Patients can take these steps to lower their high blood pressure

Mar 4, 2022

High blood pressure is typically symptomless, can quietly damage blood vessels and leads to serious health problems. While there is no cure for high blood pressure, it is important for patients to take steps that matter, such as making effective lifestyle changes and taking BP-lowering medications as prescribed by their physicians. In turn, those changes can enhance their quality of life and reduce their risk of heart and kidney disease, stroke and more.

The AMA’s What Doctors Wish Patients Knew™ series gives physicians a platform to share what they want patients to understand about today’s health care headlines, especially throughout the COVID-19 pandemic.

Here is a to-do list for patients drawn from this series on what doctors wish patients knew about addressing—and managing—high blood pressure, a condition that nearly half of adults in the United States have, and the primary or contributing cause of death for more than 516,000 people in the country.

1 Measure your BP at home
   Nearly half of adults in the United States have high blood pressure—and many don’t have their hypertension under control. But when patients measure their blood pressure regularly, and share those measurements with their doctors, they are playing an important role in their care.

   Here is what patients need to know about taking their own blood pressure measurements outside of the clinical setting, also commonly referred to as self-measured BP.

2 Make appropriate lifestyle changes
There is a growing need for people to commit to making lifestyle changes to help prevent chronic conditions such as type 2 diabetes and heart disease, yet patients are often uncertain of what changes they should make to improve their health and well-being. This article outlines some of the key changes patients should make.

3 Eat healthful food when you can
What you eat plays a leading role in your health and well-being. When someone eats healthfully, it helps to protect against many chronic diseases such as heart disease, type 2 diabetes and obesity. But with so many fad diets and food recommendations out there, it can be hard for patients to navigate what to eat and what not to eat. Two physicians offer realistic, tested advice on healthful eating.

4 Avoid unhealthy alcohol use
Disrupted routines combined with the uncertainty of the pandemic have led many people to feeling isolated at home while experiencing greater stress.

As a result, some people became their own bartenders and progressed into heavier drinking patterns to cope with pandemic anger, stress and anxiety. Learn when drinking is a problem, and what can be done about it.

5 Use medications to reach BP goals
While “lifestyle change is very beneficial for reducing blood pressure, many patients need medication to reach their BP goal,” according to Neha Sachdev, MD, a family physician who is the director of health systems relationships at the AMA. “Your doctor and you should talk about what medications are being prescribed and how the medications work to lower your BP.”

6 Watch your sodium consumption
While sodium is an essential nutrient, most people consume too much and are not even aware they are doing so. Excess sodium can increase a person’s risk for developing high BP. That is why it is important to understand where most salt intake is coming from and how to lower it. Learn more about where sodium resides and which choices to make to
7 Be mindful of your cholesterol

High cholesterol and high blood pressure tend to run together. But, while one does not necessarily cause the other, it is common to see both in an individual. Nearly 94 million adults over the age of 20 have what could be considered borderline high cholesterol, yet as with hypertension many patients are unaware of it until they visit their doctor. Sorting through the good, the bad and the ugly about high cholesterol can be confusing. One family physician explains what to keep in mind.

The AMA has developed online tools and resources created using the latest evidence-based information to support physicians and care teams to help manage their patients’ high blood pressure.

These resources are available to all physicians and health systems as part of Target: BP™, a national initiative co-led by the AMA and American Heart Association.
