INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.40	0.67
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.80	1.00
Urgency of medical decision making	0.20	0.33
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.80	1.33
Physical effort required	0.20	0.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.80	1.33
Outcome depends on the skill and judgment of physician	0.40	1.00
Estimated risk of malpractice suit with poor outcome	0.60	0.67

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.80	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

At the October 2015 CPT Editorial Panel meeting, Torax Medical Inc brought forward a CPT proposal to add codes 4328X1, 4328X2 to report laparoscopic implantation and removal of a magnetic bead sphincter augmentation device for treatment of GERD.

Survey Process and Response

The Society of Thoracic Surgeons and the Society of American Gastrointestinal Endoscopic Surgeons received approval from the Research Subcommittee to conduct a targeted survey to an industry provided list from Torax Medical Inc that included surgeons who had performed at least one procedure, although not necessarily in the past 12 months. We explained to the Research Subcommittee that only surgeons who have undergone training are allowed to order the device for implantation and therefore these trained surgeons were the only surgeons with experience. Our expert panel agreed that surgeons without training and experience would only be guessing at time and visit information related to implantation of the device and necessary postoperative followup.

A total of 145 requests were sent out and 18 responses were received. An additional seven surgeons started the survey, but because they had a financial conflict, could not complete the survey. Half of the 18 respondents indicated zero experience in the past 12 months. Explantation of the device should rarely be required and although training for implantation of the device is necessary prior to implantation, there is no training for explantation. Therefore it is possible that the respondents that indicated zero experience in the past 12 months truly have had no experience in explantation. In the Summary Excel file, we presented the segregated data for those with and without experience for this code and note that the intraoperative median time of 68 (actually 67.5) minutes is directly between the 60 minutes for those without experience and the 75 minutes for those with experience. Although 18 responses does not meet the RUC's minimum response requirement, the responses came from experienced providers in laparoscopic esophageal and gastric procedures who we believe could provide accurate time and visit estimations on the survey. Our societies also believe that it is important to value this service so that the correct "relative" value is reported and reimbursed, instead of recommending contractor pricing which would likely be widely variable.

Pre-Time Package 4 (Difficult Patient/Difficult Procedure)

Evaluation: No change in package time of 40 minutes.
Positioning: Add 12 minutes (total = 15 minutes) for positioning. The patient will initially be positioned supine and upper extremity intravenous and arterial access points are dressed, padded and secured. The arms are padded and tucked at the patient's sides. The patient's legs are padded and placed in stirrups with great care to avoid nerve injury and the foot of the table removed. The patient must be secured to the table as it may be necessary to roll the table during the procedure to use gravity to assist with shifting the abdominal contents. The lower half of the table is then lowered to allow the operating surgeon to stand between the legs for the procedure. The skin is marked, prepped and draped.
Scrub, dress, wait: Subtract 5 minutes from the package time (total = 15 minutes) to be consistent with the survey median.

Post-time Package 9B (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 3 minutes from the package time (total = 30 minutes) to be consistent with the survey median.

Recommendation – 432X2

We compared the median survey intraoperative time for 432X2 (68 minutes) to the intraoperative time for a diagnostic laparoscopy (49320, 45 minutes) and to the intraoperative time for 432X1 (60 minutes) and believe the median time of 68 minutes may be incorrect. As stated above, nine respondents had experience and nine respondents did not have experience. Because explantation of the device should rarely be required, it is probable that the respondents that indicated zero experience truly have had no experience in explantation. Further, the segregated data for those with and without experience for this code show a distinct difference in median intraoperative time (60 versus 75 minutes) with the median aggregate time of 68 minutes simply the statistic between these two values. Although our expert panel agrees that the intraoperative time to remove the device will be greater than implantation, we are uncertain about the incremental increase and are recommending the aggregate median time of 68 minutes. With respect to postoperative work, we agree that the typical patient will be outpatient, either same day or overnight, but less than 24 hours and that two postoperative office visits are appropriate to monitor wounds and assess nutrition and diet as the patient accommodates to not having the device. In review of all the data, our expert panel believes the survey median and 25th percentile work RVUs are inconsistent with the total physician work for 432X2.

We looked at other codes that are familiar to general surgeons and general thoracic surgeons, many of whom still maintain their American Board of Surgery Certification, that have the same intraoperative time, are outpatient procedures and have a similar work intensity and determined that code 47562 *Laparoscopy, surgical; cholecystectomy* met these criteria. Although 47562 has greater intraoperative time than the aggregate survey median time for 432X2, as stated above, we believe the median intraoperative time for the survey code may be understated because of the number of people without experience. Total time for both codes is almost identical. We therefore are recommending to crosswalk the work RVU for code 432X2 to code 47562; a general surgery service that has the same intraoperative time, similar work intensity and almost identical total time.

We recommend a work RVU of 10.47 for 432X2. This value is crosswalked from code 47562.

We also recommend that this code be tagged in the RUC database as "Do not use to validate physician work" until such time that this procedure is more widely performed and a RUC survey is conducted that results in the required minimum number of survey responses.

CPT	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	38	13	12
432X2	Removal of esophageal sphincter augmentation device	10.47	0.086	233	70	68	30	0.5	2	
47562	Laparoscopy, surgical; cholecystectomy	10.47	0.082	228	65	80	25	0.5	1*	1*

*Visits per CMS work time file.

Key Reference Comparison

Although the intensity of intraoperative work for 432X2 may be similar to the key reference codes 43279 and 43281, the intraoperative time and postoperative hospital work is significantly less. The recommended work RVU for 432X2

reflects a value that has similar intensity and takes into account the less intra- and postoperative work when compared with the KRS codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)
43659 Unlisted laparoscopy procedure, stomach
43999 Unlisted procedure, stomach

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Rarely

Specialty thoracic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is the societies' estimate. This will rarely be performed on Medicare-aged patients.

Specialty general surgery Frequency 3 Percentage 75.00 %

Specialty thoracic surgery Frequency 1 Percentage 25.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

432X1	Laparoscopy, surgical, esophageal sphincter augmentation procedure, placement of sphincter augmentation device (ie, magnetic band), including cruroplasty when performed	090
432X2	Removal of esophageal sphincter augmentation device	090

Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the standards for 90-day global procedures.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale: Facility only key reference code 43279 was used for comparison.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
These procedures will be performed on an elective basis and all aspects of pre-service clinical staff work that is typical of 90-day global procedures will apply: complete pre-service diagnostic & referral forms, coordinate pre-surgery services, schedule space and equipment in facility, provide pre-service education/obtain consent, and follow-up phone calls & prescriptions.

Service Clinical Labor Activities:
Clinical staff will assist the surgeon with discharge management, including arrangements for post-discharge imaging, home care, and responding to patient and family questions.

Post-Service Clinical Labor Activities:
Clinical staff will assist the surgeon at post-op office visits.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Laparoscopic Radiofrequency Ablation of Uterine Fibroids

In October 2015, the CPT Editorial Panel converted Category III code, 0336T, into Category I code 585X1 to report laparoscopic radiofrequency ablation of uterine fibroids.

The RUC reviewed the survey results from 40 physicians and determined that the survey 25th percentile work RVU of 14.08 appropriately accounts for the work required to perform CPT code 585X1. The RUC noted that this service requires 51 minutes pre-service time, 120 minutes intra-service time and 30 minutes immediate post-service time and a half-day 99238 discharge day. The specialty societies indicated, and the RUC agreed, that two 99213 office visits are appropriate as indicated by the survey respondents, which both include an expanded problem focused history and low complexity medical decision making.

The RUC compared the surveyed code to key reference codes *58546 Laparoscopy, surgical, myomectomy, excision; 5 or more intramural myomas and/or intramural myomas with total weight greater than 250 g* (work RVU = 19.94 and intra-service time 180 minutes) and 58662 *Laparoscopy, surgical; with fulguration or excision of lesions of the ovary, pelvic viscera, or peritoneal surface by any method* (work RVU = 12.15 and 80 minutes intra-service time). For additional support, the RUC compared the surveyed code to MPC codes 52649 *Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)* (work RVU = 14.56 and 120 minutes intra-service time) and *33249Insertion or replacement of permanent implantable defibrillator system, with transvenous lead(s), single or dual chamber* (work RVU = 15.17 and 120 minutes intra-service time) and determined that the survey 25th percentile work value for 585X1 appropriately ranks this new procedure with similar services and other MPC codes. **The RUC recommends a work RVU of 14.08 for CPT code 585X1.**

Practice Expense
The RUC recommends the standard 090-day direct practice expense inputs as slightly modified by the Practice Expense Subcommittee.

New Technology
The RUC recommends that CPT code 585X1 be placed on the New Technology list to examine after additional utilization data is available.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

SUMMARY OF RECOMMENDATION

CPT Code:585X1 Tracking Number U1 Original Specialty Recommended RVU: **14.08**
Presented Recommended RVU: **14.08**
Global Period: 090 RUC Recommended RVU: **14.08**

CPT Descriptor: Laparoscopy, surgical, ablation of uterine fibroid(s) including intraoperative ultrasound guidance and monitoring, radiofrequency

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old female has been treated for abnormal uterine bleeding for the past 6 months. An evaluation was done, and she has a normal coagulation panel and is mildly anemic. Pap smear and endometrial biopsy are both normal. A pelvic sonogram demonstrated multiple uterine fibroids ranging from 1 cm to 7 cm in diameter that are intramural and submucosal in location. Patient does not desire further pregnancies but does not want a hysterectomy. She is interested in a laparoscopic uterine-sparing treatment for the uterine fibroids and abnormal uterine bleeding.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 75% , In the ASC 25%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 87% , Overnight stay-less than 24 hours 13% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 20%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review and update patient record. Obtain informed consent. Discuss surgery with patient and family. Ensure necessary equipment is present and functioning. Scrub and gown. Perform surgical 'time out' with the OR team. After appropriate anesthesia is administered, the patient is positioned in supine position and prepped.

Description of Intra-Service Work: The patient is frog-legged and examined under anesthesia. The urinary bladder is catheterized. The speculum is placed in the vagina to visualize the cervix. Tenaculum is applied to the anterior lip of the cervix. The legs are straightened out and patient is draped. The surgeon performs a laparoscopy to gain access to the abdomen. Two incisions are utilized to insert two ports (5mm and 10mm). The surgeon uses the laparoscopic camera to target laparoscopic ultrasound probe to examine the uterus and map locations and sizes of all myomata. Multiple subserosal, intramural and and submucosal myomas are identified. Using the laparoscopic ultrasound as a guide, the radiofrequency thermal ablation device is placed within the first myoma and the array is deployed. Radiofrequency energy heats the myoma to 100 degrees (monitored by thermocouples within the device), and the temperature is maintained at that level for the requisite number of minutes indicated by the chart provided by the manufacturer of the device. The device is inserted deeper (if indicated by the size of the myoma) and the ablation repeated until the whole myoma has been ablated. When the ablation is complete, the device is allowed to cool for an additional minute. After each puncture, the generator is switched to coagulation mode and the radiofrequency probe is withdrawn slowly to achieve hemostasis. The uterus is examined for any sign of bleeding before removing the laparoscopic ports. The 10 mm port site fascia is closed to prevent

herniation. The C02 gas is allowed to escape from the abdominal cavity before the removal of the camera port. The small skin incisions for the trocars are sutured closed. The catheter and tenaculum are removed.

Description of Post-Service Work: Apply dressings. Instruct recovery room staff on correct positioning of patient. Write post-operative orders. Chart progress notes. Discuss surgical procedure and post op instructions with patient and family. Medications are discussed as appropriate. Dictate operative note. Communicate with referring physician. Follow-up care.

Post-Operative Office Visits:

99213 #1: This typically occurs 1-2 weeks after surgery. This typically includes an expanded problem focused history which would include questions about any elevated temperature or other constitutional symptoms, GI problems, or GU symptoms. The physical exam would include a review of any obtained vital signs, and an abdominal exam and inspection of the incisions. Sutures would be removed as needed. Low complexity medical decision making would be performed to include a discussion of the surgical procedure and any further follow up care. Any needed prescriptions for continued pain management would be provided.

