New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
010-Day Global Post-Operative Visits Screen

January 2016

Bone Biopsy

In January 2014, CPT code 20245 was identified by the 010-Day Global Post-Operative Visits Screen and code 20240 was added as a family code for review of physician work and practice expense. In September, the RUC requested and CMS approved to change the global period from a 010-day global to a 000-day global for both CPT code 20240 and 20245 and the specialty societies presented survey data at the January 2015 meeting. At the January 2015 RUC meeting, the RUC approved a physician work value for 20240. However, CPT code 20245 was not reviewed and was referred to the Research Subcommittee to approve a new survey sample. Under further review, the specialty societies determined that the code should be submitted to the CPT Editorial Panel to revise the descriptor to better specify examples of a deep bone biopsy. The CPT Editorial Panel approved these changes at the October 2015 meeting and the specialty presented work values and practice expense at the January 2016 RUC meeting.

20240 ***Biopsy, bone, open; superficial (eg, sternum, spinous process, rib, patella, olecranon process, calcaneus, tarsal, metatarsal, carpal, metacarpal, phalanx)***

The RUC noted that the CPT descriptor changes to code 20240 were editorial, simply providing additional examples of superficial bones, including "calcaneus" which was included in the typical patient vignette. The CPT Editorial Panel and the RUC agreed that the edits did not change the inherent work involved in the service. Therefore, the RUC re-affirmed the recommendations made for this code at the January 2015 RUC meeting:

> The RUC reviewed the survey responses from 71 podiatrists and orthopaedic surgeons and recommend the following physician time components: pre-service time of 58 minutes, intra-service time of 30 minutes and immediate post-service time of 30 minutes. The RUC agreed that an additional 7 minutes of positioning time above the standard pre-service time package 3 (straightforward patient, difficult procedure) to place the patient in the prone position with attention to padding and tourniquet application prior to the procedure.
>
> The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty societies that the 25th percentile work RVU of 3.73 accurately values the physician work of CPT code 20240. To justify a work RVU of 3.73, the RUC compared the surveyed code to the key reference code 11044 *Debridement, bone (includes epidermis, dermis, subcutaneous*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

tissue, muscle and/or fascia, if performed); first 20 sq cm or less (work RVU= 4.10) and noted that the reference code has more intra-service time, 45 minutes compared to 30 minutes, and is correctly valued higher than code 20240. The RUC also reviewed MPC codes 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands* (work RVU= 3.50, intra-service time= 30 minutes) and 52224 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy* (work RVU= 4.05, intra-service time 30 minutes) and agreed that the recommended value for 20240 accurately fits between these two reference services. The RUC considered 13 recently reviewed 0-day global codes with 30 minutes of intra-operative time and noted that a majority of these codes are endoscopies (through a natural orifice) or percutaneous procedures through a vessel. These 13 0-day global codes provided additional support for the recommendation of 3.73 work RVUs for code 20240 as it transitions to a 0-day global period. **The RUC recommends a work RVU of 3.73 for CPT code 20240.**

20245 ***Biopsy, bone, open; deep (eg, humeral shaft, ischium, femoral shaft)***

The specialty societies presented compelling evidence that the previous valuation was flawed and was surveyed in error as a 90-day global code using a 90-day global reference service list which after RUC and CMS review resulted in almost zero intra-service work. That is to say the RUC and CMS corrected the work RVU, but not the visit details. The RUC agreed that the previous survey was flawed and also agreed that the current review should compare the physician work to other 0-day global codes for accurate relativity.

The RUC reviewed the survey results from 61 orthopaedic surgeons and agreed with the specialty societies on the following time components: pre-service time of 70 minutes, intra-service time of 60 minutes and immediate post-service time of 30 minutes. The RUC agreed that 12 minutes of positioning time above the pre-service time package (4- Facility, difficult patient, difficult procedure) was warranted to place the patient in the lateral decubitus position. This time has been previously approved for CPT code 27130 *Total hip arthroplasty* (reviewed by the RUC in 2012).

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey median of 6.50 work RVUs is appropriate for this procedure as a 0-day global code. To justify a work RVU of 6.50, the RUC compared the surveyed code to the second key reference code 20902 *Bone graft, any donor area; major or large* (work RVU= 4.58, intra time= 45 minutes) and noted that since code 20245 has 15 additional minutes of intra-service time, the recommended value apporpriately places the code higher than this reference code and maintains a similar intra-operative intensity. The RUC also reviewed 19 codes with a 000-day global period and 60 minutes of intra-time that were reviewed by the RUC and finalized by CMS between 2011 and 2015. and noted that a work RVU of 6.50 approximately fit in the middle of these services. Two additional reference codes that closely bracketed the recommended value are: 36247 *Selective catheter placement, arterial system; initial third order or more selective abdominal, pelvic, or lower extremity artery branch, within a vascular family* (work RVU= 6.29, intra time= 60 minutes) and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* (work RVU= 6.60, intra time= 60 minutes). Finally, the RUC discussed the decrease in intra-service time from the current time (90 minutes) to the survey time (60 minutes). It was explained that the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

current time was based on a survey of 35 indivdiuals over 15 years ago. Furthermore, due to the previous flawed survey, the resulting IWPUT was almost zero Given these discrepenacies, the survyed time of 60 minutes better reflects an appopriate level of intensity and complexity (IWPUT= 0.071) for this service relative to other 000-day global procedures. **The RUC recommends a work RVU of 6.50 for CPT code 20245.**

Practice Expense:
The Practice Expense Subcommittee discussed and approved the usual 000-day global inputs, with extensive use of the clinical staff supplemented by a telephone call. The RUC approved the modification as approved by the Practice Expense Subcommittee.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲20240	H1	Biopsy, bone, open; superficial (eg, ~~ilium~~, sternum, spinous process, rib~~s~~, ~~trochanter of femur~~, patella, olecranon process, calcaneus, tarsal, metatarsal, carpal, metacarpal, phalanx)	~~010~~ 000	3.73 (Reaffirmed January 2015 RUC Recommendation)
▲20245	H2	deep (eg, ~~humerus~~ humeral shaft, ischium, ~~femur~~, femoral shaft)	~~010~~ 000	6.50

Peter Smith, MD, FACS
Chair, AMA/RUC
American Medical Association
330 N. Wabash Ave.
Chicago, IL 60611

Subject: Tab 4 - Bone Biopsy

Dear Dr. Smith:

On behalf of the American Academy of Orthopaedic Surgeons (AAOS), American Orthopaedic Foot and Ankle Society (AOFAS), and American Podiatric Medical Association (APMA), we are writing in regards to code 20240 included in Tab 4 (Bone Biopsy) for the January 2016 RUC meeting.

In January 2014, the RUC reviewed 010-day global services (based on 2012 Medicare utilization data) and identified 18 services with greater than 1.5 office visits and 2012 Medicare utilization greater than 1,000. The RUC requested these services be surveyed for work and review the practice expense for the September 2014 RUC meeting. In September, the RUC requested and CMS approved to change the global period from a 010-day global to a 000-day global for both CPT code 20240 and 20245 and the specialty societies presented survey data at the January 2015 meeting.

Prior to reviewing code 20240, the specialty societies presented compelling evidence that the work value for code 20240 may be misvalued. The specialty noted that incorrect assumptions were made in the previous valuation of the service. The (then) current intra-service time was based on a Harvard study of 8 general surgeons, while the pre- and post-service times were derived from an algorithm. Furthermore, the Harvard survey of general surgeons no longer represented the current dominant provider (podiatry). The RUC agreed with the specialty societies that there was compelling evidence that code 20240 was potentially misvalued.

The RUC reviewed the survey responses for code 20240 from 71 podiatrists and orthopaedic surgeons. The RUC also reviewed the survey respondents' estimated physician work values and agreed with the specialty societies that the 25th percentile work RVU of 3.73 accurately values the physician work of code 20240 and correctly ranks it relative to other 0-day global services. To justify a work RVU of 3.73, the RUC compared the surveyed code to the key reference code 11044 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); first 20 sq cm or less* (work RVU= 4.10) and noted that 20240 should valued less than code 11044. The RUC also reviewed MPC codes 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands* (work RVU= 3.50, intra-service time= 30 minutes) and 52224 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy* (work RVU= 4.05, intra-service time 30 minutes) and agreed that the recommended value of 3.73 for 20240 accurately fits between these two reference services. The RUC then considered 13 recently reviewed 0-day global codes with 30 minutes of intra-operative time and noted that a majority of these codes are endoscopies (through a natural orifice) or percutaneous procedures through a vessel and not open procedures, and that these 13 0-day global codes provided additional support for the recommendation of 3.73 work RVUs for code 20240 as it transitions to a 0-day global period. **This recommendation was submitted to CMS. An interim final determination that decreased the recommendation using reverse building block was published for CY 2016 in the November 2015 final rule.**

During the discussion of code 20245, several concerns were raised by RUC members. First, the RUC was uncomfortable that the surveying specialties did not get Research Subcommittee approval to selectively target only members of the Musculoskeletal Tumor Society (MSTS). Second, there were questions about the typical

patient (malignant lytic lesion) for this service because the Medicare 5% sample file does not identify this diagnosis. Therefore, it was unclear whether or not the correct survey population was chosen and the correct vignette was used.

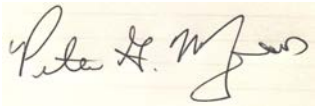
The AAOS' RUC advisors met with the CPT Advisors of AAOS, other orthopaedic subspecialties, and APMA to discuss the issues raised by RUC members and to determine how to address these issues moving forward. Specifically, the RUC questioned whether the patient vignette (open biopsy of the pelvis) was typical. The RUC also questioned whether the CPT descriptor was too general. The AAOS obtained additional data regarding diagnoses and determined that coding changes to the parentheticals in both codes 20240 and 20245 were necessary to make clear what bones were superficial and what bones were deep. The AAOS and APMA submitted a code change proposal to CPT which was reviewed at the October 2015 CPT meeting. The proposal revised the descriptor for 20245 to better clarify deep bone biopsy. In addition, the descriptor for 20240 was editorially revised to correct the parenthetical examples of bone for superficial biopsy, including the addition of calcaneus, which was used as the typical patient for 20240.

We did not resurvey code 20240 because the coding change was editorial, specifically adding calcaneus (and other superficial bones) to the descriptor at the request of a RUC member to reflect the typical patient that was surveyed.

2014 CPT Descriptor: 20240 Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur)

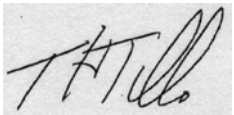
2014 Surveyed Patient: A 68-year-old diabetic with a history of a puncture wound presents with a hot, swollen, painful hindfoot. X-rays reveal a suspicious erosion on the plantar calcaneus. A core biopsy was non-diagnostic and a decision is made to perform an open bone biopsy of the **calcaneus**.

2016 CPT Descriptor: 20240 Biopsy, bone, open; superficial (eg, ~~ilium~~, sternum, spinous process, rib~~s~~, ~~trochanter of femur~~, patella, olecranon process, **calcaneus**, tarsal, metatarsal, carpal, metacarpal, phalanx)



A valid survey for code 20240 using the typical patient was conducted by all providers of the service and the survey results were reviewed by the RUC with a recommendation sent to CMS. The recent coding change to the descriptor's "eg" parenthetical was editorial and does not require re-survey. The typical patient has not changed. The work has not changed. The specialties that would survey would not be different.

We request that the RUC re-affirm its recommendation of 3.73 for code 20240 as the correct work RVU for this service relative to recently reviewed 0-day global codes. We also request that this code be marked "do not use to validate physician work" in the RUC database due to CMS's rejection of the RUC recommendation.



Sincerely,

William Creevy, MD
AAOS RUC Advisor

Peter Mangone, MD
AOFAS RUC Advisor

Timothy Tillo, DPM
APMA RUC Advisor

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20245 Tracking Number n/a Original Specialty Recommended RVU: **6.50**
Presented Recommended RVU: **6.50**
Global Period: 000 RUC Recommended RVU: **6.50**

CPT Descriptor: Biopsy, bone, open; deep (eg, humeral shaft, ischium, femoral shaft)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old male presents with a 3-month history of left pelvis pain with no preceding history of trauma. He was initially seen by his primary care physician and placed on pain medication with a presumptive diagnosis of bursitis. His pain became disabling requiring a wheelchair and x-rays were obtained which revealed a lytic lesion in the ischio-acetabular region of the left hemipelvis. An MRI scan confirmed the mass and demonstrated cortical destruction and soft tissue extension. A CT scan-directed needle biopsy was performed but revealed only blood with no diagnostic material. A bone scan was obtained which showed no other lesions except the left pelvic lesion. The decision was then made to proceed with an open biopsy of the pelvis.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 61% , Overnight stay-less than 24 hours 33% , Overnight stay-more than 24 hours 7%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 46%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review medical records with attention to imaging, pathology, and labs. Assure appropriate selection, timing, and administration of pre-surgical antibiotic. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available. The patient is positioned lateral decubitus. Bony prominences are padded and thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: A modified Gibson posterolateral incision is made. This is carried down through the skin and subcutaneous tissue and hemostasis is obtained. The fascia lata is then exposed and is incised longitudinally in line with its fibers. Hemostasis is then obtained and self-retaining retractors are placed in the wound. The trochanteric bursa is the divided longitudinally and the posterior portion is retracted posteriorly. The sciatic nerve is exposed and carefully dissected. A vessel loop is placed around the nerve to allow gentle retraction and the nerve is carefully protected throughout the procedure. The leg is internally rotated and the leading edge of the gluteus medius is identified. A rounded periosteal elevator is place below this muscle and the interval between the gluteus medius and piriformis is dissected. A right angle retractor is placed under the gluteus medius and it is retracted proximally. The piriformis muscle is incised along with the other external rotators and this muscle mass is retracted posteriorly thereby exposing the posterior wall of the acetabulum and ischium. An high-powered burr is then used to create a window posteriorly at the ischio-acetabular

junction. The surgeon's index finger is placed over the small cortical window to control excessive bleeding. Curettes are then used to obtain specimen from within the bone. This is placed in a specimen container and the window in the bone is packed with a surgical sponge. The specimen so obtained is then sent to the pathology department. The area is irrigated and bone cement is then prepared in the usual fashion. Bone cement is then inserted into the bone window to establish hemostasis. The incision is again irrigated and the wound is closed in multiple layers using nonabsorbable sutures in the deep tissues, absorbable sutures in the superficial tissues and staples in the skin.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.61	1.84
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.74	1.74
Urgency of medical decision making	0.48	1.74
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.00	0.79
Physical effort required	0.39	0.32

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.96	1.16
Outcome depends on the skill and judgment of physician	1.35	1.63
Estimated risk of malpractice suit with poor outcome	1.00	1.58

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.43	1.63

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, the RUC reviewed 010-day global services (based on 2012 Medicare utilization data) and identified 18 services with >1.5 office visits and 2012 Medicare utilization data over 1,000. Code 20245 was identified in this screen. After an initial survey that showed wide variability in postoperative care, the specialties requested a 0-day global period for both codes. CMS approved this request.

At the January 2015 RUC meeting, the AAOS presented survey data for the valuation of code 20245 as a 000-day global. However, the RUC did not accept the AAOS recommendations and instead requested the AAOS resurvey the code due to several concerns raised by RUC members. First, the RUC was uncomfortable that the surveying specialties did not get Research Subcommittee approval to selectively target only members of the Musculoskeletal Tumor Society (MSTS). Second, there were questions about the typical patient (malignant lytic lesion) for this service because the Medicare 5% sample file does not identify this diagnosis. Therefore, it was unclear whether or not the correct survey population was chosen and the correct vignette was used.

The AAOS' RUC advisors met with the CPT Advisors of AAOS and other orthopaedic subspecialties to discuss the issues raised by RUC members and to determine how to address these issues moving forward. Specifically, the RUC questioned whether the patient vignette (open biopsy of the pelvis) was typical. The RUC also questioned whether the CPT descriptor was too general. To assist with consideration of these issues, the AAOS requested additional Medicare utilization data through RUC staff and were provided these data. In looking at these data, it was apparent that code 20245 was being reported for some anatomic areas which are likely not appropriate for a deep bone biopsy code. To address correct coding concerns, the AAOS submitted a code change proposal to CPT which was review at the October 2015 CPT meeting. The proposal revised the descriptor for 20245 to better clarify deep bone biopsy. In addition, the descriptor for 20240 was editorially revised to correct the parenthetical examples of bone for superficial biopsy, including the addition of calcaneus, which was used as the typical patient for 20240.

Survey Vignette

The typical patient requiring a deep bone biopsy is not Medicare-aged and will have a lytic lesion and not infection. The vignette from the 2000 survey still represents the current patient and this vignette, approved by CPT, was used for the current survey. The diagnoses identified in 162 Medicare patients in the 2013 5% Medicare beneficiary file do not represent the typical national patient who undergo a bone biopsy. Further, with the editorial revision to code 20240 to add bones in the "eg," parenthetical, some of the current utilization for 20245 will correctly be reported with 20240.

Survey Process

The American Academy of Orthopaedic Surgeons (AAOS) and the Musculoskeletal Tumor Society (MSTS) sent a survey request to a random sample of 125 members from each society membership database. All 61 survey respondents indicated their specialty as orthopaedics. Of those 61 respondents, 11 indicated an additional specialty designation of musculoskeletal oncology.

Compelling Evidence

Flawed methodology for previous valuation. In 2000, code 20245 was surveyed in error as a 90-day global code using a 90-day global reference service list. The RUC recommended the survey 25th percentile (8.50) in comparison to a Harvard-based 90-day global code, which resulted in an IWPUT of 0.006 (**almost zero**). CMS disagreed with the RUC recommendation and instead crosswalked 20245 to 90-day global code 27635 (2000 RVW= 7.78), which resulted in a negative -0.002 IWPUT (**almost zero**). The survey global error and the RUC and CMS valuation resulting in near zero intra-work is unfortunate and resulted in a flawed work RVU that was not consistent with the global period and physician work related to this procedure.

Pre-Time Package 4 (Difficult Patient/Difficult Procedure)

Evaluation: No change in package time of 40 minutes.
Positioning: Add 12 minutes (total = 15 minutes) for positioning. A total of 15 minutes for lateral decubitus positioning is supported by CPT code 27130 Total hip arthroplasty (reviewed by the RUC in 2012).
Scrub, dress, wait: Subtract 5 minutes (total = 15 minutes) to be consistent with the median survey time.

Post-time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 3 minutes (total = 30 minutes) to be consistent with the median survey time.

Site of Service and Post-operative Visit

The Research Subcommittee approved the use of a modified 0-day global survey instrument that included the standard site-of-service question from the 10 and 90 day global survey. The results of this question indicate that the typical patient (lytic lesion) will outpatient and that an additional inpatient or observation EM visit is not typical. As stated above, the typical patient is not Medicare-aged, so although the Medicare utilization data indicate the typical patient will be inpatient, this is not the typical national patient.

Key Reference Comparison

The mean intensity / complexity measures for code 20245 are significantly greater than the key reference codes. This is especially true when comparing 20245 to 11012 where the intra-work includes the tedious and time-consuming task of debriding and removing small bits of grit or dirt.

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	PRE	INTRA	POST
20902	Bone graft, any donor area; major or large	4.58	0.068	123	58	45	20
20245	**Biopsy, bone, open; deep (eg, humeral shaft, ischium, femoral shaft)**	**6.50**	**0.075**	**160**	**70**	**60**	**30**
11012	Debridement including removal of foreign material at the site of an open fracture and/or an open dislocation (eg, excisional debridement); skin, subcutaneous tissue, muscle fascia, muscle, and bone	6.87	0.046	210	60	90	60

MPC Comparison

There is only one 0-day global MPC code with 60 minutes of intra-time.

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	PRE	INTRA	POST

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	PRE	INTRA	POST
52235	Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)	5.44	0.098	94	29	45	20

Comparison to Other Recently Reviewed 000-global Codes and Recommendation

Code 20245 is a major open procedure performed under general anesthesia in an operating room. Code 20245 is one of very few major procedures where CMS changed the global period to 000. As the RUC and CMS move forward to review and value 20245, we ask that consideration be given to the relativity of other recently reviewed codes with the same global period.

Family code 20240 is an example of what we believe to be an incomplete review by CMS. For CY2016, the value for code 20240 (changed to 000-global period) was finalized as 2.61. This value was calculated using a reverse building block to remove post-op visits from the current work RVU of 3.73 (which the RUC recommended). No consideration was given to the fact that the visits were derived from Harvard time for practice expense purposes. No consideration was given to an increase in pre-time. No consideration was given to the list of all codes that were reviewed by the RUC and CMS from 2010-2014 that had 30 minutes of intra-time and had a work RVU range of 3.50-4.79. The result was an intra-operative intensity of 0.028, equal to a nursing visit for a blood pressure check (99211, IWPUT = 0.027). In our opinion, this is not relativity. Math did not create the relative values established for the fee schedule (including 20240) and math should not be used to change the values for codes without showing relativity.

There are a total of 61 RUC-reviewed codes with a 0-day global and 60 minutes of intra-time. Of these 61 codes, 28 were reviewed recently (2011-2015). Nine of these 28 codes are cardiothoracic inpatient procedures that include a post-op hospital visit and have high work RVUs and are therefore not comparable to 20245. That leaves 19 codes with a 0-day global period and 60 minutes of intra-time that were reviewed by the RUC and finalized by CMS between 2011-2015. These codes, along with our recommendation for 20245, are presented in the table below.

Year	CPT	Long Descriptor	RVW	IWPUT	Total Time	EVAL	POSIT	SDW	INTRA	POST
2012	**31647**	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with balloon occlusion, when performed, assessment of air leak, airway sizing, and insertion of bronchial valve(s), initial lobe	4.40	0.054	**115**	19	1	5	**60**	30

2011	**52354**	Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with biopsy and/or fulguration of ureteral or renal pelvic lesion	8.00	0.110	**133**	33	5	15	**60**	20

Year	CPT	Long Descriptor	RVW	IWPUT	Total Time	EVAL	POSIT	SDW	INTRA	POST
2013	**43276**	Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged	8.94	0.123	**133**	33	10	5	**60**	25
2013	**93582**	Percutaneous transcatheter closure of patent ductus arteriosus	12.56	0.177	**156**	33	3	15	**60**	45

We recommend the survey median work RVU of 6.50. This relative value is supported by the key reference codes, the MPC codes, and recently reviewed 000-global codes with 60 minutes of intra-time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20245

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Current Medicare utilization from the RUC database indicates 3,424 allowed claims, however, almost 5% of the claims have office as the site of service and 15% of the claims in the 5% Medicare file are for chronic ulcer of skin - many of these claims will be reported using 20240 when the new CPT descriptors are published in 2017 and education is disseminated. Although the incidence of bone infection and bone lesions in any given year cannot be predicted, we anticipate the utilization for 20245 will decrease and the specialty mix will change. We only show an estimated utilization for orthopaedic surgery, but recognize other surgical specialties may provide this service. We do not believe that non-surgeons would typically be performing a deep bone biopsy and that the utilization from these providers for this code are based on miscoding that will (hopefully) change with education.

Specialty orthopaedic surgery Frequency 2200 Percentage 73.33 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

20245 Biopsy, bone, open; deep (eg, humerus, ischium, femur)

Global Period: 000 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 20245 and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. Current inputs for 20245 are used as reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The typical patient is a 60-year-old male with a 3-month history of left pelvis pain with no preceding history of trauma. He was initially seen by his primary care physician and placed on pain medication with a presumptive diagnosis of bursitis. His pain became disabling requiring a wheelchair and x-rays were obtained which revealed a lytic lesion in the ischio-acetabular region of the left hemipelvis.
Clinical staff will be used extensively prior to the procedure to perform the activities described below.

	FACILITY
Pre-Service Clinical Activities	Extensive use of Clinical Staff
Complete pre-service diagnostic and referral forms	5
Coordinate pre-service surgery services	10
Schedule space and equipment in facility	5
Provide pre-service education/obtain consent	7
Follow-up phone call and prescriptions	3
TOTAL	**30**

Service Clinical Labor Activities: N/A

Post-Service Clinical Labor Activities:
Clinical staff will contact the patient after discharge from the facility to reinforce discharge instructions and answer any family / patient questions about pain medications and activities.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
010-Day Global Post-Operative Visits Screen

January 2015

Bone Biopsy Excisional

In January 2014, the RUC reviewed 010-day global services (based on 2012 Medicare utilization data) and identified 18 services with greater than 1.5 office visits and 2012 Medicare utilization greater than 1,000. The RUC requested these services be surveyed for work and review the practice expense for the September 2014 RUC meeting. In September, the RUC requested and CMS approved to change the global period from a 010-day global to a 000-day global for both CPT code 20240 and 20245 and the specialty societies presented survey data at the January 2015 meeting.

Prior to reviewing CPT code 20240, the specialty society presented compelling evidence that the work value for CPT code 20240 may be misvalued. The specialty noted that incorrect assumptions were made in the previous valuation of the service. The current intra-service time is based on a Harvard study of 8 general surgeons, while the pre- and post-service times were derived from an algorithm. Furthermore, the Harvard survey of general surgeons no longer represents the dominant provider, which is now podiatry. The RUC agreed with the specialty societies that there is compelling evidence that CPT code 20240 is potentially misvalued.

20240 Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur)
The RUC reviewed the survey responses from 71 podiatrists and orthopaedic surgeons and recommend the following physician time components: pre-service time of 58 minutes, intra-service time of 30 minutes and immediate post-service time of 30 minutes. The RUC agreed that an additional 7 minutes of positioning time above the standard pre-service time package 3 (straightforward patient, difficult procedure) to place the patient in the prone position with attention to padding and tourniquet application prior to the procedure.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty societies that the 25th percentile work RVU of 3.73 accurately values the physician work of CPT code 20240. To justify a work RVU of 3.73, the RUC compared the surveyed code to the key reference code 11044 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); first 20 sq cm or less* (work RVU= 4.10) and noted that the reference code has more intra-service time, 45 minutes compared to 30 minutes, and is correctly valued higher than code 20240. The RUC also reviewed MPC codes 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands* (work RVU= 3.50, intra-service time= 30 minutes) and 52224 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy* (work RVU= 4.05, intra-service time 30 minutes) and agreed that the recommended value for 20240 accurately fits between these two

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

reference services. The RUC considered 13 recently reviewed 0-day global codes with 30 minutes of intra-operative time and noted that a majority of these codes are endoscopies (through a natural orifice) or percutaneous procedures through a vessel. These 13 0-day global codes provided additional support for the recommendation of 3.73 work RVUs for code 20240 as it transitions to a 0-day global period. **The RUC recommends a work RVU of 3.73 for CPT code 20240.**

20245 Biopsy, bone, open; deep (eg, humerus, ischium, femur)
During the discussion of CPT code 20245, the RUC noted several issues with the survey data. The specialty society explained that the survey sample was limited to a random sample of physician members of the Musculoskeletal Tumor Society (MSTS). This specialty was chosen since physicians in this society are more likely to perform this service than general orthopaedic surgeons. The RUC raised two concerns with this approach. First, the RUC was uncomfortable that the surveying specialties did not get Research Subcommittee approval to selectively target only members of the MSTS. Second, there were questions about the typical patient for this service. While the vast majority of survey respondents indicated that the typical patient has cancer, the Medicare 5% sample file does not indicate identification of a malignant lytic legion as any of the top diagnosis codes billed with 20245. Therefore, it was unclear whether or not the correct survey population was chosen.

In addition, the specialty societies indicated discomfort that this newly created 000-day global period service (previously 090-day) did not accurately value the work of the discharge day management service due to the use of the standard 000-day survey template. **The RUC agreed that CPT code 20245 should be referred to Research Subcommittee to approve a new survey sample which will incorporate a more general population and consider changes to the 000-day global survey template to better value the work of this major procedure. The specialty societies will present survey data at the April 2015 RUC meeting.**

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with no modifications as submitted by the specialty society and approved by the Practice Expense Subcommittee. The RUC notes the following:

- The RUC standard for 000-day and 010-day day codes is no pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that 30 minutes for facility-based procedures may apply to a select number of codes that require extensive use of clinical staff time. Although these two codes are transitioning to 000-day global assignment, both 20240 and 20245 are major procedures performed under general anesthesia. The specialty recommended and the RUC agreed that 30 minutes pre-service clinical staff work is justified.

Presented Recommended RVU: **3.73**
Global Period: 000 RUC Recommended RVU: **3.73**

CPT Descriptor: Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old diabetic with a history of a puncture wound presents with a hot, swollen, painful hindfoot. X-rays reveal a suspicious erosion on the plantar calcaneus. A core biopsy was non-diagnostic and a decision is made to perform an open bone biopsy of the calcaneus.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review medical records with attention to imaging, pathology, and labs. Assure appropriate selection, timing, and administration of pre-surgical antibiotic. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available. The patient is positioned prone. Bony prominences are padded and thermal regulation drapes are applied. The position of the extremities and head are assessed and adjusted as needed. Place tourniquet. Prep and drape foot. Inflate pneumatic tourniquet. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a linear incision is made on the plantar aspect of the heel. The soft tissues are inspected and debridement of non-viable tissue is performed as necessary. The calcaneus is exposed and a specimen of bone is obtained for biopsy. The site is copiously lavaged, hemostasis is obtained and the wound is packed open centrally. The proximal and distal incisional margins are sutured.

Description of Post-Service Work: Apply sterile dressings. Discuss postoperative care with recovery room staff. Discuss surgery outcome with patient's family. Complete brief operative note and medication orders, and all required operative documentation. Monitor patient stabilization in the recovery room, including neurovascular status. After patient is awake, discuss surgery outcome and anticipated course with patient. Complete operative report and medical record documentation. When the patient is stable, make the decision for discharge. Discuss aftercare treatment with the patient, family and other healthcare professionals, including home restrictions (ie, activity, bathing). Reconcile medications with attention to pre-admission therapy, inpatient therapy and outpatient formulary and enter orders for continued pain medication as necessary. Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management. Inform the primary care or referring physician of discharge plans. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
In January 2014, the RUC reviewed 010-day global services (based on 2012 Medicare utilization data) and identified 18 services with >1.5 office visits and 2012 Medicare utilization data over 1,000. Code 20245 was identified in this screen and code 20240 was added as a family code. After an initial survey that showed wide variability in postoperative care, the specialties requested a 0-day global period for both codes. CMS approved this request.

Compelling Evidence
Incorrect assumptions were made in the previous valuation of the service: 1) Harvard-based with only intra-time estimated by 8 general surgeons – not the dominant or only provider. 2) Pre and post time were predicted by algorithm (ie, not surveyed). 3) The code was assigned a 10-day global period (ie, "minor" procedure) even though 80% of the time it is performed in a facility (40% inpatient) and under general anesthesia (ie, should have been a major procedure). 4) An IWPUT of 0.037 significantly undervalues the work for this procedure when compared with other procedures and services in the PFS (ie, the value is not "relative").

Recommendation
We recommend the survey 25th percentile work RVU of 3.73. This is supported by the key reference codes, the MPC codes and 13 other recently reviewed 000-global codes as discussed below.

Pre-Time
Add 7 minutes (total = 10 minutes) for positioning. Although we believe positioning time would be greater, we are recommending 10 minutes based on the survey median time for position. A total of 10 minutes for positioning is supported by CPT code 28120 *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); talus or calcaneus* (reviewed by the RUC in 2011). The patient will be positioned prone, with attention to padding, and tourniquet application prior to the procedure.

Key Reference Comparison
Although the Key Reference codes have more intra-operative time, total time is similar. In addition, the intra-operative work and intra-work intensity are similar.

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	PRE	INTRA	POST
20240	**Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur)**	**3.73**	**0.066**	**118**	**58**	**30**	**30**
11044	Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); first 20 sq cm or less	4.10	0.061	116	51	45	20
20902	Bone graft, any donor area; major or large	4.58	0.068	123	58	45	20

MPC Comparison
The dominant site of service for both MPC codes is the office, while a bone biopsy is performed in a facility 80% of the time under general anesthesia or complex regional block that requires additional pre-service work.

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	PRE	INTRA	POST
52214	Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands	3.50	0.083	79	29	30	20

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	PRE	INTRA	POST
20240	**Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur)**	**3.73**	**0.066**	**118**	**58**	**30**	**30**
52224	Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy	4.05	0.101	79	29	30	20

Comparison to Other Recently Reviewed 000-global Codes

Thirteen recently reviewed 0-day global codes with 30 minutes of intra-operative time are shown in the table below. A majority of these codes are endoscopies (through a natural orifice) or percutaneous procedures through a vessel. These codes support the recommendation of 3.73 work RVUs for code 20240 as it transitions to a 0-day global period.

RUC	CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	Pre Pkg	PRE	INTRA	POST
2013	**43214**	Esophagoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)	**3.50**	**0.076**	**87**	**2b**	41	30	16

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20240

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. data not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,911
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2013 Medicare data

Specialty podiatry Frequency 1141 Percentage 39.19 %

Specialty orthopaedic surgery Frequency 348 Percentage 11.95 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

20240 Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur)
20245 Biopsy, bone, open; deep (eg, humerus, ischium, femur)

Global Period: 000 Meeting Date: January 2015

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: AAOS and APMA Advisors reviewed the current practice expense details for 20240 and 20245.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: N/A

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
Although these two codes are transitioning to 0-day global assignment, both 20240 and 20245 are major procedures performed under general anesthesia and with a significant percentage of patients admitted to the hospital. As such, the recommendation for 30 minutes pre-service clinical staff work is more than justified and probably the standard 60 minutes assigned to 90-day global codes is even more appropriate. We are recommending 30 minutes as a placeholder for pre-service clinical staff time until the RUC Practice Expense Subcommittee takes up the issue of reviewing pre-time clinical staff times for major procedures that transition to 0-day global.

Intra-Service Clinical Labor Activities:
20240: Six minutes for same day discharge to reflect dominant SOS (ie, facility outpatient and ASC).
20245: The typical patient will be discharged on a date after day of surgery. Thus, clinical staff discharge activities will be included in a separately reported discharge code and are not part of this 0-day global code.

Post-Service Clinical Labor Activities:
N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Insertion of Spinal Stability Distractive Device

At the May 2015 CPT meeting, the CPT Editorial Panel converted two Category III codes to Category I and added two Category III codes to describe the insertion of the interlaminar/interspinous process stability device. The specialty societies noted that, during their survey process, they learned that a CPT code change proposal to create Category I codes for insertion of spinal stability distraction device without decompression was submitted for consideration for the October 2015 CPT Editorial Panel meeting. The societies noted the codes in this new CPT proposal are closely related to those that were surveyed for the October 2015 RUC meeting , and therefore, requested for postponing consideration of CPT codes 22840, 228X1 and 228X2 until the January 2016 RUC meeting so both code sets could be reviewed simultaneously. The RUC agreed that the specialty societies should present CPT codes 22840, 228X1 and 228X2 at the January 2016 RUC meeting concurrently with the new CPT codes for insertion of spinal stability distraction device without decompression. At the October 2015 CPT meeting, the CPT Editorial Panel converted two Category III codes to Category I codes to report insertion of spinous distraction device(s) without concurrent performance of open decompression.

22840 ***Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)***
The specialty societies noted and the RUC agreed that CPT code 22840 is not part of the same code family as the new spinal stability distraction device codes. CPT code 22840 is part of a different family of rigid fixation codes intended to be used for spinal fusion and with additional fusion codes. This service is commonly performed with minimal open exposure, often on an outpatient basis, and has little in common with the technique of transarticular screw fixation, which is an open procedure performed on an inpatient basis.

228X1 ***Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level***
The RUC reviewed the survey results from 58 orthopaedic surgeons, neurosurgeons and spine surgeons and agreed on the following physician time components: pre-service time of 63 minutes (pre-time package of 3 with 12 minutes added to the standard package for positioning), intra-service time of 90 minutes and immediate post-service time of 30 minutes (post-service package 9B with 3 minutes removed from the standard package). The median survey immediate post-operative time was 20 minutes, though the CMS' 23-hour stay rule was also applied to this outpatient service. To apply CMS' rule, the intra-service time was reallocated from the same-day Evaluation and Management (E/M) code 99231 to the immediate post-service time (adding 10 minutes to the intra-service time). A majority of respondents (87%) indicated that the typical patient will stay overnight or be admitted. Of the survey respondents that indicated the patient was kept overnight, the majority indicated that the typical

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

patient will require an E/M visit later the same day. The RUC agreed with the specialty that a ½ day discharge visit (99238) is appropriate for this procedure that is typically performed in a facility. The RUC also concurred with the specialty that three 99213 office visits during the 090-day global period are typical.

The RUC reviewed the survey 25th percentile physician work value and agreed that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 228X1, the RUC reviewed CPT code 29915 *Arthroscopy, hip, surgical; with acetabuloplasty (ie, treatment of pincer lesion)* (work RVU=15.00, intra-service time of 90 minutes, total time of 270 minutes) and noted that both services have similar physician work, identical intra-service time and nearly identical total time. Given these similarities, the RUC recommends a work RVU of 15.00, which is a direct crosswalk to CPT code 29915. To justify this value, the RUC compared 228X1 to CPT code 29916 *Arthroscopy, hip, surgical; with labral repair* (work RVU=15.00, intra-service time of 90 minutes, total time of 270 minutes) and noted that both services have similar physician work, identical intra-service time and nearly identical total times. **The RUC recommends a work RVU of 15.00 for CPT code 228X1.**

228X2 ***Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; second level (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 49 orthopaedic surgeons, neurosurgeons and spine surgeons and agreed on the following physician time components: intra-service time of 45 minutes.

The RUC reviewed the surveyed 25th percentile work RVU of 4.00 and agreed with the specialties that this value appropriately accounts for the physician work involved. To justify a work RVU of 4.00, the RUC compared the survey code to MPC code 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU=4.88, intra-service time of 45 minutes) and noted that both services have identical intra-service time and total time, supporting the proposed work RVU for the survey code. The RUC also reviewed CPT code 37237 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)* (work RVU= 4.25, intra-service time of 45 minutes, total time of 47 minutes) and noted that both services have similar physician work, identical intra-service times and similar total times. **The RUC recommends a work RVU of 4.00 for CPT code 228X2.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

228X4 ***Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level***
The RUC reviewed the survey results from 58 orthopaedic surgeons, neurosurgeons and spine surgeons and agreed on the following physician time components: pre-service time of 63 minutes (pre-time package of 3 with 12 minutes added to the standard package for positioning), intra-service time of 43 minutes and immediate post-service time of 30 minutes (post-service package 9B with 3 minutes removed from the standard package). The median survey immediate post-operative time was 20 minutes, though the CMS' 23-hour stay rule was also applied to this outpatient service. To apply CMS' rule, the intra-service time was reallocated from the same-day E/M code 99231 to the immediate post-service time (adding 10 minutes to the intra-service time). A majority of respondents (71%) indicated that the typical patient will stay overnight or be admitted. Of the survey respondents that indicated the patient was kept overnight, the majority indicated that the typical patient will require an E/M visit later the same day. The RUC agreed with the specialty that a ½ day discharge visit (99238) is appropriate for this procedure that is typically performed in a facility. The RUC also concurred with the specialty that one 99213 office visit and one 99212 office visit during the 090-day global period are typical.

The RUC reviewed the survey 25th percentile physician work value and agreed that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 228X4, the RUC reviewed CPT code 29880 *Arthroscopy, knee, surgical; with meniscectomy (medial AND lateral, including any meniscal shaving) including debridement/shaving of articular cartilage (chondroplasty), same or separate compartment(s), when performed* (work RVU= 7.39, intra-service time of 45 minutes, total time of 199 minutes) and noted that both services have similar physician work, near identical intra-service times, though the survey code has more total time. Given these similarities, the RUC recommends a work RVU of 7.39, which is a direct crosswalk to CPT code 29880. To justify this value, the RUC compared 228X4 to CPT code 22511 *Percutaneous vertebroplasty (bone biopsy included when performed), 1 vertebral body, unilateral or bilateral injection, inclusive of all imaging guidance; lumbosacral* (work RVU= 7.58, intra-service time of 45 minutes, total time of 160 minutes) and noted that both services have similar physician work, near identical intra-service times, though the survey code has more total time. **The RUC recommends a work RVU of 7.39 for CPT code 228X4.**

228X5 ***Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 49 orthopaedic surgeons, neurosurgeons and spine surgeons and agreed on the following physician time components: intra-service time of 30 minutes.

The RUC reviewed the survey 25th percentile physician work value and agreed that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 228X5, the RUC reviewed CPT code 22103 *Partial excision of posterior vertebral component (eg, spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; each additional segment (List separately in addition to code for primary procedure)* (work RVU= 2.34, intra-service time of 30 minutes) and noted that both services have

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

similar physician work, identical intra-service and total times. Given these similarities, the RUC recommends a work RVU of 2.34, which is a direct crosswalk to CPT code 22103. To justify this value, the RUC compared 228X5 to MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU= 2.25, intra-service time of 30 minutes) and note that both services have identical intra-service times and total times, whereas the survey code involves somewhat more intensity. **The RUC recommends a work RVU of 2.34 for CPT code 228X5.**

New Technology
These services will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with the minor modifications as approved by the Practice Expense Subcommittee.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Musculoskeletal System **Spine (Vertebral Column)**				
22100		*Partial excision of posterior vertebral component (eg, spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; cervical*		
22101		*thoracic*		
22102		*lumbar*		
		(For insertion of posterior spinous process distraction devices, see ~~0171T, 0172T~~ 228X1, 228X2, ~~043X3, 043X4~~228X4, 228X5)		
22851		*Application of intervertebral biomechanical device(s) (eg,synthetic cage(s), methylmethacrylate) to vertebral defect or interspace (List separately in addition to code for primary procedure)*

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:228X1 Tracking Number A2 Original Specialty Recommended RVU: **16.47**
Presented Recommended RVU: **16.47**
Global Period: 090 RUC Recommended RVU: **15.00**

CPT Descriptor: Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old woman presents with a 6-month history of progressive low back pain and leg pain unresponsive to conservative treatments including physical therapy, oral medications and an epidural steroid injection. MRI demonstrates severe spinal stenosis at the L4-5 level. Patient is scheduled for an L4-5 lumbar decompression and implantation of an interlaminar/interspinous process stabilization/distraction device.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 5%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 13% , Overnight stay-less than 24 hours 51% , Overnight stay-more than 24 hours 36%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 54%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Perform a targeted H&P. Write orders for preoperative medications and performance standards. Review the surgical procedure, postoperative recovery in and out of the hospital, and expected outcome(s) with the patient and family. Sign and mark the operative site. Obtain informed consent. Verify that all necessary surgical instruments, supplies, and devices are available in the operative suite. Review imaging, and select and display appropriate pictures. Review the length and type of anesthesia with the anesthesiologist. Monitor initial patient positioning for induction of anesthesia. Following induction of anesthesia, assist with repositioning of patient prone with the lumbar spine in flexion. Verify and/or assist with padding of patient to prevent pressure on neurovascular structures. Supervise prepping/draping of the patient. Scrub and gown. Perform a time out to confirm patient and procedure with the OR staff.

Description of Intra-Service Work: Intraoperative imaging is used to identify the correct level and plan the surgical incision. A posterior lumbar incision is made through the skin, subcutaneous tissue, and lumbosacral fascia. Markers are placed and intraoperative imaging is utilized to again confirm the correct level of surgery. A complete decompression of the spinal stenosis removing any obstructing soft or bony tissue is performed. The lamina and spinous processes of the involved segment are fashioned and prepared to allow for the neutral stabilization of the affected vertebral levels. A measuring device is used to determine the size of the interlaminar stabilization device. The implant is selected and the size is verified. The implant is inserted and fixed into place. Final imaging (AP and lateral fluoroscopy) is obtained to confirm proper implant position. Copious irrigation is used and the wound is closed in layers.

Description of Post-Service Work:

Hospital: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Write orders for transferring to surgical floor and discuss ongoing care with floor nurses.

Later same day and on each day patient is in the facility, monitor and document patient progress. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for labs, imaging, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Next day or several days later. Write orders for follow-up, post-discharge labs, imaging, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Office: Write orders for medications and follow-up films. Review post-discharge films. Examine patient, performing periodic neurological exams. Monitor wounds and remove sutures. Review use and proper fit of brace with patient. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for the medical chart. Answer questions (oral and written) from patient, family and insurance staff. Discuss patient progress with referring physician.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.71	0.38
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.53	0.23
Urgency of medical decision making	0.24	0.00

Technical Skill/Physical Effort (Mean)

Technical skill required	0.82	0.54
Physical effort required	0.65	0.31

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.65	0.15
Outcome depends on the skill and judgment of physician	0.53	0.46
Estimated risk of malpractice suit with poor outcome	0.47	0.31

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.94	0.62

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the June 2006 CPT Panel meeting, the Panel approved two Category III codes to report insertion of posterior lumbar spinous process distraction devices.

0171T Insertion of posterior spinous process distraction device (including necessary removal of bone or ligament for insertion and imaging guidance), lumbar; single level

0172T each additional level (List separately in addition to code for primary procedure)

At the May 2015 CPT Panel meeting, two new Category I codes (228X1 and 228X2) were approved for reporting the insertion of an interlaminar stabilization device to stabilize the spine following open decompression for the treatment of lumbar spinal stenosis at one or two levels. At this same meeting, the Panel established two Category III codes to report interlaminar stabilization insertion without open decompression.

228X1 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

228X2 second level (List separately in addition to code for primary procedure)

043XT Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

043XT second level (List separately in addition to code for primary procedure)

During the process of conducting a RUC survey of the two new codes in July 2015, the AANS/CNS, NASS, and AAOS were informed that a coding change proposal was submitted by individual practitioners to convert the new Category III codes for interlaminar stabilization insertion **without** open decompression to Category I status. The RUC Advisors from AANS/CNS, NASS, and AAOS petitioned the RUC to delay presentation of the survey data collected for 228X1 and 228X2 until after the October 2015 CPT meeting so that data for all four codes could be presented together. The RUC approved this request, but with the caveat that 228X1 and 228X2 would have to be resurveyed (ie, the RUC wanted all four codes surveyed together).

At the October 2015 CPT Panel meeting, the Category III codes were converted to Category I codes (228X4 and 228X5). These two new codes describe interlaminar stabilization insertion **without** open decompression in contrast to the two codes (228X1 and 228X2) approved previously that describe interlaminar stabilization insertion **with** open decompression. None of the four codes include fusion.

228X1	Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level
228X2	second level (List separately in addition to code for primary procedure)
228X4	Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level
228X5	second level (List separately in addition to code for primary procedure)

Discuss of Survey Process and Respondent Experience

All four codes were included on one survey instrument. For codes 228X1 and 228X4, the question for site of service and E/M on the same day that is standard in the 10 and 90 day global survey was added. The survey request was sent to a random selection from the AAOS membership database. In addition, targeted samples within the AANS/CNS, NASS, and ISASS membership databases were approved by Research Subcommittee: A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves. A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members). A random selection of only U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

For the first two codes 228X1 and 228X2, the selection of respondents was random as described above and without consideration of any possible overlap from the previous survey. In addition, for this current survey, a new society (ISASS) also surveyed its members. Therefore, the survey data from the two separate surveys of codes 228X1 and 228X2 were not combined. However, on the RUC Summary Excel file, we show the summary data from the previous survey of codes 228X1 and 228X2 in the rows above the current survey data. In addition, we note that we are using the current survey data from the survey of all four codes on one instrument for our recommendations. We also note that three of the four codes have a median experience of zero. This issue will be discussed individually for each code where it applies.

Recommendation – 228X1

We recommend the survey 25th percentile work RVU of 16.47 for code 228X1.

Pre-Time Package 4

Evaluation: No change in package time of 40 minutes.
Positioning: Add 12 minutes (total = 15 minutes) to position the patient prone with the lumbar spine in flexion.
Scrub, dress, wait: Subtract 5 minutes (total = 15 minutes) to be consistent with the median survey time.

Immediate Postoperative Time and Post-time Package 9b

The median survey immediate post-operative time was 20 minutes. A majority of respondents (87%) indicated that the typical patient will stay overnight or be admitted. The respondents also indicated that the typical patient will require a E/M visit later the same day. Because CMS does not allow reporting inpatient E/M codes for procedures that will have a facility status of outpatient, we have added 10 minutes (total = 30 minutes) to the survey immediate post-time to reflect time for a visit later on the same day. We note that 30 minutes is less than the time for the recommended post-time package.

Key Reference Comparison

Code 228X1 is more intense and complex than key reference code 63047, especially with respect to the technical skill required.

MPC Comparison

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0171T

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:228X2 Tracking Number A3 Original Specialty Recommended RVU: **4.00**
Presented Recommended RVU: **4.00**
Global Period: ZZZ RUC Recommended RVU: **4.00**

CPT Descriptor: Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; second level (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old woman presents with a 6-month history of progressive low back pain and leg pain unresponsive to conservative treatments including physical therapy, oral medications and an epidural steroid injection. MRI demonstrates severe spinal stenosis at the L3-4 and L4-5 levels. Patient is scheduled for an L3-4 and L4-5 lumbar decompression and implantation of interlaminar/interspinous process stabilization/distraction devices. The L4-5 level has just been completed and now the L3-4 level is addressed.
[Note: CPT code 228XB is an add-on service. Only consider the additional physician work related to the second level.]

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: After insertion of the initial lumbar interlaminar/interspinous process stabilization/distraction device with decompression (reported separately), the incision is extended to expose the adjacent level. A complete decompression of the spinal stenosis removing any obstructing soft or bony tissue is performed at this second level. The lamina and spinous processes of the involved segment are fashioned and prepared to allow for the neutral stabilization of the affected vertebral levels. A measuring device is used to determine the size of the interlaminar stabilization device. The implant is selected and the size is verified. The implant is inserted and fixed into place. Final imaging (AP and lateral fluoroscopy) is obtained to confirm proper implant position. Copious irrigation is used and the wound is closed in layers.

Description of Post-Service Work: n/a

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.54	0.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.46	0.17

Urgency of medical decision making	0.17	0.00

Technical Skill/Physical Effort (Mean)

Technical skill required	0.75	0.00
Physical effort required	0.58	0.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.54	0.50
Outcome depends on the skill and judgment of physician	0.58	0.33
Estimated risk of malpractice suit with poor outcome	0.38	0.33

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.75	0.17

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the June 2006 CPT Panel meeting, the Panel approved two Category III codes to report insertion of posterior lumbar spinous process distraction devices.

0171T Insertion of posterior spinous process distraction device (including necessary removal of bone or ligament for insertion and imaging guidance), lumbar; single level

0172T each additional level (List separately in addition to code for primary procedure)

At the May 2015 CPT Panel meeting, two new Category I codes (228X1 and 228X2) were approved for reporting the insertion of an interlaminar stabilization device to stabilize the spine following open decompression for the treatment of lumbar spinal stenosis at one or two levels. At this same meeting, the Panel established two Category III codes to report interlaminar stabilization insertion without open decompression.

228X1 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

228X2 second level (List separately in addition to code for primary procedure)

043XT Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

043XT second level (List separately in addition to code for primary procedure)

During the process of conducting a RUC survey of the two new codes in July 2015, the AANS/CNS, NASS, and AAOS were informed that a coding change proposal was submitted by individual practitioners to convert the new Category III codes for interlaminar stabilization insertion **without** open decompression to Category I status. The RUC Advisors from AANS/CNS, NASS, and AAOS petitioned the RUC to delay presentation of the survey data collected for 228X1 and 228X2 until after the October 2015 CPT meeting so that data for all four codes could be presented together. The RUC approved this request, but with the caveat that 228X1 and 228X2 would have to be resurveyed (ie, the RUC wanted all four codes surveyed together).

At the October 2015 CPT Panel meeting, the Category III codes were converted to Category I codes (228X4 and 228X5). These two new codes describe interlaminar stabilization insertion **without** open decompression in contrast to the two codes (228X1 and 228X2) approved previously that describe interlaminar stabilization insertion **with** open decompression. None of the four codes include fusion.

228X1 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

228X2 second level (List separately in addition to code for primary procedure)

228X4 Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

228X5 second level (List separately in addition to code for primary procedure)

Discuss of Survey Process and Respondent Experience

All four codes were included on one survey instrument. For codes 228X1 and 228X4, the question for site of service and E/M on the same day that is standard in the 10 and 90 day global survey was added. The survey request was sent to a random selection from the AAOS membership database. In addition, targeted samples within the AANS/CNS, NASS, and ISASS membership databases were approved by Research Subcommittee: A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves. A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members). A random selection of only U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

For the first two codes 228X1 and 228X2, the selection of respondents was random as described above and without consideration of any possible overlap from the previous survey. In addition, for this current survey, a new society (ISASS) also surveyed its members. Therefore, the survey data from the two separate surveys of codes 228X1 and 228X2 were not combined. However, on the RUC Summary Excel file, we show the summary data from the previous survey of codes 228X1 and 228X2 in the rows above the current survey data. In addition, we note that we are using the current survey data from the survey of all four codes on one instrument for our recommendations. We also note that three of the four codes have a median experience of zero. This issue will be discussed individually for each code where it applies.

Recommendation – 228X2

Although the first survey (07/15) for code 228X2 had a median experience of 2, the second survey (10/15) resulted in a median experience of zero.

Time. Our expert panel agree that the current survey median additional intraoperative time of 45 minutes correctly reflects the time required for this this add-on service. We also note that 45 minutes is the same median time in the 07/15 survey data and the same median time for those respondents with experience in the current survey. **We therefore recommend a median intraoperative time of 45 minutes.**

Work RVU. The median and 25th percentile work RVU for the current survey is less than the statistics from the 07/15 survey which had more respondents with experience. We also note that the work RVU statistics in the current survey from respondents with experience are higher than the same data points from those without experience. Our expert panel agrees that the complexity and intensity of 228X2 is greater than 63048 and the work RVU should be higher. **We therefore recommend the (current) survey 25th percentile work RVU of 4.00 for code 228X2.**

We also recommend that this code be tagged in the RUC database as "Do not use to validate physician work" until such time that a RUC survey is conducted that results in a majority of respondents that have experience in the past 12 months.

Key Reference Comparison

Code 228X2 is more intense and complex than key reference code 63048, especially with respect to the technical skill required.

MPC and Other Code Comparison

There are very few ZZZ MPC codes and only one that corresponds to intraoperative time (57267). However, there are other recently reviewed ZZZ codes with similar intensity/complexity that support the recommended work RVU.

CPT	Descriptor	RVW	IWPUT	Total	PRE	INTRA	POST
228X2	Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; second level (List separately in addition to code for primary procedure)	**4.00**	0.089	45	0	**45**	0

Global Period: 090 RUC Recommended RVU: **7.39**

CPT Descriptor: Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A skeletally mature adult with progressive low back pain and leg pain due to a history of neurogenic claudication is unresponsive to conservative treatments. The patient achieves some relief from symptoms in flexion. Imaging confirms mild-moderate spinal stenosis at the L4-5 level, with approximately 50% reduction in spinal canal area. The implantation of a posterior interspinous process distraction device at one level without an open decompression or a fusion is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 88% , In the ASC 12%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 29% , Overnight stay-less than 24 hours 47% , Overnight stay-more than 24 hours 24%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 53%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Perform a targeted H&P. Write orders for preoperative medications and performance standards. Review the surgical procedure, postoperative recovery in and out of the hospital, and expected outcome(s) with the patient and family. Sign and mark the operative site. Obtain informed consent. Verify that all necessary surgical instruments, supplies, and devices are available in the operative suite Review imaging, and select and display appropriate pictures. Review the length and type of anesthesia with the anesthesiologist. Monitor initial patient positioning for induction of anesthesia. Following induction of anesthesia, assist with repositioning of patient prone with the lumbar spine in flexion. Verify and/or assist with padding of patient to prevent pressure on neurovascular structures and placement of chin straps and arm traction devices to facilitate intraoperative imaging. Supervise prepping/draping of the patient. Scrub and gown. Perform a time out to confirm patient and procedure with the OR staff.

Description of Intra-Service Work: Intraoperative imaging is used to identify the correct level and plan the surgical incision. A posterior lumbar incision is made through the skin, subcutaneous tissue, and lumbosacral fascia. A dilator is inserted through the incision and advanced between the spinous processes and into the interspinous process space under fluoroscopic guidance to confirm levels, position and depth. Additional larger dilators are inserted until the space is distracted to the correct degree. A gauge is used to determine the distance between the two spinous processes, and determine the appropriate implant size. The implant is selected and size verified. The implant is inserted and fixed into place. Final imaging (AP and lateral fluoroscopy) is obtained to confirm proper implant position. Copious irrigation is used and the wound is closed in layers.

Description of Post-Service Work:
Hospital: Apply sterile dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Write orders for transferring to surgical floor and discuss ongoing care with floor nurses.

Later same day and on each day patient is in the facility, monitor and document patient progress. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for labs, imaging, medications, diet, and patient activity. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Next day or several days later. Write orders for follow-up, post-discharge labs, imaging, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Postoperative Work - In Office: Write orders for medications and follow-up films. Review post-discharge films. Examine patient, performing periodic neurological exams. Monitor wounds and remove sutures. Review use and proper fit of brace with patient. Review physical therapy progress and revise orders as needed. Dictate patient progress notes for the medical chart. Answer questions (oral and written) from patient, family and insurance staff. Discuss patient progress with referring physician.

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.19	0.14
Urgency of medical decision making	-0.08	-0.07

Technical Skill/Physical Effort (Mean)

Technical skill required	0.35	0.14
Physical effort required	0.27	0.07

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.12	0.00
Outcome depends on the skill and judgment of physician	0.46	0.29
Estimated risk of malpractice suit with poor outcome	0.35	0.21

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.27	0.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the June 2006 CPT Panel meeting, the Panel approved two Category III codes to report insertion of posterior lumbar spinous process distraction devices.

0171T Insertion of posterior spinous process distraction device (including necessary removal of bone or ligament for insertion and imaging guidance), lumbar; single level

0172T each additional level (List separately in addition to code for primary procedure)

At the May 2015 CPT Panel meeting, two new Category I codes (228X1 and 228X2) were approved for reporting the insertion of an interlaminar stabilization device to stabilize the spine following open decompression for the treatment of lumbar spinal stenosis at one or two levels. At this same meeting, the Panel established two Category III codes to report interlaminar stabilization insertion without open decompression.

228X1 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

228X2 second level (List separately in addition to code for primary procedure)

043XT Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

043XT second level (List separately in addition to code for primary procedure)

During the process of conducting a RUC survey of the two new codes in July 2015, the AANS/CNS, NASS, and AAOS were informed that a coding change proposal was submitted by individual practitioners to convert the new Category III codes for interlaminar stabilization insertion **without** open decompression to Category I status. The RUC Advisors from AANS/CNS, NASS, and AAOS petitioned the RUC to delay presentation of the survey data collected for 228X1 and 228X2 until after the October 2015 CPT meeting so that data for all four codes could be presented together. The RUC approved this request, but with the caveat that 228X1 and 228X2 would have to be resurveyed (ie, the RUC wanted all four codes surveyed together).

At the October 2015 CPT Panel meeting, the Category III codes were converted to Category I codes (228X4 and 228X5). These two new codes describe interlaminar stabilization insertion **without** open decompression in contrast to the two codes (228X1 and 228X2) approved previously that describe interlaminar stabilization insertion **with** open decompression. None of the four codes include fusion.

228X1 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

228X2 second level (List separately in addition to code for primary procedure)

228X4 Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

228X5 second level (List separately in addition to code for primary procedure)

Discuss of Survey Process and Respondent Experience

All four codes were included on one survey instrument. For codes 228X1 and 228X4, the question for site of service and E/M on the same day that is standard in the 10 and 90 day global survey was added. The survey request was sent to a random selection from the AAOS membership database. In addition, targeted samples within the AANS/CNS, NASS, and ISASS membership databases were approved by Research Subcommittee: A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves. A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members). A random selection of only U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

For the first two codes 228X1 and 228X2, the selection of respondents was random as described above and without consideration of any possible overlap from the previous survey. In addition, for this current survey, a new society (ISASS) also surveyed its members. Therefore, the survey data from the two separate surveys of codes 228X1 and 228X2 were not combined. However, on the RUC Summary Excel file, we show the summary data from the previous survey of codes 228X1 and 228X2 in the rows above the current survey data. In addition, we note that we are using the current survey data from the survey of all four codes on one instrument for our recommendations. We also note that three of the four codes have a median experience of zero. This issue will be discussed individually for each code where it applies.

Recommendation – 228X4

The survey for 228X4 resulted in a median experience of zero.

Time. Our expert panel agree that code 228X4 will take considerably less intra-operative time than 228X1 and that the survey median time of 43 minutes is reasonable. This is based on a review literature including the results of a randomized controlled FDA-IDE pivotal trial. **We therefore recommend a median intraoperative time of 43 minutes.**

Work RVU. With respect to the work RVU, we are not confident that the survey respondents accurately estimated the physician work and believe the median and 25th percentile work RVUs overstate the physician work. Our expert panel agrees that it is important to assign a work RVU for 228X4 to establish correct relativity with 228X1. We have determined that code 22511, *Percutaneous vertebroplasty (bone biopsy included when performed), 1 vertebral body, unilateral or bilateral injection, inclusive of all imaging guidance; lumbosacral* has similar total physician work when considering intensity, complexity, and time. **We therefore recommend that the work RVU for 22511 of 7.58 be crosswalked to code 228X4.**

We also recommend that this code be tagged in the RUC database as "Do not use to validate physician work" until such time that a RUC survey is conducted that results in a majority of respondents that have experience in the past 12 months.

