S): 61624, 61626
SPECIALTY SOCIETY(IES): AANS, CNS, SIR, ACR, ASNR
PRESENTER(S): Henry Woo, MD; Robert Kennedy, MD; Andrew Moriarity, MD; Jacob Ormsby, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

The PE detail inputs were revised to delete the society recommended time for clinical staff for CA003 Schedule space and equipment in facility. The PE Subcommittee determined that the physician will be responsible to work with facility staff to schedule the OR time, order necessary endovascular supplies, and imaging equipment for the typical patient.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

NON-FACILITY DIRECT PE INPUTS

CPT CODE(S): 61626
SPECIALTY SOCIETY(IES): ACR, OEIS, SIR, ASNR
PRESENTER(S): Curtis Anderson, MD, PhD, Andrew Moriarity, MD, Robert Kennedy, MD, Minhaj Khaja, MD, Jacob Ormsby, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 4/2024

CPT Code	Long Descriptor	Global Period
61626	Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; non-central nervous system, head or neck (extracranial, brachiocephalic branch)	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
61626	Patient: A 65-year-old male presents to the ENT with recurrent epistaxis. He has nasal packing placed. His medical history includes hypertension, atrial fibrillation requiring anticoagulation, and multiple episodes of epistaxis refractory to medical therapy and frequent packing. He undergoes transcatheter embolization of the maxillary artery as an outpatient..

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The societies of ACR, OEIS, SIR, and ASNR convened a panel of experts familiar with this service to evaluate the direct practice expense inputs for endovascular therapy with imaging code, 61626.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   CPT code 61626 is a current CPT code with no nonfacility direct practice expense inputs. CPT 37243 was selected as a reference code due to the similar clinical experience and distribution of work to this code.

   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the non-facility?

   No

   See the *Billed Together* tab in the RUC Database.

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

Interventional radiology is the expected predominant provider in the nonfacility setting.

See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

The RUC database indicates that both codes 61624 and 61626 were reviewed by the PEAC in March 2001, only supplies and equipment were considered in 2001 This was based on a recommendation from CMS that a long list of facility-only codes have no supplies or equipment. Clinical staff time for that list of codes was not considered at that meeting.

In February 2002, the PEAC recommended that by the September 2002 PEAC meeting, those codes with global periods of 0 and 10 days will receive a PEAC recommendation of zero minutes of pre-service time unless a specialty recommends otherwise and is able to provide sufficient data to the PEAC to justify the recommended times. Unfortunately, at that time the tables used by the PEAC indicated 61624 and 61626 were 90-day global codes and were given the standard facility only 90-day global codes pre-times. The times were subsequently zeroed out by CMS prior to final implementation of the PEAC recommendations since they were actually 0-day codes.

However, whether performed in the facility or nonfacility setting, code 61626 is comparable to code 37243 which was reviewed by the RUC and Practice Expense Subcommittee in 2013. We are requesting nonfacility PE values, which code 61626 does not currently have. It is expected the utilization will continue with interventional radiology, still supporting clinical staff support from a vascular interventional technologist.

See the *PE compelling evidence guidelines* under PE Reference Materials on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

Extra personnel to assist physician - Our recommendations follow the 'interventional' standards whereby a "hip to hip" technologist is needed to assist the MD during the procedure as a scrub hand, one vascular interventional technologist (75%) and one nurse blend (25%) is used as a circulator.

Additional time
Check dressings, catheters, wounds (CA029) – due to the highly vascular nature of the area most commonly treated, additional time (+2 minutes) is needed by the RN/LPN/MTA to check dressings and ensure homeostasis prior to discharge for a total of 3 minutes.

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

We are requesting 5 minutes for vital signs to measure weight and obtain heart rate, O2 saturation, respiratory rate, temperature, and blood pressure before these procedures.

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

- Complete pre-service diagnostic & referral forms (3) - RN/LPN/MTA (L037D) During this time the staff is collecting and coordinating the request from referring physician and ensuring all appropriate preoperative imaging has been performed.
- Coordinate pre-surgery services (3) - RN/LPN/MTA (L037D) During this portion the staff is arranging an preoperative medical clearances
- Complete pre-procedure phone calls & prescriptions (3) - RN/LPN/MTA (L037D) Coordinate with patient any information related to scheduling of procedure. Prescribe preoperative lab work if any are missing.
- Perform regulatory mandated quality assurance activity (pre-service) (6) Vascular Interventional Technologist (L041A)

    b. Service period (includes pre, intra and post):

- Greet patient, provide gowning, ensure appropriate medical records are available (3) RN/LPN/MTA (L037D)
- Obtain vital signs (5) - RN/LPN/MTA (L037D) vital signs to measure weight and obtain heart rate, O2 saturation, respiratory rate, temperature and blood pressure performed
- Provide education/obtain consent – (5) RN/LPN/MTA (L037D)
- Prepare room, equipment and supplies (2) Vascular Interventional Technologist (L041A)
- Prepare, set-up and start IV, initial positioning and monitoring of patient (2) Vascular Interventional Technologist (L041A) prepares the patient by initially positioning for the physician to begin the procedure

- Assist Physician - Vascular Interventional Technologist (L041A) 100% Physician time - This is a hip-to-hip clinical staff who is scrubbed into the procedure and assists the physician throughout the procedure.
- Nurse /Tech blend - Circulating staff in the room that acquires images, opens supplies, adjusts and connects equipment. This by convention has been a 75% Vascular Interventional Technologist (L041A) 25% RN/LPN/MTA (L037D) role for interventional procedures.
- Clean room (CA024) (3) - This is typically done by the Vascular Interventional Technologist (L041A), including cleaning the imaging equipment and table.
- Review/read post-procedure x-ray, lab and pathology reports (CA028) (3) - Vascular Interventional Technologist (L041A) will review and ensure the applicable reports are posted into the medical record for further review by physician and care team.
- Check dressings, catheters and wounds (CA029) (3) - RN/LPN/MTA (L037D) check on the operative site(s) and confirm patient is stable for discharge.
- Technologist QC's images in PACS (CA030) (2) - The Vascular Interventional Technologist (L041A) QCs all images and makes sure the images transfer to PACS.
- Review examination with interpreting MD/DO (CA031) (2) Vascular Interventional Technologist (L041A) reviews the images to confirm accuracy and completeness of imaging record of procedure,
- Scan exam documents into PACS. (CA032) (1) Vascular Interventional Technologist (L041A) Complete exam in RIS system to propulate images into work queue

c. Post-service period:

- Coordinate post-procedure services (3) - RN/LPN/MTA (L037D) provides follow up communication with patient following the procedure to check on status

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

- Assist Physician - Vascular Interventional Technologist (L041A) 100% Physician time - This is a hip-to-hip clinical staff who is scrubbed into the procedure and assists the physician throughout the procedure. This staff person directly works with physician to complete procedure including handing equipment/supplies off the sterile table, maintaining sterility of wires, catheters, and devices. RN (L051A) 100% Physician time – This nurse is dedicated to the monitoring of the patient throughout the procedure.
- Nurse /Tech blend - Circulating staff in the room that acquires images, opens supplies, adjusts, and connects equipment. This by convention has been a 75% Vascular Interventional Technologist (L041A) 25% Nurse/LPN/MTA (L037D) role for interventional procedures. This staff member operates imaging equipment, obtaining images, adjusting imaging parameters, opening sterile and nonsterile supplies and otherwise assists in a mobile capacity while not scrubbed in.

SM013	**disinfectant, surface (Envirocide, Sanizide)**	1	**For cleaning of operative table, patient table, etc.**

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

4/24/24 PE Subcommittee Meeting change made at the table:

Equipment
ED032, printer laser, paper was removed from NF equipment for 61626.

Equipment Code	EQUIPMENT	Purchase Price	Equipment Formula	Cost Per Minute
~~ED032~~	~~printer, laser, paper~~	~~1014.25~~	~~Other~~	~~0.004018658~~

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

NON-FACILITY DIRECT PE INPUTS

CPT CODE(S): 75894, 75898
SPECIALTY SOCIETY(IES): SIR, ACR
PRESENTER(S): Robert Kennedy, MD, Minhaj Khaja, MD, Andrew Moriarity, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 4/2024

CPT Code	Long Descriptor	Global Period
75894	Transcatheter therapy, embolization, any method, radiological supervision and interpretation	XXX
75898	Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion, other than for thrombolysis	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
75894	A 55-year-old female is diagnosed with subarachnoid hemorrhage after presenting to the emergency department with a severe headache and vomiting. Middle cerebral artery aneurysm was identified, and intervention was performed, including aneurysm coiling. Interpretation of images obtained during the embolization procedure is performed.
75898	A 55-year-old female is diagnosed with subarachnoid hemorrhage after presenting to the emergency department with a severe headache and vomiting. Middle cerebral artery aneurysm was identified, and an aneurysm coiling was performed, including a follow-up internal carotid angiogram. Interpretation of images of the follow-up angiogram is performed.

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The societies of ACR, ASNR, and SIR convened a panel of experts familiar with these services to evaluate the direct practice expense inputs for these radiological supervision and interpretation (RS&I) codes.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   CPT codes 75894 and 75898 are current CPT codes with no direct practice expense inputs. For CPT 75894, CPT 75716 was selected as a reference code as another RS&I code provides similar clinical experiences and distributions of work to this new code. For CPT 75898, CPT 75726 was selected as a reference code as another RS&I code provides similar clinical experiences and distributions of work to this new code.

   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the non-facility?

   No

   See the *Billed Together* tab in the RUC Database.

NON-FACILITY DIRECT PE INPUTS

CPT CODE(S): 75894, 75898
SPECIALTY SOCIETY(IES): SIR, ACR
PRESENTER(S): Robert Kennedy, MD, Minhaj Khaja, MD, Andrew Moriarity, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

   Based on and following 2022 claims data diagnostic radiology would be the predominant provider with 66% utilization followed by interventional radiology with 33%.

   See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

   There currently is no PE valued in the non-facility for the survey codes 75894 and 75898 as these codes have never been surveyed by the RUC. In review of the codes which are now separated from the codes 61624, which is facility based only, and 61626, which will also be submitting recommendations for value in the nonfacility setting, it was determined establishing values for these RS&I codes in the nonfacility setting was appropriate based on the expertise of the advisors on the panel.

   When establishing the recommended values for the survey codes, it was determined the clinical staff listed for the reference codes 75716 and 75726 needed to change to from radiologic technologist to vascular interventional technologist, which has a higher rate per minute.

   In preparation of the RUC survey the neurosurgical and neurology specialties who have predominantly been the highest utilizers of the survey codes, indicated they would no longer have use for the survey codes with the new bundling of RS&I services into the primary procedure codes 61624 and 61626.

   Removing the top 2 specialties of neurosurgery and neurology from estimating utilization of the survey codes, the next highest specialties are diagnostic radiology and interventional radiology who previously utilized each of the survey codes in combination approximately 33% of the time. Based on the survey data, 35 of the 37 responses were completed by interventional radiologists and 2 by interventional radiologists who also provide diagnostic services. It is expected the utilization will transition to radiology services, specifically interventional radiology, thereby supporting clinical staff support from a vascular interventional technologist, rather than the radiologic technologist as defined within the reference codes.

   See the *PE compelling evidence guidelines* under PE Reference Materials on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

NON-FACILITY DIRECT PE INPUTS

CPT CODE(S): 75894, 75898
SPECIALTY SOCIETY(IES): SIR, ACR
PRESENTER(S): Robert Kennedy, MD, Minhaj Khaja, MD, Andrew Moriarity, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

The specialties are recommending 4 minutes for CA030 Technologist QC's images in PACS, checking for all images, reformats, and dose page. The baseline time for this clinical activity is 2 minutes. These services require additional time to account for the technologist adjusting contrast levels for each image of numerous angiography runs in different projections. In addition, the "mask" image must be manually adjusted for each image to correct poor image quality related to patient motion respiration.

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

CA008 which is reflected for both reference codes, 75716 and 75726, was split up to more current representation of this work by recommending CA007 for 1 minute and CA014 for 1 minute for both survey codes.

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

- CA006 - Confirm availability of prior images/studies 2 minutes L041A Vascular Interventional Technologist must ensure that imaging studies are available for review prior to the procedure.
- CA007 - Review patient clinical extant information and questionnaire 1minute Vascular Interventional Technologist

    b. Service period (includes pre, intra and post):

- CA013 - Prepare room, equipment and supplies 2 minutes L041A Vascular Interventional Technologist will prepare the equipment and supplies for the procedure
- CA014 - Confirm order, protocol exam 1 minute L041A Vascular Interventional Technologist
- CA021 - Perform procedure NOT directly related to physician work time – L041A Vascular Interventional Technologist is in the procedure room and assists in operating the C-arm, acquires images and circulates during critical times of the procedure.
- CA024 - Clean room/equipment by clinical staff 3 minutes, standard, L041A Vascular Interventional Technologist
- CA030 - Technologist QC's images in PACS – 3 minutes L041A Vascular Interventional Technologist will review images (commonly CT, MR) and ensure transfer to PACs is performed

- CA031 - Review examination with interpreting MD/DO – 2 minutes L041A Vascular Interventional Technologist will review the images and documentation of the treatment planning to ensure complete
- CA032 - Scan exam documents into PACS – 1 minute L041A Vascular Interventional Technologist will scan documents into PACs

c. Post-service period:

N/A

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

Vascular Interventional Technologist is in the procedure room and assists in operating the C-arm, acquires images and circulates during critical times of the procedure.

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

18. Are you recommending a PE supply pack for this recommendation? Yes or No.

If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

No

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

N/A

20. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

N/A

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

N/A

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

23. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment, please explain here:

EL011 room, angiography: "Other"
Followed "Rationale for Angiographic Room time Allocation"
To prevent double counting of room time between the procedure code and the S&I code the S&I code should receive a base time of 9 minutes for the room, and all other time will be allocated to the procedure code.

ED053 Professional PACS Workstation: "Other"
Followed "Guidelines for PACS Professional Workstation
Minutes equal to half the preservice physician work time and the full intraservice physician work time.

ED050 Technologist PACS workstation: "PACS" formula

PE-ONLY CODES ADDITIONAL INFORMATION

24. (a) Estimate the number of times this service might be provided nationally in a one-year period?

(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

25. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

N/A

ADDITIONAL INFORMATION

26. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

Supply Items

- SB008 drape, sterile, c-arm, fluoro - Required for sterile preparation of imaging equipment
- SM013 disinfectant, surface (Envirocide, Sanizide) - For cleaning imaging equipment after usage

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
New Technology/New Service*

April 2024

Dark Adaptation Diagnostic and Screening Services – Tab 5

In October 2020, CPT code 99284 was identified via the Harvard valued screen and surveyed and reviewed by the RUC in April 2021. At that time, the RUC recommended that this service be referred to CPT to editorially revise and include the word "diagnostic" in the code descriptor, which occurred at the May 2021 CPT meeting. The RUC placed 92284 on the New Technology list for follow-up review in two years due to the RUC's recognition that the proposed direct expense practice expense recommendation was recently replaced by emerging technology for administering the test. Following the RUC's review, CMS rejected the RUC-recommended work value of 0.14 RVU for 99284 and assigned a work value of 0.00 in 2023, indicating that the test was primarily performed for screening for macular degeneration despite the revised code descriptor. In September 2023, the specialty societies indicated, and the Relativity Assessment Workgroup (RAW) agreed, that this issue be referred to the February 2024 CPT meeting to differentiate between the diagnostic and screening tests before both codes are resurveyed for the RUC.

The specialty societies prepared and submitted a Category I Code Change Application to create CPT code 92288, which describes the screening test for retinal and optic nerve disease. CPT also added a parenthetical to 92284 to describe how the diagnostic dark adaptation test is conducted to identify patients with macular degeneration or inherited retinal diseases when they have symptomatic visual loss without any identifiable cause or clinical examination. An uptick in Medicare claims volume for CPT code 92284 may be attributable to the misreporting of that code when the screening test is performed, and this distinction from CPT will address the increased utilization as well as provide further clarification and coding direction. Further, a CPT Assistant article with coding guidance on correct reporting of these two services was also recommended by the CPT Editorial Panel. It is notable that both the diagnostic and screening test services in this code family describe bilateral services and would only be reported once per patient. This code family was surveyed for the April 2024 RUC meeting.

Compelling Evidence

The specialty societies presented a rationale for compelling evidence to support a change in physician work for CPT code 92284 based on flawed methodology. First, when 99284 was last surveyed by the RUC in 2021, there was significant confusion from survey respondents and discussion from the RUC regarding whether this service was a diagnostic test for retinal disorders or a screening test for macular degeneration. Second, there was additional concern regarding the median survey intra-service time of 15 minutes for 92284 and whether this was an error in which survey respondents conflated physician time with clinical technician time in their estimates. The RUC recommended a work value of 0.14 with 3 minutes intra-service time and 5 minutes total time on the basis that the survey data was representative of a mix of both diagnostic and screening test experience and overestimated physician time. In 2023, CMS assigned a work value of 0.00 for 92284 under the assumption that the diagnostic test is done for screening purposes and/or might be included as part of an office or eye visit. At the April 2024 meeting, the RUC agreed with the specialty societies that dark adaptation testing is not included in either an evaluation and management office visit or an eye visit and that there is physician work involved in interpreting test results, whether it be a diagnostic test or screening.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92284 ***Diagnostic dark adaptation examination (eg, rod and cone sensitivities, rod-cone breakpoint), with interpretation and report***
The RUC reviewed the survey results from 35 optometrists and ophthalmologists and determined a work RVU of 0.32 appropriately accounted for the physician work involved with this service. The RUC recommends 1-minute pre-service evaluation time, 7 minutes intra-service time and 1-minute post-service time for a total time of 9 minutes. Based on the discussion at pre-facilitation, the RUC agreed with the specialty societies that the survey 25th percentile work RVU of 0.43 was too high of an estimation for the physician work involved with this procedure. Therefore, the specialty societies recommended that CPT code 92284 be valued based on a direct crosswalk to CPT code 92228 *Imaging of retina for detection or monitoring of disease; with remote physician or other qualified health care professional interpretation and report, unilateral or bilateral* (work RVU = 0.32 work RVU, 7 minutes intra-service time and 9 minutes total time), as both services require similar physician work to perform.

In reviewing the survey results, the specialty societies recommended decreasing both the survey median pre-service evaluation and immediate post-service times from 5 minutes down to 1 minute each but determined the survey median intra-service time of 7 minutes was appropriate for this service. In 2021, the survey median intra-service time was 15 minutes, which the specialty societies noted is an overestimation attributable to survey respondents' misunderstanding that only physician time should be counted in the time estimates; the RUC recommended 3 minutes of intra-service time. Based on the more recent survey with updated wording and clarification, the specialty societies determined the 4 additional minutes of intra-service time appropriately accounts for the work required to perform this service. After CPT code 92284 was revised for CPT 2026 before being resurveyed, the descriptor specifically describes bilateral diagnostic testing that requires interpretation of test validity and individual, separate rod and cone plots and rod/cone intercepts for each eye resulting in a large amount of data to consider with the dark adaptation results and many diagnostic possibilities for the physician to assess. It is important to note that this testing is conducted using a legacy tabletop instrument which is not automated and is supervised and operated by a clinical technician in attendance with the patient. The specialty societies further clarified that because this procedure is typically performed on the same day as an office or eye visit, a reduction in both pre-service evaluation and immediate post-service times is also appropriate. Including 1 minute of pre-service evaluation time is necessary for explaining the nature and necessity of the diagnostic test to the patient, as well as determining a testing strategy. Additionally, 1 minute of immediate post-service time is necessary to enter the information into the medical record, sign the report, and add the findings to the referral report. The RUC agreed with all time modifications made by the specialty societies recognizing that an additional 4 minutes of intra-service work is required for this service and that the pre-service and post-service activities listed in the work descriptions are not part of the same-day office or eye visit and should be accounted for.

While survey respondents ranked the surveyed code identical in terms of overall intensity and complexity to the top two selected reference services, CPT codes 92083 *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2*) (work RVU = 0.50, 10 minutes intra-service time and 13 minutes total time) and 92250 *Fundus photography with interpretation and report* (work RVU = 0.40, 10 minutes intra-service time and 12 minutes total time), the specialty societies determined that neither was an acceptable crosswalk to value the surveyed code. The intra-service time and work RVU of both reference services are significantly greater than CPT code 92284, and the RUC agreed that neither code would make an appropriate relative comparison.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC concluded that CPT code 92284 be valued at a work RVU of 0.32 per a direct crosswalk to CPT code 92228 to more accurately reflect the physician work, time and intensity involved with this procedure in addition to maintaining rank order with the other services in this code family. For additional support, the RUC referenced MPC code 71111 *Radiologic examination, ribs, bilateral; including posteroanterior chest, minimum of 4 views* (work RVU = 0.32, 7 minutes intra-service time and 9 minutes total time), which requires identical physician work and time to perform as the surveyed code, thus supporting the RUC recommended work RVU of 0.32. **The RUC recommends a work RVU of 0.32 for CPT code 92284.**

92288 ***Screening dark adaptation measurement (eg, rod recovery intercept time), with interpretation and report.***
The RUC reviewed the survey results from 30 optometrists and ophthalmologists and determined a work RVU of 0.17 appropriately accounted for the physician work involved with this service. The RUC recommends 1-minute pre-service evaluation time, 3 minutes intra-service time and 1-minute post-service time for a total time of 5 minutes. Based on the discussion at pre-facilitation, the RUC agreed with the specialty societies that the survey 25th percentile work RVU of 0.30 was too high of an estimation for the physician work involved with this procedure. Therefore, the specialty societies recommended that CPT code 92288 be valued based on a direct crosswalk to CPT code 73010 *Radiologic examination; scapula, complete* (work RVU = 0.17, 3 minutes intra-service time and 5 minutes total time), as both services require similar physician work to perform.

In reviewing the survey results, the specialty societies recommended decreasing the survey median pre-service evaluation, intra-service and immediate post-service times to more accurately reflect the physician work and time involved with this service. The specialty societies articulated that the survey median intra-service time of 6 minutes is too long for this service, as the screening test requires less data interpretation compared to the 7 minutes of intra-service time that are necessary for performing the diagnostic test. The specialty societies further clarified that because this procedure is typically performed on the same day as an office or eye visit, a reduction in both pre-service evaluation and immediate post-service times is also appropriate. Including 1 minute of pre-service evaluation time is necessary for explaining the nature of the screening test and the reason for performing it to the patient, as well as determining a testing strategy. Additionally, 1 minute of immediate post-service time is necessary to enter the information into the medical record, sign the report, and add the findings to the referral report. The RUC agreed with all time modifications made by the specialty societies recognizing that 3 minutes of intra-service work is required for this service and that the pre-service and post-service activities listed in the work descriptions are not part of the same-day office or eye visit and should be accounted for.

While survey respondents ranked the surveyed code identical in terms of overall intensity and complexity to the top two selected reference services, CPT codes 92081 *Visual field examination, unilateral or bilateral, with interpretation and report; limited examination (eg, tangent screen, Autoplot, arc perimeter, or single stimulus level automated test, such as Octopus 3 or 7 equivalent)* (work RVU = 0.30, 7 minutes intra-service time and 10 minutes total time) and 92083 *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* (work RVU = 0.50, 10 minutes intra-service time and 13 minutes total time), the specialty societies determined that neither was an acceptable crosswalk to value the surveyed code. The intra-service time and work RVU of both reference services are significantly greater than CPT code 92288, and the RUC agreed that neither code would make an appropriate relative comparison.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC concluded that CPT code 92288 be valued at a work RVU of 0.17 per a direct crosswalk to CPT code 73010 to accurately reflect the physician work, time and intensity involved with this procedure in addition to maintaining rank order with the other services in this code family. For additional support, the RUC referenced MPC codes 93010 *Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only* (work RVU = 0.17, 3 minutes intra-service time and 6 minutes total time) and 73120 *Radiologic examination, hand; 2 views* (work RVU = 0.16, 4 minutes intra-service time and 6 minutes total time). Both reference codes require near-identical physician work and similar time to perform, thus supporting the RUC recommended work RVU of 0.17. **The RUC recommends a work RVU of 0.17 for CPT code 92288.**

Practice Expense

The Practice Expense (PE) Subcommittee agreed with the specialty societies that there is compelling evidence to support an increase over the aggregate current cost for clinical activities, supplies and equipment for the code family due to a change in technology and also a change in equipment/new device. The PE Subcommittee reviewed the practice expense inputs for CPT codes 92284 and 92288 and made two modifications to the medical supplies and equipment involved with these services. SK057 *paper, laser printing (each sheet)* was added for CPT code 92284 to account for the printed readout resulting from the dark adaptation examination. The specialty societies clarified that the paper only applies to 92284 and not 92288, as there is no printout for the screening test. The PE Subcommittee discussed and approved a new equipment input, *Dark Adaptometer, Second Generation*, for CPT code 92288, clarifying that the supporting invoice confirms that the monthly payment plan listed is a purchasing agreement and not a lease as it is typical for the device to be purchased not leased. The PE Subcommittee also reviewed for any potential overlap between the physicians and clinical staff and agreed with the specialty societies that there are 7.5 minutes of staff time for each eye tallying 15 minutes for 92284 and 5 minutes of staff time for each eye tallying 10 minutes for 92288. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

New Technology

CPT codes 99284 and 92288 will be placed on the New Technology list to be reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

RUC Database Flag

The RUC recommends that CPT code 92288 should be flagged as **Do Not Use to Validate for Physician Work** given the RUC valuation for this code is based on the rationale provided by the specialty societies and not on survey results.

SUMMARY OF RECOMMENDATION

CPT Code:92284 Tracking Number B1 Original Specialty Recommended RVU: **0.32**
Presented Recommended RVU: **0.32**
Global Period: XXX Current Work RVU: **0.00** RUC Recommended RVU: **0.32**

CPT Descriptor: Diagnostic dark adaptation examination (eg, rod and cone sensitivities, rod-cone breakpoint), with interpretation and report

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female with poor night vision has no identifiable cause on examination. Dark adaptation is performed to assess retinal function at a cellular level.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Explain the indications, risks, benefits, and nature of the dark adaptation test to the patient and/or family. Determine the appropriate testing strategy.

Description of Intra-Service Work: Review the test results for each eye to determine reliability and interocular consistency. Interpret results, correlating both the dark adaptation rod and cone plots and the rod/cone breakpoint with age-adjusted norms, physical findings, and prior test results. Determine a diagnosis or formulate a differential diagnosis and need for subsequent testing. Prepare a report and enter it into the medical record.

Description of Post-Service Work: Sign the report. Include the findings in a letter to the referring physician.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	19%	52%	24%	5%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	29%	43%	28%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	76%	19%
Physical effort required	5%	86%	9%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	43%	29%	28%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	75%	25%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	25%	50%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	50%	50%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	25%	75%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 92284, *Diagnostic dark adaptation examination (eg, rod and cone sensitivities, rod-cone breakpoint) with interpretation and report* is an XXX-global code that has traditionally been performed in tertiary care and research settings on patients with visual loss, typically poor night vision, and no identifiable cause on physical examination. In recent years, the patient population for whom dark adaptation testing is recommended has expanded to include those with macular

degeneration with claims volume increasing to 39,431 in 2022. The test is now in widespread clinical use by optometrists, who provide 85% of the service.

CPT 92284 was last reviewed by the RUC in April 2021. "Diagnostic" was added to the descriptor via a CPT editorial change to differentiate this service from a non-covered screening test. It was placed on the New Technology list for expedited review in 2 years because of emerging technology for administering the test, which is why it is now being reviewed by the RUC. The new device, the AdaptDxPro, can be worn on the head and programmed to perform either diagnostic or screening tests. It has become the typical device in use for the screening test, while the legacy device (the AdaptDX) with its more detailed data printout remains typical for diagnostic testing.

CMS rejected the last RUC-recommended work value of 0.14 RVU and assigned a work value of zero, stating that it appeared that the test was primarily performed for screening for macular degeneration despite the addition of "diagnostic" to the CPT descriptor. For that reason, a Category I Code Change Application was submitted for creation of a new code for screening, CPT 92288, *Screening dark adaptation measurement (eg, rod recovery intercept time) with interpretation and report*, which is also being reviewed at this meeting.

Although CPT 92284 and 92288 are in a section of CPT labeled "Other Specialized Services," they are not part of a family with any of the codes in that section or elsewhere in CPT. "Other Specialized Services" is a grab-bag category for an array of ophthalmic tests that do not fit elsewhere in CPT. They range from tests that measure muscle and retinal electrical responses to subjective tests of color vision to imaging of different parts of the eye using different imaging techniques for management of different diseases by different subspecialists. CPT 92284 is not in a family with any of the other codes in the "Other Specialized Services" section of CPT (CPT 92265, 92270, 92273, 92274, 92283, 92285, 92286, and 92287).

For CPT 92284, a dark adaptation test protocol is selected which is tailored to the patient's symptoms and findings and an order is placed in the electronic record. After the test is administered, the dark adaptation plots, containing testing outputs including rod and cone sensitivities and the rod/cone breakpoint, are correlated to age-adjusted norms, physical findings, and prior test results (when available) to formulate a differential diagnosis for vision loss. Findings are entered into the medical record and a report is generated.

The procedure is typically performed on the same day as an office visit.

<u>Compelling Evidence</u>
There is compelling evidence that the current IST and work value are based on flawed methodology.

The survey median IST in 2021 was 15 minutes. This was assumed to be in error at the time of the last review. Many survey respondents included staff time to obtain test data in their IST estimates. The RUC ultimately assigned a value of 3 minutes based on a combination of expert panel recommendations and concerns that some or much of the testing was performed as a screening using emerging technology with abbreviated outputs.

The last RUC-recommended work value was 0.14 in 2021, based in part on uncertainty regarding the use of the test for macular degeneration screening rather than as a diagnostic test for retinal disorders. This led to a valuation based on a sense that the survey data for CPT 92284 might represent a mix of a diagnostic and screening test data.

The diagnostic test requires interpretation of test validity and individual, separate rod and cone plots and rod/cone intercepts for each eye. The screening test requires interpretation of test validity and a much simpler readout for each eye. This resulted in a lower valuation than for a purely diagnostic test which has a greater amount of data and more diagnostic possibilities to consider than the screening test. We now have two codes, one for screening and one for diagnosis, so each can be appropriately valued.

There was also the assumption in 2021 that a newer head-worn portable device to administer the test had been introduced and was likely to become typical, with a potential for change in both physician work and PE. The newer, more expensive device has been typical for the last several years, so there has also been a change in technology.