99213 #2: This typically occurs 6-8 weeks later at a time when the patient has hopefully completed 2 menstrual cycles. This typically includes an expanded problem focused history which would include questions about any elevated temperature or other constitutional symptoms, GI problems, or GU symptoms. In addition, the patient would be questioned regarding her most recent menses to determine any changes in the length of bleeding, the amount of bleeding, and any pain associated with her menses since the surgical procedure. The physical exam would include a review of any obtained vital signs, and an abdominal exam and inspection of the incisions. Low complexity medical decision making would be performed to include a discussion of the outcome of the surgical procedure and any further follow up care needed. Any needed prescriptions for management of continued pain with her menses or to control her menstrual cycles would be provided. An ultrasound examination to evaluate the results from the surgical procedure would be scheduled for 6-12 months postoperatively.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.63	0.89
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.58	0.67
Urgency of medical decision making	0.21	0.22
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.42	1.00

Physical effort required	1.00	0.78

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.32	0.11
Outcome depends on the skill and judgment of physician	1.16	0.89
Estimated risk of malpractice suit with poor outcome	0.26	-0.11

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.26	1.11

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background
The CPT Editorial Panel recently converted Category III code 0336T into Category I CPT code 585X1 to report laparoscopic radiofrequency ablation of uterine fibroids.

Methodology
ACOG was granted research subcommittee approval to use a targeted sample to conduct our RUC survey. Halt Medical, a manufacturer of the technology used to perform this procedure, provided a list of 125 US/MDs that perform this procedure. ACOG surveyed all names on the targeted list and did not conduct a concurrent survey of random ACOG members. Halt signed the Vendor_Company Attestation statement (attached).

Survey Data
ACOG received 40 completed RUC physician work surveys. The ACOG RUC workgroup reviewed the survey data and believes the 25th percentile of 14.08 appropriately ranks this new procedure with services in OB/GYN, MPCs and other ablation procedures.

	CPT	IWPUT	wRVU	Total Time	PreTime	Intra Time	Post Time	99232	99231	99238	99214	99213	99212
MPC	57288	0.108	12.13	246	55	60	27			0.5		3	1
Reference	58662	0.115	12.15	187	45	80	30				0.5	0.5	
Related	55873	0.083	13.60	274	56	100	30			0.5		3	
Surveyed	**585X1**	**0.083**	**14.08**	**266**	**51**	**120**	**30**			**0.5**		**2**	
MPC	52649	0.083	14.56	279	53	120	25			0.5		2	1
MPC/Other	33249	0.091	15.17	249	60	120						3	
Related	50541	0.087	16.86	319	60	120	15		2	1		2	
Reference	58546	0.074	19.94	394	60	180	30	1		1		2	
Related	33254	0.126	23.71	416	95	120	40	1	1	1	1	1	

The ACOG RUC workgroup reviewed ablation procedures in the RUC database that have 090 global periods, were RUC reviewed, had similar intra times and similar visit patters and were confident the 25th percentile recommendation of 14.08 is appropriate:

55873	*Cryosurgical ablation of the prostate (includes ultrasonic guidance and monitoring)*
50541	*Laparoscopy, surgical; ablation of renal cysts*
33254	*Operative tissue ablation and reconstruction of atria, limited (eg, modified maze procedure)*

Post Operative Visits
The survey results indicate two post operative level 3 office visits are typical with this new procedure. The ACOG RUC supports this recommendation. The patient is seen at 2 weeks for incision check, to show the patient pictures and explain surgery in detail. The patient is then seen again at 6 weeks for a symptom check and to ensure that the procedure was successful.

Recommendation
The specialty society is recommending a physician work RVU of 14.08 with a total time of 266 minutes.

New technology
This procedure should be flagged as new technology and reviewed again in 2-3 years.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0336T

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty obstetrics/gynecology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Projected 600 procedures in 2015; increasing 25%-40% annually to approximatley 5,000 by 2020.

Specialty obstetrics/gynecology Frequency 600 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. An annual frequency for Medicare is not known.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Hysterectomy

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 58546

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any **Vendor or Company** that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

585X1: *Laparoscopy, surgical, ablation of uterine fibroid(s) including intraoperative ultrasound guidance and monitoring, radiofrequency*

Global Period: 090 **Meeting Date:** January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACOG RUC workgroup developed these practice expense recommendations based on the physician survey results, their understanding of the procedure and standard PE committee inputs.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We included CPT Code 58546 *Laparoscopy, surgical, myomectomy, excision; 5 or more intramural myomas and/or intramural myomas with total weight greater than 250 g* on our PE spreadsheet as a reference code. It was our most frequent reference code for the physician work side and also has standard 090-day PE inputs.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

We believe the standard 090-day inputs are appropriate for this new procedure code.

Intra-Service Clinical Labor Activities:

We included 6 minutes of clinical time associated with half a discharge day management code.

Post-Service Clinical Labor Activities:

We include the standard clinical time associated with the post-op visits we are recommending for physician work.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Endoscopic Decompression of Spinal Cord Nerve

At the October 2015 CPT meeting, the CPT Editorial Panel established one new Category I code to report endoscopic decompression of neural elements.

The RUC reviewed the survey responses from 53 physicians and determined that a work RVU of 10.47 which was below the survey 25th percentile appropriately accounts for the work required to perform CPT code 630X1. The RUC recommends 231 minutes total time with 66 minutes pre-service time, 70 minutes intra-service time, 30 minutes of immediate post-service time, ½ day discharge, and 2-99213 office visits. The RUC compared the surveyed code to similar services 63030 *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar* (work RVU=13.18 and 90 minutes intra-service time) and 63047 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar* (work RVU=15.37 and 90 minutes intra-service time) and determined that these services required slightly higher intra-service time and physician work. Therefore, the specialty society recommended and the RUC agreed that 630X1 should be crosswalked to MPC code 47562 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar* (work RVU=10.47 and 80 minutes intra-service time) as these services require similar physician work and time to perform. **The RUC recommends a work RVU of 10.47 for CPT code 630X1.**

Practice Expense
The Practice Expense Subcommittee corrected equipment times. The RUC recommends the direct practice expense inputs as approved by the Practice Expense Subcommittee with a standard 90 day global package.

New Technology
CPT code 630X1 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

Flag in RUC Database
The RUC recommends that this service be flagged in the RUC database as “Do not use to validate physician work”.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Spine and Spinal Cord **Injection, Drainage, or Aspiration** *For purposes of CPT coding the below definitions of approach and visualization apply. The primary approach and visualization defines the service, whether or not another method is incidentally applied. Surgical services are presumed open unless otherwise specified.* ***Percutaneous**: Image-guided procedures (eg, computer tomography [CT] or fluoroscopy) performed with indirect visualization of the spine without use of any device that allows visualization through a surgical incision.* ***Endoscopic**: Spinal procedures performed with continuous direct visualization of the spine through an endoscope.* ***Open**: Spinal procedures performed with continuous direct visualization of the spine through a surgical opening.* ***Indirect visualization**: Image-guided (eg, computer tomography [CT] or fluoroscopy), not light-based visualization* ***Direct visualization**: Light-based visualization; can be performed by eye, with surgical loupes, microscope or endoscope.* *(For the techniques of microsurgery and/or use of microscope, use 69990)* ▲62287 (e) Decompression procedure, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, ~~with the use of an endoscope,~~ with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar ~~(This includes endoscopic approach)~~ *(Do not report 62287 in conjunction with 62267, 62290, 62311, 77003, 77012, 72295, when performed at same level)* *(For non-needle based technique for percutaneous decompression of nucleus pulposus of intervertebral disc, see 0274T, 0275T)*			
Spine and Spinal Cord **Endoscopic and Percutaneous Decompression of Neural Elements and/or Excision of Herniated Intervertebral Discs** *For purposes of CPT coding the below definitions of approach and visualization apply. The primary approach and visualization defines the service, whether or not another method is incidentally applied. Surgical services are presumed open unless otherwise specified.* ***Percutaneous**: Image-guided procedures (eg, computer tomography [CT] or fluoroscopy) performed with indirect visualization of the spine without use of any device that allows visualization through a surgical incision.* ***Endoscopic**: Spinal procedures performed with continuous direct visualization of the spine through an endoscope.* ***Open**: Spinal procedures performed with continuous direct visualization of the spine through a surgical opening.* ***Indirect visualization**: Image-guided (eg, computer tomography [CT] or fluoroscopy), not light-based visualization* ***Direct visualization**: Light-based visualization; can be performed by eye, with surgical loupes, microscope or endoscope.* *(For the techniques of microsurgery and/or use of microscope, use 69990)*			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(For percutaneous decompression, see 03X1T or 03X3T)

●630X1	K1	Endoscopic decompression of spinal cord, nerve root(s), including laminotomy, partial facetectomy, foraminotomy, discectomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar *(For open procedures, see 63030 or 63056)* *(For bilateral procedure, report 630X1 with modifier 50)*	090	10.47

Posterior Extradural Laminotomy or Laminectomy for Exploration/ Decompression of Neural Elements or Excision of Herniated Intervertebral Discs

For purposes of CPT coding the below definitions of approach and visualization apply. The primary approach and visualization defines the service, whether or not another method is incidentally applied. Surgical services are presumed open unless otherwise specified.

***Percutaneous**: Image-guided procedures (eg, computer tomography [CT] or fluoroscopy) performed with indirect visualization of the spine without use of any device that allows visualization through a surgical incision.*

***Endoscopic**: Spinal procedures performed with continuous direct visualization of the spine through an endoscope.*

***Open**: Spinal procedures performed with continuous direct visualization of the spine through a surgical opening.*

***Indirect visualization**: Image-guided (eg, computer tomography [CT] or fluoroscopy), not light-based visualization*

***Direct visualization**: Light-based visualization; can be performed by eye, with surgical loupes, microscope or endoscope.*

(For the techniques of microsurgery and/or use of microscope, use 69990)

(For percutaneous decompression, see 0274T, 0275T)

Category III Codes

▲0274T Percutaneous laminotomy/laminectomy (interlaminar approach) for decompression of neural elements, (with or without ligamentous resection, discectomy, facetectomy and/or foraminotomy), any method, under indirect image guidance (eg, fluoroscopic, CT), ~~with or without the use of an endoscope,~~ single or multiple levels, unilateral or bilateral; cervical or thoracic

▲0275T lumbar

(For laminotomy/hemilaminectomy performed using an open ~~and endoscopically-assisted~~ approach, see 63020-63035)

(For percutaneous decompression of the nucleus pulposus of intervertebral disc utilizing needle based technique, use 62287)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:630X1 Tracking Number Original Specialty Recommended RVU: **10.47**
Presented Recommended RVU: **10.47**
Global Period: 090 RUC Recommended RVU: **10.47**

CPT Descriptor: Endoscopic decompression of spinal cord, nerve root(s), including laminotomy, partial facetectomy, foraminotomy, discectomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old patient has had severe low back pain with sciatica and weakened foot dorsiflexion. He has not responded to restricted activities, analgesics and physiotherapy over 6 weeks. An MRI confirms clinical signs, as it shows a herniated disc at L4-L5 as well as erosion of the cartilage and possible bone spurs in the facet joint at the same level. The disc herniation and bone spurs are compressing the nerve L5 exiting nerve root.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 81% , In the ASC 19%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 60% , Overnight stay-less than 24 hours 33% , Overnight stay-more than 24 hours 7%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 76%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Perform a targeted H&P. Write orders for preoperative medication. Review imaging. Review the surgical procedure, postoperative recovery in and out of the hospital, and expected outcome(s) with the patient and family. Sign and mark the operative site. Obtain informed consent. Verify that all necessary surgical instruments, supplies, and devices are available in the operative suite. Review the length and type of anesthesia with the anesthesiologist. Monitor initial patient positioning for induction of anesthesia. Following induction of anesthesia, assist with repositioning of patient prone or lateral with the lumbar spine in flexion. Verify and/or assist with padding of patient to prevent pressure on neurovascular structures and placement of chin straps and arm traction devices to facilitate intraoperative imaging. Supervise prepping/draping of the patient. Scrub and gown. Perform a time out to confirm patient procedure with the OR staff.