Crosswalk Comparison

CPT	Descriptor	RVW	IWPUT	Total	PRE	INTRA	POST	38	13	12
228X4	Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level	**7.58**	0.084	194	63	**43**	30	0.5	1	1
22511	Percutaneous vertebroplasty (bone biopsy included when performed), 1 vertebral body, unilateral or bilateral injection, inclusive of all imaging guidance; lumbosacral	**7.58**	0.98	160	53	**45**	20	0.5	1	

Pre-Time Package 4

Evaluation: No change in package time of 40 minutes.
Positioning: Add 12 minutes (total = 15 minutes) to position the patient prone with the lumbar spine in flexion.
Scrub, dress, wait: Subtract 5 minutes (total = 15 minutes) to be consistent with the median survey time.

Immediate Postoperative Time and Post-time Package 9b

The median survey immediate post-operative time was 20 minutes. A majority of respondents (71%) indicated that the typical patient will stay overnight or be admitted. The respondents also indicated that the typical patient will require a E/M visit later the same day. Although most respondents did not indicate recent experience with this procedure, our expert panel's review of the literature indicates these survey data are correct. Because CMS does not allow reporting inpatient E/M codes for procedures that will have a facility status of outpatient, we have added 10 minutes (total = 30 minutes) to the survey immediate post-time to reflect time for a visit later on the same day. We note that 30 minutes is less than the time for the recommended post-time package.

MPC Comparison

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0171T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

Specialty neurosurgery Frequency 50 Percentage 50.00 %

Specialty orthopaedic surgery Frequency 50 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:228X5 Tracking Number A5 Original Specialty Recommended RVU: **2.34**
Presented Recommended RVU: **2.34**
Global Period: ZZZ RUC Recommended RVU: **2.34**

CPT Descriptor: Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A skeletally mature adult with progressive low back pain and leg pain due to a history of neurogenic claudication is unresponsive to conservative treatments. The patient achieves some relief from symptoms in flexion. Imaging confirms mild-moderate spinal stenosis at the L3-L4 with 25% reduction in canal area and at L4-5 with a 50% reduction. The implantation of a posterior interspinous process distraction device without an open decompression or a fusion at both levels is recommended.
[Note: CPT code 228XD is an add-on service. Only consider the additional physician work related to the second level.]

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: After insertion of the initial lumbar interlaminar/interspinous process stabilization/distraction device with decompression (reported separately), the incision is extended to expose the adjacent level. A dilator is inserted through the incision and advanced between the spinous processes and into the interspinous process space under fluoroscopic guidance to confirm position and depth. Additional larger dilators are inserted until the space is distracted to the correct degree. A gauge is used to determine the distance between the two spinous processes, and determine the appropriate implant size. The implant is selected and size verified. The implant is inserted and fixed into place. Final imaging (AP and lateral fluoroscopy) is obtained to confirm proper implant position. Copious irrigation is used and the wound is closed in layers.

Description of Post-Service Work: n/a

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
22103	ZZZ	2.34	**RUC Time**

CPT Descriptor Partial excision of posterior vertebral component (eg, spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; each additional segment (List separately in addition to code for primary procedure)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
63048	ZZZ	3.47	**RUC Time**

CPT Descriptor Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99292	ZZZ	2.25	**RUC Time**	467,217

CPT Descriptor 1 Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
22103	ZZZ	2.34	**RUC Time**

CPT Descriptor Partial excision of posterior vertebral component (eg, spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; each additional segment (List separately in addition to code for primary procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 28 **% of respondents:** 57.1 **%**

Number of respondents who choose 2nd Key Reference Code: 9 **% of respondents:** 18.3 **%**

TIME ESTIMATES (Median)

	CPT Code: 228X5	**Top Key Reference CPT Code:** 22103	**2nd Key Reference CPT Code:** **63048**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.14	0.22
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.14	0.00

Urgency of medical decision making	-0.04	0.11

Technical Skill/Physical Effort (Mean)

Technical skill required	0.21	0.22
Physical effort required	0.32	0.11

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.18	0.11
Outcome depends on the skill and judgment of physician	0.43	0.33
Estimated risk of malpractice suit with poor outcome	0.18	0.33

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.36	0.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the June 2006 CPT Panel meeting, the Panel approved two Category III codes to report insertion of posterior lumbar spinous process distraction devices.

0171T Insertion of posterior spinous process distraction device (including necessary removal of bone or ligament for insertion and imaging guidance), lumbar; single level

0172T each additional level (List separately in addition to code for primary procedure)

At the May 2015 CPT Panel meeting, two new Category I codes (228X1 and 228X2) were approved for reporting the insertion of an interlaminar stabilization device to stabilize the spine following open decompression for the treatment of lumbar spinal stenosis at one or two levels. At this same meeting, the Panel established two Category III codes to report interlaminar stabilization insertion without open decompression.

228X1 Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level

228X2 second level (List separately in addition to code for primary procedure)

043XT Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level

043XT second level (List separately in addition to code for primary procedure)

During the process of conducting a RUC survey of the two new codes in July 2015, the AANS/CNS, NASS, and AAOS were informed that a coding change proposal was submitted by individual practitioners to convert the new Category III codes for interlaminar stabilization insertion **without** open decompression to Category I status. The RUC Advisors from AANS/CNS, NASS, and AAOS petitioned the RUC to delay presentation of the survey data collected for 228X1 and 228X2 until after the October 2015 CPT meeting so that data for all four codes could be presented together. The RUC approved this request, but with the caveat that 228X1 and 228X2 would have to be resurveyed (ie, the RUC wanted all four codes surveyed together).

At the October 2015 CPT Panel meeting, the Category III codes were converted to Category I codes (228X4 and 228X5). These two new codes describe interlaminar stabilization insertion **without** open decompression in contrast to the two codes (228X1 and 228X2) approved previously that describe interlaminar stabilization insertion **with** open decompression. None of the four codes include fusion.

228X1	Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level
228X2	second level (List separately in addition to code for primary procedure)
228X4	Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level
228X5	second level (List separately in addition to code for primary procedure)

Discuss of Survey Process and Respondent Experience

All four codes were included on one survey instrument. For codes 228X1 and 228X4, the question for site of service and E/M on the same day that is standard in the 10 and 90 day global survey was added. The survey request was sent to a random selection from the AAOS membership database. In addition, targeted samples within the AANS/CNS, NASS, and ISASS membership databases were approved by Research Subcommittee: A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves. A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members). A random selection of only U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

For the first two codes 228X1 and 228X2, the selection of respondents was random as described above and without consideration of any possible overlap from the previous survey. In addition, for this current survey, a new society (ISASS) also surveyed its members. Therefore, the survey data from the two separate surveys of codes 228X1 and 228X2 were not combined. However, on the RUC Summary Excel file, we show the summary data from the previous survey of codes 228X1 and 228X2 in the rows above the current survey data. In addition, we note that we are using the current survey data from the survey of all four codes on one instrument for our recommendations. We also note that three of the four codes have a median experience of zero. This issue will be discussed individually for each code where it applies.

Recommendation – 228X5

The survey for 228X5 resulted in a median experience of zero.

Time. Our expert panel agrees that code 228X5 will take considerably less intra-operative time than 228X2 and that the survey median time of 30 minutes is reasonable. **We therefore recommend a median intraoperative time of 30 minutes.**

Work RVU. With respect to the work RVU, we are not confident that the survey respondents accurately estimated the physician work and believe the median and 25th percentile work RVUs overstate the physician work. Our expert panel agrees that it is important to assign a work RVU for 228X5 to establish correct relativity with 228X2. We have determined that key reference code 22103, *Partial excision of posterior vertebral component (eg, spinous process, lamina or facet) for intrinsic bony lesion, single vertebral segment; each additional segment (List separately in addition to code for primary procedure)* has the same total physician work when considering intensity, complexity, and time. **We therefore recommend that the work RVU for 22103 of 2.34 be crosswalked to code 228X5.**

We also recommend that this code be tagged in the RUC database as "Do not use to validate physician work" until such time that a RUC survey is conducted that results in a majority of respondents that have experience in the past 12 months.

MPC and Other Code Comparison

There are very few ZZZ MPC codes and only one that corresponds to intraoperative time (99292). However, there are other recently reviewed ZZZ codes with similar intensity/complexity that support the recommended work RVU.

CPT	Descriptor	RVW	IWPUT	Total	PRE	INTRA	POST
228X5	Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; second level (List separately in addition to code for primary procedure)	**2.34**	0.078	30	0	**30**	0
99292 MPC	Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)	**2.25**	0.075	30	0	**30**	0
43273 (2013)	Endoscopic cannulation of papilla with direct visualization of pancreatic/common bile duct(s) (List separately in addition to code(s) for primary procedure)	**2.24**	0.075	30	0	**30**	0
49327 (2010)	Laparoscopy, surgical; with placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), intra-abdominal, intrapelvic, and/or retroperitoneum, including imaging guidance, if performed, single or multiple (List separately in addition to code(s) for primary procedure)	**2.38**	0.079	30	0	**30**	0
36476 (2014)	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)	**2.65**	0.088	30	0	**30**	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Report with 228X4

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0172T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Rarely

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 20 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

Specialty neurosurgery Frequency 10 Percentage 50.00 %

Specialty orthopaedic surgery Frequency 10 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 22116

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

228X1	Insertion of interlaminar/interspinous process stabilization/distraction device, without fusion, including image guidance when performed, with open decompression, lumbar; single level	090
228X2	second level (List separately in addition to code for primary procedure)	ZZZ
228X4	Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level	090
228X5	second level (List separately in addition to code for primary procedure)	ZZZ

Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the standards for 90-day global and ZZZ global procedures.

2. You must provide reference code(s) for comparison on your spreadsheet. Current inputs for 63047 and 63048 are used as reference. These were key reference codes.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
228X1 and 228X4 (090): The typical patients requiring these services will have a long standing history of low back pain. These procedures will be performed on an elective basis and all aspects of pre-service clinical staff work that is typical of 90-day global procedures will apply to codes 228X1 and 228X4: complete pre-service diagnostic & referral forms, coordinate pre-surgery services, schedule space and equipment in facility, provide pre-service education/obtain consent, and follow-up phone calls & prescriptions.
228X2 and 228X5 (ZZZ): N/A. These are add-on codes.

Service Clinical Labor Activities:
228X1 and 228X4 (090): Clinical staff will assist the surgeon with discharge management, including arrangements for post-discharge imaging, home care, and responding to patient and family questions.
228X2 and 228X5 (ZZZ): N/A. These are add-on codes.

Post-Service Clinical Labor Activities:
228X1 and 228X4 (090): Clinical staff will assist the surgeon at post-op office visits.
228X2 and 228X5 (ZZZ): N/A. These are add-on codes.

CPT Code: 228X1,228X2,228X4,228X5

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Biomechanical Device Insertion - Intervertebral, Interbody

At the October 2015 CPT meeting, the CPT Editorial Panel establish three new Category I codes to provide more detailed descriptions of placement and attachment of biomechanical spinal devices and deleted code 22851 throughout the code set.

22X81 ***Insertion of interbody biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges) when performed to intervertebral disc space in conjunction with interbody arthrodesis, each interspace (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 85 orthopaedic surgeons, neurosurgeons and spine surgeons and agreed on the following physician time components: intra-service time of 45 minutes.

The RUC reviewed the survey respondents' 25th percentile physician work value and agreed that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 22X81, the RUC reviewed CPT code 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU = 4.88, 45 minutes total time) and noted that both services have similar physician work, as well as identical intra-service and total time. Given these similarities, the RUC recommends a work RVU of 4.88, which is a direct crosswalk to CPT code 57267. To justify this value, the RUC compared 22X81 to CPT code 35600 *Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure (List separately in addition to code for primary procedure)* (work RVU= 4.94, intra-service time of 40 minutes) and noted that although the survey code has more intra-service time, the reference code is somewhat more intense, justifying a similar valuation between both services. **The RUC recommends a work RVU of 4.88 for CPT code 22X81.**

22X82 ***Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges) when performed to vertebral corpectomy(ies) (vertebral body resection, partial or complete) defect, in conjunction with interbody arthrodesis, each contiguous defect***
The RUC reviewed the survey results from 85 orthopaedic surgeons, neurosurgeons and spine surgeons and agreed on the following physician time components: intra-service time of 60 minutes.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' 25th percentile physician work value and agreed that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 22X82, the RUC reviewed CPT code 37234 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)* (work RVU = 5.50, 60 intra-service time, 62 minutes total time) and noted that both services have similar physician work, as well as identical intra-service and total time. Given these similarities, the RUC recommends a work RVU of 5.50, which is a direct crosswalk to CPT code 37234. To justify this value, the RUC compared 22X82 to 2nd key reference code 22858 *Total disc arthroplasty (artificial disc), anterior approach, including discectomy with end plate preparation (includes osteophytectomy for nerve root or spinal cord decompression and microdissection); second level, cervical (List separately in addition to code for primary procedure)* (work RVU= 8.40, intra-service time of 75 minutes) and noted that the survey code has a lower IWPUT (0.092 vs 0.112), while at the same time being rated as having higher intensity/complexity by the survey respondents, supporting the recommended valuation of 5.50 RVUs for the survey code. **The RUC recommends a work RVU of 5.50 for CPT code 22X82.**

22X83 ***Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh, methylmethacrylate) to intervertebral disc space or vertebral body defect without interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 85 orthopaedic surgeons, neurosurgeons and spine surgeons and agreed on the following physician time components: intra-service time of 60 minutes.

The RUC reviewed the respondents' 25th percentile work RVU of 6.00 and agreed that this value appropriately accounts for the physician work involved. The RUC noted that survey code 22X83 is a more intense/complex service than 22X83, indicating a higher work value for 22X83 is warranted. To justify a work value of 6.00, the RUC compared the survey code to CPT code 22534 *Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); thoracic or lumbar, each additional vertebral segment (List separately in addition to code for primary procedure)* (work RVU= 5.99, intra-service time of 60 minutes) and noted that both services have identical intra-service time and involve a similar amount of physician work. To further confirm a work RVU of 6.00, the RUC reviewed CPT code *Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; each additional vertebral segment (List separately in addition to primary procedure)* and noted that both service have identical intra-service time and involve a similar amount of physician work. **The RUC recommends a work RVU of 6.00 for CPT code 22X83.**

Practice Expense
There are no direct practice expense inputs for CPT codes 22X81-22X83 because these services are facility-only add-on services.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Musculoskeletal System
Spine (Vertebral Column)

Cervical, thoracic, and lumbar spine.

Within the spine section, bone grafting…

To report bone grafts performed after…

Report as 22612 and 20937.

Within the spine section, instrumentation is reported separately and in addition to arthrodesis. To report instrumentation procedures performed with definitive vertebral procedure(s), see 22840-22855. Instrumentation procedure codes 22840-22848 and ~~22851~~22X81, 22X82, 22X83, are reported in addition to the definitive procedure(s). Modifier 62 may not be appended to the definitive or add-on spinal instrumentation procedure code(s) 22840-22848 and 22850-22852.

Excision

22110 *Partial excision of vertebral body, for intrinsic bony lesion, without decompression of spinal cord or nerve root(s), single vertebral segment; cervical*

✚ *22116* *each additional vertebral segment (List separately in addition to code for primary procedure)*

(Use 22116 in conjunction with 22110, 22112, 22114)

(For complete or near complete resection of vertebral body, see vertebral corpectomy, 63081-63091)

(For spinal reconstruction with bone graft [autograft, allograft] and/or methylmethacrylate of cervical vertebral body, use 63081 and 22554 and 20931 or 20938)

(For spinal reconstruction with bone graft [autograft, allograft] and/or methylmethacrylate of thoracic vertebral body, use 63085 or 63087 and 22556 and 20931 or 20938)

(For spinal reconstruction with bone graft [autograft, allograft] and/or methylmethacrylate of lumbar vertebral

body, use 63087 or 63090 and 22558 and 20931 or 20938)

(For spinal reconstruction following vertebral body resection, use 63082 or 63086 or 63088 or 63091, and 22585)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(For harvest of bone autograft for vertebral reconstruction, see 20931 or 20938)

(For cervical spinal reconstruction with prosthetic replacement of resected vertebral bodies, see codes 63081 and 22554 and 20931 or 20938 and ~~22851~~22X81, 22X82, 22X83)

(For thoracic spinal reconstruction with prosthetic replacement of resected vertebral bodies, see codes 63085 or 63087 and 22556 and 20931 or 20938 and ~~22851~~22X81, 22X82, 22X83)

(For lumbar spinal reconstruction with prosthetic replacement of resected vertebral bodies, see codes 63087 or 63090 and 22558, and 20931 or 20938 and ~~22851~~22X81, 22X82, 22X83)

(For osteotomy of spine, see 22210-22226)

Arthrodesis

Arthrodesis may be performed in the ….

To report instrumentation procedures, see 22840-22855. (Codes 22840-22848, ~~22851~~22X81, 22X82, 22X83 are reported in conjunction with code[s] for the definitive procedure[s]. When instrumentation reinsertion or removal is reported in conjunction with other definitive procedures including arthrodesis, decompression, and exploration of fusion, append modifier 51 to 22849, 22850, 22852, and 22855.) To report exploration of fusion, use 22830. (When exploration is reported in conjunction with other definitive procedures, including arthrodesis and decompression, append modifier 51 to 22830.) Do not append modifier 62 to spinal instrumentation codes 22840-22848 and 22850-22852.

Exploration

To report instrumentation procedures, see 22840-22855.

(Codes 22840-22848 and ~~22851~~22X81, 22X82, 22X83 are reported in conjunction with code[s] for the definitive procedure[s]. When instrumentation reinsertion or removal is reported in conjunction with other definitive procedures including arthrodesis, decompression, and exploration of fusion, append modifier 51 to 22849, 22850, 22852 and 22855.) Code 22849 should not be reported with 22850, 22852, and 22855 at the same spinal levels. To report exploration of fusion, see 22830. (When exploration is reported in conjunction with other definitive procedures, including arthrodesis and decompression, append modifier 51 to 22830.)

(To report bone graft procedures, see 20930-20938)

22830 Exploration of spinal fusion

Spinal Instrumentation

Segmental instrumentation is defined …

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Non-segmental instrumentation is defined … Insertion of spinal instrumentation is reported separately and in addition to arthrodesis. Instrumentation procedure codes 22840-22848 and ~~22851~~22X81, 22X82, 22X83 are reported in addition to the definitive procedure(s). Do not append modifier 62 to spinal instrumentation codes22840-22848 and 22850-22852. *To report bone graft procedures…* *A vertebral segment describes the basic…* *Codes 22849, 22850, 22852, and 22855…* ✚ ***22840*** *Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)*				
D22851		~~Application of intervertebral biomechanical device(s) (eg, synthetic cage(s), methylmethacrylate) to vertebral defect or interspace (List separately in addition to code for primary procedure)~~ *(22851 has been deleted. To report, see 22X81-22X83)*	~~XXX~~	N/A
●✚22X81	J1	Insertion of interbody biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges) when performed to intervertebral disc space in conjunction with interbody arthrodesis, each interspace (List separately in addition to code for primary procedure) *(Report 22X81 for each treated intervertebral disc space)*	ZZZ	4.88
●✚22X82	J2	Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges) when performed to vertebral corpectomy(ies) (vertebral body resection, partial or complete) defect, in conjunction with interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure)	ZZZ	5.50

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●✚22X83	J3	Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh, methylmethacrylate) to intervertebral disc space or vertebral body defect without interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure) *(22X81, 22X82, or 22X83 may be reported more than once for non-contiguous defects)* *(Use 22X81, 22X82, 22X83 in conjunction with 22100-22102, 22110-22114, 22206, 22207, 22210-22214, 22220-22224, 22305-22327, 22532, 22533, 22548-22558, 22590-22612, 22630, 22633, 22634, 22800-22812, 63001-63030, 63040-63042, 63045-63047, 63050-63056, 63064, 63075, 63077, 63081, 63085, 63087, 63090, 63101, 63102, 63170-63290, 63300-63307)* *(For application of an intervertebral bone device/graft, see 20930-20938)*	ZZZ	6.00

Spinal Prosthetic Devices

~~22851~~ 22X81, 22X82, 22X83 Application of prosthetic device illustration

22856 *Total disc arthroplasty (artificial disc), anterior approach, including discectomy with end plate preparation (includes osteophytectomy for nerve root or spinal cord decompression and microdissection); single interspace, cervical*

(Do not report 22856 in conjunction with 22554, 22845, ~~22851~~22X81, 22X82, 22X83, 63075, 0375T, when performed at the same level)

(Do not report 22856 in conjunction with 69990)

(For additional interspace cervical total disc arthroplasty, see 22858, 0375T)

22857 *Total disc arthroplasty (artificial disc), anterior approach, including discectomy to prepare interspace (other than for decompression), single interspace, lumbar*

(Do not report 22857 in conjunction with 22558, 22845, ~~22851~~22X81, 22X82, 22X83, 49010 when performed at the same level)

(For additional interspace, use Category III code 0163T)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

22861	*Revision including replacement of total disc arthroplasty (artificial disc), anterior approach, single interspace; cervical*
	(Do not report 22861 in conjunction with 22845, ~~22851~~22X81, 22X82, 22X83, 22864, 63075 when *performed at the same level)*
	(Do not report 22861 in conjunction with 69990)
	(For additional interspace revision of cervical total disc arthroplasty, use 0098T)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22X81 Tracking Number J1 Original Specialty Recommended RVU: **5.25**
Presented Recommended RVU: **5.25**
Global Period: ZZZ RUC Recommended RVU: **4.88**

CPT Descriptor: Insertion of interbody biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges), when performed, to intervertebral disc space in conjunction with interbody arthrodesis, each interspace (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male undergoes a posterior lumbar interbody fusion of L5-S1 for degenerative disease. A posterior lumbar incision is made and an arthrodesis is performed using a PEEK cage. After the diskectomy and preparation of the end plates for fusion, a distractor is placed in the interspace, the interspace prepared to fit the cage, and the PEEK cage is placed in the interspace. The cage and interspace is filled with bone graft.
(Note: Code 228X1 is an add-on code that represents the additional work for insertion of a biomechanical device. Arthrodesis and/or bone grafting would be reported separately using the appropriate code[s]).

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: The exposed disk space and adjacent vertebrae are prepared with bone cutting instruments for acceptance of the biomechanical device. Preparation of the recipient site is made according to the protocol of the particular device. The recipient site is prepared by bone dissection, a trial fit with the device or a spacer or template as indicated by the protocol is inserted and removed for any final modifications of the recipient site. The biomechanical device is then screwed, impacted, or injected into place according to protocol for this particular device. (Additional fixation not integral to the device, other provision for arthrodesis, or bone grafting are coordinated with the placement of the biomechanical device and are coded separately.)

Description of Post-Service Work: n/a

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

Mental Effort and Judgment (Mean)

	Top Key Ref Code	2nd Key Ref Code
The number of possible diagnosis and/or the number of management options that must be considered	0.59	0.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.37	0.17
Urgency of medical decision making	0.22	0.08

Technical Skill/Physical Effort (Mean)

Technical skill required	0.56	0.21
Physical effort required	0.63	0.17

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.56	0.29
Outcome depends on the skill and judgment of physician	0.56	0.38
Estimated risk of malpractice suit with poor outcome	0.56	0.46

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.59	0.46

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 22851 was initially identified by CMS on a list of fastest growing procedures. The specialties requested additional data from CMS regarding billed-with codes and frequency reported per session to allow meaningful comment on growth in utilization. Upon review of these data, the specialties noted that 22851 may have been inappropriately reported for placement of certain types of structural bone allograft in the disc space. The RUC approved specialty education through a CPT Assistant article which resulted in a decreased rate of growth. In concert with the release of the article, code 22851 was identified by CMS as a high expenditure code that had not been reviewed for at least 6 years. The RAW recommended that code 22851 be surveyed because of the frequency of use, historical consistent growth of utilization, and the fact that the code had not been surveyed since April 1995 during the first 5-year review.

The specialties review of data indicated that 22851 had been used for a variety of different cases, requiring different physician work, and with different operative goals. It became evident during this assessment that survey of 22851, using the present code descriptor, would not provide meaningful data. The specialties developed three new code descriptors to more accurately reflect physician work as it relates to the various new technologies and techniques related to intervertebral biomechanical devices.

Survey Sample and Process

The survey request was sent to a random selection from the AAOS membership database. In addition, targeted samples within the AANS/CNS, NASS, and ISASS membership databases were approved by Research Subcommittee: A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves. A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members). A random selection of only U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

MPC

We have not indicated any MPC codes on this form as there are only ten MPC codes with a ZZZ global and none of these codes are at the level of work RVU for this service.

Recommendation - 22X81

The new descriptors for codes were developed to reflect increasing physician work; 22X81 -> 22X82 -> 22X83. We anticipate that the utilization for 22X81 will be greatest, followed by 22X82, and then 22X83.

Our expert panel believes the survey median and 25th percentile work RVU is inconsistent with the physician work required for 22X81. Although code 22X81 has the same intraoperative time as key reference code 22552, the expert panel believes the work intensity/complexity is less. We believe code 63295, *Osteoplastic reconstruction of dorsal spinal elements, following primary intraspinal procedure* more accurately reflects the work for 22X81 and recommend crosswalking the work RVU of 5.25 to code 22X81.

The three new add-on codes may be reported with 115 different primary procedures, including 22100-22102, 22110-22114, 22206, 22207, 22210-22214, 22220-22224, 22305-22327, 22532, 22533, 22548-22558, 22590-22612, 22630, 22633, 22634, 22800-22812, 63001-63030, 63040-63042, 63045-63047, 63050-63056, 63064, 63075, 63077, 63081, 63085, 63087, 63090, 63101, 63102, 63170-63290, and 63300-63307. The patient presentation and anatomy/pathology will be different across the spectrum of possible work. For example, preparing a defect for insertion of intervertebral biomechanical device can be widely variable. This makes valuing these add-on codes difficult. Our recommendations take into account other similar work (63295, 22552) and relativity between the three codes. We believe our recommendations create an appropriate rank order and relate well to the physician work for other add-on codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 22X81, 22X82, 22X83 in conjunction with 22100-22102, 22110-22114, 22206, 22207, 22210-22214, 22220-22224, 22305-22327, 22532, 22533, 22548-22558, 22590-22612, 22630, 22633, 22634, 22800-22812, 63001-63030, 63040-63042, 63045-63047, 63050-63056, 63064, 63075, 63077, 63081, 63085, 63087, 63090, 63101, 63102, 63170-63290, 63300-63307)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22851

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Commonly

Specialty orthopaedic surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
77,981 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimated percentage (65%) of the utilization for 22851.

Specialty neurosurgery Frequency 42200 Percentage 53.41 %

Specialty orthopaedic surgery Frequency 35500 Percentage 44.93 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.78	0.45
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.57	0.10
Urgency of medical decision making	0.35	0.50

Technical Skill/Physical Effort (Mean)

Technical skill required	0.87	0.45
Physical effort required	0.65	0.35

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.87	0.55
Outcome depends on the skill and judgment of physician	0.70	0.50
Estimated risk of malpractice suit with poor outcome	0.61	0.50

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.83	0.35

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 22851 was initially identified by CMS on a list of fastest growing procedures. The specialties requested additional data from CMS regarding billed-with codes and frequency reported per session to allow meaningful comment on growth in utilization. Upon review of these data, the specialties noted that 22851 may have been inappropriately reported for placement of certain types of structural bone allograft in the disc space. The RUC approved specialty education through a CPT Assistant article which resulted in a decreased rate of growth. In concert with the release of the article, code 22851 was identified by CMS as a high expenditure code that had not been reviewed for at least 6 years. The RAW recommended that code 22851 be surveyed because of the frequency of use, historical consistent growth of utilization, and the fact that the code had not been surveyed since April 1995 during the first 5-year review.

The specialties review of data indicated that 22851 had been used for a variety of different cases, requiring different physician work, and with different operative goals. It became evident during this assessment that survey of 22851, using the present code descriptor, would not provide meaningful data. The specialties developed three new code descriptors to more accurately reflect physician work as it relates to the various new technologies and techniques related to intervertebral biomechanical devices.

Survey Sample and Process

The survey request was sent to a random selection from the AAOS membership database. In addition, targeted samples within the AANS/CNS, NASS, and ISASS membership databases were approved by Research Subcommittee: A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves. A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members). A random selection of only U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

MPC

We have not indicated any MPC codes on this form as there are only ten MPC codes with a ZZZ global and none of these codes are at the level of work RVU for this service.

Recommendation - 22X82

The new descriptors for codes were developed to reflect increasing physician work; 22X81 -> 22X82 -> 22X83. We anticipate that the utilization for 22X81 will be greatest, followed by 22X82, and then 22X83.

Our expert panel believes the survey median and 25th percentile work RVU is inconsistent with the physician work required for 22X82. Although code 22X82 has more intraoperative time than key reference code 22552, the expert panel believes the total physician work is the same and therefore recommend crosswalking the work RVU of 6.50 to code 22X82.

The three new add-on codes may be reported with 115 different primary procedures, including 22100-22102, 22110-22114, 22206, 22207, 22210-22214, 22220-22224, 22305-22327, 22532, 22533, 22548-22558, 22590-22612, 22630, 22633, 22634, 22800-22812, 63001-63030, 63040-63042, 63045-63047, 63050-63056, 63064, 63075, 63077, 63081, 63085, 63087, 63090, 63101, 63102, 63170-63290, and 63300-63307. The patient presentation and anatomy/pathology will be different across the spectrum of possible work. For example, preparing a defect for insertion of intervertebral biomechanical device can be widely variable. This makes valuing these add-on codes difficult. Our recommendations take into account other similar work (63295, 22552) and relativity between the three codes. We believe our recommendations create an appropriate rank order and relate well to the physician work for other add-on codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 22X81, 22X82, 22X83 in conjunction with 22100-22102, 22110-22114, 22206, 22207, 22210-22214, 22220-22224, 22305-22327, 22532, 22533, 22548-22558, 22590-22612, 22630, 22633, 22634, 22800-22812, 63001-63030, 63040-63042, 63045-63047, 63050-63056, 63064, 63075, 63077, 63081, 63085, 63087, 63090, 63101, 63102, 63170-63290, 63300-63307)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22851

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Commonly

Specialty orthopaedic surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 29993
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimated percentage (25%) of the utilization for 22851.

Specialty neurosurgery Frequency 16000 Percentage 53.33 %

Specialty orthopaedic surgery Frequency 13500 Percentage 45.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 22552

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:22X83 Tracking Number J3 Original Specialty Recommended RVU: **6.70**
Presented Recommended RVU: **6.00**
Global Period: ZZZ RUC Recommended RVU: **6.00**

CPT Descriptor: Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh, methylmethacrylate) to intervertebral disc space or vertebral body defect without interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male undergoes an anterior cervical fusion of C4-C6 for a C5 pathological burst fracture from metastatic carcinoma. An anterior cervical incision is made and stabilization is performed using methylmethacrylate. After the corpectomy and resection of the tumor, a distractor is placed in the corpectomy defect, and the corpectomy defect prepared to fit the methylmethacrylate. The dura is protected, Steinman pins are placed into the vertebral bodies, the corpectomy defect is filled with methylmethacrylate, and the methylmethacrylate shaped to fit the corpectomy defect.
(Note: Code 228X3 is an add-on code that represents the additional work for insertion of a biomechanical device. Arthrodesis and/or bone grafting would be reported separately using the appropriate code[s]).

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: The exposed corpectomy defect and adjacent vertebrae are prepared with bone cutting instruments for acceptance of the biomechanical device. Preparation of the recipient site is made according to the protocol of the particular device. If methylmethacrylate is to be used, a screw or pin is inserted into the adjacent vertebral surfaces to anchor the methylmethacrylate. Provision is made for cooling of adjacent tissues and protection of heat sensitive tissue from the exothermic reaction of the curing of the methylmethacrylate. For cages, the recipient site is prepared by bone dissection, a trial fit with the device or a spacer or template as indicated by the protocol is inserted and removed for any final modifications of the recipient site. The biomechanical device is then screwed, impacted, or injected into place according to protocol for this particular device. (Additional fixation, other provision for arthrodesis are coordinated with the placement of the prosthetic device and are coded separately.)

Description of Post-Service Work: n/a

Time Segment (Mean)		
Overall intensity/complexity	0.56	0.65

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 22851 was initially identified by CMS on a list of fastest growing procedures. The specialties requested additional data from CMS regarding billed-with codes and frequency reported per session to allow meaningful comment on growth in utilization. Upon review of these data, the specialties noted that 22851 may have been inappropriately reported for placement of certain types of structural bone allograft in the disc space. The RUC approved specialty education through a CPT Assistant article which resulted in a decreased rate of growth. In concert with the release of the article, code 22851 was identified by CMS as a high expenditure code that had not been reviewed for at least 6 years. The RAW recommended that code 22851 be surveyed because of the frequency of use, historical consistent growth of utilization, and the fact that the code had not been surveyed since April 1995 during the first 5-year review.

The specialties review of data indicated that 22851 had been used for a variety of different cases, requiring different physician work, and with different operative goals. It became evident during this assessment that survey of 22851, using the present code descriptor, would not provide meaningful data. The specialties developed three new code descriptors to more accurately reflect physician work as it relates to the various new technologies and techniques related to intervertebral biomechanical devices.

Survey Sample and Process

The survey request was sent to a random selection from the AAOS membership database. In addition, targeted samples within the AANS/CNS, NASS, and ISASS membership databases were approved by Research Subcommittee: A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves. A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members). A random selection of only U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

MPC

We have not indicated any MPC codes on this form as there are only ten MPC codes with a ZZZ global and none of these codes are at the level of work RVU for this service.

Recommendation - 22X83

The new descriptors for codes were developed to reflect increasing physician work; 22X81 -> 22X82 -> 22X83. We anticipate that the utilization for 22X81 will be greatest, followed by 22X82, and then 22X83.

Code 22X83 is more intense/complex and will require more physician work than codes 22X81 and 22X82. Code 22X83 will also have the lowest expected utilization. For this code, we recommend that the current work RVU of 6.70 for 22851 be assigned.

The three new add-on codes may be reported with 115 different primary procedures, including 22100-22102, 22110-22114, 22206, 22207, 22210-22214, 22220-22224, 22305-22327, 22532, 22533, 22548-22558, 22590-22612, 22630, 22633, 22634, 22800-22812, 63001-63030, 63040-63042, 63045-63047, 63050-63056, 63064, 63075, 63077, 63081, 63085, 63087, 63090, 63101, 63102, 63170-63290, and 63300-63307. The patient presentation and anatomy/pathology will be different across the spectrum of possible work. For example, preparing a defect for insertion of intervertebral biomechanical device can be widely variable. This makes valuing these add-on codes difficult. Our recommendations take into account other similar work (63295, 22552) and relativity between the three codes. We believe our recommendations create an appropriate rank order and relate well to the physician work for other add-on codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 22X81, 22X82, 22X83 in conjunction with 22100-22102, 22110-22114, 22206, 22207, 22210-22214, 22220-22224, 22305-22327, 22532, 22533, 22548-22558, 22590-22612, 22630, 22633, 22634, 22800-22812, 63001-63030, 63040-63042, 63045-63047, 63050-63056, 63064, 63075, 63077, 63081, 63085, 63087, 63090, 63101, 63102, 63170-63290, 63300-63307)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22851

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
11,997 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimated percentage (10%) of the utilization for 22851.

Specialty neurosurgery Frequency 6400 Percentage 53.33 %

Specialty orthopaedic surgery Frequency 5300 Percentage 44.17 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society RVS Update Committee Summary of Recommendations
090-Day Global Post-Operative Visits Screen

January 2016

Closed Treatment of Pelvic Ring Fracture

In the Final Rule for 2014, CMS proposed CPT codes 21800, 22305 and 27193 for review to consider the appropriateness of having a 90-day global surgical package for a procedure that is performed in settings other than the inpatient setting 33 percent of the time. CMS believed that it is unlikely that it is appropriate for a procedure performed outside of the inpatient hospital setting at this frequency to have such a long global period. The specialties reviewed the data for code 27193 and determined that the utilization for this work is bimodal; higher energy fractures in typically non-Medicare patients requiring careful monitoring to determine if / when surgery is appropriate and isolated lower energy fractures that are more typical of those acquired in falls from standing in Medicare-aged patients that typically will not require surgery, with work reported with Evaluation and Management (E/M) service codes. Codes 27193 and family code 27194 were referred to CPT and in October 2015, the CPT Editorial Panel deleted codes 27193 and 27194 and created two new codes 271X1 and 271X2 to differentiate higher energy fractures and isolated lower energy fractures. In addition, a parenthetical was added to direct physicians to use E/M coding for the closed treatment of isolated lower energy fractures of the anterior pelvic ring (typically low energy falls from standing in the elderly) to distinguish these injuries from the higher energy and more unstable posterior pelvic ring injuries that may also include the anterior elements of the pelvic ring simultaneously. The inherently stable anterior only fracture should not require close monitoring, manipulation, or treatment and therefore can be reported with an E/M service when diagnosed. These coding changes should address the issue of site of service because a patient with a high energy impact injury would not present to an office setting and would/should not be treated in an office setting.

271X1 ***Closed treatment of posterior pelvic ring fracture(s), dislocation(s), diastasis or subluxation of the ilium, sacroiliac joint, and/or sacrum, with or without anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral; without manipulation***
The RUC reviewed the survey results from 56 orthopaedic surgeons and recommends the following physician time components: pre-service time of 12 minutes, intra-service time of 5 minutes, immediate post-service time of 10 minutes, and appropriate postoperative hospital and office visits. Pre-service package 2b (difficult patient/straightforward procedure) was reduced from 18 minutes to 12 minutes to account for overlap with an E/M service that would typically be reported in conjunction with 271X1.

The RUC reviewed the survey 25th percentile of 5.50 work RVUs, with total time of 180 minutes, and determined it appropriately accounts for the physician work required to perform this service. The RUC agreed with the specialties that this new code and associated guidelines more clearly identify higher energy fractures in patients that will be admitted to the hospital. The RUC determined that one 99232 and one 99231 inpatient visit

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

are justified because the typical trauma patient related to the new code will require careful monitoring to determine if / when surgery is appropriate. High energy pelvic ring fractures most often occur in conjunction with other trauma, so maintaining a 90-day global period allows for reporting of work related to multiple injuries in different anatomical locations. Specifically, high energy impact that results in a pelvic ring fracture may also result in a femur fracture or other spinal or lower extremity injuries. The stability of the posterior pelvic ring fracture cannot be assessed until other injuries are stabilized as they interfere with the ability to mobilize the patient. For example, after repair of a femur fracture, the posterior pelvic ring fracture will be monitored for instability or displacement to determine if/when surgery is necessary. This work is distinctly different than the post-operative work for open repair of a femur fracture. In addition, E/M codes cannot be reported to monitor the pelvic ring fracture during the global period of the femur fracture. At these visits the physician will remove the immobilizer, assess circulation, sensation, and motor function of pelvis and will follow the patient through healing and restoration of function if surgery is not required.

The RUC compared the service to key reference services CPT code 27267, *Closed treatment of femoral fracture, proximal end, head; without manipulation* (work RVU = 5.50, total time of 171 minutes) and CPT code 25605 *Closed treatment of distal radial fracture (eg, Colles or Smith type) or epiphyseal separation, includes closed treatment of fracture of ulnar styloid, when performed; with manipulation* (work RVU = 6.25, total time of 169 minutes) and noted that the two codes have similar total time to surveyed code 271X1. The intra-service time is higher for both key reference codes because this time category includes fabrication of a cast/splint. Treatment of fractures of the posterior pelvic ring is more complex and intense than a femoral head fracture or distal radius fracture because immobilization is difficult to maintain, justifying similar work values despite less intra-service time. **The RUC recommends a work RVU of 5.50 for CPT code 271X1.**

271X2 ***Closed treatment of posterior pelvic ring fracture(s), dislocation(s), diastasis or subluxation of the ilium, sacroiliac joint, and/or sacrum, with or without anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral; with manipulation, requiring more than local anesthesia (ie, general anesthesia, moderate sedation, spinal/epidural)***
The RUC reviewed the survey results from 56 orthopaedic surgeons and recommends the following physician time components: pre-service time of 58 minutes, intra-service time of 30 minutes, immediate post-service time of 25 minutes, and appropriate postoperative hospital and office visits. Pre-service package 4 (difficult patient/difficult procedure) was selected, with a reduction in scrub, dress, and wait time to be consistent with the survey median time for this activity.

The RUC reviewed the survey 25th percentile of 9.00 work RVUs, with total time of 293 minutes and determined it appropriately accounts for the physician work required to perform this service. The RUC compared the service to key reference services CPT code 20690, *Application of a uniplane (pins or wires in 1 plane), unilateral, external fixation system* (work RVU = 8.78, total time of 171 minutes) and CPT code 25605 *Closed treatment of distal radial fracture (eg, Colles or Smith type) or epiphyseal separation, includes closed treatment of fracture of ulnar styloid, when performed; with manipulation* (work RVU = 6.25, total time of 169 minutes) and noted that the two codes have less total time than the surveyed code, however the intensity and complexity of 271X2 is significantly greater justifying the greater work value. The RUC also compared 271X2 to MPC codes 50590, *Lithotripsy, extracorporeal shock wave* (work RVU = 9.77, total time of 207 minutes) and 47562, *Laparoscopy, surgical; cholecystectomy* (work RVU=10.47, total time of 228 minutes) and agreed that these codes appropriately bracket the recommendation for 271X2,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

adding further support for the 25th percentile work RVU. **The RUC recommends a work RVU of 9.00 for CPT code 271X2.**

Practice Expense
The RUC reviewed and approved the direct practice expense inputs without modification as submitted by the specialty society and approved by the PE Subcommittee. The specialty discounted the 60 minutes of pre-service clinical staff time standard for 090 day globals to 20 minutes, in line with the recommendation for emergent procedures discussed by the PE Subcommittee at this meeting.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
D27193		~~Closed treatment of pelvic ring fracture, dislocation, diastasis or subluxation; without manipulation~~	~~ZZZ~~	N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:271X1 Tracking Number L1 Original Specialty Recommended RVU: **6.09**
Presented Recommended RVU: **5.50**
Global Period: 090 RUC Recommended RVU: **5.50**

CPT Descriptor: Closed treatment of posterior pelvic ring fracture(s), dislocation(s), diastasis or subluxation of the ilium, sacroiliac joint, and/or sacrum, with or without anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral; without manipulation
(To report closed treatment of only anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral, use the appropriate Evaluation and Management Services codes)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A person involved in a vehicular crash has pelvic pain and pain with attempted weight bearing. Imaging studies show minimally displaced fractures of the anterior and posterior portions of the pelvic ring, with ipsilateral fractures of the pubic rami and sacrum. The patient's fractures are treated without manipulation.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 12% , Overnight stay-more than 24 hours 88%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 30%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Explain procedure to patient and/or family. Review the risks and complications associated with fracture treatment. Review the treatment and the expected outcome. Verify all supplies are available. View imaging studies and verify the fractures. Position patient to be immobilized.

Description of Intra-Service Work: The fractures are treated with a pelvic sling, binder, sheet or other orthosis to prevent further fracture displacement, increase patient comfort and improve patient mobility

Description of Post-Service Work: Facility. Assist positioning for permanent portable radiographs. Assist in transfer to stretcher or bed. Dictate a procedure report for patient's medical record and provide copies to patient's PCP and insurance company. Discuss activity restrictions with the nursing staff and patient/family; non-weight bearing, using ambulatory aids (wheelchair, crutches or walker). Instruct nursing staff and patient/family on care of immobilizer. Monitor fracture healing to assure continued fracture alignment and progression of healing, assessing need for surgery. Assess neurovascular status of lower extremities. Monitor pain and write orders for pain management as needed. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (eg, activity, bathing) are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge summary, discharge instructions, medication reconciliation, and insurance forms.

Office. Examine and talk with patient. Answer questions from patient and/or family. Remove immobilizer. Assess circulation, sensation, and motor function of pelvis and lower extremities. Order physical therapy and/or occupational therapy when appropriate and assess rehabilitation. Order and view radiographs. Write prescription orders for pain management. Dictate progress notes for patient's medical record and provide copies to patient's PCP. Follow the patient through healing and restoration of function.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
27267	090	5.50	**RUC Time**

CPT Descriptor Closed treatment of femoral fracture, proximal end, head; without manipulation

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
25605	090	6.25	**RUC Time**

CPT Descriptor Closed treatment of distal radial fracture (eg, Colles or Smith type) or epiphyseal separation, includes closed treatment of fracture of ulnar styloid, when performed; with manipulation

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
62362	010	5.60	**RUC Time**	7,862

CPT Descriptor 1 Implantation or replacement of device for intrathecal or epidural drug infusion; programmable pump, including preparation of pump, with or without programming

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
14000	090	6.37	**RUC Time**	8,822

CPT Descriptor 2 Adjacent tissue transfer or rearrangement, trunk; defect 10 sq cm or less

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.76	1.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.88	1.18
Urgency of medical decision making	0.60	1.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.48	0.45
Physical effort required	0.08	-0.27

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.80	1.27
Outcome depends on the skill and judgment of physician	0.84	0.82
Estimated risk of malpractice suit with poor outcome	0.56	1.00

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.76	0.91

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the Notice for Proposed Rulemaking for 2014, CMS proposed code 27193 for review. CMS questioned the appropriateness of having a 90-day global surgical package for a procedure that is performed in settings other than the inpatient setting 25 percent of the time for Medicare patients (ie, 2014 data is 24.7% office setting). The AAOS RUC and CPT Advisors reviewed data for code 27193 and determined that the utilization for this work is bimodal; higher energy fractures in typically non-Medicare patients requiring careful monitoring to determine if / when surgery is appropriate and isolated lower energy fractures that are more typical of those acquired in falls from standing in Medicare-aged patients that usually will not require surgery. The AAOS believes there is important physician work that would not be correctly captured by discrete E/M billing for all fractures of the pelvis. Significantly, the injuries treated fall into two categories, those which are inherently stable (fractures involving solely the anterior pelvic ring) and those which need treatment and close monitoring for instability and displacement as they involve the posterior pelvic ring which are affected by weightbearing.

In addition, because higher energy pelvic ring fractures most often occur in conjunction with other trauma, it is important to maintain a 90-day global period for reporting. This concept is an important factor in trauma care to allow for correct reporting of work related to multiple injuries in different anatomical locations. Specifically, high energy impact that results in a pelvic ring fracture may also result in a femur fracture or other spinal or lower extremity injuries. The stability of the posterior pelvic ring fracture cannot be assessed until other injuries are stabilized as they interfere with the ability to mobilize the patient. For example, after repair of a femur fracture, the posterior pelvic ring fracture will be monitored for instability or displacement to determine if/when surgery is necessary. This work is distinctly different than the post-operative work for open repair of a femur fracture. In addition, E/M codes cannot be reported to monitor the pelvic ring fracture during the global period of the femur fracture. It is examples such as this (multiple trauma) that resulted in the decision by CMS (then HCFA) many years ago to maintain a 90-day global period for all fracture and trauma care.

The code descriptor changes to codes 27193 and family code 27194 correspond to physician work for high energy posterior pelvic ring injuries. In addition, a parenthetical was added to direct physicians to use E/M coding for the closed treatment of isolated fractures of the anterior pelvic ring (typically low energy falls from standing in the elderly) to distinguish these injuries from the higher energy and more unstable posterior pelvic ring injuries that may also

include the anterior elements of the pelvic ring simultaneously. The inherently stable anterior only fracture should not require close monitoring, manipulation, or treatment and therefore can be reported with an E/M service when diagnosed. The AAOS believes that these coding changes should address the issue of site of service because a patient with a high energy impact injury would not present to an office setting and would/should not be treated in an office setting. Low energy anterior only fractures discovered at an office visit would not require treatment.

At CPT, the Panel coding experts determined that the proposed descriptor revisions changed the meaning of the codes so that they will now only be for posterior pelvic ring fractures, while anterior only pelvic ring fractures will be reported with E/M codes instead and that new code numbers should be assigned for quality and financial tracking purposes. This is further support that these coding changes should address the issue of office site of service.

Survey Sample and Process

The survey request was sent to an equal sized random selection from the membership database of the American Academy of Orthopaedic Surgeons (AAOS) and the Orthopaedic Trauma Association (OTA).

Pre-time Package 2A (Difficult Patient/Straightforward Procedure)

We believe that the survey respondents had difficulty parsing out pre-time categories of work for this closed treatment service. We also note that although an EM is currently typically reported with 27193, the frequency of reporting an EM should decrease with the new coding guidance.

Evaluation: Subtract 6 minutes (total = 12 minutes) for overlap with EM.
Positioning: Subtract 1 minutes (total = 0 minutes)
Scrub, dress, wait: Subtract 6 minutes (total = 0 minutes) as this is typically not a sterile procedure.

Key Reference Codes

The key reference codes have similar total time as survey code 271X1. Intra-time is higher for both KRS codes because this time category includes fabrication of a cast/splint. Treatment of fractures of the posterior pelvic ring are more complex and therefore more intense than a femoral head fracture or distal radius fracture because immobilization is difficult to maintain.

MPC Comparison

MPC code 62362 (10-day global) is an elective outpatient procedure for placement of a subcutaneous pump. MPC code 14000 is typically performed in an office setting to close a wound created by a lesion excision. Total times and intensities are similar and support the recommendation for 271X1.

MPC	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	32	31	38	13	12
62362	Implantation or replacement of device for intrathecal or epidural drug infusion; programmable pump, including preparation of pump, with or without programming	**5.60**	0.042	**170**	48	**60**	20			0.5	1	
271X1	Treat pelvic ring fracture w/o manipulation	**6.09**	0.034	**183**	15	**5**	10	1	1	1	1	2
14000	Adjacent tissue transfer or rearrangement, trunk; defect 10 sq cm or less	**6.37**	0.030	**192**	25	**64**	22				3.5	

Recommendation – 271X1

Although the lesser work of anterior only fractures is being removed from code 27193 which would suggest an increase in value, **we recommend a work RVU of 6.09,** which is the current work RVU for 27193. The intra-operative intensity (0.034) is consistent with the intensity of other closed fracture treatment codes and significantly below a mid-level office visit. A work RVU of 6.09 takes into consideration the considerable global work related to this service. The AAOS and OTA are strongly supportive of maintaining a 90-day global period of all fracture and dislocation treatment codes (ie, open, percutaneous, closed). When multiple trauma occurs, this allows for correct reporting, tracking, and reimbursement under the multiple procedure reduction policy.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Medicare data indicates this code is typically reported with an EM service on the same date.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Medicare data indicates this code is typically reported with an EM service on the same date.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27193

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not avaiable

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 14,500 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Although the current Medicare utilization for 27193 is 19,472, we expect the utilization of this code to descrease significantly (especially in the office setting) after the revised descriptor and parenthetical coding guidance is implemented and education is disseminated.

Specialty orthopaedic surgery Frequency 14000 Percentage 96.55 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 27193

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:271X2 Tracking Number L2 Original Specialty Recommended RVU: **10.20**
Presented Recommended RVU: **9.00**
Global Period: 090 RUC Recommended RVU: **9.00**

CPT Descriptor: Closed treatment of posterior pelvic ring fracture(s), dislocation(s), diastasis or subluxation of the ilium, sacroiliac joint, and/or sacrum, with or without anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral; with manipulation, requiring more than local anesthesia (ie, general anesthesia, moderate sedation, spinal/epidural)
(To report closed treatment of only anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral, use the appropriate Evaluation and Management Services codes)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient involved in a vehicular crash has pelvic pain and pain with attempted weight bearing. Imaging studies show minimally displaced fractures of the anterior and posterior portions of the pelvic ring, with ipsilateral fractures of the pubic rami and sacrum. The patient's fractures are treated with manipulation under non-local anesthesia.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 40%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Explain procedure to patient and/or family. Review the risks and complications associated with fracture treatment. Review the treatment and the expected outcome. Obtain informed consent. Verify all supplies are available. Review imaging studies and verify the fractures. Assist with transfer of patient to fracture table and positioning. Assist in positioning of fluoroscopic imaging equipment and confirm satisfactory visualization of the pelvis (AP, inlet, outlet, and Judet views). Perform surgical "time out" with operating surgical team. Scrub and gown.

Description of Intra-Service Work: The fractures are treated with manipulation under anesthesia to ascertain the propensity for displacement and stability. This includes a combination of skeletal traction, limb positioning, and external supports. A pelvic sling, binder, sheet or other orthosis is applied to enhance fracture stability, increase patient comfort and improve patient mobility.

Description of Post-Service Work:
Facility. Assist positioning for permanent portable radiographs which are reviewed prior to awakening from anesthesia. Assist in transfer from fracture table to stretcher or bed. Monitor patient stabilization in the recovery room. Dictate a procedure report for patient's medical record and provide copies to patient's PCP and insurance company. Discuss activity restrictions with the nursing staff and patient/family; non-weight bearing, using ambulatory aids (wheelchair, crutches or

walker). Instruct nursing staff and patient/family on care of immobilizer. Monitor fracture healing to assure continued fracture alignment and progression of healing, assessing need for surgery. Assess neurovascular status of lower extremities. Monitor pain and write orders for pain management as needed. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (eg, activity, bathing) are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge summary, discharge instructions, medication reconciliation, and insurance forms.

Office. Examine and talk with patient. Answer questions from patient and/or family. Remove immobilizer. Assess circulation, sensation, and motor function of pelvis and lower extremities. Order physical therapy and/or occupational therapy when appropriate and assess rehabilitation. Order and review radiographs. Write prescription orders for pain management. Dictate progress notes for patient's medical record and provide copies to patient's PCP. Follow the patient through healing and restoration of function.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.19	1.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.44	1.17
Urgency of medical decision making	1.44	1.25
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.31	1.33
Physical effort required	0.63	1.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.56	1.67
Outcome depends on the skill and judgment of physician	1.50	1.00
Estimated risk of malpractice suit with poor outcome	1.38	1.42

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.63	1.58

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the Notice for Proposed Rulemaking for 2014, CMS proposed code 27193 for review. Code 27194 was added as a family code. The CPT code descriptor changes to codes 27193 and family code 27194 reflect physician work for higher energy posterior pelvic ring injuries. In addition, a parenthetical was added to direct physicians to use E/M coding for the closed treatment of isolated fractures of the anterior pelvic ring (typically lower energy falls from standing in the elderly) to distinguish these injuries from the higher energy and more unstable posterior pelvic ring injuries that may also include the anterior elements of the pelvic ring simultaneously. The inherently stable anterior ring-only fracture should not require close monitoring, manipulation, or treatment and therefore can be reported with an E/M service when diagnosed. The AAOS believes that these coding changes should address the issue of site of service because a patient with a high energy impact injury would not present to an office setting and would/should not be treated in an office setting.

At CPT, the Panel coding experts determined that the proposed descriptor revisions changed the meaning of the codes so that they will now only be for posterior pelvic ring fractures, while anterior only pelvic ring fractures will be reported with E/M codes instead and that new code numbers should be assigned for quality and financial tracking purposes. This is further support that these coding changes should address the issue of office site of service.

Utilization

This is a procedure that will be performed in an OR under anesthesia (general or MAC). We would like to note that 92% of the claims from providers designated as family practice came from one Medicare carrier - Florida (other than Miami and other than greater Ft. Lauderdale). We anticipate that the coding descriptor changes will correct this atypical utilization. We leave further investigation to CMS.

Survey Sample and Process

The survey request was sent to an equal sized random selection from the membership database of the American Academy of Orthopaedic Surgeons (AAOS) and the Orthopaedic Trauma Association (OTA).

Pre-time Package 4 (Difficult Patient/Difficult Procedure)

Evaluation: Standard package time of 40 minutes.
Positioning: Standard package time of 3 minutes for supine positioning on a fracture table.
Scrub, dress, wait: Subtract 5 minutes (total = 15 minutes) to be consistent with survey median time.

Key Reference Codes

The intensity and complexity of 271X2 is significantly greater that the key reference services as indicated by the survey measures.

MPC Comparison

Although the MPC codes 50590 and 47562 require more intra-service time, code 271X2 requires significantly more post-operative work.

MPC	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	32	31	38	13	12
50590	Lithotripsy, extracorporeal shock wave	**9.77**	0.091	**207**	51	**60**	15			0.5	2	1
271X2	Treat pelvic ring fracture with manipulation, requiring anesthesia	**10.20**	0.081	**293**	58	**30**	25	1	2	1	2	1
47562	Laparoscopy, surgical; cholecystectomy	**10.47**	0.082	**228**	65	**80**	25			0.5	1	2

Recommendation – 271X2

Although the lesser work of anterior only fractures is being removed from code 27194, which would suggest an increase in value, **we recommend a work RVU of 10.20**, which is the current work RVU for 27194. A work RVU of 10.20 takes into consideration the considerable global work related to this service. The AAOS and OTA are strongly supportive of maintaining a 90-day global period of all fracture and dislocation treatment codes (ie, open, percutaneous, closed). When multiple trauma occurs, this allows for correct reporting, tracking, and reimbursement under the multiple procedure reduction policy.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 27194

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not avaiable

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 200
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Although the current Medicare utilization for 27194 is 247, we expect the utilization of this code to descrease after the revised descriptor and parenthetical coding guidance is implemented and education is disseminated.

Specialty orthopaedic surgery Frequency 195 Percentage 97.50 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Facility Direct Inputs

271X1	**Closed treatment of posterior pelvic ring fracture(s), dislocation(s), diastasis or subluxation of the ilium, sacroiliac joint, and/or sacrum, with or without anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral; without manipulation**
271X2	**Closed treatment of posterior pelvic ring fracture(s), dislocation(s), diastasis or subluxation of the ilium, sacroiliac joint, and/or sacrum, with or without anterior pelvic ring fracture(s) and/or dislocation(s) of the pubic symphysis and/or superior/inferior rami, unilateral or bilateral; with manipulation, requiring more than local anesthesia (ie, general anesthesia, moderate sedation, spinal/epidural)**

Global Period: 090 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 27193 and 27194 and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. Current inputs for 27193 and 27194 are used as reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The typical patient for this service will not be emergent, but will also not be an elective case. The surgeon's clinical staff will be communicating and coordinating with health care providers at the hospital to request imaging and history for the surgeon's review and the surgeon's office medical record, confirming operating room and anesthesia availability in the event manipulation and/or open treatment becomes necessary, confirming patient clearance for surgery, and monitoring patient status for the surgeon. In addition, the clinical staff will contact PCP and/or family to determine if advanced care medical directive is available and they will followup with obtaining insurance authorization.

Service Clinical Labor Activities:
Clinical staff will assist the surgeon with discharge management, including arrangements for post-discharge imaging, home care, and responding to patient and family questions.

Post-Service Clinical Labor Activities:
Clinical staff will assist the surgeon at post-op office visits.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
090-Day Global Post-Operative Visits Screen

January 2016

Bunionectomy

In January 2014, the RUC reviewed 090-day global services (based on 2012 Medicare utilization data) and identified 10 services, reported at least 1,000 times per year that included more than 6 office visits. CPT code 28293 was identified and the specialty societies added 28290-28299 as part of the family of services. The RUC requested these services be surveyed for work and review the practice expense for the January 2015 RUC meeting. The specialty societies indicated that after reviewing the vignettes and the bunionectomy code descriptors, CPT coding changes were necessary, including deletion of code(s), possible bundling of codes, and general descriptor revisions. In October 2015, the CPT Editorial Panel created two new codes (283X1, 282X2), deleted codes 28290, 28293, 28294 and revised 28289, 28292, 28296, 28297, 28298 and 28299 for more accurate description of the services as they are currently performed.