To further complicate matters, CMS set the work value of 92284 at zero RVU. That was also based on incorrect assumptions, as described in the Final Rule for 2023, that the test might be done for screening purposes and/or that it might be included as part of an office visit. Clearly there is physician work involved in interpreting test results, whether diagnostic or screening. Dark adaptation testing is not included in either office visit evaluation and management or office ophthalmological services.

Whether a screening test should be covered is a separate question from valuation. With the creation of CPT 92288 for the screening test, CMS will have the option to create a more granular coverage policy for dark adaptation testing.

For reference, the work value of CPT 92284 prior to its last valuation was 0.24 RVU.

Prior to the current survey, the CPT panel revised the code description to clarify that CPT 92284 is a diagnostic test and to differentiate it from the faster screening test, for which the output is a single time value. The panel also created a new Category I code describing a screening test which was simultaneously surveyed. In addition, a note was added to the survey questionnaire clarifying that staff time is separately accounted for in practice expense and that only provider time should be included in the IST. These changes resulted in a marked reduction in the survey median from 15 minutes in 2021 to 7 minutes in the current survey.

The strongest compelling evidence is for flawed methodology.

Survey Results

A survey was sent to a random selection of American Academy of Ophthalmology (AAO) (n=865) and American Optometric Association (AOA), (n=4,000) members. There were 35 responses (26 OD, 9 MD).

Specialty-specific results of optometry and ophthalmology, as well as combined results are reported in the Summary Spreadsheet. Only 1 ophthalmologist reported performing the service within the past year. The OD data and the combined data were identical for median IST and work RVU values and almost identical for the 25th percentile work values (0.41 OD, 0.43 combined). The MD responses did not notably alter the median or 25th percentile values or the intensity/complexity metrics.

The vignette was considered typical by 91% of respondents. The median WRVU was 0.50; the 25th percentile was 0.43. The work value of the code was 0.24 RVU prior to the 2021 RUC-recommended value of 0.14 RVU and the CMS assignment of 0.00 RVU that took effect in 2023. The survey median IST was 7 minutes, pre-service evaluation time was 5 minutes, and immediate post-service time was 5 minutes.

The expert panel, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median intraservice time of 7 minutes is significantly shorter than the 2021 survey time of 15 minutes and 4 minutes longer than the RUC-recommended 2021 IST. The additional 4 minutes is appropriate considering that the code now exclusively describes diagnostic testing, which requires interpretation of both cone and rod sensitivity plots and rod/cone breakpoints for each eye. There is a now a separate CPT code for the screening dark adaptation test, which requires interpretation of only rod recovery intercept times.

Because the procedure is typically performed on the same day as an office visit, we reduced the pre-time from the survey value of 5 minutes to 1 minute. The pre-time is necessary for explaining the nature of the test and the reason for doing it, and for choosing the test strategy.

We reduced the survey post-time from 5 minutes to 1 minute. The post-time is necessary for signing the report and adding the findings to the referral report. These activities are not part of a same-day office visit. Post-service time for this work is included in most imaging services, indicating that this is the appropriate place for them. For services typically performed with an office visit and reviewed by the RUC within the past 10 years, this work is often listed in the post-service work descriptor. The post-service time, typically 1 minute, is appropriately included in the valuation. Recent ophthalmology examples include CPT 92250, 92235, 92240, and 92245, and most recently CPT 92132, 92133, and 92134 which were reviewed by the RUC at the September 2023 meeting. It is correct to include this time, and it is necessary to maintain consistency and relativity between imaging services

The total recommended time for the service is 9 minutes, with a 7-minute IST.

The top key reference service, chosen by 60% of respondents, was CPT 92083, *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* (RUC 2012), with a WRVU of 0.50, an IST of 10 minutes, and a total time of 13 minutes. The second reference service, chosen by 11% of respondents, was CPT 92250, *Fundus photography with interpretation and report* (RUC 2016), with a WRVU of 0.40, an IST of 10

minutes, and total time of 12 minutes. Respondents ranked the surveyed code identical to both reference services on overall intensity and complexity and each of the submeasures except for physical stress, which was ranked somewhat less compared to CPT 92083.

The ISTs of both reference services are significantly longer than the survey IST, making neither an acceptable choice for valuation of the surveyed service.

We searched the RUC database for eligible XXX crosswalks with no flags which have been RUC-reviewed within the past 10 years.

We found 15 Category 1 codes with a median work value of 0.32 RVU. There were 5 imaging services, also with a median work value of 0.32 RVU. The survey 25th percentile work value estimate of 0.43 is not supported by any crosswalks with similar times.

We therefore chose a crosswalk to CPT 92228, *Imaging of retina for detection or monitoring of disease; with remote physician or other qualified health care professional interpretation and report, unilateral or bilateral* (RUC 2019) with a work value of 0.32 RVU. The crosswalk code's IST of 7 minutes and total time of 9 minutes are identical to those of the surveyed code.

This value is also supported by MPC code 71111, *Radiologic examination, ribs, bilateral; including posteroanterior chest, minimum of 4 views* (RUC 2016), with a work value of 0.32 RVU, an IST of 7 minutes, and a total time of 9 minutes.

We recommend a work value for CPT 92284 of 0.32 RVU with times of 1/7/1 and a total time of 9 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The service is typically performed with an office visit, and may also be performed with other tests.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The following table lists the 5 top billed-together codes from the RUC DB. When reported with another testing service, CPT 92284 will be subject to the multiple procedure payment reduction. We have accounted for reporting with a same-day office visit by reducing recommended pre- and post-service times.

CPT	Billed Together	Global	WRVU	Pre-time	Intra-time	Post-time	Total Time
92134	43.5%	XXX	0.45	1	10	0	11
92250	31.0%	XXX	0.40	1	10	1	12
92014	28.3%	XXX	1.42	5	24	8	37
99214	19.3%	XXX	1.92	7	30	10	47
92083	17.7%	XXX	0.50	3	10	0	13

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92284

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Optometry How often? Commonly

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 28000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Double the Medicare estimate based on typical payor mix for the specialty.

Specialty Optometry Frequency 23716 Percentage 84.70 %

Specialty Ophthalmology Frequency 4284 Percentage 15.30 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
14,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on 2022 Medicare claims data for CPT 92284 (source: AMA RUC database) and an assumption that approximately 65% of current claims for CPT 92284 will migrate to CPT 92288.

Specialty Optometry Frequency 11858 Percentage 84.70 %

Specialty Ophthalmology Frequency 2142 Percentage 15.30 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Screening dark adaptation measurement (eg, rod recovery intercept time), with interpretation and report

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old female has a family history of macular degeneration, has no drusen but is concerned about her risk for developing macular degeneration.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Explain the indications, risks, benefits, and nature of the dark adaptation test to the patient and/or family. Determine the appropriate testing strategy.

Description of Intra-Service Work: Review the test results for each eye to determine reliability and interocular consistency. Interpret results, comparing rod recovery intercept time with norms. Prepare a report and enter it into the medical record.

Description of Post-Service Work: Sign the report in the EHR.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	25%	33%	42%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	33%	33%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	75%	25%
Physical effort required	8%	83%	8%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	50%	25%	25%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	67%	33%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	17%	50%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	50%	50%
Physical effort required	0%	83%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	67%	33%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 92288, *Screening dark adaptation measurement (e.g., rod recovery intercept time), with interpretation and report*, is a new XXX-global Category I code describing a screening test for retinal and optic nerve disease. It was created to differentiate between diagnostic dark adaptation testing (CPT 92284, also being reviewed at this meeting) and screening testing that has increased in utilization. It is possible that some of the increase in claims volume for 92284 is due to reporting of that code when the screening test is performed.

Although CPT 92284 and 92288 are in a section of CPT labeled "Other Specialized Services," they are not part of a family with any other codes in that section or elsewhere in CPT. "Other Specialized Services" is a grab-bag category for an array of ophthalmic tests that do not fit elsewhere in CPT.

For CPT 92288, a dark adaptation screening protocol is selected, and an order is placed in the electronic record. After the test is administered, the rod recovery intercept time provided as an output from the instrument is compared with normative data. The findings are entered into the medical record and a report is generated.

The procedure is typically performed on the same day as an office visit.

Survey Results

A survey was sent to a random selection of American Academy of Ophthalmology (AAO) (n=865) and American Optometric Association (AOA), (n=4,000) members. There were 30 responses (23 OD, 7 MD).

Specialty specific results of optometry and ophthalmology, as well as combined results are reported in the Summary Spreadsheet. Most ophthalmologists have not reported the service within the past year. The OD data and the combined data were almost identical for median and 25th percentile IST and work RVU values.

The vignette was considered typical by 87% of respondents. The median work value was 0.40 RVU; the 25th percentile was 0.30 RVU. The survey median IST was 6 minutes, pre-service evaluation time was 4 minutes, and immediate post-service time was 5 minutes.

The expert panel, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median IST of 6 minutes is unrealistic. The screening exam requires less data interpretation than the diagnostic test (CPT 92284) which carries an IST of 7 minutes. The panel recommends an IST of 3 minutes. This is the IST assigned by the RUC to CPT 92284 in 2021 when it was assumed that the service was being provided for a mix of diagnostic and screening purposes.

Because the procedure is typically performed on the same day as an office visit, we reduced the pre-time from the survey value of 4 minutes to 1 minute. We reduced the survey post-time from 5 minutes to 1 minute. These times are necessary for explaining the test, signing the report, and making required EHR entries which are separate from a same-day office visit as described in the SOR for CPT 92284. The total recommended time for the service is 5 minutes, with a 3-minute IST.

The top key reference service, chosen by 40% of respondents, was CPT 92081, *Visual field examination, unilateral or bilateral, with interpretation and report; limited examination (eg, tangent screen, Autoplot, arc perimeter, or single stimulus level automated test, such as Octopus 3 or 7 equivalent)* (RUC 2010), with a work value of 0.30 RVU, an IST of 7 minutes, and a total time of 10 minutes. A plurality of respondents who chose this code ranked the survey code higher on overall intensity and complexity and the mental effort and judgment submeasure. They ranked the codes equal on the remaining submeasures except for psychological stress, where the surveyed code was ranked lower than the reference.

The second reference service, chosen by 20% of respondents, was CPT 92083, *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* (RUC 2012), with a WRVU of 0.50, an IST of 10 minutes, and a total time of 13 minutes. Respondents ranked the surveyed code identical to the reference service on overall intensity and complexity and each of the submeasures.

The ISTs of both reference services are longer than the survey median IST of 5 minutes and the recommended IST of 3 minutes. Neither reference service was chosen by more than half of the respondents. This makes neither an acceptable choice for valuation of the surveyed service.

We searched the RUC database for eligible XXX crosswalks with no flags which have been RUC-reviewed within the past 10 year. We found 33 codes with 3-minute ISTs matching our recommended time. The survey 25th percentile work value estimate of 0.31 is not supported by any crosswalks with similar times. The median work value of the eligible crosswalks is 0.17 RVU, with 6 of the codes sharing that value.

We recommend a work value for CPT 92288 of 0.17 RVU, with a crosswalk to CPT 73010, *Radiologic examination; scapula, complete* (RUC 2018). The crosswalk code has a work value of 0.17 RVU, an IST of 3 minutes, and a total time of 5 minutes, all of which match the recommended values and times. The work value recommendation is also supported by CPT 73080, *Radiologic examination, elbow; complete, minimum of 3 views* (RUC 2019) with an identical work value of 0.17 RVU and identical times; and by MPC code 93010, *Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only* (RUC 2019) with a work value of 0.17 RVU, IST of 3 minutes, and total time of 6 minutes.

We recommend a work value for CPT 92288 of 0.17 RVU with times of 1/3/1 and a total time of 5 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) We expect that CPT 92288 will typically be performed with a same-day office visit, and that it may also be performed with other tests.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. We anticipate that this service will typically be reported together with one of the office visit codes listed in the following table. We have accounted for reporting with a same-day office visit by reducing the recommended pre- and post-service times.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92284

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Optometry How often? Commonly

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 52000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Double the Medicare estimate based on typical payor mix for the specialty.

Specialty Optometry Frequency 44044 Percentage 84.70 %

Specialty Ophthalmology Frequency 7956 Percentage 15.30 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 26,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on 2022 Medicare claims data for CPT 92284 (source: AMA RUC database) and an assumption that approximately 65% of current claims for CPT 92284 will migrate to CPT 92288.

Specialty Optometry Frequency 22022 Percentage 84.70 %

Specialty Ophthalmology Frequency 3978 Percentage 15.30 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92284

NON-FACILITY DIRECT PE INPUTS **CPT CODE(S):_92284, 92288_**
SPECIALTY SOCIETY(IES):_AAO, AOA, ASRS_
PRESENTER(S):_ David Glasser, Ravi Parikh, Charles Fitzpatrick, John Thompson_

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April 2025

CPT Code	Long Descriptor	Global Period
92284	*Diagnostic dark adaptation examination (eg, rod and cone sensitivities, rod-cone breakpoint) with interpretation and report*	XXX
92288	*Screening dark adaptation measurement (eg, rod recovery intercept time) with interpretation and report*	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
92284	A 55-year-old female with poor night vision has no identifiable cause on examination. Dark adaptation testing is performed to assess retinal function at a cellular level.
92288	A 67-year-old female has a family history of macular degeneration has no drusen, but is concerned about her risk for developing macular degeneration.

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other healthcare providers including RUC members from the American Optometric Association who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The healthcare providers on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   Current code is used as a reference.

   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the non-facility?

   Yes.
   Yes.

   See the *Billed Together* tab in the RUC Database.

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they

must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

Optometry (84.8%) Non-facility Performance (99.9%) No difference of dominant provider in facility vs non-facility

See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

Compelling evidence is presented due to a change in technology. When this code was previously reviewed in April 2021 it was flagged for repeat review on the new technology list. At that time (April 2021) the newer AdaptDX Pro was being promoted, and although not typical at that time there was discussion and recognition at the table that this was likely to change. Prior to this meeting (April 2024), a number of members of the dominant specialty were surveyed regarding typical device utilized. There is a clear shift in typical towards the newer AdaptDX Pro device for dark adaptation measurement procedures. The cost difference is entirely related to the new device costs.

See the *PE compelling evidence guidelines* under PE Reference Materials on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

N/A

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

N/A

    b. Service period (includes pre, intra and post):

Standard times were used with care to eliminate duplication given the same day office visit.

Granular detail is provided below. Standard input times used for pre, intra, and post activities.

Pre: (Standard Inputs)
Line CA011 – The technician provides education and obtains consent for the procedure.
Line CA013 – The technician prepares the room, equipment, and supplies.
Line CA016 – The patient is positioned, the device is fit over the patient's head, and adjusted to ensure a good seal to conduct the test.

Intra:
Line CA021 – The time listed includes time to run the actual test on the dark adaptation device. The technician is in the room the whole time providing real time coaching/feedback as the test is performed. For 92284 15 minutes of time is included to run the test which is typically a lengthier diagnostic test. For 92288 10 minutes is included which translates to 5 minutes of testing time per eye for the shorter screening test (both eyes are typically screened in series).

Post: (Standard Inputs)
Line CA024 – The technician will clean the room and pack up the equipment utilized.
Line CA031 – The technician will review with the healthcare provider the patient's performance on the activities, before the provider comes up with a finalize plan.

    c. Post-service period:

N/A

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

During the intraservice period the technician will start by placing the headset over the patient. The straps are adjusted. Care is taken to make adjustments as a light proof seal is required for accurate testing. During the test the technician remains in the room with the patient 100% of the time and provides realtime feedback/coaching as the test is performed.

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

No.

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

92284:
SJ053 – Alcohol Swab (one is used pre and post procedure) to clean off the device.
SG043 – Patch
SB022 – Gloves, non-sterile – This is a separate pair for the diagnostic technician performing the procedure), independent of those included for the HCP and intake technician in the E/M pack.
SK057 – paper, laser printing (each sheet)

92288:
SJ053 – Alcohol Swab (one is used pre and post procedure) to clean off the device.
SG043 (Deleted) – Patch (no longer required with the new device)
SB022 – Gloves, non-sterile – This is a separate pair for the diagnostic technician performing the procedure), independent of those included for the HCP and intake technician in the E/M pack.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

20. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

The AdaptDX Pro is the next generation dark adaptometer. In an informal survey conducted by the dominant specialty, it was clear that there has been a shift to this technology for dark adaptation screening procedures. The legacy machine still remains typical for the diagnostic procedure. This device will use light to photo bleach the eye and subsequently test the ability of the patient to dark adapt. We have secured multiple invoices with installment payment. Standard/Default formulas would be used.

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

5 years

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

23. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment, please explain here:

92284: Default formulas were used for all equipment, as there is no highly technical equipment. Seeking reaffirmation for previously used equipment. ER124 – Dark Adaptometer EQ165 – Lens Set EF030 – Motorized Table **92288:** Default formulas were used for all equipment, as there is no highly technical equipment. ER124 – Dark Adaptometer – Deleted as this has been replaced by the newer device the AdaptDX Pro EQ165 – Lens Set – Deleted as this is no longer required with the new device. EF030 – Motorized Table – Deleted as this is no longer required with the new device. New – Dark Adaptometer (AdaptDX Pro) – second generation portable device that is now typically utilized.

PE-ONLY CODES ADDITIONAL INFORMATION

24. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

N/A

25. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

N/A

ADDITIONAL INFORMATION

26. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

For code 92284, nothing has changed, one pair of gloves was added, as it was omitted previously but is typical.

For CPT 92288, the new AdaptDx Pro is typical; this device is only capable of performing the screening test. The only difference is that the programs for screening are 5 minutes per eye (both eyes typically screened) while the diagnostic program is 15 minutes (longer testing program).

~~For the cost of the AdaptDx Pro device, we put the average of the 2 invoices we were able to secure $64,039.27.~~ Invoices are provided separately.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

SK057 – paper, laser printing (each sheet) added for CPT 92284 to account for printed readout resulting from dark adaptation examination. The paper only applies to 92284 as there is no printout for 92288.

PE Spreadsheet was updated to reflect full purchase agreement price of equipment item (AdaptDX Pro) as reflected on invoice submission.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2024

Coronary Therapeutic Services and Procedures – Tab 06

In October 2010, CPT code 92980 *Transcatheter placement of an intracoronary stent(s), percutaneous, with or without other therapeutic intervention, any method; single vessel* was identified by the Relativity Assessment Workgroup (RAW) via the MPC List screen. The RAW requested that the specialty societies survey this code for RUC review. Subsequently, the specialty societies referred the code to the CPT Editorial Panel to revise the family of procedures to more accurately describe the current physician work involved in percutaneous coronary intervention (PCI). At the October 2011 CPT meeting, the Panel approved 13 new codes to describe PCI services. The societies surveyed the family and the RUC submitted recommendations to the Centers for Medicare & Medicaid Services (CMS) in January 2012. Instead of accepting the RUC recommendations, CMS opted to assign bundled status to all the add-on codes for the additional branches off the major coronary arteries (codes 92921, 92929, 92934, 92938, 92944). In addition, CMS increased values and intra-times of all the base codes using a mathematical formula to include a fraction of the time and value of the add-on codes, based on the billed together data available at the time. For example, using 2011 Medicare claims data, CMS anticipated that the service described by add-on code 92921 would be performed with the procedure described by base code 92920 27.4% of the time. To bundle the work value of the add-on code into base code 92920, CMS multiplied the RUC recommendation for the add-on code of 4.00 by 27.4% (or 1.10) and added that fractional value to the RUC recommendation for the base code (9.00+1.10=10.10). The value of moderate sedation, which was bundled into the base codes, was systematically removed when separate moderate sedation CPT codes were created for CPT 2017.

In September 2022, the CPT Editorial Panel created one new Category I CPT code for percutaneous coronary lithotripsy. Sixteen other PCI codes were considered part of the code family. For the January 2023 RUC meeting, the specialty societies opted to survey nine of the sixteen codes. The specialty societies opted to not survey the add-on codes in the family that describe the intervention in additional branches off major coronary arteries. As described above, CMS and payers have never recognized these add-on codes as separately payable services, therefore they have no Medicare utilization. After reviewing the survey results in preparation for the January 2023 RUC meeting, the surveying specialty societies requested, and the RUC agreed, to submit a recommendation only for the new add-on code 92972 for CPT 2024 and referred the entire PCI code family to the CPT Editorial Panel for restructuring for the CPT 2025 cycle. The code family was revised at the February 2024 CPT Editorial Panel meeting for the CPT 2026 cycle and the family was surveyed for the April 2024 RUC meeting.

The new/revised PCI code family is built on progressive hierarchies with more intensive services being inclusive of lesser intensive services. The base PCI codes include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, conventional balloons, cutting balloons, wired balloons, cryoplasty balloons), atherectomy (eg, directional atherectomy, rotational atherectomy, orbital atherectomy, laser atherectomy), and stenting (eg, balloon expandable stents, self-expanding stents, bare metal stents, drug-eluting stents, covered stents). Each base code in this family also includes balloon angioplasty, when performed.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Compelling Evidence
The RUC reviewed compelling evidence based on a change in technique. At the time of the 2012 survey, PCI was typically performed via the femoral artery, whereas fewer than 5 percent of PCI were performed via the radial artery at the time. Due to improvements in technique and catheter technology, PCI is now typically performed through the radial artery (more than 60 percent of the time nationally). This approach requires different skills and techniques that are more difficult to perform than access through the femoral artery. Research has shown the radial approach to be safer for patients and involves a significant reduction in the risk of patient bleeding. The specialties noted that the average radial artery is about 2 mm compared to femoral arteries which average about 9 mm. While safer for the patient, the service is technically more challenging for the operator. Unlike the femoral artery, not only does the operator give local anesthesia, but they also must administer additional medications intra-arterially because of the tendency for the radial and brachial arteries to go into spasms. Procedures that involve the radial artery involve injections by the physician into the artery once the artery has been canulated. **The RUC accepted compelling evidence based on a change in technique.**

Pre-service and Post-service Time
The RUC agreed to make the times consistent with the survey pre-service time for each 000-day global code to reflect the time typically required to perform the pre-service evaluation and other work to prepare for the procedure, as well as additional post-service time for several of the codes. The pre-service evaluation was adjusted to 35 minutes for every 000-day code, except for emergent code 92941, which was instead adjusted to 22 minutes. Also, pre-service scrub, dress, wait time was adjusted to 10 minutes for every 000-day procedure code. Similarly, the post-service time for each 000-day service was adjusted to 30 minutes or the surveyed post-service time (if surveyed time was less than 30).

These changes were in part based on the additional time needed to evaluate and prepare access site(s) (one or both radial arteries and/or one or both femoral arteries). The myriad of techniques that are now available for percutaneous coronary intervention has expanded and that requires a full discussion with the patient because each one carries separate risks. Left and right radial pulses are also evaluated using an Allen test to determine which are available for access and which of the two offers preferable access. It is typical for the physician to prepare at least two access sites. Many operators give an anti-vasospastic cocktail routinely which also takes additional time to prepare for during the pre-service period. As part of the evaluation, the operator discusses the results of Heart Team consultations (if performed) and describes various PCI techniques, and the possibility of conversion to emergency surgery, among other typical tasks. The Heart Team for coronary revascularizations is a multidisciplinary team convened to evaluate complex patients and helps make patient-centered, evidence-based clinical decisions for patients considered for coronary revascularization.

92920 ***Percutaneous transluminal coronary angioplasty, single major coronary artery and/or its branch(es)***
The RUC reviewed the survey results from 140 interventional cardiologists and determined a direct work RVU crosswalk to CPT code 49013 *Preperitoneal pelvic packing for hemorrhage associated with pelvic trauma, including local exploration* (work RVU = 8.35, 45 minutes intra-service time and 155 minutes total time) appropriately accounts for the work required to perform this service. Both services typically involve a similar amount of intra-service time and the same overall amount of physician work. The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved similar times, so the pool of potential reference codes was limited for most survey codes in this code family. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 48 minutes intra-service time, and 27 minutes immediate post-service time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialties noted that operators now see patients undergoing PCI who have more comorbidities than when the PCI code family was last reviewed in 2012. Attention to stricter adherence to statins and other medicines in revascularization and chest pain guidelines has excluded many patients who otherwise may have been treated with lower acuity PCI. The remaining patients are more complex than they were a dozen years ago. This is true for the patient population for each of the new/revised codes in this code family. The specialty also noted that typically, to close the radial artery access site (which is now typical), the operator uses a radial artery occluder band and this work takes much less time relative to what femoral closure used to involve when this service was last valued in 2012. The femoral artery closure work was a low-intensity portion of the intra-service work back in 2012, though took up a fair amount of time. With the replacement of this work with the usage of occluder bands, the typical intra-service work has a higher average intensity as a lower proportion of the time is dedicated to the closure.

For additional support, The RUC also referenced CPT code 31601 *Tracheostomy, planned (separate procedure); younger than 2 years* (work RVU = 8.00, 45 minutes intra-service time and 135 minutes total time) and CPT code 33952 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; insertion of peripheral (arterial and/or venous) cannula(e), percutaneous, 6 years and older (includes fluoroscopic guidance, when performed)* (work RVU = 8.15, 60 minutes intra-service time and 158 minutes total time). **The RUC recommends a work RVU of 8.35 for CPT code 92920.**

92924 *Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)*

The RUC reviewed the survey results from 137 interventional cardiologists and determined a direct work RVU crosswalk to CPT code 33530 *Reoperation, coronary artery bypass procedure or valve procedure, more than 1 month after original operation (List separately in addition to code for primary procedure)* (work RVU= 10.13, 70 minutes intra-service time and 112 minutes total time) appropriately accounts for the work required to perform this service. The RUC acknowledged that this direct crosswalk has a different global period, though also noted the relative dearth of available reference codes that are 000-day global major surgical procedures that have similar times and involve a similar amount of physician work in general. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, and 30 minutes immediate post-service time. This service includes the entire physician work of CPT code 92920 when performed, plus the additional work of performing percutaneous transluminal coronary atherectomy. This places the recommendation for 92924 with appropriate relativity to the recommendation for 92920.

For additional support, the RUC referenced CPT code 33986 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; removal of central cannula(e) by sternotomy or thoracotomy, 6 years and older* (work RVU = 10.00, 60 minutes intra-service time and 205 minutes total time.) and CPT code 33964 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; reposition central cannula by sternotomy or thoracotomy, 6 years and older (includes fluoroscopic guidance, when performed)* (work RVU = 9.50, 60 minutes intra-service time and 195 minutes total time).**The RUC recommends a work RVU of 10.13 for CPT code 92924.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92928 ***Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); one lesion involving one or more coronary segments***
The RUC reviewed the survey results from 140 interventional cardiologists and determined a direct work RVU crosswalk to CPT code 33986 *Extracorporeal membrane oxygenation (ECMO)/extracorporeal life support (ECLS) provided by physician; removal of central cannula(e) by sternotomy or thoracotomy, 6 years and older* (work RVU= 10.00, 60 minutes intra-service time and 205 minutes total time) appropriately accounts for the work required to perform this service. The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work and similar times, so the pool of potential reference codes was limited. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, and 28 minutes immediate post-service time. This service includes the entire physician work of CPT code 92920 when performed, plus the additional placement of intracoronary stent(s). The RUC noted that the recommendation for this service is slightly lower than that of 92924, as this service involves two minutes less total time.

The specialties noted that the former intra-service time for CPT 92928 was based on the survey 75th percentile intra-service time from the prior survey conducted for the January 2012 meeting, whereas their recommendation based on the 2024 survey for this revised service is based on the survey median intra-service time.

For additional support, the RUC referenced CPT code 33530 *Reoperation, coronary artery bypass procedure or valve procedure, more than 1 month after original operation (List separately in addition to code for primary procedure)* (work RVU= 10.13, 70 minutes intra-service time and 112 minutes total time). **The RUC recommends a work RVU of 10.00 for CPT code 92928.**

92930 ***Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); two or more distinct coronary lesions with two or more coronary stents deployed in two or more coronary segments, or a bifurcation lesion requiring angioplasty and/or stenting in both the main artery and the side branch***
The RUC reviewed the survey results from 138 interventional cardiologists and determined that the survey 25th percentile work RVU of 12.00 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 75 minutes intra-service time, and 29 minutes immediate post-service time. The specialties noted that CPT code 92930 was created to allow coding for the work involved in placement of intracoronary stent(s) (previously coded as 92928) that exceeds the typical stenting case.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(work RVU = 15.00, 120 minutes intra-service time and 199 minutes total time) and 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and determined that although the surveyed code involves less intra-service time and total time, it is a much more intense service to perform than both of these reference codes. The RUC concurred that the total amount of physician work for the surveyed code is slightly more than the 2nd key reference code, CPT code 37225. The RUC concluded that CPT code 92930 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 12.00 for CPT code 92930.**

92933 ***Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)***
The RUC reviewed the survey results from 140 interventional cardiologists and determined that the survey 25th percentile work RVU of 11.94 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 75 minutes intra-service time, and 30 minutes immediate post-service time. The RUC noted that this service typically involves the same intra-service time as 92930 and a very similar total time, and should be valued similarly,.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* (work RVU = 13.75, 90 minutes intra-service time and 178 minutes total time) and determined that the surveyed code involves much more intensity than both reference codes. 86 percent of the survey respondents who selected top key reference code 37225 had rated the surveyed code as more intense/complex to perform. 60 percent of the survey respondents that selected second key reference code 93583 had indicated the surveyed code is more intense/complex to perform. The RUC concluded that CPT code 92933 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 11.94 for CPT code 92933.**

92937 ***Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed, single vessel major coronary artery and/its branches***
The RUC reviewed the survey results from 141 interventional cardiologists and determined that the survey 25th percentile work RVU of 11.30 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 65 minutes intra-service time, and 30 minutes immediate post-service time. The RUC noted that, relative to the currently assigned CMS from 2012, this recommendation involves 2 minutes less of intra-service time though 17 more minutes of total time. Also, as described in the introductory section, these services are more intense relative to when this service was previously reviewed.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* (work RVU = 13.75, 90 minutes intra-service time and 178 minutes total time) and determined that the surveyed code involves much more intensity than both reference codes. 84 percent of the survey respondents who selected top key reference code 37225 had rated the surveyed code as more intense/complex to perform. 68 percent of the survey respondents who selected second key reference code 93583 had indicated the surveyed code is more intense/complex to perform. The RUC concluded that CPT code 92937 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 11.30 for CPT code 92937.**

92941 ***Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single major coronary artery and/or its branches or single bypass graft and/or its subtended branches***
The RUC reviewed the survey results from 139 interventional cardiologists and determined that the survey 25th percentile work RVU of 12.72 appropriately accounts for the work required to perform this service. The RUC recommends 22 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 65 minutes intra-service time, and 30 minutes immediate post-service time. The specialties noted and the RUC concurred that this service is the most intense service to perform in the code family as it is emergent and involves a patient undergoing acute myocardial infarction. Since it is emergent, the pre-service evaluation time is typically shorter than all the planned 000-day global procedures in the code family. Also, this service is the most intense procedure to perform in the code family.