Description of Intra-Service Work: A needle is inserted through the skin into the disc space via transforaminal or interlaminar approach. The stiletto of the needle is removed and a guide wire put through the needle in place. A skin incision is made and soft tissue is sequentially dilated over the wire under fluoroscopic control. Special bone burrs or reamers are used to carefully enlarge the foramen under fluoroscopic and guide wire control as much as necessary to insert a beveled working tube through which a working channel endoscope providing also for simultaneous suction and irrigation as well as appropriate bright and clear visualization is inserted. The adequate placement of the working tube within the so called Kambin triangle for transforaminal or lamina for interlaminar (ligamentum flavum) is managed by fluoroscope in two planes. All surgical steps are performed under full direct visual endoscopic control. Decompression of all neural structures at L4-L5 through removal of herniated intervertebral disc and partial facetectomy. Osteophytes or hypertrophied

ligaments are excised as needed with endoscopic shaver blades or drills. The nerve root is always protected by turning the beveled cannula opening away from it. The surgeon performs a visual inspection of the L4-L5 segment of the spinal canal. All nucleus material from within the canal as well as loose fragments from within the disc space are removed with forceps. Using electrosurgical instrumentation, epidural fat, torn annulus and/or adhesion tissue is shrunk. Hemostasis is obtained. Nerve roots are then endoscopically inspected to confirm that they are free of any impingement. Instruments are removed and wounds are closed.

Description of Post-Service Work: Facility: Apply steri-strips and sterile dressings. The patient is turned into the supine position. Monitor patient during reversal of anesthesia. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write brief operative note. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Discuss procedure and outcome with family in waiting area. Answer patient and/or family questions. Write orders for follow-up and post-discharge laboratory tests and X rays. Write prescriptions for medications needed post-discharge. Discuss home restrictions (ie, diet, activity, bathing) with the patient, family members, and discharge nurse. Discharge patient when he has recovered from anesthesia. Complete all appropriate medical records, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Office: Examine patient. Perform neurological exams. Monitor wounds. Write orders for medications and follow-up films. Review post-discharge films. Review physical therapy progress and revise orders as needed. Document patient progress notes in medical chart. Answer patient/family questions, insurance staff questions. Discuss patient progress with referring physician (verbal and written).

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? Yes

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
63030	090	13.18	**RUC Time**

CPT Descriptor Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
63047	090	15.37	**RUC Time**

CPT Descriptor Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
47562	090	10.47	**RUC Time**	109,672

CPT Descriptor 1 Laparoscopy, surgical; cholecystectomy

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
58660	090	11.59	**RUC Time**	1,428

CPT Descriptor 2 Laparoscopy, surgical; with lysis of adhesions (salpingolysis, ovariolysis) (separate procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 34 **% of respondents:** 64.1 **%**

Number of respondents who choose 2nd Key Reference Code: 13 **% of respondents:** 24.5 **%**

TIME ESTIMATES (Median)

	CPT Code: 630X1	**Top Key Reference CPT Code:** 63030	**2nd Key Reference CPT Code:** **63047**
Median Pre-Service Time	66.00	78.00	75.00
Median Intra-Service Time	70.00	90.00	90.00
Median Immediate Post-service Time	33.00	30.00	30.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	40.00	60.00
Median Discharge Day Management Time	19.0	38.00	38.00
Median Office Visit Time	46.0	69.00	69.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	**234.00**	**345.00**	**362.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.15	0.31
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.18	0.31
Urgency of medical decision making	0.09	0.00

Technical Skill/Physical Effort (Mean)

Technical skill required	0.91	1.15
Physical effort required	0.15	0.46

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.18	-0.08
Outcome depends on the skill and judgment of physician	0.53	0.77
Estimated risk of malpractice suit with poor outcome	0.18	0.08

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.59	0.77

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the February 2015 CPT meeting, the Editorial Panel approved definitions of key terms and operative approaches to develop consistent terminology for spine surgery to be included in the 2017 code set. At the October 2015 CPT meeting, a device company requested a new code to describe an endoscopic decompression procedure that is performed with continuous direct visualization. The new code will be a new and different technique when compared with the open and percutaneous approaches.

Survey Process

Targeted samples within society membership were approved by Research Subcommittee:
A random selection from the AANS/CNS Section on Disorders of the Spine and Peripheral Nerves.
A random selection of only "surgeon" members of NASS (ie, there are also non-surgeon members).
All U.S. surgeon members of ISASS (ie, this is an international society that includes non U.S. members).

Pre-Time Package 3 (Straightforward Patient/Difficult Procedure)

Evaluation: No change in package time of 33 minutes.
Positioning: Add 15 minutes (total = 18 minutes) for positioning. The patient will initially be positioned supine for induction of anesthesia. Following induction of anesthesia, the patient will be repositioned prone or lateral with the lumbar spine in flexion and padding to prevent pressure on neurovascular structures. Chin straps will be placed, along with arm traction devices, to facilitate intraoperative imaging.
Scrub, dress, wait: Subtract 5 minutes (total = 15 minutes) to be consistent with the median survey time.

Post-time Package 9b (General Anesthesia or Complex Regional Block/Complex Procedure)

Subtract 3 minutes (total = 30 minutes) to be consistent with the median survey time.

Recommendation

The expert panel reviewing the survey data for this new technology endoscopic procedure believes the survey median and 25th percentile work RVU is inconsistent with the physician work as it relates to other major open spine procedures. Therefore **we are recommending a work RVU of 10.47 which is a value that is cross-walked from the laparoscopic MPC code 47562**, *Laparoscopy, surgical; cholecystectomy*. Although the new code 630X1 has ten minutes less intraoperative time, we believe the physician work of endoscopic decompression in the small disc interspace near the spinal nerve roots of the cauda equina is more complex. In addition, code 630X1 will require more post-discharge office work for required imaging to confirm stabilization and for physical therapy orders and monitoring. Total time for both codes is almost identical.

	CPT	DESC	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST	38	13	12
	630X1	Endoscopic decompression of spinal cord, nerve root(s), including laminotomy, partial facetectomy, foraminotomy, discectomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar	**10.47**	0.085	**231**	66	70	30	0.5	2	
CMS 2013	**47562**	Laparoscopy, surgical; cholecystectomy	**10.47**	0.082	**228**	65	80	25	0.5	1	1

We also recommend that this code be tagged in the RUC database as "Do not use to validate physician work" until physicians have more experience with this new procedure and another RUC survey is conducted.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0275T, 22899

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not availbable however in a 2013 coding change proposal, the presenters indicated that 8,000 to 10,000 endoscopic procedures are performed annually based on device sales data from two manufacturers, Joimax and Richard Wolf

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 200
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. For 2013, there were 3,110 paid Medicare claims for 0275T and in 2014 there were 267 paid Medicare claims. For both years, the number of submitted claims was significantly greater (25-45%). Coverage and the fact that 0275T may have also been used to report percutaneously-only procedures makes it difficult to estimate Medicare utilization for this new endoscopic procedure. In addition, this procedure will not typically be provided to Medicare-aged patients, although it may be appropriate for Medicare disability patients. With this information in mind, we estimate the initial Medicare utilization will be 200.

Specialty neurosurgery Frequency 100 Percentage 20.00 %

Specialty orthopaedic surgery Frequency 100 Percentage 20.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

630X1	Endoscopic decompression of spinal cord, nerve root(s), including laminotomy, partial facetectomy, foraminotomy, discectomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar	090

Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the standards for 90-day global procedures.

2. You must provide reference code(s) for comparison on your spreadsheet. Current inputs for 63030 are used as reference. This was a key reference code.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The typical patients requiring these services will have a long standing history of low back pain. This procedure will be performed on an elective basis and all aspects of pre-service clinical staff work that is typical of 90-day global procedures will apply: complete pre-service diagnostic & referral forms, coordinate pre-surgery services, schedule space and equipment in facility, provide pre-service education/obtain consent, and follow-up phone calls & prescriptions.

Service Clinical Labor Activities:
Clinical staff will assist the surgeon with discharge management, including arrangements for post-discharge imaging, home care, and responding to patient and family questions.

Post-Service Clinical Labor Activities:
Clinical staff will assist the surgeon at post-op office visits.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Mammography-Computer Aided Detection Bundling

In October 2013, the mammography G-codes were identified via the CMS/Other Source – Utilization over 250,000 screen. In January 2014, the RUC noted that both CPT codes and G-codes exist to describe screening/diagnostic mammography. The RUC recommended that it analyze the screening/diagnostic mammography services G0202, G0204 and G0206 and CPT codes 77057, 77056 and 77055 in September 2014, after the Proposed Rule was released and CMS addressed the RUC recommendation to convert the direct practice expense medical supply inputs from film to digital. In the NPRM for 2015, CMS stated it would update the direct PE inputs for all imaging codes to reflect the migration from film to digital storage technologies since digital storage is now typically used in imaging. CMS confirmed that the majority of all mammography is currently digital. As a result, CMS proposed that the CPT codes 77055-77057 be used for reporting mammography to Medicare regardless of whether film or digital technology is used and to delete G0202, G0204 and G0206. CMS proposed for CY 2015, to value the CPT codes using the values established for the digital mammography G-codes. In addition, since the G codes proposed to use for CY 2015 have not been reviewed since they were created in CY 2002, CMS proposed to include 77055, 77056 and 77057 to the list of potentially misvalued codes. In September 2014, the RUC recommended that these services be surveyed for work and review direct practice expense inputs at the January 2015 meeting. Prior to survey, the RUC noted that this service be referred to CPT to remove "film" from the descriptor for 77057 and survey for work and review direct practice expense inputs for April 2015. In April 2015, the specialty society requested that these services be referred to the CPT Editorial Panel to bundle computer aided detection (CAD) which is typically performed along with mammography. The RUC recommended that these services be referred to the CPT Editorial Panel for revision for CPT 2017. In October 2015, the CPT Editorial Panel deleted codes 77051, 77052, 77055, 77056, 77057 and created three new codes to describe mammography services with bundled computer-aided detection (CAD) and assumes that CMS will delete G-codes G0202, G0204, and G0206.

Compelling Evidence

The specialty society noted and the RUC agreed that there is compelling evidence that diagnostic and screening mammography has changed due to new technology and a change in patient population. The previous survey conducted in 2000, was based on film screen technique which was typical at the time. Since that time, full-field digital mammography (FFDM) has become typical and the use of FFDM is reflected in the current survey and recommendations. It takes significantly more time and effort to interpret FFDMs than the older analog mammograms. Now, there is much greater detail available for analysis such as many more calcifications that require additional scrutiny which were not visible with analog mammograms. Additionally, the patient population has changed to more informed patients who are knowledgeable that they have heterogeneously dense or extremely dense breasts and have many more questions that require the radiologist's time and involvement. Currently 24 states have breast density notification laws, 8 states are considering similar legislation and there is a push for federal breast density notification legislation.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Therefore, there is an increase in interpretation time and effort as there is greater demand for the radiologist to be a resource to the patients to answer questions regarding the technique, the radiation exposure, various screening protocols, supplemental and alternatives to mammography as well as provide the diagnostic exam results to all patients.

