

Three-dimensional Radiotherapy for Patients with Prostate Cancer

*This measure is to be reported **each time** an external beam radiotherapy to the prostate procedure is performed for all male patients, regardless of age, with clinically localized prostate cancer during the reporting period.*

Measure description

Percentage of patients, regardless of age, with prostate cancer receiving external beam radiotherapy to the prostate only (no metastases) who receive 3D-CRT or IMRT

What will you need to report for each male patient with clinically localized prostate cancer receiving external beam radiotherapy for this measure?

If you select this measure for reporting, you will report:

- The region of external beam radiotherapy (ie, to prostate only or to region(s) other than the prostate)

If the patient received external beam radiotherapy to prostate only, you will then need to report:

- Whether or not the patient received three-dimensional conformal radiotherapy (3D-CRT) or intensity modulated radiation therapy (IMRT)

What if this process or outcome of care is not appropriate for your patient?

Some measures provide an opportunity for the physician or non-physician provider to document when a process or outcome of care is not appropriate for a given patient (also called performance exclusions). Because this measure is applicable to most if not all patients, there are no allowable performance exclusions.