The RUC acknowledged the dearth of potential reference codes that are major surgical procedures with the 000-day global period and involved a similar amount of physician work, so the pool of potential reference codes was severely limited. The RUC compared the surveyed code to key reference codes 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* (work RVU = 13.75, 90 minutes intra-service time and 178 minutes total time) and 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 11.75, 118 minutes intra-service time and 186 minutes total time) and determined that the surveyed code involves much more intensity than both reference codes. 83 percent of the survey respondents who selected top key reference code 93583 had rated the surveyed code as more intense/complex to perform. 91 percent of the survey respondents that selected second key reference code 37225 had indicated the surveyed code is more intense/complex to perform. The RUC concluded that CPT code 92941 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 12.72 for CPT code 92941.**

92943 ***Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; antegrade approach***
The RUC reviewed the survey results from 132 interventional cardiologists and determined that the survey 25th percentile work RVU of 13.69 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, and 30 minutes immediate post-service time. The specialty noted that this is one of the longest services to perform in the code family, as it involves multiple catheter changes and multiple techniques being attempted.

The RUC compared the surveyed code to key reference codes 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry* (work RVU = 15.00, 120 minutes intra-service time and 199 minutes total time) and 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU = 17.97, 120 minutes intra-service time and 208 minutes total time) and determined that the surveyed code typically involves an identical amount of intra-service time as these two reference codes, though somewhat less total time. The RUC concurred that the recommended times and values fit appropriately with both reference services, as the surveyed code involves less total work. The RUC concluded that CPT code 92943 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 13.69 for CPT code 92943.**

92945 *Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; combined antegrade and retrograde approaches*
The RUC reviewed the survey results from 118 interventional cardiologists and determined that the survey 25th percentile work RVU of 15.00 appropriately accounts for the physician work required to perform this service. The RUC recommends 35 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 10 minutes pre-service scrub/dress/wait time, 130 minutes intra-service time, and 30 minutes immediate post-service time. The specialties noted that CPT code 92945 was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed. The specialty noted that this is one of the longest services to perform in the code family, as it involves multiple catheter changes and multiple techniques being attempted.

The RUC compared the surveyed code to key reference codes 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU = 17.97, 120 minutes intra-service time and 208 minutes total time) and 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry* (work RVU = 15.00, 120 minutes intra-service time and 199 minutes total time). The RUC noted that the surveyed code involves 10 minutes more of total time and either identical or similar total time to both reference codes. The RUC concluded that CPT code 92945 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 15.00 for CPT code 92945.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92972 ***Percutaneous transluminal coronary lithotripsy (List separately in addition to code for primary procedure)***
The RUC concurred with the societies that this add-on service should be affirmed, as it was most recently surveyed in January 2023 and the current time and value remain appropriate. The RUC affirms 30 minutes of intra-service and total time. **The RUC recommends affirming a work RVU of 2.97 for CPT code 92972.**
92973 ***Percutaneous transluminal coronary thrombectomy aspiration mechanical (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 140 interventional cardiologists and determined that a direct work RVU crosswalk to CPT code 36483 *Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU= 1.75 and 20 minutes of intra-service time) appropriately accounts for the work required to perform this service. The RUC noted that both add-on services typically involve the same amount of time to perform and the same average physician work intensity. The RUC recommends 20 minutes of intra-service time and total time.

The RUC compared the surveyed code to key reference codes 37186 *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)* (work RVU = 4.92, 60 minutes intra-service time and total time) and 92974 *Transcatheter placement of radiation delivery device for subsequent coronary intravascular brachytherapy (List separately in addition to code for primary procedure)* (work RVU = 3.00, 42.5 minutes intra-service time and total time) and noted that both key reference codes involve more than twice as much time to perform as this add-on survey code, though the surveyed code typically involves more work intensity. **The RUC recommends a work RVU of 1.75 for CPT code 92973.**

93571 ***Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; initial vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 138 interventional cardiologists and determined that a direct work RVU crosswalk to CPT code 37252 *Intravascular ultrasound (non-coronary vessel) during diagnostic evaluation and/or therapeutic intervention; initial vessel (List separately in addition to code for primary procedure)* (work RVU= 1.80, 20 minutes intra-service time and 22 minutes total time) appropriately accounts for the work required to perform this service. The RUC noted that both services typically involve an identical intra-service time, similar total time, and the same amount of physician work. The RUC recommends 20 minutes of intra-service time and total time.

The RUC compared the surveyed code to key reference code 92974 *Transcatheter placement of radiation delivery device for subsequent coronary intravascular brachytherapy (List separately in addition to code for primary procedure)* (work RVU = 3.00, 42.5 minutes intra-service and total time) and noted that although the surveyed code involves roughly half as much time, the surveyed code is more intense to perform. The RUC concurred that this justifies a work value that is 60 percent of the value of the reference code. **The RUC recommends a work RVU of 1.80 for CPT code 93571.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93572 ***Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 138 interventional cardiologists and determined that a direct work RVU crosswalk to CPT code 37253 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU= 1.44, 20 minutes intra-service time and 21 minutes total time) appropriately accounts for the work required to perform this service. Although the reference code involves more time, the surveyed code is a more intense service to perform. The RUC concurred that both services are comparable in terms of the total amount of physician work typically required ot perform each service. The RUC recommends 16 minutes of intra-service time and total time. The RUC noted that this is an increase of 5 minutes relative to the currently assigned CMS Time, a 45 percent increase.

To support the recommended work RVU, the RUC compared the surveyed code to key reference code 37252 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; initial noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU = 1.80, 20 minutes intra-service and 22 minutes total time) and determined that it is appropriate to assign the surveyed code a lower work value than this key reference code. **The RUC recommends a work RVU of 1.44 for CPT code 93572.**

Practice Expense
The RUC recommends no direct practice expense inputs for the PCI code family as they are facility-only services.

RUC Flag
The RUC recommends that CPT code 92924 should be flagged as **Do Not Use to Validate for Physician Work**. The direct work RVU crosswalk for this survey code was a different global period, ZZZ.

New Technology/New Services List
CPT code 92972 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Surgery
Cardiovascular System
Arteries and Veins
Transcatheter Procedures

Codes for catheter placement and the radiologic supervision and interpretation should also be reported, in addition to the code(s) for the therapeutic aspect of the procedure.

Mechanical Thrombectomy

Code(s) for catheter placement(s)…

Codes 37184-37188 specifically…

Intraprocedural injection(s) of a thrombolytic…

For coronary mechanical aspiration thrombectomy, use 92973.

For intracranial arterial mechanical thrombectomy, use 61645.

Transcatheter Thrombolytic Infusion

Codes 37211 or 37212 are used to report…

Endovascular Revascularization (Open or Percutaneous, Transcatheter)

Codes 37220-37235 are to be used…

These lower extremity endovascular…

…

✚*37235* *with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*

(Use 37235 in conjunction with 37231)

Codes 37246, 37247, 37248, 37249 describe open or percutaneous transluminal balloon angioplasty (eg, conventional, low profile, cutting, drug-coated balloon). Codes 37246, 37247 describe transluminal balloon angioplasty in an artery excluding the central nervous system (61630, 61635), coronary (92920-~~9294~~92945, *0913T*), pulmonary (92997, 92998), and lower extremities for occlusive disease (37220-37235). Codes

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

37248 and 37249 describe transluminal balloon angioplasty in a vein excluding the dialysis circuit (36902, 36905, 36907) when approached through the ipsilateral dialysis access. Transluminal balloon angioplasty is inherent to stenting in the extracranial carotid and innominate arteries (37215, 37216, 37217, 37218), peripheral arteries (37220-37237), and in peripheral veins (37238, 37239) and, therefore, is not separately reportable. Multiple angioplasties performed in a single vessel, including treatment of separate and distinct lesions within a single vessel, are reported with a single code. If a lesion extends across the margins of one vessel into another, but can be treated with a single therapy, the intervention should be reported only once. When additional, separate, and distinct ipsilateral or contralateral vessels are treated in the same session, 37247 and/or 37249 may be reported as appropriate.

Non-selective and/or selective catheterization …

#37248 *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein*

#✚37249 *each additional vein (List separately in addition to code for primary procedure)*

(Use 37249 in conjunction with 37248)

(Do not report 37248, 37249 in conjunction with 36836, 36837)

(Do not report 37248, 37249 in conjunction with 37238, 37239 when performed in the same vein during the same operative session)

(Do not report 37248, 37249 in conjunction with 0505T, within the femoral-popliteal segment)

(Do not report 37248, 37249 in conjunction with 0620T within the tibial-peroneal segment)

(For transluminal balloon angioplasty in aorta/visceral artery[ies] in conjunction with fenestrated endovascular repair, see 34841, 34842, 34843, 34844, 34845, 34846, 34847, 34848)

(For transluminal balloon angioplasty in iliac, femoral, popliteal, or tibial/peroneal artery[ies] for occlusive disease, see 37220-37235)

(For transluminal balloon angioplasty in a dialysis circuit performed through the circuit, see 36902, 36903, 36904, 36905, 36906, 36907, 36908)

(For transluminal balloon angioplasty in an intracranial artery, see 61630, 61635)

(For transluminal balloon angioplasty in a coronary artery, see 92920-~~92944~~ 92945)

(For transluminal balloon angioplasty in a pulmonary artery, see 92997, 92998)

Codes 37236-37239 are used to report endovascular revascularization for vessels other than lower extremity artery(ies) for occlusive disease (ie, 37221, 37223, 37226, 37227, 37230, 37231, 37234, 37235), cervical carotid (ie, 37215, 37216), intracranial (ie, 61635), intracoronary (ie, 92920, 92924, 92928,~~92929,~~ 92933, ~~92934,~~92937, ~~92938,~~92941, 92943, ~~92944~~, 92930, 92945), innominate and/or intrathoracic carotid artery through an antegrade approach (37218), extracranial vertebral (ie, 0075T, 0076T) performed percutaneously and/or through an open surgical

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

exposure, open retrograde intrathoracic common carotid or innominate (37217), or dialysis circuit when performed through the dialysis circuit (36903, 36905, 36908).

…

Intravascular stents, both covered and uncovered, are a class of devices that may be used as part of an embolization procedure.

37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery*

✚*37237* *each additional artery (List separately in addition to code for primary procedure)*

(Use 37237 in conjunction with 37236)

(Do not report 37236, 37237 in conjunction with 36836, 36837)

(Do not report 37236, 37237 in conjunction with 34841- 34848 for bare metal or covered stents placed into the visceral branches within the endoprosthesis target zone)

(For stent placement~~([s])~~ in iliac, femoral, popliteal, or tibial/peroneal artery~~([s])~~ for occlusive disease, see 37221, 37223, 37226, 37227, 37230, 37231, 37234, 37235)

(For transcatheter placement of intravascular cervical carotid artery stent~~([s])~~ see 37215, 37216)

(For transcatheter placement of intracranial stent~~([s])~~, use 61635)

(For transcatheter placement of intracoronary stent~~([s])~~, see 92928, ~~92929~~92933, ~~92934,~~ 92937, ~~92938,~~ 92941, 92943, ~~92944~~ 92930, 92945)

(For stenting of visceral arteries in conjunction with fenestrated endovascular repair, see 34841-34848)

(For open or percutaneous antegrade transcatheter placement of intrathoracic carotid/innominate artery stent(s), use 37218)

(For open or percutaneous transcatheter placement of extracranial vertebral artery stent~~([s])~~, see Category III codes 0075T, 0076T)

(For open retrograde transcatheter placement of intrathoracic common carotid/innominate artery stent~~([s])~~, use 37217)

(For placement of a stent at the arterial anastomosis of a dialysis circuit with or without transluminal mechanical thrombectomy and/or infusion for thrombolysis, see 36903, 36906)

Medicine
Cardiovascular
Therapeutic Services and Procedures
Coronary Therapeutic Services and Procedures

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Codes 92920-~~92944~~ 92945 describe percutaneous revascularization services performed for occlusive disease of the coronary vessels (major coronary arteries, coronary artery branches, or coronary artery bypass grafts). These percutaneous coronary intervention (PCI) codes are built on progressive hierarchies with more intensive services inclusive of lesser intensive services. These PCI codes all include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, conventional balloons, cutting balloons, wired balloons, cryoplasty balloons), atherectomy (eg, directional atherectomy, rotational atherectomy, orbital atherectomy, laser atherectomy), and stenting (eg, balloon expandable stents, self-expanding stents, bare metal stents, drug eluting stents, covered stents). Each code in this family includes balloon angioplasty, when performed. Diagnostic coronary angiography may be reported separately under specific circumstances as outlined below. Percutaneous transluminal coronary lithotripsy may be reported using 92972 in conjunction with 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92975, 92930, 92945, as appropriate.

Diagnostic coronary angiography codes (93454-93461) and injection procedure codes (93563-93564) should not be used with percutaneous coronary revascularization services (92920-~~92944~~ 92945) to report:

1. *Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the coronary intervention,*
2. *Vessel measurement for the coronary intervention,* ***or***
3. Post-coronary angioplasty/stent/atherectomy angiography, as this work is captured in the percutaneous coronary revascularization services codes (92920-~~92944~~ 92945).

Diagnostic angiography performed at the time of a coronary interventional procedure may be separately reportable if:

1. *No prior catheter-based coronary angiography study is available, and a full diagnostic study is performed, and a decision to intervene is based on the diagnostic angiography, or*
2. *A prior study is available, but as documented in the medical record:*
   1. *The patient's condition with respect to the clinical indication has changed since the prior study, or*
   2. The~~re is~~ prior study provides inadequate visualization of the anatomy and/or pathology, **or**
   3. *There is a clinical change during the procedure that requires new evaluation outside the target area of intervention.*

Diagnostic coronary angiography performed at a separate session from an interventional procedure is separately reportable.

Coronary Lesion: For the purposes of reporting, a single distinct coronary lesion starts at the proximal end of the target lesion and ends at the distal end of the target lesion. A single distinct coronary lesion may involve multiple coronary segments and may extend from a major coronary artery into one of its branches or from a bypass graft into the subtended vessel. For the purposes of reporting, two distinct coronary lesions within one major coronary artery are considered present when the first lesion is geographically separated from the second lesion. For example, a diffuse single coronary lesion extending from the mid to distal right coronary artery (RCA) treated with two stents constitutes a single distinct

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

coronary lesion. A coronary lesion in the proximal RCA treated with a single stent and a separate coronary lesion in the distal RCA treated with two stents would be considered two distinct coronary lesions for the purposes of reporting.

Major coronary arteries: The major coronary arteries are the left main, left anterior descending, left circumflex, right, and ramus intermedius arteries. ~~All PCI procedures performed in all segments (proximal, mid, distal) of a single major coronary artery through the native coronary circulation are reported with one code.~~ When one segment of a major coronary artery is treated through the native circulation and treatment of another segment of the same artery requires access through a coronary artery bypass graft, the intervention through the bypass graft is reported separately.

Coronary artery branches: Up to two coronary artery branches of the left anterior descending (diagonals), left circumflex (marginals), and right (posterior descending, posterolaterals) coronary arteries are recognized. The left main and ramus intermedius coronary arteries do not have recognized branches for reporting purposes. ~~All PCI(s) performed in any segment (proximal, mid, distal) of a coronary artery branch is reported with one code. PCI is reported for up to two branches of a major coronary artery. Additional PCI in a third branch of the same major coronary artery is not separately reportable.~~

Coronary Segments: Coronary segments are recognized portions of each major coronary artery and its branches. For the purpose of coding, coronary segments are defined using the established paradigm used in the National Cardiovascular Data Registry (NCDR) CathPCI database.

Coronary artery bypass grafts: Each coronary artery bypass graft represents a coronary major artery ~~vessel~~. A sequential or branching bypass graft (eg, Y graft) with more than one distal anastomosis represents only one graft. ~~A branching bypass graft (eg, Y graft)represents a coronary vessel for the main graft, and each branch off the main graft constitutes an additional coronary vessel~~. PCI performed on a major coronary artery~~ies~~ or major coronary artery branch~~es~~ by access through a bypass graft is reported using the bypass graft PCI codes. B~~All b~~ypass graft PCI codes include the use of coronary artery embolic protection devices when performed.

Only one base code from ~~this~~ the PCI family may be reported for revascularization of a major ~~coronary~~ artery and its ~~recognized~~ branches. Only one ~~base~~ code should be reported for revascularization of a coronary artery bypass graft, its subtended coronary artery, and ~~recognized~~ branches of the subtended coronary artery. If one segment of a major coronary artery and its ~~recognized~~ branches is treated through the native circulation, and treatment of another segment of the same vessel requires access through a coronary artery bypass graft, an additional base code ~~is~~ may be reported to describe the intervention performed through the bypass graft. The PCI base codes are 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92930, and 92945. T~~he PCI base code that includes the most intensive service provided for the target vessel should be reported. The hierarchy of these services is built on an intensity of service ranked from highest to lowest as 92943 = 92941 = 92933 > 92924 > 92937 = 92928 > 92920.~~

~~PCI performed during the same session in additional recognized branches of the target vessel should be reported using the applicable add-on code(s). The add-on codes are 92921, 92925, 92928, 92934, 92938, and 92944 and follow the same principle in regard to reporting the most intensive service provided. The intensity of service is ranked from highest to lowest as 92944 = 92938 > 92934 > 92925 > 92929 > 92921.~~

PCI performed during the same session in additional major coronary artery(ies) or in/through an additional coronary artery bypass graft(s) ~~should~~ may be reported using the applicable major coronary artery base code(s). ~~additional base code(s). PCI performed during the same session in additional coronary artery branches should be reported using the applicable additional add-on code(s).~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

If a single lesion extends from one target vessel (major coronary artery, coronary artery bypass graft, or coronary artery branch) into another target vessel, but can be revascularized with a single intervention bridging the two vessels, this PCI should be reported with a single code despite treating more than one vessel. For example, if a left main coronary lesion extends into the proximal left circumflex coronary artery and a single stent is placed to treat the entire lesion, this PCI should be reported as a single vessel stent (92928). ~~In this example, a code for additional vessel treatment (92929) would not be additionally reported.~~

When bifurcation lesions are treated with at least one stent, 92930 is reported.~~, PCI is reported for both vessels treated.~~ For example, when both branches of a bifurcation lesion involving the left anterior descending artery and the first diagonal artery are treated and at least one stent is used, report 92930.~~is treated by stenting both vessels, 92928 and 92929 are both reported.~~

Code 92941 is intended for situations where PCI for acute MI, usually ST-elevation MI, is done emergently. ~~Target vessel~~ PCI ~~for~~ of the culprit major coronary artery lesion(s) causing an acute MI ~~myocardial infarction~~ includes ~~is inclusive of all~~ balloon angioplasty, atherectomy, stenting, non-mechanical manual aspiration thrombectomy, distal protection, and intracoronary rheolytic agent administration when performed. Mechanical aspiration coronary thrombectomy (92973) ~~is~~ may be reported separately.

PCI for a non-emergent acute coronary syndrome (eg, late-presenting, or non-ST-elevation MI without ongoing chest pain) should not be reported with 92941.

PCI of chronic total occlusions is reported using 99243, 92945. Chronic total occlusion of a coronary vessel is present when there is no antegrade flow through the true lumen, accompanied by suggestive angiographic and clinical criteria (eg, antegrade "bridging" collaterals present, calcification at the occlusion site, no current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion). Current clinical presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion, subtotal occlusion, ~~and~~ or occlusion with dye staining at the site consistent with fresh thrombus are not considered chronic total occlusion. Some chronic total occlusions may be treated with antegrade advancement of a wire through the occluding calcified plaque or around this plaque in the subintimal space (92943). Some chronic total occlusion lesions must be traversed in a combined antegrade retrograde fashion (92945). In such cases, in addition to the antegrade approach, a wire is advanced via a non-occluded coronary artery and through collateral vessels to cross the occlusion in a retrograde fashion from its distal cap.

Codes 92973 (percutaneous transluminal coronary thrombectomy, mechanical aspiration), 92974 (coronary brachytherapy), 92978 and 92979 (intravascular ultrasound/optical coherence tomography), 93571 and 93572 (intravascular Doppler velocity and/or pressure [~~fractional flow~~ reserve measurement ~~{FFR} or coronary flow reserve {CFR}~~]), and 92972 (percutaneous transluminal coronary lithotripsy), are add-on codes for reporting procedures performed in addition to coronary and bypass graft diagnostic and PCI procedures ~~interventional services, unless included in the base code~~. Non-mechanical, manual aspiration thrombectomy is not reported with 92973, and is included in the PCI code for acute myocardial infarction (92941), when performed. For non-mechanical, manual aspiration thrombectomy performed during PCI for indications other than acute myocardial infarction, use 93799.

For purposes of reporting stent placement, there are two codes for stent PCI. Code 92928 is reported when one lesion is treated with one or more stents in a major coronary artery, whether the lesion is confined to one segment or extends across multiple coronary segments. When two or more separate coronary lesions are treated with two or more stents in two or more coronary segments in a major coronary artery and/or its branch(es), use 92930. Example #1: placement of stents to treat a single lesion that overlaps the mid and distal right coronary artery segments

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

may be reported with 92928. Example #2: Treatment of two separate lesions by placement of stents in the 1st diagonal artery and the distal LAD may be reported with 92930. *(To report transcatheter placement of radiation delivery device for coronary intravascular brachytherapy, use 92974)* *(For intravascular radioelement application, see 77770, 77771, 77772)* *(For nonsurgical septal reduction therapy [eg, alcohol ablation], use 93799)*

(Report 92978 once per session)

(Use 92978 in conjunction with ~~92975~~, 92920, 92924, 92928, 92933, 92937, 92941, 92943, 93454-93461, 93563, 93564, 92930, 92945)

(Do not report 92978 in conjunction with 0913T, 0914T for intervention in the same major coronary artery or in the same bypass graft or its subtended branches)

#✚92979 *each additional vessel (List separately in addition to code for primary procedure)*

(Report 92979 once per additional vessel)

(Use 92979 in conjunction with 92978)

(Intravascular ultrasound and optical coherence tomography services include all transducer manipulations and repositioning within the specific vessel being examined, both before and after therapeutic intervention [eg, stent placement])

Cardiac Catheterization

Cardiac catheterization is a diagnostic medical procedure which includes introduction, positioning and repositioning, when necessary, of catheter(s), within the vascular system, recording of intracardiac and/or intravascular pressure(s), and final evaluation and report of procedure. There are two code families for cardiac catheterization: one for congenital heart disease and one for all other conditions. For cardiac catheterization for congenital heart defects (93593, 93594, 93595, 93596, 93597, 93598), see the ***Medicine/Cardiovascular/Cardiac Catheterization for Congenital Heart Defects*** *subsection. The following guidelines apply to cardiac catheterization performed for indications other than the evaluation of congenital heart defects.*

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92920 Tracking Number D1 Original Specialty Recommended RVU: **9.00**
Presented Recommended RVU: **9.00**
Global Period: 000 Current Work RVU: **9.85** RUC Recommended RVU: **8.35**

CPT Descriptor: Percutaneous transluminal coronary angioplasty, single major coronary artery and/or its branch(es)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female presents with unstable angina. Coronary arteriography demonstrates diffusely diseased coronary arteries with 90% lesions in both the mid and distal parts of a tortuous left anterior descending artery. The vessel diameter is smaller than the smallest available stent. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 98% , In the ASC 2%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 65% , Overnight stay-less than 24 hours 33% , Overnight stay-more than 24 hours 2%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A coronary dilation balloon is advanced over the guidewire to the lesion and dilation performed until adequate, then it is pulled back into the guide. Angiography is performed in multiple views. If the lesion is not fully expanded, the angioplasty procedure is repeated, using different larger or less compliant balloons as needed, and repeat angiography is performed. The entire process of coronary artery imaging, guidewire placement, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot be used with femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

CPT Code: 92920

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

CPT Descriptor Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
37228	000	10.75	**RUC Time**

CPT Descriptor Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
52356	000	8.00	**RUC Time**	82,797

CPT Descriptor 1 Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
36905	000	9.00	**RUC Time**	22,013

CPT Descriptor 2 Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

Other Reference CPT Code	Global	Work RVU	Time Source
31259	000	8.48	**RUC Time**

CPT Descriptor Nasal/sinus endoscopy, surgical with ethmoidectomy; total (anterior and posterior), including sphenoidotomy, with removal of tissue from the sphenoid sinus

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 34 **% of respondents:** 24.2 **%**

Number of respondents who choose 2nd Key Reference Code: 32 **% of respondents:** 22.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 92920	Top Key Reference CPT Code: 37236	2nd Key Reference CPT Code: **37228**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	9%	41%	41%	9%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	59%	38%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	9%	55%	36%
Physical effort required	15%	70%	15%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	41%	40%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	22%	50%	28%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	25%	75%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	38%	62%
Physical effort required	6%	55%	39%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	9%	91%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not

reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery,

reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly

proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS					
A	Pre-Service Evaluation (IWPUT =0.0224)	18	33	40	34	
B	Pre-Service Positioning (IWPUT = 0.0224)	1	3	3	3	
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	15	20	6	
	DETAILS					
A	History and Exam (Performance and review of appropriate Pre-Tests)	10	10	15	10	Standard
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	4	2	Standard
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	5	5	10	+7 for detailed consenting using multi-page or electronic form. Discuss results of Heart Team consultations (if

						performed); access site options; pros and cons of various PCI techniques including intra-coronary lithotripsy, atherectomy angioplasty, stenting; and possibility of conversion to emergency surgery. Discuss alternatives to PCI (surgery or medical therapy.) Discuss risks of all 3 approaches. Obtain separate consents for transfusion and moderate sedation.
A	Communicate with other professionals	0	5	5	0	Standard
A	Check/set-up room, supplies and equipment	1	5	5	5	+4 Utilize time similar to procedures with anesthesia to assess complex array of catheter, stents, and other supplies/equipment
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned

						on. Anti-spasm cocktail is prepared for intra-arterial injection.
C	Administer local/topical anesthesia	1	0	0	1	Standard
C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92920: PTCA

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92920 will be used to report percutaneous transluminal coronary angioplasty of a single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37236, transcatheter placement of an intravascular stent(s). While procedurally similar, 37236 is a longer, less intense service.

The societies **recommend a wRVU of 9.00 with times of 43/48/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 48 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is slightly above the longer KRS, but also accounts for the increased intensity of working in the coronary arteries (which are always in motion and where rupture can cause immediate death) as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92920

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Interventional Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 57177
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 the traditional Medicare data from the RUC database to account for Medicare Advantage and commerical insurance covered performance.

Specialty Cardiology Frequency 27960 Percentage 48.90 %

Specialty Interventional Cardiology Frequency 26930 Percentage 47.09 %

Specialty Internal Medicine Frequency 1544 Percentage 2.70 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
19,059 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Cardiology Frequency 9320 Percentage 48.90 %

Specialty Interventional Cardiology Frequency 8977 Percentage 47.10 %

Specialty Internal Medicine Frequency 515 Percentage 2.70 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92920

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92924 Tracking Number D2 Original Specialty Recommended RVU: **11.25**

Global Period: 000 Current Work RVU: **11.74** RUC Recommended RVU: **10.13**

CPT Descriptor: Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old male presents with chronic angina refractory to medical therapy. Stress testing shows inferior ischemia. Coronary arteriography demonstrates heavily calcified coronary arteries. The proximal right coronary artery and its posterior descending branch each have long heavily calcified 80% stenotic lesions. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 43% , Overnight stay-less than 24 hours 52% , Overnight stay-more than 24 hours 5%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 96%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A sheath is placed and flushed. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. An appropriate-sized atherectomy device is selected, assembled, and passed through the guide into the target artery. The device is test-activated in the body and adjusted as needed. The device is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Multiple runs are performed until it can progress through the lesion. If a larger device is needed to enlarge the lumen more optimally, the above steps are repeated with the larger device. The device is removed and an angioplasty balloon is passed over the guidewire to the target lesion(s) and used to further dilate the target lesion(s). Final angiography is performed. The entire process of coronary artery imaging, guidewire placement, atherectomy, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At

the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved by appropriate technique. If a vascular closure device cannot be used with femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Physical effort required	0%	42%	58%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not

reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery,

reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly

proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS					
A	Pre-Service Evaluation (IWPUT =0.0224)	18	33	40	34

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92924: PTCA + Atherectomy

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92924 will be used to report percutaneous transluminal coronary angioplasty plus atherectomy of a single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37225, femoral/popliteal revascularization with angioplasty and atherectomy. While procedurally similar, 37225 is a longer, less intense service. 78% of key reference respondents found surveyed code 92924 to be more or much more intense/complex than 37225.

The societies **recommend a wRVU of 11.25 with times of 43/60/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 60 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS, but also accounts for the increased intensity of working in the coronary arteries (which are always in motion and where rupture can cause immediate death), as well as the increased intensity radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92924

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Interventional Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 4839
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 traditional Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Cardiology Frequency 2410 Percentage 49.80 %

Specialty Interventional Cardiology Frequency 2255 Percentage 46.60 %

Specialty Internal Medicine Frequency 121 Percentage 2.50 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,613
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Cardiology Frequency 803 Percentage 48.90 %

Specialty Interventional Cardiology Frequency 752 Percentage 46.60 %

Specialty Internal Medicine Frequency 40 Percentage 2.50 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92924

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, single major coronary artery and/or its branch(es); one lesion involving one or more coronary segments

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old obese male presents with unstable angina consistent with acute coronary syndrome. Coronary arteriography demonstrates about a 30 mm long hazy 90% lesion in the mid and distal segments of the circumflex coronary artery. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 98% , In the ASC 2%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 68% , Overnight stay-less than 24 hours 31% , Overnight stay-more than 24 hours 1%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A coronary dilation balloon is advanced over the guidewire to the lesion(s) and dilated, using repeat dilatations as needed to be sure the lesion can be fully expanded with a stent. The angioplasty balloon is then removed. Angiography is performed in multiple views. A stent of appropriate diameter is advanced to the target lesion(s), carefully positioned, and deployed. If the stent fails to cover the entire diseased segment, additional stent(s) are then placed repeating the steps above. The entire process of coronary artery imaging, guidewire placement, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a

vascular closure device cannot be used for femoral access, the sheath is sewn in for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	3%	21%	49%	27%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	35%	62%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	33%	64%
Physical effort required	11%	61%	28%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	19%	81%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	54%	38%	8%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	48%	48%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	48%	48%
Physical effort required	4%	70%	26%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	54%	46%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes.
RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92928: PTCA+ stent

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92928 will be used to report percutaneous transluminal coronary angioplasty plus stent placement in a single major coronary artery and/or its branches, one lesion involving one or more coronary segments. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37226, femoral/popliteal revascularization with transluminal stent placement and angioplasty, when performed. While procedurally similar, 37226 is a longer, less intense service. 76% of key reference respondents found surveyed code 92928 to be more or much more intense/complex than 37226.