770X1 ***Diagnostic mammography, including computer-aided detection (CAD) when performed; unilateral***
The RUC noted that the current work RVU of this service is 0.76 (current mammography 0.70 + CAD 0.06). The RUC agreed that work has increased to provide this service and therefore the work RVU should be higher than currently. The RUC reviewed the survey results from 76 radiologists and determined that survey median work RVU of 0.84 was slightly too high relative to the small increase in physician time, 2 minutes, indicated by the survey respondents. The RUC noted that although the increase in time is small, it does account for a substantial percentage (10%) of the total service since it is 21 minutes total time. The RUC recommends a direct crosswalk to the key reference code 76700 *Ultrasound, abdominal, real time with image documentation; complete* (work RVU = 0.81). The RUC recommends 5 minutes of pre-service time, 10 minutes of intra-service time and 6 minutes of immediate post-service time. The RUC also compared the surveyed code to the second key reference service 76816 *Ultrasound, pregnant uterus, real time with image documentation, follow-up (eg, re-evaluation of fetal size by measuring standard growth parameters and amniotic fluid volume, re-evaluation of organ system(s) suspected or confirmed to be abnormal on a previous scan), transabdominal approach, per fetus* (work RVU 0.85 and intra-service time of 15 minutes) and noted that the surveyed service requires slightly less physician time required to perform, therefore is valued appropriately. **The RUC recommends a work RVU of 0.81 for CPT code 770X1.**

770X2 ***Diagnostic mammography, including computer-aided detection (CAD) when performed; bilateral***
The RUC reviewed the survey results from 76 radiologists and determined that the survey median work RVU of 1.00 appropriately accounts for the physician work required to perform 770X2. The RUC indicated that 5 minutes of pre-time, 12 minutes of intra-service time and 7 minutes of immediate post-service time are appropriate for this bilateral service and noted that the times should probably be somewhat higher compared to the unilateral mammography time. The RUC compared the surveyed code to key reference services 76801 *Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation, first trimester (< 14 weeks 0 days), transabdominal approach; single or first gestation* (work RVU = 0.99 and 15 minutes intra-service time) and 74150 *Computed tomography, abdomen; without contrast material* (work RVU = 1.19 and 12 minutes intra-service time) and noted that the intensity and complexity, physician time and work RVU ranked appropriately in the middle of these two services. **The RUC recommends a work RVU of 1.00 for CPT code 770X2.**

770X3 ***Screening mammography, bilateral (2-view study of each breast), including computer-aided detection (CAD) when performed***
The RUC reviewed the survey results from 76 radiologists and determined that the current work RVU of 0.76 appropriately accounts for the physician work required to perform 770X3. The RUC noted that the survey responses displayed a narrow distribution, with the 25th percentile work RVU at 0.75 and the survey median work RVU at 0.80. The RUC recommended maintaining the current work RVU, the existing screening mammography plus CAD (0.70 + 0.06 = 0.76), which maintains appropriate relativity compared to the diagnostic bilateral examination. Screening mammograms are performed on asymptomatic women and require 4 minutes less time to complete compared to the diagnostic mammogram. The RUC compared the surveyed code to key reference services 76700 *Ultrasound, abdominal, real time with image documentation; complete* (work

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RVU = 0.81 and 11 minutes intra-service time and 78227 *Hepatobiliary system imaging, including gallbladder when present; with pharmacologic intervention, including quantitative measurement(s) when performed* (work RVU = 0.90 and 15 minutes of intra-service time) and noted that 770X3 requires less physician work, time and intensity to complete and is therefore valued lower. **The RUC recommends a work RVU of 0.76 for CPT code 770X3.**

Practice Expense
The Practice Expense Subcommittee decreased some atypical clinical labor staff time and supply items. The significant change was to add a new piece of equipment, *PACS mammography workstation*. Different then most equipment time, the equipment time for this professional workstation will be directly tied to physician work time. For the diagnostic mammography services (770X1 and 770X2) the pre-, intra- and post-service physician work time will be used to calculate the equipment minutes. For the screening mammography service (770X3) the pre- and intra-service physician work time will be used to calculate the equipment minutes. This is because it is typical for a woman undergoing diagnostic mammography to be escorted to the work station and shown images, but it is not typical for a woman undergoing diagnostic mammography to be escorted to the work station and shown images. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

G-Codes
The RUC assumes CMS will delete the associated G-codes for these services (G0202, G0204 and G0206).

SUMMARY OF RECOMMENDATION

CPT Code: 770X1 Tracking Number V1 Original Specialty Recommended RVU: **0.84**
Presented Recommended RVU: **0.84**
Global Period: XXX RUC Recommended RVU: **0.81**

CPT Descriptor: Diagnostic mammography, including computer-aided detection (CAD) when performed; unilateral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old asymptomatic female recalled from a screening mammogram for a unilateral focal asymmetry presents for further evaluation with unilateral diagnostic mammography with computer-aided detection.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review prior exams, including any notes, dictations, or annotations from prior reviewer, with attention to area of concern on previous screening mammograms including review with the technologist who will be performing the exam to determine which diagnostic views are needed for this examination.

Description of Intra-Service Work: Determine whether the diagnostic mammographic images of that side are of adequate quality for interpretation or whether any of the images require repeating due to motion unsharpness, inadequate positioning, or artifacts.
While the patient is in the department or facility, evaluate the current diagnostic images to determine if they resolve the focal asymmetry seen previously as overlapping breast tissue, or if an abnormality persists that requires further attention. Determine if additional diagnostic views are necessary, and review with the technologist. Compare the current diagnostic and recent screening exams to any older exams to evaluate for stability or interval change, or any additional suspicious findings.
Activate computer-aided detection (CAD). Evaluate any areas CAD has flagged for additional consideration. Compare those areas on current exam with recent screening mammograms and any older exams. Compare the new images to the contralateral side to assess for symmetry. Formulate recommendations. Dictate exam report. In states with dense breast notification legislation, include required verbiage informing the referring provider that his or her patient has dense breast tissue.

Description of Post-Service Work: Discuss results with patient. If diagnostic mammography resolved the issue for which the patient was recalled from screening, explain findings and provide reassurance. Encourage continued monthly self exam and regular screening mammography in absence of any breast symptoms. If diagnostic mammography demonstrates need for additional work-up such as ultrasound or core needle biopsy, explain to patient.

CPT Code: 770X1

As required by MQSA, complete “lay letter” informing the patient of the results of his or her diagnostic mammogram. In states with dense breast notification legislation, include required verbiage informing the patient she has dense breast tissue.

Urgency of medical decision making	0.67	0.33
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.38	0.83
Physical effort required	0.43	0.17

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.52	0.50
Outcome depends on the skill and judgment of physician	0.48	0.67
Estimated risk of malpractice suit with poor outcome	0.76	0.75

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.52	0.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
In recent years, two families of codes have been used to describe mammography: (1) 77055-77057 for film screen mammography and (2) G0202-G0206 for full field digital mammography (FFDM). These G-codes were created by CMS in response to the Benefits Improvement and Protection Act of 2000. For CY 2016, at the request of CMS and the RUC, CPT revised the descriptor for CPT code 77057 to remove the word "film," allowing for 77055-77057 to be used for the reporting of all mammography services, since FFDM technique is now typical. Computer-aided detection (CAD) codes are also typically used with mammography, and are reported by CPT codes 77051 and 77052.

The existing mammography codes are as follows:

CPT Code	Descriptor	Global Period
77055	Mammography; unilateral	XXX
77056	Mammography; bilateral	XXX
77057	Screening mammography, bilateral	XXX
G0202	Screening mammography, producing direct digital image, bilateral, all views	XXX
G0204	Diagnostic mammography, producing direct 2-D digital image, bilateral, all views	XXX
G0206	Diagnostic mammography, producing direct 2-D digital image, unilateral, all views	XXX
77051	CAD; diagnostic mammography	ZZZ
77052	CAD; screening mammography	ZZZ

CMS, through rule making, has requested review of the mammography codes. To that end, the CPT Editorial Panel created three new codes to modernize the reporting of mammography services. The three new codes describe diagnostic and screening mammography, including computer-aided detection (CAD) when performed. The new code structure is as follows:

CPT Code	Descriptor	Global Period
770X1	Diagnostic mammography with CAD, unilateral	XXX
770X2	Diagnostic mammography with CAD, bilateral	XXX
770X3	Screening mammography with CAD, bilateral	XXX

Survey Process:
The American College of Radiology performed a Research Committee approved random survey of: (1) a targeted subset of self-identified breast imagers and (2) a random sampling of our general membership. An expert panel, including a number of physicians familiar with these services, reviewed the data and developed the following recommendations.

General Recommendation:
The societies recommend the median work RVU and service period times for all 3 codes, which is an increase in RVUs and service period times compared to the existing codes.

Compelling Evidence:
Since our recommendations represent an increase in RVUs from the existing mammography codes, we provide the following compelling evidence.

Compelling evidence is satisfied based on a change in technique, which results in a change in physician work. The existing 70000 series mammography codes were last surveyed based on film screen technique which was typical at the time. Since that time, FFDM has become typical, and the use of FFDM is reflected in our current survey and recommendations. It has been widely acknowledged by breast imagers that it takes significantly more time and effort to interpret full-field digital mammograms than the older analog mammograms. There is now much greater detail available for analysis. As an example, many more calcifications are now seen that require scrutiny. These simply were not even visible with analog mammography.

In addition to an increase in interpretation time and effort, there are now many greater demands for the radiologist to be a resource to patients to answer questions regarding the technique, the radiation exposure, the various recommended screening protocols, the various supplemental exams to mammography, and the potential alternatives to mammography. Radiologists now give all patients results of their exams, either at the time of the encounter or in a letter after the exam is interpreted. These direct results are provided to patients for both screening and diagnostic mammograms. Some of the change in radiologist engagement has come about as the public has become more aware of breast tissue density and the impact it may have on mammography. Organizations such as ***Are You Dense?*** *http://www.areyoudense.org/* have made it their mission to educate the public about the risks and screening challenges of dense breast tissue and its impact on missed, delayed and advanced stage breast cancer. There are now breast density notification laws 24 states, with 8 states considering similar legislation, and a push for federal breast density notification legislation. Patients who are informed that they have heterogeneously dense or extremely dense breasts justifiably have many questions that require radiologist time and involvement. Mammography practiced in 2015-2016 is very different than the mammography that was valued by the RUC in 2000-2002.

Service Period Time Recommendations:
The society recommends the median service period times of 5 minutes pre-service, 10 minutes intra-service, and 6 minutes post-service.

Key Reference Service:
Our recommendation compares favorably to the #1 KRS 76700 *(Ultrasound, abdominal, w/ image documentation; complete)* chosen by 28% of respondents. 76700 has the same pre-service and total time, 1 minute more intra-service and 1 minute less post-service time than the surveyed code. The IWPUT is nearly identical also.

CPT Code	Descriptor	RVU	Pre	Intra	Post	Total	IWPUT
76700	Ultrasound, abdominal, real time with image documentation; complete	0.81	5	11	5	21	0.053
770X1	**Diagnostic mammography with CAD, unilateral**	**0.81**	**5**	**10**	**6**	**21**	**0.056**

MPC Code:
Our recommendation is supported by MPC code 78306 *(Bone and/or joint imaging; whole body)* which has comparable RVUs and service period times.

CPT Code	Descriptor	RVU	Pre	Intra	Post	Total	IWPUT
78306	Bone and/or joint imaging; whole body	0.86	5	8	5	18	0.080
770X1	**Diagnostic mammography with CAD, unilateral**	**0.81**	**5**	**10**	**6**	**21**	**0.056**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77051, 77055, G0206

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2485548
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by code 770X1 provided nationally in a one-year period is estimated to be 2,485,548.

Specialty Diagnostic Radiology Frequency 2372588 Percentage 95.45 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 828,516 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare data estimates that CPT code 770X1 is billed approximately 828,516 times in total for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 790863 Percentage 95.45 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Breast

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. G0206

Description of Pre-Service Work: Review orders with attention to current complaint of pain to determine if pain is focal or diffuse, and location of pain if focal, and evaluate for any additional complaints of lump, nodularity, or discharge. Discuss patient history with technologist who has met the patient and obtained initial diagnostic views.