28289 ***Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint; without implant***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 76 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 6.90 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time of 45 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur).* The RUC agreed that a half-day 99238, 2-99212 and 2-99213 visits are appropriate to remove splints/dressings, assess surgical wound, remove sutures, assess circulation, sensation and motor function, redress wound and order physical therapy. The RUC compared the surveyed code to key reference services 28122 *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); tarsal or metatarsal bone, except talus or calcaneus* (work RVU = 6.76 and intra-service time of 45 minutes) and 28120 *Partial excision (craterization, saucerization, sequestrectomy, or diaphysectomy) bone (eg, osteomyelitis or bossing); talus or calcaneus* (work RVU = 7.31 and intra-service time of 50 minutes) and determined the physician work and time required to perform 28289 appropriately falls in between these two similar services. **The RUC recommends a work RVU of 6.90 for CPT code 28289.**

282X1 ***Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint; with implant***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 37 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 8.01 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

of 50 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur).* The RUC agreed that a half-day 99238, 2-99212 and 2-99213 visits are appropriate to remove splints/dressings, assess surgical wound, remove sutures, assess circulation, sensation and motor function, redress wound and order physical therapy. The RUC noted that this service is appropriately more work than CPT code 28289. CPT code 28289 procedure is a clean up arthroplasty of osteophytes at joint on a degenerative joint. Whereas, this service is a total joint replacement and includes the work of 28289 with the addition of placement of the total joint including resection of both sides of the joint. The RUC compared the surveyed code to key reference services 28645 *Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed* (work RVU = 7.44 and intra-service time of 45 minutes) and 28750 *Arthrodesis, great toe; metatarsophalangeal joint* (work RVU = 8.57and intra-service time of 75 minutes) and determined the physician work and time required to perform 282X1 appropriately falls in between these two similar services. **The RUC recommends a work RVU of 8.01 for CPT code 282X1.**

28292 ***Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with resection of proximal phalanx base, when performed, any method***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 57 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 7.44 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time of 45 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur).* The RUC agreed that a half-day 99238, 3-99212 and 2-99213 visits are appropriate. This service is an osteotomy, which requires more work involving the healing at the joint from a soft tissue stand point and healing of the osteotomy and maintenance of the alignment. The additional office visit is required to assess x-rays for healing, motion and strength at the joint as well as mobility of the patient. Osteotomies require 6-8 weeks to heal and the physician must confirm prior to discharge. The RUC compared the surveyed code to key reference services 28645 *Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed* (work RVU = 7.44 and intra-service time of 45 minutes) and determined the physician work and time required to perform 28292 is the same as reference service code 28645. For additional support, the RUC compared the surveyed code 28750 *Arthrodesis, great toe; metatarsophalangeal joint* (work RVU = 8.57and intra-service time of 75 minutes) **The RUC recommends a work RVU of 7.44 for CPT code 28292.**

28296 ***Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with distal metatarsal osteotomy, any method***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 73 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 8.25 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time of 60 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*trochanter of femur).*The RUC agreed that a half-day 99238, 3-99212 and 2-99213 visits are appropriate. This service includes an osteotomy which requires more work involving the healing at the joint from a soft tissue stand point and healing of the osteotomy and maintenance of the alignment. The additional office visit is required to assess x-rays for healing, motion and strength at the joint as well as mobility of the patient. Osteotomies require 6-8 weeks to heal and the physician must confirm prior to discharge. The RUC compared the surveyed code to key reference services 28645 *Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed* (work RVU = 7.44 and intra-service time of 45 minutes) and 28750 *Arthrodesis, great toe; metatarsophalangeal joint* (work RVU = 8.57and intra-service time of 75 minutes) and determined the physician work and time required to perform 28296 appropriately falls in between these two similar services. **The RUC recommends a work RVU of 8.25 for CPT code 28296.**

282X2 ***Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with proximal metatarsal osteotomy, any method***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 67 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 8.57 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time of 60 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur).*The RUC agreed that a half-day 99238, 3-99212 and 2-99213 visits are appropriate. This service includes an osteotomy which requires more work involving the healing at the joint from a soft tissue stand point and healing of the osteotomy and maintenance of the alignment. The additional office visit is required to assess x-rays for healing, motion and strength at the joint as well as mobility of the patient. Osteotomies require 6-8 weeks to heal and the physician must confirm prior to discharge. The RUC compared the surveyed code to key reference services 28750 *Arthrodesis, great toe; metatarsophalangeal joint* (work RVU = 8.57and intra-service time of 75 minutes) and determined the physician work to perform 282X2 is the same as key reference code 28750. For additional support, the RUC compared the surveyed code to 28740 *Arthrodesis, midtarsal or tarsometatarsal, single joint* (work RVU = 9.29 and intra-service time of 80 minutes). The specialty societies indicated and the RUC agreed that this service is more intense than 28296. CPT code 28296 is a metatarsal neck osteotomy and is already exposed at that level and has been operated on. With this service the physician must move the dissection back at the base of the metatarsal, which is harder and contains more cortical bones, which are more difficult to heal. **The RUC recommends a work RVU of 8.57 for CPT code 282X2.**

28297 ***Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with first metatarsal and medial cuneiform joint arthrodesis, any method***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 65 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 9.29 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time of 75 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur).* The RUC agreed that a half-day 99238, 3-99212 and 2-99213 visits are appropriate. This service includes an osteotomy

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

which requires more work involving the healing at the joint from a soft tissue stand point and healing of the osteotomy and maintenance of the alignment. The additional office visit is required to assess x-rays for healing, motion and strength at the joint as well as mobility of the patient. Osteotomies require 6-8 weeks to heal and the physician must confirm prior to discharge. The RUC compared the surveyed code to key reference services 28740 *Arthrodesis, midtarsal or tarsometatarsal, single joint* (work RVU = 9.29 and intra-service time of 80 minutes) and determined the physician work to perform 28297 is the same as key reference code 28740 and requires similar intensity and complexity to perform. For additional support, the RUC compared the surveyed code to 27814 *Open treatment of bimalleolar ankle fracture (eg, lateral and medial malleoli, or lateral and posterior malleoli, or medial and posterior malleoli), includes internal fixation, when performed* (work RVU = 10.62 and intra-service time of 90 minutes) **The RUC recommends a work RVU of 9.29 for CPT code 28297.**

28298 ***Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with proximal phalanx osteotomy, any method***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 73 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 7.75 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time of 60 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur).* The RUC agreed that a half-day 99238, 2-99212 and 2-99213 visits are appropriate. The RUC compared the surveyed code to key reference services 28645 *Open treatment of metatarsophalangeal joint dislocation, includes internal fixation, when performed* (work RVU = 7.44 and intra-service time of 45 minutes) and 28750 *Arthrodesis, great toe; metatarsophalangeal joint* (work RVU = 8.57 and intra-service time of 75 minutes) and determined the physician work and time required to perform 28298 appropriately falls in between these two similar services. **The RUC recommends a work RVU of 7.75 for CPT code 28298.**

28299 ***Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with double osteotomy, any method***
After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 25th percentile. The RUC reviewed the survey responses from 65 orthopaedic surgeons and podiatrists and determined that the survey 25th percentile work RVU of 9.29 appropriately accounts for the work required to perform this service. The RUC agreed with pre-service time of 53 minutes, intra-service time of 75 minutes and immediate post-operative time of 15 minutes. The RUC noted that the pre-service time is appropriate for this service and comparable to other similar services, for example CPT code 20240 *Biopsy, bone, open; superficial (eg, ilium, sternum, spinous process, ribs, trochanter of femur).* The RUC agreed that a half-day 99238, 3-99212 and 2-99213 visits are appropriate. This service includes an osteotomy which requires more work involving the healing at the joint from a soft tissue stand point and healing of the osteotomy and maintenance of the alignment. The additional office visit is required to assess x-rays for healing, motion and strength at the joint as well as mobility of the patient. Osteotomies require 6-8 weeks to heal and the physician must confirm prior to discharge. The RUC compared the surveyed code to key reference services 28750 *Arthrodesis, great toe; metatarsophalangeal joint* (work RVU = 8.57 and intra-service time of 75 minutes) and 27814 *Open treatment of bimalleolar ankle fracture (eg, lateral and medial malleoli, or lateral and posterior malleoli, or medial and posterior malleoli), includes internal fixation, when performed* (work RVU = 10.62 and intra-service time of 90 minutes) and determined the physician work and time

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

required to perform 28299 appropriately falls in between these two similar services. The RUC also noted that 28299 requires the same work and intensity and complexity as 28297 (recommended above) and 28740 *Arthrodesis, midtarsal or tarsometatarsal, single joint* (work RVU = 9.29 and intra-service time of 80 minutes). **The RUC recommends a work RVU of 9.29 for CPT code 28299.**

Practice Expense
The Practice Expense Subcommittee made minor modifications and reduced the number of scalpels, ace wraps and the equipment minutes. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28289 Tracking Number M1 Original Specialty Recommended RVU: **7.44**
Presented Recommended RVU: **6.90**
Global Period: 090 RUC Recommended RVU: **6.90**

CPT Descriptor: Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint; without implant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female presents with a painful 1st metatarsophalangeal joint that is non-responsive to conservative care. Joint motion is painful and limited. X-rays reveal a dorsal exostosis, with preservation of the joint space. A cheilectomy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 33% , In the ASC 66%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is centered over the first metatarsophalangeal joint. The neurovascular structures are identified and protected. The incision is carried down to the joint capsule and the capsule is elevated off of the metatarsal head and base of the proximal phalanx. Osteophytes are excised from the metatarsal head and base of the proximal phalanx. The remaining bone is rasped smooth. The joint motion is assessed, and additional bone is removed if necessary. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Local anesthetic medication is injected for post-operative pain control. The incision is closed in layers.

Description of Post-Service Work:

Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Provide completed forms for handicap parking. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine and talk with patient. Answer patient/family questions. Removal of splint/dressings. Assessment of surgical wound. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.38	0.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.12	0.31
Urgency of medical decision making	-0.12	0.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.27	0.63
Physical effort required	0.12	0.38

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.08	0.50
Outcome depends on the skill and judgment of physician	0.27	0.50
Estimated risk of malpractice suit with poor outcome	0.15	0.44

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.23	0.69

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1. An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are re-dressed. The splint is reapplied. A PT prescription is generated and discussed with the patient and therapist (by phone if therapist is off site). Patient questions about home activities are addressed. Pain is assessed and medication is ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 2. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site) The PT report is reviewed and signed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 3. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 4. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent deformity. If appropriate, discussion is had with the patient regarding return to work and resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28289

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilzation not available

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See Excel utilization table below

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 28289

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

2017 CPT	Estimated Utilization	podiatry		orthopaedic surgery		% Others
28289	4,314	2,896	67.1%	1,406	32.6%	0.3%
282X1	3,335	3,157	94.7%	172	5.2%	0.2%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:282X1 Tracking Number M2 Original Specialty Recommended RVU: **8.57**
Presented Recommended RVU: **8.01**
Global Period: 090 RUC Recommended RVU: **8.01**

CPT Descriptor: Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint; with implant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male presents with chronic 1st metatarsophalangeal joint pain that is non-responsive to conservative care. Joint motion is markedly limited and painful. X-rays reveal marked degenerative changes with end stage arthrosis. A cheilectomy with total joint implant is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 35% , In the ASC 65%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is centered over the first metatarsophalangeal joint. The neurovascular structures are identified and protected. The incision is carried down to the joint capsule and the capsule is elevated off of the metatarsal head and base of the proximal phalanx. Osteophytes are excised from the metatarsal head and base of the proximal phalanx. The articular cartilage is removed from the joint surfaces. The medullary canal of the metatarsal head and base of the proximal phalanx are reamed to appropriate size. The area is copiously irrigated. The implant is placed and assessed for size and stability. Joint range of motion is evaluated. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Redundant joint capsule is removed and the capsule is repaired. Local anesthetic medication is injected for post-operative pain control. The wound is closed in layers.

Description of Post-Service Work:

Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Provide completed forms for handicap parking. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine and talk with patient. Answer patient/family questions. Removal of splint/dressings. Assessment of surgical wound. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.24	0.88
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.00	0.25
Urgency of medical decision making	0.06	-0.25
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.06	0.50
Physical effort required	-0.12	0.38
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.06	0.13

Outcome depends on the skill and judgment of physician	0.18	0.50
Estimated risk of malpractice suit with poor outcome	0.12	0.38

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.18	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1.An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are re-dressed. The splint is reapplied. A PT prescription is generated and discussed with the patient and therapist (by phone if therapist is off site). Patient questions about home activities are addressed. Pain is assessed and medication is ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 2. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 3. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 4. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent deformity. If appropriate, discussion is had with the patient regarding return to work and resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28293

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Sometimes

Specialty orthopaedic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilzation not available

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See Excel utilization table below

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 28293

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

2017 CPT	Estimated Utilization	podiatry		orthopaedic surgery		% Others
28289	4,314	2,896	67.1%	1,406	32.6%	0.3%
282X1	3,335	3,157	94.7%	172	5.2%	0.2%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28292 Tracking Number M3 Original Specialty Recommended RVU: **8.20**
Presented Recommended RVU: **7.44**
Global Period: 090 RUC Recommended RVU: **7.44**

CPT Descriptor: Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with resection of proximal phalanx base, when performed, any method

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female presents with a painful bunion deformity that is non-responsive to conservative care. X-rays reveal a moderate bunion with hallux valgus. A bunionectomy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 49%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 28% , In the ASC 72%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is centered over the first metatarsophalangeal joint. The neurovascular structures are identified and protected. This incision is carried down to the joint capsule and the capsule is elevated off of the medial aspect of the metatarsal head and base of the proximal phalanx. The medial eminence is excised. The remaining bone is rasped smooth. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Redundant joint capsule is removed and the capsule is repaired to assist in alignment of the hallux. Local anesthetic medication is injected for post-operative pain control. The wound is closed in layers.

Description of Post-Service Work:
Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative

recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Provide completed forms for handicap parking. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine and talk with patient. Answer patient/family questions. Removal of splint/dressings. Assessment of surgical wound. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1. An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are re-dressed. The splint is reapplied. A PT prescription is generated and discussed with the patient and therapist (by phone if therapist is off site). Patient questions about home activities are addressed. Pain is assessed and medication is ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 2. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 3. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 4. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 5. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent deformity. If

appropriate, discussion is had with the patient regarding return to work and resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28292, 28290

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Commonly

Specialty orthopaedic surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilzation not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See Excel utilization table below

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28296 Tracking Number M4 Original Specialty Recommended RVU: **8.35**
Presented Recommended RVU: **8.25**
Global Period: 090 RUC Recommended RVU: **8.25**

CPT Descriptor: Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with distal metatarsal osteotomy, any method

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female presents with a painful bunion that is non-responsive to conservative care. X-rays reveal a moderate bunion deformity with a moderate intermetatarsal angle. A bunionectomy with a distal first metatarsal osteotomy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 32% , In the ASC 67%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is centered over the first metatarsophalangeal joint. The neurovascular structures are identified and protected. The adductor hallucis tendon is freed and released. The incision is carried down to the joint capsule and the capsule is elevated off of the metatarsal head and base of the proximal phalanx. The medial eminence is excised. An osteotomy of the metatarsal neck is then performed. The distal portion of the head of the metatarsal is displaced laterally and impacted onto the proximal aspect of the osteotomy. Fixation of the osteotomy is accomplished. Redundant bone on the medial aspect of the first metatarsal is resected. The remaining bone is rasped smooth. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Redundant metatarsophalangeal joint capsule is removed and the capsule is repaired to assist in alignment of the hallux. Local anesthetic medication is injected for post-operative pain control. The wound is closed in layers.

Description of Post-Service Work:
Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine and talk with patient. Answer patient/family questions. Removal of splint/dressings. Assessment of surgical wound. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.33	0.36
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.18	0.00
Urgency of medical decision making	0.10	-0.71
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.28	0.14
Physical effort required	0.10	-0.07
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.23	0.14

Outcome depends on the skill and judgment of physician	0.38	0.57
Estimated risk of malpractice suit with poor outcome	0.51	0.50

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.49	0.36

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1. An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are re-dressed. The splint is reapplied. A PT prescription is generated and discussed with the patient and therapist (by phone if therapist is off site). Patient questions about home activities are addressed. Pain is assessed and medication is ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 2. An interval history is verbally obtained and documented in the medical record The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 3. An interval history is verbally obtained and documented in the medical record The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 4. An interval history is verbally obtained and documented in the medical record The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 5. An interval history is verbally obtained and documented in the medical record The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent deformity. If

appropriate, discussion is had with the patient regarding return to work and resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28296

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:282X2 Tracking Number M5 Original Specialty Recommended RVU: **9.29**
Presented Recommended RVU: **8.57**
Global Period: 090 RUC Recommended RVU: **8.57**

CPT Descriptor: Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with proximal metatarsal osteotomy, any method

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female presents with a painful bunion deformity that is non-responsive to conservative care. X-rays reveal a moderate-severe bunion deformity with a markedly increased intermetatarsal angle. A bunionectomy with proximal metatarsal osteotomy is performed

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 30% , In the ASC 70%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is made from the medial cuneiform to the base of the proximal phalanx. The neurovascular structures are identified and protected. The adductor hallucis tendon is freed and released. Distally, the incision is carried down to the metatarsophalangeal joint capsule and the capsule is elevated off of the metatarsal head and base of the proximal phalanx. The medial eminence is excised. The remaining bone is rasped smooth and the site is irrigated. Dissection is then directed to the base of the first metatarsal. The long extensor tendon is retracted and the base of the first metatarsal is exposed by sub-periosteal dissection. An osteotomy is made at the base of the first metatarsal and the metatarsal is realigned. Fixation of the osteotomy is accomplished. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Redundant metatarsophalangeal joint capsule is removed

and the capsule is repaired to assist in alignment of the hallux. Local anesthetic medication is injected for post-operative pain control. The wound is closed in layers.

Description of Post-Service Work:
Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Provide completed forms for handicap parking. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine and talk with patient. Answer patient/family questions. Removal of splint/dressings. Assessment of surgical wound. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.33	0.28
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.25	0.22
Urgency of medical decision making	0.17	0.11
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.42	0.50
Physical effort required	0.21	0.17
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.17	0.33

Outcome depends on the skill and judgment of physician	0.46	0.44
Estimated risk of malpractice suit with poor outcome	0.46	0.44

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.50	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1. An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are re-dressed. The splint is reapplied. A PT prescription is generated and discussed with the patient and therapist (by phone if therapist is off site).Patient questions about home activities are addressed. Pain is assessed and medication is ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 2. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 3. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 4. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 5. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent

deformity. If appropriate, discussion is had with the patient regarding return to work and resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28292, 28306-51

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown is completed. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is made from the medial cuneiform to the base of the proximal phalanx. The neurovascular structures are identified and protected. The adductor hallucis tendon is freed and released. The incision is carried down to the metatarsophalangeal joint capsule and the capsule is elevated off of the metatarsal head and base of the proximal phalanx. The medial eminence is excised. The remaining bone is rasped smooth. and the site is irrigated. Dissection is then directed to the base of the first metatarsal and medial cuneiform. The long extensor tendon is retracted and the first metatarsal cuneiform joint is exposed. The articular cartilage of the medial cuneiform first metatarsal joint is excised and the joint surface is appropriately remodeled to allow for correction of the intermetatarsal angle. Temporary fixation with K-wires is obtained and radiographs are taken to assess alignment. Permanent fixation is accomplished, and the K-wires are removed. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Redundant metatarsophalangeal joint capsule is removed and the capsule is repaired

to assist in alignment of the hallux. Local anesthetic medication is injected for post-operative pain control. The wound is closed in layers.

Description of Post-Service Work: Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home instructions and restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Provide completed forms for handicap parking. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Obtain interval history. Examine and talk with patient. Answer patient/family questions. Removal and re-application of splint/dressings. Assessment of surgical wound. Imaging studies ordered and reviewed. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy, including reading and responding to physical therapist notes/questions. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

SURVEY DATA

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.49	0.75
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.33	0.50
Urgency of medical decision making	0.15	-0.38
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.74	0.75
Physical effort required	0.56	0.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.46	0.00

Outcome depends on the skill and judgment of physician	0.51	0.63
Estimated risk of malpractice suit with poor outcome	0.69	0.38

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.79	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1. An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are re-dressed. Imaging studies ordered and reviewed with the patient as necessary. Splint or immobilization is applied. A physical therapy prescription is generated and discussed with the patient and, as necessary, with the therapist (by phone if the therapist is off site). Patient questions about home activities are addressed. Pain is assessed and new medication prescriptions written as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is completed if needed.

Visit 2. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Imaging studies ordered and reviewed as necessary. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are redressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and, as necessary, with the therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Pain is assessed and medication prescriptions written as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is completed if needed.

Visit 3. An interval history is verbally obtained and documented in the medical record. The patient's dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Imaging studies ordered and reviewed. The wounds are redressed, as appropriate and immobilization applied. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and, as necessary, with the therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication prescriptions written as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is completed if needed.

Visit 4. An interval history is verbally obtained and documented in the medical record. The patient's dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Imaging studies ordered and reviewed. The wounds are redressed, as appropriate and immobilization applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and, as necessary, with the therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication prescriptions written as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is completed if needed.

Visit 5. An interval history is verbally obtained and documented in the medical record. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent deformity. If appropriate, discussion is had with the patient regarding return to work and

resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28297

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilzation not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See Excel utilization table below

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 28297

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

2017 CPT	Estimated Utilization	podiatry		orthopaedic surgery		% Others
28289	4,314	2,896	67.1%	1,406	32.6%	0.3%

Global Period: 090 RUC Recommended RVU: **7.75**

CPT Descriptor: Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with proximal phalanx osteotomy, any method

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female presents with a painful bunion deformity with an angular deviation of the great toe at the proximal phalanx that is non-responsive to conservative care. X-rays reveal a mild bunion deformity with moderate hallux valgus. A bunionectomy with proximal phalanx osteotomy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 36% , In the ASC 63%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 96% , Overnight stay-less than 24 hours 4% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is centered over the first metatarsophalangeal joint. The neurovascular structures are identified and protected. The adductor hallucis tendon is freed and released. The incision is carried down to the joint capsule and the capsule is elevated off of the metatarsal head and base of the proximal phalanx. The medial eminence of the metatarsal head is excised. The bone is rasped smooth. Dissection is then directed to the base of the proximal phalanx. After retracting the long extensor tendon, the base of the phalanx is exposed by sub-periosteal dissection. An osteotomy is performed on the phalangeal base and the bone is realigned. Fixation of the osteotomy is accomplished. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Redundant metatarsophalangeal joint capsule is removed and the capsule is repaired to assist in alignment of the hallux. Local anesthetic medication is injected for post-operative pain control. The wound is closed in layers.

Description of Post-Service Work:
Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Provide completed forms for handicap parking. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine and talk with patient. Answer patient/family questions. Removal of splint/dressings. Assessment of surgical wound. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.29	0.31
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.10	0.19
Urgency of medical decision making	0.13	-0.06
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.13	0.25
Physical effort required	0.06	0.13
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	-0.06	0.06

Outcome depends on the skill and judgment of physician	0.35	0.25
Estimated risk of malpractice suit with poor outcome	0.29	0.38

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.10	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1. An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are redressed. The hallux is taped into a neutral position. Immobilization is reapplied. A PT prescription is generated and discussed with the patient and therapist (by phone if therapist is off site). Patient questions about home activities are addressed. Pain is assessed and medication is ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 2. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 3. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 4. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent deformity. If appropriate, discussion is had with the patient regarding return to work and resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28298

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilzation not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See Excel utilization table below

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 28298

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

2017 CPT	Estimated Utilization	podiatry		orthopaedic surgery		% Others

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:28299 Tracking Number M8 Original Specialty Recommended RVU: **10.50**
Presented Recommended RVU: **9.29**
Global Period: 090 RUC Recommended RVU: **9.29**

CPT Descriptor: Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with double osteotomy, any method

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female presents with a painful bunion deformity that is non-responsive to conservative treatment. X-rays reveal a moderate-severe bunion deformity with a markedly increased intermetatarsal angle. A bunionectomy with double osteotomy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 41% , In the ASC 59%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 96% , Overnight stay-less than 24 hours 4% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review pre-procedural imaging, pathology, and laboratory studies; with special attention to imaging and exam of ipsi- and contralateral lower extremities. Perform and document admission history and physical in facility medical record. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Monitor/assist with patient positioning; padding of bony prominences; and application of thermal regulation drapes. Assess position of the extremities and head, adjust as needed. The patient's leg is placed on the table and positioned with proper bolstering to aid surgical exposure. Supervise positioning of fluoroscopic equipment. Indicate areas of skin to be prepped and mark surgical incisions. An ankle tourniquet is placed. The leg is prepped and draped. Scrub and gown. Perform surgical "time out" with operating team. The leg is elevated and exsanguinated. The pneumatic tourniquet is inflated.

Description of Intra-Service Work: Under anesthesia, a skin incision is made from the medial cuneiform to the interphalangeal joint of the hallux. The neurovascular structures are identified and protected. The adductor hallucis tendon is freed and released. The incision is carried down to the metatarsophalangeal joint capsule and the capsule is elevated off of the metatarsal head and base of the proximal phalanx. The medial eminence is excised. The remaining bone is rasped smooth. Dissection is then directed to the base of the first metatarsal. The long extensor tendon is retracted and the base of the first metatarsal is exposed by sub-periosteal dissection. An osteotomy is made at the base of the first metatarsal and the metatarsal is realigned. The osteotomy is fixated using screws. The dissection is then directed to the base of the proximal phalanx. After retracting the long extensor tendon, the base of the proximal phalanx is exposed by sub-periosteal dissection. An osteotomy is performed on the phalangeal base and the bone is realigned. Fixation of the osteotomy is

accomplished. The tourniquet is deflated and hemostasis is obtained. The wound is inspected and irrigated. Redundant metatarsophalangeal joint capsule is removed and the capsule is repaired to assist in alignment of the hallux. Local anesthetic medication is injected for post-operative pain control. The wound is closed in layers.

Description of Post-Service Work:
Facility: Apply bulky dressing and short leg splint. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Monitor patient stabilization in the recovery room, including neurovascular status. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Physical therapy for the uses of crutches or walker is ordered. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Provide completed forms for handicap parking. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine and talk with patient. Answer patient/family questions. Removal of splint/dressings. Assessment of surgical wound. Remove sutures. Assess of circulation, sensation and motor function of the operated extremity. Redress wound. Order physical therapy. Supervise rehabilitation. Monitor physical therapy. Discuss progress with PCP (verbal and written). Write medication prescriptions. Enter progress notes into medical record. During the first six weeks, special attention is given to retaping the forefoot to help control the correction in order to avoid recurrent deformity, or overcorrection.

CPT Descriptor Open treatment of bimalleolar ankle fracture (eg, lateral and medial malleoli, or lateral and posterior malleoli, or medial and posterior malleoli), includes internal fixation, when performed

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
47562	090	10.47	**RUC Time**	109,200

CPT Descriptor 1 Laparoscopy, surgical; cholecystectomy

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
57288	090	12.13	**RUC Time**	26,683

CPT Descriptor 2 Sling operation for stress incontinence (eg, fascia or synthetic)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 15 **% of respondents:** 23.0 **%**

Number of respondents who choose 2nd Key Reference Code: 13 **% of respondents:** 20.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 28299	Top Key Reference CPT Code: 28750	2nd Key Reference CPT Code: **27814**
Median Pre-Service Time	53.00	40.00	58.00
Median Intra-Service Time	75.00	75.00	90.00
Median Immediate Post-service Time	15.00	30.00	30.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	40.00
Median Discharge Day Management Time	19.0	0.00	38.00

Median Total Time	**256.00**	**237.00**	**334.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.47	0.31
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.20	0.00
Urgency of medical decision making	0.07	-0.92
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.40	0.38
Physical effort required	0.27	0.08

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.13	-0.23
Outcome depends on the skill and judgment of physician	0.27	0.69
Estimated risk of malpractice suit with poor outcome	0.27	0.23

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.53	0.54

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2014, code 28293 was identified by the RUC as a 090-day global service that included more than six office visits. The RUC requested review of physician work and practice expense for this code. After reviewing the vignettes and the code descriptors for 28293 and family codes, the specialty societies determined that CPT coding changes were required to reflect current practice. The RUC referred the codes to the CPT Editorial Panel for revision. The CPT Editorial Panel deleted three codes, added two codes and revised six codes related to bunion surgery. In addition, the new and revised codes will not retain legacy named procedures (eg, Keller, McBride, or Mayo type procedure). Over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

Survey Process

A RUC survey that included all eight codes was sent to a random selection of surgeons from the membership database of the AOFAS, AAOS, and APMA.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change to standard package time of 33 minutes.

Positioning: Add 7 minutes to package time of 3 minutes (total = 10 minutes) for application of a tourniquet, bolstering the leg and foot to aid surgical exposure, setting up fluoroscopy for guidance during procedure, and assessing position of head and other extremities. This is the same or less than additional positioning time that has been approved for many similar ankle and lower leg procedures after implementation of pre-time packages (eg, 28120, 28122, 28725, 28730, 28820, 28825).

Scrub, dress, wait: Subtract 5 minutes from package time of 15 minutes (total = 10 minutes) to correspond to survey median.

Post-Time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 18 minutes from package time of 33 minutes (total = 15 minutes) to correspond to survey median.

Post-operative Office Visits

The healing process after hallux deformity correction is dependent on the severity of the deformity and the age and health of the patient.

Visit 1. An interval history is verbally obtained and documented in the medical record. Patient and family's questions about surgical procedure and intra-operative finding is reviewed. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection. Circulation, sensation, and motor function is assessed. The wounds are redressed. Immobilization is reapplied. A PT prescription is generated and discussed with the patient and therapist (by phone if therapist is off site). Patient questions about home activities are addressed. Pain is assessed and medication is ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 2. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The sutures are removed assuming the second visit is two weeks after surgery, although sutures on the bottom of the foot may be left in longer. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Therapy orders are modified to include scar and edema control techniques. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 3. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 4. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. The wounds are re-dressed, as appropriate. Splint or immobilization is applied, as appropriate. Appropriate changes are made in the physical therapy protocol depending upon the patient's progress with healing. Edema control is continued, as is scar control. The PT prescription is generated and discussed with the patient and therapist (by phone if the therapist is off site). The PT report is reviewed and signed. Patient questions about home activities are addressed. Pain is assessed and medication ordered as necessary. Progress notes are documented in the medical record and copied to the referring physician and/or PCP. Disability documentation is competed if needed.

Visit 5. An interval history is verbally obtained and documented in the medical record. The patient's splint is removed and dressings are taken down. The wound is assessed. Evaluation is made for any evidence of infection or wound dehiscence. Circulation, sensation, and motor function is assessed. Range of motion of the hallux MTP joint is measured and documented. Typically at this point the patient will require continued therapy including a home exercise program. Strengthening exercises are advanced. Discussion is undertaken with patient regarding appropriate shoe wear and activity restrictions to prevent recurrent deformity. If appropriate, discussion is had with the patient regarding return to work and resumption of exercise. The PT report is reviewed and signed. Progress notes are documented in the medical record and copied to the referring physician and/or PCP.

Recommendation

As presented above, three codes were deleted, two codes were added and six codes were revised. In addition, the new and revised codes have not retained legacy named procedures because over time, modifications to and variations of the legacy named procedures have evolved such that including the legacy names in the code descriptors is no longer appropriate.

The time, visit and work RVU recommendations for this family of codes is shown below. We believe that the MPC codes and reference codes support these recommendations. We also believe that the relative rank order is reasonably correct. These recommendations will result in a decrease in work RVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 28299

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilzation not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See Excel utilization table below

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

BETOS Sub-classification Level II:
Orthopedic - other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 28299

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

2017 CPT	Estimated Utilization	podiatry	orthopaedic surgery	% Others

28289	4,314	2,896	67.1%	1,406	32.6%	0.3%

28292	Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with resection of proximal phalanx base, when performed, any method	090
28296	with distal metatarsal osteotomy, any method	090
282X2	with proximal metatarsal osteotomy, any method	090
28297	with first metatarsal and medial cuneiform joint arthrodesis, any method	090
28298	with proximal phalanx osteotomy, any method	090
28299	with double osteotomy, any method	090

Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for the bunionectomy procedures and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. Current codes have been used for 28289, 28292, 28296, 28297, 28298, 28299 and code 28289 was used as a reference for the two new codes 282X1 and 282X2.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

PRE-SERVICE PERIOD
Clinical staff will complete pre-service diagnostic and referral forms, obtain insurance authorization, schedule space and equipment in facility, provide patient education about the procedure and necessary postoperative therapy and witness consent with surgeon, and contact the patient prior to the day of the procedure to confirm any necessary medication adjustments, appropriate clothes and shoes for the day of the procedure, and send necessary perioperative prescriptions to the pharmacy.

SERVICE PERIOD
Clinical staff will assist the surgeon with discharge management, including arrangements for post-discharge imaging, home care, and responding to patient and family questions.

POST-SERVICE PERIOD
Clinical staff will assist the surgeon at postoperative office visits and respond to phone calls from the patient, family, insurers, therapists, and imaging facilities.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

28289	Hallux rigidus correction with cheilectomy, debridement and capsular release of the first metatarsophalangeal joint; without implant	090
282X1	with implant	090
28292	Correction, hallux valgus (bunionectomy), with sesamoidectomy, when performed; with resection of proximal phalanx base, when performed, any method	090
28296	with distal metatarsal osteotomy, any method	090
282X2	with proximal metatarsal osteotomy, any method	090
28297	with first metatarsal and medial cuneiform joint arthrodesis, any method	090
28298	with proximal phalanx osteotomy, any method	090
28299	with double osteotomy, any method	090

Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for the bunionectomy procedures and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. Current codes have been used for 28289, 28292, 28296, 28297, 28298, 28299 and code 28289 was used as a reference for the two new codes 282X1 and 282X2.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

Row	Activity	Evidence / Rationale
24	Prepare room, equipment, supplies	Additional 3 minutes recommended over the standard 2 minutes (total= 5 minutes). **Rationale:** The 2 minutes standard is reflective of preparing room, equipment, supplies for an E/M services. These procedures include a significant number of additional supplies, instruments, and equipment above what is required for an E/M service.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Row	Activity	08/2003	01/2016	Compelling Evidence / Rationale
34	Monitor pt. following service/check tubes, monitors, drains (not related to moderate sedation)	**2**	**7**	These codes were reviewed prior to the establishment of standard monitoring time. The current standard is 15 minutes per one hour of monitoring. These patients will have undergone a block prior to the procedure and will need to be monitored for at least 30 minutes. Seven minutes is recommended to reflect current standards.
40	Check dressings & wound/ home care instructions /coordinate office visits /prescriptions	**3**	**6**	When these codes were reviewed, there was no consideration given to the time to assure appropriate gait training prior to discharge from the office to be certain the patient can safely and correctly ambulate with crutches.

Supply items have been deleted and added to reflect supplies required for current practice: Marcaine has been added to provide the block. Alcohol pads are required to clean the tops of the vials prior to withdrawing the anesthetics. A power saw blade is required for bone work. An ankle tourniquet is required. Kerlix has been changed to Kling and Ace wraps as more typical for these procedures.

Supply items have also been added to correct errors from previous submission. For example, although a suction machine is correctly included as equipment, the related supplies (suction canister, suction tubing) were not included.

5. Please describe in detail the clinical activities of your staff:

PRE-SERVICE PERIOD
Clinical staff will complete pre-service diagnostic and referral forms, obtain insurance authorization, provide patient education about the procedure and necessary postoperative therapy and witness consent with surgeon, and contact the patient prior to the day of the procedure to confirm any necessary medication adjustments, appropriate clothes and shoes for the day of the procedure, and send necessary perioperative prescriptions to the pharmacy.

SERVICE PERIOD
Clinical staff will:
- Ensure appropriate medical records are available, including prior imaging;
- Prepare the room, supplies, and equipment, including the surgical instrument pack, cautery supplies and equipment, suction supplies and equipment, power tool supplies and equipment;
- Greet the patient, provide gowning, and obtain vital signs;
- Assist the surgeon with positioning the patient and applying local anesthetic and regional block;
- Assist physician in performing procedure (100%);
- Monitor the patient following the procedure;
- Clean the procedure room, equipment and surgical instruments; and
- Provide gait training, check dressings, provide home care instructions and prescriptions prior to discharge from office.

POST-SERVICE PERIOD
Clinical staff will assist the surgeon at postoperative office visits and respond to phone calls from the patient, family, insurers, therapists, and imaging facilities.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Laryngoplasty

CPT code 31588 was identified via the 090-Day Global Post-Operative Visits screen. When the code family was reviewed it was determined that some codes in the family required revision to reflect the typical patient and those changes needed to be made prior to conducting a survey.

In October 2014, the CPT Editorial Panel created four new codes, revised three codes and deleted two codes to more accurately reflect the services currently performed for laryngoplasty procedures. However, following conclusion of the survey process the specialty societies realized there were multiple problems with the CPT descriptors and subsequent survey responses. In response, AAO-HNS requested to rescind the recent CPT changes and develop a new coding structure to define laryngoplasty services for separate patient populations. AAO-HNS indicated that there are clear differences in physician time, work and post-operative care for adult versus pediatric patients. Second, AAO-HNS requested the opportunity to redefine CPT code 31580, as it describes 2-stages of services but is actually two separate procedures: one for insertion and one for removal. The pre-, intra- and post-service physician work and time are different and the patient is seen on different days for the keel insertion and for the removal. The RUC agreed with the specialty to refer this code set back to CPT for revisions. At the October 2015 CPT Editorial Panel meeting, the Panel approved the creation of six new codes, revision of three codes and deletion of three codes.

Adult Laryngoplasty Procedures

31580 ***Laryngoplasty; for laryngeal web, with indwelling keel or stent insertion***

The RUC reviewed the survey results from 57 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 120 minutes and immediate post-service time of 30 minutes. The RUC also recommends the following post-operative visits: one 99291, one 99231, one 99238 and three 99213 office visits. The specialty society explained that the otolaryngologists work involved in the critical care visits is truly critical care work and not simply checking post-surgical wounds. During this time, the otolaryngologist and the intensivist are adjusting ventilator settings, titrating sedation and evaluating multiple points of radiologic and laboratory data.

The RUC reviewed the survey respondents' physician work values and agreed with the specialty society that the survey 25th percentile work RVU of 14.60 is appropriate for CPT code 31580. To justify a work RVU of 14.60, the RUC compared the survey code to MPC code 52649 *Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed) (work RVU= 14.56, intra time= 120 minutes) and noted that with identical intra-service time and comparable work, the surveyed code should be valued similar to this reference code. The RUC also reviewed CPT code 21048 *Excision of benign tumor or cyst of maxilla; requiring intra-oral osteotomy (eg, locally aggressive or destructive lesion[s])* (work RVU= 14.71, intra time= 120 minutes) and also agreed that this reference code validated the recommended work RVU of 14.60. **The RUC recommends a work RVU of 14.60 for CPT code 31580.**

315X2 ***Laryngoplasty; for laryngeal stenosis, with graft, without indwelling stent placement, age 12 years or older***

The RUC reviewed the survey results from 53 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 180 minutes and immediate post-service time of 30 minutes. The RUC also recommends the following post-operative visits: one 99291, one 99231, one 99232, one 99238 and three 99213 office visits. The specialty society explained that the otolaryngologists work involved in the critical care visits is truly critical care work and not simply checking post-surgical wounds. During this time, the otolaryngologist and the intensivist are adjusting ventilator settings, titrating sedation and evaluating multiple points of radiologic and laboratory data.

The RUC reviewed the survey respondents' physician work values and agreed with the specialty society that the survey median work RVU of 20.50 is appropriate for CPT code 3158X2. To justify a work RVU of 20.50, the RUC compared the survey code to the top two key reference services: 60252 *Thyroidectomy, total or subtotal for malignancy; with limited neck dissection* (work RVU= 22.01, intra time= 180 minutes) and 42420 *Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve* (work RVU 19.53, intra time= 180 minutes) and agreed that with identical intra-service time and comparable physician work, the recommedned value of 20.50 appropraitely fits in between these two services. Finally, the RUC noted that the while the intra-service time is being reduced from 210 mintues to 180 minutes, the work value is currently 23.22 and is seeing a similar reduction as well. **The RUC recommends a work RVU of 20.50 for CPT code 315X2.**

315X4 ***Laryngoplasty; for laryngeal stenosis, with graft, with indwelling stent placement, age 12 years or older***

The RUC reviewed the survey results from 52 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 195 minutes and immediate post-service time of 30 minutes. The RUC also recommends the following post-operative visits: one 99291, two 99231s, one 99232, one 99238 and three 99213 office visits. The specialty society explained that the otolaryngologists work involved in the critical care visits is truly critical care work and not simply checking post-surgical wounds. During this time, the otolaryngologist and the intensivist are adjusting ventilator settings, titrating sedation and evaluating multiple points of radiologic and laboratory data.

The RUC reviewed the survey respondents' physician work values and agreed with the specialty society that the survey median work RVU of 22.00 is appropriate for CPT code 315X4. To justify a work RVU of 22.00, the RUC compared the survey code to MPC code 50546 *Laparoscopy,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

surgical; nephrectomy, including partial ureterectomy (work RVU= 21.87, intra time= 205 minutes) and noted that while the reference code has slightly more intra-service time, code 315X4 has more total time, 540 minutes compared to 466.5 minutes, and is accurately values slightly higher. Finally, the RUC made two observations. First, the recommended work RVU of 22.00 accurately places this service higher than 315X2, which accounts for the additional 15 minutes of intra-service time. Second, the RUC noted that while the survey intra-service time drops from 210 to 195, the recommended work RVU is less than the current work value of 23.22. **The RUC recommends a work RVU of 22.00 for CPT code 315X4.**

31584 Laryngoplasty; with open reduction and fixation (eg, plating) of fracture, includes tracheostomy, if performed

The RUC reviewed the survey results from 68 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 120 minutes and immediate post-service time of 30 minutes. The RUC also recommends the following post-operative visits: one 99291, one 99231, one 99232, one 99238 and three 99213 office visits. The specialty society explained that the otolaryngologists work involved in the critical care visits is truly critical care work and not simply checking post-surgical wounds. During this time, the otolaryngologist and the intensivist are adjusting ventilator settings, titrating sedation and evaluating multiple points of radiologic and laboratory data.

The RUC reviewed the survey respondents' physician work values and agreed that the survey median work RVU of 20.00 is appropriate for CPT code 31584. To justify a work RVU of 20.00, the RUC compared the survey code to several reference codes, including: 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU= 21.16, intra time= 120 minutes) and 24160 *Removal of prosthesis, includes debridement and synovectomy when performed; humeral and ulnar components* (work RVU= 18.63, intra time= 120 minutes) and agreed that these services offer appropriate work RVU brackets around the recommended work value. **The RUC recommends a work RVU of 20.00 for CPT code 31584.**

315X5 Laryngoplasty, medialization; unilateral

The RUC reviewed the survey results from 78 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 39 minutes, intra-service time of 120 minutes and immediate post-service time of 28 minutes. The RUC also recommends the following post-operative visits: a half-day discharge 99238 and three 99213 office visits.

The RUC reviewed the survey respondents' physician work values and agreed that the respondents overestimated the physician work involved at the median level (work RVU= 17.20). To arrive at an appropriate value, the RUC compared the surveyed code to CPT code 58544 *Laparoscopy, surgical, supracervical hysterectomy* (work RVU= 15.60, intra time= 120 minutes) and noted that both services have identical intra-service time and comparable physician work and intensity. Therefore, the RUC agreed that CPT code 315X5 should be directly crosswalked to code 58544. To justify a work RVU of 15.60, the RUC reviewed MPC codes 60500 P*arathyroidectomy or exploration of parathyroid(s)* (work RVU= 15.60, intra

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

time= 120 minutes) and 58150 *Total abdominal hysterectomy (corpus and cervix), with or without removal of tube(s), with or without removal of ovary(s)* (work RVU= 17.31, intra time= 120 minutes) and agreed that both these reference codes provide appropriate magnitude estimation to justify the recommended work value of 15.60. **The RUC recommends a work RVU of 15.60 for CPT code 315X5.**

Pediatric Laryngoplasty Procedures

315X1 ***Laryngoplasty; for laryngeal stenosis, with graft, without indwelling stent placement, younger than 12 years of age***

The RUC reviewed the survey results from 31 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 180 minutes and immediate post-service time of 33 minutes. The RUC also recommends the following post-operative visits: one 99291, three 99231s, one 99232, two 99233s, one 99238 and three 99213 office visits. The specialty society noted that while the survey respondents indicated that there were three critical care visits in the post-operative period, to ensure there is no duplication of work there should only be one critical care visit included. The other two visits were shifted over to be hospital visits (99233s). The specialty again reiterated that the otolaryngologist is heavily involved in the critical care of these pediatric patients as well. During this time, the otolaryngologist and the intensivist are adjusting ventilator settings, titrating sedation and evaluating multiple points of radiologic and laboratory data.

The RUC reviewed the survey respondents' physician work values and agreed that the survey median work RVU of 21.50 is appropriate for CPT code 315X1. To justify a work RVU of 21.50, the RUC compared the survey code to the top key reference code 60252 *Thyroidectomy, total or subtotal for malignancy; with limited neck dissection* (work RVU= 22.01, intra time= 180 minutes) and note that since both codes have identical intra-service time and comparable physician work, the recommended value of 21.50 is appropriate. Furthermore, the RUC compared this pediatric code to the adult code with identical intra-service time (315X2, RUC recommended work RVU= 20.50) and agreed that 315X1 is appropriately valued higher due to greater total time and intensity of the procedure. **The RUC recommends a work RVU of 21.50 for CPT code 315X1.**

315X3 ***Laryngoplasty; for laryngeal stenosis, with graft, with indwelling stent placement, younger than 12 years of age***

The RUC reviewed the survey results from 31 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 180 minutes and immediate post-service time of 33 minutes. The RUC also recommends the following post-operative visits: one 99291, four 99232s, two 99233s, one 99238 and three 99213 office visits. The specialty society noted that while the survey respondents indicated that there were three critical care visits in the post-operative period, to ensure there is no duplication of work there should only be one critical care visit included. The other two visits were shifted over to be hospital visits (99233s). The specialty again reiterated that the otolaryngologist is heavily involved in the critical care of these pediatric patients as well. During this time, the otolaryngologist and the intensivist are adjusting ventilator settings, titrating sedation and evaluating multiple points of radiologic and laboratory data.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' physician work values and agreed that the survey median work RVU of 22.00 is appropriate for CPT code 315X3. To justify a work RVU of 22.00, the RUC compared the survey code to the two key reference codes: 21558 *Radical resection of tumor (eg, sarcoma), soft tissue of neck or anterior thorax; 5 cm or greater* (work RVU= 21.58, intra time= 160 minutes) and 60252 *Thyroidectomy, total or subtotal for malignancy; with limited neck dissection* (work RVU= 22.01, intra time= 180 minutes) and agreed that these services, with comparable physician work, and similar intra-service times, appropriately place the recommended value between these two reference codes. The RUC also compared this service to code 315X1 and noted that this value appropriate accounts for the additional work of placing the stent, which is included in the descriptor of 315X3. **The RUC recommends a work RVU of 22.00 for CPT code 315X3.**

31587 ***Laryngoplasty, cricoid split, without graft placement***

The RUC reviewed the survey results from 34 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 95 minutes and immediate post-service time of 30 minutes. The RUC also recommends the following post-operative visits: three 99231s, one 99232, one 99233, one 99238 and three 99213 office visits. The specialty society noted that while the survey respondents indicated that there were four critical care visits in the post-operative period, the specialty indicated that for this procedure there is no critical care. However, the RUC agreed that one of those critical care visits should be moved to a hospital level three visit (99233).

The RUC reviewed the survey respondents' physician work values and agreed with the specialty society that the respondents overestimated the physician work involved at the survey 25th percentile (work RVU= 15.70). Considering that no compelling evidence exists at this time to increase the value of this procedure, the RUC agreed that the current work RVU of 15.27 is appropriate. To justify a work RVU of 15.27, the RUC compared the surveyed code to the second key reference code 60500 *Parathyroidectomy or exploration of parathyroid(s)* (work RVU= 16.50, intra time= 120 minutes) and noted that since the reference code has more intra-service time, it is appropriately valued higher than 31587. The RUC also reviewed CPT code 63047 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar* (work RVU= 15.37, intra time= 90 minutes) and agreed that since this procedure has similar intra-service time and comparable post-operative follow-up care to the surveyed code, the two services should be valued similarly. **The RUC recommends a work RVU of 15.27 for CPT code 31587.**

315X6 ***Cricotracheal resection***

Prior to discussing the value for this code, the RUC received compelling evidence from the specialty society that the current work RVU for this procedure may be misvalued. Specifically, the current code used to report this service, CPT code 31582 *Laryngoplasty; for laryngeal stenosis, with graft or core mold, including tracheotomy* (work RVU= 23.22) is an inadequate clinical comparison of physician work to 315X6. Therefore,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the current vignette for 31582 is flawed in that it describes a "2-year-old child who has anterior subglottic stenosis (70%). Surgical correction is accomplished with an autogenous costal cartilage graft. An Aboulker stent is also utilized," which does not represent the typical patient under the new code descriptor.

The RUC agreed that given the information above, there is compelling evidence that the current work RVU for 315X6 may be misvalued.

The RUC reviewed the survey results from 47 practicing otolaryngologists and agreed with the specialty society on the following time components: pre-service time of 58 minutes, intra-service time of 240 minutes and immediate post-service time of 33 minutes. The RUC also recommends the following post-operative visits: one 99291, three 99232s, two 99233s, one 99238 and three 99213 office visits. The specialty society noted that while the survey respondents indicated that there were three critical care visits in the post-operative period, to ensure there is no duplication of work there should only be one critical care visit included. The other two visits were shifted over to be hospital visits (99233s). The specialty again reiterated that the otolaryngologist is heavily involved in the critical care of these pediatric patients as well. During this time, the otolaryngologist and the intensivist are adjusting ventilator settings, titrating sedation and evaluating multiple points of radiologic and laboratory data.

The RUC reviewed the survey respondents' physician work values and agreed that the survey median (work RVU= 25.00) is appropriate for CPT code 315X6. To justify a work RVU of 25.00, the RUC compared the surveyed code to the top key reference code 60252 *Thyroidectomy, total or subtotal for malignancy; with limited neck dissection* (work RVU= 22.01, intra time= 180 minutes) and agreed that since the survyed code has more intra-service time and more post-operative follow-up care, the recommended value is appropriately higher than the reference code. The RUC also reviewed CPT code 43336 *Repair, paraesophageal hiatal hernia, (including fundoplication), via thoracoabdominal incision, except neonatal; without implantation of mesh or other prosthesis* (work RVU= 25.81, intra time= 240 minutes) and agreed that since both codes have identical intra-service time and similar post-operative visits, the values should also be similar. Finally, the RUC noted that the survey intra-service time of 240 minutes is an increase of 30 minutes over the current reporting of this services, CPT code 31582 (work RVU= 23.22). Therefore, the recommended work RVU of 25.00 represents a reaonsable increase over this procedure, which has less physician work. **The RUC recommends a work RVU of 25.00 for CPT code 315X6.**

Practice Expense
The RUC reviewed and approved the modifications as established by the Practice Expense Subcommittee

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

SUMMARY OF RECOMMENDATION

CPT Code:31580 Tracking Number Original Specialty Recommended RVU: **14.60**
Presented Recommended RVU: **14.60**
Global Period: 090 RUC Recommended RVU: **14.60**

CPT Descriptor: Laryngoplasty; for laryngeal web, with indwelling keel or stent insertion

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32 year old female has undergone multiple surgeries for removal of respiratory papillomas, and she is now experiencing dyspnea on exertion. Laryngoscopy reveals a thick web involving the anterior 50% of the glottis. Laryngoplasty with keel insertion is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 2%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 11% , Overnight stay-less than 24 hours 31% , Overnight stay-more than 24 hours 58%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 39%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 5%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: The patient is brought into the operating room and anesthesia is induced. The surgeon must be in attendance because of the possibility of airway obstruction during induction. If the patient’s ventilation can be supported comfortably, intubation can be performed through a transoral route. Intubation is performed either by the attending surgeon through direct laryngoscopy or by the anesthesia attending with video guidance so that the entire team can visualize the airway and the atraumatic passage of the endotracheal tube.

An incision is made in a horizontal direction over the midline through the skin and platysma muscle. Subplastysmal flaps are elevated to the hyoid bone superiorly and over the cricoid ring inferiorly. The strap muscles are identified and incised in the midline from the hyoid to below the cricoid. These are retracted and the laryngeal framework identified. The laryngeal cartilage is split vertically in the midline with care taken not to enter the lumen of the airway. The cricothyroid membrane is incised horizontally and the interior of the larynx is exposed. Under direct visualization, the web is incised sharply. Often some additional repair, resection of scar tissue, etc. must be performed on the inside of the larynx. The appropriate sized laryngeal keel is chosen and trimmed to fit. The keel is then placed into the larynx and sutured in place with a nonabsorbable suture. A nasogastric feeding tube is placed. The laryngeal lamina are reapproximated over the keel

with either miniplates or heavy non-absorbable sutures. The strap muscles are then closed in the midline and the neck incision is closed in layers. Prior to closing the wound a drain is placed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor. Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of breathing, presence of stridor and oxygen saturation. Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions. Answer nursing staff questions. Discuss patient progress with ICU physician. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Dictate discharge letter to referring physician.
Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Change tracheostomy tube. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities with patient. Discuss long term scar management. Dictate progress notes for chart for each follow up visit

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
60252	090	22.01	**RUC Time**

CPT Descriptor Thyroidectomy, total or subtotal for malignancy; with limited neck dissection

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
69930	090	17.73	**RUC Time**

CPT Descriptor Cochlear device implantation, with or without mastoidectomy

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
52649	090	14.56	**RUC Time**	3,243

CPT Descriptor 1 Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
60500	090	15.60	**RUC Time**	14,939

CPT Descriptor 2 Parathyroidectomy or exploration of parathyroid(s);

Other Reference CPT Code	Global	Work RVU	Time Source
21048	090	14.71	**RUC Time**

CPT Descriptor Excision of benign tumor or cyst of maxilla; requiring intra-oral osteotomy (eg, locally aggressive or destructive lesion[s])

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 9 **% of respondents:** 15.7 **%**

Number of respondents who choose 2nd Key Reference Code: 5 **% of respondents:** 8.7 **%**

TIME ESTIMATES (Median)

	CPT Code: 31580	Top Key Reference CPT Code: 60252	2nd Key Reference CPT Code: **69930**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.44	0.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.11	0.20
Urgency of medical decision making	0.56	1.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.00	0.00
Physical effort required	1.00	0.40

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.67	0.60
Outcome depends on the skill and judgment of physician	1.00	0.40
Estimated risk of malpractice suit with poor outcome	0.56	0.80

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.33	0.40

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Laryngologists or Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 1680 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are

available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time

We are recommending our survey time of 120 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the post service package time of 33 minutes down to the recommended survey time of 30 minutes was appropriate. **The expert panel recommends a post-service time of 30 minutes.**

Post-Operative Visits

99291:

The patient is intubated and sedated. The otolaryngologist, as well as the intensivist, are performing critical care work, including reviewing and assessing data such as chest x-ray, arterial blood gas and other laboratory values, adjusting ventilator settings, titrating sedation, determining need for blood and volume expanders and communicating with intensive care physicians, staff and family.

99231

The physician will need to monitor the wound and graft site for infection, crepitus, and the patient for breathing, oral intake, vocal communication ability and pain management. The visit includes reviewing a chest X-ray, auscultating the neck and chest, and closely monitoring vital signs. The physician evaluates for signs and symptoms of aspiration.

99213 x3

The physician will need to perform a wound check and remove sutures. The physician will assess breathing, voice production and swallowing. Breathing is assessed through clinical complaints as well direct inspection of the airway with indirect endoscopy for signs of edema or granulation tissue. Voice is assessed with perceptual evaluation and indirect endoscopy to exam vocal fold motion and closure during voice production. Swallowing is assessed clinically and through observation of swallowing. If the patient exhibits excessive coughing or difficulty, SLP evaluation and education will need to be initiated through referral. A flexible laryngoscopy is performed at each visit and is not separately reportable.

Physician Work RVU

Upon review of the survey results, the expert panel **recommends a value below existing value in accordance with the 25th percentile of our survey, for an RVW of 14.60**.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 31580, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT
21048	Excision of benign tumor or cyst of maxilla; requiring intra-oral osteotomy (eg, locally aggressive or destructive lesion[s])	090	14.71	75	120	30	400	RUC	Apr02	0.0497
27827	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal fixation, when performed; of tibia only	090	14.79	85	120	30	441	RUC	Feb07	0.0387

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

   31580 Laryngoplasty; for laryngeal web, with indwelling keel or stent insertion
   Global - 090 14.60 Pre -85 Intra- 120 Post- 30 Total Time - 432 MPRR: 100%
31600 Tracheostomy, planned (separate procedure);
Global - 000 7.71 Pre- 50 Intra- 40 Post- 66 Total Time - 156 MPPR: 50%

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31580

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 90
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We utilized the 2014 RUC database volume of 26 and multipled by three to project the national volume. We estimate that the national volume is typically three times that of the Medicare volume for these services.

Specialty Otolaryngology Frequency 90 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 26 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the 2014 Medicare volume as listed in the RUC database.

Specialty Otolaryngology Frequency 26 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Laryngoplasty; for laryngeal stenosis, with graft, without indwelling stent placement, age 12 years or older

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old patient presents with subglottic stenosis and has been tracheostomy dependent since shortly after birth. laryngoplasty with graft, without stent placement is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 2%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 14% , Overnight stay-more than 24 hours 86%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 39%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: The patient is induced with general anesthesia with the surgeon present in the room due to the risk of airway obstruction. The surgeon performs direct laryngoscopy and bronchoscopy to evaluate the airway, the tracheostomy tube is removed and the surgeon places the appropriate size endotracheal tube.
A horizontal neck incision is made over the thyroid cartilage through the skin and platysma layers. Subplasysmal flaps are elevated to the hyoid superiorly and over the trachea inferiorly. The strap muscles are incised in the midline and separated. The thyroid is divided in the midline and retracted. The trachea and larynx are skeletonized with care taken to avoid major vessels and the recurrent laryngeal nerves. The lower portion of the larynx, the cricoid and the trachea are incised. Scar tissue in the lumen of the airway is resected as needed and rotational flaps sutured into place to cover as much of the exposed cartilage surface as possible. The graft is harvested through a separate incision. It is then contoured to fit into place expanding the airway lumen. The graft is sutured into place using non-resorbable sutures. A nasogastric feeding tube is placed. If the graft and airway are stable, then the decision can be made to extubate that patient after closure of the wound. The strap muscles are reapproximated in the midline. The skin and platysma are closed in layers. A drain may be placed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor. Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of breathing, presence of stridor and oxygen saturation. Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions. Answer nursing staff questions.

Discuss patient progress with ICU physician. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Dictate discharge letter to referring physician.

Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities with patient. Discuss long term scar management. Dictate progress notes for chart for each follow up visit.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.55	0.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.45	0.33
Urgency of medical decision making	0.73	0.56
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.18	0.33
Physical effort required	1.09	-0.11
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	1.55	0.67

Outcome depends on the skill and judgment of physician	1.36	0.22
Estimated risk of malpractice suit with poor outcome	0.82	0.22

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.45	0.89

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Laryngologists or Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 1680 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time

We are recommending our survey time of 180 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the to the survey time down from the package time of 33 minutes was appropriate. **The expert panel recommends a post-service time of 30 minutes.**

Post-Operative Visits

99291

The patient is intubated and sedated. The otolaryngologist, as well as the intensivist, are performing critical care work, including reviewing and assessing data such as chest x-ray, arterial blood gas and other laboratory values, adjusting ventilator settings, titrating sedation, determining need for blood and volume expanders and communicating with intensive care physicians, staff and family.

99232

Surgeon will need to do a wound check, check the chest x ray, check the graft harvest site, and check the neck for crepitus and infection. These patients have an unstable airway for the first 1-3 days after surgery. They need to be observed for signs of airway edema with continuous pulse oximetry. The surgeon will need to clinically assess the patients' safety for PO intake with a bedside swallow evaluation.

99231

The physician will need to monitor the wound and graft site for infection, crepitus, and the patient for breathing, oral intake, vocal communication ability and pain management. The visit includes reviewing a chest X-ray, auscultating the neck and chest, and closely monitoring vital signs. The physician evaluates for signs and symptoms of aspiration.

99213 x3

The physician will need to perform a wound check and remove sutures. The physician will assess breathing, voice production and swallowing. Breathing is assessed through clinical complaints as well direct inspection of the airway with indirect endoscopy for signs of edema or granulation tissue. Voice is assessed with perceptual evaluation and indirect endoscopy to exam vocal fold motion and closure during voice production. Swallowing is assessed clinically and through observation of swallowing. If the patient exhibits excessive coughing or difficulty, SLP evaluation and education will need to be initiated through referral. A flexible laryngoscopy is performed at each visit and is not separately reportable.

Physician Work RVU

Upon review of the survey results, the expert panel **recommends a value below existing value, in accordance with the survey median, for an RVW of 20.50**.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 3158X2, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT
35612	Bypass graft, with other than vein; subclavian-subclavian	090	20.35	65	180	40	485	RUC	Oct10	0.0614
47371	Laparoscopy, surgical, ablation of 1 or more liver tumor(s); cryosurgical	090	20.8	80	180	35	455	RUC	Feb02	0.0687

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31582

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 56
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We utilized the 2014 Medicare data of 37 and multipled by three to project the national volume, as we typically estimate that the national volume is typically three times that of the Medicaid volume for these services. We then divided that by 2 given that only two of the codes that have been carved out of 31582 are adult procedures (X2 and X4). This reulsts in (37*3=111/2 =55.5). We rouned up to 56 for each code (X2 and X4).

Specialty Otolaryngology Frequency 56 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 19 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. In order to calculate this we took the 2014 Medicare volume, as listed in the RUC database, and divided it by 2 as there are 2 codes to describe adult services that represent the current Medicare volume of former CPT code 31582. This results in 37/2 = 18.5, so we rounded to 19 for all codes which replace the volume of 31582.