The societies **recommend a wRVU of 10.41 with times of 43/60/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 60 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is above the longer KRS, yet below the current 92928 value. The recommendation accounts for the increased intensity of working in the coronary arteries, (which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92928

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 421805
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on data from the CathPCI Registry the new 92930 code would apply to 27% of the stent cases currently performed. As such we anticipate 73% of the previous volume of this service to continue to be reported as 92928. We arrived at this estimate by multiplying the the 2022 traditional Medicare utilization found in the RUC database by three to account for Medicare Advantage and commerical covered performance, then applying 73% of that number.

Specialty Interventional Cardiology Frequency 211325 Percentage 50.10 %

Specialty Cardiology Frequency 195718 Percentage 46.40 %

Specialty Internal Medicine Frequency 10123 Percentage 2.39 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 140,602 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Procedure data from the CathPCI Registry predicts that 73% of the current 92928 procedures would continue to be coded as such after the 92930 code is implemented. This estimate for 92928 is 73% of the 2022 RUC Database data for 92928.

Specialty Interventional Cardiology Frequency 70442 Percentage 50.10 %

Specialty Cardiology Frequency 65239 Percentage 46.39 %

Specialty Internal Medicine Frequency 3375 Percentage 2.40 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92928

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed, two or more distinct coronary lesions with two or more coronary stents deployed int wo or more coronary segments, or a bifurcation lesion requiring angioplasty and/or stenting in both the main artery and the side branch

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 77-year-old diabetic female presents with accelerated angina despite medical therapy. Coronary angiography demonstrates about a 30 mm long 90% stenosis in the mid segment of the left anterior descending coronary artery at the bifurcation with a large first diagonal artery branch which itself has a 90% focal stenosis. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 43% , Overnight stay-less than 24 hours 50% , Overnight stay-more than 24 hours 7%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 97%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intra-arterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A second guidewire is manipulated across the lesion(s) into the side branch with the same cautions and confirmed angiographically. An appropriate-sized balloon is advanced into the main branch, dilates it, and is removed. Angiography is performed in multiple views. If the lesion is not fully expanded the procedure is repeated multiple times with progressively larger balloons or higher pressures. Once an adequate expansion is achieved, a balloon is passed over the sidebranch wire half-way into the side branch, and inflated until the side branch is adequately dilated. Then a stent of appropriate diameter and length is advanced half-way into the side branch. A non-compliant balloon is then placed in the

main vessel adjacent to the branch stent. The sidebranch stent is deployed at high pressure, the stent delivery system is withdrawn, and angiography is performed to verify adequate coverage of the lesion dilatation of the lesion. The balloon in the main vessel is immediately inflated to crush the portion of the stent to the side of the main vessel. The main vessel balloon is withdrawn into the guide. A new guidewire is placed through the side of the crushed stent into the side branch and the original sidebranch wire is removed. A new balloon is placed half-way into the side branch through the side of the crushed sidebranch stent. The balloon in the main artery is again advanced to the site of the lesion alongside the proximal half of the sidebranch balloon and both balloons are inflated simultaneously (1st "kissing balloon inflation"). The balloons are withdrawn and angiography is performed to assess interim results. The sidebranch guidewire is removed. A stent is advanced in the main vessel to the target lesion covering the ostium of the sidebranch and deployed at high pressure. The stent delivery balloon is removed over the guidewire. A larger balloon is advanced to the bifurcation point of the main vessel and inflated at the origin of the side branch to optimize the size of the larger proximal portion of the main vessel (1st "Proximal Optimization Technique" or "POT") and then removed. A new guidewire is advanced into the side branch stent through the side of the main vessel stent. A new balloon is passed over the sidebranch wire half-way into the sidebranch, another balloon is passed over the main branch wire to the lesion, and both balloons are inflated simultaneously ("2nd kissing balloon inflation"). These balloons are removed and another larger balloon is passed over the guidewire in the main artery to the bifurcation point. The segment of the main vessel stent just proximal to the bifurcation point is dilated (2nd POT). All guidewires are removed. Final angiography is performed to assess the result and ensure no perforation as well as adequate stent deployment and continuity of coronary flow after administration of vasodilators. The guide catheter is removed and anticoagulation infusion is stopped. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	24%	56%	20%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	40%	52%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	75%	25%
Physical effort required	4%	42%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	24%	76%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	12%	32%	56%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	20%	80%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	25%	75%
Physical effort required	4%	29%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	12%	88%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes.
RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**	
	CATEGORY SUBTOTALS

A	Prepare for Procedure (Check labs,	2	2	4	2	Standard

	plan, assess risks, review procedure)					
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	5	5	10	+7 for detailed consenting using multi-page or electronic form. Discuss results of Heart Team consultations (if performed); access site options; pros and cons of various PCI techniques including intra-coronary lithotripsy, atherectomy angioplasty, stenting; and possibility of conversion to emergency surgery. Discuss alternatives to PCI (surgery or medical therapy.) Discuss risks of all 3 approaches. Obtain separate consents for transfusion and moderate sedation.
A	Communicate with other professionals	0	5	5	0	Standard
A	Check/set-up room, supplies and equipment	1	5	5	5	+4 Utilize time similar to procedures with anesthesia to assess complex array of catheter, stents, and other supplies/equipment
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned on. Anti-spasm cocktail is prepared for intra-arterial injection.
C	Administer local/topical anesthesia	1	0	0	1	Standard

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92930: PTCA + Non-Straightforward Stent

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92930 will be used to report percutaneous transluminal coronary angioplasty plus stent placement in a single major coronary artery and/or its branches, two or more distinct coronary lesions with two or more coronary stents deployed in two or more coronary segments, or a bifurcation lesion requiring angioplasty and/or stenting in both the main artery and the side branch. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93653, Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry. While procedurally similar in that it is also a catheter service, 93653 is a longer and different service inside the heart. 76% of key reference respondents found surveyed code 92930 to be more or much more intense/complex than 93653.

The societies **recommend a wRVU of 12.00 with times of 43/75/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 75 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS, but also accounts for the intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92928

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 156010
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 27% of the services reported as 92928 will be reported as 92930 when the code is implemented. This estimate is 27% of the 2022 traditional Medicare volume as reported in the RUC database multiplied by three to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 78161 Percentage 50.09 %

Specialty Cardiolgoy Frequency 72389 Percentage 46.40 %

Specialty Internal Medicine Frequency 3744 Percentage 2.39 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 52,003 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CathPCI Registry data predict that 27% of the services reported as 92928 will be reported as 92930 when the code is implemented. This estimate is 27% of the 2022 utilization of 92928 per the RUC database.

Specialty Interventional Cardiology Frequency 26054 Percentage 50.10 %

Specialty Cardiology Frequency 24129 Percentage 46.39 %

Specialty Internal Medicine Frequency 1248 Percentage 2.39 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92928

CPT Descriptor: Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed, single major coronary artery and/or its branch(es)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male presents with progressive angina and pharmacologic stress testing showing lateral ischemia. Coronary arteriography shows 50% lesions in the left and right coronary arteries and an 80%, tubular left circumflex coronary artery lesion. The vessels are extremely heavily calcified. Percutaneous coronary intervention is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 37% , Overnight stay-less than 24 hours 55% , Overnight stay-more than 24 hours 8%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 99%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed(i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A sheath is placed and flushed. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. An appropriate-sized atherectomy device is selected, assembled, and passed through the guide into the target artery. The device is test-activated in the body and adjusted as needed. The device is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Multiple runs are performed until it can progress through the lesion. If a larger device is needed to enlarge the lumen more optimally, the above steps are repeated with the larger device. The device is removed and an angioplasty balloon is advanced over the guidewire to the lesion(s) and dilated, using repeat dilatations as needed to be sure the lesion can be fully expanded with a stent. A stent of appropriate diameter and length is selected and advanced over the guidewire to the target lesion and deployed. If the stent fails to cover the entire diseased segment, additional

stent(s) are then placed using the same techniques. The stent deployment balloon is removed and a high-pressure, non-compliant balloon is advanced over the wire into the stented segment and inflated at high pressure to ensure stent expansion. The entire process of coronary artery imaging, guidewire placement, atherectomy, stent placement, and balloon inflation may be repeated at multiple stenotic sites in separate locations in the coronary artery or its branches. At the end of the procedure the guide catheter is disengaged and removed. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot be used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer					
Specialty Society(ies):	ACC, SCAI

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	19%	45%	36%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	27%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	28%	68%
Physical effort required	2%	55%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	7%	91%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	16%	24%	24%	36%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	12%	42%	46%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	28%	64%
Physical effort required	8%	32%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	44%	48%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not

reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery,

reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly

proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92933: PTCA + Atherectomy + Stent

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92933 will be used to report percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed, single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37225, femoral/popliteal revascularization with angioplasty and atherectomy. While procedurally similar, 37225 is a longer, less intense service. 81% of key reference respondents found surveyed code 92933 to be more or much more intense/complex than 37225.

The societies **recommend a wRVU of 11.94 with times of 43/75/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 77 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS, but also accounts for the increased intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92933

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 44157
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 traditional Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 23050 Percentage 52.20 %

Specialty Cardiology Frequency 19562 Percentage 44.30 %

Specialty Internal Medicine Frequency 1016 Percentage 2.30 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
14,719 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Interventional Cardiology Frequency 7683 Percentage 52.19 %

Specialty Cardiology Frequency 6521 Percentage 44.30 %

Specialty Internal Medicine Frequency 339 Percentage 2.30 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92933

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92937 Tracking Number D6 Original Specialty Recommended RVU: **11.30**
Presented Recommended RVU: **11.30**
Global Period: 000 Current Work RVU: **10.95** RUC Recommended RVU: **11.30**

CPT Descriptor: Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed, single major coronary artery and/its branches

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 79-year-old female who had bypass surgery 10 years ago presents with unstable angina consistent with an acute coronary syndrome. Coronary arteriography demonstrates that the culprit is a saphenous vein graft to a large left circumflex coronary artery. The vein graft is diffusely diseased and has subtotal occlusion by a 3-mm long thrombus. Percutaneous coronary intervention is
performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 31% , Overnight stay-less than 24 hours 58% , Overnight stay-more than 24 hours 11%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary or graft ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. A distal protection device is then advanced down the graft over the coronary guidewire to capture embolic debris and help prevent no-reflow. Microvascular vasodilators are administered through the graft to help prevent no-reflow. A stent of appropriate diameter and length is selected, advanced over the guidewire to the target lesion and carefully positioned. The stent is deployed at nominal or high pressure. If the stent fails to cover the entire diseased segment, additional stent(s) are then placed using the same techniques. If there is no-reflow (slow flow of contrast down the vessel,

electrocardiography changes, and chest pain) microvascular vasodilators are administered again and if there is no resolution an aspiration catheter is advanced down into the graft, debris is aspirated to restore flow, and coronary vasodilators are delivered into the distal vessel. Once adequate flow is restored, assessment of the need for further balloon expansion is performed. If needed, an appropriate-sized balloon is selected and the lesion dilated. Intracoronary vasodilators are again administered. If the result is acceptable, the distal protection device is then removed by advancing the recapture catheter over the guidewire. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation, or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guidewire from the body. Anticoagulation infusions are stopped. The sheath is removed, and hemostasis is achieved by an appropriate technique. If a vascular closure device cannot used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	2%	14%	40%	44%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	24%	76%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	29%	71%
Physical effort required	5%	55%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	7%	93%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	18%	14%	39%	29%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	32%	47%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	11%	36%	53%
Physical effort required	7%	43%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	36%	53%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not

reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery,

reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly

proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

93237: Any PCI in CABG

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 93237 will be used to report percutaneous transluminal coronary intervention of/through a coronary artery bypass graft, using any combination of angioplasty, atherectomy, and/or stent in a single major coronary artery and/or its branches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 37225, femoral/popliteal revascularization with angioplasty and atherectomy. While procedurally similar, 37225 is a longer, less intense service. 84% of key reference respondents found surveyed code 93237 to be more or much more intense/complex than 37225.

The societies **recommend a wRVU of 11.30 with times of 43/65/28.** The preservice time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 77 minutes relies on 70 minutes from the survey plus 7 minutes from bundling of the branch codes. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS yet above the current value. The change accounts for the increased intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity of radial artery access as opposed to the prior typical technique using femoral artery access. Patients undergoing PCI of bypass graft have higher long term complications than conventional native artery PCI. https://www.practiceupdate.com/content/pci-innative-coronary-arteries-vs-bypassgrafts-in-patients-with-prior-cabg/38087

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92933

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 37014
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 traditonal Medicare data for usage to account for Medicare Advantage and commercial insurance covered performance.

Specialty Interventional Cardiology Frequency 19765 Percentage 53.39 %

Specialty Cardiology Frequency 16138 Percentage 43.59 %

Specialty Internal Medicine Frequency 777 Percentage 2.09 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
12,338 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.9

Specialty Interventional Cardiology Frequency 6588 Percentage 53.39 %

Specialty Cardiology Frequency 5379 Percentage 43.59 %

Specialty Internal Medicine Frequency 259 Percentage 2.09 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92933

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single major coronary artery and/or its branches or single bypass graft and/or its subtended branches

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male calls 911 for sudden onset of crushing substernal chest pain. Prehospital electrocardiography demonstrates acute anterior myocardial infarction. The emergency medical personnel bypass the emergency department and take the patient directly to the cardiac catheterization laboratory. After rapid assessment, immediate coronary angiography (reported separately), demonstrates thrombotic 100% occlusion of the mid-left anterior descending artery. Percutaneous coronary intervention is planned immediately with the goal of first medical contact-toballoon time under 90 minutes.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 6% , Overnight stay-less than 24 hours 22% , Overnight stay-more than 24 hours 72%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are rapidly reviewed. A physical examination is rapidly conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is quickly reviewed with the patient. The risks and benefits of the procedure are rapidly presented, as well as the alternatives. Informed consent is obtained. In an emergent fashion, hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is rushed to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. Angiography of the access site is performed as needed to assess anatomy of the access vessel and appropriate location of the access site. A sheath is placed and flushed. Intraarterial vasodilators are administered. An appropriate guiding catheter is passed under fluoroscopic guidance to the ascending aorta, engaged into the coronary ostium, and re-positioned as needed to prevent pressure damping. Appropriate antiplatelet therapy treatment is confirmed and anticoagulation administered. Therapeutic anticoagulation is confirmed by testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Multiple coronary injections are performed in different views to assess the target lesion(s). A coronary guidewire is used to cross the target lesion(s) and its position distally in the artery is confirmed. If there is no re-flow down the vessel or significant thrombus, an appropriate aspiration catheter is rapidly advanced to the occluded vessel and thrombus is aspirated. Multiple rounds of intracoronary microvascular vasodilators are administered. If antegrade coronary flow is restored but there is residual thrombus, intravenous and/or intracoronary

antiplatelet agents may be infused to help resolve the thrombus. An appropriate-sized balloon is selected, advanced over the coronary guidewire to the lesion, inflated as needed to open the lesion, and withdrawn. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. Once an adequate expansion is achieved to allow stent deployment, a stent of appropriate diameter and length is selected and advanced to the target lesion and carefully positioned. The stent is deployed but frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. Next a high-pressure, non-compliant balloon is advanced over the coronary guidewire into the stented segment, and this is inflated at high pressure to ensure stent expansion. If the result is acceptable, the coronary guidewire is then withdrawn back into the guide. The catheter and sheath are removed, and hemostasis is achieved by appropriate means. Closure devices require device/suture deployment. If a vascular closure/suture device is placed, observation of the site is performed to ensure no immediate bleeding and manual pressure is required for a short time to achieve complete hemostasis. If a vascular closure device is not used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level after which manual compression is held for approximately 20 minutes to achieve hemostasis. A full report is dictated or entered into the record.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	3%	14%	30%	53%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	31%	46%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	28%	66%
Physical effort required	8%	42%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	19%	78%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	9%	33%	58%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	9%	91%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	29%	71%
Physical effort required	0%	40%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	9%	91%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not

reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery,

reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly

proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**

C	Observe (wait anesthesia care)	0	10	15	0	Standard
C	Dress and scrub for procedure	5	5	5	5	Standard

92941: Any PCI of Myocardial Infarction

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92941 will be used to report percutaneous transluminal coronary intervention of an acute occlusion during acute myocardial infarction, using any combination of angioplasty, atherectomy, and/or stent in a single major coronary artery and/or its branches or single bypass graft and/or its subtended branches. This is a race to save as much myocardial tissue as possible during AMI minimizing door-to-balloon time. The panel reviewed the preservice time and selected package 2 with the *some* of the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93583, percutaneous transcatheter septal reduction therapy. While procedurally similar, 93583 is a longer, less intense service. 83% of key reference respondents found surveyed code 92941 to be more or much more intense/complex than 93583.

The societies **recommend a wRVU of 12.72 with times of 30/65/28.** The pre-service time of 30 was adjusted upward from Package 2 to reflect the some, but not all, of the enhanced steps described above: 2 additional minutes for complicated consent of this emergent case, 1 additional minute for complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 65 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

This value is below the longer KRS yet higher than the current value. The change accounts for the increased intensity of working in the coronary arteries(which are always in motion and where rupture can cause immediate death), as well as the increased intensity radial artery access as opposed to the prior typical technique using femoral artery access.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☒ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152. Since these patients are seen emergently and are unknown to the operator who is focused on door to balloon time, separately reportable diagnostic catheterization codes are typically reported and reduced by multiple procedure payment reduction policy.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92941

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 92289
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 45406 Percentage 49.19 %

Specialty Cardiology Frequency 42914 Percentage 46.49 %

Specialty Internal Medicine Frequency 2861 Percentage 3.10 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30,763 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2022 RUC Database data. Recent trends show gradual decline, but we do not know if that will continue.

Specialty Interventional Cardiology Frequency 15135 Percentage 49.19 %

Specialty Cardiology Frequency 14305 Percentage 46.50 %

Specialty Internal Medicine Frequency 954 Percentage 3.10 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92941

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92943 Tracking Number D8 Original Specialty Recommended RVU: **13.69**
Presented Recommended RVU: **13.69**
Global Period: 000 Current Work RVU: **12.31** RUC Recommended RVU: **13.69**

CPT Descriptor: Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; antegrade approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old female presents with six months of exertional angina despite guideline directed medical therapy. Coronary angiography shows 100% left circumflex coronary stenosis. The lesion is on a bend in the circumflex coronary artery with focal calcification at the site and has antegrade bridging collaterals to the distal vessel, consistent with a chronic total occlusion. The patient is referred for percutaneous coronary intervention.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 99% , In the ASC 1%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 17% , Overnight stay-less than 24 hours 64% , Overnight stay-more than 24 hours 19%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained in two peripheral arteries, typically through the femoral arteries and/or radial artery. Angiography of the access site(s) is performed as needed to assess anatomy of the access vessel(s) and appropriate location of the access site(s). Sheaths are placed and flushed. Intraarterial vasodilators are administered as needed. An appropriate guiding catheter is advanced retrograde to the ascending aorta. The guidewire is removed and the catheter is attached to the pressure manifold and aspirated and pressure measured. The catheter is placed in the left or right coronary ostium. Using this same technique, a second catheter is placed in the other coronary ostium. Appropriate antiplatelet therapy pretreatment is confirmed and anticoagulation is administered. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Intracoronary vasodilators are administered. Multiple coronary injections are performed simultaneously through both guide catheters to determine anatomy of the target lesion and collaterals. A coronary guidewire is then manipulated through the guide catheter in the target artery and down the coronary artery and used to attempt to cross the target lesion or lesions. Typically, the operator uses additional multiple guidewires progressing to increasingly stiff guidewires to puncture through the chronic total occlusion, or more lubricious (hydrophilic) or tapered tip guidewires are used to engage and cross a microchannel. Multiple other techniques may be employed as needed (dual

guidewire, dissection f the arterial wall using microcatheters, re-entry into the true lumen using a specialized balloon catheter). Guidewire position across the lesion is confirmed angiographically by injections through the guide catheter in the artery providing collaterals to the occluded artery. An appropriate-sized balloon is selected and advanced to the lesion. Often, no balloon will cross and guide extension catheters or special microcatheters may be employed to corkscrew through the total occlusion. Plaque modification (atherectomy) may be needed to ablate calcium at the total occlusion site. If balloon crossing is eventually achieved, the angioplasty balloon is inflated then pulled back. Intracoronary vasodilators are administered. Angiography is performed in multiple views. Repeat balloon inflations are performed as needed to allow a stent to pass. An appropriately sized stent is passed across the lesion and deployed at high pressure. If the stent fails to cover the entire diseased segment, additional stent(s) are then placed repeating the steps above. A high-pressure, non-compliant balloon is advanced over the coronary guidewire into the stented segment, inflated at high pressure to ensure stent expansion, and pulled back. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are administered. Angiography is performed in multiple views. The artery used for the retrograde technique is carefully imaged to rule out trauma or thrombus. Final angiogram of the target artery and lesion are taken. If the result is acceptable, the guidewire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Both catheters and sheaths are removed, and hemostasis at both access sites is achieved by appropriate techniques. If a vascular closure device cannot be used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024					
Presenter(s):	Dr. Richard Wright, Dr. Ed Tuohy, Dr. Afnan Tariq, Dr. Mark Hoyer

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	17%	19%	58%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	14%	80%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	17%	83%
Physical effort required	6%	20%	74%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	19%	81%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	10%	29%	61%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	23%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	13%	87%
Physical effort required	7%	20%	73%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	10%	90%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes.
RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**

C	Dress and scrub for procedure	5	5	5	5	Standard

92943: Any PCI of CTO, Antegrade

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92943 percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft with any combination of intracoronary stent, atherectomy and angioplasty; antegrade approach. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93653, comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry. The KRS compares reasonably well with the survey times and RVUs here, though 93653 is performed under general anesthesia and represents intracardiac work rather than intracoronary work.

To appropriately reflect the notable increase in time and wRVU found in this survey the societies **recommend a wRVU of 13.69 with times of 43/120/28.** The pre-service time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 120 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

CTO treatment has evolved since this code was first valued. CTO PCI has now become a dedicated sub-specialty of interventional cardiology, with operators who specialize in CTO PCI and spend more time and try more techniques to reach success, compared to 10 years ago when less experienced operators would often abort procedures when initial attempts failed. Additional catheter tools have been developed in the intervening decade. CTO operators spend more time and deploy more catheters to treat these lesions. The increased time and RVUs estimated from the survey are consistent with the experience of the expert panel.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92943

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Caridology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 16814
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 25% of the services reported as 92943 will be reported as 92945 when the code is implemented. This estimate is 75% of the 2022 traditional Medicare volume of 92943 as reported in the RUC database multiplied by three to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 9096 Percentage 54.09 %

Specialty Cardiology Frequency 7180 Percentage 42.70 %

Specialty Internal Medicine Frequency 370 Percentage 2.20 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,605
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 75% of the services reported as 92943 will continue to be reported as such when the 92945 code is implemented. This estimate is 75% of the 2022 utilization of 92943 per the RUC database.

Specialty Interventional Cardiology Frequency 3032 Percentage 54.09 %

Specialty Cardiology Frequency 2393 Percentage 42.69 %

Specialty Internal Medicine Frequency 123 Percentage 2.19 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92943

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92945 Tracking Number D9 Original Specialty Recommended RVU: **15.00**
Presented Recommended RVU: **15.00**
Global Period: 000 Current Work RVU: **N/A** RUC Recommended RVU: **15.00**

CPT Descriptor: Percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft any combination of intracoronary stent, atherectomy and angioplasty; combined antegrade and retrograde approaches

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old man is referred for treatment of chronic (greater than 3 months) totally occluded right coronary artery. Antegrade coronary intervention is unsuccessfully attempted using antegrade wire escalation and antegrade dissection re-entry techniques. Retrograde coronary intervention is undertaken via septals from the left anterior descending artery.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 12% , Overnight stay-less than 24 hours 64% , Overnight stay-more than 24 hours 24%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The patient's history, records, laboratory, and diagnostic tests are reviewed. A physical examination is conducted. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed (i.e., the “Heart Team approach”). The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, and attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment to retain the data from the upcoming study.

Description of Intra-Service Work: Percutaneous arterial access is obtained in two peripheral arteries, typically through the femoral arteries and/or radial artery. Angiography of the access site(s) is performed as needed to assess anatomy of the access vessel(s) and appropriate location of the access site(s). Sheaths are placed and flushed. Intraarterial vasodilators are administered as needed. An appropriate guiding catheter is advanced retrograde to the ascending aorta. The guidewire is removed and the catheter is attached to the pressure manifold and aspirated and pressure measured. The catheter is placed in the left or right coronary ostium. Using this same technique, a second catheter is placed in the other coronary ostium. Appropriate antiplatelet therapy pretreatment is confirmed and anticoagulation is administered. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an activated clotting time (ACT). Additional anticoagulation is administered as needed. Intracoronary vasodilators are administered. Multiple coronary injections are performed simultaneously through both guide catheters to determine anatomy of the target lesion and collaterals. Antegrade technique: A coronary guidewire is then manipulated down the target coronary artery to attempt to cross the target lesion. A micro-catheter is passed over the guidewire to the lesion to provide extra support to the guidewire. Typically, the operator uses additional multiple guidewires progressing to increasingly stiff guidewires to puncture through the chronic total occlusion, and/or more lubricious (hydrophilic) or tapered tip guidewires to cross a microchannel. Multiple other

techniques may be employed (dual guidewire, dissection using microcatheters). Retrograde technique: If extensive efforts to cross the lesion antegradely are unsuccessful, a retrograde approach is attempted. A guide wire in a micro-catheter is passed into the coronary artery (often the left anterior descending artery) that provides collaterals to the target artery. Various specialized guidewires are advanced into different collateral micro-vessels until one is found that connects with the target artery distal to the target lesion. The wire is passed retrogradely in the target artery to the target lesion and the micro-catheter is advanced over the guidewire to the target lesion. Typically the guidewire is passed into a dissection plane in the target arterial wall to get past the target lesion. At this point an angioplasty balloon is passed over the guidewire in the proximal target artery to the target lesion and inflated to purposefully create a dissection in the wall of the proximal target artery. The antegrade guidewire is advanced antegradely in the dissection plane of the arterial wall and the retrograde wire is advanced retrogradely in the dissection plane of the arterial wall until both connect, allowing the retrograde wire to pass along the dissection plane proximal to the lesion and thence into the true lumen and into the mouth of the target artery guide catheter. The micro-catheter is advanced into the target artery guide catheter. The guidewire is then advanced retrogradely through the target artery guide catheter to the outside of the body (ie, “externalization”). This guidewire is then used to perform balloon angioplasty and stenting of the culprit lesion(s) using standard techniques. After an adequate result is obtained, the microcatheter is again passed into the target artery guide catheter and through it the retrograde guidewire is withdrawn through the retrograde artery catheter, followed by the microcatheter. The artery used for the retrograde technique is carefully imaged to rule out trauma or thrombus. Final angiogram of the target artery and lesion are taken. If the result is acceptable, the guidewire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Both catheters and sheaths are removed, and hemostasis at both access sites is achieved by appropriate techniques. If a vascular closure device cannot used for femoral access, the sheath is sutured in place for subsequent removal once the ACT level falls to a safe level for manual compression.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, the patient's family, and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and the patient's family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2024

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	2%	18%	23%	57%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	28%	68%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	26%	72%
Physical effort required	5%	36%	59%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	22%	78%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	22%	11%	67%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	28%	72%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	6%	88%
Physical effort required	0%	22%	78%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	11%	89%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes.
RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

92945: Any PCI of CTO, Antegrade + Retrograde

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92943 percutaneous transluminal revascularization of chronic total occlusion, single coronary artery, coronary artery branch, or coronary artery bypass graft, and/or subtended major coronary artery branches of the bypass graft with any combination of intracoronary stent, atherectomy and angioplasty; combined antegrade and retrograde approaches. The panel reviewed the preservice time and selected package 2 with the modifications described above for a straightforward procedure on a difficult patient without anesthesia in a facility.

The key reference service is 93591, percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve. 93591 is a longer, slightly more intense service based on its time and wRVU versus the survey 25th percentile wRVU and median time. Interestingly, 80% of key reference respondents stated that 92945 was more or much more intense/complex than 93591.

To reflect the slightly greater intra-service time over 92943 and the increased complexity of deploying both antegrade and retrograde therapies, the societies **recommend a wRVU of 15.00 with times of 43/130/28.** The pre-service time of 43 was adjusted upward from Package 2 to reflect the enhanced steps described above: 7 additional minutes for complicated consent, 4 additional minutes to setup room similar to a procedure that utilizes anesthesia, 5 additional minutes for double and complex draping and ultrasound for vessel viability, and 2 additional minutes for complex positioning of the arm and heart imaging. The intra-service time of 130 minutes is the survey median. Post-service time is the standard 8B package for a complex procedure under sedation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The interventional cardiologisty typically also manages moderate sedation, 99152.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92943

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 5605
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 25% of the services currently reported as 92943 will be reported as 92945 when the code is implemented. This estimate is 25% of the 2022 traditional Medicare volume of 92943 as reported in the RUC database multiplied by three to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 3032 Percentage 54.09 %

Specialty Cardiology Frequency 2393 Percentage 42.69 %

Specialty Internal Medicine Frequency 123 Percentage 2.19 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,868
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on CathPCI Registry data we anticipate that 25% of the services reported as 92943 will be reported as 92945 when the code is implemented. This estimate is 25% of the 2022 utilization of 92943 per the RUC database.

Specialty Interventional Cardiology Frequency 1011 Percentage 54.12 %

Specialty Cardiology Frequency 798 Percentage 42.71 %

Specialty Internal Medicine Frequency 41 Percentage 2.19 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Coronary angioplasty (PTCA)

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92943

Global Period: ZZZ Current Work RVU: **3.28** RUC Recommended RVU: **1.75**

CPT Descriptor: Percutaneous transluminal coronary thrombectomy aspiration mechanical (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male, eight years after coronary artery bypass grafting (CABG), now presents with unstable angina and recent non-Q wave myocardial infarction (MI). Coronary angiography demonstrates a high-grade stenosis in the saphenous vein graft (SVG) to the right coronary artery (RCA) with a large filling defect consistent with fresh thrombus. A coronary mechanical aspiration thrombectomy is performed. [Note: This is an add-on service. Only consider the additional physician work related to percutaneous transluminal coronary mechanical thrombectomy.]