Description of Intra-Service Work: Determine whether the diagnostic mammographic images are of adequate quality for interpretation or whether any of the images require repeating due to motion unsharpness, inadequate positioning, or artifacts.
While the patient is in the department or facility, evaluate the current diagnostic images to determine if there are abnormalities, post-surgical changes, normal variants, or other imaging findings in the areas of clinical concern that would account for the clinical findings, or if an abnormality persists that requires further attention. Determine if additional diagnostic views are necessary, and review with the technologist. Assess the remainder of both breasts. Compare the current diagnostic exams to any older exams to evaluate for stability or interval change, or any additional suspicious findings.
Activate computer-aided detection (CAD). Evaluate any areas CAD has flagged for additional consideration. Compare those areas on current exam with any older exams. Formulate recommendations. Dictate exam report. In states with dense breast notification legislation, include required verbiage informing the referring provider that his or her patient has dense breast tissue.

Description of Post-Service Work: Discuss results with patient. If diagnostic mammography resolved the issues for which the patient was sent for evaluation, explain findings and provide reassurance. Encourage continued monthly self-exam and regular screening mammography in absence of any breast symptoms. If diagnostic mammography demonstrates need for additional work-up such as ultrasound or core needle biopsy, explain to patient.

As required by MQSA, complete “lay letter” informing the patient of the results of his or her diagnostic mammogram. In states with dense breast notification legislation, include required verbiage informing the patient she has dense breast tissue.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.83	0.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.70	1.21
Urgency of medical decision making	0.65	1.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.61	1.00
Physical effort required	0.39	0.86

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.61	1.00
Outcome depends on the skill and judgment of physician	0.87	1.36
Estimated risk of malpractice suit with poor outcome	0.74	1.86

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.57	1.43

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
In recent years, two families of codes have been used to describe mammography: (1) 77055-77057 for film screen mammography and (2) G0202-G0206 for full field digital mammography (FFDM). These G-codes were created by CMS in response to the Benefits Improvement and Protection Act of 2000. For CY 2016, at the request of CMS and the RUC, CPT revised the descriptor for CPT code 77057 to remove the word "film", allowing for 77055-77057 to be used for the reporting of all mammography services, since FFDM technique is now typical. Computer-aided detection (CAD) codes are also typically used with mammography, and are reported by CPT codes 77051 and 77052.

The existing mammography codes are as follows:

CPT Code	Descriptor	Global Period
77055	Mammography; unilateral	XXX
77056	Mammography; bilateral	XXX
77057	Screening mammography, bilateral	XXX
G0202	Screening mammography, producing direct digital image, bilateral, all views	XXX
G0204	Diagnostic mammography, producing direct 2-D digital image, bilateral, all views	XXX
G0206	Diagnostic mammography, producing direct 2-D digital image, unilateral, all views	XXX
77051	CAD; diagnostic mammography	ZZZ
77052	CAD; screening mammography	ZZZ

CMS, through rule making, has requested review of the mammography codes. To that end, the CPT Editorial Panel created three new codes to modernize the reporting of mammography services. The three new codes describe diagnostic and screening mammography, including computer-aided detection (CAD) when performed. The new code structure is as follows:

CPT Code	Descriptor	Global Period
770X1	Diagnostic mammography with CAD, unilateral	XXX
770X2	Diagnostic mammography with CAD, bilateral	XXX
770X3	Screening mammography with CAD, bilateral	XXX

Survey Process:
The American College of Radiology performed a Research Committee approved random survey of: (1) a targeted subset of self-identified breast imagers and (2) a random sampling of our general membership. An expert panel, including a number of physicians familiar with these services, reviewed the data and developed the following recommendations.

General Recommendation:
The societies recommend the median work RVU and service period times for all 3 codes, which is an increase in RVUs and service period times compared to the existing codes.

Compelling Evidence:
Since our recommendations represent an increase in RVUs from the existing mammography codes, we provide the following compelling evidence.

Compelling evidence is satisfied based on a change in technique, which results in a change in physician work. The existing 70000 series mammography codes were last surveyed based on film screen technique which was typical at the time. Since that time, FFDM has become typical, and the use of FFDM is reflected in our current survey and recommendations. It has been widely acknowledged by breast imagers that it takes significantly more time and effort to interpret full-field digital mammograms than the older analog mammograms. There is now much greater detail available for analysis. As an example, many more calcifications are now seen that require scrutiny. These simply were not even visible with analog mammography.

In addition to an increase in interpretation time and effort, there are now many greater demands for the radiologist to be a resource to patients to answer questions regarding the technique, the radiation exposure, the various recommended screening protocols, the various supplemental exams to mammography, and the potential alternatives to mammography. Radiologists now give all patients results of their exams, either at the time of the encounter or in a letter after the exam is interpreted. These direct results are provided to patients for both screening and diagnostic mammograms. Some of the change in radiologist engagement has come about as the public has become more aware of breast tissue density and the impact it may have on mammography. Organizations such as ***Are You Dense?*** *http://www.areyoudense.org/* have made it their mission to educate the public about the risks and screening challenges of dense breast tissue and its impact on missed, delayed and advanced stage breast cancer. . There are now breast density notification laws 24 states, with 8 states considering similar legislation, and a push for federal breast density notification legislation. Patients who are informed that they have heterogeneously dense or extremely dense breasts justifiably have many questions that require radiologist time and involvement. Mammography practiced in 2015-2016 is very different than the mammography that was valued by the RUC in 2000-2002.

Work Recommendation:
The society recommends the median work RVU of 1.00 RVUs.

Service Period Time Recommendations:
The society recommends the median service period times of 5 minutes pre-service, 12 minutes intra-service and 7 minutes post-service.

Key Reference Service:
Our recommendation compares favorably to the #1 KRS 76801 *(Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation, first trimester (< 14 weeks 0 days), transabdominal approach; single or first gestation)* chosen by 30% of respondents. These two services have nearly the same RVU and identical pre and post service times. While 770X2 has 3 minutes less intra-service time, it is a service of greater intensity so the comparison is appropriate. In fact, respondents rated the surveyed code greater in intensity on 11 of 11 measures, with the highest relative measure involving the "Estimated risk of malpractice suit with poor outcome."

CPT Code	Descriptor	RVU	Pre	Intra	Post	Total	IWPUT
76801	Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation, first trimester (< 14 weeks 0 days), transabdominal approach; single or first gestation	0.99	5	15	7	23	0.048
770X2	**Diagnostic mammography with CAD, bilateral**	**1.00**	**5**	**12**	**7**	**24**	**0.061**

MPC Code:
Our recommendation is supported by MPC code 76805 *(Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation, after first trimester (> or = 14 weeks 0 days), transabdominal approach; single or first gestation)* which has comparable RVUs and service period times. Diagnostic mammography is more intense than many other services, including fetal survey, because by definition, diagnostic mammography has a previously identified abnormality that must be evaluated and patient disposition immediately determined. The radiologist must do everything he or she deems necessary to determine if the exam is normal and nothing further is needed, or if the issues are caused by probably benign findings, in which case short interval follow-up is appropriate, or if the abnormalities suggest malignancy, for which further imaging or biopsy will be recommended.

CPT Code	Descriptor	RVU	Pre	Intra	Post	Total	IWPUT
76805	Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation, after first trimester (> or = 14 weeks 0 days), transabdominal approach; single or first gestation	0.99	5	15	6	26	0.050
770X2	**Diagnostic mammography with CAD, bilateral**	**1.00**	**5**	**12**	**7**	**24**	**0.061**

Summary:
Our recommendation for 770X2: 1.00 RVUs and service period times of 5 pre, 12 intra, and 7 post compares favorably to the KRS code and the MPC codes described herein.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77056, G0204, 77051

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1979781
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by code 770X2 provided nationally in a one-year period is estimated to be 1,979,781.

Specialty Diagnostic Radiology Frequency 1877278 Percentage 94.82 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 659,927 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare data estimates that CPT code 770X2 were billed approximately 659,927 times in total for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 625759 Percentage 94.82 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Breast

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. G0204

SUMMARY OF RECOMMENDATION

CPT Code: 770X3 Tracking Number V3 Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.76**
Global Period: XXX RUC Recommended RVU: **0.76**

CPT Descriptor: Screening mammography, bilateral (2-view study of each breast), including computer-aided detection (CAD) when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 46-year-old asymptomatic female presents for her annual screening mammogram with computer-aided detection.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review patient history questionnaire and technologist notes to assure patient was indeed a candidate for screening and not in need of a diagnostic study for any sign or symptom. Assess patient risk factors from questionnaire.

Description of Intra-Service Work: Determine whether the screening mammographic images are of adequate quality for interpretation or whether any of the images require repeating due to motion unsharpness inadequate positioning, or artifacts.
Compare the current screening exams to any older exams to evaluate for stability or interval change. Evaluate the current screening images to determine if there are any findings that require additional evaluation with diagnostic mammography.
Activate computer-aided detection (CAD). Evaluate any areas CAD has flagged for additional consideration. Compare those areas on current exam with any older exams. Determine if there is need to recall the patient for diagnostic mammography for additional evaluation of any areas flagged by CAD. Dictate exam report. In states with dense breast notification legislation, include required verbiage informing the referring provider that his or her patient has dense breast tissue.

Description of Post-Service Work: As required by MQSA, complete “lay letter” informing the patient of the results of his or her screening mammogram. In states with dense breast notification legislation, include required verbiage informing the patient she has dense breast tissue.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.80	0.22
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.70	0.00
Urgency of medical decision making	0.50	-0.44
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.45	0.44
Physical effort required	0.50	-0.11

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.55	0.33
Outcome depends on the skill and judgment of physician	0.70	1.22
Estimated risk of malpractice suit with poor outcome	0.75	1.33

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.70	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
In recent years, two families of codes have been used to describe mammography: (1) 77055-77057 for film screen mammography and (2) G0202-G0206 for full field digital mammography (FFDM). These G-codes were created by CMS in response to the Benefits Improvement and Protection Act of 2000. For CY 2016, at the request of CMS and the RUC, CPT revised the descriptor for CPT code 77057 to remove the word "film", allowing for 77055-77057 to be used for the reporting of all mammography services, since FFDM technique is now typical. Computer-aided detection (CAD) codes are also typically used with mammography, and are reported by CPT codes 77051 and 77052.

The existing mammography codes are as follows:

CPT Code	Descriptor	Global Period
77055	Mammography; unilateral	XXX
77056	Mammography; bilateral	XXX
77057	Screening mammography, bilateral	XXX
G0202	Screening mammography, producing direct digital image, bilateral, all views	XXX
G0204	Diagnostic mammography, producing direct 2-D digital image, bilateral, all views	XXX
G0206	Diagnostic mammography, producing direct 2-D digital image, unilateral, all views	XXX
77051	CAD; diagnostic mammography	ZZZ
77052	CAD; screening mammography	ZZZ

CMS, through rule making, has requested review of the mammography codes. To that end, the CPT Editorial Panel created three new codes to modernize the reporting of mammography services. The three new codes describe diagnostic and screening mammography, including computer-aided detection (CAD) when performed. The new code structure is as follows:

CPT Code	Descriptor	Global Period
770X1	Diagnostic mammography with CAD, unilateral	XXX
770X2	Diagnostic mammography with CAD, bilateral	XXX
770X3	Screening mammography with CAD, bilateral	XXX

Survey Process:
The American College of Radiology performed a Research Committee approved random survey of: (1) a targeted subset of self-identified breast imagers and (2) a random sampling of our general membership. An expert panel, including a number of physicians familiar with these services, reviewed the data and developed the following recommendations.

General Recommendation:
The societies recommend the median work RVU and service period times for all 3 codes, which is an increase in RVUs and service period times compared to the existing codes.

Compelling Evidence:
Since our recommendations represent an increase in RVUs from the existing mammography codes, we provide the following compelling evidence.