Specialty Otolaryngology Frequency 19 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31582

Global Period: 090 RUC Recommended RVU: **22.00**

CPT Descriptor: Laryngoplasty; for laryngeal stenosis, with graft, with indwelling stent placement, age 12 years or older

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old male underwent prolonged intubation during recent closed head trauma. he is now tracheotomy dependent and laryngoscopy reveals posterior glottic stenosis. He undergoes laryngoplasty with graft, with stent placement.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 2%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 10% , Overnight stay-more than 24 hours 90%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 44%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: The patient is induced with general anesthesia with the surgeon present in the room due to the risk of airway obstruction. The tracheostomy tube is exchanged for an endotracheal tube placed through the tracheotomy. A direct laryngoscopy and bronchoscopy is performed to evaluate the airway. A horizontal neck incision is made over the thyroid cartilage through the skin and platysma layers. Subplasysmal flaps are elevated to the hyoid superiorly and over the trachea inferiorly. The strap muscles are incised in the midline and separated. The thyroid gland is divided in the midline and retracted. The trachea and larynx are skeletonized with care taken to avoid major vessels and the recurrent laryngeal nerves. The lower portion of the larynx, the cricoid and the trachea are incised. If not performed previously, or if it exists in an unfavorable position, a tracheotomy is revised or performed through the same prepared site but though a separate neck incision. Care is taken to keep 1 to 2 intact tracheal rings between the tracheotomy site and the lower portion of the graft. Scar tissue in the lumen of the airway is resected as needed and rotational flaps sutured into place to cover as much of the exposed cartilage surface as possible. The cartilage graft is harvested through a separate incision. It is then contoured to fit into place. The stent is inserted to expand the airway and the cartilage graft, that was previously contoured, is modified as needed and sutured into place using non-resorbable sutures. A nasogastric feeding

tube is placed. The strap muscles are reapproximated in the midline. The skin and platysma are closed in layers. A drain may be placed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor, Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of breathing, presence of stridor and oxygen saturation. Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions. Answer nursing staff questions.

Discuss patient progress with ICU physician. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Dictate discharge letter to referring physician.

Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Change tracheostomy tube. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities with patient. Discuss long term scar management. Dictate progress notes for chart for each follow up visit

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.53	0.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.13	1.00
Urgency of medical decision making	0.87	0.44
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.93	0.78
Physical effort required	0.87	0.78

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.27	1.44
Outcome depends on the skill and judgment of physician	1.07	1.11
Estimated risk of malpractice suit with poor outcome	0.87	0.67

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.47	1.44

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Laryngologists or Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 1680 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are

available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time

We are recommending our survey time of 195 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the time to the lesser of the package time and the survey time was appropriate. **The expert panel recommends a post-service time of 30 minutes.**

Post-Operative Visits

99291

The patient has a fresh tracheostomy, is on the ventilator and is sedated. The otolaryngologist, as well as the intensivist, are performing critical care work, including reviewing and assessing data such as chest x-ray, arterial blood gas and other laboratory values, adjusting ventilator settings, titrating sedation, determining need for blood and volume expanders and communicating with intensive care physicians, staff and family.

99232

Surgeon will need to do a wound check, check the chest x ray, check the graft harvest site, and check the neck for crepitus and infection. These patients have an unstable airway for the first 1-3 days after surgery. They need to be observed for signs of airway edema with continuous pulse oximetry. The surgeon will need to clinically assess the patients' safety for PO intake with a bedside swallow evaluation. The physician changes this tracheostomy during this period. The physician also ensures patency of the tracheostomy during each visit, evaluating for any granulation tissue or obstruction distal to the tracheostomy.

99231 x2

The physician will need to monitor the wound and graft site for infection, crepitus, and the patient for breathing, oral intake, vocal communication ability and pain management. The visit includes reviewing a chest X-ray, auscultating the neck and chest, and closely monitoring vital signs. The physician evaluates for signs and symptoms of aspiration.

99213 x3

The surgeon will monitor the neck wound and graft site for infection and crepitus. Sutures are removed. The surgeon will evaluate the tracheotomy site and tracheotomy appliance. Patient's ability to care for tracheotomy will be assessed. Endoscopy will be performed though the tracheotomy to evaluate the lower airway for signs of crusting or infection as well as from above for position of the stent. The surgeon will assess the patient's PO intake through a clinical evaluation and observation of swallowing.

Physician Work RVU

Upon review of the survey results, the expert panel **recommends a value below existing value, in accordance with the median of our survey, for an RVW of 22**.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 3158X4, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT
43334	Repair, paraesophageal hiatal hernia (including fundoplication), via thoracotomy, except neonatal; without implantation of mesh or	090	22.12	80	180	30	549	RUC	Apr10	0.0579

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
3.
4. 3158X4 laryngoplasty; for laryngeal stenosis, with graft, with indwelling stent placement, age 12 years or older
5. Global - 090 14.60 Pre -105 Intra- 195 Post- 30 Total Time - 587 MPRR: 100%
6. 31600 Tracheostomy, planned (separate procedure);
7. Global - 000 7.71 Pre- 50 Intra- 40 Post- 66 Total Time - 156 MPPR: 50%

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31582

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 56
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We utilized the 2014 Medicare data of 37 and multipled by three to project the national volume, as we typically estimate that the national volume is typically three times that of the Medicaid volume for these services. We then divided that by 2 given that only two of the codes that have been carved out of 31582 are adult procedures (X2 and X4). This reulsts in (37*3=111/2 =55.5). We rouned up to 56 for each code (X2 and X4)

Specialty Otolaryngology Frequency 56 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 19 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. In order to calculate this we took the 2014 Medicare volume, as listed in the RUC database, and divided it by 2 as there are 2 codes to describe adult services that represent the current Medicare volume of former CPT code 31582. This results in 37/2 = 18.5, so we rounded to 19 for all codes which replace the volume of 31582.

Specialty Otolaryngology Frequency 19 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

SUMMARY OF RECOMMENDATION

CPT Code:31584 Tracking Number Original Specialty Recommended RVU: **22.00**
Presented Recommended RVU: **22.00**
Global Period: 090 RUC Recommended RVU: **20.00**

CPT Descriptor: Laryngoplasty; with open reduction and fixation (eg, plating) of fracture, includes tracheostomy, if performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 28-year-old male presents as an unrestrained driver in an automobile collision. he sustained blunt trauma to his larynx and evaluation demonstrates a fracture in the thyroid cartilage resulting in airway compromise and hoarseness with mucosal tears and exposed cartilage. laryngoplasty with open reduction and fixation of the fracture is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 97% , In the ASC 1%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 1% , Overnight stay-less than 24 hours 11% , Overnight stay-more than 24 hours 88%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 43%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 9%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: The patient is induced with general anesthesia with the surgeon present in the room due to the risk of airway obstruction. A tracheostomy is secured and performed. The surgeon then performs a direct laryngoscopy and bronchoscopy to evaluate the airway. A horizontal neck incision is made over the thyroid cartilage through the skin and platysma layers. Subplatysmal flaps are elevated to the hyoid superiorly and over the trachea inferiorly. The strap muscles are incised in the midline and separated. The thyroid gland is divided in the midline and retracted. The larynx is skeletonized with care taken to avoid major vessels and the recurrent laryngeal nerves. The entire larynx involved with the fracture is exposed; the interior of the larynx is opened in midline or through a fracture line. Intralaryngeal mucosal tears are sutured and grafted as necessary. The laryngeal skeletal fractures are fixed with suture, wire, or plating. An appropriately sized stent may need to be placed and secured with non-absorbable sutures. The wound is irA drain may be placed. The strap muscles are reapproximated in the midline. The skin and platysma are closed in layers. A nasogastric feeding tube is placed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor. Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of breathing, presence of stridor and oxygen saturation. Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management and tracheostomy care with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions and educate family regarding tracheostomy care. Answer nursing staff questions.

Discuss patient progress with ICU physician specifically use of inhaled and systemic steroids to prevent granulation tissue formation. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Assure adequate feeding and swallowing. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Dictate discharge letter to referring physician.

Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Change tracheostomy tube. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities. Discuss long-term scar management. Dictate progress notes for chart for each follow up visit

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.53	0.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.13	1.00
Urgency of medical decision making	0.87	0.44
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.93	0.78
Physical effort required	0.87	0.78

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.27	1.44
Outcome depends on the skill and judgment of physician	1.07	1.11
Estimated risk of malpractice suit with poor outcome	0.87	0.67

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.47	1.44

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Laryngologists or Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 1680 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are

available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time

We are recommending our survey time of 120 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the post service package time of 33 minutes down to the recommended survey time of 30 minutes was appropriate. **The expert panel recommends a post-service time of 30 minutes.**

Post Operative Visits

99291

The patient has a fresh tracheostomy, is on the ventilator and is sedated. The otolaryngologist, as well as the intensivist, are performing critical care work, including reviewing and assessing data such as chest x-ray, arterial blood gas and other laboratory values, adjusting ventilator settings, titrating sedation, determining need for blood and volume expanders and communicating with intensive care physicians, staff and family.

99232

Surgeon will need to do a wound check, check the chest x ray, check the graft harvest site, and check the neck for crepitus and infection. These patients have an unstable airway for the first 1-3 days after surgery. They need to be observed for signs of airway edema with continuous pulse oximetry. The surgeon will need to clinically assess the patients' safety for PO intake with a bedside swallow evaluation.

The physician changes this tracheostomy during this period. The physician also ensures patency of the tracheostomy during each visit, evaluating for any granulation tissue or obstruction distal to the tracheostomy.

99231 x2

The physician will need to monitor the wound and graft site for infection, crepitus, and the patient for breathing, oral intake, vocal communication ability and pain management. The visit includes reviewing a chest X-ray, auscultating the neck and chest, and closely monitoring vital signs. The physician evaluates for signs and symptoms of aspiration.

99213 x3

The surgeon will monitor the neck wound and graft site for infection and crepitus. Sutures are removed. The surgeon will evaluate the tracheotomy site and tracheotomy appliance. Patient's ability to care for tracheotomy will be assessed. Endoscopy will be performed though the tracheotomy to evaluate the lower airway for signs of crusting or infection as well as from above for position of the stent. The surgeon will assess the patient's PO intake through a clinical evaluation and observation of swallowing.

Physician Work RVU

Upon review of the survey results, the expert panel **recommends the survey median value for an RVW of 20.00**.

Compelling Evidence (Was approved by the Panel but is not needed with the median value).

Our expert panel recognizes that it is uncommon to recommend a value which exceeds the median, and in many cases, the 25th percentile, for physician work; however, for the new codes in this family which have been added to accurately capture the work associated with performing these major procedures on infants, we believe a recommendation of the 75th percentile work RVU is appropriate. This is based on compelling evidence that "the work involved in this procedure has significantly changed." Specifically, this code was revised to include the work of tracheostomy when performed which significantly changes the physician work involved in providing the service based on the bundling of that code (which was previously separately reportable) and the work of 31584. Further, this code did not have a vignette so it is unclear what description of the procedure was previously valued. Therefore, we believe an increase in value for the aforementioned reasons is appropriate.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 31584, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT

43820	Gastrojejunostomy; without vagotomy	090	22.53	60	120	30	545	RUC	Aug05	0.0715

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31584 and 31600

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 33
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We utilized the 2014 RUC database volume of 11 and multipled by three to project

the national volume. We estimate that the national volume is typically three times that of the Medicare volume for these services.

SUMMARY OF RECOMMENDATION

CPT Code:315X5 Tracking Number

Original Specialty Recommended RVU: **17.20**
Presented Recommended RVU: **17.20**
RUC Recommended RVU: **15.60**

Global Period: 090

CPT Descriptor: Laryngoplasty, medialization; unilateral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 62-year-old male presents with hoarseness and a weak cough, and he occasionally chokes on liquids. laryngoscopy reveals left vocal fold paralysis. He undergoes medialization laryngoplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 92% , In the ASC 6%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 15% , Overnight stay-less than 24 hours 74% , Overnight stay-more than 24 hours 11%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 25%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 26%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management and level of sedation with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Decongest and anesthetize nasal cavity; Place flexible transnasal laryngoscope; Inject planned incision with local anesthetic and topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: A horizontal skin incision is made over the cricothyroid membrane through the skin and platysma layers. Subplatysmal flaps are elevated to the hyoid superiorly and over the cricoid ring inferiorly. The strap muscles are incised in the midline and retracted laterally. The thyroid cartilage is rotated to better expose the side to be medialized and skeletonized to allow creation of an appropriately sized and positioned cartilage defect for insertion of material to medialze the vocal fold. Once the defect is created in the cartilage, gentle dissection inside the thyroid cartilage is performed in the paraglottic space to allow medialization of the vocal fold. The stent material, (Gortex ribbon, silastic, calcium hydroxyapatite or metal) is inserted through the cartilage defect. The vocal fold is medialized and the patient’s voice is tested to determine adequacy. In addition to perceptual analysis of voice, observation from a laryngoscope is used to guide the repositioning of the vocal fold and observe patterns of laryngeal closure during voice production. The stent or implant is sutured into position as required. The soft tissue is closed over the top of the thyroid cartilage defect. The strap muscles are reapproximated in the midline and the platysma and skin are closed in layers. A drain may be placed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and

nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor, Write postoperative note. Dictate operative report and copy the referring physician. Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Answer patient/family questions. Assess for adequacy of pain control. Discuss advancing diet and daily activities with patient. Discuss long term scar management. Dictate progress notes for chart for each follow up visit

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.40	0.63
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.00	0.50
Urgency of medical decision making	0.00	-0.13
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.40	0.88
Physical effort required	0.00	0.50

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.20	0.38
Outcome depends on the skill and judgment of physician	0.40	0.63
Estimated risk of malpractice suit with poor outcome	-0.10	0.25

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.00	0.88

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Laryngologists or Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 1680 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 2B (Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)) for this family of codes based on the fact they are performed in the facility setting, under moderate sedation. While we do not agree that this is a "straightforward procedure" there is not a pre-service package using moderate sedation that indicates a "difficult procedure". We are recommending taking the lesser of the survey or the pre-time package.
Therefore, we recommend a pretime of 39 minutes.

Intra-Service Time
We are recommending our survey time of 120 minutes for intra service work.

Post-Service Time
The expert panel selected post-package 8B (IV Sedation/ Complex Procedure) for this code. They concluded that reducing the survey time to the package time of 28 minutes was appropriate. **The expert panel recommends a post-service time of 28 minutes.**

Post-Operative Visits
99213 x3
The surgeon will monitor the neck wound for infection. Clinical assessment of voice will be undertaken through patient history and auditory vocal assessment. Flexible laryngoscopy, not separately reportable, will be performed to evaluate the internal appearance of the larynx for contusion, hematoma, signs of infection and vocal fold position. The surgeon will assess the patient's PO intake through a clinical evaluation and observation of swallowing. If the patient exhibits excessive difficulty swallowing or continued difficult with voice production, then SLP evaluation and education will be initiated through referral.

Physician Work RVU
Upon review of the survey results, the expert panel **recommends a crosswalk to CPT 58544 Laparoscopy, surgical, supracervical hysterectomy with an RVW of 15.60 to value the X5 code. This is also nearly identical to existing value of 31588 and 31575 after the MPP reduction is taken into account.**

Compelling Evidence
Our expert panel is recommending an increased value for this new CPT code for several reasons. First, this code was created to provide more specificity and replaces the volume of the prior code, 31588, which was an unspecified code. We believe there is compelling evidence based on the fact that the current vignette for 31588 is flawed in that it describes an epiglottic flap for glottic stenosis after a vertical hemilaryngectomy which is does not represent the typical patient under the new code descriptor. Based on this, we believe there is compelling evidence to increase the value for this new code given that the prior code does not accurately describe the work involved in providing this procedure as better defined by the new X5 code.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 3158X5, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31588 and 31575

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3514
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This service was previously reported using 31588. We expect that approximately 95% of 31588's volume will be attributed to this new code, so we took 95% of the 2014 RUC database Medicare volume (1233) and multipled by three to project the national volume. We estimate that the national volume is typically three times that of the Medicaid volume for these services.

Specialty Otolaryngology Frequency 3514 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,172
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This service was previously reported using 31588. We expect that approximately 95% of 31588's volume will be attributed to this new code, so we took 95% of the 2014 RUC database Medicare volume (1233).

Specialty Otolaryngology Frequency 1172 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:315X1 Tracking Number Original Specialty Recommended RVU: **23.22**
Presented Recommended RVU: **23.22**
Global Period: 090 RUC Recommended RVU: **21.50**

CPT Descriptor: Laryngoplasty; for laryngeal stenosis, with graft, without indwelling stent placement, younger than 12 years of age

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 2-year-old child presents with subglottic stenosis and has been tracheostomy dependent since shortly after birth. laryngoplasty with graft, without stent placement is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 3% , Overnight stay-more than 24 hours 97%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 45%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: The child is induced with general anesthesia with the surgeon present in the room due to the risk of airway obstruction. The surgeon performs direct laryngoscopy and bronchoscopy to evaluate the airway, the tracheostomy tube is removed and the surgeon places the appropriate size endotracheal tube. A horizontal neck incision is made over the thyroid cartilage through the skin and platysma layers. Subplatysmal flaps are elevated to the hyoid superiorly and over the trachea inferiorly. The strap muscles are incised in the midline and separated. The thyroid is divided in the midline and retracted. The trachea and larynx are skeletonized with care taken to avoid major vessels and the recurrent laryngeal nerves. The lower portion of the larynx, the cricoid and the trachea are incised. Scar tissue in the lumen of the airway is resected as needed and rotational flaps used to cover as much of the exposed cartilage surface as possible. The graft is harvested either from the thyroid cartilage or through a separate incision. It is then contoured to fit into place expanding the airway lumen. The graft is sutured into place. A nasogastric feeding tube is placed. The patient is left intubated at the conclusion of the procedure. The strap muscles are reapproximated in the midline. The skin and platysma are closed in layers. A drain may be placed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to ICU. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor. Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of the incision and to ensure that there is neither a hematoma nor subcutaneous air. Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions. Answer nursing staff questions.

Discuss patient progress with ICU physician specifically sedation protocols, ventilator settings as well as use of inhaled and systemic steroids to prevent granulation tissue formation. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Assure adequate feeding and swallowing. Assess for signs of narcotic withdrawal given significant sedation during time in intensive care unit and initiate treatment as needed. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Dictate discharge letter to referring physician.

Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities. Discuss long term scar management. Dictate progress notes for chart for each follow up visit

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.38	1.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.63	0.50
Urgency of medical decision making	0.88	0.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.13	1.00
Physical effort required	1.38	1.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.50	1.33
Outcome depends on the skill and judgment of physician	1.25	1.00
Estimated risk of malpractice suit with poor outcome	0.88	0.83

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.63	1.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 319 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are

available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time
We are recommending our survey time of 180 minutes for intra service work.

Post-Service Time
The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the survey time to the package time of 33 minutes was appropriate. **The expert panel recommends a post-service time of 33 minutes.**

Post operative Visit Descriptions
99291:
The patient is intubated and sedated. The otolaryngologist, as well as the intensivist, are performing critical care work, including reviewing and assessing data such as chest x-ray, arterial blood gas and other laboratory values, adjusting ventilator settings, titrating sedation, determining need for blood and volume expanders and communicating with intensive care physicians, staff and family.

99293 x2
The patient remains intubated and sedated in the intensive care unit. The otolaryngologist evaluates the neck for signs of graft dehiscence or wound infection, monitors sedation, evaluates laboratory values and vital signs, updates family and communicates with intensive care physicians and staff.

99232
Occurs in the immediate period after transfer from the ICU. Three main areas are being evaluated: breathing, feeding and narcotic withdrawal. The patients breathing must be closely monitored, including reviewing a chest X-ray, auscultating the neck and chest, and closely monitoring vital signs. Evaluate the wound for crepitus and infection. Nutrition is closely monitored as often swallowing is difficult. Last, most children go into an opiod withdrawal that requires methadone and close monitoring of vital signs and neurological status.

99231x3
Similar issues as in 99231, however, as the post-operative course progresses, the risks of graft failure decrease. The physician is checking their breathing, voice tone, and feeding every day. Evaluate the wound for crepitus and infection. They are managing the methadone taper and discussing the progress of treatment with the speech therapy and medical pediatrics teams. They are also reviewing the progress of the patient with the parents.

99213x3
Check breathing. Stridor frequently persists for several weeks post operatively. Edema can occur. If the child contracts an upper respiratory infection, the consequences can be dire. There is frequently a delay in resumption of normal diet. Physician will also review the progress of speech therapy and the progress of the methadone taper to get the child over their narcotic dependence. Evaluate the wound for crepitus and infection. The physician will also frequently need to discuss the care with the patient's pediatrician and speech therapist. A flexible laryngoscopy is also performed which is not separately reportable.

Physician Work RVU
Upon review of the survey results, the expert panel **recommends a value in accordance with the survey median value which is an RVW of 21.50**.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 3158X1, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT
43341	Esophagojejunostomy (without total gastrectomy); thoracic approach	090	24.23	90	180	60	770	RUC	Aug00	0.0166
43320	Esophagogastrostomy (cardioplasty), with or without vagotomy and pyloroplasty, transabdominal or transthoracic approach	090	23.31	90	180	30	740	RUC	Aug00	0.0152

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31582

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 191

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We utilized the 2009 RUC database Medicaid volume of 318 and multipled by three to project the national volume, as we typically estimate that the national volume is typically three times that of the Medicaid volume for these services. We then divided that by 5 among the five codes that replaced 31582 (X1-X4 and X6). (954/5 =191)

Specialty Otolaryngology Frequency 191 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is now a pediatric procedure and will not be reported in the Medicare population.

Specialty Otolaryngology Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: The child is induced with general anesthesia with the surgeon present in the room due to the risk of airway obstruction. The tracheostomy tube is exchanged for an endotracheal tube placed through the tracheotomy. A direct laryngoscopy and bronchoscopy is performed to evaluate the airway. A horizontal neck incision is made over the thyroid cartilage through the skin and platysma layers. Subplatysmal flaps are elevated to the hyoid superiorly and over the trachea inferiorly. The strap muscles are incised in the midline and separated. The thyroid is divided in the midline and retracted. The trachea and larynx are skeletonized with care taken to avoid major vessels and the recurrent laryngeal nerves. The lower portion of the larynx, the cricoid and the trachea are incised. Scar tissue in the lumen of the airway is resected as needed and rotational flaps used to cover as much of the exposed cartilage surface as possible. The graft is harvested either from the thyroid cartilage or through a separate incision. It is then contoured to fit into place expanding the airway lumen. The graft is sutured into place. An appropriately sized stent is selected and placed into the airway to stent open the expanded airway. The stent is secured into place using non-absorbable sutures. The endotracheal tube is exchanged for a tracheostomy tube that is secured. A drain may be placed. The strap muscles are reapproximated in

the midline. The sutures of the stent are secured over a button beneath the skin. The skin and platysma are closed in layers. A nasogastric feeding tube is placed.

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor. Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of the incision and to ensure that there is neither a hematoma nor subcutaneous air Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management and tracheostomy care with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions and educate family regarding tracheostomy care. Answer nursing staff questions.

Discuss patient progress with ICU physician specifically use of inhaled and systemic steroids to prevent granulation tissue formation. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Assure adequate feeding and swallowing. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Dictate discharge letter to referring physician.

Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Change tracheostomy tube. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities. Discuss long-term scar management. Dictate progress notes for chart for each follow up visit.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
21558	090	21.58	**RUC Time**

CPT Descriptor Radical resection of tumor (eg, sarcoma), soft tissue of neck or anterior thorax; 5 cm or greater

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
60252	090	22.01	**RUC Time**

CPT Descriptor Thyroidectomy, total or subtotal for malignancy; with limited neck dissection

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
50546	090	21.87	**RUC Time**	2,081

CPT Descriptor 1 Laparoscopy, surgical; nephrectomy, including partial ureterectomy

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
55866	090	32.06	**RUC Time**	13,422

CPT Descriptor 2 Laparoscopy, surgical prostatectomy, retropubic radical, including nerve sparing, includes robotic assistance, when performed

Other Reference CPT Code	Global	Work RVU	Time Source
47711	090	25.90	**RUC Time**

CPT Descriptor Excision of bile duct tumor, with or without primary repair of bile duct; extrahepatic

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 9 **% of respondents:** 29.0 **%**

Number of respondents who choose 2nd Key Reference Code: 7 **% of respondents:** 22.5 **%**

TIME ESTIMATES (Median)

	CPT Code: 315X3	Top Key Reference CPT Code: 21558	2nd Key Reference CPT Code: **60252**
Median Pre-Service Time	58.00	72.00	60.00

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.89	0.29
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.89	1.43
Urgency of medical decision making	0.67	0.71
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.00	1.00
Physical effort required	0.67	1.14

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.11	1.29
Outcome depends on the skill and judgment of physician	1.11	1.29
Estimated risk of malpractice suit with poor outcome	0.89	1.00

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.44	1.71

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 319 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are

available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time

We are recommending our survey time of 180 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the survey time to the package time of 33 minutes was appropriate. **The expert panel recommends a post-service time of 33 minutes.**

Post-Service Operative Visits

99291:

The patient is intubated and sedated. The otolaryngologist, as well as the intensivist, are performing critical care work, including reviewing and assessing data such as chest x-ray, arterial blood gas and other laboratory values, adjusting ventilator settings, titrating sedation, determining need for blood and volume expanders and communicating with intensive care physicians, staff and family.

99233 x2

The patient remains intubated and sedated in the intensive care unit. The otolaryngologist evaluates the neck for signs of graft dehiscence or wound infection, monitors sedation, evaluates laboratory values and vital signs, updates family and communicates with intensive care physicians and staff.

99232 x4

Patient has a fresh tracheostomy. Patient is evaluated for breathing, feeding and narcotic withdrawal. The patients breathing must be closely monitored, including reviewing a chest X-ray, auscultating the neck and chest, and closely monitoring vital signs. Evaluate the wound for crepitus and infection. Nutrition is closely monitored as often swallowing is difficult. Last, most children go into an opiod withdrawal that requires methadone and close monitoring of vital signs and neurological status. The physician changes this tracheostomy during this period. The physician also ensures patency of the single lumen tracheostomy during each visit, evaluating for any granulation tissue or obstruction distal to the tracheostomy.

99213 x3

This is an extended length visit where we review how the patient has been doing at home. We will discuss trach care, remove sutures, review diet, speech (including considering a passy Muir valve), and breathing. We need to make sure that crusts are not forming in the stent that can migrate beneath the trach and cause an obstruction. We will be reviewing medications and wound/tracheostomy care with the family and parents. We will frequently need to talk to the child's pediatrician and review speech therapy records. School paperwork will need to be completed.

Physician Work RVU

Upon review of the survey results, the expert panel **recommends a value in accordance with the survey median for an RVW of 22.00**.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 3158X3, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT
43425	Closure of esophagostomy or fistula; transthoracic or transabdominal approach	090	25.04	90	180	45	845	RUC	Aug00	-0.0063

47711	Excision of bile duct tumor, with or without primary repair of bile duct; extrahepatic	090	25.9	75	180	45	670	RUC	Aug00	0.0546

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
   3158X3 laryngoplasty; for laryngeal stenosis, with graft, with indwelling stent placement, younger than 12 years of age
3. Global - 090 25 Pre -115 Intra- 180 Post- 33 Total Time - 829 MPRR: 100%
4. 31600 Tracheostomy, planned (separate procedure);
5. Global - 000 7.71 Pre- 50 Intra- 40 Post- 66 Total Time - 156 MPPR: 50%

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31582

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 191
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We utilized the 2009 RUC database Medicaid volume of 318 and multipled by three to project the national volume, as we typically estimate that the national volume is typically three times that of the Medicaid volume for these services. We then divided that by 4 among the four codes that replaced 31582. (954/4 =238.5)

Specialty Otolaryngology Frequency 191 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is now a pediatric procedure and will not be reported in the Medicare database.

Specialty Otolaryngology Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31582

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31587 Tracking Number Original Specialty Recommended RVU: **15.27**
Presented Recommended RVU: **15.27**
Global Period: 090 RUC Recommended RVU: **15.27**

CPT Descriptor: laryngoplasty, cricoid split, without graft placement

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a neonate presents with intubation and difficult weaning from the ventilator. laryngoscopy reveals subglottic stenosis. laryngoplasty with cricoid split, without graft placement, is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 94% , In the ASC 0%, In the office 6%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 6% , Overnight stay-more than 24 hours 94%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 47%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 9%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of ventilator settings, imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical "time out" with surgical operating team.

Description of Intra-Service Work: An incision is made in the neck; dissection is carried out between the strap muscles; the trachea and larynx are identified; and an incision is made from approximately the first or second tracheal ring upwards through the cricoid cartilage and into the lower part of the thyroid cartilage but not into the anterior commissure of the vocal cords. Cases with more severe stenosis require splitting of the posterior part of the cricoid cartilage as well. A larger endotracheal tube is inserted, sutures are used to hold the edges of the split cartilages laterally and the wound is closed in layers

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to the ICU. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor. Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of the incision and to ensure that there is neither a hematoma nor subcutaneous air. Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for

airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions. Answer nursing staff questions. Discuss patient progress with ICU physician specifically sedation protocols, ventilator settings as well as use of inhaled and systemic steroids to prevent granulation tissue formation. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Assure adequate feeding and swallowing. Assess for signs of narcotic withdrawal given significant sedation during time in intensive care unit. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family.

Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities. Discuss long term scar management. Dictate progress notes for chart for each follow up visit

CPT Descriptor Parathyroidectomy or exploration of parathyroid(s);

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
52601	090	15.26	**RUC Time**	46,675

CPT Descriptor 1 Transurethral electrosurgical resection of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
60500	090	15.60	**RUC Time**	14,939

CPT Descriptor 2 Parathyroidectomy or exploration of parathyroid(s);

Other Reference CPT Code	Global	Work RVU	Time Source
45562	090	17.98	**RUC Time**

CPT Descriptor Exploration, repair, and presacral drainage for rectal injury;

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 5 **% of respondents:** 14.7 **%**

Number of respondents who choose 2nd Key Reference Code: 3 **% of respondents:** 8.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 31587	Top Key Reference CPT Code: 60240	2nd Key Reference CPT Code: **60500**
Median Pre-Service Time	58.00	72.00	72.00

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.20	0.33
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.20	1.00
Urgency of medical decision making	0.20	1.67
Technical Skill/Physical Effort (Mean)		
Technical skill required	-0.40	1.00
Physical effort required	-0.20	1.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.40	0.67
Outcome depends on the skill and judgment of physician	0.20	0.67
Estimated risk of malpractice suit with poor outcome	-0.20	0.67

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.00	0.67

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 319 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are

available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time

We are recommending our survey time of 95 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the time to the lesser of the package time and the survey time was appropriate. **The expert panel recommends a post-service time of 30 minutes.**

Post-Operative Visits

99233

These procedures are only done on neonates who fail extubation in the NICU. They are the only patient population, and they spend their entire post-op course in the NICU (and if they are discharged, it is ultimately from the NICU). The first 5-7 post-op days involve reviewing sedation, positioning, ventilator settings, respiratory status, and medications in addition to reviewing a chest x-ray and examining the neck for crepitus, infection, and an air leak. The physician communicates with intensive care physicians, staff and family.

99232

This visit represents the day after extubation. The first day after extubation will involve reviewing chest X-ray and closely examine the neck for crepitus and checking respiratory status. The physician checks for Stridor, cyanosis and increased work of breathing. The physician monitors feeding status and discusses a feeding plan with speech therapy. The physician communicates with intensive care physicians, staff and family.

99231

The visits from post-extubation day 2 onward are usually less intense, but still involve reviewing a chest-X-ray and closely monitoring feeding and breathing status.

99213x3

Remove sutures. After discharge, will need to see weekly for several weeks to monitor breathing and feeding. Re-stenosis can occur for weeks to months following procedure. Evaluate the wound for crepitus and infection. The physician will also frequently need to discuss the care with the patient's pediatrician and speech therapist. A flexible laryngoscopy is performed at each visit, which is not separately reportable.

Physician Work RVU

Upon review of the survey results, the expert panel **recommends maintenance of existing value, which is below the 25th percentile, for an RVW of 15.27**.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 31587, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT
45562	Exploration, repair, and presacral drainage for rectal injury;	090	17.98	90	95	30	561	RUC	Aug00	0.0296
48510	External drainage, pseudocyst of pancreas, open	090	17.19	83	98	30	581	RUC	Aug00	0.013

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31587

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 45
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We utilized the 2014 RUC database Medicare volume of 15 and multipled by three to project the national volume. We estimate that the national volume is typically three times that of the Medicaid volume for these services.

Specialty Otolaryngology Frequency 45 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the 2014 Medicare volume as listed in the RUC database.

Specialty Otolaryngology Frequency 15 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31587

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:315X6 Tracking Number

Original Specialty Recommended RVU: **30.00**
Presented Recommended RVU: **30.00**
RUC Recommended RVU: **25.00**

Global Period: 090

CPT Descriptor: Cricotracheal resection

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 5 year old child has been tracheotomy dependent since prolonged intubation after cardiac surgery. exam reveals normal vocal fold motion with high grade, long segment subglottic stenosis. He undergoes cricotracheal resection to remove the stenosis.

Percentage of Survey Respondents who found Vignette to be Typical: 70%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 98% , In the ASC 0%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 43%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 9%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: Discussion with patient and family regarding planned procedure and post-operative management; Review of imaging and laboratory values; Obtain informed consent; Discuss airway management with anesthesiologist; Review airway management with OR staff; Change into scrub clothes; Verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are available; Monitor/assist with positioning of patient with placement of shoulder roll for neck extension; Mark planned incision; Inject planned incision with topical vasoconstrictor; Scrub preparation of neck; Surgeon scrub and gown; Draping of patient; Perform surgical “time out” with surgical operating team.

Description of Intra-Service Work: The patient is induced with general anesthesia with the surgeon present in the room due to the risk of airway obstruction. The tracheostomy tube is exchanged for an endotracheal tube placed through the tracheotomy. A direct laryngoscopy and bronchoscopy is performed to evaluate the airway. A horizontal neck incision is made over the thyroid cartilage through the skin and platysma layers. Subplatysmal flaps are elevated to the hyoid superiorly and over the trachea inferiorly. The strap muscles are incised in the midline and separated. The thyroid is divided in the midline and retracted. The trachea and larynx are skeletonized with care taken to avoid major vessels and the recurrent laryngeal nerves. The lower portion of the larynx, the cricoid and the trachea are incised. The laryngotracheal complex is opened and the area of stenosis examined. The area of scar is excised, which may include the inferior aspect of the thyroid cartilage, the anterior cricoid cartilage, and the upper trachea, taking care not to enter the esophagus posteriorly. Endoscopy is performed as needed when making the airway incisions. De-nuded cartilage is covered by mucosa utilizing adjacent transfer flaps. The larynx is released superiorly, and the trachea is released inferiorly until the larynx and trachea can be connected in a tension free anastomosis. A drain may be placed. The strap muscles are reapproximated in the midline. The skin and platysma are closed in layers. A nasogastric feeding tube is placed

Description of Post-Service Work: Apply sterile dressings. Monitor patient during reversal of anesthesia. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Review immediate postoperative care with Post-Anesthesia Care Unit/ICU staff. Write postoperative orders. Discuss procedure and outcome with family in waiting area. Exam the patient to insure adequate breathing, oxygen saturation and absence of stridor. Write postoperative note. Dictate operative report and copy the referring physician. The physician then can leave the bedside to return 2-4 hours later for evaluation of the incision and to ensure that there is neither a hematoma or subcutaneous air. Post-operative chest x-ray is evaluated for feeding tube placement. Check wounds and monitor patient progress. Assess for airway patency, signs of respiratory distress, subcutaneous air and tolerance of feedings either PO or via feeding tube. Chart notes. Review patient management with nursing staff. Monitor overall medical condition of the patient including fluid and electrolyte balance, blood pressure, respiratory status and urinary function. Monitor neck incisions for signs of infection, hematoma, or seroma. Watch for signs of atelectasis. Ensure adequate swallowing and transition to oral feeds as appropriate. Answer patient and family questions. Answer nursing staff questions.

Discuss patient progress with ICU physician specifically sedation protocols, ventilator settings as well as use of inhaled and systemic steroids to prevent granulation tissue formation. Discuss patient progress with referring physician (verbal and written). Assure adequate level of pain control. Assure adequate feeding and swallowing. Assess for signs of narcotic withdrawal given significant sedation during time in intensive care unit and initiate treatment as needed. Remove drain prior to discharge if appropriate. Chart discharge instructions. Write orders for follow-up, post-discharge labs, imaging and home care. Write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family. Dictate discharge summary. Dictate discharge letter to referring physician.

Examine patient, remove sutures and staples. Evaluate the patient for airway and voice related complaints, assess the voice by perceptual means, inspect the larynx. After applying topical anesthesia to the nasal cavity, perform flexible laryngoscopy. Answer patient/family questions. Review pathology report. Assess for adequacy of pain control. Discuss advancing diet and daily activities. Discuss long term scar management. Dictate progress notes for chart for each follow up visit

Estimated risk of malpractice suit with poor outcome	0.88	0.80

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.69	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In 2014, CPT code 31588 was captured by the RAW screen for 090 globals with more than 6 office visits and greater than 1000 utilization in 2012. In response, the Academy submitted an Action Plan for the April 2014 RUC meeting which recommended survey of the Laryngoplasty family of codes for the October 2014 RUC meeting. Upon further review, our experts recommended further modifications to the family of codes so the family was referred to CPT for the October 2014 meeting where new codes were added to the existing family. The codes were then surveyed for the January 2015 RUC meeting. The survey responses, however, revealed multiple issues with the revised code set. Most notably, that there was a significant difference in post operative visits and work following these procedures depending on whether the patient was an adult or a child. Based on this and other issues with the survey responses for the family, the Academy requested that the tab be removed from the January 2015 RUC agenda so that we could take the code set back to CPT to develop pediatric codes, where appropriate, within the family. That request was approved and the codes were again revised during the October 2015 CPT meeting. They are now being re-surveyed and presented to the RUC.

Survey Sample:
The survey data and recommendations are based upon a targeted, random sample of AAO-HNS members who have self-designated in the Academy member database as Pediatric Otolaryngologists. This sample was approved by the Research Subcommittee. The total sample size was 319 otolaryngologists.

Physician Time:

Pre-Service Time
Our expert panel selected pre-service package 4 (Difficult Patient/Difficult Procedure) for this family of codes based on the fact they are performed in the facility setting, under general anesthesia. We believe this qualifies as a "difficult procedure" and "difficult patient" based on the risk that is inherent in airway procedures. The physician must discuss airway management with anesthesiologist and review airway management with OR staff which is extremely time consuming. They must also verify that all required instruments and supplies, including laryngoscopy and bronchoscopy cart, are

available. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a pretime of 58 minutes.**

Intra-Service Time

We are recommending our survey time of 240 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9B (General Anesthesia or Complex Regional Block/Complex Procedure) for this code. They concluded that reducing the survey time to the package time of 33 minutes was appropriate. **The expert panel recommends a post-service time of 33 minutes.**

Post-Operative Visits

99291

The patient is intubated and sedated. The otolaryngologist, as well as the intensivist, are performing critical care work, including reviewing and assessing data such as chest x-ray, arterial blood gas and other laboratory values, adjusting ventilator settings, titrating sedation, determining need for blood and volume expanders and communicating with intensive care physicians, staff and family.

99233 x2

The patient remains intubated and sedated in the intensive care unit. The otolaryngologist evaluates the neck for signs of graft dehiscence or wound infection, monitors sedation, evaluates laboratory values and vital signs, updates family and communicates with intensive care physicians and staff.

99232x3

Occurs in the immediate period after transfer from the ICU. Three main areas are being evaluated: breathing, feeding and narcotic withdrawal. The patients breathing must be closely monitored, including reviewing a chest X-ray, auscultating the neck and chest, and closely monitoring vital signs. Evaluate the wound for crepitus and infection. Nutrition is closely monitored as often swallowing is difficult. Last, most children go into an opiod withdrawal that requires methadone and close monitoring of vital signs and neurological status.

99213 x 3

Check breathing. Stridor frequently persists for several weeks post operatively. Edema can occur. If the child contracts an upper respiratory infection, the consequences can be dire. There is frequently a delay in resumption of normal diet. Physician will also review the progress of speech therapy and the progress of the methadone taper to get the child over their narcotic dependence. Evaluate the wound for crepitus and infection. The physician will also frequently need to discuss the care with the patient's pediatrician and speech therapist. A flexible laryngoscopy is also performed which is not separately reportable.

Physician Work RVU

Upon review of the survey results, the expert panel **recommends the survey median for an RVW of 25.00**.

Compelling Evidence

Our expert panel is recommending an increased value for this new CPT code for several reasons. First, this code was created to provide more specificity. Previously, there was not a clear code to report crichotracheal resection and while 31582 is used as a comparator for this new code on the summary of recommendation worksheet, it is not a true clinical comparison of work. Thus, we believe there is compelling evidence based on the fact that the current vignette for 31582 is flawed in that it describes a "2-year-old child who has anterior subglottic stenosis (70%). Surgical correction is accomplished with an autogenous costal cartilage graft. An Aboulker stent is also utilized" which does not represent the typical patient under the new code descriptor. Based on this, we believe there is compelling evidence to increase the value for this new code given that the prior code does not accurately describe the work involved in providing this procedure as better defined by the new X6 code.

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 3158X6, as they demonstrate relativity across the fee schedule.

Additional Reference Codes

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	Time Source	Most Recent RUC Review	IWPUT
45136	Excision of ileoanal reservoir with ileostomy	090	30.82	40	240	30	783	RUC	Feb/Apr 01	0.0431
23220	Radical resection of tumor, proximal humerus	090	30.21	72	240	30	602	RUC	Feb09	0.078
42845	Radical resection of tonsil, tonsillar pillars, and/or retromolar trigone; closure with other flap	090	32.56	95	240	40	825	RUC	Aug05	0.0559

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31582 and 31588

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 377
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This service was previously reported usng 31582 and 31588. We believe 5% of the volume of 31588 will be attributed to this new code and 95% to the 3158X5 code. Thus, we multipled the 2014 RUC database Medicare volume of 1233 by .05 and then multipled by three to project the national volume, as we typically estimate that the national volume is typically three times that of the Medicaid volume for these services. For 31582, we utilized the 2009 RUC database Medicaid volume of 318 and multipled by three to project the national volume, as we typically estimate that the national volume is typically three times that of the Medicaid volume for these services. We then divided that by 5 among the five codes that replaced 31582 (X1-X4 and X6). (954/5 =191)

Specialty Otolaryngology Frequency 377 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 70 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This service was previously reported usng 31588. We believe 5% of the volume of 31588 will be attributed to this new code and 95% to the 3158X5 code. Thus, we multipled the 2014 RUC database Medicare volume of 1233 by .05, totaling 62. For 31582, we took the 2014 Medicare volume, as listed in the RUC database, and divided it by 5 as there are now 5 codes to describe the volume of former CPT code 31582. This results in 37/5 = 7.4, so we rounded to 8 for all codes which replace the volume of 31582.

Specialty Otolaryngology Frequency 70 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Code(s): 31580-315X6

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptors:

31580 Laryngoplasty; for laryngeal web, with indwelling keel or stent insertion

3158X1 Laryngoplasty, for laryngeal stenosis, with graft, without indwelling stent placement, younger than 12 years of age

3158X2 Laryngoplasty,for laryngeal stenosis, with graft, without indwelling stent placement, age 12 years or older

3158X3 Laryngoplasty, for laryngeal stenosis, with graft, with indwelling stent placement, younger than 12 years of age

3158X4 Laryngoplasty,for laryngeal stenosis, with graft, with indwelling stent placement, age 12 years or older

31584 Laryngoplasty, with open reduction and fixation (eg, plating) of fracture, includes tracheostomy, if performed

31587 Laryngoplasty, cricoid split, without graft placement

3158X5 Laryngoplasty, medialization; unilateral

3158X6 Cricotracheal resection

Global Period: 090 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our Society convened an expert panel of physicians made up of our RUC advisors and two laryngology experts (one of whom specializes in pediatric procedures) to review the practice expense inputs for these codes.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

The total facility time for codes 31580 and 3158X1-6 is increased over current comparator codes (note five of these codes are new and do not have a direct crosswalk under the MPFS). This is a result of the survey respondents indicating a full discharge management visit following these services, whereas only a half a discharge management visit was previously indicated.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Staff Time: *We believe that based on the survey responses there is reliable data to support that these procedures are associated with lengthy hospital stays, therefore, a full discharge management visit is justified.*

Changes to Supplies: *Of note, we reduced or removed many of the existing supply inputs for these codes. In the following instances, we increased or added supplies. Rationale for doing so is outlined below.*

- *Line 60 – we increased the incision care post op pack to include one for every post op visit for all codes where a tracheostomy tube is typical (31580, 3158X3, 3158X4, and 31584) as the staff needs to check the tube and sutures during each post op visit.*
- *Line 68 – added topical lidocaine for X5 which was previously omitted in error. This procedure includes using a scope post-operatively which requires the application of topical lidocaine.*
- *Line 74 – we added in this input for all codes with tracheostomy tubes as the staff need to clean out trach during each post op visit. They squirt saline down trach and suction any mucus.*
- *Line 75 – we added in this input for all codes tracheostomy tubes. It is used to deal with granulation tissue that builds around the stoma.*
- *Lines 81-83 – we increased the units from one to 3 for all codes with tracheostomy tubes for the same reasons as stated above.*
- *Line 86 – we added a tongue depressor for all codes as this is necessary to perform an exam of the throat.*

Changes to Equipment*:*

- *For codes where a tracheostomy tube is typical, a new halogen light source has been included (and invoice submitted) as this is the standard light source utilized to evaluate and assess the tube and clean it.*
- *Lines 94 and 95: For code 31587, a fiberoptic light source was previously indicated with no accompanying recording system. This was an error, so we have added a video system and a fiberscope to correct this.*
- *Line 98 – a basic instrument pack has been added for all codes as items such as a nasal speculum, forceps, otoscope and scissors were previously omitted from the PE for these services.*

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Staff undertake the following activities: complete preservice diagnostic and referral forms, coordinate pre-surgery services, schedule space and equipment in the facility, provide pre-service education and obtain consent, conduct follow up phone calls and prescriptions. For codes where a tracheostomy tube is also typical (31580, 3158X3, 3158X4, 31584), stoma education is conducted with the patient prior to the procedure.

Intra-Service Clinical Labor Activities:

The only intraservice activity for these codes is the discharge management visit, as they are facility based services.

Post-Service Clinical Labor Activities:

Staff perform three post operative visits for all codes in this family following the procedures. For all codes except 3158X3, the three post op visits are 99213. For X3, the visits are two 99213 and one 99214.

CPT Code: 31580-31588
Specialty Society('s) AAO-HNS

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non-Facility Direct Inputs

CPT Long Descriptors:

31580 Laryngoplasty; for laryngeal web, with indwelling keel or stent insertion

3158X1 Laryngoplasty, for laryngeal stenosis, with graft, without indwelling stent placement, younger than 12 years of age

3158X2 Laryngoplasty,for laryngeal stenosis, with graft, without indwelling stent placement, age 12 years or older

3158X3 Laryngoplasty, for laryngeal stenosis, with graft, with indwelling stent placement, younger than 12 years of age

3158X4 Laryngoplasty,for laryngeal stenosis, with graft, with indwelling stent placement, age 12 years or older

31584 Laryngoplasty, with open reduction and fixation (eg, plating) of fracture, includes tracheostomy, if performed

31587 Laryngoplasty, cricoid split, without graft placement

3158X5 Laryngoplasty, medialization; unilateral

3158X6 Cricotracheal resection

Global Period: 090 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our Society convened an expert panel of physicians made up of our RUC advisors and two laryngology experts (one of whom specializes in pediatric procedures) to review the practice expense inputs for these codes.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Staff undertake the following activities: complete preservice diagnostic and referral forms, coordinate pre-surgery services, schedule space and equipment in the facility, provide pre-service education and obtain consent,

conduct follow up phone calls and prescriptions. For codes where a tracheostomy tube is also typical (31580, 3158X3, 3158X4, 31584), stoma education is conducted with the patient prior to the procedure.

Intra-Service Clinical Labor Activities:

The only intraservice activity for these codes is the discharge management visit, as they are facility based services.

Post-Service Clinical Labor Activities:

Staff perform three post operative visits for all codes in this family following the procedures. For all codes except 3158X3, the three post op visits are 99213. For X3, the visits are two 99213 and one 99214.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Closure Left Atrial Appendage with Endocardial Implant

At the October 2015 CPT Editorial Panel meeting, the Panel deleted category III code 0281T and created CPT code 333X3 to describe Percutaneous transcatheter closure of the left atrial appendage with implant.

The RUC reviewed the survey results from 53 practicing cardiologists and agreed with the specialty societies on the following time components: pre-service time of 63 minutes, intra-service time of 90 minutes and immediate post-service time of 30 minutes.

The RUC reviewed the survey respondents' physician work values and agreed that the respondents overestimated the physician work involved at the survey 25th percentile (work RVU= 19.88). To determine an appropriate work value, the RUC compared the surveyed code to CPT code 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* (work RVU= 14.00, intra time= 90 minutes) and agreed that this value, with identical intra-service time, accurately accounted for the physician work involved in the surveyed code. Therefore, the RUC recommends a direct physician work crosswalk from CPT code 93583 to CPT code 333X3. To justify a work RVU of 14.00, the RUC reviewed CPT code 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU= 14.00, intra time= 90 minutes). **The RUC recommends a work RVU of 14.00 for CPT code 333X3.**

Practice Expense
The RUC reviewed and accepted the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:333X3 Tracking Number N1 Original Specialty Recommended RVU: **19.88**
Presented Recommended RVU: **15.00**
Global Period: 000 RUC Recommended RVU: **14.00**

CPT Descriptor: Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76- year-old female with diabetes, hypertension, and congestive heart failure suffering from non-valvular paroxysmal, persistent, or permanent atrial fibrillation (AF) requires long term anticoagulant therapy. She is eligible for anticoagulation, but due to her general frailty and risk for falls, her physicians are concerned about the potential for long term bleeding complications. Left atrial appendage closure with an implantable device is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 25%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. Informed consent is obtained. The operative plan is reviewed with the anesthesiologist. The patient positioned on the procedural table. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure.

Baseline transesophageal echo (TEE) is performed by an echocardiographer. The echocardiographer performs TEE imaging throughout the procedure to provide guidance for transseptal puncture, LAA imaging, and device placement.

Percutaneous venous access is obtained, typically through the femoral vein. A thin-walled needle is inserted percutaneously into the vein, through which a flexible guidewire is inserted into the vein. The needle is removed over the wire, a sheath/dilator system is inserted over the guidewire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Percutaneous arterial access is obtained, typically through the femoral artery. A thin-walled needle is inserted percutaneously into the artery, through which a flexible guidewire is inserted into the artery. The needle is removed over the wire, a sheath/dilator system is inserted over the guidewire, the dilator is removed, and the sidearm of

the sheath is flushed to remove any clot or air. An appropriate catheter is inserted over a wire through the venous sheath into the venous system and advanced under fluoroscopic guidance up to the superior vena cava. The wire is removed. A rigid trans-septal puncture needle is carefully advanced through the catheter stopping just short of the end of the catheter. The needle-catheter unit is flushed and attached to a second pressure manifold and then withdrawn to the level of the fossa ovalis in the inter-atrial septum under fluoroscopic guidance. The imaging system is rotated in both the anterior and lateral positions to confirm proper positioning with respect to the arterial wire or catheter which has been positioned just above the aortic valve. Exquisite precision of the needle-catheter unit is imperative as improper positioning can lead to puncture of the aorta or perforation through the atrial wall into the pericardium. Continuous arterial pressure monitoring is maintained. Typically, the needle-catheter unit may not be positioned properly on the first attempt and one or more repositionings of the unit may be required. This typically requires removal of the needle, reinsertion of the guidewire, readvancement of the wire and catheter to the superior vena cava, removal of the wire, reinsertion of the needle and then repeating the process of positioning the needle-catheter unit in the proper spot on the interatrial septum. Once successful positioning is achieved, the needle-catheter unit is then advanced several millimeters across the interatrial septum to the left atrium while observing the pressure waveform. The transseptal puncture is achieved. Left atrial position is confirmed by pressure waveform analysis, oxygen saturation measurement, and contrast injection through the system. If the needle-catheter unit has not traversed the septum properly, complications are first excluded and then the device is repositioned and repeat attempt is performed until successful. Once the needle is confirmed to be safely in the left atrium, the transseptal dilator is advanced over the needle into the left atrium, the needle withdrawn to the right atrial side, and then the transseptal sheath is telescoped over the dilator into the left atrium. The trans-septal needle is removed from the sheath/dilator apparatus, which is now in the left atrium. The dilator is then removed while infusing saline through it to minimize risk of air introduction. The access sheath and dilator are prepped and inserted over the guidewire into the left atrium. The dilator and wire are removed and the pigtail catheter is inserted into the access sheath and into the left atrium/left atrial appendage under fluoroscopy. Left atrial appendage angiography is performed.

The access sheath is advanced over the pigtail catheter into the left atrial appendage under fluoroscopic guidance and the pigtail is removed. Fluoroscopy and contrast angiography are used to assess the anatomy of the LAA and to define if it is multi-lobed. The echocardiographer uses TEE to measure the LAA ostium width and length in at least 3-4 views (0°, 45°, 90°, 135°). Appropriate size implant based on the maximum LAA ostium width is recorded. The catheter used to deliver the LAA closure implant is prepped and inserted into the access sheath and advanced under fluoroscopic guidance into the left atrial appendage.

The device is delivered into the left atrial appendage and assessed under fluoroscopy to confirm release criteria are met. While observing under fluoroscopy, implant stability is confirmed by gently pulling back on the deployment knob and visualizing the proximal movement of the implant AND the LAA. Appropriate implant size selection is also confirmed by measuring the deployed diameter of the implant in situ using TEE. The device is released. Implant stability is assessed under fluoroscopy. Images are reviewed to ensure no additional views are required before leaving the procedure suite. The echocardiographer separately performs TEE imaging to independently confirm release criteria are met, to assess implant stability, and to ensure appropriate implant size selection. Patient is awakened from anesthesia by anesthesiology on the table and transferred to stretcher and sent to recovery.

Description of Post-Service Work: The patient's procedural outcome is communicated to family and to the referring physician(s). The physician writes orders and dictates an operative report. Prior to disposition the patient is observed carefully to ensure no bleeding from the access site and no hemodynamic or rhythm instability to suggest a procedural complication. Patient is transferred to routine care once stable.

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 18 **% of respondents:** 33.9 **%**

Number of respondents who choose 2nd Key Reference Code: 16 **% of respondents:** 30.1 **%**

TIME ESTIMATES (Median)

	CPT Code: 333X3	Top Key Reference CPT Code: 93580	2nd Key Reference CPT Code: **93581**
Median Pre-Service Time	63.00	30.00	30.00
Median Intra-Service Time	90.00	120.00	180.00
Median Immediate Post-service Time	30.00	60.00	60.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	**183.00**	**210.00**	**270.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.33	0.19
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.39	0.38
Urgency of medical decision making	-0.06	-0.25
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.72	0.75
Physical effort required	0.56	0.50

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.94	1.00
Outcome depends on the skill and judgment of physician	0.83	0.88
Estimated risk of malpractice suit with poor outcome	0.61	1.13

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.89	0.88

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

333X3 is a new code to describe the work of closing the left atrial appendage through deployment of an occlusion device via a catheter. It is currently reported with a Category III code. After review by the Research Subcommittee, the service was surveyed as a targeted pool of all providers identified by the device manufacturer as operators who have completed device training—regardless whether they have begun providing the service commercially—as of October 1.

A joint RVS panel of ACC, SCAI, and HRS members reviewed the survey data. The panel reviewed the preservice time and selected package 4 for a difficult patient/procedure with sedation. The service is performed general anesthesia. We recommend postservice package 9B for a complex procedure with 3 minutes removed to align with the survey response. The service is exclusively performed in a hospital and the patient is sent home several days later.

The key reference service is 93580, transcatheter closure of a congenital interatrial defect. The key reference was selected by 18 survey respondents, or 34% of respondents. The second key reference is another transcatheter congenital service. Sixteen respondents, or 30%, selected closure of a ventricular septal defect as a reference code. Respondents who selected the key reference services indicated 333X3 to be more intense/complex than the key reference services in all metrics except urgency of decision making.

We have included on the SOR the highest 0-day global MPC code (52353 at 7.50 work RVUs). Consistent with the survey, the societies recommend the 25th-precentile work RVU of 19.88 with 63 minutes of preservice time from package 4, 90 minutes intraservice time, and 30 minutes postservice time from package 9B after 3 minutes is removed to align with the survey response of 30 minutes postservice time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0281T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Sometimes

Specialty cardiac electrophysiology How often? Sometimes

Specialty interventional cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 12000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on manufacturer estimates.

Specialty cardiology Frequency 4000 Percentage 33.33 %

Specialty cardiac electrophysiology Frequency 4000 Percentage 33.33 %

Specialty interventional cardiology Frequency 4000 Percentage 33.33 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on manufacturer estimates.

Specialty cardiology Frequency 3667 Percentage 33.33 %

Specialty cardiac electrophysiology Frequency 3667 Percentage 33.33 %

Specialty interventional cardiology Frequency 3666 Percentage 33.32 %

Do many physicians perform this service across the United States? No

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation

Global Period: 000 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: A specialty panel representing cardiology, cardiac electrophysiology, and interventional cardiology discussed the practice expense inputs for 333X3.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: The Panel selected the survey key reference code 93580 as a PE reference code due to its clinical similarities and its 0-day global period.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: We recommend the PE Subcommittee standards for a 0-day facility service with extensive use of clinical staff time, similar to key reference code 93580.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
-Complete pre-service diagnostic and referral forms
-Coordinate pre-service surgery services
-Schedule space and equipment in facility
-Provide pre-service education/obtain consent
-Follow-up phone calls and prescriptions

Intra-Service Clinical Labor Activities:

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Valvuloplasty

At the May 2015 CPT Editorial Panel meeting, the Panel restructured the valvuloplasty family and added two new codes 334X1 and 334X2 to better describe aortic valve repairs, which, under the current codes, are not accurately defined.

334X1 ***Valvuloplasty, aortic valve, open, with cardiopulmonary bypass; simple (ie, valvotomy, debridement, debulking and/or simple commissural resuspension)***

The RUC reviewed the survey results from 41 thoracic surgeons and agreed with the following physician time components: pre-service time of 95 minutes, intra-service time of 180 minutes and immediate post-service time of 45 minutes. The RUC also recommends the following post-operative visits: one 99291, one 99231, two 99232s, one 99233, one 99238, one 99212 and one 99213. The RUC agreed that there is 20 additional minutes for evaluation above the standard pre-service time package to account for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the additional complexity associated with an aortic valve repair. Extensive planning and review is required to identify the extent and type of repair required for the valve. In addition, the surgeon must take time to explain all of the elements usually discussed with standard aortic valve replacement should attempts at repairing the patient's own aortic valve fail and the reasons/implications of valve repair failure. The RUC also agreed to add 12 minutes of positioning time above the standard for this cardiac procedure, which is supported by many recently reviewed cardiothoracic procedures (e.g. codes 33405 and 33533).

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overestimate the physician work RVUs, with a 25th percentile work RVU of 40.00. The current work RVU for this procedure is 41.50; however the valuation includes the work of both a simple and a complex procedure. To determine an appropriate value, the RUC compared the surveyed code to CPT code 33315 *Cardiotomy, exploratory (includes removal of foreign body, atrial or ventricular thrombus); with cardiopulmonary bypass* (work RVU= 35.00, intra time= 180 minutes) and agreed that since both codes have identical intra-service time and comparable physician work, the two codes should be valued the same. Therefore, the RUC recommends a direct work RVU crosswalk of 35.00 from CPT code 33315 to CPT code 334X1. To justify a work RVU of 35.00, the RUC reviewed both the top two reference codes 33405 *Replacement, aortic valve, with cardiopulmonary bypass; with prosthetic valve other than homograft or stentless valve* (work RVU= 41.32, intra time= 197 minutes) and 33710 *Repair sinus of Valsalva fistula, with cardiopulmonary bypass; with repair of ventricular septal defect* (work RVU= 37.50, intra time= 200 minutes) and agreed that since both reference services have more intra-service time than the surveyed code, the recommended value for 334X1 is appropriately valued less than these codes. **The RUC recommends a work RVU of 35.00 for CPT code 334X1.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

334X2 ***Valvuloplasty, aortic valve, open, with cardiopulmonary bypass; complex (eg, leaflet extension, leaflet resection, leaflet reconstruction or annuloplasty)***

The RUC reviewed the survey results from 49 thoracic surgeons and agreed with the following physician time components: pre-service time of 95 minutes, intra-service time of 210 minutes and immediate post-service time of 45 minutes. The RUC also recommends the following post-operative visits: one 99291, one 99231, two 99232s, one 99233, one 99238, one 99213 and one 99214. The RUC agreed that there is 20 additional minutes for evaluation above the standard pre-service time package to account for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the additional complexity associated with an aortic valve repair. Extensive planning and review is required to identify the extent and type of repair required for the valve. In addition, the surgeon must take time to explain all of the elements usually discussed with standard aortic valve replacement should attempts at repairing the patient's own aortic valve fail and the reasons/implications of valve repair failure. In addition, the RUC also agreed to add 12 minutes of positioning time above the standard for this cardiac procedure, which is supported by many recently reviewed cardiothoracic procedures (e.g. codes 33405 and 33533).