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: After defining the relevant anatomy by coronary angiography, introduce a guiding catheter (reported separately) to the ostium of the vessel to be treated. Through the guiding catheter, use a guidewire to cross the lesion and thrombus (reported separately) and advance the mechanical thrombus aspiration catheter over the guidewire to the thrombotic lesion. Position the catheter appropriately and activate the catheter. Pass the catheter through the thrombus one or more times. Deactivate the catheter, withdraw it, and assess the results by coronary angiography. Treat the remaining lesion as appropriate, usually with additional balloon angioplasty or stent placement (reported separately).

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	2%	0%	31%	37%	30%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	49%	49%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	42%	52%

Physical effort required	6%	51%	43%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	35%	63%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	41%	45%	7%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	48%	45%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	59%	37%
Physical effort required	7%	63%	30%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	39%	54%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code

family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended

values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	5	5	6	+5 Left and right radial pulses are evaluated to determine which are available for access (eg not harvested for prior CABG) and which of the two offers better access. Evaluate whether femoral artery is available for access and determine if left, right, or both femoral access sites should be prepped. Time out is performed.
A	Prepare/ review/ confirm procedure	1	1	1	1	Standard
B	Perform/ supervise patient positioning	1	3	3	3	+2 Utilize time similar to procedures with anesthesia to position patient comfortably on the table with arm in uncomfortable position, usually on a special pad. Arm used for radial access must be positioned and supinated with ventral surface oriented up and secured with tape to keep it there for entire procedure. Ultra-sound probe is inserted into sterile sleeve; console is programmed and turned on. Anti-spasm cocktail is prepared for intra-arterial injection.
C	Administer local/topical anesthesia	1	0	0	1	Standard
C	Observe (wait anesthesia care)	0	10	15	0	Standard

C	Dress and scrub for procedure	5	5	5	5	Standard

92973: Thrombectomy add-on

This code for mechanical transluminal coronary thrombectomy was reviewed as part of the family of PCI codes. It was not reviewed in 2012 when the rest of the PCI codes were created and last reviewed. This low-volume service was last reviewed when it was added to CPT in 2001.

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 37186, noncoronary transluminal thrombectomy. 67% of respondents found surveyed code 92973 to be of somewhat more or much more intense/complex, while 31% felt it to be identical. The second key reference service is 92974, transcatheter placement of a radiation delivery device for subsequent coronary intravascular brachytherapy.

To account for the significant reduction in time for this code while still maintaining a work intensity above the KRS **we recommend a crosswalk to 36483 for subsequent endovenous ablation of an incompetent vein with a wRVU of 1.75 and 20 minutes intra-service and total time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92973

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 6627
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 3254 Percentage 49.10 %

Specialty Cardiology Frequency 3062 Percentage 46.20 %

Specialty Internal Medicine Frequency 205 Percentage 3.09 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,209
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database for 2022 data. Recent trends show this service being stable between 2,000-2,500.

Specialty Interventional Cardiology Frequency 1085 Percentage 49.11 %

Specialty Cardioloyg Frequency 1021 Percentage 46.22 %

Specialty Internal Medicine Frequency 68 Percentage 3.07 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Thromboendarterectomy

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92973

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:93571 Tracking Number D12 Original Specialty Recommended RVU: **1.80**
Presented Recommended RVU: **1.80**
Global Period: ZZZ Current Work RVU: **1.38** RUC Recommended RVU: **1.80**

CPT Descriptor: Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; initial vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 55-year-old female presents with a three-week history of progressive chest discomfort at rest and with mild exertion. Cardiac catheterization demonstrates a 60% stenosis in the mid left anterior descending artery. To determine the hemodynamic significance of the lesion, intracoronary fractional flow reserve (FFR) measurement testing is performed. [Note: This is an add-on service. Only consider the additional physician work related to intra-coronary FFR testing for the initial vessel.]

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Exchange diagnostic catheter for a guide catheter and selectively cannulate the coronary artery. Prepare the physiologic testing wire by flushing on the table,
calibrating the pressure sensor outside of the body. Pass the wire through the guide catheter and into the coronary artery. Normalize (equalize) the pressure tracings from the guide catheter and the pressure sensor on the wire, readjusting the guide catheter as needed to provide undamped pressures. Pass the wire across the target lesion(s) until the pressure sensor on the wire is well beyond the lesion(s). Measure the wave free ratio first at rest. If physiologic stress will be performed, reconstitute the appropriate pharmacologic agent and inject it intra-coronary or infuse it intravenously and record pressures from the wire and guide catheter. If tracings contain artifacts, if tracings are disrupted by asystole or complete heart block caused by the drug, or if measurements are of borderline clinical significance, obtain repeat measurements by pulling the wire back proximal to the lesion, re-normalizing, passing it distal to the lesion, and re-measuring pressures. If serial lesions are being assessed, measure pressures distal to the most distal lesion, pull the wire back across the most distal lesion, repeat pressure measurements, then pull the wire proximal to all lesions and check measurements to assess for electronic drift. If electronic drift has occurred, re-normalize the pressure tracings and repeat the above process. When measurements are complete, remove the wire from the guide catheter. Perform coronary arteriography in appropriate views to be sure that the wire has not damaged the coronary artery. If coronary intervention is not undertaken, remove the guide catheter.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	13%	41%	24%	22%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	15%	48%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	48%	42%
Physical effort required	7%	68%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	45%	45%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	15%	46%	23%	15%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	28%	36%	36%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	21%	50%	29%
Physical effort required	25%	55%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	26%	42%	32%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not

reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery,

reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly

proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**

93571: Fractional flow reserve measurement add-on

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 37252, intravascular ultrasound, initial vessel. 46% of respondents found surveyed code 93571 to be of somewhat more or much more intense/complex, while 41% felt it to be identical.

While the time for this code greatly increased in the survey over the current time, the intensity of the code even when applying the 25th percentile survey wRVU seemed too high versus its KRS. As such, our panel felt the KRS itself would serve as an ideal crosswalk. We note that the increase in recommended RVU is almost directly in proportion to the increase in survey time. **We recommend a wRVU of 1.80 for 93571 with 20 minutes intra-service and total time via crosswalk to the survey KRS 37252.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93571

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 186234

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 98332 Percentage 52.80 %

Specialty Cardiology Frequency 80826 Percentage 43.40 %

Specialty Internal Medicine Frequency 4842 Percentage 2.59 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 62,078 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC Database for 2022 data. In recent years this service declined somewhat from a pre-pandemic high. Utilization could tick up in coming years as this service remains a Class I recommendation.

Specialty Interventional Cardiology Frequency 32777 Percentage 52.79 %

Specialty Cardiology Frequency 26942 Percentage 43.40 %

Specialty Internal Medicine Frequency 1614 Percentage 2.59 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93571

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93572 Tracking Number D13 Original Specialty Recommended RVU: **1.44**
Presented Recommended RVU: **1.44**
Global Period: ZZZ Current Work RVU: **1.00** RUC Recommended RVU: **1.44**

CPT Descriptor: Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress; each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female presents with a 3-week history of progressive chest discomfort at rest and with mild exertion. Cardiac catheterization demonstrates a 60% stenosis in two coronary arteries. After intra-coronary fractional flow reserve measurement (FFR) testing is performed to evaluate the first lesion (coded separately), FFR testing is performed to evaluate the second artery lesion. [Note: This is an add-on service. Only consider the additional physician work related to intracoronary FFR testing for one additional vessel.]

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: After analysis of lesions in the first artery is complete, wipe the wire and prepare it for re-insertion. Typically a different guide catheter is passed to the ascending aorta and positioned in the ostium of the other coronary artery. The wire is passed through the guide catheter and into the coronary artery. Normalize (equalize) the pressure tracings from the guide catheter and the pressure sensor on the wire, readjusting the guide catheter as needed to provide undamped pressures. Pass the wire across the target lesion(s) until the pressure sensor on the wire is well beyond the lesion(s). Measure the wave free ratio first at rest. If physiologic stress will be performed, reconstitute the appropriate pharmacologic agent and inject it intra-coronary or infuse it intravenously and record pressures from the wire and guide catheter. If tracings contain artifacts, if tracings are disrupted by asystole or complete heart block caused by the drug, or if measurements are of borderline clinical significance, obtain repeat measurements by pulling the wire back proximal to the lesion, re-normalizing, passing it distal to the lesion, and re-measuring pressures. If serial lesions are being assessed, measure pressures distal to the most distal lesion, pull the wire back across the most distal lesion, repeat pressure measurements, then pull the wire proximal to all lesions and check measurements to assess for electronic drift. If electronic drift has occurred, re-normalize the pressure tracings and repeat the above process. When measurements are complete, remove the wire from the guide catheter. Perform coronary arteriography in appropriate views to be sure that the wire has not damaged the coronary artery. If coronary intervention is not undertaken, remove the guide catheter.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	44%	29%	21%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	4%	53%	43%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	38%	56%
Physical effort required	8%	56%	36%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	44%	50%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	16%	50%	18%	16%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	50%	29%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	57%	29%
Physical effort required	9%	70%	21%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	57%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The full family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not

reviewed in the prior 5 years as potentially misvalued. The codes were surveyed for the January 2023 RUC meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer. The societies had planned to make other revisions to the code family at the following CPT cycle. At the January 2023 RUC meeting the societies proposed that only the new IVL code be valued, and the remainder of the code set be sent to CPT for revision before review. The RUC approved this proposal and, after several code change applications, the revised family was approved at the February 2024 CPT Panel meeting.

The CPT updates included code deletions, revisions, and additions.

- The original code set included additional branch add-on codes for several of the procedures. CMS assigned the branch codes a value of 0 RVUs, rolling a prorated portion of their value into their base codes (more on this later). Due to this lack of RVUs neither CMS nor commercial payers reimbursed these codes from 2013 to present and they were deleted by CPT in February 2024. The deleted codes included 92921, 92925, 92929, 92934, 92938, and 92944.
- CPT amended the base codes to each of these deleted add-on codes (92920, 92924, 92928, 92933, 92937, 92941, and 92943) to include the work, when performed, of potential branch vessels which was not included in the original code definitions and descriptions of work. This essentially matches the code descriptors to CMS's approach to not pay separately for additional branch work.
- Also, in February 2024 CPT created two new codes within the family. First, 92930, was created to allow coding for the work involved in placement of intracoronary stent(s) (currently coded as 92928) that exceeds the typical stenting case. The second new code, 92945, was created to allow coding for revascularization of a chronic total occlusion when both antegrade and retrograde approaches are employed.
- Finally, CPT revised codes 93571 and 93572 to make a correction to the fractional flow reserve (FFR) codes to correct a coding issue relating to instant flow reserve (iFR).

92972 Intravascular Lithotripsy (IVL)

As noted above, the IVL code was surveyed, reviewed by the RUC and issued a value at the January 2023 RUC meeting. The IVL code survey was robust, with 139 respondents. There have been no significant technological or other changes to the IVL procedure since its initial valuation. With the recent survey of this code and in an effort to maximize survey response by keeping it a bit shorter, we did not include the code in this survey and recommend affirmation of current value and time.

Current RVUs and Times

As referenced above, CMS does not recognize the add-on branch codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, moderate sedation was unbundled, removing commensurate work and time. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for branch code bundling, the adjustments for unbundling of moderate sedation, and finally the current values.

Background: PCI Evolution & Compelling Evidence

Change in Technique

The recommendations for this tab produce an increase in RVUs of less than one half of a percent aggregated across the family of codes. Accordingly, we submit that these services have undergone changes in technique and patient population that substantiate compelling evidence to allow an increase in the aggregate value of the code family. At the time of the 2012 survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery. PCI is now typically performed through the radial artery,

reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Radial access is safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as decreased mortality for some patient subsets. https://pubmed.ncbi.nlm.nih.gov/33507598/.

Radial access requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator in several respects.

(1) The average radial artery is about 2 mm compared to femoral arteries that average about 9 mm, so entering the artery with a needle is more difficult.
(2) The radial and brachial arteries are smaller and more prone to spasm making catheter advancement or torquing difficult or impossible; many operators give an anti-vasospastic cocktail routinely which takes additional time.
(3) Whereas femoral access requires catheters to traverse one 180-degree bend to reach the heart, radial access requires the catheter to make one-180 degree bend and usually two more 90-degree bends to reach the heart, which makes catheter advancement and torquing more difficult.
(4) Radial access provides more frequent challenging anatomic variants such as radial loop, accessory radial arteries, early take-off radial arteries, and aberrant innominate arteries (arteria lusoria); in contrast anatomy from the femoral artery to the heart has few variants. These problems lead to conversion from radial to femoral access in about 10% of cases, while conversion from femoral to radial is almost non-existent.

Positioning for radial increases the risk of radiation and precautions. More time is spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

Change in Patient Population

We also see patients undergoing PCI who generally have more comorbidities than a decade ago. Attention to stricter adherence on statins and other medicines in revascularization and chest pain guidelines has eliminated many patients who otherwise may have been treated with lower acuity PCI, something we see in the declining utilization of these services. Remaining patients are more complex than they were a dozen years ago.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Incorrect Assumptions

Finally, with the current times and valuation consisting of a mix of RUC recommendations, pro-rated bundling of time and work of PCI in branches by CMS, and reductions of work and time by CMS to apply coding changes related to unbundling moderate sedation, we submit that the current values were derived using a flawed mechanism. CMS bundled the now-deleted branch codes using a type of prorated building block methodology that casts the current values in doubt and provides compelling evidence that the best values for these services should be derived from the robust survey before us.

Recommendations Methodology

We have laid out a rationale above for the intensity/complexity of these codes rising while in some cases the performance time may have decreased. We recommend the survey 25th percentile for all the 000 codes in this family. We chose the survey 25th percentile work RVUs because this approach generally kept the recommended values in line with the trajectory of the reduction or addition of intra-service and total time for the codes while maintaining rank order. While changes to the work RVUs and times are not recommended in exactly

proportional amounts, they do maintain relativity in the magnitude to which they change to the positive or the negative. That is to say, where there is a significant reduction in intra-service time there is a more modest reduction in recommended work RVU and the same is true in the positive direction. Where there is a significant increase in intra-service time there is a more modest recommended increase in work RVU for those codes. RVU.

In developing recommendations for the family, we observed that recommendations for times and values generate WPUT (ie, intensity) values that maintain rank order relationships within the family and align with operators' estimates of work intensity. For instance, 92920 for PTCA has a lower WPUT than 92924 for PTCA with atherectomy, reflecting the higher complication rates of atherectomy and operators' perception that atherectomy is more intense. WPUT for 92941 (PCI of an acute myocardial infarction) has the highest WPUT consistent with operators' perceptions that this is the most intense interventional service. CTO codes 92943 and 92945 have lower WPUTs because they are longer services with multiple catheter changes and techniques being attempted. This consistency of WPUT with current rank order and with operators' perceptions of intensity support the recommendations at the 25th-percentile survey values.

This approach produces the following recommendations for the family that would produce budget increase of 12,342 RVUs out of a baseline of over 3.2 million RVUs (0.38%)

Preservice Time

For each of the 000 codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care) that are supported by the survey. While these are 000 codes provided to patients with short or no hospital stay, there are certain elements of preservice time that are more akin to that of a service which utilizes general anesthesia.

		FACILITY			**PCI**	**Notes**
		2	**3**	**4**	**2+**	
	Total Pre-Service Time	**25**	**51**	**63**	**43**

C	Dress and scrub for procedure	5	5	5	5	Standard

93572: Additional fractional flow reserve measurement add-on

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 37252, intravascular ultrasound, initial vessel. 50% of respondents found surveyed code 93572 to be of somewhat more or much more intense/complex, while 44% felt it to be identical. The second key reference code was 37253, intravascular ultrasound, each additional vessel. 34% of respondents found the 2nd KRS to be somewhat more or much more intense/complex than the survey code 93572 while 50% found it to be identical.

While the time for this code notably increased in the survey over the current, the intensity of the code, even when applying the 25th percentile survey wRVU, seemed too high versus its KRS and 2nd KRS. In order to address the increase in time, keep the intensity at an appropriate level and maintain rank order in relation to the 93571 code we recommend a crosswalk to the 2nd KRS code 37253. **We recommend a wRVU of 1.44 for 93571 with 16 minutes intra-service and total time via crosswalk to the survey 2nd KRS 37253.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93572

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Internal Medicine How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 35634
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is three times the 2022 Medicare data for usage to account for Medicare Advantage and commerical insurance covered performance.

Specialty Interventional Cardiology Frequency 19706 Percentage 55.30 %

Specialty Cardiology Frequency 14503 Percentage 40.69 %

Specialty Internal Medicine Frequency 891 Percentage 2.50 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,878 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC Database for 2022 data. In recent years this service declined somewhat from a pre-pandemic high. Utilization could tick up in coming years as this service remains a Class I recommendation.

Specialty Interventional Cardiology Frequency 6569 Percentage 55.30 %

Specialty Cardiology Frequency 4834 Percentage 40.69 %

Specialty Internal Medicine Frequency 297 Percentage 2.50 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93572

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/RVS Update PE Subcommittee
American Medical Association
330 N. Wabash Avenue
Chicago, IL 60611

Re: Tab 6 Coronary Therapeutic Services and Procedures

Dear Dr. Manaker:

Tab 6 on the April 2024 RUC agenda addresses 13 codes for percutaneous coronary interventions (PCIs). This family of codes was referred to the CPT Editorial Panel for modification after a new code for coronary intravascular lithotripsy (IVL), code 92972, was valued at the January 2023 RUC meeting.

All of the codes in this tab are exclusively performed in the facility setting with either a 000 or ZZZ global period. As such, the Society for Cardiovascular Angiography and Interventions and the American College of Cardiology recommend no direct practice expense inputs for these codes in Tab 6.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact Matt Minnella at mminnella@acc.org if you have any questions.

Sincerely,

Afnan Tariq, MD
SCAI RUC Advisor

Richard Wright, MD
ACC RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2023

Percutaneous Coronary Interventions – Tab 12

Referral to the CPT Editorial Panel
In October 2010, CPT code 92980 *Transcatheter placement of an intracoronary stent(s), percutaneous, with or without other therapeutic intervention, any method; single vessel* was identified by the Relativity Assessment Workgroup (RAW) via the MPC List screen. The RAW requested that the specialty societies survey this code for RUC review. Subsequently, the specialty society referred the code to the CPT Editorial Panel to revise the family of procedures to more accurately describe the current physician work involved in PCI. At the October 2011 CPT meeting, the Panel approved 13 new codes to describe PCI services. The societies surveyed the family and the RUC submitted recommendations to the Centers for Medicare & Medicaid Services (CMS) in January 2012. Instead of accepting the RUC recommendations, CMS opted to assign bundled status to all the add-on codes for the additional branches off the major coronary arteries (codes 92921, 92929, 92934, 92938, 92944). In addition, CMS increased values and intra-times of all the base codes using a mathematical formula to include a fraction of the time and value of the add-on codes, based on the billed together data available at the time. For example, using 2011 Medicare claims data, CMS anticipated that the service described by add-on code 92921 would be performed with the procedure described by base code 92920 27.4% of the time. To bundle the work value of the add-on code into base code 92920, CMS multiplied the RUC recommendation for the add-on code of 4.00 by 27.4% (or 1.10) and added that fractional value to the RUC recommendation for the base code (9.00+1.10=10.10). The value of moderate sedation, which was bundled into the base codes, was systematically removed when separate moderate sedation CPT codes were created for CPT 2017.

In September 2022, the CPT Editorial Panel created one new Category I CPT code for percutaneous coronary lithotripsy. Sixteen other percutaneous coronary intervention (PCI) codes were considered part of the code family.

For the January 2023 RUC meeting, the specialty societies opted to survey nine of the sixteen codes. The specialty societies opted to not survey the add-on codes in the family that describe intervention in additional branches off major coronary arteries. CMS and payers have never recognized these add-on codes as separately payable services, therefore they have no Medicare utilization. The specialty societies noted they did not want to confuse respondents by asking them to survey codes with which they are not familiar or to lengthen the survey for services that are not separately reportable. As part of the societies' plans for future updates to this family of codes, the societies noted their intention is to delete add-on codes for PCI in additional branches.

After reviewing the survey results in preparation for the January 2023 RUC meeting, the surveying specialty societies requested, and the RUC agreed, to submit a recommendation only for the new add-on code 92972 for CPT 2024 and referred the entire percutaneous coronary intervention code family to the CPT Editorial Panel for restructuring for the CPT 2025 cycle.

The specialty societies noted that their intent is to update the CPT code structure for PCI services to incorporate the bundling of the branch services and to account for modern technology and changes in the techniques used to provide these services.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialties also explained that PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. Research has shown the radial approach to be safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in the risk of patient bleeding. At the time of the prior survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery; PCI via the radial artery was just emerging in this country.

The RUC recommends that existing CPT codes 92920, 92921, 92924, 92925, 92928, 92929, 92933, 92934, 92937, 92938, 92941, 92943, 92944, 92973, 92975, 92977 and new add-on code 92972 be referred to the CPT Editorial Panel for revision in the 2025 CPT cycle. It is the expectation of the RUC that the specialties will submit their code change application for the September 2023 CPT meeting and survey new and/or revised codes within the 2025 CPT cycle.

92972 ***Percutaneous transluminal coronary lithotripsy (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 139 interventional cardiologists and noted that the survey respondents overestimated the typical physician work required to perform this add-on code. Therefore, the RUC recommended a direct work RVU crosswalk to CPT Code 37249 *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; each additional vein (List separately in addition to code for primary procedure)* (work RVU= 2.97, intra-service and total time of 30 minutes) and noted that both services typically involve the same amount of intra-service and total time and similar physician work intensity.

Code 92972 is a new Category I code to report intravascular lithotripsy (IVL) as an add-on to other PCI services. IVL is a new revascularization treatment option, in which pulsating sonic pressure waves pass through soft tissue and selectively interact strongly with high-density calcium, producing significant shear stresses that have the ability to fracture the calcium. Arterial calcification is associated with increased cardiovascular risks. Intimal arterial calcification (IAC), considered a representation of underlying atherosclerotic plaque burden, has long been held responsible for this association, whereas increasing interest is directed towards medial arterial calcification (MAC). IVL is designed to modify both intimal and medial calcium across a wide range of vascular applications to increase vessel compliance, restore vessel mobility and provide new versatile treatment options for patients. Coronary IVL received pre-market approval on February 12, 2021 from the FDA for lithotripsy-enabled, low-pressure balloon dilatation of severely calcified, stenotic de novo coronary arteries prior to stenting.

The RUC compared the surveyed code to reference CPT code 67335 *Placement of adjustable suture(s) during strabismus surgery, including postoperative adjustment(s) of suture(s) (List separately in addition to code for specific strabismus surgery)* (work RVU= 3.23, intra-service and total time of 30 minutes) and CPT code 32668 *Thoracoscopy, surgical; with diagnostic wedge resection followed by anatomic lung resection (List separately in addition to code for primary procedure)* (work RVU= 3.00, intra-service and total time of 30 minutes) and noted that all three services typically involve an identical amount of time and similar physician work intensities to perform. The RUC concluded that CPT code 92972 should be valued based on a direct work RVU crosswalk to CPT code 37249 and agreed the crosswalk value below the survey 25th percentile was appropriate. **The RUC recommends a work RVU of 2.97 for CPT code 92972.**

Practice Expense
No direct practice expense inputs are recommended for CPT code 92972 as it is a facility-based add-on service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Cardiovascular
Therapeutic Services and Procedures
Coronary Therapeutic Services and Procedures

Codes 92920-92944, describe percutaneous revascularization services performed for occlusive disease of the coronary vessels (major coronary arteries, coronary artery branches, or coronary artery bypass grafts). These percutaneous coronary intervention (PCI) codes are built on progressive hierarchies with more intensive services inclusive of lesser intensive services. These PCI codes all include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, balloon, cutting balloon, wired balloons, cryoplasty), atherectomy (eg, directional, rotational, laser), and stenting (eg, balloon expandable, self-expanding, bare metal, drug eluting, covered). Each code in this family includes balloon angioplasty, when performed. Diagnostic coronary angiography may be reported separately under specific circumstances. Percutaneous transluminal coronary lithotripsy may be reported using ~~0715T~~ 92972 in conjunction with 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92975, as appropriate.

Diagnostic coronary angiography codes (93454-93461)and injection procedure codes (93563-93564) should notbe used with percutaneous coronary revascularizationservices (92920-92944) to report:

1. Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the coronaryintervention,
2. Vessel measurement for the coronary intervention, or
3. Post-coronary angioplasty/stent/atherectomyangiography, as this work is captured in thepercutaneous coronary revascularization services codes (92920-92944).

Diagnostic angiography performed at the time of a coronary interventional procedure may be separately reportable if:

1. No prior catheter-based coronary angiography study is available, and a full diagnostic study is performed, and a decision to intervene is based on the diagnostic angiography, or
2. A prior study is available, but as documented in the medical record:
    a. The patient's condition with respect to the clinical indication has changed since the prior study, or
    b. There is inadequate visualization of the anatomy and/or pathology, or
    c. There is a clinical change during the procedure that requires new evaluation outside the target area of intervention.

Diagnostic coronary angiography performed at a separate session from an interventional procedure is separately reportable.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Major coronary arteries: The major coronary arteries are the left main, left anterior descending, left circumflex, right, and ramus intermedius arteries. All PCI procedures performed in all segments (proximal, mid, distal) of a single major coronary artery through the native coronary circulation are reported with one code. When one segment of a major coronary artery is treated through the native circulation and treatment of another segment of the same artery requires access through a coronary artery bypass graft, the intervention through the bypass graft is reported separately.

Coronary artery branches: Up to two coronary artery branches of the left anterior descending (diagonals), left circumflex (marginals), and right (posterior descending, posterolaterals) coronary arteries are recognized. The left main and ramus intermedius coronary arteries do not have recognized branches for reporting purposes. All PCI(s) performed in any segment (proximal, mid, distal) of a coronary artery branch is reported with one code. PCI is reported for up to two branches of a major coronary artery. Additional PCI in a third branch of the same major coronary artery is not separately reportable.

Coronary artery bypass grafts: Each coronary artery bypass graft represents a coronary vessel. A sequential bypass graft with more than one distal anastomosis represents only one graft. A branching bypass graft (eg, Y graft) represents a coronary vessel for the main graft, and each branch off the main graft constitutes an additional coronary vessel. PCI performed on major coronary arteries or coronary artery branches by access through a bypass graft is reported using the bypass graft PCI codes. All bypass graft PCI codes include the use of coronary artery embolic protection devices when performed.

Only one base code from this family may be reported for revascularization of a major coronary artery and its recognized branches. Only one base code should be reported for revascularization of a coronary artery bypass graft, its subtended coronary artery, and recognized branches of the subtended coronary artery. If one segment of a major coronary artery and its recognized branches is treated through the native circulation, and treatment of another segment of the same vessel requires access through a coronary artery bypass graft, an additional base code is reported to describe the intervention performed through the bypass graft. The PCI base codes are 92920, 92924, 92928, 92933, 92937, 92941, and 92943. The PCI base code that includes the most intensive service provided for the target vessel should be reported. The hierarchy of these services is built on an intensity of service ranked from highest to lowest as 92943 = 92941 = 92933 > 92924 > 92937 = 92928 > 92920.

PCI performed during the same session in additional recognized branches of the target vessel should be reported using the applicable add-on code(s). The add-on codes are 92921, 92925, 92928, 92934, 92938, and 92944 and follow the same principle in regard to reporting the most intensive service provided. The intensity of service is ranked from highest to lowest as 92944 = 92938 > 92934 > 92925 > 92929 > 92921.

PCI performed during the same session in additional major coronary or in additional coronary artery bypass grafts should be reported using the applicable additional base code(s). PCI performed during the same session in additional coronary artery branches should be reported using the applicable additional add-on code(s).

If a single lesion extends from one target vessel (major coronary artery, coronary artery bypass graft, or coronary artery branch) into another target vessel, but can be revascularized with a single intervention bridging the two vessels, this PCI should be reported with a single code despite treating more than one vessel. For example, if a left main coronary lesion extends into the proximal left circumflex coronary artery and a single stent is placed to treat the entire lesion, this PCI should be reported as a single vessel stent (92928). In this example, a code for additional vessel treatment (92929) would not be additionally reported.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

When bifurcation lesions are treated, PCI is reported for both vessels treated. For example, when a bifurcation lesion involving the left anterior descending artery and the first diagonal artery is treated by stenting both vessels, 92928 and 92929 are both reported. Target vessel PCI for acute myocardial infarction is inclusive of all balloon angioplasty, atherectomy, stenting, manual aspiration thrombectomy, distal protection, and intracoronary rheolytic agent administration performed. Mechanical thrombectomy is reported separately. Chronic total occlusion of a coronary vessel is present when there is no antegrade flow through the true lumen, accompanied by suggestive angiographic and clinical criteria (eg, antegrade "bridging" collaterals present, calcification at the occlusion site, no current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion). Current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion, subtotal occlusion, and occlusion with dye staining at the site consistent with fresh thrombus are not considered chronic total occlusion. Codes 92973 (percutaneous transluminal coronary thrombectomy, mechanical), 92974 (coronary brachytherapy), 92978 and 92979 (intravascular ultrasound/optical coherence tomography), 93571 and 93572 (intravascular Doppler velocity and/or pressure [fractional flow reserve (FFR) or coronary flow reserve (CFR)]), and ~~0715T~~ 92972 (percutaneous transluminal coronary lithotripsy), are add-on codes for reporting procedures performed in addition to coronary and bypass graft diagnostic and interventional services, unless included in the base code. Non-mechanical, aspiration thrombectomy is not reported with 92973, and is included in the PCI code for acute myocardial infarction (92941), when performed. (To report transcatheter placement of radiation delivery device for coronary intravascular brachytherapy, use 92974) (For intravascular radioelement application, see 77770, 77771, 77772) (For nonsurgical septal reduction therapy [eg, alcohol ablation], use 93799)

SUMMARY OF RECOMMENDATION

CPT Code:92972 Tracking Number Q14 Original Specialty Recommended RVU: **3.90**
Presented Recommended RVU: **3.90**
Global Period: ZZZ Current Work RVU: **NA** RUC Recommended RVU: **2.97**

CPT Descriptor: Percutaneous transluminal coronary lithotripsy (list separately in addition to code for primary procedure) (use 9x070 in conjunction with 92920, 92924, 92928, 92933, 92937, 92941, 92943, 92975)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 62-year-old male with a history of left anterior descending coronary stent placement presents with exertional chest pain despite appropriate medical therapy. coronary angiography (coded separately) reveals severe in-stent restenosis, and imaging shows a circumferential calcified ring in the distal portion of the stent. he is sent to an angioplasty center and the lesion is treated with intravascular lithotripsy to allow appropriate stent expansion with balloon dilation.
[note: this is an add-on service. only consider the additional physician work related to percutaneous transluminal coronary lithotripsy.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Based on separately reportable diagnostic coronary angiography, the presence of severe coronary artery calcium (CAC) is observed. The appropriate diameter coronary IVL catheter is selected. The coronary IVL catheter is inserted over the standard guidewire and advanced to the target location using fluoroscopy and marker bands. Once the coronary IVL catheter is placed, the integrated balloon is inflated to 4-atm, or enough pressure to make contact with the vessel wall. The first lithotripsy cycle of pulses is then delivered. Once the cycle is complete, the integrated balloon is then inflated to its nominal pressure of 6-atm. The balloon is then deflated. The mid LAD segment is also treated with the 3.0 mm × 20 mm balloon inflated at 8 atmosphere for 50 seconds. Final angiogram shows good angiographic results in LAD with residual stenosis of 30%, no overt dissection and TIMI 3 flow. No special patient care is needed post-op.