Compelling evidence is satisfied based on a change in technique, which results in a change in physician work. The existing 70000 series mammography codes were last surveyed based on film screen technique which was typical at the time. Since that time, FFDM has become typical, and the use of FFDM is reflected in our current survey and recommendations. It has been widely acknowledged by breast imagers that it takes significantly more time and effort to interpret full-field digital mammograms than the older analog mammograms. There is now much greater detail available for analysis. As an example, many more calcifications are now seen that require scrutiny. These simply were not even visible with analog mammography.

In addition to an increase in interpretation time and effort, there are now many greater demands for the radiologist to be a resource to patients to answer questions regarding the technique, the radiation exposure, the various recommended screening protocols, the various supplemental exams to mammography, and the potential alternatives to mammography. Radiologists now give all patients results of their exams, either at the time of the encounter or in a letter after the exam is interpreted. These direct results are provided to patients for both screening and diagnostic mammograms. Some of the change in radiologist engagement has come about as the public has become more aware of breast tissue density and the impact it may have on mammography. Organizations such as ***Are You Dense?*** *http://www.areyoudense.org/* have made it their mission to educate the public about the risks and screening challenges of dense breast tissue and its impact on missed, delayed and advanced stage breast cancer. . There are now breast density notification laws 24 states, with 8 states considering similar legislation, and a push for federal breast density notification legislation. Patients who are informed that they have heterogeneously dense or extremely dense breasts justifiably have many questions that require radiologist time and involvement. Mammography practiced in 2015-2016 is very different than the mammography that was valued by the RUC in 2000-2002.

Service Period Time Recommendations:
The society recommends the median service period times of 2 minutes pre-service, 6 minutes intra-service and 2 minutes post-service. This is the same intra-service time as the existing codes and 3 minutes less post time than the existing codes.

Key Reference Service:
The #1 KRS for 770X3 is 76700 *(Ultrasound, abdominal, real time with image documentation; complete)* chosen by 26% of respondents. 76700 has a nearly identical RVU but longer service period times. Screening mammography is considered more intense by radiologists because of the risk and concordant stress of missing breast cancer in an otherwise healthy patient. While it is never desirable to miss gallstones or hydronephrosis during an abdominal ultrasound, those processes, if missed, will cause the patient or his/her physician to seek additional testing such as laboratory analysis or additional imaging such as CT if the signs or symptoms continue. Screening mammograms are performed on asymptomatic women, so if the radiologist determines the exam is normal, that woman will likely receive no further breast evaluation until her breast exam and mammogram next year, since many women unfortunately do not perform their monthly self breast exams with regularity. Therefore, if the radiologist misses an abnormality, there is no "backstop" or "second chance" at detection of a small cancer until the patient presents with a larger mass. Because a missed diagnosis of breast cancer is the most common cause of a lawsuit against radiologists, and because there is no second chance for detection once an exam is interpreted as negative, there is great intensity in reading screening mammograms.

CPT Code	Descriptor	RVU	Pre	Intra	Post	Total	IWPUT
76700	Ultrasound, abdominal, real time with image documentation; complete	0.81	5	11	5	21	0.053
770X3	**Screening mammography with CAD, bilateral**	**0.76**	**2**	**6**	**2**	**10**	**0.112**

MPC Code:
Our recommendation is supported by MPC code 45300 *(Proctosigmoidoscopy, rigid; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure))* which has the same RVU and yet longer service period times. The greater intensity relates to factors which are similar to those described for our key reference service, including the psychological stress associated with malpractice risk from a poor outcome.

CPT Code	Descriptor	RVU	Pre	Intra	Post	Total	IWPUT
45300	Proctosigmoidoscopy, rigid; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)	0.80	5	10	10	27	0.042
770X3	**Screening mammography with CAD, bilateral**	**0.76**	**2**	**6**	**2**	**10**	**0.112**

Summary:
Our recommendation for 770X3: 0.80 RVUs and service period times of 2 pre, 6 intra, and 2 post compares favorably to the KRS code and the MPC codes described herein. Importantly, this is the same pre and intra-service times as the existing screening mammography code plus CAD, but 3 minutes less post service time. As described in our compelling evidence discussions, the increased intensity is justified by the change in technology from film screen to full field digital mammography technique.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77057, G0202, 77052

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 17294841
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 770X3 provided nationally in a one-year period is estimated to be 17,294,841.

Specialty Diagnostic Radiology Frequency 16327473 Percentage 94.40 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,764,947 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare data estimates that CPT code 770X3 was billed approximately 5,764,947 times in total for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 5442491 Percentage 94.40 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Breast

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. G0202

CPT Code:_ 770X1, 770X2, 770X3
Specialty Society('s)_American College of Radiology

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

770X1	Diagnostic mammography, including computer-aided detection (CAD) when performed; unilateral
770X2	Diagnostic mammography, including computer-aided detection (CAD) when performed; bilateral
770X3	Screening mammography, bilateral (2-view study of each breast), including computer-aided detection (CAD) when performed

Global Period: XXX Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology (ACR) convened a consensus panel to finalize the practice expense data for mammography codes with computer-aided detection (CAD), 770X1, 770X2, and 770X3.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The ACR included the existing PE inputs for film screen mammography codes, 77055-77057, CAD codes 77051-77052, and the recently-surveyed digital breast tomosynthesis (DBT) codes, 77061-77063, which are included to show consistency within the larger family of mammography codes.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

- **Availability of prior images confirmed** – Clinically appropriate, and consistent with RUC-approved times for the DBT codes. A patient may have multiple films from several different practices that the tech must collate and review prior to the exam. A patient may have a long history of prior exams since mammo is recommended to be performed at least every two years.
- **Technologist QC's images in PACS, checking for all images, reformats, and dose page**- CMS [2016 MPFS Final Rule] and the RUC [2016 MPFS Final Rule Comment Letter] has acknowledged that this activity may vary based on the complexity of the exam. Thus, no standard exists for this activity. The specialties do acknowledge that our recommendation is an increase over codes reviewed before the 2016 MPFS Final Rule release. The QC activities associated with Mammography with CAD are defined by MQSA requiring additional time to ensure these standards are met and that the acquisition is sufficient to evaluate for subtle masses, densities and micro-calcifications. It is also critical that the entire breast tissue is included including the axillary region and breast tail.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

- **Technologist QC's images in PACS, checking for all images, reformats, and dose page**- CMS [2016 MPFS Final Rule] and the RUC [2016 MPFS Final Rule Comment Letter] has acknowledged that this activity may vary based on the complexity of the exam. Thus, no standard exists for this activity. The specialties do acknowledge that our recommendation is an increase over codes reviewed before the 2016 MPFS Final Rule release. The QC activities associated with Mammography with CAD are defined by MQSA requiring additional time to ensure these standards are met and that the acquisition is sufficient to evaluate for subtle masses, densities and micro-calcifications. It is also critical that the entire breast tissue is included including the axillary region and breast tail.
- **markers, radiographic, multi-modality (SD096)** – clinically necessary supply. These markers are placed on the patient's skin to mark scars, moles, and/or palpable abnormalities, which will assist in the review of the images. These markers are not reusable.
- **PACS Mammo Workstation** – In the CY 2016 MPFS Final Rule, CMS asserts that some costs of the professional workstation may be analogous to costs previously incorporated as direct PE inputs. This is used by the interpreting physician so the time equals the sum of the following activities: (1) technologist – review exam with MD; (2) the physician intra-service time. The specialties are recommending that this equipment time equal the sum of the physician work pre-service time, intra-service time, and post-service time for the diagnostic mammo codes, 770X1 and 770X2 since the physician typically reviews images with the patient immediately after the procedure. We are recommending that the equipment time for the screening code, 770X3 only include the physician work pre-service time and intra-service time.
- **Room, digital mammography** – New input and clinically necessary as a substitute for the current film screen mammography room (EL013)

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Availability of prior images confirmed
- Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocoled by radiologist

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Acquire images
- Clean room/equipment by physician staff
- Technologist QC's images in PACS, checking for all images, reformats, and dose page
- Review examination with interpreting MD
- Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue
- Accompany MD for discussion of results

Post-Service Clinical Labor Activities:

- Federally Mandated MQSA Activities Allocated To Each Mammogram

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Ophthalmoscopic Angiography

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT codes 92235 *fluorescein angiography (includes multiframe imaging) with interpretation and report* and 92240 *indocyanine-green angiography (includes multiframe imaging) with interpretation and report* (work RVU = 1.10) were identified as part of this screen. The specialty determined that the two services are performed together for a measureable number of patients, typically with macular disease when 92240 is performed. The specialty submitted a code change proposal to the CPT Editorial Panel to create a new CPT code 922X4 *Fluorescein angiography and indocyanine-green angiography (includes multiframe imaging) performed at the same patient encounter with interpretation and report, unilateral or bilateral* to be utilized when the services are performed together. The specialty also determined that 92235 and 92240 are both typically done bilaterally. The value of the services currently represents a unilateral service, so the CPT Editorial Panel revised the descriptors to reflect the typical patient and include language for the service to be performed unilaterally or bilaterally.

92235 *Fluorescein angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral*
The RUC reviewed the survey results from 75 ophthalmologists and retinal surgeons and recommends the following physician time components: pre-service time of 1 minute, intra-service time of 15 minutes and immediate post-service time of 1 minute. The RUC recognized that although the intra-service time remains consistent with the RUC survey conducted in 2012, the pre-service and post-service time has decreased. The RUC has incorporated these time decreases into the recommendations.

The RUC reviewed the survey respondents' work values and determined that the survey 25th percentile work value of 0.75, below the current work value appropriately captures the work and complexity of this service. The RUC compared the service to recently reviewed CPT code 93261, *Interrogation device evaluation (in person) with analysis, review and report by a physician or other qualified health care professional, includes connection, recording and disconnection per patient encounter; implantable subcutaneous lead defibrillator system* (work RVU = 0.74, intra-service time of 15 minutes) and noted that the services have identical intra-service time and should be valued similarly. For additional support the RUC compared the surveyed code to key reference service CPT code 92083 *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg;, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

30/60-2) (work RVU = 0.50, intra-service time of 10 minutes) and noted that the surveyed code is requires more time and is more intense to perform, justifying the greater work value. **The RUC recommends a work RVU of 0.75 for CPT code 92235.**

92240 ***Indocyanine-green angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral***
The RUC reviewed the survey results from 57 ophthalmologists and retinal surgeons and recommends the following physician time components: pre-service time of 1 minute, intra-service time of 20 minutes and immediate post-service time of 1 minute. The specialty clarified that although this service is an indocyanine-green angiography alone the patient would have had a fluorescein angiography at a previous visit that was previously interpreted and part of the physician work of this service is to compare angiographic findings with previous studies and other diagnostic modalities. The RUC recognized significant time decreases as well as evolving physician work since the RUC survey in 1996 and incorporated these time decreases into the recommendations. When this service was last reviewed it was new technology that was only performed by 15-20% of retinal specialists. At that time indocyanine-green angiography was dangerous and could cause life-threatening adverse reactions. In addition, previously indocyanine-green angiography required more pre-service and post-service time than fluorescein angiography and today the two services require identical pre-service and post-service time.

The RUC reviewed the survey respondents' work values and determined that the survey 25th percentile work value of 0.80, below the current work value appropriately captures the work and complexity of this service. The RUC compared the service to key reference service CPT code 92002, Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; intermediate, new patient (work RVU = 0.88, intra-service time of 15 minutes, total time of 25) and noted that the service has less intra-service time, but greater total time and is more intense to perform, justifying the higher work value. For additional support the RUC compared the surveyed code to MPC list CPT code 76700 *Ultrasound, abdominal, real time with image documentation; complete* (work RVU = 0.81, intra-service time of 11 minutes, total time of 21 minutes) and noted that the surveyed code has slightly more total time, but is less intense to perform, justifying the slightly lower work value. **The RUC recommends a work RVU of 0.80 for CPT code 92240.**

922X4 ***Fluorescein angiography and indocyanine-green angiography (includes multiframe imaging) performed at the same patient encounter with interpretation and report, unilateral or bilateral***
The RUC reviewed the survey results from 53 ophthalmologists and retinal surgeons and recommends the following physician time components: pre-service time of 1 minute, intra-service time of 20 minutes and immediate post-service time of 1 minute. The specialty clarified that this service is an indocyanine-green angiography and a fluorescein angiography performed during the same visit and both are interpreted as part of this service. When the physician conducts the two studies together there are the same amount of pictures as one study so the intra-service time is the same, however the physician work is higher because the physician is interpreting an additional study.