Finally, the RUC determined a 99214 post-operative office visit is required for this procedure, whereas the simple code (334X1) has a 99213. This complex procedure requires more evaluations of the degree of residual valve disease. For the simple procedure, the post-operative care is more straightforward.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results accurately value this procedure at the 25th percentile work RVU of 44.00. To justify a work RVU of 44.00, the RUC compared the survey code to the top key reference code 33427 *Valvuloplasty, mitral valve, with cardiopulmonary bypass; radical reconstruction, with or without ring* (work RVU= 44.83, intra time= 221 minutes) and MPC codes 33426 *Valvuloplasty, mitral valve, with cardiopulmonary bypass; with prosthetic ring* (work RVU= 43.28, intra time= 205 minutes) and 33512 *Coronary artery bypass, vein only; 3 coronary venous grafts* (work RVU= 43.98, intra time= 213 minutes). The RUC determined that these three comparative codes provide appropriate brackets around the recommended value for 334X2. Finally, the RUC noted that while the total time for this procedure goes down slightly, from 742 minutes to 676 minutes, the previous valuation had three level three (99233) hospital visits. The time for the procedure has not changed. Also, the complex procedure, when it was last surveyed over 10 years ago, is not comparable to the procedure today, which has become more complex due to the change in patient population. **The RUC recommends a work RVU of 44.00 for CPT code 334X2.**

Practice Expense:
The RUC approved the direct practice expense inputs as approved by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:334X1 Tracking Number O1 Original Specialty Recommended RVU: **35.00**
Presented Recommended RVU: **35.00**
Global Period: 090 RUC Recommended RVU: **35.00**

CPT Descriptor: Valvuloplasty, aortic valve, open, with cardiopulmonary bypass; simple (ie, valvotomy, debridement, debulking and/or simple commissural resuspension)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 3-year-old born with congenital aortic stenosis presents with recurrent valvular aortic stenosis and mild insufficiency following balloon valvuloplasty of his bicuspid aortic valve as a neonate. The family reports decreased exercise tolerance with shortness of breath and easy fatigability. Electrocardiogram shows left ventricular hypertrophy. Echocardiogram documents a 60 mmHg gradient across the aortic valve with residual fusion of the commissure between the left and non-coronary cusps and dysplastic thickening of the leaflets beneath this area.

Percentage of Survey Respondents who found Vignette to be Typical: 61%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 51%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Perform complete or interval History and Physical Examination (comprehensive), Write pre-op orders. Review work-up and notes from referring and primary physicians. Review pre-op imaging studies (x-ray, echocardiogram, cardiac catheterization, MRI or CT). Review pre-op laboratory studies. Review indications, surgical procedure, expected recovery, and expected outcomes including potential complications with family. Answer questions from the family and obtain informed consent. Schedule OR time and arrange for surgical assistant. On day of procedure identify patient, marked surgical site per hospital policy and respond to any family questions. Ensure availability of blood and any special instruments or medical devices. Review trans-esophageal echocardiogram (TEE) findings with echocardiographer. Ensure proper patient positioning. Conduct pre-operative “time-out” in accordance with hospital policy, scrub, gown, and glove. Place surgical drapes as appropriate

Description of Intra-Service Work: Perform sternotomy, divide or resect thymus, open and suspend pericardium, heparinize and place appropriate purse string sutures for cannulation. Insert arterial and venous cannulas for cardiopulmonary bypass (CPB). Initiate CPB after ensuring adequate anticoagulation. Insert left atrial vent. Initiate cooling as appropriate. Place cardioplegia delivery catheter, cross clamp aorta and administer cardioplegia. Perform appropriate ascending aortotomy. Perform valve repair, which may include valvotomy, debridement, debulking, or simple commissuroplasty. Perform closure of the aortotomy. Ensure egress for potential retained intracardiac air and remove aortic cross clamp. Rewarm and resuscitate the heart. Place temporary pacing wires as indicated. Remove left atrial vent. Wean from CPB and assess post-repair TEE for potential retained intracardiac air, adequacy of valve repair, and ventricular function. Direct heparin reversal

with protamine after decannulation from CPB. Place appropriate mediastinal and pleural tubes and insure hemostasis and close pericardium (primary or with patch augmentation) as appropriate. Close sternotomy incision

Description of Post-Service Work: Post-op same day work through admission to intensive care: Perform Operating Room debriefing. Apply sterile dressings to the incision. Remove drapes with close attention to pacing wires (if any), tubes and lines to ensure that none are dislodged or disconnected. This attention continues as the patient is moved to the ICU bed for transfer. In a coordinated team manner, monitor patient's overall condition as the anesthesia team converts the monitoring equipment (arterial blood pressure, pulmonary artery pressures, ECG) to a portable monitor. Periodically observe chest drainage system to assess interval bleeding and to ascertain that negative pressure is not lost and that the tubes are not obstructed. Accompany patient to the ICU and direct the team should the patient's condition change en route. Sign OR forms, indicating pre and post-op diagnoses, operation performed. Obtain and examine postoperative chest x-ray to assess expansion of the lungs and placement of the chest and nasogastric tubes (if inserted). Write orders for post-op labs, films, medications, diet, and patient activity. Write brief operative note for the patient's chart documenting in the daily progress notes pre- and postoperative diagnoses, operation performed, findings, blood loss, intraoperative IV fluids administered, complications, and specimens sent to pathology (if any). Review intensive care and medications with staff. Establish short-term goals for patient with ICU nursing staff. Discuss procedure outcome with family describing procedure performed, any variance from the planned procedure, the general findings, an initial assessment of the degree of procedural success, and expectations for the remainder of the day of surgery and the longer term. Discuss procedure outcome with patient after emergence from anesthesia. Dictate post-op report. Discuss procedure outcome with referring physician. Coordinate care with other physicians. Dictate procedure outcome and expected recovery letter for referring physician and/or insurance company

Postoperative Intensive Care: Assess neurological state: Monitor emergence from anesthesia. Administer sedatives, paralyzing agents and analgesics as needed. Evaluate gross neurologic function including level of consciousness, behavioral appropriateness, and presence and nature of focal neurological defect if present. Repeat evaluation until intraoperative neurologic injury is ruled out.
Assess hemodynamic condition: Evaluate cardiac rhythm. Assess rate, conduction abnormalities. Consider temporary pacemaker. Initiate temporary pacing as needed. Determine suitable mode, adjust output and sensitivity of device. Repeat assessment of hemodynamic effects. Assess arrhythmias, differentiate atrial extrasytoles or runs from ventricular extrasystoles or runs, correlate with operative events and hemodynamic effects, consider antiarrhythmic therapy (treatment or prophylaxis). Review 12-lead EKG for signs or ischemia or injury, compare to preoperative tracing. Assess blood pressure, central venous pressure, pulmonary artery pressures, cardiac output and index. Correlate filling pressures at baseline, confirm calibration of transducers with zero level at the level of the right heart, assess waveforms. Administer crystalloid fluids or blood products depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Adjust inotropic and vasoactive agents given by continuous infusion to optimize O2 delivery and minimize adverse end-organ effects. Carefully evaluate peripheral perfusion by observation and physical exam, correlating findings with invasive monitoring results. Monitor chest tube bleeding. Assess the character of the mediastinal drainage (rate, amount, tenacity, stability of clot). Assess the patency of the mediastinal tubes, ensure that a cardiac tamponade state is avoided. Correlate bleeding quantity and character with chest x-ray, labs, hemodynamics, urine output and physical exam. Assess laboratory results, correlate with other findings, and determine the need for blood, blood products including platelets cryoprecipitate and fresh frozen plasma. Consider other adjunctive pharmacologic therapies for coagulopathy. Consider need for re-exploration if chest tube output exceeds acceptable limits or if tamponade is present. Assess Respiratory System: Examine breath sounds, observe chest mechanics, assure mid-line tracheal position by physical exam. Assess ventilator settings, observe underlying respiratory pattern, observe baseline airway pressures generated and minute gas flow. Re-evaluate post-operative chest x-ray if necessary. Confirm endo-tracheal tube placement by review of post-operative chest x-ray. Monitor lungs for infiltrate/atelectasis. Assess pleural spaces for fluid collection. Assess blood gases and adjust ventilator as needed. Wean from ventilator. Assess readiness for extubation. Extubate patient and assure airway and adequacy of ventilation. Assess adequacy of urine output. Check post-operative creatinine in light of pre-operative renal function. Assess volume status and administer fluids as needed. Decide if diuretic is indicated, determine dose, monitor response. Correlate urine flow with blood pressure compared to preop, assess interaction of cardiac output and vasoactive agents with renal function. Monitor distal extremity perfusion. Assess peripheral pulses. Compare to preoperative findings. Integrate comprehensive evaluation with patient history, expected status based on conduct of the operation, and response to critical care interventions. Assess extent of inflammatory state, consider treatment with antipyretics or steroids as indicated. Review nursing/other staff patient chart notes. Discuss interval plans with nursing staff. Set parameters for interval adjustments in patient treatment. Establish interval to next patient evaluation if expected goals met. Answer nursing/other staff questions. Answer patient family questions. Write orders. Chart patient progress notes

Post-op other hospital work - beginning on post-op day 2 until discharge day:
Perform directed interval history and physical exam. Inspect all wounds for drainage, underlying hematoma, inflammation. Review nursing/other staff patient chart notes. Assess postoperative pain, use of analgesics, adequacy of response. Assess adequacy of respiration, character of breathing, relationship to surgical pain and intravascular volume status. Assess character of pulmonary secretions, patients ability to clear airway. Review vital signs, I&O, laboratory results, patient daily weight. Review chest radiograph. Evaluate cardiac monitor for rate, rhythm, presence or absence of arrhythmia. Evaluate stored EKG monitoring history, if indicated. Assess progress of system recovery, assess risk for development of complications. Encourage ambulation and vigorous pulmonary physiotherapy. Carefully assess and monitor postoperative nutritional status as maintained by both enteral (if necessary) and oral feedings. Remove chest tube when appropriate (usually 24-48 hours post-operatively). Obtain and review chest X-ray after tube removal and at least once more before discharge as indicated by patient's condition. Remove temporary pacemaker wires if present. Answer patient/family questions. Answer nursing/other staff questions (verbal and written). Develop interval plan of care, including drug therapy for underlying conditions (eg diabetes), surgically induced conditions, actual or anticipated complications (eg Beta blockers for atrial fibrillation, antibiotics for prophylaxis or treatment) or preventive care. Answer insurance staff questions. Write orders for post-op labs, films, medications, diet, and patient activity. Evaluate and review postoperative echocardiogram. Discuss patient progress with referring physician (verbal and written). Coordinate care with other physicians. Document evaluation, patient progress and plan in medical record.

Discharge day work: Perform history and physical exam. Check final pathology/lab/film reports and discuss with patient. Check wounds and patient progress. Carefully explain to patient and a family member dietary management, activities permitted, bathing, handling of would, return appointment to office, etc. Outline expectations for recovery, adjusted to specific underlying cardiac state, associated chronic diseases, operative findings and character of postoperative recovery. Describe potential complications, how to recognize them, and what to do if recovery is not as anticipated. Coordinate care with other physicians. Review nursing/other staff patient chart notes. Review post-discharge wound care and activity limitations with patient. Answer patient/family questions. Answer nursing/other staff questions. Answer insurance staff questions. Write orders for post-discharge labs, films, and medications. Chart patient discharge notes. Write prescriptions and discharge instructions. Explain nature, purpose and expected duration of use of new medications. Relate importance of secondary prevention of cardiac disease through risk factor reduction. Specific instructions on the need to notify other treating physicians or dentists of the presence of a heart valve abnormality and the need for prophylactic peri-procedural antibiotics. Review patient’s home medications and homeopathic agents, ensure that additional agents are compatible or will not be used. Dictate discharge summary. Communicate with patient's primary care physician(s)

Post-op office work - After discharge from hospital: Perform expanded problem-focused history and physical exam. Review medications and determine compliance. Review interval encounters with other care providers. Check wounds and patient progress. Remove sutures/drains. Review post-discharge labs/films. Specifically, review echo studies to assess valve function and compare to pre-op studies. Write orders for medications. Answer patient/family questions. Answer insurance staff questions. Discuss patient progress with referring physician (verbal and written). Coordinate care with other physicians. Discuss progress with patient/family. Dictate patient progress notes for medical chart and letters to referring physicians

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.58	0.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.42	0.20
Urgency of medical decision making	0.17	0.20
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.83	0.80

Physical effort required	0.33	0.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.42	0.40
Outcome depends on the skill and judgment of physician	0.75	1.40
Estimated risk of malpractice suit with poor outcome	0.17	0.20

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	0.67	0.80

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

PRE-TIME CHANGES
The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for the two aortic valvuloplasty codes.

ADDITIONAL EVALUATION TIME
For the evaluation the Expert Panel is recommending a 20-minute increase in time over the package for a total evaluation time of 60 minutes. This is supported by the survey data of 75 minutes for both codes. The total evaluation time accounts for the review of the patient, by the surgeon and the collaborative efforts that go into each case. The additional evaluation time of 20 minutes accounts for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the additional complexity associated with an aortic valve repair and the associated aftercare. Extensive planning and review is required to identify the extent and type of repair required for the valve. In addition, the surgeon must take time to explain the all of the elements usually discussed with standard aortic valve replacement should attempts at repairing the patient's own aortic valve fail and the reasons/implications of valve repair failure. The Expert Panel felt that adding 20 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the pre-service work involved with the procedure.

SAME DAY IMMEDIATE POST TIME
The expert panel selected post-time package 9B for a general Anesthesia or Complex Regional Block/Complex Procedure. The survey supported 45 minutes of immediate post time and there are numerous examples in the RUC database supporting this time. The additional 12 minutes above the package time can be attributed to additional time for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished for the procedure.

CRITICAL CARE VISIT
For the procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours.
The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient once the patient arrives in the ICU. The critical care visit covers that time that the physician spends with the patient directly related to the procedure providing critical care services. The survey supported a critical care visit for the procedure and the Expert Panel agreed.

ADDITIONAL POSITIONING TIME
For the positioning, an additional 12 minutes was added to both codes to account for additional positioning, which is common for cardiac procedures and there are numerous examples in the RUC database supporting this time.

RECOMMENDED RVW
The survey data for 334X1, which is the simple aortic valve repair, supported 180 minutes of intra-time and the survey RVWs ranged from 40.00 at the 25th percentile to 45.00 at the 75th percentile, with a median RVW of 42.00. The expert panel felt that the survey value was too high based on the work involved. The Expert panel felt that an RVW of 35.00, which is below the 25th percentile, was more representative of the work involved in the procedure. The Panel identified code 33315 - Cardiotomy, exploratory (includes removal of foreign body, atrial or ventricular thrombus); with cardiopulmonary bypass as a code that can be used to crosswalk this value. Code 33315 was RUC reviewed as part of the 4th 5-year review in 2010. Code 33315 is also a heart procedure. Both codes have 180 minutes of intra-service time and with similar post-operative visit times, total times and intensities. There are slight variations in the pre-service time with 20 minutes of evaluation added to the surveyed code. The main difference here is that code 33315 would typically be considered more of an emergent procedure then the simple aortic valve repair where more imaging, coordination and planning occur in preparation for the procedure. The Expert panel felt that code 33315 provided a reasonable crosswalk and that the survey inputs for code 334X1 are similar to this code and therefore the panel is recommending a work RVW of 35.00 which is supported by crosswalking the value to code 33315.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33400

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgeons How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 336

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the 2009 Medicaid volume of 832 and the 2014 Medicare volume of 287 for a total of 1,119 procedures per year. It is esitmated that 30% of the existing procedures will now be performred using 334X1 for a total of 336 and 70% of the procedures will be performed using 334X2 for a total of 783. 100% of the procedures will be performed by cardiothoracic surgeons

Specialty cardiothoracic surgeons Frequency 336 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 86 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare volume is 287 procedures per year. It is estimated that 30% of the total procedures will be performed using 334X1 for a total of 86 procedures per year and that 70% of procedures will be performed using 334X2 for a total of 201 procedures per year

Specialty cardiothoracic surgery Frequency 86 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33400

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:334X2 Tracking Number O2 Original Specialty Recommended RVU: **44.00**
Presented Recommended RVU: **44.00**
Global Period: 090 RUC Recommended RVU: **44.00**

CPT Descriptor: Valvuloplasty, aortic valve, open, with cardiopulmonary bypass; complex (eg, leaflet extension, leaflet resection, leaflet reconstruction or annuloplasty)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old male with a bicuspid aortic valve presents with valvular aortic stenosis and severe aortic insufficiency. He reports decreased exercise tolerance with shortness of breath and easy fatigability. Electrocardiogram shows left ventricular hypertrophy. Echocardiogram documents a 40 mmHg gradient across the aortic valve with severe aortic insufficiency due to fusion of the commissure between the left and non-coronary cusps with retraction and dysplastic thickening of the aortic valve leaflets.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 49%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Perform complete or interval History and Physical Examination (comprehensive), Write pre-op orders. Review work-up and notes from referring and primary physicians. Review pre-op imaging studies (x-ray, echocardiogram, cardiac catheterization, MRI or CT). Review pre-op laboratory studies. Review indications, surgical procedure, expected recovery, and expected outcomes including potential complications with family. In addition, discuss with patient and family the possibility of, and reasons for, aortic valve repair failure and possible conventional aortic valve replacement. Answer questions from the family and obtain informed consent. Schedule OR time and arrange for surgical assistant. On day of procedure identify patient, marked surgical site per hospital policy and respond to any family questions. Ensure availability of blood and any special instruments or medical devices. Review trans-esophageal echocardiogram (TEE) findings with echocardiographer. Ensure proper patient positioning. Conduct pre-operative "time-out" in accordance with hospital policy, scrub, gown, and glove. Place surgical drapes as appropriate

Description of Intra-Service Work: Perform sternotomy, Divide or resect thymus, open and suspend pericardium, heparinize and place appropriate purse string sutures for cannulation. Insert arterial and venous cannulas for cardiopulmonary bypass (CPB). Initiate CPB after ensuring adequate anticoagulation. Insert left atrial vent. Initiate cooling as appropriate. Place cardioplegia delivery catheter, cross clamp aorta and administer cardioplegia. Perform appropriate ascending aortotomy. . Perform valve repair, which may include resection of thickened rudimentary commissure with reconstruction using a pericardial patch. The valve commissures are resuspended and a sub-valvular annuloplasty is performed in addition to debulking the thickened aortic valve leaflets. Perform closure of the aortotomy.

Ensure egress for potential retained intracardiac air and remove aortic cross clamp. Rewarm and resuscitate the heart. Place temporary pacing wires as indicated. Remove left atrial vent. Wean from CPB and assess post-repair TEE for potential retained intracardiac air, adequacy of valve repair, and ventricular function. Direct heparin reversal with protamine after decannulation from CPB. Place appropriate mediastinal and pleural tubes and ensure hemostasis and close pericardium (primary or with patch augmentation) as appropriate. Close sternotomy incision

Description of Post-Service Work: Post-op same day work through admission to intensive care: Perform Operating Room debriefing. Apply sterile dressings to the incision. Remove drapes with close attention to pacing wires (if any), tubes and lines to ensure that none are dislodged or disconnected. This attention continues as the patient is moved to the ICU bed for transfer. In a coordinated team manner, monitor patient's overall condition as the anesthesia team converts the monitoring equipment (arterial blood pressure, pulmonary artery pressures, ECG) to a portable monitor. Periodically observe chest drainage system to assess interval bleeding and to ascertain that negative pressure is not lost and that the tubes are not obstructed. Accompany patient to the ICU and direct the team should the patient's condition change en route. Sign OR forms, indicating pre and post-op diagnoses, operation performed. Obtain and examine postoperative chest x-ray to assess expansion of the lungs and placement of the chest and nasogastric tubes (if inserted). Write orders for post-op labs, films, medications, diet, and patient activity. Write brief operative note for the patient's chart documenting in the daily progress notes pre- and postoperative diagnoses, operation performed, findings, blood loss, intraoperative IV fluids administered, complications, and specimens sent to pathology (if any). Review intensive care and medications with staff. Establish short-term goals for patient with ICU nursing staff. Discuss procedure outcome with family describing procedure performed, any variance from the planned procedure, the general findings, an initial assessment of the degree of procedural success, and expectations for the remainder of the day of surgery and the longer term. Discuss procedure outcome with patient after emergence from anesthesia. Dictate post-op report. Discuss procedure outcome with referring physician. Coordinate care with other physicians. Dictate procedure outcome and expected recovery letter for referring physician and/or insurance company

Postoperative Intensive Care: Assess neurological state: Monitor emergence from anesthesia. Administer sedatives, paralyzing agents and analgesics as needed. Evaluate gross neurologic function including level of consciousness, behavioral appropriateness, and presence and nature of focal neurological defect if present. Repeat evaluation until intraoperative neurologic injury is ruled out. Assess hemodynamic condition: Evaluate cardiac rhythm. Assess rate, conduction abnormalities. Consider temporary pacemaker. Initiate temporary pacing as needed. Determine suitable mode, adjust output and sensitivity of device. Repeat assessment of hemodynamic effects. Assess arrhythmias, differentiate atrial extrasytoles or runs from ventricular extrasystoles or runs, correlate with operative events and hemodynamic effects, consider antiarrhythmic therapy (treatment or prophylaxis). Review 12-lead EKG for signs or ischemia or injury, compare to preoperative tracing. Assess blood pressure, central venous pressure, pulmonary artery pressures, cardiac output and index. Correlate filling pressures at baseline, confirm calibration of transducers with zero level at the level of the right heart, assess waveforms. Administer crystalloid fluids or blood products depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Adjust inotropic and vasoactive agents given by continuous infusion to optimize O2 delivery and minimize adverse end-organ effects. Carefully evaluate peripheral perfusion by observation and physical exam, correlating findings with invasive monitoring results. Monitor chest tube bleeding. Assess the character of the mediastinal drainage (rate, amount, tenacity, stability of clot). Assess the patency of the mediastinal tubes, ensure that a cardiac tamponade state is avoided. Correlate bleeding quantity and character with chest x-ray, labs, hemodynamics, urine output and physical exam. Assess laboratory results, correlate with other findings, and determine the need for blood, blood products including platelets cryoprecipitate and fresh frozen plasma. Consider other adjunctive pharmacologic therapies for coagulopathy. Consider need for re-exploration if chest tube output exceeds acceptable limits or if tamponade is present. Assess Respiratory System: Examine breath sounds, observe chest mechanics, assure mid-line tracheal position by physical exam. Assess ventilator settings, observe underlying respiratory pattern, observe baseline airway pressures generated and minute gas flow. Re-evaluate post-operative chest x-ray if necessary. Confirm endo-tracheal tube placement by review of post-operative chest x-ray. Monitor lungs for infiltrate/atelectasis. Assess pleural spaces for fluid collection. Assess blood gases and adjust ventilator as needed. Wean from ventilator. Assess readiness for extubation. Extubate patient and assure airway and adequacy of ventilation. Assess adequacy of urine output. Check post-operative creatinine in light of pre-operative renal function. Assess volume status and administer fluids as needed. Decide if diuretic is indicated, determine dose, monitor response. Correlate urine flow with blood pressure compared to preop, assess interaction of cardiac output and vasoactive agents with renal function. Monitor distal extremity perfusion. Assess peripheral pulses. Compare to preoperative findings. Integrate comprehensive evaluation with patient history, expected status based on conduct of the operation, and response to critical care interventions. Assess extent of inflammatory state, consider treatment with antipyretics or steroids as indicated. Review nursing/other staff patient chart notes. Discuss interval plans with nursing staff. Set parameters for interval adjustments in patient treatment. Establish interval to next patient evaluation

if expected goals met. Answer nursing/other staff questions. Answer patient family questions. Write orders. Chart patient progress notes

Post-op other hospital work - beginning on post-op day 2 until discharge day:
Perform directed interval history and physical exam. Inspect all wounds for drainage, underlying hematoma, inflammation. Review nursing/other staff patient chart notes. Assess postoperative pain, use of analgesics, adequacy of response. Assess adequacy of respiration, character of breathing, relationship to surgical pain and intravascular volume status. Assess character of pulmonary secretions, patients ability to clear airway. Review vital signs, I&O, laboratory results, patient daily weight. Review chest radiograph. Evaluate cardiac monitor for rate, rhythm, presence or absence of arrhythmia. Evaluate stored EKG monitoring history, if indicated. Assess progress of system recovery, assess risk for development of complications. Encourage ambulation and vigorous pulmonary physiotherapy. Carefully assess and monitor postoperative nutritional status as maintained by both enteral (if necessary) and oral feedings. Remove chest tube when appropriate (usually 24-48 hours post-operatively). Obtain and review chest X-ray after tube removal and at least once more before discharge as indicated by patient's condition. Remove temporary pacemaker wires if present. Answer patient/family questions. Answer nursing/other staff questions (verbal and written). Develop interval plan of care, including drug therapy for underlying conditions (eg diabetes), surgically induced conditions, actual or anticipated complications (eg Beta blockers for atrial fibrillation, antibiotics for prophylaxis or treatment) or preventive care. Answer insurance staff questions. Write orders for post-op labs, films, medications, diet, and patient activity. Evaluate and review postoperative echocardiogram. Discuss patient progress with referring physician (verbal and written). Coordinate care with other physicians. Document evaluation, patient progress and plan in medical record.

Discharge day work: Perform detailed interval history and physical exam. Check final pathology/lab/film reports and discuss with patient. Check wounds and patient progress. Carefully explain to patient and a family member dietary management, activities permitted, bathing, handling of would, return appointment to office, etc. Outline expectations for recovery, adjusted to specific underlying cardiac state, associated chronic diseases, operative findings and character of postoperative recovery. Describe potential complications, how to recognize them, and what to do if recovery is not as anticipated. Coordinate care with other physicians. Review nursing/other staff patient chart notes. Review post-discharge wound care and activity limitations with patient. Answer patient/family questions. Answer nursing/other staff questions. Answer insurance staff questions. Write orders for post-discharge labs, films, and medications. Chart patient discharge notes. Write prescriptions and discharge instructions. Explain nature, purpose and expected duration of use of new medications. Relate importance of secondary prevention of cardiac disease through risk factor reduction. Specific instructions on the need to notify other treating physicians or dentists of the presence of a heart valve abnormality and the need for prophylactic peri-procedural antibiotics. Review patient’s home medications and homeopathic agents, ensure that additional agents are compatible or will not be used. Dictate discharge summary. Communicate with patient's primary care physician(s)

Post-op office work - After discharge from hospital: Perform detailed history and physical exam. Review medications, compliance. Review interval encounters with other care providers. Check wounds and patient progress. Remove sutures/drains. Review post-discharge labs/films, assess valve function by reviewing current echo studies and comparing them to previous studies. Write orders for medications. Answer patient/family questions. Answer insurance staff questions. Discuss patient progress with referring physician (verbal and written). Coordinate care with other physicians. Discuss progress with patient/family. Dictate patient progress notes for medical chart and letters to referring physicians

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.47	1.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.27	0.57
Urgency of medical decision making	0.27	0.43
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.67	1.36
Physical effort required	0.27	0.64

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.40	0.64
Outcome depends on the skill and judgment of physician	0.80	1.43
Estimated risk of malpractice suit with poor outcome	0.53	0.29

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.67	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

PRE-TIME CHANGES
The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for the two aortic valvuloplasty codes.

ADDITIONAL EVALUATION TIME
For the evaluation the Expert Panel is recommending a 20-minute increase in time over the package for a total evaluation time of 60 minutes. This is supported by the survey data of 75 minutes for both codes. The total evaluation time accounts for the review of the patient, by the surgeon and the collaborative efforts that go into each case. The additional evaluation time of 20 minutes accounts for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the additional complexity associated with an aortic valve repair and the associated aftercare. Extensive planning and review is required to identify the extent and type of repair required for the valve. In addition, the surgeon must take time to explain the all of the elements usually discussed with standard aortic valve replacement should attempts at repairing the patient's own aortic valve fail and the reasons/implications of valve repair failure. The Expert Panel felt that adding 20 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the pre-service work involved with the procedure.

SAME DAY IMMEDIATE POST TIME
The expert panel selected post-time package 9B for a general Anesthesia or Complex Regional Block/Complex Procedure. The survey supported 45 minutes of immediate post time and there are numerous examples in the RUC database supporting this time. The additional 12 minutes above the package time can be attributed to additional time for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished for the procedure.

CRITICAL CARE VISIT
For the procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours.
The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient once the patient arrives in the ICU. The critical care visit covers that time that the physician spends with the patient directly related to the procedure providing critical care services. The survey supported a critical care visit for the procedure and the Expert Panel agreed.

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to both codes to account for additional positioning, which is common for cardiac procedures and there are numerous examples in the RUC database supporting this time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33400

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgeons How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 783
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. Based on the 2009 Medicaid volume of 832 and the 2014 Medicare volume of 287 for a total of 1,119 procedures per year. It is esitmated that 30% of the existing procedures will now be performred using 334X1 for a total of 336 and 70% of the procedures will be performed using 334X2 for a total of 783. 100% of the procedures will be performed by cardiothoracic surgeons

Specialty cardiothoracic surgery Frequency 783 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 201
If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate. The 2014 Medicare volume is 287 procedures per year. It is estimated that 30% of

the total procedures will be performed using 334X1 for a total of 86 procedures per year and that 70% of procedures will be performed using 334X2 for a total of 201 procedures per year

Specialty cardiothoracic surgery Frequency 201 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

334X1 - Valvuloplasty, aortic valve, open, with cardiopulmonary bypass; simple (ie, valvotomy, debridement, debulking and/or simple commissural resuspension

334X2 - Valvuloplasty, aortic valve, open, with cardiopulmonary bypass; complex (eg, leaflet extension, leaflet resection, leaflet reconstruction or annuloplasty)

Global Period: 090 Meeting Date: 01/2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: Expert Panel

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Code 33405 was selected as the reference code. Code 33405, is also an aortic valve procedure and is representative of the practice expense that would be associated with the new codes.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:
The standard 90-day global facility inputs are recommended for these codes.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

A staff type of RN, which has previously been established and is typical for cardiothoracic services, has been applied.

The clinical staff completes pre-service diagnostic and referral forms. They call the facility to schedule space and equipment needed and coordinate with the facility, the patient and other offices, particularly other surgeon’s offices, as necessary to prepare for the procedure. Clinical staff will provide and review educational materials and information including instructions on the medications prior to the procedure. Clinical staff will call in any prescriptions necessary for the patient prior to the procedure and contact the patient prior to the procedure to confirm pre-procedure instructions are being carried out. Calls may also be necessary to coordinate changes in polypharmacy with the PCP prior to the procedure.

Intra-Service Clinical Labor Activities:

Office staff participate in discharge day management activities including coordination of home health services, phoning in prescriptions, reviewing and emphasizing follow-up instructions, notifying the office of the referring physician, coordinating follow-up office visits and answering patient and family questions.

Post-Service Clinical Labor Activities:

	A	B	C	D	E	F

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Partial Exchange Transfusion

In May 2015, the CPT Editorial Panel established one new code to describe newborn partial exchange transfusion. At the October 2015 RUC meeting, while reviewing the specialty society's recommendation for new code 364X1, the RUC agreed that CPT codes 36440, 36450, 36455 and 36460 are also part of the same code family and should have been surveyed. The RUC also noted that CPT code 36450, a Harvard valued code, was placed on the reference service list for the RUC survey of 364X1 in error. Therefore, the RUC did not provide a recommendation for 364X1. The RUC requested that the specialty society survey codes 364X1, 36440, 36450, 36455 and 36460 for the January 2016 RUC meeting.

Compelling Evidence
The specialty societies presented compelling evidence for code 36450. The societies noted that the patient population for this service has changed since the code was originally developed. When first described, the procedure was very commonly performed on smaller pre-mature infants. This is no longer the case as the criteria for double volume exchange transfusion for hyperbilirubinemia has changed over the years, resulting in the typical patient being a relatively larger newborn. When the typical patient was smaller, the volume of blood that needed to be exchanged was smaller and the time for the exchange transfusion was shorter. In addition, the increased work RVU brings the value of this service more in line with the RUC recommended value for 364X1. The RUC agreed that there is compelling evidence that the service described by code 36450 was potentially misvalued.

364X1 ***Partial exchange transfusion, blood, plasma or crystalloid necessitating the skill of a physician or other qualified health care professional, newborn***
The RUC reviewed the survey results from 47 pediatricians and agreed with the following physician time components: pre-service time of 15 minutes, intra-service time of 30 minutes, and post-service time of 15 minutes. The specialty noted that, during the intraservice period, the typical case may need the procedure to be stopped temporarily or slowed down due to a variety of issues such as instability of the patient, the vascular access not working properly, etc. The physician is at the bedside during this waiting time.

The RUC reviewed the survey 25th percentile work RVU of 2.00 and agreed that this value appropriately accounts for the physician work involved. To justify a work RVU of 2.00, the RUC 2nd key reference and MPC code 99233 *Subsequent hospital care, per day, for the evaluation and management of a patient* (work RVU= 2.00, intra-service time of 30 minutes, total time of 55 minutes) and noted that both services have identical intra-service times, similar total times and intensities, and therefore should be valued similarly. The RUC also reviewed CPT code 95939 *Central motor evoked potential study (transcranial motor stimulation); in upper and lower limbs* (work RVU= 2.25, intra-service time of 30

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

minutes, total time of 60 minutes) and noted that both services have identical intra-service times and total times, while the survey code has somewhat less intensity, further supporting a work RVU of 2.00 for the survey code. **The RUC recommends a work RVU of 2.00 for CPT code 364X1.**

36440 ***Push transfusion, blood, 2 years or younger***
The RUC reviewed the survey results from 41 pediatricians and agreed with the following physician time components: pre-service time of 10 minutes, intra-service time of 15 minutes, and post-service time of 10 minutes. The RUC noted that the existing physician time from the Harvard study was not valid and that this service had never been evaluated by the RUC in the past.

The RUC reviewed the survey 25th percentile work RVU of 1.20 and agreed that the survey responds had somewhat overvalued the physician work involved in performing this service. The specialty society noted that there was no compelling evidence to support an increase in the work RVU of this service. The RUC compared the survey code to key reference and MPC code 94004 *Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; nursing facility, per day* (work RVU= 1.00, intra-service time of 15 minutes and total time of 35 minutes) and noted that both services have identical times, thought the survey code has somewhat more physician work intensity as per the survey intensity/complexity ratings, supporting maintaining the work RVU of the survey code at 1.03 RVUs. To further justify maintaining the current work RVU, the RUC compared the survey code to CPT code 95907 *Nerve conduction studies; 1-2 studies* (work RVU=1.00, intra-service time of 15 minutes, total time of 35 minutes) and noted that both services have identical physician times, while the survey code involves somewhat more physician intensity. **The RUC recommends a work RVU of 1.03 for CPT code 36440.**

36450 ***Exchange transfusion, blood; newborn***
The RUC reviewed the survey results from 44 pediatricians and agreed with the following physician time components: pre-service time of 30 minutes, intra-service time of 120 minutes, and post-service time of 30 minutes. The specialty society noted that this service is a double volume exchange transfusion. The specialty society noted that although the 364X1 procedure involves a sicker typical patient than code 36450, the double exchange involves substantially more physician time than the partial exchange code. The specialty society explained to the RUC that the typical patient has an estimated blood volume of 85 ml/kg and is 3.5 kg. The volume of blood needed for a double volume exchange for this patient is 595 ml. Typically, 15 ml is exchanged per pass, which will require 40 passes. The specialty society provided literature that supported each cycle taking 3 minutes. The RUC noted that this analysis supported the median intraservice time of 120 minutes. In addition, the RUC noted that the existing physician time from the Harvard study was not valid and had never been evaluated by the RUC in the past.

The RUC reviewed the survey median work RVU of 3.50 and agreed that this value appropriately accounts for the physician work involved. To justify a work RVU of 3.50, the RUC compared the survey code to CPT code 92523 *Evaluation of speech sound production (eg, articulation, phonological process, apraxia, dysarthria); with evaluation of language comprehension and expression (eg, receptive and expressive language)* (work RVU=3.00, intra-service time of 120 minutes, total time of 157 minutes) and noted that both codes have identical intraservice times, while

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the survey code has much more total time and involves more intensity, supporting a higher work RVU for the survey code. The RUC also compared the survey code to CPT code 38230 *Bone marrow harvesting for transplantation; allogeneic* (work RVU=3.50, intra-service time of 90 minutes, total time of 175 minutes) and noted that both services have similar total times and involve a similar amount of total physician work, supporting a similar work RVU. **The RUC recommends a work RVU of 3.50 for CPT code 36450.**

36455 ***Exchange transfusion, blood; other than newborn***
The RUC reviewed the survey results from 77 pediatricians and agreed with the following physician time components: pre-service time of 30 minutes, intra-service time of 60 minutes, and post-service time of 30 minutes. The RUC noted that the existing physician time from the Harvard study was not valid and that this service had never been evaluated by the RUC in the past.

The RUC reviewed the survey 25th percentile work RVU and agreed that the survey responds had somewhat overvalued the physician work involved in performing this service. The specialty society noted that there was no compelling evidence to support an increase in the work RVU of this service. The RUC compared the survey code to CPT code 91117 *Colon motility (manometric) study, minimum 6 hours continuous recording (including provocation tests, eg, meal, intracolonic balloon distension, pharmacologic agents, if performed), with interpretation and report* (work RVU= 2.45, intra-service time of 60 minutes, total time of 105 minutes) and noted that both services have identical intra-service time and similar intensity, whereas the survey code has more total time, which supports maintaining the work RVU for the survey code at 2.43. To further justify a work RVU of 2.43, the RUC compared the survey code to CPT code 95872 *Needle electromyography using single fiber electrode, with quantitative measurement of jitter, blocking and/or fiber density, any/all sites of each muscle studied* (work RVU= 2.88, intra-service time of 60 minutes) and noted that both services have identical intra-service times, though the reference code involves more intense physician work, supporting a lower work RVU for the survey code. **The RUC recommends a work RVU of 2.43 for CPT code 36455.**

36460 ***Transfusion, intrauterine, fetal***
For the January 2016 RUC meeting, the American Congress of Obstetricians and Gynecologists submitted a letter to the RUC noting that CPT code 36460, is not part of the same code family as CPT code 364X1 and the RUC agreed, noting this service is performed by a different provider and involves a different patient (mother not newborn). The RUC also noted that this service was only had a Medicare utilization of 10 in 2014. **The RUC agreed with the specialty society that this service is not part of the same code family as 364X1.**

Practice Expense
There are no direct practice expense inputs for CPT codes 364X1, 36440, 36450 and 36455. These services are facility-only and do not require any clinical staff pre-service time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●364X1	C1	Partial exchange transfusion, blood, plasma or crystalloid necessitating the skill of a physician or other qualified health care professional, newborn *(Do not report 364X1 in conjunction with 36430, 36440, 36450)*	XXX	2.00
36440(f)	C2	Push transfusion, blood, 2 years or younger *(When a partial exchange transfusion is performed in a newborn, use 364X1)*	XXX	1.03 (No Change)
36450(f)	C3	Exchange transfusion, blood; newborn *(When a partial exchange transfusion is performed in a newborn, use 364X1)*	XXX	3.50
36455 (f)	C4	other than newborn	XXX	2.43 (No Change)
36460 (f)	C5	Transfusion, intrauterine, fetal	XXX	Not part of the code family – Not performed by pediatricians

Re: Tab 12 Partial Exchange Transfusion (36460)

Dear Dr. Smith:

A new code for partial exchange transfusion (PET) was approved during the May 2015 CPT Editorial Panel meeting. Prior to release of the LOI for the October 2015 RUC meeting, CMS assigned several additional codes (36440, 36450, 36555, 36460) to the PET "family". ACOG does not believe CPT Code 36460 *Transfusion, intrauterine, fetal* is part of this PET family. CPT Code 36460 has both a different provider and a different patient (mother not newborn), which by definition makes it not part of the family. As such we are not submitting RUC recommendations for this code for the January 2016 RUC meeting.

Thank you,

George A. Hill, MD
ACOG RUC Advisor

Re: Direct Practice Expense Inputs for Partial Exchange Transfusion (PET) Family of Codes (Tab 12/Tracking Codes C1-C4)

Dear Dr Smith:

Codes 364XX1 (*Partial exchange transfusion, blood, plasma or crystalloid, necessitating the skill of a physician or other qualified health care professional; newborn*), 36440 (*Push transfusion, blood, 2 years or younger*), 36450 (*Exchange transfusion, blood; newborn*), and 36455 (*Exchange transfusion, blood; other than newborn*) are among the codes being considered during the January 2016 RUC meeting.

The American Academy of Pediatrics (AAP) has conducted physician work surveys for codes 364XX1-36455 and developed work RVU recommendations based on the survey results. However, since the services described by codes 364XX1-36455 typically occur in the facility setting, we recommend no direct practice expense inputs for codes 364XX1-36455.

If you have any questions, please contact Linda Walsh, AAP staff, at 847/434-7931 or lwalsh@aap.org. Thank you.

Sincerely,

Steven E. Krug, MD, FAAP
AAP RUC Advisor

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:364X1 Tracking Number C1 Original Specialty Recommended RVU: **2.00**
Presented Recommended RVU: **2.00**
Global Period: XXX RUC Recommended RVU: **2.00**

CPT Descriptor: Partial exchange transfusion, blood, plasma or crystalloid; newborn

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 3-kilogram, full-term newborn is admitted to the neonatal intensive care unit (NICU) due to respiratory distress. Her chest x-ray is clear. Her central hematocrit is 72% consistent with polycythemia. An echocardiogram shows pulmonary hypertension.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 18%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Discuss care plan with parents and obtain consent. After the neonate's blood volume is determined and a target hematocrit chosen, the physician places order for blood products and/or fluid. The physician scrubs and puts on sterile gown, gloves, and mask.

Description of Intra-Service Work: An exchange transfusion kit is attached to the vascular access by the physician who continues to use strict sterile technique throughout the procedure. The physician slowly removes small aliquots of blood from the patient (5 ml/kg), discards the blood, draws up the replacement fluid (pRBC for anemia or saline for polycythemia) in an equal volume to what has be removed and manually infuses it into the patient. Each cycle of removal and infusion takes several minutes to achieve. These cycles are continued until the total desired amount of fluid has been exchanged.

Description of Post-Service Work: Following the procedure, the physician obtains post-PET laboratory tests to confirm that the desired hematocrit has been achieved and to detect any hematologic or electrolyte disturbances. The physician documents a procedure note that addresses procedure characteristics such as type of vascular access, volume exchanged, and type of replacement fluid.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99222	XXX	2.61	**RUC Time**

CPT Descriptor Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99233	XXX	2.00	**RUC Time**

CPT Descriptor Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Typically, 35 minutes are spent at the bedside and on the patient's hospital floor or unit.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99239	XXX	1.90	**RUC Time**	4,143,060

CPT Descriptor 1 Hospital discharge day management; more than 30 minutes

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99349	XXX	2.33	**RUC Time**	1,103,340

CPT Descriptor 2 Home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the

presenting problem(s) are moderate to high severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.53	0.82

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.74	0.73
Urgency of medical decision making	1.32	1.36

Technical Skill/Physical Effort (Mean)

Technical skill required	1.37	1.27
Physical effort required	1.16	1.27

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.32	1.27
Outcome depends on the skill and judgment of physician	1.26	0.82
Estimated risk of malpractice suit with poor outcome	1.32	0.91

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.05	1.27

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

An AAP expert panel reviewed the survey results and recommends the 25th percentile work RVU (wRVU) and times:

wRVU: 2.00

Pre-service time: 15 minutes

Intra-service time: 30 minutes

Post-service time: 15 minutes

It is conceivable that surveyees may have included scrub, dress, and preparation time in the intra-service time. Therefore, we believe that that 25th percentile times and wRVU most accurately represent this procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Partial exchange transfusion is the standard of care for neonates with severe polycythemia or severe chronic anemia who meet specific criteria and, therefore, is typically reported with a NICU E/M code (eg, 99468).

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 364XX1 (XXX global; 2.00 wRVU; 15/30/15) plus 99468 (XXX global; 18.46 wRVU; 45/180/48.80)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36450-52 Exchange transfusion, blood; newborn, with modifier 52 appended

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1200
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. According to a large database of NICUs, the incidence of Partial Exchange Transfusion is approximately 3 per 10,000 deliveries. With 4 million annual deliveries in the US, there should be approximately 1200 PETs.

Specialty Pediatrics Frequency 1200 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. N/A

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 8%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Attend delivery of infant with a history of acute blood loss. Assessment of a newborn at the time of delivery reveals signs of hypovolemia. Based on acute decompensation and history, physician decides to order unmatched blood and resuscitation fluids on an emergent basis. The physician scrubs and puts on sterile gown, gloves, and mask.

Description of Intra-Service Work: Physician will give an initial normal saline bolus as volume if blood cells are not immediately available. The ordered blood arrives and physician pushes the blood (20 ml/kg) slowly monitoring vital signs throughout.

Description of Post-Service Work: Continue to monitor vital signs. Assess the need for additional transfusion. Document care provided. Discuss the need for emergent transfusion with the parents.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.06	0.43
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.19	0.43
Urgency of medical decision making	1.44	1.79

Technical Skill/Physical Effort (Mean)

Technical skill required	0.25	1.43
Physical effort required	0.88	1.21

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.00	1.79
Outcome depends on the skill and judgment of physician	0.63	1.36
Estimated risk of malpractice suit with poor outcome	1.00	1.64

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.75	1.36

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

An AAP expert panel reviewed the survey results and recommends the existing wRVU and 25th percentile times:

wRVU: 1.03

Pre-service time: 10 minutes

Intra-service time: 15 minutes

Post-service time: 10 minutes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☒ Other reason (please explain) Typically reported with a NICU E/M code (eg, 99468)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 36440 (XXX global; 1.03 wRVU; 10/15/10) plus 99468 (XXX global; 18.46 wRVU; 45/180/48.80)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36440

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 16
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 2009 Medicaid claims data

Specialty Pediatrics Frequency 16 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. N/A

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36440

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36450 Tracking Number C3 Original Specialty Recommended RVU: **3.50**
Presented Recommended RVU: **3.50**
Global Period: XXX RUC Recommended RVU: **3.50**

CPT Descriptor: Exchange transfusion, blood; newborn

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A four day old male infant has an ABO incompatibility. Despite intense phototherapy, the bilirubin rises to 28.0 mg/dl. A double volume exchange transfusion is performed by the physician.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 20%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Based on current recommendations for the care of infants with hyperbilirubinemia, physician establishes the need for a double volume exchange transfusion. Discuss care plan with parents and obtain consent. Perform calculations to determine the amount of blood needed and how it should be prepared by the blood bank. The physician scrubs and puts on sterile gown, gloves, and mask.

Description of Intra-Service Work: Using sterile technique, an exchange transfusion kit is attached to the vascular access by the physician, who continues to use strict sterile technique throughout the procedure. The physician slowly removes small aliquots of blood from the patient (5 ml/kg), discards the blood, draws up the replacement packed red blood cells (pRBC) in an equal volume to what has be removed and manually infuses it into the patient. Each cycle of removal and infusion takes several minutes to achieve. These cycles are continued until the total desired amount of fluid has been exchanged.

Description of Post-Service Work: Following the procedure, the physician obtains post-exchange transfusion laboratory tests to confirm that the desired level of bilirubin has been achieved and to detect any hematologic or electrolyte disturbances. The physician documents a procedure note that addresses procedure characteristics such as type of vascular access, volume exchanged, and any complications.

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99222	XXX	2.61	**RUC Time**

CPT Descriptor Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99350	XXX	3.28	**RUC Time**

CPT Descriptor Home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive interval history; A comprehensive examination; Medical decision making of moderate to high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. The patient may be unstable or may have developed a significant new problem requiring immediate physician attention. Typically, 60 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99327	XXX	3.46	**RUC Time**	51,412

CPT Descriptor 1 Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of high severity. Typically, 60 minutes are spent with the patient and/or family or caregiver.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
15004	000	4.58	**RUC Time**	23,056

CPT Descriptor 2 Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet and/or multiple digits; first 100 sq cm or 1% of body area of infants and children

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.27	0.14
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.64	0.79
Urgency of medical decision making	1.32	1.43
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.41	1.71
Physical effort required	1.64	1.79
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	1.82	1.71
Outcome depends on the skill and judgment of physician	1.32	1.57
Estimated risk of malpractice suit with poor outcome	1.64	1.79

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.59	1.43

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

An AAP expert panel reviewed the survey results and recommends the median work RVU (wRVU) and times:

wRVU: 3.50
Pre-service time: 30 minutes
Intra-service time: 120 minutes
Post-service time: 30 minutes

The calculation for a 36450 double volume exchange transfusion for a four day old infant with a bilirubin of 28.0 mg/dl due to ABO incompatibility is as follows:

3.5 kg patient with estimated blood volume 85 ml/kg

Formula for the amount of blood to exchanged = *Weight in kg x Blood Volume (Actual Hematocrit-Desired Hematocrit/Actual Hematocrit)*

Volume of blood needed for a double volume exchange= 3.5 x 85 x 2 = 595 ml

Typically, 15 ml is exchanged per pass, which will require 40 passes (595÷15). According to *Neonatology: management, procedures, on-call problems, diseases, and drugs* **(TL Gomella (Editor); Seventh Edition; McGraw Hill (New York); 2013), each cycle typically takes 3 minutes.**

Therefore, the typical double volume exchange transfusion will take 120 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Typically reported with a NICU E/M code (eg, 99468)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting

each CPT code in your scenario. 36450 (XXX global; 3.50 wRVU; 30/120/30) plus 99468 (XXX global; 18.46 wRVU; 45/180/48.80)

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 70%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 15%

Description of Pre-Service Work: Determine need for exchange transfusion through assessment of the infant, child, or adolescent based on current recommendations (eg, patient with sickle cell disease with acute chest syndrome). Based upon patient weight, calculate the blood volume to be exchanged. Place order for the appropriate blood products. Discuss care plan with family and obtain informed consent. The physician scrubs and puts on sterile gown, gloves, and mask.

Description of Intra-Service Work: Verify blood product volume and expiration times. Withdraw the aliquot volume and replace with same volume of blood product until predetermined blood volume has been exchanged.

Description of Post-Service Work: Document care provided and counsel family. Evaluate post-transfusion blood count and other laboratory tests as needed (eg, percentage of hemoglobin SS). Based on clinical status and lab work, assess the need for additional exchange transfusion.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99222	XXX	2.61	**RUC Time**

CPT Descriptor Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99350	XXX	3.28	**RUC Time**

CPT Descriptor Home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive interval history; A comprehensive examination; Medical decision making of moderate to high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. The patient may be unstable or may have developed a significant new problem requiring immediate physician attention. Typically, 60 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99349	XXX	2.33	**RUC Time**	1,103,340

CPT Descriptor 1 Home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are moderate to high severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99336	XXX	2.46	**RUC Time**	1,086,479

CPT Descriptor 2 Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are spent with the patient and/or family or caregiver.

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.33	1.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.70	1.53
Urgency of medical decision making	1.44	1.82
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.33	1.76
Physical effort required	1.28	1.76
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	1.35	1.88
Outcome depends on the skill and judgment of physician	0.93	1.65
Estimated risk of malpractice suit with poor outcome	1.19	1.76

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.12	1.82

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Typically reported with critical care code (eg, 99291)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 36450 (XXX global; 2.43 wRVU; 20/35/15) plus 99291 (XXX global; 4.50 wRVU; 15/40/15)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36455

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1436
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 2009 Medicaid claims data

Specialty Pediatrics Frequency 1436 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. N/A

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36455

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Mechanochemical (MOCA) Vein Ablation

At the October 2015 CPT meeting, the CPT Editorial Panel established two Category I codes for reporting venous mechanochemical ablation.

36X41 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated***
The RUC reviewed the survey results from 91 physicians and agreed with the following physician time components: pre-service time of 31minutes (standard pre-time package 6A with 3 minutes added to positioning and 5 minutes added to scrub/dress/wait), intra-service time of 30 minutes, and post-service time of 15 minutes (standard post-time package 7A minus 3 minutes).

The RUC reviewed the survey respondents' physician work values for CPT code 36X41 and agreed with the specialty that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 36X41, the RUC reviewed MPC code 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands* (work RVU= 3.50, intra-service time of 30 minutes, total time of 79 minutes) and noted that both services have identical intra-service time, as well as similar physician work and total time. Given these similarities, the RUC recommends a work RVU of 3.50, which is a direct crosswalk to CPT code 52214. To justify a work RVU of 3.50, the RUC reviewed CPT code 45380 *Colonoscopy, flexible; with biopsy, single or multiple* (work RVU= 3.66, intra-service time of 28 minutes, total time of 70 minutes) and noted that the survey code has more intra-service and total time, while also involving a similar amount of physician work. **The RUC recommends a work RVU of 3.50 for CPT code 36X41.**

364X2 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 74 physicians and agreed with the following physician time components: intra-service time of 30 minutes.

The RUC reviewed the survey respondents' physician work values for CPT code 364X2 and agreed with the specialty that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 364X2, the RUC reviewed CPT code 49435 *Insertion of subcutaneous extension to intraperitoneal cannula or catheter with remote chest exit site (List separately in addition to code for primary procedure)* (work RVU= 2.25, intra-service time of 30 minutes) and noted that both services have identical intra-service time and involve

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

a similar amount of physician work. Given these similarities, the RUC recommends a work RVU of 2.25, which is a direct crosswalk to CPT code 49435. To justify a work RVU of 2.25, the RUC reviewed MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU= 2.25, intra-service time of 30 minutes) and noted that both services have identical intra-service time and a similar amount of physician work. In addition, the RUC observed that, compared to the radiofrequency ablation (RFA) and endovascular laser treatment (EVLT) families of services, the total time ratio between the base code and add-on code for MOCA vein ablation is much smaller. This distinction supports a narrower RVU differential for the MOCA base code and add-on code, when compared to the larger gap between the RFA/EVLT base and add-on codes. **The RUC recommends a work RVU of 2.25 for CPT code 364X2.**

36475 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated***
The RUC briefly discussed CPT code 36475, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 5.30 for CPT code 36475.**

36476 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***
The RUC briefly discussed CPT code 36476, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 2.65 for CPT code 36476.**

36478 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated***
The RUC briefly discussed CPT code 36478, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 5.30 for CPT code 36478.**

36479 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***
The RUC briefly discussed CPT code 36479, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 2.65 for CPT code 36479.**

New Technology
CPT codes 36X41 and 364X2 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and specifically review utilization trends.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with the minor modifications as approved by the Practice Expense Subcommittee.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Vascular Injection Procedures
Venous
Venipuncture, needle or…
36460 *Transfusion, intrauterine, fetal*
(Do not report modifier 63 in conjunction with 36460)
(For radiological supervision and interpretation, use 76941)
Codes 36468, 36470, and 36471 describe sclerotherapy of telangiectasia and/or incompetent veins. Ultrasound guidance, when performed, is not included and may be reported separately. When performed in the office setting, all required supplies and equipment are inherent to the procedure and not separately reportable.
36468 *Single or multiple injections of sclerosing solutions, spider veins (telangiectasia), limb or trunk*
(Do not report 36468 in conjunction with 37241 in the same surgical field)
(36469 has been deleted)
36470 *Injection of sclerosing solution; single vein*
36471 *multiple veins, same leg*
(For vascular embolization and occlusion procedures, see 37241, 37242, 37243, 37244)
(Do not report 36470, 36471 in conjunction with 37241 in the same surgical field)

Codes 36X41-36479 describe endovascular ablation therapy of incompetent extremity vein(s). Codes 36X41 and 364X2 (mechanochemical ablation) are performed under local anesthesia and involve concomitant use of an intraluminal device that mechanically disrupts/abrades the venous intima and infusion of a physician-specified medication in the target vein(s). Sclerosant injection by either needle or catheter followed by a compression technique is not mechanochemical vein ablation. Codes 36475 and 36476 (radiofrequency ablation) and 36478 and 36479 (laser ablation) are performed under tumescent anesthesia. All imaging guidance and monitoring is inherent to all six endovascular ablation therapy codes. In addition, when performed in the office setting, all required supplies and equipment are inherent to the procedure and not separately reportable. The add-on codes for subsequent vein(s) treated in the same extremity may only be reported once per extremity, regardless of the number of additional vein(s) treated.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●36X41	Q1	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated	000	3.50
●✚364X2	Q2	subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure) *(Use 364X2 in conjunction with 36X41)* *(Do not report 364X2 more than once per extremity)* *(Do not report 36X41, 364X2 in conjunction with 29581, 29582, 36000, 36002, 36005, 36410, 36425, 36475, 36476, 36478, 36479, 37241, 75894, 76000, 76001, 76937, 76942, 76998, 77022, 93970, 93971 in the same surgical field)* *(For catheter injection of sclerosant without concomitant endovascular mechanical disruption of the vein intima, use 37799)* *(For catheter injection of an adhesive, use 37799)*	ZZZ	2.25
36475 (f)	Q3	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated	000	5.30 (Reaffirmed April 2014 RUC Recommendation)
✚▲36476	Q4	~~second and~~ subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure) *(Use 36476 in conjunction with 36475)* *(Do not report 36476 more than once per extremity)* *(Do not report 36475, 36476 in conjunction with 29581, 29582, 36000, 36002, 36005, 36410, 36425, 36478, 36479, 37241-37244, 75894, 76000, 76001, 76937, 76942, 76998, 77022, 93970, 93971 in the same surgical field)*	ZZZ	2.65 (Reaffirmed April 2014 RUC Recommendation)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Re: RSL Review

Dear Dr. Leahy:

The CPT Editorial Panel recently approved two new CPT codes to describe Mechanochemical (MOCA) Vein Ablation. CPT Codes 364X1, 364X2 were recently included on the January 2016 RUC meeting new/revised LOI form. CPT Code 36475, 36476, 36478 and 36479 were included on the LOI as part of the family codes to be reviewed. Those four vein codes were recently surveyed in April 2014. The specialty societies do not plan to re-survey those codes for the upcoming meeting. We plan to use those codes on our reference service list for the MOCA RUC survey.

We request a research subcommittee review of the RSL we plan to use for the MOCA survey. Attached is the RSL with all the requested data points. Thank you for reviewing our request. We look forward to discussing this on the October 20th conference call.

Sincerely,

Matthew Sideman, MD

cc: Michael Morrow
Robert Zwolak, MD
Michael Hall, MD

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36X41 Tracking Number Q1 Original Specialty Recommended RVU: **3.50**
Presented Recommended RVU: **3.50**
Global Period: 000 RUC Recommended RVU: **3.50**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. She chooses to undergo mechanochemical ablation therapy under local anesthesia utilizing an intraluminal device that mechanically disrupts/abrades the venous intima and disperses a physician-selected medication into the insufficient great saphenous vein.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at access site prior to vein access and continue local anesthesia as needed throughout procedure.

Description of Intra-Service Work: Ultrasound guidance is utilized to localize primary target vein (eg, great saphenous vein) as well as map and mark entire length of target vein. Vein is accessed under ultrasound guidance (not separately reportable). Guidewire is introduced using Seldinger technique. Dilator is advanced over guidewire. Dilator is exchanged for sheath. Treatment catheter is advanced under ultrasound guidance to treatment area. Mechanochemical ablation is initiated through the catheter. This involves the use of an intraluminal device that infuses a physician-specified medication in the target vein as well as mechanically disrupts the venous intima. The catheter and sheath are removed.

Description of Post-Service Work: Desired outcome of primary treated vessel and any possible thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate type of compression stocking is applied to the entire extremity. The patient is transported to recovery. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician

SURVEY DATA

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.07	0.13
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.07	0.07
Urgency of medical decision making	-0.04	0.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.20	0.17

Physical effort required	0.00	-0.07

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.07	0.17
Outcome depends on the skill and judgment of physician	0.13	0.17
Estimated risk of malpractice suit with poor outcome	0.13	0.10

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	0.09	0.13

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Mechanochemical endovenous ablation (MOCA) of incompetent veins represent a new technology in the treatment of venous insufficiency. The procedure is similar to endovenous thermal ablation (e.g. radiofrequency, laser) in that a catheter is inserted into the vein to be treated under ultrasound guidance. It differs from thermal ablation in that it uses mechanical irritation and chemical infusion to achieve ablation of the treated vein without the need for tumescent anesthesia. Two new codes were created by CPT to capture the work of MOCA. They are 36X41 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated* and 364X2 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure).*

Methodology

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the SVS, SIR, and the American College of Phlebology (ACP). The codes for endovenous thermal ablation of incompetent veins were recently reviewed by the RUC and approved by CMS. With the approval of the research subcommittee, these codes were placed on the reference service list for use as potential comparators.

Results of Survey

A total of 2676 survey requests were sent out with 91 responses received for a survey response rate of 3%. The results of the survey showed an extremely tight distribution with no statistical differences between the median and 25th percentile for both codes. Furthermore, the recommended RVU for both codes was identical to the RVU of the thermal ablation codes, despite 1/3rd less intra-service time for 36X41. The expert panel

convened to discuss these results and decided that the survey respondents had been inadvertently misled by the RSL and failed to consider the differences in time and intensity when making their recommendations. They overwhelmingly decided that the work of treating incompetent veins was the same regardless of technique. We therefore decided to set aside the survey results and make RVU recommendations base on crosswalks.

Work RVU Recommendation

We are recommending a crosswalk to CPT code 52214 for a value of 3.50*** RVW for 36X41.

Pre-service and post-service time

Pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with addition time added as outlined below. Post-service time package 7A is appropriate for these procedures.