Description of Post-Service Work:

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	17%	80%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Changes

The family of percutaneous coronary intervention (PCI) codes was last reviewed by the RUC at the January 2012 meeting, when the code family was updated to reflect bundling after CMS identified MPC codes not reviewed in the prior 5 years as potentially misvalued. The codes were reviewed for this meeting after the CPT Editorial Panel approved creation of a single add-on code that describes the work of coronary intravascular lithotripsy (IVL), a technology to modify lesions that did not exist at the time of the prior review. That code change application was submitted by a device manufacturer, and the societies worked aggressively to execute a survey that was not anticipated. Work to incorporate this technology was slated by our CPT committees for the subsequent cycle.

Survey Approach

One result of the unanticipated review was a decision to streamline the survey in order to increase the likelihood of completion. In consultation with RUC staff, we opted to not survey the add-on codes in the family that describe intervention in additional branches off major coronary arteries. CMS and payers have never recognized these add-on codes as separately payable services and they have no utilization. We did not want to confuse respondents by asking them to survey codes with which they are not familiar, or to lengthen the survey for services that are not actually paid. As part of the societies' plans for future updates to this family of codes, we intended to delete those add-on codes for PCI in additional branches. Therefore, we recommend affirmation or contractor pricing or bundling for those codes, whichever is most appropriate for the circumstances.

Current RVUs

As referenced above, CMS does not recognize the add-on codes as separately payable. However, the agency did bundle them into the underlying PCI codes. In doing so, it also added small amounts of work and time, proportionate to predicted utilization. Also, since the last time these codes were valued, work and time were removed when changes were made for moderate sedation billing. The summary spreadsheet shows the original RUC recommended value, the CMS adjustments for bundling, the adjustments for moderate sedation, and finally the current values.

Background: PCI Evolution

The recommendations for this tab do not produce an increase in RVUs and do not require a compelling evidence argument. However, these services have changed in a way that merits consideration of a change in technique that informs the results of the survey. PCI is now typically performed through the radial artery, reflecting best practice recommendations from the field. https://onlinelibrary.wiley.com/doi/10.1002/ccd.28672 Research has shown the radial approach to be safer for patients despite being technically more challenging for the operator. The main advantage is a significant reduction in bleeding risk as well as some improvement in other factors. https://pubmed.ncbi.nlm.nih.gov/33507598/ At the time of the prior survey, PCI was typically performed via the femoral artery, with a very small minority of cases performed through the radial artery; PCI via the radial artery was just emerging in this country. PCI via the radial artery requires additional preservice time that is discussed further below. This approach also requires different skills and techniques that are more difficult to perform than access through the femoral artery. While safer for the patient, the service is more technically challenging for the operator. In contrast to the femoral approach, using the radial access creates more potential roadblocks in terms of procedural execution that requires additional catheter manipulations. The radial artery cannot connect directly to the heart in a straight-line fashion, having a loop in it. This can influence the catheter availability and support for doing angioplasty. In some instances, one will fall back to a femoral position. There can also be trouble getting the catheter into the aorta and then into ascending aorta, so it goes into coronaries and not the valve as opposed to into the leg. Catheters don't always have ability to support push and backup in the same way as femoral access, making those manipulations more challenging. Some catheters also can't engage anomalous coronary arteries.

There have been some changes in catheters have improved certain elements of procedures that may also explain some reduction in time, such as catheters that allow us to access things radially that we didn't have previously and others that allow for easier canulation of a vessel without as many catheter changes as in the past, reducing lower acuity procedure time. These allow access to lesions that were previously not able to be treated, such as certain grafts, anomalous coronaries, or tortuous anatomy. There has been a procedural shift to more comprehensive lesion preparation. We also see patients undergoing PCI who are generally older and have more comorbidities than a decade ago. Attention to stricter appearance on statins and other medicines has eliminated many patients who otherwise may have been treated with lower acuity PCI. Those remaining are more complex. Positioning for radial increases the risk of radiation and precautions. More time is

spent closer to the image intensifier at different angles as opposed to standing farther back when patient is in the femoral area. Now we are closer to the heart and reaching across the patient's chest.

All of these factors lead to services that are both more intense/complex while also successfully decreasing the intra-procedure time the patient is on the table.

Recommendations Methodology

We struggled with how best to incorporate the bundling of the add-on branch codes. Because of the lack of recognition of the CPT-defined and previously RUC-valued add-on codes for interventions in branch vessels, we offer work recommendations at the survey 25th-percentile values for these codes with the addition of the same work increments CMS added when it bundled the branch intervention services into the base codes in 2013. We chose the survey 25th-percentile work RVUs as the starting point because this approach generally kept the recommended values below the current values. In instances where this approach did not keep the recommendations below the current values and times were similar or lower, we recommend the current value. As we move to the codes that are based on patient characteristics with use of any intervention—of/through a CABG, during AMI, and of a chronic total occlusion—where times are similar or higher, we recommend the current values for two codes where the survey 25th would be an increase and the survey 25th with a higher value for one code that shows a significant increase in time that reflects a different patient population than a decade ago. (Though that recommendation doesn't require a compelling evidence argument since the overall recommendations are budget neutral, we'll discuss that change in patient population for the chronic total occlusion code later.) In a similar manner, we added the bundled times to our recommendations in the same manner that CMS did in 2013 to account for work in the branch codes that would otherwise go unrecognized.

This approach produces the following recommendations for the family that would produce budget neutral savings of nearly 94,000 RVUs.

Code	Description	Rec.	Curr. Value	Rec. Pre	Rec. Intra	Rec. Post	Rec. Total
92920	Angioplasty	9.60	9.85	43	53	28	124
92921	Angioplasty, additional	0.00	0.00		30		30
92924	Atherectomy w/ angioplasty	11.74	11.74	43	69	28	140
92925	Atherectomy w/ angioplasty, additional	0.00	0.00		45		45
92928	Stent w/ angioplasty	10.57	10.96	43	60	28	131
92929	Stent w/ angioplasty, additional	0.00	0.00		30		30
92933	Atherectomy w/ stent w/ angioplasty	11.97	12.29	43	77	28	148
92934	Atherectomy w/ stent w/ angioplasty, additional	0.00	0.00		45		45
92937	Any revasc of CABG w/ w/out distal protection	10.95	10.95	43	77	28	148
92938	Any revasc of CABG w/ w/out distal protection, additional	0.00	0.00		60		60
92941	Any revasc of AMI total/subtotal occlusion	12.31	12.31	43	70	28	141
92943	Any revasc of chronic total occlusion w/ w/out thrombectomy	14.24	12.31	43	122	28	193
92944	Any revasc of chronic total occlusion w/ w/out thrombectomy, additional	0.00	0.00		60		60
92973	Thrombectomy add-on	2.97	3.28		30		30

Obsolete Codes

The RUC also identified codes 92975 and 92977 for thrombolysis as part of this family. With the extremely low volume and obsolete nature of these codes (78 and 2 units, respectively), the societies did not survey these. Instead, we recommend contractor pricing until they can be updated to reflect current practice or deleted.

Preservice Time

For each of the codes, we recommend additions to preservice package 2 (Difficult patient/straightforward procedure without anesthesia care). While these are 000 codes provided to patients with short or no hospital stay, the certain elements of preservice time are more akin to that of a service that utilizes general anesthesia.

92972

This is a new Category I code to report intravascular lithotripsy (IVL) as an add-on to other PCI services. IVL is a new revascularization treatment option that pulsatile sonic pressure waves that pass through soft tissue and selectively interact strongly with high-density calcium, producing significant shear stresses that have the ability to fracture the calcium. Arterial calcification is associated with increased cardiovascular risks. Intimal arterial calcification (IAC),

considered a representation of underlying atherosclerotic plaque burden, has long been held responsible for this association, whereas increasing interest is directed towards medial arterial calcification (MAC). IVL is designed to modify both intimal and medial calcium across a wide range of vascular applications to increase vessel compliance, restore vessel mobility and provide new versatile treatment options for patients. Coronary IVL received PMA approval February 12, 2021 from the FDA for lithotripsy-enabled, low-pressure balloon dilatation of severely calcified, stenotic de novo coronary arteries prior to stenting.

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed this ZZZ code and recommends the survey median intra-service time with no preservice or post-service time.

The key reference service is 92974, transcatheter placement of a radiation delivery device for subsequent coronary intravascular brachytherapy. 43% of key reference respondents found surveyed code 92972 to be of similar intensity/complexity, while 48% found it to be somewhat more or much more intense/complex. The second key reference service is 37233, angioplasty and atherectomy of an additional tibial/peroneal additional vessel. 68% of respondents found surveyed code 92972 to be of somewhat more or much more intense/complex, while 29% felt it to be identical.

The second KRS is helpful in valuing the new code for coronary IVL. We can determine from the survey that if 92972 is half the time of 37233, that value is 3.25. With respondents indicating 92972 to be more intense, that would comport with a higher value. The survey 25th-percentile wRVU would make sense from that perspective. We did seek and find additional 30-minute procedural add-on codes that suggest 3.90 may be about right for this new technology and newly defined service. A thoracoscopy code and stereotactic radiosurgery code that both have 30 minutes of time bracket the 25th-percentile value at 4.12 and 3.48, respectively, as shown in the summary spreadsheet.

As such, the societies **recommend the survey 25th-percentile wRVU of 3.90 with times of 0/30/0** for this add-on code**.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Cardiology How often? Commonly

Scott Manaker, MD
AMA/RVS Update PE Subcommittee
American Medical Association
330 N. Wabash Avenue
Chicago, IL 60611

Re: Tab 12 Percutaneous Coronary Interventions

Dear Dr. Manaker:

Tab 12 on the January 2023 RUC agenda addresses 17 codes. One of these is a new code, which describes intravascular lithotripsy, 92972. This code will be provided exclusively in the facility setting with a ZZZ global period. As such, the Society for Cardiovascular Angiography and Interventions and the American College of Cardiology recommend no direct practice expense inputs for this code in Tab 12.

The RUC also identified 16 established codes as part of this family. These include 92920, 92921, 92924, 92925, 92928, 92929, 92933, 92934, 92937, 92938, 92941, 92943, 92973, 92975 and 92977. All of these codes are exclusively performed in the facility setting with either a 000, XXX, or ZZZ global periods. As such, the Society for Cardiovascular Angiography and Interventions and the American College of Cardiology recommend no direct practice expense inputs for these codes in Tab 12.

Thank you for your consideration of this information as you prepare for the upcoming meeting. Please contact Matt Minnella at mminnella@acc.org if you have any questions.

Sincerely,

Afnan Tariq, MD
SCAI RUC Advisor

Richard Wright, MD
ACC RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2024

Respiratory Syncytial Virus (RSV) Monoclonal Antibody Administration – Tab 07

In September 2023, the CPT Editorial Panel created two codes to report administration of respiratory syncytial virus (RSV), monoclonal antibody and seasonal dose, with and without counseling. These two administration codes were created following FDA approval of Nirsevimab to protect against severe disease caused by RSV, which is common throughout the fall and winter seasons and highly contagious, sometimes deadly, for infants. CPT codes 96380 and 96381 were effective October 6, 2023, for immediate use. CPT codes 96380 and 96381 were reviewed and valued with interim recommendations to CMS the following week at the September 28-30, 2023, RUC meeting. Following that expedited review, CPT codes 96380 and 96381 were surveyed for the April 2024 RUC meeting after more widespread use occurred. These codes are not subject to compelling evidence since the September RUC recommendations were interim.

96380 ***Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, with counseling by physician or other qualified health care professional***
The RUC reviewed the survey results from 112 pediatricians and nurse practitioners and determined the survey median work RVU of 0.28 appropriately accounts for the work required to perform this service. The RUC recommends 8 minutes intra-service and total time. There is no pre-service or post-service time as this service is typically reported with an Evaluation and Management (E/M) office visit.

The RUC compared code 96380 to the top key reference service CPT code 90460 *Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; first or only component of each vaccine or toxoid administered* (work RVU = 0.24- and 7-minutes intra-service and total time). The RUC agreed that the surveyed code requires slightly more physician work and time than CPT code 90460. The counseling associated with administering the RSV monoclonal antibodies is distinct in that, beyond discussing whether the infant/child should receive the product, counseling also needs to address how this product differs from traditional pediatric vaccines and optimal product administration timing. Therefore, an additional minute of intra-service time for that additional discussion beyond that of what is included in CPT code 90460 is justified. However, infants born to mothers who are administered RSV monoclonal antibodies at least two weeks before delivery will have protection and, in most cases, should not also need RSV monoclonal antibodies directly.

The RUC noted that although the vignette described a 6-month-old, the specialty societies and the RUC believe that the typical patient receiving the RSV monoclonal antibody will be much younger than a 6-month-old. Additionally, the specialty societies indicated that currently, this monoclonal antibody is not typical for patients over 8 months old unless they are in a specific high-risk category, which is less than 2% of infants nationally. Further, it is typical that patients will only receive this antibody once in their lifetime.

For additional support, the RUC referenced MPC code 96413 *Chemotherapy administration, intravenous infusion technique; up to 1 hour, single or initial substance/drug* (work RVW = 0.28, 7 minutes intra-service time and 13 minutes total time), CPT code 77073 *Bone length studies*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(orthoroentgenogram, scanogram) (work RVU = 0.26, 5 minutes intra-service time and 7 minutes total time), CPT code 71110 *Radiologic examination, ribs, bilateral; 3 views* (work RVU = 0.29, 6 minutes intra-service and 8 minutes total time), and MPC code 71111 *Radiologic examination, ribs, bilateral; including posteroanterior chest, minimum of 4 views* (work RVW = 0.32, 7 minutes intra-service time and 9 minutes total time). The RUC determined that the median work value of 0.28 appropriately places CPT code 96380 relative to other services in the MFS based on time, work, intensity and complexity. **The RUC recommends a work RVU of 0.28 for CPT code 96380.**

96381 ***Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection***
The RUC reviewed the survey results from 97 pediatricians and nurse practitioners and determined that the survey 25th percentile work RVU of 0.17 appropriately accounts for the work required to perform this service. The RUC recommends 3 minutes intra-service and total time. There is no pre-service or post-service time as this service is typically reported with an Evaluation and Management (E/M) office visit.

The RUC compared the surveyed code to the top key reference service CPT code 90471 *Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); 1 vaccine (single or combination vaccine/toxoid)* (work RVU = 0.17, 7 minutes intra-service and total time) and determined that the physician work required to perform these services are the same. The RUC noted when 90471 was last surveyed, the specialties survey time data was disparate, based on the specialty completing the survey. After much discussion, the RUC agreed that the time and work for 90471 and 96381 are comparable.

For additional support, the RUC referenced CPT code 96372 *Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular (*work RVW = 0.17, 3 minutes intra-service time and 7 minutes total time). CPT code 96372 was recently valued by the RUC in 2017 and is the code that would have been used to report this service before the creation of this new code. The RUC also referenced CPT code 73080 (work RVU = 0.17, 3 minutes intra-service time and 5 minutes total time), MPC code 99211 *Office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician or other qualified health care professional* (work RVW = 0.18, 5 minutes intra-service time and 7 minutes total time), and CPT code 90970 *End-stage renal disease (ESRD) related services for dialysis less than a full month of service, per day; for patients 20 years of age and older* (work RVU = 0.18, 3.2 minutes intra-service and total time). The RUC determined that the survey 25th percentile work RVU of 0.17 appropriately places CPT code 96381 relative to other services in the MFS based on time, work, intensity and complexity. **The RUC recommends a work RVU of 0.17 for CPT code 96381.**

Practice Expense
The Practice Expense (PE) Subcommittee reviewed the direct inputs for CPT codes 96380 and 96381 and made one modification. Clinical staff activity CA005 *Complete pre-procedure phone calls and prescription* was removed as this time is already captured in the typically associated E/M service. The Subcommittee accepted 5 minutes for CA007 *Review patient clinical extant information and questionnaire*. Four additional minutes of clinical staff time were recommended by the surveying societies to complete the monoclonal antibody pre-check eligibility process (see attachment Nirsevimab Visual Guide). The PE Subcommittee agreed that the time required to check the mother's RSV immunization status and timing of dose in the typical patient is a minimum of 5 minutes. Clinical staff have the expertise and access to non-patient (i.e., the mother) information. This activity requires looking up the mother's records at the birthing hospital or physician office as it is not typical for this information to be sent to the state immunization registry. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Technology/New Services List
CPT codes 96380 and 96381 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions. The RUC noted that the Relativity Assessment Workgroup may want to examine the typical patient since the specialty societies and RUC agreed that the typical patient receiving the RSV monoclonal antibody to be much younger than 6 months old.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Category I
Evaluation and Management Services
Preventive Medicine Services

The following codes are used to report the preventive medicine evaluation and management of infants, children, adolescents, and adults.

The extent and focus of the services will largely depend on the age of the patient.

Immunization/vaccine/toxoid products, immunization administrations, ancillary studies involving laboratory, radiology, other procedures, or screening tests (eg, vision, hearing, developmental) identified with a specific CPT code are reported separately. For immunization administration and ~~vaccine~~ immunization risk/benefit counseling, see 90460, 90461, 90471-90474, *90480*, 96380, 96381 ~~*, 0001A, 0002A, 0003A, 0004A, 0011A, 0012A, 0013A, 0021A, 0022A, 0031A, 0034A, 0041A, 0042A, 0044A, 0051A, 0052A, 0053A, 0054A, 0064A, 0071A, 0072A, 0073A, 0074A, 0081A, 0082A, 0083A, 0091A, 0092A, 0093A, 0094A, 0104A, 0111A, 0112A, 0113A, 0121A, 0124A, 0134A, 0141A, 0142A, 0144A, 0151A, 0154A, 0164A, 0171A, 0172A, 0173A, 0174A*~~. For immunization/vaccine/toxoid products, see *91304, 91318, 91319, 91320, 91321, 91322,* 90380, 90381, 90476-90759~~*, 91300-91317*~~.

Medicine
Immune Globulins, Serum or Recombinant Products

Codes 90281-90399 identify the serum globulins . . .

In recognition of public health interest in immune globulin products, the CPT Editorial Panel has chosen to publish new immune globulin product codes prior to approval by the US Food and Drug Administration (FDA). These codes are indicated with the ✓ symbol and will be tracked by the AMA to monitor FDA approval status. Once the FDA status changes to approved, the ✓ symbol will be removed. CPT code users should refer to the AMA CPT website (ama-assn.org/cpt-cat-i-immunization-codes) for the most up-to-date information on codes with the ✓ symbol.

90378 Respiratory syncytial virus, monoclonal antibody, recombinant, for intramuscular use, 50 mg, each

90380 Respiratory syncytial virus, monoclonal antibody, seasonal dose; 0.5 mL dosage, for intramuscular use

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

90381 *1 mL dosage, for intramuscular use*

(Do not report 90380, 90381 in conjunction with 96372)

(For administration of respiratory syncytial virus, monoclonal antibody, seasonal dose, see 96380, 96381)

90384 *Rho(D) immune globulin (RhIg), human, full-dose, for intramuscular use*

Immunization Administration for Vaccines/Toxoids

Report vaccine immunization . . .

. . .

A component refers to all antigens in a vaccine that prevent disease(s) caused by one organism (90460 and 90461). Multi-valent antigens or multiple serotypes of antigens against a single organism are considered a single component of vaccines. Combination vaccines are those vaccines that contain multiple vaccine components. Conjugates or adjuvants contained in vaccines are not considered to be component parts of the vaccine as defined above.

For immune globulins and monoclonal antibodies immunizations, see 90281-90399. For administration of immune globulins and monoclonal antibodies immunizations, see 96365, 96366, 96367, 96368, 96369, 96370, 96371, 96372, 96374, 96380, 96381.

(For allergy testing, see 95004 et seq)

(For skin testing of bacterial, viral, fungal extracts, see 86485-86580)

(For therapeutic or diagnostic injections, see 96372- 96379)

Vaccines, Toxoids

To assist users to report the most recent new or revised vaccine product codes, the American Medical Association (AMA) currently uses the CPT website (ama-assn.org/ cpt-cat-i-immunization-codes), which features updates of CPT Editorial Panel actions regarding these products. See the Introduction section of the CPT code set for a complete list of the dates of release and implementation.

The CPT Editorial Panel, in recognition of the public health interest in vaccine products, has chosen to publish new vaccine product codes prior to approval by the US Food and Drug Administration (FDA). These codes are indicated with the ⌿ symbol and will be tracked by the AMA to monitor FDA approval status. Once the FDA status changes to approval, the ⌿ symbol will be removed. CPT users should refer to the AMA CPT website (ama-assn.org/cpt-cat-i-immunization-codes) for the most up-to-date information on codes with the ⌿ symbol.

[…]

Separate codes are available for combination vaccines (eg, Hib-HepB, DTap-IPV/Hib). It is inappropriate to code each component of a combination vaccine separately. If a specific vaccine code is not available, the unlisted procedure code should be reported, until a new code becomes available.

The immunization/vaccine/toxoid abbreviations listed in codes 90380, 90381, 90476-90759, 91304, 91318, 91319, 91320, 91321, 91322 ~~91300-91317~~ reflect the most recent US vaccine abbreviation references used in the Advisory Committee on Immunization Practices (ACIP) recommendations at the time of CPT code set publication. Interim updates to vaccine code descriptors will be made following abbreviation approval

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

by the ACIP on a timely basis via the AMA CPT website (ama-assn.org/cpt-cat-i-immunization-codes). The accuracy of the ACIP vaccine abbreviation designations in the CPT code set does not affect the validity of the vaccine code and its reporting function.

~~*For the purposes of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) (coronavirus disease [COVID-19]) vaccinations, codes 0003A, 0013A, 0053A, 0073A, 0083A, 0093A, 0113A, and 0173A represent the administration of a third dose in the primary series (eg, patient with immunocompromising condition or patient age 6 months through 4 years). In contrast, the booster or additional dose codes 0004A, 0034A, 0044A, 0054A, 0064A, 0074A, 0094A, 0104A, 0124A, 0134A, 0144A, 0154A, 0164A, and 0174A represent the administration of a dose of vaccine when the initial immune response to a primary vaccine series was sufficient, but has likely waned over time.*~~

(For immune globulins and monoclonal antibodies immunizations, see 90281-90399)

(For administration of immune globulins and monoclonal antibodies immunizations, with the exception of respiratory syncytial virus, monoclonal antibody, seasonal product, see 96365-96375)

(For administration of respiratory syncytial virus, monoclonal antibody, seasonal product, see 96380, 96381)

(91303 has been deleted. To report severe acute respiratory syndrome coronavirus 2 [SARS-CoV-2] [coronavirus disease {COVID-19}] vaccine product immunization, see 91318, 91319, 91320, 91321, 91322)

#91304 *Severe acute respiratory syndrome coronavirus 2 (SARSCoV-2) (coronavirus disease [COVID-19]) vaccine, recombinant spike protein nanoparticle, saponin-based adjuvant, 5 mcg/0.5 mL dosage, for intramuscular use*

(Report 91304 with administration codes 90480)

90683 *Respiratory syncytial virus vaccine, mRNA lipid nanoparticles, for intramuscular use*

(For seasonal respiratory syncytial virus [RSV] monoclonal antibodies immunization codes, see 90380, 90381. For administration of seasonal RSV monoclonal antibodies immunizations, ~~use 96372~~ see 96380, 96381)

90680 *Rotovirus vaccine, pentavalent*

Hydration, Therapeutic, Prophylactic, Diagnostic Injections and Infusions, and Chemotherapy and Other Highly Complex Drug or Highly Complex Biologic Agent Administration

Therapeutic, Prophylactic, and Diagnostic Injections and Infusions (Excludes Chemotherapy and Other Highly Complex Drug or Highly Complex Biologic Agent Administration)

A therapeutic, prophylactic, or diagnostic IV infusion or injection (other than hydration) is for the administration of substances/drugs. When fluids are used to administer the drug(s), the administration of the fluid is considered incidental hydration and is not separately reportable. These services typically require direct supervision for any or all purposes of patient assessment, provision of consent, safety oversight, and intra-service supervision of staff. Typically, such infusions require special consideration to prepare, dose or dispose of, require practice training and competency for staff who administer the infusions, and require periodic patient assessment with vital sign monitoring during the infusion. These codes are not intended to be reported by the physician or other qualified health care professional in the facility setting.

Passive immunizations, such as an immune globulin or monoclonal antibody, provide long-term passive immunization to the patient.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

See codes 96401-96549 for the administration of chemotherapy or other highly complex drug or highly complex biologic agent services. These highly complex services require advanced practice training and competency for staff who provide these services; special considerations for preparation, dosage or disposal; and commonly, these services entail significant patient risk and frequent monitoring. Examples are frequent changes in the infusion rate, prolonged presence of nurse administering the solution for patient monitoring and infusion adjustments, and frequent conferring with the physician or other qualified health care professional about these issues. *(Do not report 96365-96379 with codes for which IV push or infusion is an inherent part of the procedure [eg, administration of contrast material for a diagnostic imaging study])* *(For mechanical scalp cooling, see 0662T, 0663T)* *96365 Intravenous infusion, for therapy, prophylaxis, or diagnosis (specify substance or drug); initial, up to 1 hour* *96372 Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular* *(For administration of vaccines/toxoids, see 90460, 90461, 90471, 90472, 90473, 90474, 90480 ~~0001A, 0002A, 0003A, 0004A, 0011A, 0012A, 0013A, 0021A, 0022A, 0031A, 0034A, 0041A, 0042A, 0044A, 0051A, 0052A, 0053A, 0054A, 0064A, 0071A, 0072A, 0073A, 0074A, 0081A, 0082A, 0083A, 0091A, 0092A, 0093A, 0094A, 0104A, 0111A, 0112A, 0113A, 0121A, 0124A, 0134A, 0141A, 0142A, 0144A, 0151A, 0154A, 0164A, 0171A, 0172A, 0173A, 0174A~~)* *(Report 96372 for non-antineoplastic hormonal therapy injections)* *(Report 96401 for anti-neoplastic nonhormonal injection therapy)* *(Report 96402 for anti-neoplastic hormonal injection therapy)* *(For intradermal cancer immunotherapy injection, see 0708T, 0709T)* *(Do not report 96372 for injections given without direct physician or other qualified health care professional supervision. To report, use 99211. Hospitals may report 96372 when the physician or other qualified health care professional is not present)* *(96372 does not include injections for allergen immunotherapy. For allergen immunotherapy injections, see 95115-95117)* *96377 Application of on-body injector (includes cannula insertion) for timed subcutaneous injection*

CPT Descriptor: Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, with counseling by physician or other qualified health care professional

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 6-month-old female presents during the fall season. The physician or other qualified healthcare professional provides benefit and risk counseling on immunization for the seasonal respiratory syncytial virus to the parents and answers all their questions. The parent agrees to have their child receive the product.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The physician or qualified health care professional recommends passive immunization with the respiratory syncytial virus (RSV) immune globulin seasonal product for protection against RSV during the infant's vulnerable first year. The physician or QHP provides benefit and risk counseling to the parents and answers all their questions. Consent is obtained from the parent or guardian. Following the administration of the injection the patient is monitored for any adverse reaction. The physician or QHP then discusses the care plan for the child in the days to follow specific to the anticipated or possible side effects (eg, soreness and pain at the injection site, fever) and reviews the signs or symptoms that warrant a call back.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	2%	0%	25%	59%	14%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	32%	66%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	1%	83%	16%
Physical effort required	2%	83%	15%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	36%	59%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	33%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	50%	42%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	75%	8%
Physical effort required	8%	75%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

New CPT codes for an immune globulin product protecting against respiratory syncytial virus for seasonal duration, Nirsevimab, were approved during the May 2023 CPT meeting. There was discussion surrounding the fact that the current administration code used for intramuscular injection of an immune globulin product, 96372, was not sufficient for this product, which will be administered to all infants prophylactically as a passive immunization. Subsequent to the May 2023 CPT meeting, the Food and Drug

Administration (FDA) and the FDA's Pediatric Advisory Committee approved Nirsevimab via their Fast Track process and the CDC's Advisory Committee on Immunization Practices (ACIP) recommended single dose of Nirsevimab for all infants younger than 8 months born during or entering their first RSV season and infants and for children aged 8 through 19 months who are at increased risk of severe RSV disease and entering their second RSV season.

At the September 2023 meeting, the CPT Editorial Panel created two new CPT codes to report the passive immunization administration of respiratory syncytial virus, monoclonal antibody, seasonal dose, with and without counseling. The new administration codes were developed for this product to support the increased physician and other qualified healthcare provider (QHP) work involved in parent/caretaker counseling regarding this novel vaccine-like product as well as address efforts that are commonly associated with the administration of an immunization (in this case, a passive immunization) in a preventive care setting and practice expenses associated with product storage and entry into the state immunization registry. These codes fell under the CPT Panel's Early Release Policy and became effective on October 6, 2023. This expedited process was to protect against severe disease caused by RSV, which is common, highly contagious, and sometimes deadly. RSV is one of the leading causes of death for otherwise healthy young infants and for young and older infants with underlying medical concerns, creating the urgency to get this countermeasure approved.

Interim Valuation at the September 2023 RUC Meeting
Based on the urgent need for the RUC to value these passive immunization administration codes and forward recommendations to CMS so children could immediately begin to receive this potentially life-saving intervention, at the September 2023 meeting, the AAP proposed, and the RUC agreed to assign interim work and time valuations to the two new CPT codes (96380, 96381) using crosswalk methodology.