The RUC reviewed the survey respondents' work values and determined that the survey 25th percentile work value of 0.95 appropriately captures the work and complexity of this service. The RUC compared the service to key reference service CPT code 99202, *Office or other outpatient visit for the evaluation and management of a new patient,* (work RVU = 0.93, intra-service time of 15 minutes, total time of 22 minutes) and noted that

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the surveyed code has slightly more intra-service time, justifying the slightly higher work value. **The RUC recommends a work RVU of 0.95 for CPT code 922X4.**

Practice Expense
The PE Subcommittee discussed that these services are typically performed with an opthalmic evaluation and management code and verified that all overlapping clinical staff time was removed. Additionally, cleaning time was added in to clean the angiograophy room which is different then the opthalmic evaluation and management exam lane. The Subcommittee extensively reviewed the work of the clinical staff and determined that for the 922X4 code although the staff is performing two studies the photographs are done between each other accounting for only 2 additional minutes over the indocyanine-green angiography. The Subcommittee also replaced the opthalmic exam lane with an *exam table* (EF023) and *exam light* (EQ168). The RUC reviewed and approved the practice expense inputs as modified and approved by the PE Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲92235	W1	Fluorescein angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral (When fluorescein and indocyanine-green angiography are performed at the same patient encounter, use 922X4)	XXX	0.75
▲92240	W2	Indocyanine-green angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral (When indocyanine-green and fluorescein angiography are performed at the same patient encounter, use 922X4)	XXX	0.80
●922X4	W3	Fluorescein angiography and indocyanine-green angiography (includes multiframe imaging) performed at the same patient encounter with interpretation and report, unilateral or bilateral (To report fluorescein angiography and indocyanine-green angiography not performed at the same patient encounter, see 99235, 92240)	XXX	0.95

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92235 Tracking Number W1 Original Specialty Recommended RVU: **0.75**
Presented Recommended RVU: **0.75**
Global Period: XXX RUC Recommended RVU: **0.75**

CPT Descriptor: Fluorescein angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 82-year-old female with age-related macular degeneration and noted blurred vision is found to have a hemorrhage in the macula upon examination. Fluorescein angiography is ordered to determine the cause.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 9%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Explain the indications, risks, and benefits of the angiography to the patient and/or family.

Description of Intra-Service Work: Evaluate the quality of the study. Interpret the fluorescein angiogram and determine a diagnosis. Compare angiographic findings with previous studies and other diagnostic modalities to determine disease progression/interval change. Review the angiographic findings and discuss with the patient. Select representative images for archiving for future comparison. Prepare and dictate report. Inform referring physician(s) of outcome.

Description of Post-Service Work: Report is signed. Dictation of findings prepared for letter to referring physician to accompany report

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.96	1.74
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.92	1.32
Urgency of medical decision making	1.36	1.74
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.24	1.47
Physical effort required	0.76	0.84

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.72	1.74
Outcome depends on the skill and judgment of physician	1.52	1.47
Estimated risk of malpractice suit with poor outcome	1.52	1.32

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.40	1.53

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 92235, *fluorescein angiography (includes multiframe imaging) with interpretation and report*, was surveyed as part of a family of codes used to image the retinal and choroidal vasculature, including CPT 92240 *indocyanine-green angiography (includes multiframe imaging) with interpretation and report* and CPT 9224x, a new combined fluorescein/indocyanine green angiography code.

A random survey of AAO and ASRS members had 75 respondents, 93% of whom found the vignette typical. The median WRVU was 0.97 and the 25th percentile was 0.75. Median IST was 15 minutes. The current value of the code is 0.81. The primary reference service, chosen by 35%, was CPT 99213, *Office or other outpatient visit for the evaluation and management of an established patient* (RUC February 2006) with a WRVU of 0.97 and 15 minutes IST. The second highest key reference service, chosen by 26% of respondents, was CPT 92083, *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination…* (RUC April 2012) with a WRVU of 0.50 and 10 minutes IST. The intensity and complexity metrics for the surveyed code were higher than those of either reference code.

The expert panel of the AAO, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median survey IST of 15 minutes was unchanged from the current value. We reduced the pre-evaluation time from the survey median of 10 minutes to 1 minute and eliminated the survey post-time as the procedure is typically done with an office visit. **We recommend the survey 25th percentile value of 0.75 WRVU.**

This value is supported by MPC code 76817, *Ultrasound, pregnant uterus, real time with image documentation, transvaginal* (RUC April 2002), with 0.75 WRVU, an IST of 10 minutes and total time of 23 minutes, and MPC code 99231 *Subsequent hospital care, per day, for the evaluation and management of a patient… straightforward…* (RUC February 2006) with 0.76 WRVU, an IST of 10 minutes, and total time of 20 minutes. The value is also supported by CPT code 93380, *Duplex scan of extracranial arteries; complete bilateral study* (RUC April 2014) with 0.80 WRVU, an IST of 15 minutes, and total time of 25 minutes and CPT 70486, *Computed tomography, maxillofacial area; without contrast material* (RUC April 2014) with 0.85 WRVU, an IST of 10 minutes, and total time of 16 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Billed with an office visit

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3. E/M or the ophthalmalogic exam codes

4.	CPT Code	Pre-	Intra-	Post-	Total Time	Work RVU	Global Period
5.	92002	5	15	5	25	.88	XXX
6.	92004	5	25	10	40	1.82	XXX
7.	92012	5	15	5	25	.92	XXX
8.	92014	5	24	8	37	1.42	XXX
9.	99212	2	10	4	16	.48	XXX
10.	99213	3	15	5	23	.97	XXX

CPT Code:92240 Tracking Number Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: Indocyanine-green angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old male presents to his ophthalmologist with sudden loss of vision in an otherwise normal eye. The patient is found to have a subretinal hemorrhage in the posterior pole, obscuring examination of the deeper ocular elements. Intravenous fluorescein angiography cannot demonstrate any abnormalities of the posterior pole. The patient undergoes indocyanine-green video angiography, which detects a treatable subretinal neovascular membrane. The subretinal neovascular membrane is treated with laser photocoagulation.

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Explain the indications, risks, and benefits of the angiography to the patient and/or family.

Description of Intra-Service Work: Evaluate the quality of the study. Interpret the angiogram and determine a diagnosis. Compare angiographic findings with previous studies and other diagnostic modalities to determine disease progression/interval change. Review the angiographic findings and discuss with the patient. Select representative images for archiving for future comparison. Prepare and dictate report. Inform referring physician(s) of outcome.

Description of Post-Service Work: Report is signed. Dictation of findings prepared for letter to referring physician to accompany report.

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	0.97	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
92002	XXX	0.88	**RUC Time**

CPT Descriptor Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; intermediate, new patient

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
76700	XXX	0.81	**RUC Time**	999,613

CPT Descriptor 1 Ultrasound, abdominal, real time with image documentation; complete

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99231	XXX	0.76	**RUC Time**	9,707,427

CPT Descriptor 2 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
99282	XXX	0.88	**RUC Time**

CPT Descriptor Emergency department visit for the evaluation and management of a patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; and Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity.

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 26 **% of respondents:** 45.6 **%**

Number of respondents who choose 2nd Key Reference Code: 12 **% of respondents:** 21.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 92240	**Top Key Reference CPT Code:** 99213	**2nd Key Reference CPT Code:** **92002**
Median Pre-Service Time	1.00	3.00	5.00
Median Intra-Service Time	20.00	15.00	15.00
Median Immediate Post-service Time	0.00	5.00	5.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00

Median Total Time	**21.00**	**23.00**	**25.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.08	0.58
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.35	0.92

Urgency of medical decision making	1.31	1.25

Technical Skill/Physical Effort (Mean)

Technical skill required	1.69	1.08
Physical effort required	1.12	0.58

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.77	1.33
Outcome depends on the skill and judgment of physician	1.62	1.33
Estimated risk of malpractice suit with poor outcome	1.50	1.33

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.58	1.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT 92240 *indocyanine-green angiography (includes multiframe imaging) with interpretation and report* was surveyed as part of a family of codes used to image the retinal and choroidal vasculature, including CPT 92235, *fluorescein angiography (includes multiframe imaging) with interpretation and report,* and CPT 9224X, a new combined fluorescein/indocyanine green angiography code.

A random survey of AAO and ASRS members had 57 respondents, 77% of whom found the vignette typical. The median WRVU was 1.00 and the 25th percentile was 0.80. Median IST was 20 minutes. The current value of the code is 1.10. The primary reference service, chosen by 46%, was CPT 99213, *Office or other outpatient visit for the evaluation and management of an established patient…* (RUC February 2006) with a WRVU of 0.97 and 15 minutes IST. The second highest reference service, chosen by 21% of respondents, was CPT 92002, *Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; intermediate, new patient* (RUC February 2007) with a WRVU of 0.88 and 15 minutes IST. The intensity and complexity metrics for the surveyed code were higher than those of either reference code.

The expert panel of the AAO and ASRS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median survey IST of 20 minutes was less than the current value of 30 minutes, reflecting increased familiarity with the procedure since its introduction and last valuation 20 years ago. We reduced the pre-evaluation time from the survey median of 10 minutes to 1 minute and eliminated the survey post-time as the procedure is typically done with an office visit. It was previously valued with pre- and post-times assuming no same-day office visit. That resulted in a value and times that carry a negative IWPUT. In light of this, the panel felt that despite the 33% decrease in IST and larger percent decrease in total time, the 25th percentile value of the survey, which is a 15% decrease in WRVU, accurately represents the procedure's work. **We recommend the survey 25th percentile value of 0.80 WRVU.**

This value is supported by MPC code 99231 *Subsequent hospital care, per day, for the evaluation and management of a patient…straightforward…* (RUC February 2006) with 0.76 WRVU, an IST of 10 minutes, and total time of 20 minutes, MPC code 76700 *Ultrasound, abdominal, real time with image documentation; complete* (RUC October 2013) with 0.81 WRVU, an IST of 11 minutes, and total time of 21 minutes, and MPC code 99282 *Emergency department visit for the evaluation and management of a patient… low complexity…* (RUC September 2005) with 0.88 WRVU, an IST of 10 minutes and total time of 18 minutes. The value is also supported by CPT code 93380, *Duplex scan of extracranial arteries; complete bilateral study* (RUC April 2014) with 0.80 WRVU, an IST of 15 minutes, and total time of 25 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Billed with an office visit

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3. E/M or the ophthalmologic exam codes

4.	CPT Code	Pre-	Intra-	Post-	Total Time	Work RVU	Global Period
5.	92002	5	15	5	25	.88	XXX
6.	92004	5	25	10	40	1.82	XXX
7.	92012	5	15	5	25	.92	XXX
8.	92014	5	24	8	37	1.42	XXX
9.	99212	2	10	4	16	.48	XXX
10.	99213	3	15	5	23	.97	XXX

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 151254
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. Estimation Only

Specialty Ophthalmology Frequency 151193 Percentage 99.95 %

Specialty Frequency 0 Percentage 0.00 %

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92240

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:922X4 Tracking Number W3 Original Specialty Recommended RVU: **0.95**
Presented Recommended RVU: **0.95**
Global Period: XXX RUC Recommended RVU: **0.95**

CPT Descriptor: Fluorescein angiography and indo-cyanine-green aniography (includes multiframe imaging) performed at the same patient encounter with interpretation and report, unilateral or bilateral.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 77 year old female with a history dry age-related macular degeneration presents with subretinal blood and fluid.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Explain the indications, risks, and benefits of the angiography to the patient and/or family.