1. Positioning: The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.

2. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

Comparison to crosswalk code

The crosswalk code chosen by expert panel is CPT code 52214 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands*). This crosswalk code is similar to 36X41 in that they have identical intra-service times and very similar overall times and intensities. We feel this code represents a very accurate crosswalk for 36X41 and recommend the value of 3.50 RVW.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36X41	3.50	0.087	76	17	4	10	30	15
52214	3.50	0.082	79	19	5	5	30	20

Comparison to key reference codes

The key reference codes chosen by the majority of the survey respondents were 36475 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated* (49%) and 36478 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated* (33%). These key references are similar to 36X41 in the sense that they are all endoluminal venous procedures to treat venous insufficiency. The primary difference between 36X41, 36475 and 36478 is in the intra-service time and intensity. CPT 36X41 has 1/3rd less intra-service time than the key reference codes. Clinically, this is accounted for in the need for tumescence in the key reference codes. The pre-service and post-service times are almost identical. Subtracting 1/3rd of the RVW to account for the lesser intra-service time in 36X41 would

predict an RVW of 3.53. This comparison thus favorably supports our crosswalk recommendation value of 3.50 for CPT 36X41.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36475 Key Ref	5.30	0.097	94	20	4	10	45	15
35478 Key Ref	5.30	0.097	94	20	4	10	45	15
36X41	3.50	0.087	76	17	4	10	30	15

Comparison to MPC codes

Comparison with MPC List Code, 31622

MPC 31622 *(Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm))* is a 0-day global MPC service with similar intra-service time and intensity to 36X41. Both 31622 and 36X41 require technical skill to complete successfully. MPC 31622 and 36X41 have identical intra-service times and almost identical intensities. The pre- and post-service times have minor variations. In conclusion, comparison with this MPC code justifies our recommended crosswalk value of 3.50 RVW for 36X41.

Comparison with MPC List Code, 37191

MPC 37191 *(Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed)* is a 0-day global MPC service with similar times and intensity to 36X41. Both 36X41 and 37191 are endoluminal venous procedures that require technical skill to complete successfully. They have identical intra-service times but different intensities accounting for the different RVWs. Comparison with MPC 37191 supports our recommendation for the crosswalk value of 3.50 RVW for 36X41.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
31622 MPC	2.78	0.069	65	10	5	5	30	15
36X41	3.50	0.087	76	17	4	10	30	15
37191 MPC	4.71	0.120	83	30	3	5	30	15

Conclusion

Comparison with our crosswalk code of 52214, key reference services, and comparison with two MPC codes supports our crosswalk recommendation of 3.50 RVW for CPT code 36X41.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Interventional Radiology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 25000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Thermal ablation of an incompetent vein is a common procedure, with a Medicare incidence in 2014 of 177,903 claims for the initial vein (CPT 36475 and 36478) and 21,478 for the secondary vein (CPT 36476 and 36479). Mechanochemical ablation (364X1, 364X2) will be performed based on provider and patient preference in lieu of other ablation techniques, and therefore, utilization is difficult to estimate. Information provided by the manufacturer indicates a 2015 national (both Medicare and non-Medicare) projected utilization above 25,000.

Specialty Vascular Surgery Frequency 6752 Percentage 27.00 %

Specialty Interventional Radiology Frequency 2500 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Thermal ablation of an incompetent vein is a common procedure, with a Medicare incidence in 2014 of 177,903 claims for the initial vein (CPT 36475 and 36478) and 21,478 for the secondary vein (CPT 36476 and 36479). Mechanochemical ablation (364X1, 364X2) will be performed based on provider and patient preference in lieu of other ablation techniques, and therefore, utilization is difficult to estimate. Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Ultrasound guidance is utilized to localize a second primary target vein access site. Local anesthetic is injected at access site. Ultrasound guidance is utilized to map and mark entire length of target vein. Vein is accessed under ultrasound guidance (not separately reportable). Guide wire is introduced using Seldinger technique. Dilator is advanced over guidewire. Dilator is exchanged for sheath. Treatment catheter is advanced under ultrasound guidance to treatment area. Mechanochemical ablation is initiated through the catheter. This involves the use of an intraluminal device that infuses a physician-specified medication in the target vein as well as mechanically disrupts the venous intima. The catheter and sheath are removed. Desired outcome of primary treated vessel and any possible thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate type of compression stocking is applied to the entire extremity.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.11	0.10
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.11	0.03
Urgency of medical decision making	-0.08	0.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.31	0.14

Physical effort required	0.14	-0.03

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.11	0.14
Outcome depends on the skill and judgment of physician	0.28	0.21
Estimated risk of malpractice suit with poor outcome	0.19	0.03

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	0.22	0.07

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Mechanochemical endovenous ablation (MOCA) of incompetent veins represent a new technology in the treatment of venous insufficiency. The procedure is similar to endovenous thermal ablation (e.g. radiofrequency, laser) in that a catheter is inserted into the vein to be treated under ultrasound guidance. It differs from thermal ablation in that it uses mechanical irritation and chemical infusion to achieve ablation of the treated vein without the need for tumescent anesthesia. Two new codes were created by CPT to capture the work of MOCA. They are 36X41 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated* and 364X2 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure).*

Methodology

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the SVS, SIR, and the American College of Phlebology (ACP). The codes for endovenous thermal ablation of incompetent veins were recently reviewed by the RUC and approved by CMS. With the approval of the research subcommittee, these codes were placed on the reference service list for use as potential comparators.

Results of Survey

A total of 2676 survey requests were sent out with 74 responses received for a survey response rate of 3%. The results of the survey showed an extremely tight distribution with no statistical differences between the median and 25th percentile for both codes. Furthermore, the recommended RVU for both codes was identical to the RVU of the thermal ablation codes, despite 1/3rd less intra-service time for 36X41. The expert panel

convened to discuss these results and decided that the survey respondents had been inadvertently misled by the RSL and failed to consider the differences in time and intensity when making their recommendations. They overwhelmingly decided that the work of treating incompetent veins was the same regardless of technique. We therefore decided to set aside the survey results and make RVU recommendations base on crosswalks.

Work RVU Recommendation

We are recommending a crosswalk to CPT code 49435 for a value of 2.25 RVW for 364X2.

Comparison to crosswalk code

The crosswalk code chosen by expert panel is 49435 (*Insertion of subcutaneous extension to intraperitoneal cannula or catheter with remote chest exit site*). This crosswalk code is similar to 364X2 in that they are both add on codes with 30 minutes of intra-service time. We feel this code represents a very accurate crosswalk for 364X2 and recommend the value of 2.25 RVW

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
364X2	2.25	0.075	30				30	
49435 Crosswalk	2.25	0.075	30				30	

Comparison to key reference codes

The key reference codes chosen by the majority of the survey respondents were 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites* (49%) and 36479 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; second and subsequent veins treated in a single extremity, each through separate access sites* (39%). These key references are similar to 364X2 in the sense that they are all add on endoluminal venous procedures to treat venous insufficiency. Although the survey respondents indicated 30 minutes of intra-service time, the reference codes also utilize tumescence that 364X2 does not. For this reason, we chose the above crosswalk for a recommended value of 2.25 RVW for CPT 364X2.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36476 Key Ref	2.65	0.088	30				30	
35479 Key Ref	2.65	0.088	30				30	
364X2	2.25	0.075	30				30	

Comparison to MPC codes

There are only 10 ZZZ MPC codes in the RUC database. The majority of these codes have RVW's below 2.0. There is only one ZZZ MPC code with 30 minutes of intra-service time. Therefore, we have chosen the following MPC codes for comparison.

Comparison with MPC List Code, 99292

MPC 99292 *(Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service))* is a ZZZ MPC service with identical times and intensity to 364X2.

Comparison with MPC List Code, 57267

MPC 57267 *(Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure))* is a ZZZ MPC service. It has more intra-service time and a higher intensity compared to 364X2.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
99292 MPC	2.25	0.075	30				30	
364X2	2.25	0.075	30				30	
57267 MPC	4.88	0.108	45				45	

Conclusion

Comparison with our crosswalk code of 49435, key reference services, and comparison with two MPC codes supports our crosswalk recommendation value of 2.25 RVW for CPT code 364X2.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Interventional Radiology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Thermal ablation of an incompetent vein is a common procedure, with a Medicare incidence in 2014 of 177,903 claims for the initial vein (CPT 36475 and 36478) and 21,478 for the secondary vein (CPT 36476 and 36479). Mechanochemical ablation (364X1, 364X2) will be performed based on provider and patient preference in lieu of other ablation techniques, and therefore, utilization is difficult to estimate. Information provided by the manufacturer indicates a 2015 national (both Medicare and non-Medicare) projected utilization above 25,000

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Thermal ablation of an incompetent vein is a common procedure, with a Medicare incidence in 2014 of 177,903 claims for the initial vein (CPT 36475 and 36478) and 21,478 for the secondary vein (CPT 36476 and 36479). Mechanochemical ablation (364X1, 364X2) will be performed based on provider and patient preference in lieu of other ablation techniques, and therefore, utilization is difficult to estimate. Information provided by the manufacturer indicates a 2015 national (both Medicare and non-Medicare) projected utilization above 25,000.

Specialty Frequency 0 Percentage 0.00 %

Global Period: 000 **Meeting Date:** January 2016

36X41 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated*

Global Period: ZZZ **Meeting Date:** January 2016

364X2 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent vein(s) treated in a single extremity, each through separate access sites*

---

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A multispecialty group from SVS, SIR and ACPh convened to make consensus practice expense recommendations. The group included physicians and clinical staff from NF and F settings and various geographic regions.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

This new procedure is currently reported with an unlisted code. As such, we included reference codes on the PE spreadsheet. We included CPT codes 36475 and 36476, which were recently approved by CMS.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We believe there is extensive use of clinical staff time for 36X41. However, we are recommending 12 minutes of nurse blend pre service time instead of the 18 minute standard. We believe our recommendations appropriately reflect the minimal use of clinical staff for these activities.

Complete pre-service diagnostic & referral forms	2
Coordinate pre-surgery services	3
Provide pre-service education/obtain consent	4
Follow-up phone calls & prescriptions	3

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic & referral forms
Coordinate pre-surgery services
Provide pre-service education/obtain consent
Availability of prior images confirmed and reviewed
Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocoled by radiologist

Intra-Service Clinical Labor Activities:

Prepare room, equipment, supplies
Patient is greeted, gowned and escorted into procedure room
Vital signs obtained
Prepare and position patient prone on table / obtain vitals / set up IV / monitor patient
Sterile prep performed and draping of target site
Assist physician in performing procedure
Monitor pt. following service/check tubes, monitors, drains *(not related to moderate sedation)*
Clean room/equipment by physician staff
Technologist archives and QC's images to/in PACS, checking for all images and dose page
Review examination with interpreting MD
Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

AMA/Specialty Society RVS Update Committee Summary of Recommendations

High Volume Growth

April 2014

Endovenous Ablation

At the October 2013 meeting, the Relativity Assessment Workgroup reviewed High Volume Growth Services where Medicare utilization increased by at least 100% from 2006 to 2011. The RUC requested that these services be surveyed for physician work and develop practice expense inputs.

36475 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated***
The RUC reviewed the survey results from 81 physicians for CPT code 36475 and determined that the survey 25th percentile work RVU of 5.30 appropriately accounts for the work required to perform this service. The RUC recommends the following physician times: 34 minutes pre-time, 45 minutes intra-service time and 15 minutes immediate post-time. The RUC noted that the physician work and time has decreased for these services since it was last surveyed and therefore the recommended decrease is appropriate. However, the intensity for this service has increased and the RUC determined that is appropriate as the site in which this service is typically performed has changed. This service is now typically performed in the office and is more intense since the physician is on his/her own. Therefore, more mental effort and stress is placed on the physician to perform properly because if a complication occurs the patient must be transferred to the hospital.

The RUC noted that the work for percutaneous radiofrequency and percutaneous laser services, CPT codes 36475 and 36478 is the same. The RUC compared 36475 to the key reference service 35476 *Transluminal balloon angioplasty, percutaneous; venous* (work RVU = 5.10 and intra-service time 35 minutes) and noted both services are endoluminal venous procedures, however, 36475 requires 10 more minutes of intra-service time and is more intense to perform than 35476. Therefore, 36475 is appropriately valued higher than the key reference service. The RUC also referenced MPC codes 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.71) and 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* (work RVU = 5.44). **The RUC recommends a work RVU of 5.30 for CPT code 36475.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

36476 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 73 physicians for CPT 36476 and determined that the work RVU should be 2.65 work RVUs, half that of the base code 36475 (RUC recommended work RVU = 5.30). The RUC also recommended that the pre-service and post-service time as indicated by the survey respondents be deleted as all work should be accounted for in the base code. The RUC recommends 30 minutes of intra-service time. The RUC referenced similar services 15152 *Tissue cultured skin autograft, trunk, arms, legs; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 2.50) and 15156 *Tissue cultured skin autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; additional 1 sq cm to 75 sq cm (List separately in addition to code for primary procedure)* (work RVU = 2.75), which demonstrate the relativity of CPT code 36476 among other similar services. Lastly, the RUC referenced MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 2.25). **The RUC recommends a work RVU of 2.65 for CPT code 36476.**

36478 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated***

The RUC reviewed the survey results from 81 physicians for CPT code 36478 and determined that the survey 25th percentile work RVU of 5.30 appropriately accounts for the work required to perform this service. The RUC recommends the following physician times: 34 minutes pre-time, 45 minutes intra-service time and 15 minutes immediate post-service time. The RUC noted that the physician work and time has decreased for these services since it was last surveyed and therefore the recommended decrease is appropriate. However, the intensity for this service has increased and the RUC determined that is appropriate as the site in which this service is typically performed has changed. This service is now typically performed in the office and is more intense, since the physician is on his/her own. Therefore, more mental effort and stress is placed on the physician to perform properly because, if a complication occurs, the patient must be transferred to the hospital.

The RUC noted that the work for percutaneous radiofrequency and percutaneous laser services, CPT codes 36475 and 36478 is the same .The RUC compared 36478 to the key reference service 35476 *Transluminal balloon angioplasty, percutaneous; venous* (work RVU = 5.10) and noted both services are endoluminal venous procedures, however, 36478 requires 10 more minutes of intra-service time and is more intense to perform than 35476. Therefore, 36478 is appropriately valued higher than the key reference service. The RUC also referenced MPC codes 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.71) and 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* (work RVU = 5.44). **The RUC recommends a work RVU of 5.30 for CPT code 36478.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

36479 ***Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 75 physicians for CPT 36479 and determined that the work RVU should be 2.65 work RVUs, half that of the base code 36478 (RUC recommended work RVU = 5.30). The RUC also recommended that the pre-service and post-service time as indicated by the survey respondents be deleted as all work should be accounted for in the base code. The RUC recommends 30 minutes of intra-service time. The RUC referenced similar services 15152 *Tissue cultured skin autograft, trunk, arms, legs; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 2.50) and 15156 *Tissue cultured skin autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; additional 1 sq cm to 75 sq cm (List separately in addition to code for primary procedure)* (work RVU = 2.75), which demonstrate the relativity of CPT code 36479 among other similar services. Lastly, the RUC referenced MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 2.25). **The RUC recommends a work RVU of 2.65 for CPT code 36479.**

New Technology

CPT codes 36475, 36476, 36478 and 36479 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and specifically review utilization trends.

Work Neutrality

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense

The Practice Expense Subcommittee deleted sedation for the clinical labor staff on line 35, and eliminated the duplicative tilt table from the equipment. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
36475	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated	000	5.30
36476	second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)	ZZZ	2.65
36478	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated	000	5.30
36479	second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)	ZZZ	2.65

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36475 Tracking Number Original Specialty Recommended RVU: **5.30**
Presented Recommended RVU: **5.30**
Global Period: 000 RUC Recommended RVU: **5.30**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous radiofrequency ablation therapy of the insufficient saphenous vein is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The operating physician reviews the previously obtained diagnostic non-invasive imaging studies, history and physical exam, and lab tests. The procedure is reviewed with the patient, including a final discussion of risks, benefits and alternatives. Informed consent is obtained. The physician checks to ensure presence of sterile drapes, sterile ultrasound probe cover, gel, flush solutions, pressure bag and sterile IV set, local tumescent anesthetic, scalpel, access needle, dilator, vascular sheath, guide wires, sterile Radiofrequency ablation catheter, and other necessary supplies and equipment. Change into surgical scrubs and position patient such that target veins are accessible. Prep and drape patient. Instill local anesthesia at access site prior to vein access and continued local anesthesia as needed throughout procedure.

Description of Intra-Service Work:
•Set up operating field
•Attach pressurized heparin saline drip to the sterile Radiofrequency ablation catheter.
•Test actuation, temperature, and impedance to ensure that all components are connected and operating properly.
•Use ultrasound guidance to find target greater saphenous vein (GSV) access site
•Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
•Use ultrasound guidance to map vein tributaries•
•Access vein under ultrasound guidance (not separately reportable)
•Using Seldinger technique to introduce guide wire
•Advance dilator over guidewire

•Exchange dilator for sheath of appropriate size.
•Remove guidewire and flush sheath.
•Place RF probe through the sheath and advance to the saphenofemoral junction using ultrasound guidance
•Locate tip of probe just below the superficial epigastric tributary vein
•Verify RF probe position by ultrasound
•Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a "halo" of fluid around the GSV from the entry site to the saphenofemoral junction (not separately reportable)
•With patient in Trendelenberg, verify target parameters are within acceptable range
•Reconfirm RF position with ultrasound imaging
•Apply RF energy
•Carefully withdraw probe, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
•Monitor impedance, power and vein wall temperature throughout procedure.
•Record total RF application time
•Repeat ultrasound of the saphenous to confirm successful ablation, capture images
•Capture images of the common femoral vein with and without compression to ensure no thrombus or involvement of the common femoral vein in the ablation.

Description of Post-Service Work:
•Elevate extremity and apply sterile dressings.
•Apply compression wrap or stocking starting at foot and ending at most proximal thigh
•Transfer patient to stretcher
•Ensure patient hemodynamic stability and comfort in Recovery area
•Write orders
•Dictate operative note
•Review results with patient's family
•Communicate with referring physician
•Review results with patient after sedation wears off
•Evaluate after recovery interval for discharge suitability
•Provide discharge activity advice to patient/family
•Arrange for follow-up care as required

Pre-Service intensity/complexity	2.80	2.87
Intra-Service intensity/complexity	3.20	3.27

Post-Service intensity/complexity	2.20	2.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

36475 Rationale for Recommendation

Background
In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

Methodology
A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

DISCLOSURE
After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treats venous disease. This communication was emailed to all of their members on March 10th and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10th to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

Results of Survey
Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a ***reduction*** the in the RVW from a current value of 6.72 to the 25th percentile from our survey data.

Work RVU Recommendation
We are recommending the 25th percentile survey value of 5.30 RVW for 36475.

Pre-time
Pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with addition time added as outlined below.

Evaluation: An additional 27 minutes of pre-service evaluation time was identified by the survey recipients. The societies recommend adding 3 minutes of evaluation time to check and calibrate the radiofrequency generator as these tasks are not captured in the standard package.

Positioning: An additional 9 minutes of pre-service positioning time was identified by the survey recipients. The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.

Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

Comparison to key reference code

The key reference code chosen by the majority of the survey respondents (19%) was 35476 (*Transluminal balloon angioplasty, percutaneous; venous*). This key reference is similar to 36475 in the sense that they are both endoluminal venous procedures. The primary difference between 35476 and 36475 lies in the intra-service time and intensity. The time of CPT Code 36475 is more than the key reference code but 36475 is slightly less intense. This comparison thus favorably supports our recommendation for the 25th percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
Survey	**36475**	5.30	0.097	94	20	4	10	45	15
Key Ref	**35476**	5.10	0.118	81	17	4	5	35	20

Comparison to MPC codes

Comparison with MPC List Code, CPT 37191 – RVW 4.71

37191 *(Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed)* is a 0-day global MPC service with similar times and intensity to 36475. Both 36475 and 37191 are endoluminal venous procedures that require technical skill to complete successfully. 36475 has more intra-service time than 37191supporting our recommendation for the 25th percentile survey RVW of 5.30.

Comparison with MPC List Code, CPT 52235 – RVW 5.44

52235 *(Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm))* is a 0-day global MPC service with similar intra-service time and intensity to 36475. Both 52235 and 36475 require technical skill to complete successfully. 52235 and 36475 have identical intra-service times and almost identical intensities. The pre- and post-service times have minor variations. In conclusion, comparison with this MPC code justifies our recommendation for the 25th percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
MPC	**37191**	4.71	0.120	83	30	3	5	30	15
Survey	**36475**	5.30	0.097	94	20	4	10	45	15
MPC	**52235**	5.44	0.098	94	19	5	5	45	20

Conclusion

Favorable comparison with the key reference service and two MPC codes supports our recommendation of the 25th percentile survey value of 5.30 RVW for 36475.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36475

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 68,276 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery Frequency 37000 Percentage 54.19 %

Specialty Cardiology Frequency 14000 Percentage 20.50 %

Specialty Radiology Frequency 5000 Percentage 7.32 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36475

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36476 Tracking Number Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: ZZZ RUC Recommended RVU: **2.65**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great and small saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous radiofrequency ablation therapy of the insufficient great and small saphenous veins is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Additional pre-service work includes examining the extra veins to be ablated, review of additional pre-procedural imaging services, extra time positioning the patient such that both the primary vein and the additional vein are accessible for treatment, and instillation of local anesthesia at the new access site prior to vein access and continued local anesthesia as needed throughout procedure. This is important because the typical second vein is the lesser saphenous, which is located directly posterior on the calf. Operators must be able to reach this vein in addition to the primary target, the greater saphenous, which is located medially.

Description of Intra-Service Work:
•Retest actuation, temperature, and impedance to ensure that all components are connected and operating properly.
•Use ultrasound guidance to find target secondary vein access site
•Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
•Use ultrasound guidance to map vein tributaries
•Access vein under ultrasound guidance (not separately reportable)
•Using Seldinger technique to introduce guide wire
•Advance dilator over guidewire
•Exchange dilator for sheath of appropriate size.
•Remove guidewire and flush sheath.

•Place RF probe through the sheath and advance to target endpoint using ultrasound guidance
•Verify RF probe position by ultrasound
•Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a “halo” of fluid around the target vein from the entry site to the endpoint (not separately reportable)
•With patient in Trendelenberg, verify target parameters are within acceptable range
•Reconfirm RF position with ultrasound imaging
•Apply RF energy
•Carefully withdraw probe, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
•Monitor impedance, power and vein wall temperature throughout procedure.
•Record total RF application time
•Repeat ultrasound of the saphenous to confirm successful ablation, capture images
•Capture images of the popliteal vein with and without compression to ensure no thrombus or involvement of the popliteal vein in the ablation.

Description of Post-Service Work:
Additional post-service work over and above that already provided for the primary procedure includes:
•apply additional dressings;
•dictating extra procedural details in the operative report; and
•longer discussion and explanation to patient and family.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

36476 Rationale for Recommendation

Background

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

Methodology

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

*****DISCLOSURE*****

After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treats venous disease. This communication was emailed to all of their members on March 10th and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10th to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

Results of Survey

Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a ***reduction*** the in the RVW from a current value of 3.38.

Comparison to key reference code

The key reference code chosen by the majority of the survey respondents (27%) was 37222 (*Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*). This key reference is similar to 36476 in the sense that they are both endoluminal procedures. The primary difference between 37222 and 36476 lies in the pre-, intra-, and post-service times. 36476 has 10 minutes less of intra-service time supporting the decreased RVW in comparison to the key reference service. This comparison thus favorably supports our recommendation for the 25th percentile survey value of 3.00.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
Survey	**36476**	2.65	0.088	30	0	0	0	30	0
Key Ref	**37222**	3.73	0.092	42	1	0	0	40	1

Comparison to MPC codes

Comparison with MPC List Code, CPT 99292 – RVW 2.25

99292 *(Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service))* is a ZZZ global MPC service with similar times and

intensity to 36476. Both 36476 and 99292 are add on codes with 30 minutes of intra-service time. 36476 has a higher intensity and 10 more minutes of total time accounting for the difference in RVW. Therefore, comparison with this MPC code justifies our recommendation for the 25th percentile survey value of 3.00.

Comparison with MPC List Code, CPT 57267 – RVW 4.88

57267 *(Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure))* is a ZZZ global MPC service with similar intensity to 36476. 57267 has 15 more minutes of intra-service time accounting for the higher RVW. This MPC code comparison supports our recommendation for the 25th percentile survey value of 3.00.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
MPC	**99292**	2.25	0.075	30	0	0	0	30	0
Survey	**36476**	2.65	0.088	30	0	0	0	30	0
MPC	**57267**	4.88	0.108	45	0	0	0	45	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36476

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,494
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery	Frequency 4700	Percentage 62.71 %
Specialty Cardiology	Frequency 700	Percentage 9.34 %
Specialty Radiology	Frequency 600	Percentage 8.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous laser ablation therapy of the insufficient saphenous vein is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The operating physician reviews the previously obtained diagnostic non-invasive imaging studies, history and physical exam, and lab tests. The procedure is reviewed with the patient, including a final discussion of risks, benefits and alternatives. Informed consent is obtained. The physician checks to ensure presence of sterile drapes, sterile ultrasound probe cover, gel, flush solutions, pressure bag and sterile IV set, local tumescent anesthetic, scalpel, access needle, dilator, vascular sheath, guide wires, laser fiber, safety goggles for all present during the procedure and any other necessary supplies and equipment. Change into surgical scrubs and position patient such that target veins are accessible. Prep, drape and place safety goggles on patient. Instill local anesthesia at access site prior to vein access and continued local anesthesia as needed throughout procedure.

Description of Intra-Service Work:
•Set up operating field
•Attach pressurized heparin saline drip to the sterile laser ablation catheter.
•Test actuation, temperature, and impedance to ensure that all components are connected and operating properly.
•Use ultrasound guidance to find target greater saphenous vein (GSV) access site
•Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
•Use ultrasound guidance to map vein tributaries
•Access vein under ultrasound guidance (not separately reportable)
•Using Seldinger technique to introduce guide wire
•Advance dilator over guidewire

•Exchange dilator for sheath of appropriate size.
•Remove guidewire and flush sheath.
•Place laser fiber through the sheath and advance to the saphenofemoral junction using ultrasound guidance
•Locate tip of fiber just below the superficial epigastric tributary vein
•Verify fiber position by ultrasound
•Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a “halo” of fluid around the GSV from the entry site to the saphenofemoral junction (not separately reportable)
•With patient in Trendelenberg, verify target parameters are within acceptable range
•Reconfirm laser fiber position with ultrasound imaging
•Apply laser energy
•Carefully withdraw laser fiber, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
•Monitor impedance, power and vein wall temperature throughout procedure.
•Record total laser application time
•Repeat ultrasound of the saphenous to confirm successful ablation, capture images
•Capture images of the common femoral vein with and without compression to ensure no thrombus or involvement of the common femoral vein in the ablation.

Description of Post-Service Work:
•Elevate extremity and apply sterile dressings.
•Apply compression wrap or stocking starting at foot and ending at most proximal thigh
•Transfer patient to stretcher
•Ensure patient hemodynamic stability and comfort in Recovery area
•Write orders
•Dictate operative note
•Review results with patient’s family
•Communicate with referring physician
•Review results with patient after sedation wears off
•Evaluate after recovery interval for discharge suitability
•Provide discharge activity advice to patient/family
•Arrange for follow-up care as required

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

36478 Rationale for Recommendation

Background

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

Methodology

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

*****DISCLOSURE*****

After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treats venous disease. This communication was emailed to all of their members on March 10th and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10th to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

Results of Survey

Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a ***reduction*** the in the RVW from a current value of 6.72 to the 25th percentile from our survey data.

Work RVU Recommendation

We are recommending the 25th percentile survey value of 5.30 RVW for 36478.

Pre-time

Pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with addition time added as outlined below.

Evaluation: An additional 27 minutes of pre-service evaluation time was identified by the survey recipients. The societies recommend adding 3 minutes to evaluation time to check and calibrate the laser generator as these tasks are not captured in the standard package.

Positioning: An additional 9 minutes of pre-service positioning time was identified by the survey recipients. The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.

Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

Comparison to key reference code

The key reference code chosen by the majority of the survey respondents (14%) was 35476 (*Transluminal balloon angioplasty, percutaneous; venous*). This key reference is similar to 36475 in the sense that they are both endoluminal venous procedures. The primary difference between 35476 and 36475 lies in the intra-service time and intensity. The time of CPT Code 36475 is more than the key reference code but 36475 is slightly less intense. This comparison thus favorably supports our recommendation for the 25th percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
Survey	**36478**	5.30	0.097	94	20	4	10	45	15
Key Ref	**35476**	5.10	0.118	81	17	4	5	35	20

Comparison to MPC codes

Comparison with MPC List Code, CPT 37191 – RVW 4.71

37191 *(Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed)* is a 0-day global MPC service with similar times and intensity to 36478. Both 36478 and 37191 are endoluminal venous procedures that require technical skill to complete successfully. 36475 has more intra-service time than 37191supporting our recommendation for the 25th percentile survey value of 5.30.

Comparison with MPC List Code, CPT 52235 – RVW 5.44

52235 *(Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm))* is a 0-day global MPC service with similar intra-service time and intensity to 36478. Both 52235 and 36478 require technical skill to complete successfully. 52235 and 36475 have identical intra-service times and almost identical intensities. The pre- and post-service times have minor variations. In conclusion, comparison with this MPC code justifies our recommendation for the 25th percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
MPC	**37191**	4.71	0.120	83	30	3	5	30	15
Survey	**36478**	5.30	0.097	94	20	4	10	45	15
MPC	**52235**	5.44	0.098	94	19	5	5	45	20

Conclusion

Favorable comparison with the key reference service and two MPC codes supports our recommendation of the 25th percentile survey value of 5.30 RVW for 36478.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36478

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery (V&GS) How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology (D&IR) How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
36,478 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery (V&GS) Frequency 17550 Percentage 48.11 %

Specialty Cardiology Frequency 4800 Percentage 13.15 %

Specialty Radiology (D&IR) Frequency 3700 Percentage 10.14 %

Do many physicians perform this service across the United States? Yes

---

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36479 Tracking Number

Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
RUC Recommended RVU: **2.65**

Global Period: ZZZ

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great and small saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous laser ablation therapy of the insufficient great and small saphenous veins is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Additional pre-service work includes examining the extra veins to be ablated, review of additional pre-procedural imaging services, extra time positioning the patient such that both the primary vein and the additional vein are accessible for treatment, and instillation of local anesthesia at the new access site prior to vein access and continued local anesthesia as needed throughout procedure. This is important because the typical second vein is the lesser saphenous, which is located directly posterior on the calf. Operators must be able to reach this vein in addition to the primary target, the greater saphenous, which is located medially.

Description of Intra-Service Work:
•Use ultrasound guidance to find target secondary vein access site
•Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
•Use ultrasound guidance to map vein tributaries
•Access vein under ultrasound guidance (not separately reportable)
•Using Seldinger technique to introduce guide wire
•Advance dilator over guidewire
•Exchange dilator for sheath of appropriate size.
•Remove guidewire and flush sheath.
•Place laser fiber through the sheath and advance to target endpoint using ultrasound guidance
•Verify laser fiber position by ultrasound

•Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a “halo” of fluid around the target vein from the entry site to the endpoint (not separately reportable)
•With patient in Trendelenberg, verify target parameters are within acceptable range
•Reconfirm laser fiber position with ultrasound imaging
•Apply laser energy
•Carefully withdraw laser fiber, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
•Monitor impedance, power and vein wall temperature throughout procedure.
•Record total laser application time
•Repeat ultrasound of the saphenous to confirm successful ablation, capture images
•Capture images of the popliteal vein with and without compression to ensure no thrombus or involvement of the poplitea vein in the ablation.

Description of Post-Service Work:
Additional post-service work over and above that already provided for the primary procedure includes:
•apply additional dressings;
•dictating extra procedural details in the operative report; and
•longer discussion and explanation to patient and family.

Intra-Service intensity/complexity	3.37	3.21

Post-Service intensity/complexity	2.63	2.63

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

36479 Rationale for Recommendation

Background

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

Methodology

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

*****DISCLOSURE*****

After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treats venous disease. This communication was emailed to all of their members on March 10th and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10th to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

Results of Survey

Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a ***reduction*** the in the wRVU from a current value of 3.38.

Comparison to key reference code

The key reference code chosen by the majority of the survey respondents (25%) was 37239 (*Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; each additional vein (List separately in addition to code for primary procedure)*). This key reference is similar to 36476 in the sense that they are both endoluminal venous procedures. They have identical intra-service times and very similar intensities. This comparison thus favorably supports our recommendation for the 25th percentile survey value of 3.00.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
Survey	**36479**	2.65	08893	40	0	0	0	30	0
Key Ref	**37239**	2.97	0.098	32	1	0	0	30	1

Comparison to MPC codes

Comparison with MPC List Code, CPT 99292 – RVW 2.25

99292 *(Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service))* is a ZZZ global MPC service with similar times and intensity to 36476. Both 36476 and 99292 are add on codes with 30 minutes of intra-service time. 36476 has a higher

intensity and 10 more minutes of total time accounting for the difference in RVW. Therefore, comparison with this MPC code justifies our recommendation for the 25th percentile survey value of 3.00.

Comparison with MPC List Code, CPT 57267 – RVW 4.88

57267 *(Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure))* is a ZZZ global MPC service with similar intensity to 36476. 57267 has 15 more minutes of intra-service time accounting for the higher RVW. This MPC code comparison supports our recommendation for the 25th percentile survey value of 3.00.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36479

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,563 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery	Frequency 7300	Percentage 63.13 %
Specialty Cardiology	Frequency 850	Percentage 7.35 %
Specialty Radiology	Frequency 1400	Percentage 12.10 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

36475 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **radiofrequency**; **first** vein treated

36476 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **radiofrequency**; **second** and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

36478 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **laser**; **first** vein treated

36479 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **laser**; **second** and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

Global Period: **36475 & 36478 - 000**
36476 & 36479 - ZZZ

Meeting Date: **April 2014**

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The multispecialty organizations (SVS, ACS, SIR, ACR, ACC, SCAI and ACP) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this procedure. The panel made recommendations based on existing inputs and the new coding conventions.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We are making recommendations for existing CPT codes. As such, we have included the current direct PE recommendations and not a reference code.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

CPT Codes 36475 & 36478:

Pre-Service Clinical Labor Activities:
Complete pre-service diagnostic and referral forms: a clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. Coordinate pre-surgery services. Clinical staff member ensures that all appropriate labs are drawn and results are acceptable. Schedule space and equipment in facility. Provide pre-service education/obtain consent. Follow-up phone calls and prescriptions: Clinical staff will contact the patient prior to the procedure, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed.

DAY OF Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities:
Conducts phone calls/call in prescription.

CPT Codes 36476 & 36479:

Pre-Service Clinical Labor Activities:
N/A

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities:
N/A

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Pre Service Period
Lines 23 & 24 - Added 4 minutes for digital activities. The existing inputs do not include minutes to account for these activities.

Service Period
We have modified the 'assist physician" section of the PE recommendations to reflect current PE 'standard' for interventional procedures. (Source: carotids, embo, stents).
Line 39 – recommended 75% total physician time for tech to acquire images (current 'standard' for interventional procedures)
Line 40 – added RN/LPN/MTA time to account for the 25% circulator
Line 42 – added RN/LPN/MTA time to apply multi-layer comprehensive dressing
Line 44 – increased post procedure monitoring from 3 min to 8 min. The 8 min represents the standard for 30 min of post procedure monitoring.

5. Please describe in detail the clinical activities of your staff:

CPT Codes 36475 & 36478:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms: a clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. Coordinate pre-surgery services: Clinical staff member ensures that all appropriate labs are drawn and results are acceptable. Follow-up phone calls and prescriptions: Clinical staff will contact the patient prior to the procedure, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed. Other clinical activities: The vascular technologist prior to the patient's arrival will retrieve any prior imaging exams, display these exams for the physician to review, verify orders, review the chart to incorporate any relative clinical information.

DAY OF Service Clinical Labor Activities:

Greet patient, provide gowning, and ensure appropriate medical records are available: Patient is greeted by the clinical staff, escorted to the intake area, provided with gowning and given assistance with changing into the gown if needed. Obtain vital signs: blood pressure, heart rate, respiratory rate, temperature, rhythm strip and pulse oximetry, are all obtained. Prepare room, equipment, supplies: Vascular technologist checks imaging equipment to make sure that it is turned on, warmed up, functioning properly, enters the patient demographics, opens the sterile tray and sets it up, goes to the storage room to pull all the supplies that will be used for the procedure, and brings them to the procedure room. Prepare and position patient/Monitor patient/Setup IV. Intra-service Time of varying clinical personnel: a vascular tech is scrubbed next to the physician the entire case, an additional individual who is not scrubbed will assist with

the imaging equipment and opening supplies. Monitor patient following service/Check tubes, monitors, drains. The patients are recovered before being discharged. Check dressings and wound/home care instructions/coordinated office visits/prescriptions. In addition to checking the dressings and reviewing at home instructions the clinical staff will also discuss pain prescriptions for the patients and review the medications with them. Other clinical activities: The vascular tech post procedure annotates the images, processes them, and then either hangs the films for interpretation or sends digital images to PACS and ensures they are received.

Post-Service Clinical Labor Activities:

Conducts phone calls/call in prescription.

CPT Codes 36476 & 36479:

Pre-Service Clinical Labor Activities:

N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% or More

January 2016

Dialysis Circuit

In January 2015, the Joint CPT/RUC Workgroup on Codes Reported Together Frequently identified codes 35475, 35476, 36147, 36148, 37236, 37238, 75791, 75962, and 75968 as being frequently reported together in various combinations. At the October 2015 CPT Editorial Panel meeting, the Panel approved the creation of nine new codes and deletion of four codes to describe bundled dialysis circuit intervention services.

369X1 ***Introduction of needle(s) and/or catheter(s), dialysis circuit, with diagnostic angiography of the dialysis circuit, including all direct puncture(s) and catheter placement(s), injection(s) of contrast, all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava, fluoroscopic guidance, radiologic supervision and interpretation and image documentation and report***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologists and vascular surgeons and agreed with the following physician time components: pre-service time of 26 minutes, intra-service time of 25 minutes and immediate post-service time of 15 minutes. The RUC agreed that 3 additional minutes above the standard pre-service time package is necessary because the procedure is performed on the extremity, typically the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. In addition, the RUC added 5 minutes to the scrub, dress and wait time, as the pre-service time package does not allocate minutes for dressing and scrubbing for the procedure, only for administration of a local anesthetic. Sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overestimate the work involved in the service at the 25th percentile work RVU of 3.72. To determine an appropriate work RVU, the RUC compared the surveyed code to CPT code 45378 *Colonoscopy, flexible; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)* (work RVU= 3.36, intra time= 25 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC recommends a work RVU of 3.36, a direct work RVU crosswalk from code 45378, for CPT code 369X1. To justify a work RVU of 3.36, the RUC reviewed CPT codes 19083 *Biopsy, breast, with placement of breast localization device(s) (eg, clip, metallic pellet), when performed, and imaging of the biopsy specimen, when performed, percutaneous; first lesion, including ultrasound guidance* (work RVU= 3.10, intra time= 25 minutes) and 15277 *Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

digits, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children (work RVU= 4.00, intra time= 25 minutes) and agreed that these two services, with identical intra-service time and comparable work, provide accurate comparisons to the recommended value. **The RUC recommends a work RVU of 3.36 for CPT code 369X1.**

369X2 ***Introduction of needle(s) and/or catheter(s), dialysis circuit, with diagnostic angiography of the dialysis circuit, including all direct puncture(s) and catheter placement(s), injection(s) of contrast, all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava, fluoroscopic guidance, radiologic supervision and interpretation and image documentation and report; with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologists and vascular surgeons and agreed with the following physician time components: pre-service time of 26 minutes, intra-service time of 40 minutes and immediate post-service time of 20 minutes. The RUC agreed that 3 additional minutes above the standard pre-service time package is necessary because the procedure is performed on the extremity, typically the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. In addition, the RUC added 5 minutes to the scrub, dress and wait time, as the pre-service time package does not allocate minutes for dressing and scrubbing for the procedure, only for administration of a local anesthetic. Sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overestimate the work involved in the service at the 25th percentile work RVU of 6.00. To determine an appropriate work RVU, the RUC compared the surveyed code to CPT code 43253 *Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided transmural injection of diagnostic or therapeutic substance(s) (eg, anesthetic, neurolytic agent) or fiducial marker(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)* (work RVU= 4.83, intra time= 40 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC recommends a work RVU of 4.83, a direct work RVU crosswalk from code 43253, for CPT code 369X2. To justify a work RVU of 4.83, the RUC reviewed MPC code 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* (work RVU= 5.44, intra time= 45 minutes) and CPT code 45393 *Colonoscopy, flexible; with decompression (for pathologic distention) (eg, volvulus, megacolon), including placement of decompression tube, when performed* (work RVU= 4.78, intra time= 40 minutes) and agreed that these two services, with similar intra-service time and work, provide accurate comparisons to the recommended value. **The RUC recommends a work RVU of 4.83 for CPT code 369X2.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

369X3 ***Introduction of needle(s) and/or catheter(s), dialysis circuit, with diagnostic angiography of the dialysis circuit, including all direct puncture(s) and catheter placement(s), injection(s) of contrast, all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava, fluoroscopic guidance, radiologic supervision and interpretation and image documentation and report; with transcatheter placement of intravascular stent(s) peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis segment***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologistsand vascular surgeons and agreed with the following physician time components: pre-service time of 26 minutes, intra-service time of 50 minutes and immediate post-service time of 20 minutes. The RUC agreed that 3 additional minutes above the standard pre-service time package is necessary because the procedure is performed on the extremity, typically the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. In addition, the RUC added 5 minutes to the scrub, dress and wait time, as the pre-service time package does not allocate minutes for dressing and scrubbing for the procedure, only for administration of a local anesthetic. Sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overestimate the work involved in the service at the 25th percentile work RVU of 8.00. To determine an appropriate work RVU, the RUC compared the surveyed code to CPT code 52282 *Cystourethroscopy, with insertion of permanent urethral stent* (work RVU= 6.39, intra time= 50 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC recommends a work RVU of 6.39, a direct work RVU crosswalk from code 52282, for CPT code 369X3. To justify a work RVU of 6.39, the RUC reviewed CPT codes 36224 *Selective catheter placement, internal carotid artery, unilateral, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed* (work RVU= 6.50, intra time= 50 minutes) and 93459 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed, catheter placement(s) in bypass graft(s) (internal mammary, free arterial, venous grafts) with bypass graft angiography* (work RVU= 6.60, intra time= 50 minutes) and agreed that these two services, with identical intra-service time and comparable work, provide accurate comparisons to the recommended value. **The RUC recommends a work RVU of 6.39 for CPT code 369X3.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

369X4 ***Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s)***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologists and vascular surgeons and agreed with the following physician time components: pre-service time of 31 minutes, intra-service time of 60 minutes and immediate post-service time of 20 minutes. The RUC agreed that 3 additional minutes above the standard pre-service time package is necessary because the procedure is performed on the extremity, typically the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. In addition, the RUC added 5 minutes to the scrub, dress and wait time, as the pre-service time package does not allocate minutes for dressing and scrubbing for the procedure, only for administration of a local anesthetic. Sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results accurately value this service at the 25th percentile work RVU of 7.50. To justify a work RVU of 7.50, the RUC compared the surveyed code to MPC code 52353*Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* (work RVU= 7.50, intra time = 60 minutes) and agreed that since both services should be valued the same, given their identical intra-service times and comparable physician work. The RUC also reviewed CPT codes 39402 *Mediastinoscopy; with lymph node biopsy(ies) (eg, lung cancer staging)* (work RVU= 7.25, intra time= 60 minutes) and 37211 *Transcatheter therapy, arterial infusion for thrombolysis other than coronary or intracranial, any method, including radiological supervision and interpretation, initial treatment day* (work RVU= 8.00, intra time= 60 minutes) and agreed that these two services, with identical intra-service time and comparable work, provide accurate comparisons to the recommended value. **The RUC recommends a work RVU of 7.50 for CPT code 369X4.**

369X5 ***Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologists and vascular surgeons and agreed with the following physician time components: pre-service time of 31 minutes, intra-service time of 75 minutes and immediate post-service time of 20 minutes. The RUC agreed that 3 additional minutes above the standard pre-service time package is necessary because the procedure is performed on the extremity, typically the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. In addition, the RUC added 5 minutes to the scrub, dress and wait time, as the pre-service time package does not allocate minutes for dressing and scrubbing for the procedure, only for administration of a local anesthetic. Sterile operating room technique is

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results accurately value this service at the 25th percentile work RVU of 9.00. To justify a work RVU of 9.00, the RUC compared the surveyed code to CPT codes 37224 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty* (work RVU= 9.00, intra time= 80 minutes) and 43265 *Endoscopic retrograde cholangiopancreatography (ERCP); with destruction of calculi, any method (eg, mechanical, electrohydraulic, lithotripsy)* (work RVU= 8.03, intra time= 78 minutes) and agreed that these two services, with comparable intra-service time and work, provide accurate comparisons to the recommended value. Finally, the RUC noted that code 389X5 has 15 additional minutes of intra-service time compared to 369X4, resulting in an appropriate increment of 1.50 work RVUs. **The RUC recommends a work RVU of 9.00 for CPT code 369X5.**

369X6 ***Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of an intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation to perform the stenting and all angioplasty within the peripheral dialysis circuit***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologists and vascular surgeons and agreed with the following physician time components: pre-service time of 31 minutes, intra-service time of 90 minutes and immediate post-service time of 20 minutes. The RUC agreed that 3 additional minutes above the standard pre-service time package is necessary because the procedure is performed on the extremity, typically the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. In addition, the RUC added 5 minutes to the scrub, dress and wait time, as the pre-service time package does not allocate minutes for dressing and scrubbing for the procedure, only for administration of a local anesthetic. Sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results accurately value this service at the 25th percentile work RVU of 10.42. To justify a work RVU of 10.42, the RUC compared the surveyed code to the second key reference code 37221 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 10.00, intra time= 90 minutes) and agreed that since both services have identical intra-service time, they should both be valued similarly. The RUC also reviewed CPT codes 61650 *Endovascular intracranial prolonged administration of pharmacologic agent(s) other than for thrombolysis, arterial, including catheter placement, diagnostic angiography, and imaging guidance; initial vascular territory* (work RVU= 10.00, intra time= 90 minutes) and 37226 *Revascularization, endovascular, open or percutaneous,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (work RVU= 10.49, intra time= 90 minutes) and agreed that these two services, with comparable intra-service time and work, provide accurate comparisons to the recommended value. Finally, the RUC noted that code 379X6 has 15 additional minutes of intra-service time compared to 369X5, resulting in an appropriate increment of approximately 1.50 work RVUs that was established between 369X4 and 369X5. **The RUC recommends a work RVU of 10.42 for CPT code 369X6.**

369X7 ***Transluminal balloon angioplasty, central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the angioplasty (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologists and vascular surgeons and agreed that an intra-service time of 25 minutes is appropriate for this add-on procedure.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overestimate the work involved in the service at the 25th percentile work RVU of 3.73. To determine an appropriate work RVU, the RUC compared the surveyed code to CPT code 32506 *Thoracotomy; with therapeutic wedge resection (eg, mass or nodule), each additional resection, ipsilateral* (work RVU= 3.00, intra time= 25 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC recommends a work RVU of 3.00, a direct work RVU crosswalk from code 32506, for CPT code 369X7. To justify a work RVU of 3.00, the RUC reviewed CPT code 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites* (work RVU= 2.65, intra time= 30 minutes) and 61782 *Stereotactic computer-assisted (navigational) procedure; cranial, extradural* (work RVU= 3.18, intra time= 25 minutes) and agreed that these two services, with similar intra-service time and work, provide accurate comparisons to the recommended value. **The RUC recommends a work RVU of 3.00 for CPT code 369X7.**

369X8 ***Transcatheter placement of an intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologist and vascular surgeons and agreed that an intra-service time of 40 minutes is appropriate for this add-on procedure.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results accurately value this service at the 25th percentile work RVU of 4.25. To justify a work RVU of 4.25, the RUC compared the surveyed code to the top key reference code 37223 *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 4.25, intra time= 45 minutes) and noted that while the reference code

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

has 5 additional minutes of intra-service time, 369X8 represents more intense work and is justifiably valued the same. The RUC also reviewed CPT code 37232 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty* (work RVU= 4.00, intra time= 40 minutes) and agreed that this service, with similar intra-service time and work, provide an accurate comparison to the recommended value. **The RUC recommends a work RVU of 4.25 for CPT code 369X8.**

369X9 ***Dialysis circuit permanent vascular embolization or occlusion (including main circuit or any accessory veins), endovascular, including all imaging and radiological supervision and interpretation necessary to complete the intervention (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 114 interventional radiologists, nephrologists and vascular surgeons and agreed that an intra-service time of 30 minutes is appropriate for this add-on procedure.

The RUC reviewed the survey respondents' physician work values and agreed that the survey 25th percentile work RVU of 4.25 is too high for this procedure. To determine an appropriate work value, the RUC compared the surveyed code to CPT code 38746 *Thoracic lymphadenectomy by thoracotomy, mediastinal and regional lymphadenectomy* (work RVU= 4.12, intra time= 30 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC recommends a work RVU of 4.12, a direct work RVU crosswalk from code 38746, for CPT code 369X9. To justify a work RVU of 4.12, the RUC reviewed CPT codes 32674*Thoracoscopy, surgical; with mediastinal and regional lymphadenectomy* (work RVU= 4.12, intra time= 30 minutes and 36228 *Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery)* (work RVU= 4.25, intra time= 30 minutes) and agreed that these two services, with identical intra-service time and work, provide accurate comparisons to the recommended value.

The RUC also compared this service to the similar transluminal balloon angioplasty service reviewed at this meeting, CPT code 372X4 (RUC recommended work RVU of 2.97). The RUC noted that while these two services have identical intra-service times, embolization of the fistula is a very different, more complex service than an angioplasty. CPT code 369X9 involves manipulating the catheter more frequently than an angioplasty. The physician is also depositing multiple coils and coil placement is important as the risk that the coil may travel centrally in to the pulmonary vasculature is high. Furthermore, the RUC noted that code 369X9 is the next step following the work of code 369X1 and therefore represents an appropriate increase above 369X1 (RUC recommended work RVU= 3.36, intra time= 25 minutes) given the 5 additional minutes of intra-service time. **The RUC recommends a work RVU of 4.12 for CPT code 369X9.**

Practice Expense
The RUC approved the direct practice expense inputs as modified by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Arteries and Veins **Vascular Injection Procedures** **Intra-Arterial-Intra-Aortic** ~~***Diagnostic Studies of Arteriovenous (AV) Shunts for Dialysis:*** *For diagnostic studies, the arteriovenous (AV) dialysis shunt (AV shunt) is defined as beginning with the arterial anastomosis and extending to the right atrium. This definition includes all upper and lower extremity AV shunts (arteriovenous fistulae [AVF] and arteriovenous grafts [AVG]). Code 36147 includes the work of directly accessing and imaging the entire AV shunt. Antegrade and/or retrograde punctures of the AV shunt are typically used for imaging, and contrast may be injected directly through a needle or through a catheter placed into the AV shunt. Occasionally the catheter needs to be advanced further into the shunt to adequately visualize the arterial anastomosis or the central veins, and all manipulation of the catheter for diagnostic imaging of the AV shunt is included in 36147. Advancement of the catheter to the vena cava to adequately image that segment of the AV shunt is included in 36147 and is not separately reported. Advancement of the catheter tip through the arterial anastomosis to adequately visualize the anastomosis is also considered integral to the work of 36147 and is not separately reported.*** ~~*Ultrasound guidance for puncture of the AV shunt is not included in 36147. Particularly in the case of new or failing AVF, ultrasound may be necessary to safely and effectively puncture the AV access for evaluation, and this may be reported separately with 76937 if all the appropriate elements for reporting 76937 are performed. Evaluation of the peri-anastomotic portion of the inflow is considered an integral part of the dialysis fistulagram and is included in the work of 36147. The perianastomotic portion of the vessel at the arterial anastomosis includes the short segment of the artery immediately adjacent to the anastomosis, the anastomosis itself, and the portion of the vessel or graft immediately distal to the anastomosis.*~~ ~~*The arterial inflow to the AV access is considered a separate vessel. If a more proximal inflow problem separate from the peri-anastomotic segment is suspected and additional catheter work and imaging must be done for adequate evaluation, this work is not included in 36147. If a catheter is selectively advanced from the AV shunt puncture into the inflow artery, an additional catheterization code may be reported. In the typical case of an upper extremity AV shunt, 36215 is used to report this work, and includes placement of the catheter retrograde into the inflow artery and into the aorta if necessary (ie, 36200 may not be also reported since that work is included in the work defined by 36215).*~~ ~~***Interventions for Arteriovenous (AV) Shunts Created for Dialysis (AV Grafts and AV Fistulae):*** *For the purposes of coding interventional procedures in arteriovenous (AV) shunts created for dialysis (both arteriovenous fistulae [AVF] and arteriovenous grafts [AVG]), the AV shunt is artificially divided into two vessel segments. The first segment is peripheral and extends from the peri-arterial anastomosis through*~~				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~*the axillary vein (or entire cephalic vein in the case of cephalic venous outflow). The second segment includes the veins central to the axillary and cephalic veins, including the subclavian and innominate veins through the vena cava. Interventions performed in a single segment, regardless of the number of lesions treated, are coded as a single intervention.*~~

~~*The AV shunt is considered to be venous and most interventions are coded with the venous intervention codes (ie, angioplasty is reported with venous angioplasty codes 35476, 75978). Codes 35476 and 75978 would be reported once to describe all angioplasty work performed in one segment of the AV dialysis shunt, regardless of the number of distinct lesions treated within that segment, the number of times the balloon is inflated, or the number of balloon catheters required to open all lesions.*~~

~~*There is an exception to the use of venous interventional codes. When there is a stenosis at the arterial anastomosis, it typically extends across the anastomosis and involves the artery just proximal to and at the anastomosis as well as the outflow vessel or graft. This segment is called the peri-anastomotic (or juxta-anastomotic) region, and even though the stenosis can involve multiple vessels, it is typically a single lesion with a single etiology crossing the anastomosis, and treatment to open this lesion crosses from the artery into the vein or venous graft. An intervention treated in this peri-anastomotic segment is coded as an arterial intervention (35475, 75962). Since the entire segment of the AV shunt from the peri-arterial anastomosis through the axillary vein is considered a single vessel for coding of interventions, the arterial angioplasty codes include the work of opening the perianastomotic stenosis, as well as all other stenoses treated within this segment of the vessel. Codes 35475 and 75962 are reported once to describe all work done to angioplasty any lesion from the peri-arterial anastomosis through the axillary vein in procedures that involve angioplasty of the peri-arterial anastomosis of the AV shunt. In these special instances, venous angioplasty codes would not be reported additionally for this first or most peripheral shunt segment, even if balloon angioplasty is performed on segments of the AV dialysis shunt that are purely venous anatomy within this specific vessel segment.*~~

~~*It is never appropriate to report removal of the arterial plug during a declot/thrombectomy procedure as an arterial or venous angioplasty (35475, 35476). Removal of the arterial plug is included in the work of a fistula thrombectomy (36870), even if a balloon catheter is used to mechanically dislodge the resistant thrombus.*~~

~~*The central veins (eg, subclavian, innominate, and cava) are considered an additional, separate venous vessel segment for purposes of interventional coding for AV dialysis shunt interventions. If one or more central venous stenoses are treated with angioplasty, this is reported as a single venous angioplasty (35476, 75978), regardless of the number of discrete lesions treated within this segment, and also independent of the number of balloon inflations or number of balloon catheters or sizes required. This additional work should be clearly documented in the patient record and in the recorded images.*~~

~~*The same rules used for angioplasty apply to stent placements for AV dialysis shunts with respect to the number of interventions reported for each patient. Either 37236 or 37238 is reported once to describe all work of stenting lesions within the defined AV dialysis shunt segment from the peri-arterial anastomosis through the axillary and cephalic veins, regardless of the number of stents placed or the number of discrete lesions treated within that vessel segment. Code 37238 is reported for placement of AV access stent unless the treated lesion includes the peri-anastomotic region. This perianastomotic region is considered an artery and therefore 37236 is reported instead of 37238. If additional stenting is required for central venous stenosis, this may be reported as an additional stent placement (37239), describing all the work of stent placement within the central venous segment.*~~

~~*The work of catheterizing all the veins in the dialysis AV shunt is included in 36147 (and, if appropriate, 36148). Selective catheterization of*~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~*the inferior/superior vena cava and central veins cannot be separately reported when performed from a direct puncture of the AVF/AVG. However, if additional venous side branches off of the conduit, known as accessory veins, are separately catheterized for diagnosis or intervention such as embolization of a large competing accessory vein, this additional work may be separately reported using the appropriate selective venous catheterization codes (36011 and 36012). The embolization may be reported using 37241 once, irrespective of the number of branches embolized.*~~

36160 *Introduction of needle or intracatheter, aortic, translumbar*

……

36215 *Selective catheter placement, arterial system; each first order thoracic or brachiocephalic branch, within a vascular family*

(For catheter placement for coronary angiography, see 93454-93461)

36861 *with balloon catheter*
(If imaging guidance is performed, use 76000)

Dialysis Circuit

Definitions:

Dialysis circuit – The arteriovenous (AV) dialysis circuit is designed for easy and repetitive access to perform hemodialysis. It begins at the arterial anastomosis and extends to the right atrium. The circuit may be created using either an arterial-venous anastomosis, known as an arteriovenous fistula [AVF], or a prosthetic graft placed between an artery and vein, known as an arteriovenous graft [AVG]. The dialysis circuit is comprised of two segments termed the 1) peripheral dialysis segment and 2) the central dialysis segment. Both are defined below.

Peripheral dialysis segment – The peripheral dialysis segment is that portion of the dialysis circuit that begins at the arterial anastomosis and extends to the central dialysis segment. In the upper extremity, the peripheral dialysis segment extends through the axillary vein (or entire

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

cephalic vein in the case of cephalic venous outflow). In the lower extremity, the peripheral dialysis segment extends through the common femoral vein. The peripheral dialysis segment includes the historic "peri-anastomotic region" (defined below).

Central dialysis segment – The central dialysis segment includes all draining veins central to the peripheral dialysis segment. In the upper extremity, the central dialysis segment includes the veins central to the axillary and cephalic veins, including the subclavian and innominate veins through the superior vena cava. In the lower extremity, the central dialysis segment includes the veins central to the common femoral vein, including the external iliac and common iliac veins through the inferior vena cava.

Peri-anastomotic region – A historic term referring to the region of an dialysis circuit near the arterial anastomosis encompassing a short segment of the parent artery, the anastomosis, and a short segment of the dialysis circuit immediately adjacent to the anastomosis. The peri-anastomotic region is included within the peripheral segment of the dialysis circuit.

Performed through dialysis circuit – Any diagnostic study or therapeutic intervention within the dialysis circuit performed through a direct percutaneous access to the dialysis circuit.

Code 369X1 includes direct access and imaging of the entire dialysis circuit. Antegrade and/or retrograde punctures of the dialysis circuit are typically used for imaging, and contrast may be injected directly through a needle or through a catheter placed into the dialysis circuit. All dialysis circuit punctures required to perform the procedure are included in 369X1. Occasionally the catheter needs to be advanced further into the circuit to adequately visualize the arterial anastomosis or the central veins, or selective catheterization of a venous branch may be required. All manipulation(s) of the catheter for diagnostic imaging of the dialysis circuit is included in 369X1. Advancement of the catheter to the vena cava to adequately image that segment of the dialysis circuit is included in 369X1 and is not separately reported. Code 369X1 also includes catheterization of additional venous side branches communicating with the dialysis circuit, known as accessory veins. Advancement of the catheter tip through the arterial anastomosis to adequately visualize the anastomosis is also included in the service described by 369X1 and is not separately reported. Evaluation of the peri-anastomotic portion of the inflow is an integral part of the dialysis circuit angiogram and is included in 369X1.

For purposes of reporting dialysis access maintenance services, the arterial inflow to the dialysis circuit is considered a separate vessel. If a more proximal arterial inflow problem separate from the peripheral dialysis segment is suspected, additional catheter placement and imaging required for adequate evaluation of the artery may be separately reported. If a catheter is selectively advanced from the dialysis circuit puncture beyond the peri-anastomotic segment into the inflow artery, an additional catheterization code may be reported. For example, 36215 may be used to report image-guided retrograde catheter placement into the inflow artery and into the aorta if necessary (36200 is not reported in addition to 36215 in this example). Note that 75710 may also be reported if contrast injection for diagnostic arteriography is performed through this catheter and radiologic supervision and interpretation and imaging documentation is performed.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Ultrasound guidance for puncture of the dialysis circuit access is not typically performed and is not included in 369X1, 369X2, 369X3, 369X4, 369X5, and 369X6. However, in the case of a new (immature) or failing AVF, ultrasound may be necessary to safely and effectively puncture the dialysis circuit for evaluation, and this may be reported separately with 76937 if all the appropriate elements for reporting 76937 are performed and documented.

For radiologic supervision and interpretation of dialysis circuit angiography performed through existing access(es) or catheter-based arterial access, report 369X1 with modifier 52.

Dialysis Circuit Interventions (AV Grafts and AV Fistulae): For the purposes of coding interventional procedures in the dialysis circuit (both arteriovenous fistulae [AVF] and arteriovenous grafts [AVG]), the dialysis circuit is artificially divided into two distinct segments: the peripheral dialysis segment and the central dialysis segment (see definitions above).