For CPT code 96380, the RUC recommended a work RVU of 0.24 based on a direct crosswalk to CPT code 90460 *Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; first or only component of each vaccine or toxoid administered* (work RVU = 0.24 and 7 minutes intra-service and total time), which maintained relativity within the Medicare Physician Payment Schedule. The RUC recommended 7 minutes intra-service and total time. There is no pre-service or post-service time as this service is typically reported with an Evaluation and Management (E/M) office visit.

For additional support, the RUC compared code 96380 to MPC code 99406 *Smoking and tobacco use cessation counseling visit; intermediate, greater than 3 minutes up to 10 minutes* (work RVU = 0.24 and 7 minutes intra-service time and total time), code 88311 *Decalcification procedure (List separately in addition to code for surgical pathology examination*) (work RVU = 0.24, 5 minutes intra-service time and 7 minutes total time), 77073 *Bone length studies (orthoroentgenogram, scanogram)* (work RVU = 0.26, 5 minutes intra-service time and 7 minutes total time) and 92202 *Ophthalmoscopy, extended; with drawing of optic nerve or macula (eg, for glaucoma, macular pathology, tumor) with interpretation and report, unilateral or bilateral* (work RVU = 0.26, 5 minutes intra-service time and 7 minutes total time).

The RUC determined that an interim work value of 0.24 appropriately placed 96380 relative to other services based on the anticipated time, work, intensity, and complexity for this new service. The specialty societies agreed to survey this service for the April 2024 RUC meeting after more widespread use had occurred.

The RUC also noted at this time that since interim values were established at the September 2023 RUC meeting, compelling evidence would NOT be required if the society recommended a value higher than the interim value at the April 2024 RUC meeting.

The societies found that gaining experience with the service during this period was extremely informative in developing recommendations for the April 2024 meeting. The societies found that the impact of the documented growth in vaccine hesitancy, a legacy of the COVID-19 pandemic, impacts the administration of this vaccine. Providers must spend time communicating the needs and benefits to patients. Another factor that came to light is that unique to this vaccine is the need to confirm if the mother has received the vaccine during the window (at least two weeks before delivery), which would negate the need for the infant to receive the vaccine. Confirming these details takes additional time especially since mothers typically do not present with their immunization records.

Survey Process
In late February/early March, ANA and AAP conducted a survey to value CPT code 96380, with 112 survey respondents. Both societies used a random sample of applicable subsets of their members. The societies established an expert panel to review the survey results. The vignette of the typical patient used for the survey was provided by the CPT Editorial Panel. 90% of respondents found the vignette to be typical.

Recommendations
Based on the review of the survey data, the specialties recommend the survey median of 0.28 work RVUs and the survey median of 8 minutes intra-service time, which also serves as the total time.

Intensity Measures
The median RVUs of 0.28 is supported by the intensity/complexity measures, where 73% of survey respondents indicated the service overall was more intense/complex than the top key reference service code, 90460, Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; first or only component of each vaccine or toxoid, which has an RVW of 0.24.

Comparison Codes
CPT code 90460: CPT code 90460 is valued at 0.24 work RVUs and has an intra service time of 7 minutes. The specialties believed that the higher work valuation and time for surveyed code 96380 is justified based on the need to address ongoing vaccine hesitancy that has intensified with COVID-19. Surveys on the impact of the COVID-19 pandemic on vaccine confidence indicate vaccine hesitancy overall has increased (CDC's State of Vaccine Confidence Insights Report, KFF COVID-19 Vaccine Monitor, American Academy of Family Physicians, American College Health Association, Pediatrics, Journal of Community Health).

The counseling associated with administering the RSV monoclonal antibodies is unique in that, beyond discussing whether the infant/child should receive the product, counseling also needs to address optimal product administration timing. Babies born to mothers who get RSV vaccine at least 2 weeks before delivery will have protection and, in most cases, should not need an RSV vaccine. Therefore, an additional minute of intra-service time for that additional discussion beyond that of the KRS is justified.

CPT code 96413: The recommended valuation is also supported by MPC code 96413 Chemotherapy administration, intravenous infusion technique; up to 1 hour, single or initial substance/drug (work RVW = 0.28; 7 minutes intra-service time and 13 minutes total time) and 71111 Radiologic examination, ribs, bilateral; including posteroanterior chest, minimum of 4 views (work RVW = 0.31; 7 minutes intra-service time and 9 minutes total time). The recommended time is supported by the primary key reference service, 90460, Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; first or only component of each vaccine or toxoid, which has an intra-service time of 7 minutes.

Other comparison codes: There are multiple other RUC-reviewed services with an XXX global period that have comparable times and work RVUs:

Code	Descriptor	Global	Work RVU	Pre-Time	Intra-Time	Post-Time	Total Time
90460	Immunization administration through 18 years of age via any route of administration, with counseling by physician or other qualified health care professional; first or only component of each vaccine or toxoid administered	XXX	0.24	0	7	0	7
77073	Bone length studies (orthoroentgenogram, scanogram)	XXX	0.26	1	5	1	7
92202	Ophthalmoscopy, extended; with drawing of optic nerve or macula (eg, for glaucoma, macular pathology, tumor) with interpretation and report, unilateral or bilateral)	XXX	0.26	1	5	1	7
96380	Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, with counseling by physician or other qualified health care professional	XXX	0.28	0	8	0	8
71110	Radiologic examination, ribs, bilateral; 3 views	XXX	0.29	1	6	1	8

Code	Descriptor	Global	Work RVU	Pre-Time	Intra-Time	Post-Time	Total Time
73523	Radiologic examination, hips, bilateral, with pelvis when performed; minimum of 5 views	XXX	0.31	1	6	1	8

These examples illustrate that the recommended value and time for code 96380 are properly positioned in the resource-based relative value scale compared to services of other specialties.

Conclusion
For code 96380, Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, with counseling by physician or other qualified health care professional, **the societies recommend the survey median, an RVU of 0.28 and intra-service time of 8 minutes**.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Code 96380 is typically reported in addition to an office visit E/M

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

		Code	Global	Work RVU	Pre-Time	Intra-Time	Post-Time

4.	4.	96380	XXX	0.28	0	8	0
5.	5.	Total		1.58	5	28	5

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) New service

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatricians How often? Commonly

Specialty Nurse Practitioners How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2025000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. There are 3.6 million births in the US annually; we estimated that 900,000 or 25% of

these parents either refused early immunizations or the mother received the RSV shot during the appropriate time period, and the infant did not need to be separately immunized. This leaves us with 2,700,000 births; we estimated that 75% of these, or 2,025,000, will provide immunization with counseling, and 25%, or 675,000, will not provide counseling with immunization. Of those provided with counseling, 85%, or 1,721,250, will be provided by Pediatricians, and 15%, or 303,750, will be provided by Nurse Practitioners.

Specialty Pediatricians Frequency 1721250 Percentage 85.00 %

Specialty Nurse Practitioners Frequency 303750 Percentage 15.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate was derived from a crosswalked to the 2022 utilization for CPT code 90461, Immunization through 18 years of age with counseling.

Specialty Pediatricians Frequency 26 Percentage 86.66 %

Specialty Nurse Practitioners Frequency 4 Percentage 13.33 %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 6-month-old female presents during the fall season for immunization against seasonal respiratory syncytial virus. The parent is offered and accepts an intramuscular injection of the RSV monoclonal antibody for their child.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The physician or qualified health care professional recommends passive immunization with the respiratory syncytial virus (RSV) immune globulin seasonal product for protection against RSV during the infant's vulnerable first year. Consent is obtained from the parent or guardian. Following the administration of the injection the patient is monitored for any adverse reaction. The physician or QHP then discusses the care plan for the child in the days to follow specific to the anticipated or possible side effects (eg, soreness and pain at the injection site, fever) and reviews the signs or symptoms that warrant a call back.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	5%	5%	41%	45%	4%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	12%	44%	44%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	3%	83%	14%
Physical effort required	4%	84%	12%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	50%	43%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	11%	44%	39%	6%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	11%	56%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	89%	5%
Physical effort required	6%	83%	11%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	33%	56%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

New CPT codes for an immune globulin product protecting against respiratory syncytial virus for seasonal duration, Nirsevimab, were approved during the May 2023 CPT meeting. There was discussion surrounding the fact that the current administration code used for intramuscular injection of an immune globulin product, 96372, was not sufficient for this product, which will be administered to all infants prophylactically as a passive immunization. Subsequent to the May 2023 CPT meeting, the Food and Drug

Administration (FDA) and the FDA's Pediatric Advisory Committee approved Nirsevimab via their Fast Track process and the CDC's Advisory Committee on Immunization Practices (ACIP) recommended single dose of Nirsevimab for all infants younger than 8 months born during or entering their first RSV season and infants and for children aged 8 through 19 months who are at increased risk of severe RSV disease and entering their second RSV season.

At the September 2023 meeting, the CPT Editorial Panel created two new CPT codes to report the passive immunization administration of respiratory syncytial virus, monoclonal antibody, seasonal dose, with and without counseling. The new administration codes were developed for this product to support the increased physician and other qualified healthcare provider (QHP) work involved in parent/caretaker counseling regarding this novel vaccine-like product as well as address efforts that are commonly associated with the administration of an immunization (in this case, a passive immunization) in a preventive care setting and practice expenses associated with product storage and entry into the state immunization registry. These codes fell under the CPT Panel's Early Release Policy and became effective on October 6, 2023. This expedited process was to protect against severe disease caused by RSV, which is common, highly contagious, and sometimes deadly. RSV is one of the leading causes of death for otherwise healthy young infants and for young and older infants with underlying medical concerns, creating the urgency to get this countermeasure approved.

Interim Valuation at the September 2023 RUC Meeting
Based on the urgent need for the RUC to value these passive immunization administration codes and forward recommendations to CMS so children could immediately begin to receive this potentially life-saving intervention, at the September 2023 meeting the AAP proposed, and the RUC agreed to assign interim work and time valuations to the two new CPT codes (96380, 96381) using crosswalk methodology.

For CPT code 96381, the RUC recommended a work RVU of 0.17 based on a direct crosswalk to CPT code 90471 *Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); 1 vaccine (single or combination vaccine/toxoid)* (work RVU = 0.17, 7 minutes intra-service and total time), which maintained relativity within Medicare Physician Payment Schedule. The RUC recommended 7 minutes intra-service and total time. There is no pre-service or post-service time as this service is typically reported with an Evaluation and Management (E/M) office visit.

For additional support, the RUC compared code 96381 to MPC code 99211 *Office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician or other qualified health care professional* (work RVU = 0.18 and 5 minutes intra-service time and 7 minutes total time) and code 90970 *End-stage renal disease (ESRD) related services for dialysis less than a full month of service, per day; for patients 20 years of age and older* (work RVU = 0.18, 3.2 minutes intra-service and total time).

The RUC determined that an interim work value of 0.17 appropriately placed 96381 relative to other services based on the anticipated time, work, intensity, and complexity for this new service. The specialty societies agreed to survey this service for the April 2024 RUC meeting after more widespread use had occurred.

It was also noted at this time that since the values established at the September 2023 meeting were interim values, compelling evidence would NOT be required if the society recommended a value higher than the interim value at the April 2024 meeting.

Survey Process
In late February/early March, ANA and AAP conducted a survey to value CPT code 96381, with 97 survey respondents. Both societies used a random sample of applicable subsets of their members. The societies established an expert panel to review the survey results. The CPT Editorial Panel provided the vignette of the typical patient used for the survey. 87% of respondents found the vignette to be typical. Most respondents indicated that the vignette was not typical and noted that it was unusual not to provide counseling as part of the service.

Recommendations
Based on the review of the survey data, the specialties recommend the survey 25th percentile of 0.17 work RVUs and the survey median of 3 minutes intra-service time, which also serves as the total time.

Comparison Codes
CPT code 96372: These values are supported by CPT code 96372 *Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular (*work RVW = 0.17; 3 minutes intra-service time and 7 minutes total time). CPT code 96372 was recently valued by the RUC (2017) and is the code that would have been used to report this service before the creation of this new code.

CPT code 90471: The recommended work RVW is supported by the top key reference service code, 90471 *Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); 1 vaccine (single or combination vaccine/toxoid*), which has a work RVW of 0.17.

CPT codes 99211 and 99212: It is also supported by MPC codes 99211 *Office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician or other qualified health care professional* (work RVW = 0.18) and 99212 *Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded* (work RVW= 0.70; 11 minutes intra-service time and 16 minutes total time). The specialties' recommended values for CPT code 96381 align well by taking ¼ of the work RVW and time values of the latter MPC code.

Other comparison codes: The expert panel also looked at other RUC-reviewed services with an XXX global period that have comparable times and work RVUs:

Code	Descriptor	Global	Work RVU	Pre-Time	Intra-Time	Post-Time	Total Time
72020	Radiologic examination, spine, single view, specify level	XXX	0.16	1	3	1	5
73080	Radiologic examination elbow; complete, minimum of 3 views	XXX	0.17	1	3	1	5
96381	Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection	XXX	0.17	0	3	0	3
96372	Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); subcutaneous or intramuscular	XXX	0.17	2	3	2	7
74018	Radiologic examination, abdomen; 1 view	XXX	0.18	1	3	1	5
72070	Radiologic examination, spine; thoracic, 2 views	XXX	0.20	1	3	1	5

These examples illustrate that the recommended value and time for code 96381 are properly positioned when compared to other services of other specialties in the resource-based relative value scale.

Conclusion

For code 96381 Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, **the societies recommend the survey 25th percentile, an RVU of 0.17 and intra-service time of 3 minutes.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Code 96381 is typically reported in addition to an office visit E/M

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

		Code	Global	Work RVU	Pre-Time	Intra-Time	Post-Time
3.	3.	99213	XXX	1.30	5	20	5
4.	4.	96381	XXX	0.17	0	7	0
5.	5. Total			1.47	5	27	5

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) New service

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty Nurse Practitioners How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 675000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. There are 3.6 million births in the US annually; we estimated that 900,000 or 25% of these parents either refused early immunizations or the mother received the shot during the appropriate time period. This leaves us with 2,700,000 births; we estimate that 75% of these, or 2,025,000, will provide immunization with counseling, and 25%, or 675,000, will not provide counseling. Of those provided without counseling, 85%, or 573,750, will be provided by Pediatricians, and 15%, or 101,250, will be provided by Nurse Practitioners.

Specialty Pediatricians Frequency 573750 Percentage 85.00 %

Specialty Nurse Practitioner Frequency 101250 Percentage 15.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate was derived from a crosswalked to the 2022 utilization for CPT code 90461, Immunization through 18 years of age with counseling. We estimate the volume of 96381 to be 25% of the volume of 90461.

Specialty Pediatricians Frequency 6 Percentage 75.00 %

Specialty Nurse Practitioner Frequency 2 Percentage 25.00 %

Specialty Frequency 0 Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Other

BETOS Sub-classification:
Immunizations/Vaccinations

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 90471

NON-FACILITY DIRECT PE INPUTS **CPT CODE(S): 96380-96381**

SPECIALTY SOCIETY(IES): AAP, ANA

PRESENTER(S): Steven Krug, MD (AAP), Suzanne Berman, MD (AAP) , Korinne Van Keuren, DNP, APRN, NP-BC, RNFA (ANA)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April 2024

CPT Code	Long Descriptor	Global Period
96380	Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection, with counseling by physician or other qualified health care professional	XXX
96381	Administration of respiratory syncytial virus, monoclonal antibody, seasonal dose by intramuscular injection	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
96380	A 6-month-old female presents during the fall season. The physician or other qualified healthcare professional provides benefit and risk counseling on immunization for the seasonal respiratory syncytial virus to the parents and answers all their questions. The parent agrees to have their child receive the product.
96381	A 6-month-old female presents during the fall season for immunization against seasonal respiratory syncytial virus. The parent is offered and accepts an intramuscular injection of the RSV monoclonal antibody for their child.

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   RUC Advisors from AAP and ANA and several AAP members from large pediatric practices with expertise in immunization administration acted as an expert panel and communicated via email to develop the recommended PE inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   We are utilizing CPT code 90460 *Immunization administration through 18 years of age via any route of administration, with counseling by physician or other QHP; first or only component of each vaccine or toxoid administered* as our base reference code for 96380 due to the inherent similarity between the service described by 90460 and this new service. Code 90460 is a recently PE reviewed IA service. To the base of 90460 direct PE inputs, we are recommending incremental direct PE inputs as established by manufacturers and the CDC Advisory Committee on Immunization Practices for administering the Nirsevemab vaccine and Expert Panel input.

   We are utilizing CPT code 90471 *Immunization administration (includes percutaneous, intradermal, subcutaneous, or intramuscular injections); 1 vaccine (single or combination vaccine/toxoid)* as our base reference code for 96381 due to the inherent similarity between the service described by 90471 and this new service. Code 90471 is a recently PE reviewed IA service. To the base of 90471 direct PE inputs, we are recommending incremental direct PE inputs as

established by manufacturers and the CDC Advisory Committee on Immunization Practices for administering the Nirsevemab vaccine and Expert Panel input.

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the non-facility?

   Codes 96380 and 96381 are typically reported with an E/M service. Codes 96380 and 96381 are typically reported with an E/M service in the NF setting.

   See the *Billed Together* tab in the RUC Database.

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

   The dominant provider for new CPT Codes 96380 and 96381 in the facility and nonfacility is not known at this time.

   See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

   N/A

   See the *PE compelling evidence guidelines* under PE Reference Materials on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

6. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

   N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

7. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

Pre Service
CA005 Complete pre-procedure phone calls and prescription.
Specialties are recommending 3 minutes (standard time for phone calls) to account for the clinical staff time spent calling parent of eligible infant/child to schedule appointment for E/M visit and product administration when stock of RSV monoclonal antibody product is available from the manufacturer and at the practice. Activity requires expertise of clinical staff to review patient waiting list for the product to determine specific patient eligibility for the size of the dose available (50 mg vs 100 mg) and answering parent questions.

CA007 Review patient clinical extant information and questionnaire
Used for imaging service. 1 minute standard.
Specialties are recommending 5 minutes to account for the clinical staff time to review the patient immunization questionnaire and complete the required pre-check eligibility process (see attachment Nirsevemab Visual Guide). Expert Panel members experienced with administering this product report that the time required to check the mother's RSV immunization status and timing of dose in the typical patient is a minimum of 5 minutes. Clinical staff have the expertise and access to non-patient (i.e., the mother) information. This activity requires looking up the mother's records at the birthing hospital as it is not typical for this information to be sent to the state immunization registry.

CA008
Perform regulatory mandated quality assurance activity (pre-service)
Standard is 0 for XXX services.
Specialties are recommending 1 minute to account for the clinical staff time to ensure the vaccine stock is viable.

Service
CA014 Confirm order, protocol exam
Used for imaging service. 1 minute standard.
Specialties are recommending 2 minutes to account for the clinical staff time to compute the correct dose based on patient's age and weight. Additional calculation complexity based on the "If baby is under X kg or over age Y" component of formula.

8. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

9. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

10. Please provide a brief description of the clinical staff work for the following:
    a. Pre-Service period:

CA005: Determining appropriateness of available vaccine for patient. Calling parent to notify them of availability of product and scheduling appointment for E/M visit and product administration. Answering parent questions.

CA007: Confirming vaccine order/checking appropriateness for patient. Complete vaccine pre-check eligibility process (see attachment Nirsevemab Visual Guide).

CA008: Checking historical and current temperatures for vaccine refrigerator; recording temperatures; reporting temperatures; vaccine inventorying; ordering vaccines; completing required Vaccines for Children (VFC) paperwork; receiving vaccines; inspecting/logging vaccines and putting them in the vaccine refrigerator; creating lot numbers in EHR

    b. Service period (includes pre, intra and post):

CA011: Giving Vaccine Information Sheet (VIS) to patient/family; getting informed consent and signature if applicable

CA014: Going to laboratory and taking vaccine vials out of vaccine refrigerator; computing dose based on patient's age and weight; drawing up vaccine into syringe; going back to patient room and preparing patient/parent, confirming that this is correct patient-correct vaccine

CA021: Actual administration of vaccine; bandage application

CA022: Watching patient after vaccine is administered

CA024: Disposal of vaccine-specific medical waste

CA034: Charting administered immunizations in the patient chart and EMR; preparing patient record/immunization card

    c. Post-service period:

CA037: Contacting patient/parent to follow up on immunization administration

11. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

CA021: RN/LPN/MTA prepares the vaccine, instructs the patient (or parent) on proper positioning, selects and prepares the injection site, administers the vaccine, and applies a bandage to the injection site. The patient is then monitored for potential anaphylaxis response to the vaccine.

12. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

13. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

14. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

15. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

16. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

17. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

18. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

19. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

N/A

20. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

N/A

21. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

N/A

22. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?

a. If yes, please explain how the computer is used for this service(s).
b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

23. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment, please explain here:

The specialty societies included the following equipment items:

EF049 refrigerator, vaccine medical grade, 2-data logger single glass door
ED043 refrigerator, vaccine, temperature monitor w-alarm, security mounting w-sensors, NIST certificates

The specialties used the 'default' equipment formula for both EF049 and ED043.

PE-ONLY CODES ADDITIONAL INFORMATION

24. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

25. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

N/A

ADDITIONAL INFORMATION

26. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

Equipment
ED043: While its description begins with "refrigerator, vaccine," it is the temperature monitor with alarm for the vaccine medical grade refrigerator. The specialties do not have two vaccine refrigerators included as part of the recommendations.

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

NON-FACILITY DIRECT PE INPUTS **CPT CODE(S): 96380-96381**

SPECIALTY SOCIETY(IES): AAP, ANA

PRESENTER(S): Steven Krug, MD (AAP), Suzanne Berman, MD (AAP) , Korinne Van Keuren, DNP, APRN, NP-BC, RNFA (ANA)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Clinical Staff Activity CA005 (pre-service time) 3 minutes decreased to 0 minutes for 96380 and 96381 as this time is already captured in the associated E/M service.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

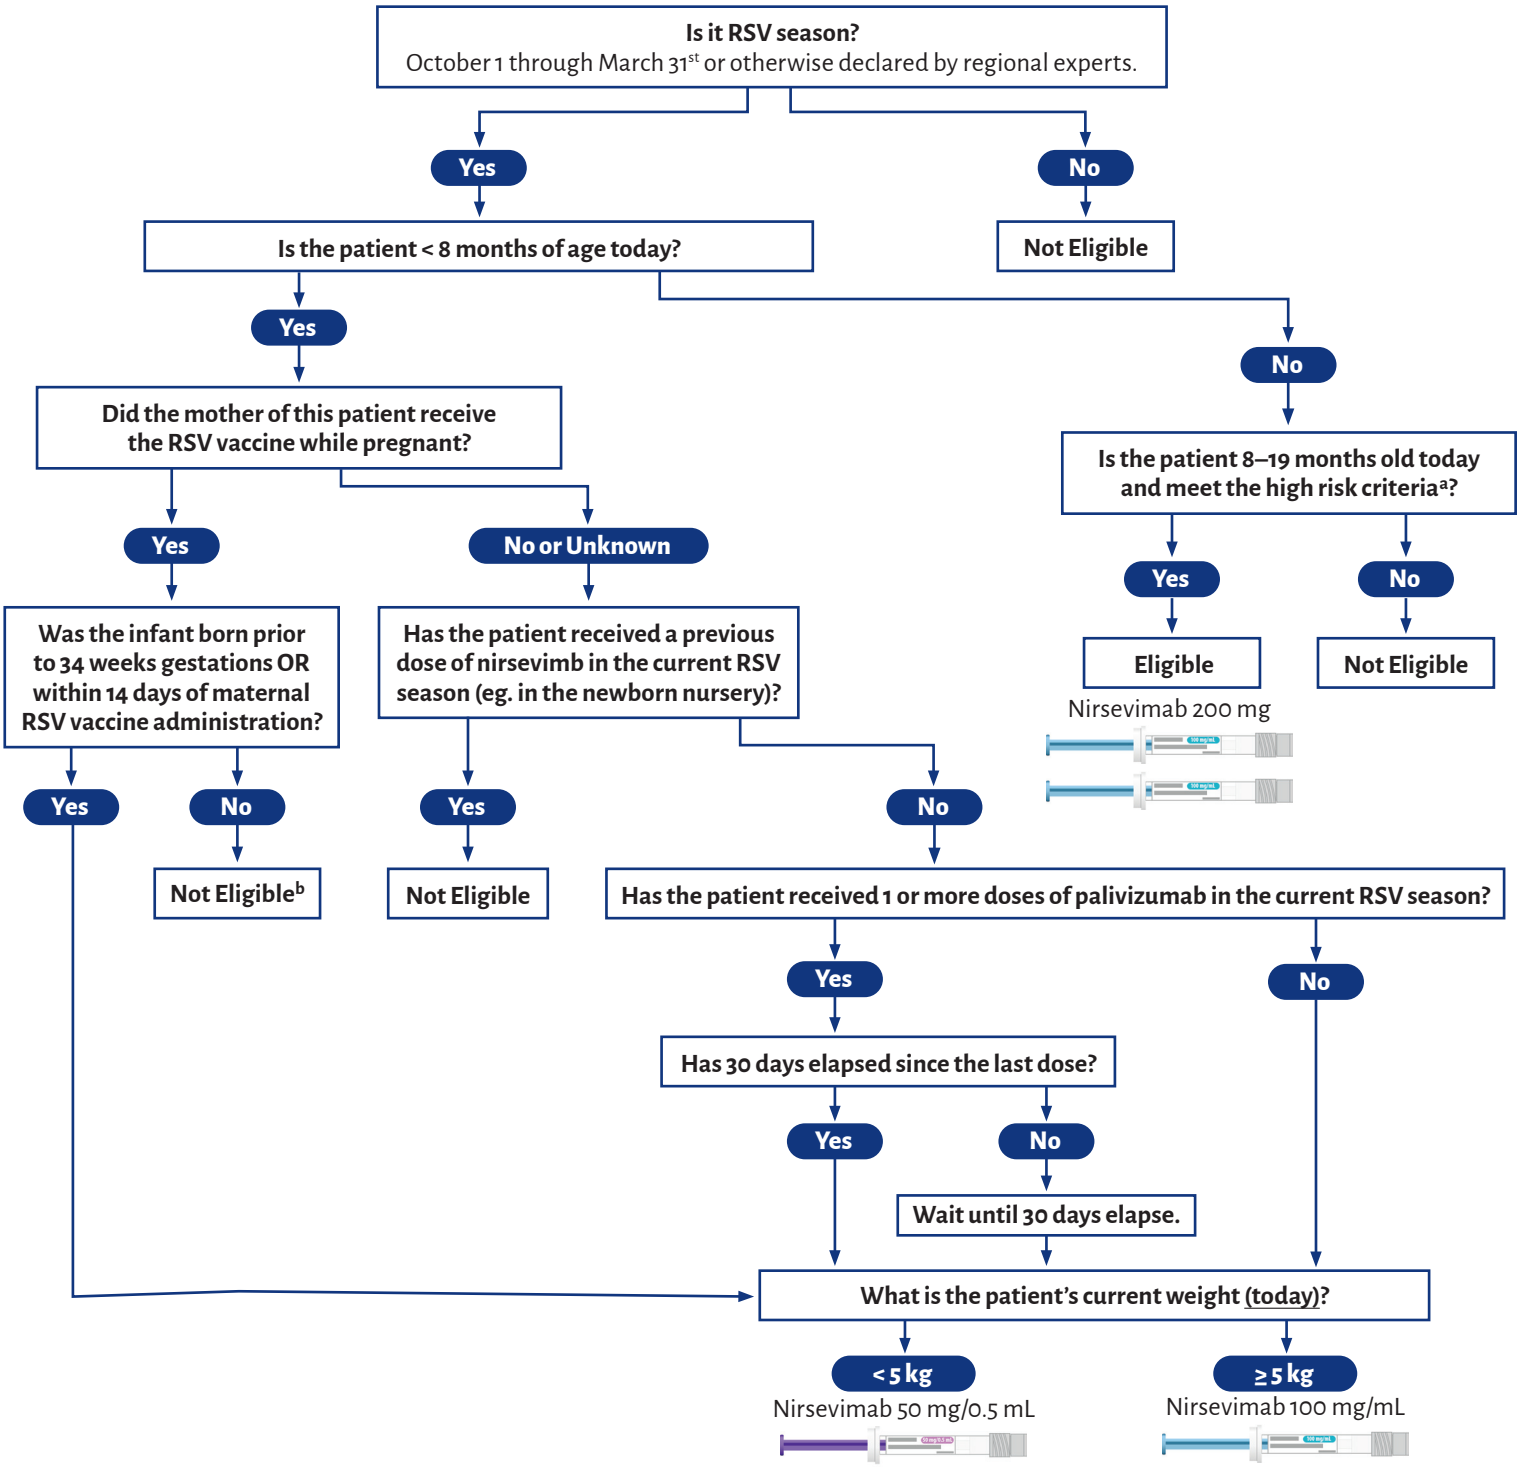
Nirsevimab Administration Visual Guide

American Academy of Pediatrics
DEDICATED TO THE HEALTH OF ALL CHILDREN®



a. Children 8 through 19 months of age who are recommended to receive nirsevimab when entering their second RSV season because of increased risk of severe disease.

- Children with chronic lung disease of prematurity who required medical support (chronic corticosteroid therapy, diuretic therapy, or supplemental oxygen) any time during the 6-month period before the start of the second RSV season.
- Children who are severely immunocompromised.
- Children with cystic fibrosis who have manifestations of severe lung disease (previous hospitalization for pulmonary exacerbation in the first year of life or abnormalities on chest imaging that persist when stable) or have weight-for-length that is <10th percentile.
- American Indian and Alaska Native children (note that this is a new group for whom second-season prophylaxis is recommended in contrast to the current palivizumab recommendations).

b. Nirsevimab can be considered in rare circumstances when, per the clinical judgment of the healthcare provider, the potential incremental benefit of administration is warranted:

- Infants born to pregnant people who may not mount an adequate immune response to vaccination or have conditions associated with reduced transplacental antibody transfer
- Infants who have undergone cardiopulmonary bypass, leading to loss of maternal antibodies
- Infants with substantial increased risk for severe RSV disease (eg, hemodynamically significant congenital heart disease, intensive care admission, and requiring oxygen at discharge).