Codes 369X1, 369X2, 369X3 and 369X4, 369X5, 369X6 are built on progressive hierarchies with more intensive services inclusive of less intensive services. Report only one code (369X1, 369X2, 369X3, 369X4, 369X5, 369X6) for services provided in a dialysis circuit.

Code 369X1 describes the diagnostic evaluation of the dialysis circuit, and this service is included in the services described by 369X1, 369X2, 369X3, 369X4, 369X5, 369X6. All catheterizations required to perform diagnostic fistulography are included in 369X1. All catheterizations required to perform additional interventional services are included in codes 369X2, 369X3, 369X4, 369X5, 369X6, 369X7, 369X8, 369X9 and are not separately reported. All angiography, fluoroscopic image guidance, roadmapping, and radiological supervision and interpretation required to perform each service is included in each code. Closure of the puncture(s) by any method is included in the service of each individual code.

Code 369X2 includes the services in 369X1 plus transluminal balloon angioplasty in the peripheral segment of the dialysis circuit. Code 369X2 would be reported only once per session to describe all angioplasty services performed in the peripheral segment of the dialysis circuit, regardless of the number of distinct lesions treated within that segment, the number of times the balloon is inflated, or the number of balloon catheters or sizes required to open all lesions, and includes angioplasty of the “peri-anastomotic segment” when performed. Code 369X3 includes the services in 369X2 plus transcatheter stent placement in the peripheral segment of the dialysis circuit. Code 369X3 is reported only once per session to describe placing stent(s) within the peripheral segment, regardless of the number of stent(s) placed or the number of discrete lesion(s) treated within the peripheral segment. If both angioplasty and stenting are performed in the peripheral segment, including treatment of separate lesions, report 369X3 only once.

Code 369X4 describes percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis in the dialysis circuit (all thrombus treated in both the peripheral and central dialysis circuit segments) and includes diagnostic angiography (369X1), fluoroscopic image guidance, catheter placement(s), and all maneuvers required to remove thrombus from the peripheral and/or central segments including

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

all intraprocedural pharmacological thrombolytic injection(s)/infusion(s). It is never appropriate to report removal of the arterial plug during a declot/thrombectomy procedure as an angioplasty (369X5). Removal of the arterial plug is included in a fistula thrombectomy even if a balloon catheter is used to mechanically dislodge the resistant thrombus. Codes 369X5 (angioplasty) and 369X6 (stent) describe services in the peripheral circuit when performed in conjunction with thrombolysis/thrombectomy. Code 369X5 includes the services in 369X4 plus transluminal balloon angioplasty in the peripheral segment of the dialysis circuit. Code 369X5 may be reported only once per session to describe all angioplasty performed in the peripheral segment of the dialysis circuit, regardless of the number of distinct lesions treated within that segment, the number of times the balloon is inflated, or the number of balloon catheters required to open all lesions. Code 369X6 includes the services in 369X5 plus transcatheter stent placement in the peripheral segment of the dialysis circuit. Code 369X6 is reported only once per session to describe placing stent(s) within the peripheral segment, regardless of the number of stent(s) placed or the number of discrete lesion(s) treated within the peripheral segment.

Code 369X7 and 369X8 describe procedures performed through puncture(s) in the dialysis circuit. Similar procedures performed from a different access (eg, common femoral vein) may be reported using 362X3X, 362X4X or 37238X, 37239X. Code 369X7 is an add-on code used in conjunction with 369X1, 369X2, 369X3, 369X4, 369X5, 369X6 to report angioplasty within the central dialysis segment when performed through puncture of the dialysis circuit, and is reported once per session independent of the number of discrete lesions treated, the number of balloon inflations, and number of balloon catheters or sizes required. These additional services should be clearly documented in the patient record, including the recorded images. Code 369X7 may be reported only once per session with 369X1, 369X2, 369X3, 369X4, 369X5 or 369X6, as appropriate. Report 369X7 once for all angioplasty performed within the central dialysis segment.

Code 369X8 is an add-on code used in conjunction with 369X1, 369X2, 369X3, 369X4, 369X5, and 369X6 to report stenting lesion(s) in the central dialysis segment when performed through puncture of the dialysis circuit. It is reported once regardless of the number of discrete lesions treated or the number of stents placed. Code 369X8 includes the services in 369X7; therefore, code 369X8 may not be reported with 369X7 in the same session. Code 369X8 may be reported only once per session with 369X1, 369X2, 369X3, 369X4, 369X5 or 369X6, as appropriate.

Code 369X9 is an add-on code used to report endovascular embolization or occlusion of the main vessel or side branches arising from (emptying into) the dialysis circuit. Code 369X9 may only be reported once per therapeutic session, irrespective of the number of branches embolized or occluded. Embolization or occlusion of the main vessel or these side branches may not be reported with 37241.

If open dialysis circuit creation, revision, and/or thrombectomy (36818-36833) are performed, completion angiography is bundled, as is peripheral segment angioplasty and/or stent placement (369X1, 369X2, 369X3) and therefore not separately reported. However, dialysis circuit central segment angioplasty and/or stent placement may be separately reported (369X7, 369X8).

~~For mechanical thrombectomy for dialysis fistula, use 36870.~~

Cardiovascular System

Arteries and Veins

Endovascular Revascularization (Open or Percutaneous, Transcatheter)

Codes 37236-37239 are used to report endovascular revascularization for vessels other than lower extremity artery(s) for occlusive disease (ie, 37221, 37223, 37226, 37227, 37230, 37231, 37234, 37235), cervical carotid (ie, 37215, 37216), intracranial (ie, 61635), intracoronary (ie, 92928, 92929, 92933, 92934, 92937, 92938, 92941, 92943, 92944), innominate and/or intrathoracic carotid artery through an antegrade approach (37218), extracranial vertebral (ie, 0075T, 0076T) performed percutaneously and/or through an open surgical exposure, open retrograde intrathoracic common carotid or innominate (37217), or dialysis ~~segment~~ circuit when performed through the dialysis circuit (369X3, 369X5, 369X8).

Codes 37236, 37237 describe transluminal intravascular stent insertion in an artery while 37238, 37239 describe transluminal intravascular stent insertion in a vein. Multiple stents placed in a single vessel may only be reported with a single code. If a lesion extends across the margins of one vessel into another, but can be treated with a single therapy, the intervention should be reported only once. When additional, different vessels are treated in the same session, report 37237 and/or 37239 as appropriate. Each code in this family (37236-37239) includes any and all balloon angioplasty(s) performed in the treated vessel, including any pre-dilation (whether performed as a primary or secondary angioplasty), postdilation following stent placement, treatment of a lesion outside the stented segment but in the same vessel, or use of larger/smaller balloon to achieve therapeutic result. Angioplasty in a separate and distinct vessel may be reported separately. Non-selective and/or selective catheterization(s) (eg, 36005, 36010-36015, 36200, 36215-36218, 36245-36248) is reported separately.

Codes 37236-37239 include radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy by pressure, application of an arterial closure device or standard closure of the puncture by suture, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. Extensive repair or replacement of an artery may be reported separately (eg, 35226 or 35286). Report 76937 for ultrasound guidance for vascular access, when performed in conjunction with 37236-37239. Intravascular ultrasound may be reported separately (ie, ~~37250, 37251,~~ 37252, 37253). For mechanical thrombectomy and/or thrombolytic therapy, when performed, see 37184-37188, 37211-37214.

⊙37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

+37237 *each additional artery (List separately in addition to code for primary procedure)*
(Use 37237 in conjunction with 37236)
(Do not report 37236, 37237 in conjunction with 34841-34848 for bare metal or covered stents placed into the visceral branches within the endoprosthesis target zone)
(For stent placement(s) in iliac, femoral, popliteal, or tibial/peroneal artery(s) for occlusive disease, see 37221, 37223, 37226, 37227, 37230, 37231, 37234, 37235)
(For transcatheter placement of intravascular cervical carotid artery stent(s), see 37215, 37216)
(For transcatheter placement of intracranial stent(s), use 61635)
(For transcatheter placement of intracoronary stent(s), see 92928, 92929, 92933, 92934, 92937, 92938, 92941, 92943, 92944)
(For stenting of visceral arteries in conjunction with fenestrated endovascular repair, see 34841-34848)
(For open or percutaneous antegrade transcatheter placement of intrathoracic carotid/innominate artery stent(s), use 37218)
(For open or percutaneous transcatheter placement of extracranial vertebral artery stent(s), see Category III codes 0075T, 0076T)
(For open retrograde transcatheter placement of intrathoracic common carotid/innominate artery stent(s), use 37217)
(For placement of a stent at the arterial anastomosis of a dialysis circuit with or without transluminal mechanical thrombectomy and/or infusion for thrombolysis, see 369X3, 369X6)

37238 *Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; initial vein*

+37239 *each additional vein (List separately in addition to code for primary procedure)*
(Use 37239 in conjunction with 37238)
~~(For transluminal balloon angioplasty within the dialysis circuit performed through that circuit, see 369X2, 369X5, 369X7)~~
(For placement of a stent(s) ~~at the arterial anastomosis of a dialysis circuit~~ within the peripheral segment of the dialysis circuit ~~with or without transluminal mechanical thrombecomy and/or infusion for thrombolysis~~, see 369X3, 369X6)
(For transcatheter placement of an intravascular stent(s) within central dialysis segment when performed through the dialysis circuit, use 369X8)

Cardiovascular System
Arteries and Veins
Vascular Embolization and Occlusion

Codes 37241-37244 are used to describe ~~the work of~~ vascular embolization and occlusion procedures, excluding the central nervous system and the head and neck, which are reported using 61624, 61626, 61710, and 75894, and excluding the ablation/sclerotherapy procedures for venous insufficiency/telangiectasia of the extremities/skin, which are reported using 36468, 36470, and 36471. Embolization and occlusion procedures are performed for a wide variety of clinical indications and in a range of vascular territories. Arteries, veins, and lymphatics may all be the target of embolization.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The embolization codes include all associated radiological supervision and interpretation, intra-procedural guidance and road-mapping, and imaging necessary to document completion of the procedure. They do not include diagnostic angiography and all necessary catheter placement(s). Code(s) for catheter placement(s) may be separately reported using selective catheter placement code(s), if used consistent with guidelines. Code(s) for diagnostic angiography may also be separately reported, when performed according to guidelines for diagnostic angiography during endovascular procedures, using the appropriate diagnostic angiography codes. Report these services with an appropriate modifier (eg, modifier 59). Please see the guidelines on the reporting of diagnostic angiography preceding 75600 in the ***Vascular Procedures, Aorta and Arteries*** *section.*

Code 37241 is used to report endovascular embolization or occlusion procedures performed for venous conditions other than hemorrhage or hemodialysis access. Examples include embolization of venous malformations, capillary hemangiomas, varicoceles, and visceral varices. ~~Embolization of side branch(es) of an outflow vein from a hemodialysis access would be reported using 37241.~~(For endovascular embolization or occlusion of side branch(es) of an outflow vein(s) from a hemodialysis access, use 369X9.)

Code 37242 is used to report vascular embolization or occlusion performed for arterial conditions other than hemorrhage or tumor such as arteriovenous malformations and arteriovenous fistulas whether congenital or acquired. Embolizations of aneurysms and pseudoaneurysms are also reported with 37242. Tumor embolization is reported with 37243. Note that injection to treat an extremity pseudoaneurysm is correctly reported with 36002. Sometimes, embolization and occlusion of an artery are performed prior to another planned interventional procedure; an example is embolization of the left gastric artery prior to planned implantation of a hepatic artery chemotherapy port. The artery embolization is reported with 37242.

Code 37243 is used to report embolization for the purpose of tissue ablation and organ infarction or ischemia. This can be performed in many clinical circumstances, including embolization of benign or malignant tumors of the liver, kidney, uterus, or other organs. When chemotherapy is given as part of an embolization procedure, additional codes (eg, 96420) may be separately reported. When a radioisotope (eg, Yttrium-90) is injected as part of an embolization, then additional codes (eg, 79445) may be separately reported. Uterine fibroid embolization is reported with 37243.

Code 37244 is used to report embolization for treatment of hemorrhage or vascular or lymphatic extravasation. Examples include embolization for management of gastrointestinal bleed, trauma-induced hemorrhage of the viscera or pelvis, embolization of the thoracic duct for chylous effusion and bronchial artery embolization for hemoptysis. Embolization of the uterine arteries for management of hemorrhage (eg, postpartum hemorrhage) is also reported with 37244.

Intravascular stents, both covered and uncovered, are a class of devices that may be used as part of an embolization procedure. As such, there is the potential for overlap among codes used for placement of vascular stents and those used for embolization. When a stent is placed for the purpose of providing a latticework for deployment of embolization coils, such as for embolization of an aneurysm, the embolization code is reported and not the stent code. If a stent is deployed as the sole management of an aneurysm, pseudoaneurysm, or vascular extravasation, then the stent deployment code should be reported and not the embolization code.

Only one embolization code should be reported for each surgical field (ie, the area immediately surrounding and directly involved in a treatment/procedure). ~~For example, embolization of one or more venous side branches in a single arm for a patient with a dialysis arteriovenous fistula is reported with 37241 only once per session.~~ Embolization procedures performed at a single setting and including

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

multiple surgical fields (eg, a patient with multiple trauma and bleeding from the pelvis and the spleen) may be reported with multiple embolization codes with the appropriate modifier (eg, modifier 59).

There may be overlapping indications for an embolization procedure. The code for the immediate indication for the embolization should be used. For instance, if the immediate cause for embolization is bleeding in a patient with an aneurysm, report 37244.

⊙***37241*** *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; venous, other than hemorrhage (eg, congenital or acquired venous malformations, venous and capillary hemangiomas, varices, varicoceles)*

(For sclerosis of veins or endovenous ablation of incompetent extremity veins, see 36468-36479)

(For dialysis circuit permanent endovascular embolization or occlusion, use 369X9)

(Do not report 37241 in conjunction with 36468, 36470, 36471, 36475-36479, 75894, 75898 in the same surgical field)

⊙***37242*** *arterial, other than hemorrhage or tumor (eg, congenital or acquired arterial malformations, arteriovenous malformations, arteriovenous fistulas, aneurysms, pseudoaneurysms)*

(For percutaneous treatment of extremity pseudoaneurysm, use 36002)

⊙***37243*** *for tumors, organ ischemia, or infarction*

⊙***37244*** *for arterial or venous hemorrhage or lymphatic extravasation*

(Do not report 37242-37244 in conjunction with 75894, 75898 in the same surgical field)

(For embolization procedures of the central nervous system or head and neck, see 61624, 61626, 61710)

Category I

Radiology

Diagnostic Radiology (Diagnostic Imaging)

Vascular Procedures

Aorta and Arteries

✚***75774*** *Angiography, selective, each additional vessel studied after basic examination, radiological supervision and interpretation (List separately in addition to code for primary procedure)*

(Use 75774 in addition to code for specific initial vessel studied)

(Do not report 75774 as part of diagnostic angiography of the extracranial and intracranial cervicocerebral vessels. It may be appropriate to report 75774 for diagnostic angiography of upper extremities and other vascular beds performed in the same session)

(For angiography, see 36147, 75600-75756, ~~75791~~)

(For catheterizations, see codes 36215-36248)

(For cardiac catheterization procedures, see 93452-93462, 93531-93533, 93563-93568)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:369X1 Tracking Number R1 Original Specialty Recommended RVU: **3.72**
Presented Recommended RVU: **3.72**
Global Period: 000 RUC Recommended RVU: **3.36**

CPT Descriptor: Introduction of needle(s) and/or catheter(s), dialysis circuit, with diagnostic angiography of the dialysis circuit, including all direct puncture(s) and catheter placement(s), injection(s) of contrast, all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava, fluoroscopic guidance, radiologic supervision and interpretation and image documentation and report;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease is referred from his dialysis session due to a report of decreased clearance during dialysis.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine on the angiographic table. The skin over the extremity with the dialysis fistula is prepared and draped in sterile fashion and local anesthetic is adminstered subcutaneously.

Description of Intra-Service Work: A micropuncture needle is used to access the fistula using palpation. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. Contrast is injected through sheath to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. The sheaths are removed and pressure is applied to the access site until hemostasis is achieved.

Description of Post-Service Work: Sterile dressings are applied. The patient is transported to the recovery room for hemodynamic monitoring and pain control. The procedure is documented in the permanent record. Fluoroscopic results and patient status are communicated to the patient's family. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician and dialysis facility.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.20	0.39
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.12	0.39
Urgency of medical decision making	0.00	0.17

Technical Skill/Physical Effort (Mean)

Technical skill required	-0.16	-0.13
Physical effort required	-0.12	0.17

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.48	-0.09
Outcome depends on the skill and judgment of physician	0.00	0.22
Estimated risk of malpractice suit with poor outcome	-0.20	-0.13

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	-0.20	0.35

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 369X1

We are recommending the 25th percentile survey value of 3.72 RVW for 369X1 which is the existing value.

Pre- and Post-Service Time Packages

The new CPT code 369X1 will replace the existing 36147 code for fistula access and imaging of the fistula and outflow. Medicare utilization data from 2014 shows that this procedure is performed in the physician

office 60.09% of the time. We therefore recommend pre-service time package 6b (procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 369X1 with the following adjustments:

1. Evaluation: We recommend removing 5 minutes of evaluation time for "Administer moderate sedation/observe (wait) anesthesia care". This new family of dialysis codes will use the new moderate sedation codes to report moderate sedation services.

2. Positioning: We recommend an additional 3 minutes of positioning time as the procedure is performed on the extremity, typically the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. All non-radiopaque materials need to be clear of the area of interest.

3. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia,* there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages.

Comparison with Key Reference Services

The most common key reference codes chosen by the survey respondents were 36200 *Introduction of catheter, aorta* (22%) and 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (20%). These key references are similar to 369X1 in the sense that they are all endovascular procedure codes. 36200 involves placing a catheter into the aorta for the purpose of imaging but it does not involve performing images or the supervision and interpretation of the images as is included in 369X1. Therefore 369X1 is appropriately valued higher than 36200. Similarly, 36251 involves catheterization and imaging of a single kidney including the supervision and interpretation of the angiographic images acquired. This code is appropriately valued higher than 369X1 given the additional work of catheterization of the renal artery.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36200 Key Ref	3.02	0.058	91	33	3	5	30	20
369X1 Survey	3.72	0.115	66	17	4	5	25	15
36251 Key Ref	5.35	0.087	113	30	3	5	45	30
36147 Existing	3.72	0.065	80	20			45	15

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 3.72 RVW for CPT 369X1.

Comparison to MPC codes

New code 369X1 ranks appropriately between two MPC codes with similar intra-service times and intensities: 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands,* and 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed.* 369X1 is appropriately valued between these two MPC codes

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52214 MPC	3.50	0.083	79	19	5	5	30	20
369X1 Survey	3.72	0.115	66	17	4	5	25	15
37191 MPC	4.71	0.119	83	30	3	5	30	15

Additional Rationale

Comparison of 369X1 to the family of Hemodialysis Access Interventions

CPT code 369X1 is the base code for the entire family of hemodialysis access interventions. All of the subsequent codes involve performance of a fistulogram. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	**Fistulogram**	**3.72**	**0.115**	**66**	**26**	**25**	**15**
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT 369X1 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, two MPC codes, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 3.72 appropriately ranks CPT 369X1 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36147

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
54,370 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. see attached

Specialty Radiology/Interventional Radiology Frequency 20117 Percentage 37.00 %

Specialty Nephrology Frequency 15224 Percentage 28.00 %

Specialty Vascular Surgery Frequency 10875 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine on the angiographic table. The skin over the extremity with the dialysis fistula is prepared and draped in sterile fashion and local anesthetic is administered subcutaneously.

Description of Intra-Service Work: A micropuncture needle is used to access the fistula using palpation. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. Contrast is injected through sheath to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. A bolus of systemic intravenous heparin is given. A guidewire is used to gently traverse a dialysis circuit stenosis. An appropriately sized balloon catheter is advanced over the guidewire into the stenotic vascular segment. The balloon is inflated to an appropriate pressure and then deflated. Contrast is injected through a catheter placed proximal to the treated segment to assess treatment response. The catheters and wires are removed. A purse string suture is applied around the vascular sheaths and the suture is tied once each sheath is removed. .

Description of Post-Service Work: Sterile dressings are applied. The patient is transported to the recovery room for hemodynamic monitoring and pain control. The procedure is documented in the permanent record. Fluoroscopic results

and patient status are communicated to the patient's family. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician and dialysis facility.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.09	0.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.00	-0.07
Urgency of medical decision making	0.09	-0.15

Technical Skill/Physical Effort (Mean)

Technical skill required	-0.03	0.00
Physical effort required	-0.09	-0.04

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.31	-0.22
Outcome depends on the skill and judgment of physician	-0.03	0.07
Estimated risk of malpractice suit with poor outcome	-0.34	-0.19

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.03	0.04

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 369X2

We are recommending the 25th percentile survey value of 6.00 RVW for 369X2.

Pre- and Post-Service Time Packages

The new CPT code 369X2 will replace the existing codes 35475, 35476, 75962, 75964, 75978 when used for angioplasty of a hemodialysis access. There are also new codes to replace 35475, 35476, 75962, 75964, 75978 when used to treat arterial and venous disease other than within the hemodialysis access, the lower extremities, the carotid arteries, or the coronary arteries. Medicare utilization data from 2014 shows that 35475 and 35476 were performed in the physician office 64.26% and 62.17% of the time. We therefore recommend pre-service time package 6b (procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 369X2 with the following adjustments:

1. Evaluation: We recommend removing 5 minutes of evaluation time for "Administer moderate sedation/observe (wait) anesthesia care". This new family of dialysis codes will use the new moderate sedation codes to report moderate sedation services.

2. Positioning: We recommend an additional 3 minutes of positioning time as the procedure is performed on the extremity, usually the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. All non-radiopaque materials need to be clear of the area of interest.

3. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37220 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty* (28%) and 37224 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty* (24%). These key references are similar to 369X2 in the sense that they are all endovascular procedure codes involving angioplasty. CPT code 37220 involves angioplasty of an iliac artery and 37224 involves angioplasty of a femoral and/or popliteal artery. They both require significantly more time than 369X2 accounting for the differences in RVU. The lower portion of the table outlines the typical coding scenario under the current component coding scheme.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37220 Key Ref	8.15	0.108	138	40	3	5	60	30
369X2 Survey	6.00	0.126	86	22	4	5	40	20
37224 Key Ref	9.00	0.092	158	40	3	5	80	30
35476 Existing	5.10	0.118	81	17	4	5	35	20
36147 Existing	3.72	0.065	80	20			45	15
75978 Existing	0.54	NA	12				NA	

Total Existing	7.50							

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 6.00 RVW for CPT 369X2. ***This will represent a 20% reduction over current coding***.

Comparison to MPC codes

New code 369X2 ranks appropriately between two MPC codes with similar intra-service times and intensities: 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* and 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included)*

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52235 MPC	5.44	0.098	94	19	5	5	45	20
369X2 Survey	6.00	0.126	86	22	4	5	40	20
52352 MPC	6.75	0.118	118	33	5	15	45	20

Additional Rationale

Comparison of 369X2 to the family of Hemodialysis Access Interventions

CPT code 369X2 involves the work of the base code (369X1) with the addition of angioplasty. The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	**Fistulogram with angioplasty**	**6.00**	**0.126**	**86**	**26**	**40**	**20**
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT 369X2 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, two MPC codes, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 6.00 appropriately ranks CPT 369X2 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36147, 35476 and 75978

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 215,908 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see attached

Specialty Radiology/Interventional Radiology Frequency 79886 Percentage 37.00 %

Specialty Nephrology Frequency 60455 Percentage 28.00 %

Specialty Vascular Surgery Frequency 43183 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:

CPT Descriptor: Introduction of needle(s) and/or catheter(s), dialysis circuit, with diagnostic angiography of the dialysis circuit, including all direct puncture(s) and catheter placement(s), injection(s) of contrast, all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava, fluoroscopic guidance, radiologic supervision and interpretation and image documentation and report; with transcatheter placement of intravascular stent(s) peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis segment

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease with a history of multiple percutaneous angioplasties of the same vascular segment in a dialysis circuit, presents after an unsuccessful dialysis session due to increased pressures.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine on the angiographic table. The skin over the extremity with the dialysis fistula is prepared and draped in sterile fashion and local anesthetic is administered subcutaneously.

Description of Intra-Service Work: A micropuncture needle is used to access the fistula using palpation close to the vascular anastomosis and directed towards the central veins. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. Contrast is injected through sheath to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. A bolus of systemic intravenous heparin is administered. A guidewire is used to traverse a dialysis circuit stenosis. A balloon catheter is advanced over the guidewire into the stenotic vascular segment. The balloon is inflated and then deflated. Contrast is injected through a catheter placed proximal to the treated segment to assess treatment response. An appropriately sized stent is advanced over the guidewire into the stenotic vascular segment. The stent is deployed and the stent catheter is removed. An appropriately sized balloon catheter is advanced over the guidewire and used to appose the stent to the vessel wall. The balloon is inflated to an appropriate pressure then deflated. Contrast is injected through a

catheter placed proximal to the treated segment to assess treatment response. The catheters and wires are removed. A purse string suture is applied around the vascular sheaths and the suture is tied once each sheath is removed.

Description of Post-Service Work: Sterile dressings are applied. The patient is transported to the recovery room for hemodynamic monitoring and pain control. The procedure is documented in the permanent record. Fluoroscopic results and patient status are communicated to the patient's family. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician and dialysis facility.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.15	0.31
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.06	0.00
Urgency of medical decision making	0.18	0.17
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.09	0.24

Physical effort required	0.09	0.07

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.18	0.07
Outcome depends on the skill and judgment of physician	0.18	0.28
Estimated risk of malpractice suit with poor outcome	-0.12	-0.03

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	0.27	0.17

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 369X3

We are recommending the 25th percentile survey value of 8.00 RVW for 369X3.

Pre- and Post-Service Time Packages

The work of new CPT code 369X3 is currently captured with codes 36147 and 37238. Medicare utilization data from 2014 shows that 36147 and 37238 were performed in the physician office 60.09% and 51.42% of the

time, respectively. We therefore recommend pre-service time package 6b (procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 369X3 with the following adjustments:

1. Evaluation: We recommend removing 5 minutes of evaluation time for "Administer moderate sedation/observe (wait) anesthesia care". This new family of dialysis codes will use the new moderate sedation codes to report moderate sedation services.

2. Positioning: We recommend an additional 3 minutes of positioning time as the procedure is performed on the extremity, usually the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. All non-radiopaque materials need to be clear of the area of interest.

3. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37221 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (29%) and 37226 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (25%). These key references are similar to 369X3 in the sense that they are all endovascular procedure codes involving angioplasty and stenting. CPT code 37221 involves stenting of an iliac artery and 37226 involves stenting of a femoral and/or popliteal artery. They both require significantly more time than 369X3 accounting for the differences in RVU. The lower portion of the table outlines the typical coding scenario under the current component coding scheme.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37221 Key Ref	10.00	0.092	168	40	3	5	90	30
369X3 Survey	8.00	0.141	96	22	4	5	50	20
37226 Key Ref	10.49	0.098	168	40	3	5	90	30
37238 Existing	6.29	0.080	131	33	3	5	60	30
36147 Existing	3.72	0.065	80	20			45	15
Total Existing	8.15							

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 8.00 RVW for CPT 369X3. ***This will represent a 2% reduction over current coding***.

Comparison to MPC codes

The highest value 000 day global MPC code is 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* with 7.50 wRVUs. New code 369X3 compares appropriately with this code.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52353 MPC	7.50	0.101	133	33	5	15	60	20
369X3 Survey	8.00	0.141	96	22	4	5	50	20

Additional Rationale

Comparison of 369X3 to the family of Hemodialysis Access Interventions

CPT code 369X3 involves the work of 369X2 with the addition of a stent. The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	**Fistulogram with angioplasty and stent**	**8.00**	**0.141**	**96**	**26**	**50**	**20**
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT 369X3 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, two MPC codes, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 8.00 appropriately ranks CPT 369X3 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36147 and 37238

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
12,090 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. see attached

Specialty Radiology/Interventional Radiology Frequency 4475 Percentage 37.01 %

Specialty Nephrology Frequency 3386 Percentage 28.00 %

Specialty Vascular Surgery Frequency 2419 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 35476

SUMMARY OF RECOMMENDATION

CPT Code:369X4 Tracking Number R4 Original Specialty Recommended RVU: **7.50**
Presented Recommended RVU: **7.50**
Global Period: 000 RUC Recommended RVU: **7.50**

CPT Descriptor: Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s);

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease with hypotension after a dialysis session notices a loss of thrill in his fistula. A pre-procedure ultrasound demonstrates a thrombosed fistula.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine on the angiographic table. The skin over the extremity with the dialysis fistula is prepared and draped in sterile fashion and local anesthetic is administered subcutaneously.

Description of Intra-Service Work: A micropuncture needle is used to access the fistula close to the vascular anastomosis and directed towards the central veins. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. The micropuncture needle is used to access the fistula close to the central veins directed towards the vascular anastomosis. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. Contrast is injected through both sheaths to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. A guidewire is directed into the central veins under fluoroscopic guidance. Tissue plasminogen activator is injected through an infusion catheter through the length of clotted vessels in the dialysis fistula and allowed to dwell. The infusion catheter is exchanged for a mechanical thrombectomy device over a guidewire. The mechanical thrombectomy device is used to mechanically dissociate clot within the dialysis circuit vessels. The thrombectomy device is exchanged for a suction catheter over a guidewire and the lysed clot is aspirated. Contrast is injected through a catheter placed proximal to the treated segment to assess treatment response. A guidewire is used to cross the vascular anastomosis and an occlusion balloon catheter is advanced past the anastomosis. The balloon is inflated and pulled through the anastomosis to remove

thrombus within the anastomosis. The catheters and wires are removed. A purse string suture is applied around the vascular sheath and the suture is tied once each sheath is removed.

Description of Post-Service Work: Sterile dressings are applied. The patient is transported to the recovery room for hemodynamic monitoring and pain control. The procedure is documented in the permanent record. Fluoroscopic results and patient status are communicated to the patient's family. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.06	0.69
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.00	0.38
Urgency of medical decision making	0.44	0.69

Technical Skill/Physical Effort (Mean)

Technical skill required	0.25	0.75
Physical effort required	0.25	0.88

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.13	0.88
Outcome depends on the skill and judgment of physician	0.19	0.69
Estimated risk of malpractice suit with poor outcome	-0.31	0.81

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.13	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 369X4

We are recommending the 25th percentile survey value of 7.50 RVW for 369X4.

Pre- and Post-Service Time Packages

The new CPT code 369X4 will replace the existing code 36870. It will also bundle in the work of 36147 and 36148. Medicare utilization data from 2014 shows that 36870 was performed in the physician office 54.74% of the time. We therefore recommend pre-service time package 6b (procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 369X4 with the following adjustments:

1. Evaluation: We recommend removing 5 minutes of evaluation time for "Administer moderate sedation/observe (wait) anesthesia care". This new family of dialysis codes will use the new moderate sedation codes to report moderate sedation services. We also recommend an additional 5 minutes of evaluation time to assess these complicated patients who have missed dialysis treatments, have thrombosed access, have fluid gain and atypical serum K levels. The treating physician must determine the urgency and stability of the patient.

2. Positioning: We recommend an additional 3 minutes of positioning time as the procedure is performed on the extremity, usually the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. All non-radiopaque materials need to be clear of the area of interest.

3. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37193 *Retrieval (removal) of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (14%) and 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (14%). These key references are similar to 369X4 in the sense that they are all endovascular procedure codes. CPT code 37193 involves catheterization of the vena cava and removal of a filter. This requires less time but at a higher intensity resulting in similar RVW. CPT 37225 described the work of catheterization, atherectomy and angioplasty of a femoral and/or popliteal artery. This procedure requires significantly more time than 369X4 accounting for the differences in RVW. The lower portion of the table outlines the typical coding scenario under the current component coding scheme.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37193 Key Ref	7.35	0.137	101	33	3	5	45	15
369X4 Survey	7.50	0.107	111	27	4	5	60	20
37225 Key Ref	12.00	0.087	196	40	3	5	118	30
36870 Existing	5.20	0.055	130	20			60	15

36147 Existing	3.72	0.065	80	20			45	15
36148 Existing	1.00	0.067	15				15	
Total Existing	8.06							

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 7.50 RVW for CPT 369X4. ***This will represent a 7.5% reduction over current coding***.

Comparison to MPC codes

The highest value 000 day global MPC code is 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* with 7.50 wRVUs. New code 369X4 compares appropriately with this code.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52353 MPC	7.50	0.101	133	33	5	15	60	20
369X4 Survey	7.50	0.107	111	27	4	5	60	20

Additional Rationale

Comparison of 369X4 to the family of Hemodialysis Access Interventions

CPT code 369X4 is the base code for the thrombectomy of a clotted hemodialysis access. It replaces the existing CPT code 36870 and bundles in the work of the fistulogram base code (369X1) as well as a secondary access (36148). The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	**Thrombectomy**	**7.50**	**0.107**	**111**	**31**	**60**	**20**
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT 369X4 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, an MPC code, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 7.50 appropriately ranks CPT 369X4 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36147, 36148 and 36870

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
17,625 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate. see attached

Specialty Radiology/Interventional Radiology Frequency 6522 Percentage 37.00 %

Specialty Nephrology Frequency 4936 Percentage 28.00 %

Specialty Vascular Surgery Frequency 3526 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 35476

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:369X5 Tracking Number R5 Original Specialty Recommended RVU: **9.00**
Presented Recommended RVU: **9.00**
Global Period: 000 RUC Recommended RVU: **9.00**

CPT Descriptor: Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease presents with a loss of pulses and thrill in his fistula. A pre-procedure ultrasound demonstrates a thrombosed fistula.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine on the angiographic table. The skin over the extremity with the dialysis fistula is prepared and draped in sterile fashion and local anesthetic is administered subcutaneously.

Description of Intra-Service Work: A micropuncture needle is used to access the fistula close to the vascular anastomosis and directed towards the central veins. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. The micropuncture needle is used to access the fistula close to the central veins directed towards the vascular anastomosis. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. Contrast is injected through both sheaths to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. A guidewire is directed into the central veins under fluoroscopic guidance. Tissue plasminogen activator is injected through an infusion catheter through the length of clotted vessels in the dialysis fistula and allowed to dwell. The infusion catheter is exchanged for a mechanical thrombectomy device over a guidewire. The mechanical thrombectomy device is used to mechanically dissociate clot within the dialysis circuit vessels. The thrombectomy device is exchanged for a suction catheter over a guidewire and the lysed clot is aspirated. Contrast injected through a catheter placed proximal to the treated segment to assess treatment response reveals a venous stenosis. A bolus of systemic intravenous heparin is administered.

A guidewire is used to gently traverse a dialysis circuit stenosis. An appropriately sized balloon catheter is advanced over the guidewire into the stenotic vascular segment. The balloon is inflated to an appropriate pressure for 3 minutes and then deflated. Contrast is injected through a catheter placed proximal to the treated segment to assess treatment response. A guidewire is used to cross the vascular anastomosis and an occlusion balloon catheter is advanced past the anastomosis. The balloon is inflated and pulled through the anastomosis to remove thrombus within the anastomosis. The catheters and wires are removed. A purse string suture is applied around the vascular sheath and the suture is tied once the sheath is removed.

Description of Post-Service Work: Sterile dressings are applied. The patient is transported to the recovery room for hemodynamic monitoring and pain control. The procedure is documented in the permanent record. Fluoroscopic results and patient status are communicated to the patient's family. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 369X5

We are recommending the 25th percentile survey value of 9.00 RVW for 369X5.

Pre- and Post-Service Time Packages

The new CPT code 369X5 will replace the existing code 36870 and bundle in the work of angioplasty (35475, 35476, 75962, 75964, 75978). It will also bundle in the work of 36147 and 36148. Medicare utilization data

from 2014 shows that 36870 was performed in the physician office 54.74% of the time. We therefore recommend pre-service time package 6b (procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 369X5 with the following adjustments:

1. Evaluation: We recommend removing 5 minutes of evaluation time for "Administer moderate sedation/observe (wait) anesthesia care". This new family of dialysis codes will use the new moderate sedation codes to report moderate sedation services. We also recommend an additional 5 minutes of evaluation time to assess these complicated patients who have missed dialysis treatments, have thrombosed access, have fluid gain and atypical serum K levels. The treating physician must determine the urgency and stability of the patient.

2. Positioning: We recommend an additional 3 minutes of positioning time as the procedure is performed on the extremity, usually the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. All non-radiopaque materials need to be clear of the area of interest.

3. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* (28%) and 37230 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (14%). These key references are similar to 369X5 in the sense that they are all complex endovascular procedures. CPT code 37225 involves atherectomy of the femoral and/or popliteal artery and 37230 involves stenting of a tibial artery. They both require significantly more time than 369X5 accounting for the differences in RVU. The lower portion of the table outlines the typical coding scenario under the current component coding scheme.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
369X5 Survey	9.00	0.106	126	27	4	5	75	20
37225 Key Ref	12.00	0.087	196	40	3	5	118	30
37230 Key Ref	13.80	0.101	198	40	3	5	120	30
36870 Existing	5.20	0.055	130	20			60	15
35476 Existing	5.10	0.118	81	17	4	5	35	20
36147 Existing	3.72	0.065	80	20			45	15

36148 Existing	1.00	0.067	15				15	
75978 Existing	0.54	NA	12				NA	
Total Existing	11.15							

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 9.00 RVW for CPT 369X5. ***This will represent a 19% reduction over current coding***.

Comparison to MPC codes

The highest value 000 day global MPC code is 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* with 7.50 wRVUs. New code 369X5 compares appropriately with this code.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52353 MPC	7.50	0.101	133	33	5	15	60	20
369X5 Survey	9.00	0.106	126	27	4	5	75	20

Additional Rationale

Comparison of 369X5 to the family of Hemodialysis Access Interventions

CPT code 369X5 includes the base code for the thrombectomy of a clotted hemodialysis access (369X4) with the additional work of angioplasty (35475, 35476, 75962, 75964, 75978). The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	**Thrombectomy with angioplasty**	**9.00**	**0.106**	**126**	**31**	**75**	**20**
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT 369X5 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, an MPC code, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 9.00 appropriately ranks CPT 369X5 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36147, 36148, 35476, 75978 and 36870

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 28,200 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see attached

Specialty Radiology/Interventional Radiology Frequency 10435 Percentage 37.00 %

Specialty Nephrology Frequency 7897 Percentage 28.00 %

Specialty Vascular Surgery Frequency 5641 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 35476

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:369X6 Tracking Number R6 Original Specialty Recommended RVU: **10.42**
Presented Recommended RVU: **10.42**
Global Period: 000 RUC Recommended RVU: **10.42**

CPT Descriptor: Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of an intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation to perform the stenting and all angioplasty within the peripheral dialysis circuit

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease and history of multiple percutaneous angioplasties of the same vascular segment in a dialysis circuit, presents with a loss of pulses and thrill in his fistula. A pre-procedure ultrasound demonstrates a thrombosed fistula.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine on the angiographic table. The skin over the extremity with the dialysis fistula is prepared and draped in sterile fashion and local anesthetic is administered subcutaneously.

Description of Intra-Service Work: A micropuncture needle is used to access the fistula close to the vascular anastomosis and directed towards the central veins. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. The micropuncture needle is used to access the fistula close to the central veins directed towards the vascular anastomosis. Once blood return is noted, a guidewire is introduced. The needle is exchanged for a vascular sheath over the guidewire. Contrast is injected through both sheaths to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. A guidewire is directed into the central veins under fluoroscopic guidance. Tissue plasminogen activator is injected through an infusion catheter through the length of clotted vessels in the dialysis fistula and allowed to dwell. The infusion catheter is exchanged for a mechanical thrombectomy device over a guidewire. The mechanical thrombectomy device is used to mechanically dissociate clot within the dialysis circuit vessels. The thrombectomy device is exchanged for a suction catheter over a guidewire and the lysed clot is aspirated. Contrast injected through a catheter placed proximal to the treated

segment to assess treatment response reveals a venous stenosis. A bolus of systemic intravenous heparin is administered. A guidewire is used to traverse a dialysis circuit stenosis. A balloon catheter is advanced over the guidewire into the stenotic vascular segment. The balloon is inflated and then deflated. Contrast is injected through a catheter placed proximal to the treated segment to assess treatment response. An appropriately sized stent is advanced over the guidewire into the stenotic vascular segment. The stent is deployed and the stent catheter is removed. An appropriately sized balloon catheter is advanced over the guidewire and used to appose the stent to the vessel wall. The balloon is inflated to an appropriate pressure then deflated. A contrast injection is made to assess treatment response. A guidewire is used to cross the vascular anastomosis and an occlusion balloon catheter is advanced past the anastomosis. The balloon is inflated and pulled through the anastomosis to remove thrombus within the anastomosis. The catheters and wires are removed. A purse string suture is applied around the vascular sheaths and the suture is tied once each sheath is removed.

Description of Post-Service Work: Sterile dressings are applied. The patient is transported to the recovery room for hemodynamic monitoring and pain control. The procedure is documented in the permanent record. Fluoroscopic results and patient status are communicated to the patient's family. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician.

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.49	0.25
Urgency of medical decision making	0.65	0.69
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.65	0.06

Physical effort required	0.69	0.31

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.55	0.44
Outcome depends on the skill and judgment of physician	0.49	0.50
Estimated risk of malpractice suit with poor outcome	0.40	0.06

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.71	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 369X6

We are recommending the 25th percentile survey value of 10.42 RVW for 369X6.

Pre- and Post-Service Time Packages

The new CPT code 369X6 will replace the existing code 36870 and bundle in the work of stenting. It will also bundle in the work of 36147 and 36148. Medicare utilization data from 2014 shows that 36870 was

performed in the physician office 54.74% of the time. We therefore recommend pre-service time package 6b (procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 369X6 with the following adjustments:

1. Evaulation: We recommend removing 5 minutes of evaluation time for "Administer moderate sedation/observe (wait) anesthesia care". This new family of dialysis codes will use the new moderate sedation codes to report moderate sedation services. We also recommend an additional 5 minutes of evaluation time to assess these complicated patients who have missed dialysis treatments, have thrombosed access, have fluid gain and atypical serum K levels. The treating physician must determine the urgency and stability of the patient.

2. Positioning: We recommend an additional 3 minutes of positioning time as the procedure is performed on the extremity, usually the arm, with fluoroscopy. The arm needs to be appropriately placed and padded to allow imaging of the entire arm, access, and central venous drainage. All non-radiopaque materials need to be clear of the area of interest.

3. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37230 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (48%) and 37221 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (14%). These key references are similar to 369X6 in the sense that they are all complex endovascular stenting procedures. CPT code 37230 is stenting of a tibial artery and 37221 is stenting of an iliac artery. 369X6 and 37221 have identical intra-service times and similar intensities confirming similar RVUs. There is significantly more time in 37230 than 369X6 accounting for the differences in RVU. The lower portion of the table outlines the typical coding scenario under the current component coding scheme.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37221 Key Ref	10.00	0.092	168	40	3	5	90	30
369X6 Survey	10.42	0.104	141	27	4	5	90	20
37230 Key Ref	13.80	0.101	198	40	3	5	120	30
37238 Existing	6.29	0.080	131	33	3	5	60	30
36870 Existing	5.20	0.055	130	20			60	15
36147	3.72	0.065	80	20			45	15

Existing								
36148 Existing	1.00	0.067	15				15	
Total Existing	11.75							

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 10.42 RVW for CPT 369X6. ***This will represent a 11% reduction over current coding***.

Comparison to MPC codes

The highest value 000 day global MPC code is 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* with 7.50 wRVUs. New code 369X6 compares appropriately with this code.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52353 MPC	7.50	0.101	133	33	5	15	60	20
369X6 Survey	10.42	0.104	141	27	4	5	90	20

Additional Rationale

Comparison of 369X6 to the family of Hemodialysis Access Interventions

CPT code 369X6 includes the base code for the thrombectomy of a clotted hemodialysis access (369X4) with the additional work of angioplasty (35475, 35476, 75962, 75964, 75978). The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	**Thrombectomy with angioplasty and stent**	**10.42**	**0.104**	**141**	**31**	**90**	**20**
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT 369X6 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, an MPC code, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 10.42 appropriately ranks CPT 369X6 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36147, 36148, 37238 and 36870.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:369X7 Tracking Number R7 Original Specialty Recommended RVU: **3.73**
Presented Recommended RVU: **3.73**
Global Period: ZZZ RUC Recommended RVU: **3.00**

CPT Descriptor: Transluminal balloon angioplasty, central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the angioplasty

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease presents with slow flow during his dialysis session. An angiogram indicates the need for an angioplasty within the central vein(s).

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Using previously acquired access(es), contrast is injected through both sheaths to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. A bolus of systemic, intravenous heparin is administered. A guidewire is used to gently traverse a central vein stenosis. An appropriately sized balloon catheter is advanced over the guidewire into the stenotic vascular segment. The balloon is inflated to an appropriate pressure for 3 minutes and then deflated. Contrast is injected through a catheter placed proximal to the treated segment to assess treatment response. The catheters and wires are removed. A purse string suture is applied around the vascular sheath and the suture is tied once the sheath is removed. Sterile dressings are applied. The additional procedure is documented in the permanent record. Additional permanent reports are created for the medical record.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.08	0.20
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.14	0.15
Urgency of medical decision making	0.14	0.05

Technical Skill/Physical Effort (Mean)

Technical skill required	0.22	0.20
Physical effort required	0.33	0.20

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.08	0.15
Outcome depends on the skill and judgment of physician	0.19	0.50
Estimated risk of malpractice suit with poor outcome	0.17	0.20

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.25	0.15

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for +369X7

We are recommending the 25th percentile survey value of 3.73 RVW for +369X7.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were +37222 *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)* (32%) and +37232 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)* (18%). These key references are similar to +369X7 in the sense that they are all add on endovascular procedure codes involving angioplasty. CPT code 37222 involves additional angioplasty of an iliac artery and 37232 involves additional angioplasty of a tibial artery. They both require significantly more time than +369X7 accounting for the differences in RVU. The lower portion of the table outlines the typical coding scenario under the current component coding scheme which does not address this procedure as an add on code.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
+37222 Key Ref	3.73	0.092	42	1			40	1
+369X7 Survey	3.73	0.149	25				25	
+37232 Key Ref	4.00	0.099	42	1			40	1
35476 Existing	5.10	0.118	81	17	4	5	35	20
75978 Existing	0.54	NA	12				NA	
Total Existing	5.64							

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 3.73 RVW for CPT +369X7. ***This will represent a 34% reduction over current coding***.

Comparison to MPC codes

New code +369X7 ranks appropriately between two MPC codes with similar intra-service times and intensities: +99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* and +57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure).*

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
+99292 MPC	2.25	0.075	30				30	
+369X7 Survey	3.73	0.149	25				25	
+57267 MPC	4.88	0.108	45				45	

Additional Rationale

Comparison of +369X7 to the family of Hemodialysis Access Interventions

CPT code +369X7 represents additional work that is done as an add on to one of the first six codes in the family. It describes the work of a central venous angioplasty. The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	**Central venous angioplasty through hemodialysis access**	**3.73**	**0.149**	**25**		**25**	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT +369X7 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, two MPC codes, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 3.73 appropriately ranks CPT +369X7 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 35476 and 75978

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:369X8 Tracking Number R8 Original Specialty Recommended RVU: **4.25**
Presented Recommended RVU: **4.25**
Global Period: ZZZ RUC Recommended RVU: **4.25**

CPT Descriptor: Transcatheter placement of an intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segmen

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease and a history of multiple percutaneous angioplasties of the same vascular segment in a central vein presents after an unsuccessful dialysis session. The dialysis nurse reports slow flows on the dialysis machine. After performing an angioplasty of the peripheral dialysis circuit, he undergoes placement of stent(s) within the central vein(s).

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Using previously acquired access(es), contrast is injected through both sheaths to assess the vessels in the dialysis circuit as well as the anastomosis. A guidewire and catheter are manipulated through the dialysis circuit vessels under fluoroscopic guidance. Contrast is injected through the catheter to assess distal vessels in the dialysis circuit. A bolus of systemic intravenous heparin is administered. A guidewire is used to gently traverse a central vein stenosis. An appropriately sized stent is advanced over the guidewire into the stenotic vascular segment. The stent is deployed and the stent catheter is removed. An appropriately sized balloon catheter is advanced over the guidewire and used to appose the stent to the vessel wall. The balloon is inflated to an appropriate pressure then deflated. Contrast is injected through a catheter placed proximal to the treated segment to assess treatment response. The catheters and wires are removed. A purse string suture is applied around the vascular sheath and the suture is tied once the sheath is removed. Sterile dressings are applied. The additional procedure is documented in the permanent record. Additional permanent reports are created for the medical record.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.21	0.48
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.14	0.24
Urgency of medical decision making	0.24	0.57

Technical Skill/Physical Effort (Mean)

Technical skill required	0.17	0.67
Physical effort required	0.28	0.38

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.52	0.57
Outcome depends on the skill and judgment of physician	0.28	0.67
Estimated risk of malpractice suit with poor outcome	0.45	0.33

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.34	0.86

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for +369X8

We are recommending the 25th percentile survey value of 4.25 RVW for +369X8.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were +37223 *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)* (25%) and +37234 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)* (18%). These key references are similar to +369X8 in the sense that they are all add on endovascular procedure codes involving stenting. CPT code +37223 involves additional stenting of an iliac artery and +37234 involves additional stenting of a tibial artery. CPT code +369X8 is very similar to +37223 in both time and intensity supporting the recommended value. CPT code +37234 requires significantly longer intra-service time than +369X8 accounting for the differences in RVU. The lower portion of the table outlines the typical coding scenario under the current component coding scheme which does not address this procedure as an add on code.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
+37223 Key Ref	4.25	0.093	47	1			45	1
+369X8 Survey	4.25	0.106	40				40	
+37234 Key Ref	5.50	0.091	62	1			60	1
37238 Existing	6.29	0.080	131	33	3	5	60	30

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 4.25 RVW for CPT +369X8. ***This will represent a 32% reduction over current coding***.

Comparison to MPC codes

New code +369X8 ranks appropriately between two MPC codes with similar intra-service times and intensities: +99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* and +57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure).*

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
+99292 MPC	2.25	0.075	30				30	
+369X8 Survey	4.25	0.106	40				40	
+57267 MPC	4.88	0.108	45				45	

Additional Rationale

Comparison of +369X8 to the family of Hemodialysis Access Interventions

CPT code +369X8 represents additional work that is done as an add on to one of the first six codes in the family. It describes the work of a central venous stent placement. The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post
369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	**Central venous stent through hemodialysis access**	**4.25**	**0.106**	**40**		**40**	
+369X9	Embolization of hemodialysis access	4.25	0.142	30		30	

Conclusion

A multi-disciplinary survey of CPT +369X8 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, two MPC codes, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 4.25 appropriately ranks CPT +369X8 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37238

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,796
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see attached

Specialty Radiology/Interventional Radiology Frequency 665 Percentage 37.02 %

Specialty Nephrology Frequency 504 Percentage 28.06 %

Specialty Vascular Surgery Frequency 360 Percentage 20.04 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Global Period: ZZZ RUC Recommended RVU: **4.12**

CPT Descriptor: Dialysis circuit permanent vascular embolization or occlusion (including main circuit or any accessory veins), endovascular, including all imaging and radiological supervision and interpretation necessary to complete the intervention

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with end stage renal disease presents with a new fistula that has failed to mature. A pre-procedure ultrasound and angiogram shows flow diversion from the main outflow vein through a large collateral vein requiring permanent vascular occlusion of the dialysis circuit.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Using previously acquired access(es), a guidewire and catheter are manipulated through the dialysis circuit vessels into the previously identified collateral vein. The wire is removed and an embolic material is introduced into the collateral vein. Contrast is injected to confirm occlusion. The catheters and wires are removed. The sheath is removed and hemostasis is achieved through manual pressure at the access site. Sterile dressings are applied. The additional procedure is documented in the permanent record. Additional permanent reports are created for the medical record.

Description of Post-Service Work:

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
37233	ZZZ	4.25	**RUC Time**

CPT Descriptor Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
35572	ZZZ	6.81	**RUC Time**

CPT Descriptor Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99292	ZZZ	2.25	**RUC Time**	456,453

CPT Descriptor 1 Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
57267	ZZZ	4.88	**RUC Time**	8,063

CPT Descriptor 2 Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 19 **% of respondents:** 16.6 **%**

Number of respondents who choose 2nd Key Reference Code: 16 **% of respondents:** 14.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 369X9	Top Key Reference CPT Code: 37233	2nd Key Reference CPT Code: **35572**
Median Pre-Service Time	0.00	1.00	0.00

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.84	0.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.58	0.88
Urgency of medical decision making	0.68	0.81

Technical Skill/Physical Effort (Mean)

Technical skill required	0.89	0.94
Physical effort required	0.63	0.88

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.95	1.06
Outcome depends on the skill and judgment of physician	0.84	1.00
Estimated risk of malpractice suit with poor outcome	0.68	0.81

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.95	0.94

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT code 36870 was identified by CMS as potentially misvalued on the high expenditure screen. It was sent to CPT to create a new bundled family to describe intervention and maintenance of hemodialysis access. The specialty societies (SVS, SIR, ACR, and RPA) presented the new family of codes at the October 2015 CPT meeting. The new family consists of nine new codes to describe a fistulogram (369X1), fistulogram with angioplasty (369X2), fistulogram with angioplasty and stent (369X3), thrombectomy (369X4), thrombectomy with angioplasty (369X5), and thrombectomy with angioplasty and stent (369X6). There are also three add on codes to describe central venous angioplasty done through the hemodialysis access (+369X7), central venous stent through the hemodialysis access (+369X8), and coil embolization of the hemodialysis access (+369X9).

Methodology

A multi-disciplinary expert panel including SVS, SIR, ACR, ASIN, and RPA was convened. A survey was distributed randomly to the members of the representative societies. There were 114 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for +369X9

We are recommending the 25th percentile survey value of 4.25 RVW for +369X9.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were +37233 *'Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)* (17%) and +35572 *Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery) (List separately in addition to code for primary procedure)* (14%). These key references are similar to +369X9 in the sense that they are all add on procedure codes. CPT code +37233 involves additional atherectomy of a tibial artery. CPT code +35572 is an open surgical code for harvest of deep venous conduit. CPT code +37233 requires significantly longer intra-service time than +369X9 accounting for the differences in RVU. The lower portion of the table outlines the typical coding scenario under the current component coding scheme which does not address this procedure as an add on code.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
+37233 Key Ref	4.25	0.093	47	1			45	1
+369X9 Survey	4.25	0.142	30				30	
+35572 Key Ref	6.81	0.114	60				60	
37241 Existing	9.00	0.087	147	19	3	5	90	30

This comparison thus favorably supports our recommendation for the 25th percentile survey value of 4.25 RVW for CPT +369X9. ***This will represent a 53% reduction over current coding***.

Comparison to MPC codes

New code +369X9 ranks appropriately between two MPC codes with similar intra-service times and intensities: +99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* and +57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure).*

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
+99292 MPC	2.25	0.075	30				30	
+369X9 Survey	4.25	0.142	30				30	
+57267 MPC	4.88	0.108	45				45	

Additional Rationale

Comparison of +369X9 to the family of Hemodialysis Access Interventions

CPT code +369X9 represents additional work that is done as an add on to one of the first six codes in the family. It describes the work of a coil embolization of the access itself or tributaries that are impairing the flow through the access. The 25th percentile provides appropriate relativity within the family. The table below highlights the current code in relation to the family.

CPT	Description	RVW	IWPUT	total	pre	intra	post

369X1	Fistulogram	3.72	0.115	66	26	25	15
369X2	Fistulogram with angioplasty	6.00	0.126	86	26	40	20
369X3	Fistulogram with angioplasty and stent	8.00	0.141	96	26	50	20
369X4	Thrombectomy	7.50	0.107	111	31	60	20
369X5	Thrombectomy with angioplasty	9.00	0.106	126	31	75	20
369X6	Thrombectomy with angioplasty and stent	10.42	0.104	141	31	90	20
+369X7	Central venous angioplasty through hemodialysis access	3.73	0.149	25		25	
+369X8	Central venous stent through hemodialysis access	4.25	0.106	40		40	
+369X9	**Embolization of hemodialysis access**	**4.25**	**0.142**	**30**		**30**	

Conclusion

A multi-disciplinary survey of CPT +369X9 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, two MPC codes, and across the new family of hemodialysis access interventions, we believe that the 25th percentile survey RVW of 4.25 appropriately ranks CPT +369X9 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37241

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 500
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see attached

Specialty Radiology/Interventional Radiology Frequency 185 Percentage 37.00 %

Specialty Nephrology Frequency 140 Percentage 28.00 %

Specialty Vascular Surgery Frequency 100 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 35476

AT MEETING

CPT Code(s): 369X1-9
Specialty Society('s): SIR, ACR, RPA, SVS and ACPh

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

Global Period: '000 **January 2016**

●369X1	*Introduction of needle(s) and/or catheter(s), dialysis circuit, with diagnostic angiography of the dialysis circuit, including all direct puncture(s) and catheter placement(s), injection(s) of contrast, all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava, fluoroscopic guidance, radiologic supervision and interpretation and image documentation and report;*
●369X2	*with transluminal balloon angioplasty; peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
●369X3	*with transcatheter placement of intravascular stent(s) within the peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis segment*
●369X4	*Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation; diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s);*
●369X5	*with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
●369X6	*with transcatheter placement of an intravascular stent(s), peripheral dialysis segment, including all imaging radiological supervision and interpretation to perform the stenting and all angioplasty within the peripheral dialysis circuit,*

AT MEETING

CPT Code(s): 369X1-9
Specialty Society('s): SIR, ACR, RPA, SVS and ACPh

Global Period: 'ZZZ **January 2016**

●+369X7	*Transluminal balloon angioplasty, central dialysis segment, performed through dialysis access, including all imaging and radiological supervision and interpretation required to perform the angioplasty (List separately in addition to code for primary procedure)*
●+369X8	*Transcatheter placement of an intravascular stent(s), central dialysis segment, performed through dialysis access, including all imaging radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
●+369X9	*Dialysis circuit permanent vascular embolization or occlusion (including main circuit or any accessory veins), endovascular, including all imaging and radiological supervision and interpretation necessary to complete the intervention (List separately in addition to code for primary procedure)*

---

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

SIR, ACR, RPA, SVS and ACPh convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this new dialysis family of codes.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The dialysis circuit tab includes nine new bundled procedures. We have included notes (row 3) that describe how the new codes are currently coded. We have included the direct practice expense inputs for the codes that are currently used to report these services (columns Z-AM). We have also included the moderate sedation practice expense inputs approved at the September 2015 meeting (pending at CMS).

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We believe there is extensive use of clinical staff time for this dialysis tab. The staff must obtain pre-authorization for the procedure including appropriate referral authorization. Clinical staff confirm the date and time with the patient and notify to patient's dialysis center and nephrologist of the planned procedure. We are requesting 3 additional minutes of pre service time for 369x4 – 369x6 for clinical staff to arrange an unscheduled dialysis treatment for the patient. These patients typically present with a thrombosed access on the day of their dialysis treatment. In addition to arranging for the procedure, staff must arrange for an urgent dialysis treatment because the patient who missed a treatment typically cannot wait until the next regularly scheduled dialysis session.

369X1-369X3
Pre Service Time

- *Complete pre-service diagnostic & referral forms (3)*
- *Coordinate pre-surgery services (3)*
- *Follow-up phone calls & prescriptions (3)*

369X4-369X6
Pre Service Time

- *Coordinate pre-service diagnostic & referral forms (3)*
- *Coordinate pre-surgery services (6)*
- *Follow-up phone calls & prescriptions (6)*

Prepare and Position Patient
We are requesting three extra minutes of positioning. This extra time is needed to prepare the arm for the procedure.

Equipment
We are requesting use of a stretcher chair EF019 instead of the standard stretcher. We believe that a reclining or stretcher type chair is commonly used in the office, non-facility access center setting because of concern for patient and staff safety. ESRD patients frequently have mobility challenges due to age, amputations and other comorbidities. Reducing the number of transfers before and after the procedure greatly reduces the risk of falls. Patients are seated in the preoperative area, transported to the interventional suite, and returned to postoperative care with only one transfer from chair to angiography table in the controlled environment of the interventional suite. Eliminating the need for multiple patient transfers from stretcher to chair has proven to be valuable in reducing risk of falling, reducing risk of staff injury, and improving efficiency.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic & referral forms
Coordinate pre-surgery services
Phone calls and prescriptions
Availability of prior images confirmed and reviewed
Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocoled by radiologist

Intra-Service Clinical Labor Activities:

Prepare room, equipment, supplies
Patient is greeted, gowned and escorted into procedure room
Vital signs obtained
Prepare and position patient prone on table / obtain vitals / set up IV / monitor patient

Sterile prep performed and draping of target site
Assist physician in performing procedure
Monitor pt. following service/check tubes, monitors, drains *(not related to moderate sedation)*
Clean room/equipment by physician staff
Technologist archives and QC's images to/in PACS, checking for all images and dose page
Review examination with interpreting MD
Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

●369X2 *with transluminal balloon angioplasty; peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*

●369X3 *with transcatheter placement of intravascular stent(s) within the peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis segment*

●369X4 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation; diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s);*

●369X5 *with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*

●369X6 *with transcatheter placement of an intravascular stent(s), peripheral dialysis segment, including all imaging radiological supervision and interpretation to perform the stenting and all angioplasty within the peripheral dialysis circuit,*

AT MEETING

CPT Code(s): 369X1-9
Specialty Society('s): SIR, ACR, RPA, SVS and ACPh

Global Period: 'ZZZ **January 2016**

●+369X7	*Transluminal balloon angioplasty, central dialysis segment, performed through dialysis access, including all imaging and radiological supervision and interpretation required to perform the angioplasty (List separately in addition to code for primary procedure)*
●+369X8	*Transcatheter placement of an intravascular stent(s), central dialysis segment, performed through dialysis access, including all imaging radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
●+369X9	*Dialysis circuit permanent vascular embolization or occlusion (including main circuit or any accessory veins), endovascular, including all imaging and radiological supervision and interpretation necessary to complete the intervention (List separately in addition to code for primary procedure)*

---

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

SIR, ACR, RPA, SVS and ACPh convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this new dialysis family of codes.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The dialysis circuit tab includes nine new bundled procedures. We have included notes (row 3) that describe how the new codes are currently coded. We have included the direct practice expense inputs for the codes that are currently used to report these services (columns Z-AM). We have also included the moderate sedation practice expense inputs approved at the September 2015 meeting (pending at CMS).

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We believe there is extensive use of clinical staff time for this dialysis tab.
The staff must obtain pre-authorization for the procedure including appropriate referral authorization. The staff calls the facility to schedule to patient. They then confirm the date and time with the patient and notify to patient's dialysis center and nephrologist of the planned procedure. We are requesting 3 additional minutes of pre service time for 369x4 – 369x6 for clinical staff to arrange an unscheduled dialysis treatment for the patient. These patients typically present with a thrombosed access on the day of their dialysis treatment. In addition to arranging for the procedure, staff must arrange for an urgent dialysis treatment

because the patient who missed a treatment typically cannot wait until the next regularly scheduled dialysis session.

369X1-369X3
Pre Service Time
Coordinate pre-surgery services (3 min) and Schedule space/equipment in facility (3 min)

We are recommending 6 minutes of pre service time

369X4-369X6
Pre Service Time

- *Coordinate pre-service diagnostic & referral forms (3)*
- *Coordinate pre-surgery services (6)*
- *Schedule space and equipment in facility (6)*
- *Follow-up phone calls & prescriptions (6)*

We are recommending 24 minutes of pre service time.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic & referral forms
Coordinate pre-surgery services
Schedule space and equipment in facility
Phone calls and prescriptions

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% or More

January 2016

Open and Percutaneous Transluminal Angioplasty

In January 2015, the Joint CPT/RUC Workgroup on Codes Reported Together Frequently identified codes 35475, 35476, 36147, 36148, 37236, 37238, 75791, 75962, and 75968 as being frequently reported together in various combinations. At the October 2015 CPT Editorial Panel meeting, the Panel approved the creation of four new codes and deletion of 13 codes to describe bundled percutaneous transluminal angioplasty services.

372X1 ***Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery***

The RUC reviewed the survey results from 78 practicing radiologists, interventional radiologists and vascular surgeons and agreed with the following physician time components: pre-service time of 31 minutes, intra-service time of 60 minutes and immediate post-service time of 28 minutes. The RUC agreed to add 2 minutes of pre-service positioning time to the standard pre-service time package to assist with adjusting the imaging table and anesthesia lines to ensure the physician can obtain all the necessary views required for the intervention.

The RUC reviewed the survey respondents' physician work values and agreed that the survey 25th percentile work RVU of 7.00 is appropriate. To justify a work RVU of 7.00, the RUC compared the surveyed code to the second key reference code 37211 *Transcatheter therapy, arterial infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, initial treatment day* (work RVU= 8.00, intra time= 60 minutes) and noted that while both codes have identical intra-service time, the reference code has greater total time, 138 minutes compared to 119 minutes, and is justifiably valued higher than 372X1. The RUC also reviewed MPC code 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* (work RVU= 7.50, intra time= 60 minutes) and code 43264 *Endoscopic retrograde cholangiopancreatography (ERCP); with removal of calculi/debris from biliary/pancreatic duct(s)* (work RVU= 6.73, intra time= 60 minutes) and agreed that both these services, with identical intra-service time and comparable physician work, the recommended value for 372X1 is relative to other similar services. **The RUC recommends a work RVU of 7.00 for CPT code 372X1.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

372X2 ***Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery***

The RUC reviewed the survey results from 78 practicing radiologists, interventional radiologists and vascular surgeons and agreed with the median intra-service time of 30 minutes for this add-on procedure.

The RUC reviewed the survey respondents' physician work values and agreed that the survey 25th percentile work RVU of 3.50 is appropriate. To justify a work RVU of 3.50, the RUC compared the surveyed code to CPT codes 22512 *Percutaneous vertebroplasty (bone biopsy included when performed), 1 vertebral body, unilateral or bilateral injection, inclusive of all imaging guidance; each additional cervicothoracic or lumbosacral vertebral body* (work RVU= 4.00, intra time= 30 minutes) and 61783 *Stereotactic computer-assisted (navigational) procedure; spinal* (work RVU= 3.75, intra time= 30 minutes) and agreed that both these services, with identical intra-service time and comparable physician work, the recommended value for 372X2 is relative to other similar services. Furthermore, this service represents half the intra-service time of the base procedure 372X1 and thus represents half the work value as well. **The RUC recommends a work RVU of 3.50 for CPT code 372X2.**

372X3 ***Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein***

Prior to valuing this procedure, the RUC discussed compelling evidence that the work RVUs associated with the current reporting of this procedure may be undervalued. The RUC did note however that due to the bundling of procedures with this entire family, significant redistribution is occurring. The specialty societies noted that there will be a change in patient population for this procedure. The utilization of the former venous angioplasty code 35476 will be dispersed between the new bundled codes for dialysis and the new bundled codes for angioplasty. Based on 2014 Medicare utilization data, approximately 81% of the 35475 claims were for hemodialysis related procedures. These patients will be captured in the new dialysis bundle codes while the remaining 19% represent a new patient population that is distinctly different from the previous code. These venous angioplasties will involve mainly central venous stenoses and represent more work at a higher intensity compared to a venous angioplasty in a dialysis access. Given this evidence, the RUC accepted compelling evidence for CPT code 372X3.

The RUC reviewed the survey results from 78 practicing radiologists, interventional radiologists and vascular surgeons and agreed with the following physician time components: pre-service time of 31 minutes, intra-service time of 60 minutes and immediate post-service time of 28 minutes. The RUC agreed to add 2 minutes of pre-service positioning time to the standard pre-service time package to assist with adjusting the imaging table and anesthesia lines to ensure the physician can obtain all the necessary views required for the intervention.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey 25th percentile work RVU of 6.00 is appropriate. To justify a work RVU of 6.00, the RUC compared the surveyed code to the top two key reference codes 37238 *Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; initial vein* (work RVU= 6.29, intra time= 60 minutes) and 37212 *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day* (work RVU=7.06, intra time= 60 minutes) and agreed that both these services, with identical intra-service time and comparable physician work, the recommended value for 372X3 is relative to other similar services. **The RUC recommends a work RVU of 6.00 for CPT code 372X3.**

372X4 ***Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; each additional vein***

The RUC reviewed the survey results from 78 practicing radiologists, interventional radiologists and vascular surgeons and agreed with the median intra-service time of 30 minutes for this add-on procedure.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey 25th percentile work RVU of 2.97 is appropriate. To justify a work RVU of 2.97, the RUC compared the surveyed code to the top key reference code 37239 *Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; each additional vein* (work RVU= 2.97, intra time= 30 minutes) and agreed that this reference code, with identical intra-service time, should be valued the same as 372X4. In addition, the RUC reviewed CPT codes 22515 *Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body* (work RVU= 4.00, intra time= 30 minutes) and 32668 *Thoracoscopy, surgical; with diagnostic wedge resection followed by anatomic lung resection* (work RVU= 3.00, intra time= 30 minutes) and agreed that both these services, with identical intra-service time and comparable physician work, the recommended value for 372X4 relative to other similar services. As was the case with the relationship between the arterial angioplasty base code and the associated add-on code, this venous angioplasty add-on code (372X4) represents half the intra-service time of the base code 372X3 and roughly half the work RVU. **The RUC recommends a work RVU of 2.97 for CPT code 372X4.**

Practice Expense:
The RUC approved the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

36216 *initial second order thoracic or brachiocephalic branch, within a vascular family*
36217 *initial third order or more selective thoracic or brachiocephalic branch, within a vascular family*
+36218 *additional second order, third order, and beyond, thoracic or brachiocephalic branch, within a vascular family (List in addition to code for initial second or third order vessel as appropriate)*

(Use 36218 in conjunction with 36216, 36217, 36225, 36226)

(For angiography, see 36222-36228, 75600-75774~~, 75791~~)

(For transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), see 372X1, 372X2)

37217 *Transcatheter placement of intravascular stent(s), intrathoracic common carotid artery or innominate artery by retrograde treatment, open ipsilateral cervical carotid artery exposure, including angioplasty, when performed, and radiological supervision and interpretation*

(*37217 includes open vessel exposure and vascular access closure, all access and selective catheterization of the vessel, traversing the lesion, and any radiological supervision and interpretation directly related to the intervention when performed, standard closure of arteriotomy by suture, and imaging performed to document completion of the intervention in addition to the intervention[s] performed. Carotid artery revascularization services [eg, 33891, 35301, 35509, 35510, 35601, 35606] performed during the same session may be reported separately, when performed)*

(Do not report 37217 in conjunction with 35201, ~~35458~~, 36221-36227, 372X1, 372X2~~75962~~ for ipsilateral services)

(For open or percutaneous transcatheter placement of intravascular cervical carotid artery stent[s], see 37215, 37216)

(For open or percutaneous antegrade transcatheter placement of innominate and/or intrathoracic carotid artery stent[s], use 37218)

(For open or percutaneous transcatheter placement of extracranial vertebral artery stent[s], see 0075T, 0076T)

(For transcatheter placement of intracranial stent[s], use 61635)

Arteries and Veins

Endovascular Revascularization (Open or Percutaneous, Transcatheter)

+37235 *with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*

(Use 37235 in conjunction with 37231)

Codes 372X1, 372X2, 372X3, 372X4 describe open or percutaneous transluminal balloon angioplasty (eg, conventional, low-profile, cutting, drug-coated balloon). Codes 372X1, 372X2 describe transluminal balloon angioplasty in an artery excluding the central nervous system (61630, 61635), coronary (92920-92944), pulmonary (92997, 92998), and lower extremities for occlusive disease (37220-37235. Codes 372X3 and 372X4 describe transluminal balloon angioplasty in a vein excluding the dialysis circuit (369X2, 369X5, 369X7) when approached through the ipsilateral dialysis access. Transluminal balloon angioplasty is inherent to stenting in the extracranial carotid and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

innominate arteries (37215, 37216, 37217, 37218), the peripheral arteries (37220-37237), and in peripheral veins (37238, 37239) and therefore is not separately reportable. Multiple angioplasties performed in a single vessel, including treatment of separate and distinct lesions within a single vessel, are reported with a single code. If a lesion extends across the margins of one vessel into another, but can be treated with a single therapy, the intervention should be reported only once. When additional, separate and distinct ipsilateral or contralateral vessels are treated in the same session, 372X2 and/or 372X4 may be reported as appropriate. Non-selective and/or selective catheterization (eg, 36005, 36010, 36011, 36012, 36200, 36215, 36216, 36217, 36218, 36245, 36246, 36247, 36248) is reported separately. Codes 372X1, 372X2, 372X3, 372X4 include radiological supervision and interpretation directly related to the intervention performed and imaging performed to document completion of the intervention. Extensive repair or replacement of an artery may be reported separately (eg, 35226 or 35286). Intravascular ultrasound may be reported separately (ie, 37252, 37253). Mechanical thrombectomy and/or thrombolytic therapy, when performed, may be reported (eg, 37184, 37185, 37186, 37187, 37188, 37211, 37212, 37213, 37214).

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:372X1 Tracking Number P1 Original Specialty Recommended RVU: **7.00**
Presented Recommended RVU: **7.00**
Global Period: 000 RUC Recommended RVU: **7.00**

CPT Descriptor: Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old female with history of hypertension undergoes a magnetic resonance arteriogram that reveals fibromuscular dysplasia involving the right renal artery. The patient is referred for right renal angioplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: A targeted H&P is performed. The proposed procedure is discussed with the patient and family and consent is obtained and documented. The patient is transported to the procedure room and placed supine on the procedure table.

Description of Intra-Service Work: The right common femoral artery access and sheath placement are performed. A catheter is advanced into the right renal artery. Diagnostic arteriography is performed (all separately reported). The diagnostic catheter and indwelling sheath are exchanged for a longer sheath that is advanced to the origin of the right renal artery. An angioplasty balloon is advanced through the sheath over the wire, and is placed across the right renal artery stenosis. The right renal artery stenoses are angioplastied, and the angioplasty balloon is removed. Post-angioplasty right renal arteriography is performed through the sheath to confirm dilation of the right renal artery stenoses, and exclude arterial extravasation. The sheath and wire are removed, and hemostasis is obtained with manual compression, or by a closure device.

Description of Post-Service Work: Sterile dressing is applied. Appropriate care orders are entered in the electronic medical record. The procedure is documented in the chart. The patient is transferred from the procedure table to the recovery area and monitored for 4 hours. The procedure outcome is discussed with the patient and family. The patent is discharged home with follow up care instructions.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

Mental Effort and Judgment (Mean)

	Top Key Ref Code	**2nd Key Ref Code**
The number of possible diagnosis and/or the number of management options that must be considered	0.33	0.44
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.30	0.67
Urgency of medical decision making	0.15	0.00

Technical Skill/Physical Effort (Mean)

Technical skill required	0.21	0.33
Physical effort required	0.15	0.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.24	0.22
Outcome depends on the skill and judgment of physician	0.27	0.56
Estimated risk of malpractice suit with poor outcome	0.36	0.44

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.33	0.56

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In response to a 'codes reported together' screen, a CCP was written to create new coding convention to describe intervention and maintenance of hemodialysis access. Previous coding convention for angioplasty included 35475 *Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel* and 35476 *Transluminal balloon angioplasty, percutaneous; venous*, with separate radiologic supervision and interpretation including 75962 *Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac or lower extremity, radiological supervision and interpretation*, 75964 *Transluminal balloon angioplasty, each additional peripheral artery other than renal or other visceral artery, iliac or lower extremity, radiological supervision and interpretation (List separately in addition to code for primary procedure)* and 75978 *Transluminal balloon angioplasty, venous (eg, subclavian stenosis), radiological supervision and interpretation.* These codes did not differentiate between angioplasty done within a hemodialysis access from an angioplasty done within any other peripheral artery or vein. A joint work group consisting of SVS, SIR and ACR presented a new family of codes to describe intervention and maintenance of hemodialysis access at the October 2015 CPT meeting. The new family bundled angioplasty and radiologic supervision and interpretation of the dialysis circuit into the codes distinguishing them from the previous codes.

As a corollary, a second CCP was presented by SVS, SIR, and ACR at the October 2015 CPT addressing the residual angioplasty codes. Open and percutaneous arterial angioplasty codes (35450, 35452, 35458, 35471, 35472, and 35475), open and percutaneous venous angioplasty codes (35460, 35476), and angioplasty radiologic and supervision codes (75962, 75964, and 75978) will all be bundled into four new codes. The new

codes are 372X1 *Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery*, 372X2 *each additional artery*, 372X3 *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein*, and 372X4 *each additional vein*.

Methodology

A multi-disciplinary expert panel including SVS, SIR, and ACR was convened. A survey was distributed randomly to the members of the representative societies. There were 78 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 372X1

We are recommending the 25th percentile survey value of 7.00 RVW for 372X1.

Pre- and Post-Service Time Packages

We recommend pre-service time package 2b (difficult patient/straightforward procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 372X1 with the following adjustments:

> Evaluation: We recommend removing the 10 minutes of pre-service evaluation time associated with 'administer moderate sedation'. Moderate sedation will be separately reportable, when performed, using the new moderate sedation codes.
>
> Positioning: Package 2b positioning time is 1 minute. An additional 2 minutes (total=3) of pre-service positioning time for 372X1 is recommended to assist with adjusting the imaging table and anesthesia lines for appropriate positioning in order to be able to obtain all appropriately necessary views required for the intervention.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery* (42%) and 37211 *Transcatheter therapy, arterial infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, initial treatment day* (12%). These key references are similar to 372X1 in the sense that they are all endovascular procedure codes. CPT 37236 describes the work of placing a stent into a peripheral artery. It has 30 minutes more intra-service time compared to 372X1 resulting in an appropriately higher RVW. CPT 37211 describes the work of initiation of arterial thrombolysis. It has similar times to 372X1 but a higher intensity resulting in an appropriately higher RVW.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37236 Key Ref	9.00	0.083	161	33	3	5	90	30
37211 Key Ref	8.00	0.105	138	40	3	5	60	30
372X1 Survey	7.00	0.096	119	23	3	5	60	28

This comparison with the two key reference services favorably supports our recommendation for the 25th percentile survey value of 7.00 RVW for CPT 372X1.

Comparison to Existing Value

Open and percutaneous angioplasty is currently reported with component coding using a 30000 code to describe the location and a 70000 code to describe the radiologic supervision and interpretation. There are 8 codes (35450, 35452, 35458, 35471, 35472, 35475, 75962, and 75966) that are being combined into 372X1. They have variable utilization and varied RVWs. To add further complexity, 79% of the previous CPT code 35475 will be incorporated into the new bundled hemodialysis codes.

CPT	RVW	2014 Utilization	Percent to X1		Weighted RVW
35450	10.05	68	100%	683	
35452	6.9	37	100%	255	
35458	9.48	753	100%	7138	
35471	10.05	2754	90%	24910	
35472	6.9	437	100%	3015	
35475	6.6	50192	17%	56315	
				92318	**7.50**
75962	0.54	49430	25%	6673	
75966	1.31	2445	100%	3203	
				9876	**0.67**
TOTAL					**8.17**

Thus a weighted calculation of the existing codes would predict an RVW for 372X1 of 8.17. This favorably supports our recommendation for the 25th percentile survey value of 7.00 RVW for CPT 372X1.

Comparison to MPC codes

New code 372X1 ranks appropriately between two MPC codes with similar intra-service times and intensities: 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included),* and 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included).* 372X1 is appropriately valued between these two MPC codes.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52352 MPC	6.75	0.118	118	33	5	15	45	20
372X1 Survey	7.00	0.096	119	23	3	5	60	28
52353 MPC	7.50	0.101	133	33	5	15	60	20

Conclusion

A multi-disciplinary survey of CPT 372X1 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, estimated existing value, and two MPC codes, we believe that the 25th percentile survey value of 7.00 RVW appropriately ranks CPT 372X1 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Non-selective and/or selective catheterization (eg, 36005, 36010-36015, 36200, 36215-36218, 36245-36248) is reported separately if performed. Intravascular ultrasound(37250,37251) may be reported separately, when performed.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 35471 and 75966

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 14,751 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See attached

Specialty Radiology/Inteventional Radiology Frequency 5753 Percentage 39.00 %

Specialty Vascular Surgery Frequency 5163 Percentage 35.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

SUMMARY OF RECOMMENDATION

CPT Code:372X2 Tracking Number P2 Original Specialty Recommended RVU: **3.50**
Presented Recommended RVU: **3.50**
Global Period: ZZZ RUC Recommended RVU: **3.50**

CPT Descriptor: Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old female with history of hypertension undergoes a magnetic resonance arteriogram that reveals fibromuscular dysplasia involving bilateral renal arteries. The patient is referred for bilateral renal angioplasties.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Subsequent to the primary procedure, attention is directed towards the left renal artery. The sheath is retracted into the abdominal aorta. The catheter is advanced into the left renal artery. Diagnostic arteriography is performed (all separately reported). The long sheath is advanced to the origin of the left renal artery. An angioplasty balloon is advanced through the sheath and over the wire, and is placed across the left renal artery stenoses. The left renal artery stenoses are angioplastied, and the angioplasty balloon is removed. Post-angioplasty left renal arteriography is performed through the sheath to confirm dilation of the left renal stenoses, and exclude arterial extravasation. The sheath and wire are removed, and hemostasis is obtained with manual compression, or by a closure device, and a sterile dressing is applied. Appropriate care orders are entered in the electronic medical record. The procedure is documented in the chart.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In response to a 'codes reported together' screen, a CCP was written to create new coding convention to describe intervention and maintenance of hemodialysis access. Previous coding convention for angioplasty included 35475 *Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel* and 35476 *Transluminal balloon angioplasty, percutaneous; venous,* with separate radiologic supervision and interpretation including 75962 *Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac or lower extremity, radiological supervision and interpretation,* 75964 *Transluminal balloon angioplasty, each additional peripheral artery other than renal or other visceral artery, iliac or lower extremity, radiological supervision and interpretation (List separately in addition to code for primary procedure)* and 75978 *Transluminal balloon angioplasty, venous (eg, subclavian stenosis), radiological supervision and interpretation.* These codes did not differentiate between angioplasty done within a hemodialysis access from an angioplasty done within any other peripheral artery or vein. A joint work group consisting of SVS, SIR and ACR presented a new family of codes to describe intervention and maintenance of hemodialysis access at the October 2015 CPT meeting. The new family bundled angioplasty and radiologic supervision and interpretation of the dialysis circuit into the codes distinguishing them from the previous codes.

As a corollary, a second CCP was presented by SVS, SIR, and ACR at the October 2015 CPT addressing the residual angioplasty codes. Open and percutaneous arterial angioplasty codes (35450, 35452, 35458, 35471, 35472, and 35475), open and percutaneous venous angioplasty codes (35460, 35476), and angioplasty radiologic and supervision codes (75962, 75964, and 75978) will all be bundled into four new codes. The new codes are 372X1 *Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery*, 372X2 *each additional artery*, 372X3 *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein*, and 372X4 *each additional vein.*

Methodology

A multi-disciplinary expert panel including SVS, SIR, and ACR was convened. A survey was distributed randomly to the members of the representative societies. There were 78 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 372X2

We are recommending the 25th percentile survey value of 3.50 RVW for 372X2.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37237 *'Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)* (53%) and 37239 *Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; each additional vein (List separately in addition to code for primary procedure)* (18%). These key references are similar to 372X2 in the sense that they are all endovascular procedure codes. They are both add on codes that describe the work of placing a stent, one into a peripheral artery, one into a vein. The arterial code has 15 minutes more intra-service time compared to 372X2 resulting in an appropriately higher RVW. The venous code has the same intra-service time but a lower intensity resulting in an appropriately lower RVW when compared to 372X2.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37237 Key Ref	4.25	0.093	47	1			45	1
372X2 Survey	3.50	0.117	30				30	
37239 Key Ref	2.97	0.098	32	1			30	1

Thus comparison with the two key reference services favorably supports our recommendation for the 25th percentile survey value of 3.50 RVW for CPT 372X2.

Comparison to Existing Value

Open and percutaneous angioplasty is currently reported with component coding using a 30000 code to describe the location and a 70000 code to describe the radiologic supervision and interpretation. Partial utilization of 4 codes (35471, 35475, 75964, and 75968) will be combined to estimate the existing RVW for 372X2. Accounting for the 50% reduction with an additional code, the weighted value of the angioplasty

codes is divided by two before adding the radiologic supervision and interpretation for a total estimated existing value of 3.87 RVW.

CPT	RVW	2014 Utilization	Percent to X2		Weighted RVW
35471	10.05	2754	10%	2768	
35475	6.6	50192	4%	13251	
				16019	**7.02 (3.51)**
75968	0.36	216	100%	78	
75964	0.36	1965	100%	707	
				785	**0.36**
TOTAL					**3.87**

Thus a weighted calculation of the existing codes would predict an RVW for 372X2 of 3.87. This favorably supports our recommendation for the 25th percentile survey value of 3.50 RVW for CPT 372X2.

Comparison to MPC codes

New code 372X2 ranks appropriately between two MPC codes with similar intra-service times and intensities: 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service),* and 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure).* 372X2 is appropriately valued between these two MPC codes.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
99292 MPC	2.25	0.075	30				30	
372X2 Survey	3.50	0.117	30				30	
57267 MPC	4.88	0.108	45				45	

Conclusion

A multi-disciplinary survey of CPT 372X2 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, estimated existing value, and two MPC codes, we believe that the 25th percentile survey value of 3.50 RVW appropriately ranks CPT 372X2 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 35471 and 75968

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,283
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See attached

Specialty radiology/interventional radiology Frequency 891 Percentage 39.02 %

Specialty vascular surgery Frequency 800 Percentage 35.04 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female with history of breast cancer and history of an infusion port that was removed after being in place for 1 year presents with bilateral upper extremity and facial edema. A magnetic resonance venogram reveals superior vena cava stenosis. The patient is referred for angioplasty of the superior vena cava.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: A targeted H&P is performed. The proposed procedure is discussed with the patient and family and consent is obtained and documented. The patient is transported to the procedure room and placed supine on the procedure table.

Description of Intra-Service Work: The right common femoral vein is punctured, a sheath is placed, a catheter and guidewire are negotiated across the superior vena cava stenosis and advanced to the right subclavian vein, and diagnostic venography is performed (all separately reported). An angioplasty balloon is advanced through the sheath and over the wire, and is placed across the superior vena cava stenosis. The superior vena cava stenosis is angioplastied, and the angioplasty balloon is removed. The catheter is advanced through the sheath into the right subclavian vein. Post-angioplasty central venography is performed through the catheter to confirm dilation of the superior vena cava, and exclude venous extravasation. The sheath, catheter and wire are removed, and hemostasis is obtained with manual compression.

Description of Post-Service Work: A sterile dressing is applied. Appropriate care orders are entered in the electronic medical record. The procedure is documented in the chart. The patient is transferred from the procedure table to the recovery area and monitored for 2 hours. The procedure outcome is discussed with the patient and family. The patent is discharged home with follow up care instructions.

Physical effort required	0.03	0.27

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.06	0.18
Outcome depends on the skill and judgment of physician	0.15	0.36
Estimated risk of malpractice suit with poor outcome	0.15	0.36

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.03	0.45

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In response to a 'codes reported together' screen, a CCP was written to create new coding convention to describe intervention and maintenance of hemodialysis access. Previous coding convention for angioplasty included 35475 *Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel* and 35476 *Transluminal balloon angioplasty, percutaneous; venous*, with separate radiologic supervision and interpretation including 75962 *Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac or lower extremity, radiological supervision and interpretation*, 75964 *Transluminal balloon angioplasty, each additional peripheral artery other than renal or other visceral artery, iliac or lower extremity, radiological supervision and interpretation (List separately in addition to code for primary procedure)* and 75978 *Transluminal balloon angioplasty, venous (eg, subclavian stenosis), radiological supervision and interpretation.* These codes did not differentiate between angioplasty done within a hemodialysis access from an angioplasty done within any other peripheral artery or vein. A joint work group consisting of SVS, SIR and ACR presented a new family of codes to describe intervention and maintenance of hemodialysis access at the October 2015 CPT meeting. The new family bundled angioplasty and radiologic supervision and interpretation of the dialysis circuit into the codes distinguishing them from the previous codes.

As a corollary, a second CCP was presented by SVS, SIR, and ACR at the October 2015 CPT addressing the residual angioplasty codes. Open and percutaneous arterial angioplasty codes (35450, 35452, 35458, 35471, 35472, and 35475), open and percutaneous venous angioplasty codes (35460, 35476), and angioplasty radiologic and supervision codes (75962, 75964, and 75978) will all be bundled into four new codes. The new

codes are 372X1 *Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery*, 372X2 *each additional artery*, 372X3 *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein*, and 372X4 *each additional vein*.

Methodology

A multi-disciplinary expert panel including SVS, SIR, and ACR was convened. A survey was distributed randomly to the members of the representative societies. There were 78 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 372X3

We are recommending the 25th percentile survey value of 6.00 RVW for 372X3, which is an increase in value over existing.

Compelling Evidence

We believe that there is compelling evidence to recommend an increase in value for 372X3 based on a *new patient population*. The utilization of the former venous angioplasty code 35476 will be dispersed between the new bundled codes for dialysis and the new bundled codes for angioplasty. Based on 2014 Medicare utilization data, approximately 81% of the 35475 claims were for hemodialysis related procedures. These patients will be captured in the new dialysis bundle codes while the remaining 19% represent *a new patient population* that is distinctly different from the previous code. These venous angioplasties will involve mainly central venous stenoses and represent more work at a higher intensity compared to a venous angioplasty in a dialysis access.

Pre- and Post-Service Time Packages

We recommend pre-service time package 2b (difficult patient/straightforward procedure with sedation) and post-service time package 8b (IV sedation/complex procedure) for 372X3 with the following adjustments:

> Evaluation: We recommend removing the 10 minutes of pre-service evaluation time associated with 'administer moderate sedation'. Moderate sedation will be separately reportable, when performed, using the new moderate sedation codes.
>
> Positioning: Package 2b positioning time is 1 minute. An additional 2 minutes (total=3) of pre-service positioning time for 372X3 is recommended to assist with adjusting the imaging table and anesthesia lines for appropriate positioning in order to be able to obtain all appropriately necessary views required for the intervention.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37238 *Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; initial vein* (44%) and 37212 *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day* (14%). These key references are similar to 372X3 in the sense that they are all endovascular procedure codes. CPT 37238 describes the work of placing a venous stent. It has identical intra time but a slightly higher intensity when compared to 372X3 resulting in an appropriately higher RVW. CPT 37212 describes the work of initiation of venous thrombolysis. It has similar times to 372X3 but a higher intensity resulting in an appropriately higher RVW.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37238 Key Ref	6.29	0.080	131	33	3	5	60	30
37212 Key Ref	7.06	0.090	138	40	3	5	60	30
372X3 Survey	6.00	0.079	119	23	3	5	60	28

This comparison with the two key reference services favorably supports our recommendation for the 25th percentile survey value of 6.00 RVW for CPT 372X3.

Comparison to Existing Value

Open and percutaneous angioplasty is currently reported with component coding using a 30000 codes to describe the location and a 70000 code to describe the radiologic supervision and interpretation. There are 3 codes (35460, 35476, and 75978) that are being combined into 372X3. They have variable utilization and varied RVWs. To add further complexity, roughly 80% of the previous CPT codes 35476 and 75978 will be incorporated into the new bundled hemodialysis codes.

CPT	RVW	2014 Utilization	Percent to X3		Weighted RVW
35460	6.03	3544	100%	21370	
35476	5.10	281365	15%	215666	
				237037	**5.18**
75978	0.54	281464	16%	24318	**0.54**
TOTAL					**5.72**

Thus a weighted calculation of the existing codes would predict an RVW for 372X3 of 5.72. This favorably supports our recommendation for the 25th percentile survey value of 6.00 RVW for CPT 372X3.

Comparison to MPC codes

New code 372X3 ranks appropriately between two MPC codes with similar intra-service times and intensities: 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm),* and 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included).* 372X3 is appropriately valued between these two MPC codes.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52235 MPC	5.44	0.098	94	19	5	5	45	20
372X3 Survey	6.00	0.079	119	23	3	5	60	28
52352 MPC	6.75	0.118	118	33	5	15	45	20

Conclusion

A multi-disciplinary survey of CPT 372X3 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, estimated existing value, and two MPC codes, we believe that the 25th percentile survey value of 6.00 RVW appropriately ranks CPT 372X3 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Non-selective and/or selective catheterization (eg, 36005, 36010-36015, 36200, 36215-36218, 36245-36248) is reported separately if performed. Intravascular ultrasound(37250,37251) may be reported separately, when performed.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 35476 and 75978

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology/Interventional Radiology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 45,849 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See attached

Specialty radiology/interventional radiology Frequency 17882 Percentage 39.00 %

Specialty vascular surgery Frequency 16048 Percentage 35.00 %

Specialty Frequency 0 Percentage 0.00 %

SUMMARY OF RECOMMENDATION

CPT Code:372X4 Tracking Number P4 Original Specialty Recommended RVU: **2.97**
Presented Recommended RVU: **2.97**
Global Period: ZZZ RUC Recommended RVU: **2.97**

CPT Descriptor: Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; each additional vein (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female with history of right breast cancer and history of a left-sided infusion port that was removed after being in place for 1 year presents with bilateral upper extremity (left greater than right) and facial edema. A magnetic resonance venogram reveals left subclavian vein stenosis and superior vena cava stenosis. The patient is referred for angioplasty of the left subclavian vein and superior vena cava.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Subsequent to the primary procedure, attention is directed towards the superior vena cava stenosis. A larger angioplasty balloon is advanced through the sheath and over the wire, and is placed across the superior vena cava stenosis. The superior vena cava stenosis is angioplastied, and the angioplasty balloon is removed. The catheter is advanced through the sheath into the left subclavian vein. Post-angioplasty central venography is performed through the catheter to confirm dilation of the superior vena cava, and exclude venous extravasation. The sheath, catheter and wire are removed, hemostasis is obtained with manual compression, and a sterile dressing is applied. Appropriate care orders are entered in the electronic medical record. The procedure is documented in the chart.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.21	0.15
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.21	0.22

Urgency of medical decision making	0.07	0.10

Technical Skill/Physical Effort (Mean)

Technical skill required	0.14	0.12
Physical effort required	0.21	0.10

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.50	0.20
Outcome depends on the skill and judgment of physician	0.29	0.20
Estimated risk of malpractice suit with poor outcome	0.43	0.29

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.29	0.17

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In response to a 'codes reported together' screen, a CCP was written to create new coding convention to describe intervention and maintenance of hemodialysis access. Previous coding convention for angioplasty included 35475 *Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel* and 35476 *Transluminal balloon angioplasty, percutaneous; venous,* with separate radiologic supervision and interpretation including 75962 *Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac or lower extremity, radiological supervision and interpretation,* 75964 *Transluminal balloon angioplasty, each additional peripheral artery other than renal or other visceral artery, iliac or lower extremity, radiological supervision and interpretation (List separately in addition to code for primary procedure)* and 75978 *Transluminal balloon angioplasty, venous (eg, subclavian stenosis), radiological supervision and interpretation.* These codes did not differentiate between angioplasty done within a hemodialysis access from an angioplasty done within any other peripheral artery or vein. A joint work group consisting of SVS, SIR and ACR presented a new family of codes to describe intervention and maintenance of hemodialysis access at the October 2015 CPT meeting. The new family bundled angioplasty and radiologic supervision and interpretation of the dialysis circuit into the codes distinguishing them from the previous codes.

As a corollary, a second CCP was presented by SVS, SIR, and ACR at the October 2015 CPT addressing the residual angioplasty codes. Open and percutaneous arterial angioplasty codes (35450, 35452, 35458, 35471, 35472, and 35475), open and percutaneous venous angioplasty codes (35460, 35476), and angioplasty radiologic and supervision codes (75962, 75964, and 75978) will all be bundled into four new codes. The new codes are 372X1 *Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery*, 372X2 *each additional artery*, 372X3 *Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein,* and 372X4 *each additional vein.*

Methodology

A multi-disciplinary expert panel including SVS, SIR, and ACR was convened. A survey was distributed randomly to the members of the representative societies. There were 78 surveys completed. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved.

Work RVU Recommendation for 372X4

We are recommending the 25th percentile survey value of 2.97 RVW for 372X4.

Comparison with Key Reference Services

The key reference codes chosen by the majority of the survey respondents were 37239 *Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; each additional vein (List separately in addition to code for primary procedure)* (51%) and 37237 *'Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)* (18%). These key references are similar to 372X4 in the sense that they are all endovascular procedure codes. They are both add on codes that describe the work of placing a stent, one into a vein and one into an artery. The arterial code has 15 minutes more intra-service time compared to 372X4 resulting in an appropriately higher RVW. The venous code has the almost identical time and intensity when compared to 372X4.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37239 Key Ref	2.97	0.098	32	1			30	1
372X4 Survey	2.97	0.099	30				30	
37237 Key Ref	4.25	0.093	47	1			45	1

Thus comparison with the two key reference services favorably supports our recommendation for the 25th percentile survey value of 2.97 RVW for CPT 372X4.

Comparison to Existing Value

Open and percutaneous angioplasty is currently reported with component coding using a 30000 codes to describe the location and a 70000 code to describe the radiologic supervision and interpretation. Partial utilization of 2 codes (35476 and 75978) will be combined to estimate the existing RVW for 372X4. Accounting for the 50% reduction with an additional code, the weighted value of the angioplasty code is

divided by two before adding the radiologic supervision and interpretation for a total estimated existing value of 3.10 RVW.

CPT	RVW	2014 Utilization	Percent to X4		Weighted RVW
35476	5.10	281365	4%	57511	**5.11 (2.56)**
75978	0.54	281464	4%	6080	**0.54**
TOTAL					**3.10**

Thus a weighted calculation of the existing codes would predict an RVW for 372X4 of 3.10. This favorably supports our recommendation for the 25th percentile survey value of 2.97 RVW for CPT 372X4.

Comparison to MPC codes

New code 372X4 ranks appropriately between two MPC codes with similar intra-service times and intensities: 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service),* and 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure).* 372X4 is appropriately valued between these two MPC codes.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
99292 MPC	2.25	0.075	30				30	
372X4 Survey	2.97	0.099	30				30	
57267 MPC	4.88	0.108	45				45	

Conclusion

A multi-disciplinary survey of CPT 372X4 was performed with strong survey results and concordance between specialties. When comparing the survey results to the key reference services, estimated existing value, and two MPC codes, we believe that the 25th percentile survey value of 2.97 RVW appropriately ranks CPT 372X4 relative to other services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

Global Period: '000 **January 2016**

372X1	Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery
372X3	Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein

Global Period: 'ZZZ **January 2016**

372X2	each additional artery
372X4	each additional vein

---

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

SIR, ACR and SVS convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this new open and percutaneous angioplasty family of codes.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The open and percutaneous angioplasty tab includes four new bundled procedures. We have included the direct practice expense inputs for the codes that are currently used to report these services. We have also included the moderate sedation practice expense inputs approved at the September 2015 meeting (pending at CMS). Finally, we have also included the direct PE inputs for CPT Code 37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery* a reference code for this new tab.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

372X1 and 372X2

We believe there is extensive use of clinical staff time for these Transluminal balloon angioplasty codes. However, we are recommending 6 minutes of nurse blend pre service time instead of the standard 30 minutes.

Pre Service Time
Coordinate pre-surgery services and Schedule space/equipment in facility
We are recommending 6 minutes of pre service time (3 for each of the tasks listed above). We believe our recommendations appropriately reflect the minimal use of clinical staff for these activities.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Coordinate pre-surgery services
Schedule space and equipment in facility

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

CPT Code(s): 372X1-X4
Specialty Society('s): SIR, ACR and SVS

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

Global Period: '000 **January 2016**

372X1	Transluminal balloon angioplasty (except lower extremity artery(s) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; initial artery
372X3	Transluminal balloon angioplasty (except dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same vein; initial vein

Global Period: 'ZZZ **January 2016**

372X2	each additional artery
372X4	each additional vein

---

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

SIR, ACR and SVS convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this new open and percutaneous angioplasty family of codes.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The open and percutaneous angioplasty tab includes four new bundled procedures. We have included the direct practice expense inputs for the codes that are currently used to report these services. We have also included the moderate sedation practice expense inputs approved at the September 2015 meeting (pending at CMS). Finally, we have also included the direct PE inputs for CPT Code 37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery* a reference code for this new tab.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We believe there is extensive use of clinical staff time for these Transluminal balloon angioplasty codes. However, we are recommending 9 minutes of nurse blend pre service time instead of the standard 18 minutes. We believe our recommendations appropriately reflect the minimal use of clinical staff for these activities.

Pre Service Time

- *Complete pre-service diagnostic & referral forms*
- *Coordinate pre-surgery services*
- *Follow-up phone calls & prescriptions*

Prepare and Position Patient
We are requesting three extra minutes of positioning time to move leads out of X-ray field, check that X-ray is not obstructed and that there is no risk of collision of X-ray equipment with patient.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic & referral forms
Coordinate pre-surgery services
Phone calls and prescriptions
Availability of prior images confirmed and reviewed
Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocoled by radiologist

Intra-Service Clinical Labor Activities:

Prepare room, equipment, supplies
Patient is greeted, gowned and escorted into procedure room
Vital signs obtained
Prepare and position patient prone on table / obtain vitals / set up IV / monitor patient
Sterile prep performed and draping of target site
Assist physician in performing procedure
Monitor pt. following service/check tubes, monitors, drains *(not related to moderate sedation)*
Clean room/equipment by physician staff
Technologist archives and QC's images to/in PACS, checking for all images and dose page
Review examination with interpreting MD
Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Esophagectomy

In October 2015, the CPT Editorial Panel created three new codes 432X5, 432X6, 432X7 to report esophagectomy via laparoscopic and thoracoscopic approaches, and revised 43112 to clarify this service. However, during the CPT Panel minutes review the vignette was altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the Panel and tried to correct prior to survey; however, the Panel did not adjust the vignette. The specialty societies conducted a survey and found that a significant number of respondents did not agree that the vignette described the typical patient and noted that the typical patient does undergo neoadjuvant chemotherapy and radiation therapy prior to surgery. Therefore, the survey is flawed and the codes should be re-surveyed with the appropriate vignette. **The RUC agrees with the specialty societies and recommends:**

1) **The CPT Editorial Panel table new codes 432X5, 432X6, 432X7 until CPT 2018;**
2) **The specialty societies go to the Research Subcommittee to obtain approval for the current typical patient (vignette) for both the new thoracoscopic/laparoscopic codes and open codes (43107, 43112 and 43117); and**
3) **The specialty societies survey all six codes for the October 2016 RUC meeting.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●432X5	S1	Esophagectomy, total or near total, with laparoscopic mobilization of the abdominal and mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, laparoscopic transhiatal esophagectomy)	090	Survey for October 2016 RUC meeting

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●432X6	S2	Esophagectomy, distal two-thirds, with laparoscopic mobilization of the abdominal and lower mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with separate thoracoscopic mobilization of the middle and upper mediastinal esophagus and thoracic esophagogastrostomy (ie, laparoscopic-thoracoscopic esophagectomy, Ivor Lewis esophagectomy) (Do not report 32551 in conjunction with 432X6 for right tube thoracostomy)	090	Survey for October 2016 RUC meeting
●432X7	S3	Esophagectomy, total or near total, with thoracoscopic mobilization of the upper, middle, and lower mediastinal esophagus, with separate laparoscopic proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, thoracoscopic, laparoscopic and cervical incision esophagectomy, McKeown esophagectomy, tri-incisional esophagectomy) (Do not report 32551 in conjunction with 432X7 for right tube thoracostomy)	090	Survey for October 2016 RUC meeting

Subject: Tab 16 - Thoracoscopic/Laparoscopic Esophagectomy

Dear Dr. Smith:

On behalf of the Society of Thoracic Surgeons, American College of Surgeons and Society of American Gastrointestinal Endoscopic Surgeons, we are writing in regards to the three new codes included in Tab 16 for the January 2016 RUC meeting.

After the October 2015 CPT Panel meeting concluded, during the minutes review, a Panel member altered the typical patient vignettes removing the text that indicated the typical patient undergoes chemotherapy and radiation therapy prior to surgery. We immediately responded to the Panel's post-meeting action with a comment indicating the most common scenario for patients currently treated for esophageal cancer includes neoadjuvant chemotherapy and radiotherapy, a period of time to recover from these treatments, restaging (most commonly including physical exam, lab work, and PET/CT scan), followed by the appropriate surgical resection. This combined multimodality treatment program occurs independent of the surgical approach(es) used during the esophagogastrectomy. Thus, we indicated and continue to believe it is most appropriate to retain neoadjuvant chemotherapy and radiation therapy in the vignettes as originally submitted. This element significantly impacts physician work for the planned surgery and subsequent perioperative care when compared with the atypical patient that does not undergo these preoperative treatments. The Panel did not acknowledge or discuss our rationale in their response requiring that the vignettes not include prior neoadjuvant therapy.

Our societies conducted a RUC survey of the three new codes and found that a significant number of respondents did not agree that the vignette described the typical patient and offered that a typical patient does undergo neoadjuvant chemotherapy and radiation therapy prior to surgery. We therefore are forced to believe this was a flawed survey.

Through our review, we have also recognized that the values for the comparable open codes, last reviewed in 2000, are now misvalued by virtue of the shift in standard practice for the typical patient to now undergo pre-operative chemotherapy and radiation therapy. In addition, another major change in the esophagectomy patient population has occurred. Within the last ten years, the number of esophagectomies performed for benign, premalignant esophageal disease (eg. Barrett's esophagus) and early stage cancers has markedly decreased. Further, a review of data available in the STS General Thoracic database also suggests that the intraoperative times for both the current open codes and the surveyed new codes are inaccurate.

We propose the following actions:

1. Table the new CPT codes until CPT 2018
2. Allow our societies to go to the Research Subcommittee to obtain approval for correct typical patient vignettes for both the open codes (43107, 43112, 43117) and new thoracoscopic/laparoscopic codes (432X5, 432X6, 432X7)
3. Survey all six codes for the April or October 2016 RUC meeting.

We have attached the survey summary data for information. We look forward to discussing our proposed actions at the January 2016 RUC meeting.

Sincerely,

James Levett, MD, FACS
RUC Advisor for the Society of Thoracic Surgeons

Charles Mabry, MD, FACS

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Esophageal Sphincter Augmentation

In October 2015, the CPT Editorial Panel created two new codes to describe laparoscopic implantation and removal of a magnetic bead sphincter augmentation device for treatment of gastroesophageal reflux disease (GERD).

With Research Subcommittee approval, the specialty societies utilized an industry provided provider list and conducted a targeted survey of the 145 physicians who have undergone training and are allowed to order the device for implantation and are the only physicians who have performed these procedures. Only 18 non-conflicted survey responses were received even after multiple communications following up with the 145 physicians.

432X1 ***Laparoscopy, surgical, esophageal sphincter augmentation procedure, placement of sphincter augmentation device (ie, magnetic band), including cruroplasty when performed***
The specialty societies convened an expert panel and compared the survey median intra-service time for 432X1 (60 minutes) to the intra-service time for 49320 *Laparoscopy, abdomen, peritoneum, and omentum, diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* (intra-service time = 45 minutes) and agreed with the survey respondents that 60 minutes appropriately accounts for the additional work of placing the magnetic bead device. The RUC agreed and recommends 63 minutes of pre-service time, 60 minutes of intra-service time, 30 minutes of immediate post service time, a half-day 99238 discharge day management and two 99213 Evaluation and Management office visits. The specialty societies noted, and the RUC agreed, that the survey median and 25th percentile work RVUs are inconsistent with the total physician work for 432X1 and are not relative to other similar procedures. Therefore, to determine an appropriate work value, the RUC recommends a direct crosswalk to CPT code 19301 *Mastectomy, partial (eg, lumpectomy, tylectomy, quadrantectomy, segmentectomy* (work RVU = 10.13 and 60 minutes intra-service time). The RUC noted that both 432X1 and 19301 require the same intra-service time and almost identical total time. Additionally, both services require similar work intensity to perform and are both outpatient procedures. For additional support, the RUC referenced neighboring CPT codes 45171 *Excision of rectal tumor, transanal approach; not including muscularis propria (ie, partial thickness)* (work RVU = 8.13 and 45 minutes) and 36821 *Arteriovenous anastomosis, open; direct, any site (eg, Cimino type) (separate procedure)* (work RVU = 11.90 and 75 minutes intra-service time). **The RUC recommends a work RVU of 10.13 for CPT code 432X1.**

432X2 ***Removal of esophageal sphincter augmentation device***
The specialty societies convened an expert panel and compared the survey median intra-service time for 432X2 (68 minutes) to the intra-service time for 432X1 (60 minutes) and 49320 *Laparoscopy, abdomen, peritoneum, and omentum, diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* (intra-service time = 45 minutes) and agreed with the survey respondents that the removal of the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

esophageal sphincter augmentation device will require more time than the implantation. The RUC agreed and recommends 70 minutes of pre-service time, 68 minutes of intra-service time, 30 minutes of immediate post service time; a half-day 99238 discharge day management and two 99213 Evaluation and Management office visits. The specialty societies noted, and the RUC agreed, that the survey median and 25th percentile work RVUs are inconsistent with the total physician work for 432X2 and are not relative to other similar procedures. Therefore, to determine an appropriate work value, the RUC recommends a direct crosswalk to CPT code 47562 *Laparoscopy, surgical; cholecystectomy* (work RVU = 10.47 and 80 minutes intra-service time). The RUC noted that although 47562 requires more intra-service time than the aggregate survey median time for 432X2, the median intra-service time may be understated because of the number of people without experience. The RUC noted that the total time for these services is nearly identical and both require similar work and intensity. For additional support of a 10.47 work RVU for 432X2, the RUC referenced MPC codes 50590 *Lithotripsy, extracorporeal shock wave* (work RVU = 9.77 and 60 minutes) and 57288 *Sling operation for stress incontinence (eg, fascia or synthetic)* (work RVU = 12.13 and 60 minutes intra-service time). **The RUC recommends a work RVU of 10.47 for CPT code 432X2.**

Practice Expense
The Practice Expense Subcommittee corrected one typo on the number of visit packs. The RUC recommends the standard 090-day global direct practice expense inputs for CPT codes 432X1 and 432X2.

New Technology
The RUC recommends that codes 432X1 and 432X2 be placed on the new technology and re-survey once these services are more widely performed. It was noted that the American Society of General Surgeons (ASGS) thought that the RUC recommendation was insufficient to describe the physician work required for these services, even though cruroplasty is included in the descriptor.

Flag in RUC Database
The RUC recommends that this service be flagged in the RUC database as "Do not use to validate physician work" until this procedure is more widely performed and a RUC survey is conducted that results in the required minimum number of survey responses.

Presented Recommended RVU: **10.13**
Global Period: 090 RUC Recommended RVU: **10.13**

CPT Descriptor: Laparoscopy, surgical, esophageal sphincter augmentation procedure, placement of sphincter augmentation device (ie, magnetic band), including cruroplasty when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old patient with chronic gastroesophageal reflux disease (GERD) continues to have break-through symptoms of regurgitation, cough and heartburn despite optimal medical and pharmacologic management. The patient has undergone diagnostic evaluation confirming abnormal levels of esophageal acid exposure through pH testing, and symptoms are confirmed to be related to GERD. After discussion of treatment options, the patient elects to proceed with laparoscopic esophageal sphincter augmentation, with placement of a sphincter augmentation device.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 39% , Overnight stay-less than 24 hours 44% , Overnight stay-more than 24 hours 17%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 45%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Meet with patient and family to review planned procedure and post-operative management. Review preadmission work-up, with particular attention to imaging information and reports (lab, EKG, chest x-ray, upper endoscopy report, objective data supporting diagnosis of gastroesophageal reflux). Reexamine patient to make sure that physical findings have not changed, make sure the patient's medication regimen remains the same, confirm the patient has no new allergies, and has not undergone any recent procedures. Update the H&P accordingly in the electronic health record. Review the details of the procedure again including risk for morbidity, obtain informed consent, including witness, and contact the OR staff that documentation is complete. Assure appropriate selection, timing, and administration of DVT prophylaxis. Determine indication for intra-operative antibiotics and prescribe as necessary based on the patient's allergy. Assess need for beta-blockers, order as required. Review length and type of anesthesia with anesthesiologist including the potential for adjunctive analgesia regimens including transversus abdominis plane block. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. Specifically, assure that the operating room has several available sizes of the magnetic esophageal sphincter augmentation device and sizing tool available confirming the expiration date. Assist in transfer of patient from hospital gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. Monitor/assist with positioning of patient. Use appropriate techniques to clear skin hair from the upper abdominal wall. Indicate areas of skin to be prepped. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under general anesthesia, surgical laparoscopy is performed. Pneumoperitoneum is established to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are carefully monitored so as not to impair ventilation or venous return. Four to six trocar ports are inserted through the anterior abdominal wall above the umbilicus after the region is appropriately infiltrated with local anesthetic. Exposure of the anterior stomach and the esophageal hiatus requires insertion of liver retractor generally attached to a table mounted device. The gastrohepatic ligament is opened above and below the hepatic branch of the anterior vagal nerve. The fundus of the stomach is mobilized to expose the anterior border of the left crus. The distal esophagus and gastroesophageal junction are dissected circumferentially. The base of the right and left crus are identified and exposed to allow safe exposure and identification of the posterior vagus nerve. The posterior vagal nerve is separated from the posterior esophageal wall and a minimal eyelet is created for securement of the magnetic band. The esophageal circumference is measured with a specialized laparoscopic instrument to determine the exact diameter of the external aspect of the esophageal body at the location of the gastro-esophageal junction. Based on the measured circumference, an appropriately sized augmentation device is introduced through a port. The device is carefully inserted through the formed eyelet between the posterior vagus nerve and the esophageal body. The device is then placed circumferentially around the external lower esophageal sphincter and secured anteriorly by a mechanical clasp or attached sutures. Remove the liver retractor. A surgical assistant facilitates the procedure by assisting with port placement, retraction, manipulation of structures, camera movements and port closure. Surgical access is closed.

Description of Post-Service Work:
Hospital: Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including the potential need for patient controlled analgesia. Instruct nursing staff in care of tubes and other devices. Review post-operative labs as appropriate. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart and record. Dictate operative report and copy referring physician(s). Discontinue perioperative antibiotic therapy as appropriate. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. liquid or mechanical soft diet and its duration). Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms. Arrange for first follow-up outpatient.

Office:
Talk with and examine patient. Remove dressings, sutures, when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Assess effect of procedure with gastroesophageal reflux quality of life questionnaire. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Coordinate continuing care by nutritionist. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.60	0.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.50	0.25
Urgency of medical decision making	-0.10	0.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	-0.20	0.25
Physical effort required	-0.10	0.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.50	0.00
Outcome depends on the skill and judgment of physician	0.20	0.00
Estimated risk of malpractice suit with poor outcome	0.40	0.00

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.20	0.25

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

At the October 2015 CPT Editorial Panel meeting, Torax Medical Inc brought forward a CPT proposal to add codes 4328X1, 4328X2 to report laparoscopic implantation and removal of a magnetic bead sphincter augmentation device for treatment of GERD.

Survey Process and Response

The Society of Thoracic Surgeons and the Society of American Gastrointestinal Endoscopic Surgeons received approval from the Research Subcommittee to conduct a targeted survey to an industry provided list from Torax Medical Inc that included surgeons who had performed at least one procedure, although not necessarily in the past 12 months. We explained to the Research Subcommittee that only surgeons who have undergone training are allowed to order the device for implantation and therefore these trained surgeons were the only surgeons with experience. Our expert panel agreed that surgeons without training and experience would only be guessing at time and visit information related to implantation of the device and necessary postoperative followup.

A total of 145 requests were sent out and 18 responses were received. An additional seven surgeons started the survey, but because they had a financial conflict, could not complete the survey. Although some of the 18 respondents indicated zero experience in the past 12 months, this did not mean they had no experience. Although 18 responses does not meet the RUC's minimum response requirement, the responses came from experienced providers in laparoscopic esophageal and gastric procedures who we believe could provide accurate time and visit estimations on the survey. Our societies also believe that it is important to value this service so that the correct "relative" value is reported and reimbursed, instead of recommending contractor pricing which would likely be widely variable.

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change in package time of 33 minutes.
Positioning: Add 12 minutes (total = 15 minutes) for positioning. The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient's legs are padded and placed in stirrups with great care to avoid nerve injury and the foot of the table removed. The patient must be secured to the table as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. The lower half of the table is then

lowered to allow the operating surgeon to stand between the legs for the procedure. The skin is marked, prepped and draped.
Scrub, dress, wait: No change in package time of 15 minutes.

Post-time Package 9A (General Anesthesia or Complex Regional Block/Straightforward Procedure)

No change in package time of 30 minutes.

Recommendation – 432X1

Our expert panel compared the survey median intraoperative time for 432X1 (60 minutes) to the intraoperative time for a diagnostic laparoscopy (49320, 45 minutes) and agree that 60 minutes appropriately accounts for the additional work of placing the magnetic bead device. We also agree that the typical patient will be outpatient, either same day or overnight, but less than 24 hours and that two postoperative office visits are appropriate to monitor wounds and assess nutrition and diet as the patient accommodates to the new device. Although we agree with the time and visit estimates, our expert panel believes the survey median and 25th percentile work RVUs are inconsistent with the total physician work for 432X1 and not relative to other procedures.

We looked at other laparoscopic procedures, including the key reference codes to find a comparison, but determined that most laparoscopic procedures are inpatient and/or have significantly more intraoperative time. We then looked at other codes that are familiar to general surgeons and thoracic surgeons, many of whom still maintain their American Board of Surgery Certification, that have the same intraoperative time, are outpatient procedures and have a similar work intensity. We determined that code 19301 met these criteria. We therefore are recommending to crosswalk the work RVU for code 432X1 to code 19301; a general surgery service that has the same intraoperative time, similar work intensity and almost identical total time.

We recommend a work RVU of 10.13 for 432X1. This value is crosswalked from code 19301.

We also recommend that this code be tagged in the RUC database as "Do not use to validate physician work" until such time that this procedure is more widely performed and a RUC survey is conducted that results in the required minimum number of survey responses.

CPT	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	38	13	12
432X1	Laparoscopy, surgical, esophageal sphincter augmentation procedure, placement of sphincter augmentation device (ie, magnetic band), including cruroplasty when performed	10.13	0.095	218	63	60	30	0.5	2	
19301	Mastectomy, partial (eg, lumpectomy, tylectomy, quadrantectomy, segmentectomy);	10.13	0.093	216	55	60	20	0.5	2	1

Key Reference Comparison

Although the intensity of intraoperative work for 432X1 may be similar to the key reference codes 43279 and 43281, the intraoperative time and postoperative hospital work is significantly less for 432X1. The recommended work RVU for 432X1 reflects a value that has similar intensity and takes into account less intra- and postoperative work when compared with the KRS codes.

CPT	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	32	31	38	13	12

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43659 Unlisted laparoscopy procedure, stomach

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Rarely

Specialty thoracic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 40 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is the societies' estimate. This will rarely be performed on Medicare-aged patients.

Specialty general surgery	Frequency 35	Percentage 87.50 %
Specialty thoracic surgery	Frequency 5	Percentage 12.50 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? No

CPT Descriptor: Removal of esophageal sphincter augmentation device

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old patient with medically refractory GERD underwent laparoscopic surgery for esophageal sphincter augmentation with placement of a sphincter augmentation device. One year after surgery, the patient continues to experience intermittent dysphagia for solid foods despite conservative management. The patient elects to have the device removed.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 28% , Overnight stay-less than 24 hours 44% , Overnight stay-more than 24 hours 28%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 46%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review preadmission work-up, with particular attention to imaging information and reports (lab, EKG, chest x-ray). Reexamine patient to make sure that physical findings have not changed, make sure the patient's medication regimen remains the same, confirm the patient has no new allergies, and has not undergone any recent procedures. Update the H&P accordingly in the electronic health record. Review the details of the procedure again including risk for morbidity, obtain informed consent, including witness, and contact the OR staff that documentation is complete. Assure appropriate selection, timing, and administration of DVT prophylaxis. Determine indication for intra-operative antibiotics and prescribe as necessary based on the patient's allergy. Assess need for beta-blockers, order as required. Review length and type of anesthesia with anesthesiologist including the potential for adjunctive analgesia regimens including transversus abdominis plane block. Verify that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. Assist in transfer of patient from hospital gurney to operating table. Assist anesthesia team with line placement and induction of anesthesia and intubation. Monitor/assist with positioning of patient. Use appropriate techniques to clear skin hair from the upper abdominal wall. Indicate areas of skin to be prepped. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under general anesthesia, surgical laparoscopy is performed. Pneumoperitoneum is established to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are carefully monitored so as not to impair ventilation or venous return. Four to six trocar ports are inserted through the anterior abdominal wall above the umbilicus after the region is appropriately infiltrated with local anesthetic. Exposure of the anterior stomach and the esophageal hiatus requires insertion of liver retractor generally attached to a table mounted device. The capsule surrounding the device is identified anterior to the esophagus. The capsule is opened anteriorly and

several beads are exposed. The link connecting one of the beads is cut. Lateral traction is placed on one end of the device, and the device is removed from the capsule by continuing to open it, exposing further beads until the device is completely free from the capsule. Great care is taken to avoid transmural injury to the esophagus or stomach and to avoid damaging the posterior vagus nerve which borders the device posteriorly. The device is then removed from the abdominal cavity through one of the ports. Remove the liver retractor. A surgical assistant may facilitate the procedure by assisting with port placement, retraction, manipulation of structures, camera movements and port closure. Surgical access is closed.

Description of Post-Service Work:
Hospital: Apply sterile adhesive strips and dressings. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including the potential need for patient controlled analgesia. Instruct nursing staff in care of tubes and other devices. Review post-operative labs as appropriate. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart and record. Dictate operative report and copy referring physician(s). Discontinue perioperative antibiotic therapy as appropriate. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. liquid or mechanical soft diet and its duration). Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (i.e, diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms. Arrange for first follow-up outpatient.

Office:
Talk with and examine patient. Remove dressings, sutures, when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Assess effect of procedure with a review of pre-operative symptoms and a thorough assessment of current symptomatology. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Coordinate continuing care by nutritionist. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart.