Nirsevimab Administration Visual Guide (continued)

American Academy of Pediatrics
DEDICATED TO THE HEALTH OF ALL CHILDREN®

At the time of administration, affirm the 7 rights to reduce errors:

1. Right patient
2. Right time (age, in RSV season)
3. Right immunization (correct medication)
4. The right dosage (based on weight)
5. The right route, needle length, and technique
6. Right site

Intramuscular (IM) injection Use a 22–25 gauge needle. Choose the injection site and needle length that is appropriate to the person's age and body mass.		
Age	**Needle length**	**Injection site**
Newborns (1st 28 days)	⅝"[c]	Anterolateral thigh muscle
Infants (1–12 months)	1"	Anterolateral thigh muscle
Toddlers (1–2 years)	1–1¼"	Anterolateral thigh muscle[e]
	⅝[d]–1"	Deltoid muscle of arm

7. The right documentation

c. If skin is stretched tightly and subcutaneous tissues are not bunched.

d. Alternate needle lengths may be used if the skin is stretched tightly and subcutaneous tissues are not bunched, as follows: a) a ⅝" needle in toddlers, children, and patients weighing less than 130 lbs (less than 60 kg) for IM injection in the deltoid muscle only, or b) a 1" needle for administration in the thigh muscle for adults of any weight.

e. Preferred site

NOTE: Always refer to the package insert included with each biologic for complete vaccine administraation information. CDC's Advisory Committee on Immunization Practices (ACIP) recommendations for the particular vaccine should be reviewed as well. Access the ACIP recommendations at www.immunize.org/acip.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
New Technology/New Services

April 2024

Closure Left Atrial Appendage with Endocardial Implant – Tab 08

CPT code 33340 was created for CPT 2017 and was reviewed by the Relativity Assessment Workgroup (RAW) in 2023 as part of the new technology/new services screen. At that time, , the specialty societies noted that a new FDA indication was recently released, suggesting this service was still changing. The RAW recommended and the RUC agreed that the specialty societies should conduct a survey for the April 2024 RUC meeting. The delay would allow for the technology and indications to stabilize prior to survey.

33340 ***Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation***
The RUC recommends a work RVU of 10.25 based on a direct crosswalk to CPT code 49614 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), recurrent, including implantation of mesh or other prosthesis when performed, total length of defect(s); less than 3 cm, incarcerated or strangulated* (work RVU = 10.25, 75 minutes intra-service and 165 minutes total time), which maintains relativity within the Medicare Physician Payment Schedule (MFS). The RUC recommends 47 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 70 minutes intra-service time and 30 minutes immediate post-service time.

This service is typically performed on a patient under general anesthesia. The specialty societies added 7 minutes of pre-service evaluation time to the package as reflected by the survey, to include additional time for the operator to review cardiac CT images to fine-tune pre-procedure planning for placement of the occlusion device. This service is the transcatheter closure of the left atrial appendage, performed via a catheter. This is distinct from the surgical closure, which can be performed by surgeons using thoracoscopy. This service is exclusively performed in a hospital and the patient is typically discharged 1-2 days later.

The RUC noted that the survey 25th percentile work RVU of 16.00 is higher than the current value of 14.00 for CPT code 33340. However, the survey respondents indicated that the intra-service time has decreased by 20 minutes, from 90 to 70 minutes, with total time decreasing by 18 minutes since it was initially surveyed in 2016. Moreover, electrophysiologists, the physicians who typically report this service, indicated that the intra-service time typically requires 75 minutes to complete. The RUC noted that there are a limited number of 000-day surgical procedures with similar intra-service time.

For additional support, the RUC compared code 33340 to MPC code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU = 13.75 and 90 minutes intra-service time and 166 minutes total time), which requires

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

more time, thus valued higher; and MPC code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU = 10.42, 90 minutes intra-service time and 141 minutes total time), which also requires more time to performed than 33340, however is appropriately has a lower intensity because it is a less intense/complex procedure that does not involve working inside the heart across the septum.

The RUC determined that a crosswalk work value of 10.25 appropriately places CPT code 33340 relative to other services in the MFS based on time, work, intensity, and complexity. **Therefore, the RUC recommends a work RVU of 10.25 for CPT code 33340.**

Practice Expense
The Practice Expense Subcommittee noted that the specialties recommended the current existing facility only direct practice expense inputs for CPT code 33340 and made no modifications. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

Work Neutrality
The RUC's recommendation for these codes will result in overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
33340	Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation (Do not report 33340 in conjunction with 93462) (Do not report 33340 in conjunction with 93452, 93453, 93458, 93459, 93460, 93461, 93595, 93596, 93597, 93598, unless catheterization of the left ventricle is performed by a non-transseptal approach for indications distinct from the left atrial appendage closure procedure) (Do not report 33340 in conjunction with 93451, 93453, 93456, 93460, 93461, 93593, 93594, 93596, 93597, 93598, unless complete right heart catheterization is performed for indications distinct from the left atrial appendage closure procedure)	000	10.25

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old female with diabetes, hypertension, and congestive heart failure has nonvalvular paroxysmal atrial fibrillation. She has been taking anticoagulation therapy for two years and has had recurrent gastrointestinal bleeding requiring transfusion. She is referred for left atrial appendage occlusion

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 29% , Overnight stay-less than 24 hours 54% , Overnight stay-more than 24 hours 16%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 98%

Description of Pre-Service Work: The patient's history, records, and laboratory and diagnostic tests are reviewed. Appropriate communication is provided with the patient and family as well as other medical professionals as needed. Informed consent is obtained. The operative plan is reviewed with the anesthesiologist. The echocardiographer performs a baseline transesophageal echo (TEE) to assess anatomy and evaluate the left atrial appendage for possible thrombus. Next, the operator and echocardiographer review the pre-procedure CT scan and baseline TEE images to determine the optimal site for the transseptal puncture and for procedure planning and device sizing. The patient is positioned on the procedure table. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient.

Description of Intra-Service Work: A time-out occurs to confirm critical information, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances that might influence the procedure, is performed. Percutaneous venous access is obtained, typically through the femoral vein. A thin-walled needle is inserted percutaneously into the vein, through which a flexible guidewire is inserted into the vein. The needle is removed over the wire, a sheath/dilator system is inserted over the guidewire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Heparin bolus and infusion are administered to maintain the proper level of anticoagulation to minimize the risk of thrombus formation in the left atrium. An appropriate catheter is inserted over a wire through the venous sheath into the venous system and advanced under fluoroscopic guidance up to the superior vena cava. The wire is removed. A rigid transseptal puncture needle is carefully advanced through the catheter, stopping just short of the end of the catheter. The needle catheter unit is flushed and attached to a second pressure manifold and then withdrawn to the level of the fossa ovalis in the interatrial septum under fluoroscopic guidance. Using fluoroscopic, transesophageal echocardiography and intracardiac pressure guidance, a transseptal puncture is performed. Exquisite precision in placing the needle catheter unit is imperative as improper positioning can lead to puncture of the aorta or perforation through the atrial wall into the pericardium. Furthermore, the location of the transseptal puncture across the fossa ovalis must align with the patient’s left atrial appendage as viewed on the TEE in order to be able to deliver the closure device at the appropriate angle. Biplane TEE imaging is performed by the echocardiographer and displayed to the operator in real time in order to position the transseptal needle at the appropriate

transverse and sagittal plain. Failure to puncture the fossa at the appropriate location requires that a second puncture be performed to achieve the proper angulation in the left atrium to deliver the device to the left atrial appendage. Typically, the needle catheter unit may not be positioned properly on the first attempt, and one or more repositionings of the unit may be required. Each attempt requires removal of the needle, reinsertion of the guidewire, readvancement of the wire and catheter to the superior vena cava, removal of the wire, and reinsertion of the needle. Once successful positioning is achieved, the needle catheter unit is advanced several millimeters across the interatrial septum to the left atrium while observing the pressure waveform. Once the transseptal puncture is achieved, left atrial position is confirmed by pressure waveform analysis, oxygen saturation measurement, and contrast injection through the system. If the needle catheter unit has not traversed the septum properly, complications are excluded and then the device is repositioned and a repeat attempt is performed until successful. Once the needle is confirmed to be safely in the left atrium, the transseptal dilator is advanced over the needle into the left atrium, the needle is withdrawn to the right atrial side, and the transseptal sheath is telescoped over the dilator into the left atrium. The transseptal needle is removed from the sheath/dilator apparatus, which is now in the left atrium. The dilator is then removed while infusing saline through it to minimize risk of air introduction. The access sheath and dilator are prepared and inserted over the guidewire into the left atrium. The dilator and wire are removed, and the pigtail catheter is inserted into the access sheath and into the left atrium/left atrial appendage under fluoroscopy. Left atrial appendage angiography is performed. The access sheath is advanced over the pigtail catheter into the left atrial appendage under fluoroscopic guidance, and the pigtail is removed. Fluoroscopy and contrast angiography are used to assess the anatomy of the LAA and to determine if it is multilobed. The echocardiographer uses TEE to measure the LAA ostium width and length in at least three to four views (0, 45, 90, 135). The appropriate-size implant, based on the maximum LAA ostium width, is recorded. The catheter used to deliver the LAA closure implant is prepped and inserted into the access sheath and advanced under fluoroscopic guidance into the left atrial appendage. The device is delivered into the left atrial appendage and assessed under fluoroscopy and TEE to confirm release criteria have been met. While observing under fluoroscopy, implant stability is confirmed by gently pulling back on the deployment knob and visualizing the proximal movement of the implant and the LAA. Appropriate implant size selection is confirmed by measuring the deployed diameter of the implant in situ using TEE. Finally, contrast is injected through the delivery sheath to the os of the left atrial appendage to ensure that the appendage is fully sealed by the closure device. Once there criteria have been met, the device is released. Implant stability is again assessed under fluoroscopy and TEE. Images are reviewed to ensure no additional views are required before leaving the procedure suite. The echocardiographer separately performs TEE imaging to independently confirm release criteria have been met, to assess implant stability, and to ensure appropriate implant size selection. TEE is also used to assess for any evidence of a pericardial effusion. The patient is awakened from anesthesia by anesthesiology, transferred to a stretcher, and sent to recovery.

Description of Post-Service Work: The patient's procedural outcome is communicated to the family and referring physician(s). Orders are written, and an operative report is dictated. Prior to discharge, the patient is observed carefully to ensure there is no bleeding from the access site and no hemodynamic or rhythm instability to suggest a procedural complication. The patient is transferred to routine care once stable.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
93656	000	17.00	**RUC Time**

CPT Descriptor Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/recording, right ventricular pacing/recording, and His bundle recording, when performed

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
93581	000	24.39	**RUC Time**

CPT Descriptor Percutaneous transcatheter closure of a congenital ventricular septal defect with implant

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
37244	000	13.75	**RUC Time**	13,397

CPT Descriptor 1 Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
36906	000	10.42	**RUC Time**	8,498

CPT Descriptor 2 Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit

Other Reference CPT Code	Global	Work RVU	Time Source
92941	000	12.31	**RUC Time**

CPT Descriptor Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single vessel

---

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 68 **% of respondents:** 27.5 **%**

Number of respondents who choose 2nd Key Reference Code: 55 **% of respondents:** 22.2 **%**

TIME ESTIMATES (Median)

	CPT Code: 33340	Top Key Reference CPT Code: 93656	2nd Key Reference CPT Code: **93581**
Median Pre-Service Time	65.00	53.00	30.00
Median Intra-Service Time	70.00	180.00	180.00
Median Immediate Post-service Time	30.00	30.00	60.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Median Total Time	**165.00**	**263.00**	**270.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	12%	35%	38%	15%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	38%	56%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	9%	56%	35%
Physical effort required	25%	57%	18%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	3%	26%	71%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	5%	24%	45%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	33%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	4%	35%	62%
Physical effort required	5%	49%	46%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	20%	74%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 33340 that describes the work of closing the left atrial appendage through deployment of an occlusion device via a catheter was identified by the RUC for review under the new technology screen. During RAW discussions at the April 2023 meeting, review was deferred one year to allow technology to further stabilize before a survey.

A joint RVS panel of ACC, SCAI, and HRS members reviewed the survey data. The panel reviewed the preservice time and selected package 4 for a difficult patient/procedure with sedation. The service is performed general anesthesia. We recommend an additional 7 minutes of preservice evaluation time, as reflected by the survey, to include additional time for the operator to review cardiac CT images to fine-tune pre-procedure planning for placement of the occlusion device. We recommend postservice package 9B for a complex procedure with 3 minutes removed to align with the survey response. The service is exclusively performed in a hospital and the patient is typically sent home 1-2 days later.

The key reference service is 93656, comprehensive EP study and ablation for atrial fibrillation. The key reference was selected by 68 survey respondents, or 28% of respondents. The second key reference is a transcatheter congenital service. 55 respondents, or 22%, selected closure of a ventricular septal defect as a reference code. Respondents who selected the key reference services indicated 33340 to be more intense/complex than the key reference services for most metrics.

We have included on the SOR 000 global MPC code 37244 at 13.75 work RVUs as a helpful comparison that is a longer service with a higher value and 36906 at 10.42 RVUs that is also a longer service but one that would appropriately be less intense/complex because it's not working inside the heart across the septum.

While the survey showed an increase in wRVU, time went down from the original survey by 20 minutes. Electrophysiologists that responded to the survey reported a median time of 75 minutes while interventional cardiologists reported a median time of 60 minutes. We discovered no compelling evidence argument to suggest both a drop in time and increase in work RVU would be appropriate. To account for this decrease in time, the societies recommend a crosswalk to 92941 with 12.31 wRVUs and an intraservice time of 70 minutes. We believe this value acknowledges a reduction in time while recognizing the significant intensity of the work to deploy this transcatheter intracardiac therapy. We also recognize that 92941 is a service under review at this meeting but were unable to identify any other appropriate crosswalk. That makes our final recommendation 12.31 RVUs from a crosswalk to 92941 with times of 65 minutes preservice that includes 7 minutes additional time for reviewing additional CT images with 5 minutes removed for SDW from preservice package 4, 70 minutes intraservice, and 30 minutes postservice from the survey with 3 minutes removed from postservice package 9B.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33340

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Interventional Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 110000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Double FFS-based estimate below to account for cases in MA and commercial insurance.

Specialty Electrophysiology Frequency 54500 Percentage 49.54 %

Specialty Cardiology Frequency 26500 Percentage 24.09 %

Specialty Interventional Cardiology Frequency 26000 Percentage 23.63 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 55,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Anticipating additional growth from 2022 utilizatino of 39,210 as AF continues to be a key problem for the aging population.

Specialty Electrophysiology Frequency 27250 Percentage 49.54 %

Specialty Cardiology Frequency 13250 Percentage 24.09 %

Specialty Interventional Cardiology Frequency 13000 Percentage 23.63 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33340

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SS Rec Summary

FACILITY DIRECT PE INPUTS **CPT CODE(S):__33340_____**
SPECIALTY SOCIETY(IES):_ACC, HRS, SCAI__
PRESENTER(S):_Wright, Tuohy, Slotwiner, Schoenfeld, Tariq____

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: April 2024

CPT Code	Long Descriptor	Global Period
33340	Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation	000

Vignette(s) (*vignette required even if PE only code(s)*):

CPT Code	Vignette
33340	A 76- year-old female with diabetes, hypertension, and congestive heart failure suffering from non-valvular paroxysmal, persistent, or permanent atrial fibrillation (AF) requires long term anticoagulant therapy. She is eligible for anticoagulation, but due to her general frailty and risk for falls, her physicians are concerned about the potential for long term bleeding complications. Left atrial appendage closure with an implantable device is recommended.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A specialty panel representing cardiology, cardiac electrophysiology, and interventional cardiology discussed the practice expense inputs for 33340.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   Existing code 33340

   NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?

   No

   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

   N/A

   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure).

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

No

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

The existing inputs for 33340 were developed in comparison to 93580. In 2016, the RUC agreed with these recommendations to apply contemporaneous PE Subcommittee standards for a 0-day facility service with extensive use of clinical staff time, similar to key reference code 93580. The specialty panel reviewed these inputs and agreed that the current inputs remain valid to describe the preservice work clinical staff execute to coordinate care for a transcatheter therapy that constitutes a major surgical procedure. These inputs total half of those for clinical staff time for a 90-day global surgery in a facility.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

-Complete pre-service diagnostic and referral forms -Coordinate pre-service surgery services -Schedule space and equipment in facility -Provide pre-service education/obtain consent -Follow-up phone calls and prescriptions

   b. Service period (includes pre, intra and post):

   c. Post-service period:

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

14. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

FACILITY DIRECT PE INPUTS **CPT CODE(S):__33340_____**
SPECIALTY SOCIETY(IES):_ACC, HRS, SCAI__
PRESENTER(S):_Wright, Tuohy, Slotwiner, Schoenfeld, Tariq____

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Growth

April 2024

Biofeedback Training – Tab 9

In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 90901 via the high-volume growth screen for codes with 2021 Medicare utilization of 10,000 or more that increased by at least 100% from 2016 through 2021. In September 2023, the Workgroup reviewed the action plan for CPT code 90901 and agreed with the specialty societies that 90901, along with the other services in this code family (90912 and 90913) should be surveyed for the April 2024 RUC meeting.

However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the code family through the CPT process before surveying. The specialty societies noted that the current code descriptor for CPT code 90901 is not well understood based on their review of past RUC rationales for valuation, claims data, and the vignettes used for review in 1995 and 1996 by the RUC and RUC HCPAC Review Board. In the 1995 RUC rationale, the vignette described 45–60-minute sessions (and brief 30-minute sessions) and included information about psychiatrists and psychologists, though it is unclear who was surveyed. However, the 1996 RUC rationale of the HCPAC review was based on a different vignette and surveyed by physical therapists, which led to a reduction of the work RVU from 0.89 to 0.41 based on a comparison to a time-based therapy code, CPT code 97110. The specialty societies note that although 90901 is not time-based, the comparison for the current value was to a 15-minute time-based code despite the current intra-service time being 45 minutes. In their letter to request a referral to CPT for this code family, the specialty societies proposed revising the code descriptor for CPT code 90901 to be consistent with other physical therapy time-based and modality codes, as well as similar to other biofeedback training codes. Additionally, code descriptor clarification may resolve the continued confusion about the intent and correct coding for 90901. **The RUC recommends that CPT codes 90901, 90912 and 90913 be referred to the September 2024 CPT Editorial Panel meeting for revision. The specialties anticipate a requested global period change for CPT codes 90901 and 90912 from a 010 to a 000-day global at the time of revision due to a change in patient population and specialties that perform the services.**

Chicago, IL 60611

Subject: Tab 9, Biofeedback Training

Dear Dr. Silva:

The APTA, ACOG, and AUA request that CPT code 90901 be referred to CPT for revision prior to survey of codes 90901, 90912, and 90913. After reviewing the vignettes used for review of 90901 in 1995 and 1996, along with the RUC rationales for valuation, and claims data, we have determined that the current code descriptor is not well understood.

Code 90901 (renumbered from code 90915) was first reviewed in 1995. The vignette described 45-60 minutes sessions, with a brief session being 30 minutes. The RUC rationale for the 1995 review includes information about psychiatrists and psychologists (the survey society states psychology)—we are not certain who surveyed:

> *The psychiatrists noted that the biofeedback codes 90900 and 90915* [now 90901] *had never been surveyed before. The psychiatrists also noted that the use of biofeedback by a psychologist is part of integrated behavioral therapy coupled with a psychotherapy component. This procedure is not performed in a group setting and typically requires 50 minutes of individual face-to-face time. The specialty society noted that there seems to be some confusion between biofeedback training and biofeedback therapy. Based on their survey results, the psychiatrists recommended an increased RVU for 90900 and 90915* [now 90901]*, which represent the survey medians for both codes. The RUC was concerned about the confusion regarding the difference between biofeedback training and biofeedback therapy. The RUC suggested that the psychiatrists refer this issue to CPT for action now, or in the near future. At this time the RUC agreed to maintain the current values of the biofeedback codes 90900 and 90915* [now 90901]. *This recommendation is based on the Harvard work and time data for these procedures and the consistency of the current values within the family of codes. (This code was renumbered from 90915 to 90901)*

The RUC rationale for the 1996 review by HCPAC, based on a different vignette and surveyed by 20 physical therapists, appears to have considered a CMD five-year-review comment and comparison to a timed therapy code. This resulted in a reduction of the work RVU from 0.89 to 0.41 [based on 1995 work RVUs for 97110].

> *The RUC HCPAC Review Board accepted a recommendation from physical therapists to reduce the current value for biofeedback which is similar to the work RVU proposed in the CMD comment in the five-year review. 90901 is similar in work to 97110 [Therapeutic procedure; one or more areas, each 15 minutes; therapeutic exercises to develop strength and endurance, range or motion or flexibility].*

Although code 90901 is not time-based, the comparison for the current value was to a 15-minute time-based code and the current intra-time is 45 minutes.

As there is confusion about the time component for code 90901 from the prior HCPAC and RUC reviews, the APTA proposes to revise the code descriptor to be consistent with other physical therapy time-based therapy and modality codes and similar to other biofeedback training codes. In addition, there appears to be continued confusion about when to report code 90901 that may required additional code descriptor clarification. For example, three of the top five diagnoses codes are related to psychological disorders where biofeedback therapy should be reported with codes 90875-90876, per CPT instructions. Code descriptor changes should resolve the intent and correct coding of 90901 for biofeedback training.

The APTA will submit a code change application by the June 2024 deadline for the Sep 2024 CPT meeting. After CPT Panel review and edits, a survey of the new/revised codes will be conducted for the January 2025 RUC meeting which would still be in the same CPT cycle. The other two codes, 90912 and 90913 would be surveyed at the same time since we do not know if the CPT Panel may want to make further changes to these codes to further differentiate them from 90901.

We appreciate you consideration of this request.

Sincerely,

Richard Rausch, DPT

Subject: HCPAC Review Board Recommendations

Dear Administrator Brooks-LaSure:

The RUC Health Care Professionals Advisory Committee (HCPAC) Review Board submits the enclosed recommendation to the Centers for Medicare and Medicaid Services (CMS). At the April 25, 2024 meeting, the following issue was reviewed by the HCPAC:

- Hearing Device Services (92628, 92629, 92631, 92632, 92634, 92635, 92636, 92637, 92638, 92639, 92641, 92642)

The RUC and HCPAC are fully committed to this ongoing effort to improve relativity in the work, practice expense, and professional liability insurance values. The HCPAC appreciates the opportunity to provide recommendations related to the 2026 Medicare Physician Payment Schedule. If you have any questions regarding this submission, please contact Katlyn Palmer (ph: 312-464-5576; email: Katlyn.Palmer@ama-assn.org) at the AMA for clarification regarding these recommendations.

Sincerely,

Peter Hollmann, MD
HCPAC Chair

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2024

Hearing Device Services – Tab 10

At the February 2024 CPT Editorial Panel meeting, 12 new Category I codes were created to report hearing devices services (eg, air-conduction hearing aids) including hearing aid candidacy determination, hearing aid selection, hearing aid fitting, follow-up after fitting, hearing aid verification, and assistive-device services. The current CPT codes, 92590-92595, are recommended for deletion. It is important to note that codes 92590-92595 are considered non-covered services by CMS. Therefore, the RUC database reflects minimal data related to the delivery and utilization of these services. Given the current status of Medicare coverage, CPT codes 92590-92595 have never been surveyed by the RUC HCPAC Review Board. CPT codes 92628-92642 were reviewed at the April 2024 RUC HCPAC meeting.

92628 ***Evaluation for hearing aid candidacy, unilateral or bilateral, including review and integration of audiologic function tests, assessment, and interpretation of hearing needs (eg, speech-in-noise, suprathreshold hearing measures) discussion of candidacy results, counseling on treatment options with report, and, when performed, assessment of cognitive and communication status; first 30 minutes***
92629 ***Evaluation for hearing aid candidacy, unilateral or bilateral, including review and integration of audiologic function tests, assessment, and interpretation of hearing needs (eg, speech-in-noise, suprathreshold hearing measures) discussion of candidacy results, counseling on treatment options with report, and, when performed, assessment of cognitive and communication status; each additional 15 minutes (List separately in addition to code for primary procedure)***
92631 ***Hearing aid selection services, unilateral or bilateral, including review of audiologic function tests and hearing aid candidacy evaluation, assessment of visual and dexterity limitations, and psychosocial factors, establishment of device type, output requirements, signal processing strategies and additional features, discussion of device recommendations with report; first 30 minutes***
92632 ***Hearing aid selection services, unilateral or bilateral, including review of audiologic function tests and hearing aid candidacy evaluation, assessment of visual and dexterity limitations, and psychosocial factors, establishment of device type, output requirements, signal processing strategies and additional features, discussion of device recommendations with report; each additional 15 minutes (List separately in addition to code for primary procedure)***
92634 ***Hearing aid fitting services, unilateral or bilateral, including device analysis, programming, verification, counseling, orientation, and training, and, when performed, hearing assistive device, supplemental technology fitting services; first 60 minutes***
92635 ***Hearing aid fitting services, unilateral or bilateral, including device analysis, programming, verification, counseling, orientation, and training, and, when performed, hearing assistive device, supplemental technology fitting services; each additional 15 minutes (List separately in addition to code for primary procedure)***
92636 ***Hearing aid post-fitting follow-up services, unilateral or bilateral, including confirmation of physical fit, validation of patient benefit and performance, sound quality of device, adjustment(s) (eg, verification, programming adjustment(s), device connection(s), and device training), as indicated, and, when performed, hearing assistive device, supplemental technology fitting services; first 30 minutes***

92642 ***Hearing assistive device, supplemental technology fitting services (eg, personal frequency modulation (FM)/ digital modulation (DM) system, remote microphone, alerting devices)***

The RUC HCPAC Review Board reviewed the recommendation from the specialty societies to contractor price all 12 of the new hearing device services codes. The recommended codes for deletion to report hearing aid services (92590-92595) are currently non-covered by Medicare. The specialty societies noted that since these services, which are predominantly performed by audiologists, are either noncovered services for commercial payers or statutorily excluded services for government health care programs they should be contractor priced. Further, existing payment models for hearing aid services are varied, and may be bundled into payments for hearing aids. The RUC HCPAC Review Board agreed with the recommendation of contractor pricing for all 12 codes.

The RUC HCPAC Review Board recommends contractor pricing for CPT codes 92628, 92629, 92631, 92632, 92634, 92635, 92636, 92637, 92638, 92639, 92641, 92642.

Evaluative and Therapeutic Services

Codes 92601 and 92603 describe post-operative…

(For placement of cochlear implant, use 69930)

Codes 92622, 92623 describe the analysis, programming…

Codes 92628-92642 describe services primarily related to air-conduction hearing aids for the treatment of sensorineural, mixed, and conductive hearing loss. Following a diagnosis of hearing loss, this set of codes would apply to the full range of services specific to air-conduction hearing aids. These services fall into six major categories: 1) Hearing aid candidacy determination; 2) hearing aid selection; 3) hearing aid fitting; 4) follow-up services after fitting; 5) verification; and 6) assistive-device services. Objective verification is typically performed at the time of either fitting or post-fitting follow-up, and it can be performed through behavioral verification, probe-microphone measurement and/or electroacoustic analysis. Each technique constitutes significantly different work and practice expense. Codes 92628, 92629, 92631, 92632, 92634, 92635, 92636, 92637, 92638 are unilateral or bilateral. Codes 92639, 92641 represent services performed on both ears, and modifier 52 must be appended if the service is only performed on one ear.

Codes 92638, 92639, 92641 represent the three different methods of objective verification and may be reported concurrently with 92634, 92635, 92636, 92637.

Codes 92634, 92635, 92636, 92637, 92638, 92639 are not intended for use with implantable or osseointegrated hearing devices. However, these codes may be reported when providing air conduction hearing aid services to an ear on the same date of service that implantable or osseointegrated device services are provided to the contralateral ear. Electroacoustic analysis verification (92641) can be performed by itself or

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

with other types of hearing devices, such as frequency modulated/digitally modulated technology or osseointegrated devices. Code 92642 describes fitting services for hearing assistive supplemental technology.

The table below lists the major categories of service, their associated codes, and assigned times:

Code	**Service**	**Time in code (minutes)**	**Minimum time to report (minutes)**
92628	Evaluation for hearing aid candidacy	30	16-37
+92629	Evaluation for hearing aid candidacy	15	Each additional 15 minutes starting at 38 minutes
92631	Hearing aid selection	30	16-37
+92632	Hearing aid selection	15	Each additional 15 minutes starting at 38 minutes
92634	Hearing aid fitting	60	31-67
+92635	Hearing aid fitting	15	Each additional 15 minutes starting at 68 minutes
92636	Hearing aid post-fitting follow-up services	30	16-37
+92637	Hearing aid post-fitting follow-up services	15	Each additional 15 minutes starting at 38 minutes
+92638	Behavioral verification	Not time-based	Not time-based
+92639	Probe-microphone verification	Not time-based	Not time-based
92641	Electroacoustic analysis verification	Not time-based	Not time-based
92642	Hearing assistive devices services	Not time-based	Not time-based

★*92601* *Diagnostic analysis of cochlear implant, patient younger than 7 years of age; with programming*

…

92626 *Evaluation of auditory function for surgically implanted device(s) candidacy or postoperative status of a surgically implanted device(s); first hour*

RE: Hearing Device Services (Tab 31)

Dear Doctor Silva:

On behalf of the American Academy of Audiology (AAA) and the American Speech-Language-Hearing Association (ASHA), we write to address Hearing Device Services (Tab 31), which was recently approved at the February 2024 CPT Editorial Panel meeting and forwarded to the RUC for valuation. We appreciate the collaborative efforts undertaken to define the clinical services related to hearing aid candidacy, selection, fitting and related services and would like to provide an update regarding our level of interest (LOI) in surveying this updated set of codes. **AAA and ASHA respectfully submit an LOI of 2 for Hearing Device Services (Tab 31) and appreciate the opportunity to outline our rationale for declining to survey this important code set.**

Hearing aid services (CPT codes 92590-92595), which are predominantly performed by audiologists, are currently carrier priced because they often fall into the category of either non-covered services (for commercial payers) or statutorily excluded services (for government health care programs such as Medicare Part B). In addition, existing payment models for hearing aid services are varied, and may be bundled into payments for hearing aids. Therefore, we believe it necessary for audiologists performing these services to engage directly with payers to educate them regarding the modernized code set and determine reasonable payment rates.

Given the complexities surrounding payment for hearing aid services, we propose that these services continue to be carrier-priced to ensure consistent reimbursement rates across the various health care settings, payer types, and variable practice patterns and payment models.

Thank you for considering our request to identify the codes for hearing device services as carrier priced. If you or your staff have any questions, please contact Denise Garris, AAA Payment Policy Advisor, at dgarris@korrisgroup.com, and Neela Swanson, ASHA senior director of health care and education policy, at nswanson@asha.org.

Sincerely,

Paul M. Pessis, AuD