Description of Intra-Service Work: Evaluate the quality of the study. Interpret the angiogram and determine a diagnosis. Compare angiographic findings with previous studies and other diagnostic modalities to determine disease progression/interval change. Review the angiographic findings and discuss with the patient. Select representative images for archiving for future comparison. Prepare and dictate report. Inform referring physician(s) of outcome

Description of Post-Service Work: Report is signed. Dictation of findings prepared for letter to referring physician to accompany report

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	0.97	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
92083	XXX	0.50	**RUC Time**

CPT Descriptor Emergency department visit for the evaluation and management of a patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99213	XXX	0.97	**RUC Time**	99,525,665

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99202	XXX	0.93	**RUC Time**	2,996,676

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 20 minutes are spent face-to-face with the patient and/or family.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.38	1.78
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.50	1.56
Urgency of medical decision making	1.34	1.56
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.69	1.44
Physical effort required	1.16	0.78
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	1.72	1.56
Outcome depends on the skill and judgment of physician	1.69	1.44
Estimated risk of malpractice suit with poor outcome	1.50	1.33

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.72	1.78

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 9224X is a new code describing combined fluorescein angiography and indocyanine green angiography. This procedure is used to image the retinal and choroidal vasculature. CPT 92235, *fluorescein angiography (includes multiframe imaging) with interpretation and report,* and CPT 92240 *indocyanine-green angiography (includes multiframe imaging) with interpretation and report* were surveyed for this meeting as part of the same family.

A random survey of AAO and ASRS members had 53 respondents, 81% of whom found the vignette typical. The median WRVU was 1.25 and the 25th percentile was 0.95. Median IST was 20 minutes. The primary reference service, chosen by 60%, was CPT 99213, *Office or other outpatient visit for the evaluation and management of an established patient.…* (RUC February 2006) with a WRVU of 0.97 and 15 minutes IST. The second highest reference service, chosen by 17% of respondents, was CPT 92083, *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination.…* (RUC April 2012) with a WRVU of 0.50 and 10 minutes IST. The intensity and complexity metrics for the surveyed code were higher than those of either reference code.

The expert panel of the AAO, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median survey IST of 20 minutes was equal to that of the median IST survey time for CPT 92240 *Indocyanine green angiography*. We reduced the pre-evaluation time from the survey median of 15 minutes to 1 minute and eliminated the survey post-time as the procedure is typically done with an office visit. Although IST and total time are identical to CPT 92240, the increased number of images to analyze with combined indocyanine green and fluorescein angiography is consistent with a greater work value than 92240. **We recommend the survey 25th percentile value of 0.95 WRVU.**

This value is supported by MPC code 99202 *Office or other outpatient visit for the evaluation and management of a new patient… straightforward…* (RUC February 2006) with 0.93 WRVU, an IST of 15 minutes, and total time of 22 minutes, and MPC code 99213 *Office or other outpatient visit for the evaluation and management of an established patient… low complexity* (RUC February 2006) with 0.97 WRVU, an IST of 15 minutes and total time of 23 minutes. The value is also supported by CPT code 70460, *Computed tomography, head or brain; with contrast material(s)* (RUC October 2012) with 1.13 WRVU, an IST of 12 minutes, and total time of 22 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Billed with an office visit.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
3. E/M or the ophthalmologic exam codes

CPT Code: 922X4

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 144000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation Only

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 96,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation Only

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number NA

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92240

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non- Facility Direct Inputs

CPT Long Descriptor:

Fluorescein angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral.

Global Period: XXX Meeting Date: 01/2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other physicians who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: **N/A**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: **N/A**

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: **N/A**

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available: 3 min.
    - This time is spent greeting the patient, reviewing the patient records including ocular diagnosis, allergies, pregnancy status, systemic diseases, reviewing photographic request and confirming the retinal area of interest, as well as planning the photographic procedure and confirming adequate dilation.
- Provide pre-service education/obtain consent: 1 min.

    - The patient is informed of the procedure, pharmacologic agents to be administered, and potential adverse reactions. Questions and concerns are answered and addressed. Given the complexity of the procedure and its risks, this process takes more than the standard amount allotted to an E&M code. To reflect this, we have represented the excess amount of discussion with one minute here.
- Prepare room, equipment, supplies: 2 min.
    - This time is spent entering patient demographic information into the capture software, setting the eyepiece for accommodative correction, setting the viewing angle, flash power, and viewing light.
- Prepare and position patient/ monitor patient/ set up IV: 2 min.
    - This time is spent placing the IV for the patient.
- Acquire images: 20 min.
    - This time is spent performing fluorescein angiography. The photographer establishes fixation with a fixation device, aligns the illumination beam within the pupil, focuses on a designated field of view, uses astigmatic correction device, sets the camera settings to the monochromatic green (red-free) photograph setting, engages the green filter, sets the flash power, and takes red-free photographs of the required area of interest.
    - Next, the camera is switched back to the settings for fluorescein angiography, and the photographer makes preparations for the IV fluorescein injection, engages the exciter and barrier filters, sets the flash power, positions the patient for the procedure with arm extended. The photographer establishes fixation with fixation device, aligns the illumination beam within the pupil of the eye, focuses on the designated field of view, takes a control photograph to confirm the absence of pseudofluorescence, then cues the injector to begin and starts the timer concurrent with the administration of dye.
    - The photographer then begins the pre-planned photographic sequence, taking early transit photographs rapidly for the first 40 seconds.
    - The photographer then captures posterior pole photographs of the fellow eye, returning to the eye of interest for peripheral survey fields if necessary. The photographer monitors and assesses the patient's response to the injection, responding to any adverse reactions experienced by the patient.
    - The mid-phase photographs are then taken a few minutes post injection, with the late phase photographs taken several minutes after the injection. In order to take the late phase photographs, the photographer must increase the flash setting or camera gain settings for adequate late exposure.
    - Following the completion of the procedure, the patient's IV is removed, and the patient's status is assessed prior to their leaving the room. The equipment is cleaned and IV equipment properly disposed of.
- Label & file photos/slides w/ patient chart: 3 min.
    - This time is spent uploading and ordering photographs from the procedure into the medical record.

Post-Service Clinical Labor Activities:

N/A

CPT Code: 92240
Specialty Society('s) American Academy of Ophthalmology

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non-Facility Direct Inputs

CPT Long Descriptor:

Indocyanine-green angiography (includes multiframe imaging) with interpretation and report, unilateral or bilateral.

Global Period: XXX Meeting Date: 01/2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other physicians who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: **N/A**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: **N/A**

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: **N/A**

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available: 3 min
    - This time is spent greeting the patient, reviewing the patient records including ocular diagnosis, allergies, pregnancy status, systemic diseases, reviewing photographic request and confirming the retinal area of interest, as well as planning the photographic procedure and confirming adequate dilation.
- Provide pre-service education/obtain consent: 1 min

    - The patient is informed of the procedure, pharmacologic agents to be administered, and potential adverse reactions. Questions and concerns are answered and addressed. Given the complexity of the procedure and its risks, this process takes more than the standard amount allotted to an E&M code. To reflect this, we have represented the excess amount of discussion with one minute here.
- Prepare room, equipment, supplies: 2 min
    - This time is spent entering patient demographic information into the capture software, setting the eyepiece for accommodative correction, setting the viewing angle, flash power, and viewing light.
- Prepare and position patient/ monitor patient/ set up IV: 2 min
    - This time is spent placing the IV for the patient.
- Acquire images: 37 min
    - This time is spent performing indo-cyanine-green (ICG) angiography. The camera settings are adjusted for monochromatic green (red-free) photographs, the green filter is engaged, and the flash power is set. The photographer establishes fixation with a fixation device, aligns the illumination beam within the pupil, focuses on a designated field of view, uses astigmatic correction device, and takes monochromatic green (red-free) photographs of the required area of interest. The photographer then reviews images for quality and corrects artifacts and adjusts settings accordingly, repeating as needed.
    - Next, the camera is switched to the settings for ICG angiography, and the photographer makes preparations for the IV ICG injection, engages the exciter and barrier filters, sets the flash power, positions the patient for the procedure with arm extended. The photographer establishes fixation with fixation device, aligns the illumination beam within the pupil of the eye, focuses on the designated field of view, takes a control photograph to confirm the absence of pseudofluorescence, then cues the injector to begin and starts the timer concurrent with the administration of dye.
    - The photographer then begins the pre-planned photographic sequence, taking early transit photographs rapidly for the first several seconds.
    - The photographer then captures posterior pole photographs of the fellow eye, returning to the eye of interest for peripheral survey fields if necessary. The photographer monitors and assesses the patient's response to the injection, responding to any adverse reactions experienced by the patient.
    - The mid-phase photographs are taken approximately ten minutes post injection. As the ICG signal increases through the procedure, the photographer has to reduce the gain in order to keep an accurate signal.
    - The late phase photographs are taken up to 60 minutes after the injection.
    - Following the completion of the procedure, the patient's IV is removed, and the patient's status is assessed prior to their leaving the room. The equipment is cleaned and IV equipment properly disposed of.
- Label & file photos/slides w/ patient chart: 3 min
    - This time is spent uploading and ordering photographs from the procedure into the medical record.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non-Facility Direct Inputs

CPT Long Descriptor:

Fluorescien angiography and indo-cycanine-green angiography (includes multiframe imaging) performed at the same patient encounter with interpretation and report, unilateral or bilateral.

Global Period: XXX Meeting Date: 01/2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other physicians who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

92240. 922X4 comprises a combination of both 92240 and 92235. The length of time performing the procedure most resembles 92240.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: **N/A**

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: **N/A**

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available: 3 min
    - This time is spent greeting the patient, reviewing the patient records including ocular diagnosis, allergies, pregnancy status, systemic diseases, reviewing photographic request and confirming the retinal area of interest, as well as planning the photographic procedure and confirming adequate dilation.

- Provide pre-service education/obtain consent: 1 min
    - The patient is informed of the procedure, pharmacologic agents to be administered, and potential adverse reactions. Questions and concerns are answered and addressed. Given the complexity of the procedure and its risks, this process takes more than the standard amount allotted to an E&M code. To reflect this, we have represented the excess amount of discussion with one minute here.
- Prepare room, equipment, supplies: 2 min
    - This time is spent entering patient demographic information into the capture software, setting the eyepiece for accommodative correction, setting the viewing angle, flash power, and viewing light.
- Prepare and position patient/ monitor patient/ set up IV: 2 min
    - This time is spent placing the IV for the patient.
- Acquire images: 39 min
    - This time is spent performing indo-cyanine-green (ICG) angiography and fluorescein angiography (FA). As it takes longer, the ICG angiography is started first, followed by the FA.
    - The camera settings are adjusted for monochromatic green (red-free) photographs, the green filter is engaged, and the flash power is set. The photographer establishes fixation with a fixation device, aligns the illumination beam within the pupil, focuses on a designated field of view, uses astigmatic correction device, and takes monochromatic green (red-free) photographs of the required area of interest. The photographer then reviews images for quality and corrects artifacts and adjusts settings accordingly, repeating as needed.
    - Next, the camera is switched to the settings for ICG angiography, and the photographer makes preparations for the IV ICG injection, engages the exciter and barrier filters, sets the flash power, positions the patient for the procedure with arm extended. The photographer establishes fixation with fixation device, aligns the illumination beam within the pupil of the eye, focuses on the designated field of view, takes a control photograph to confirm the absence of pseudofluorescence, then cues the injector to begin and starts the timer concurrent with the administration of dye.
    - The photographer then begins the pre-planned photographic sequence, taking early transit photographs rapidly for the first several seconds.
    - The photographer then captures posterior pole photographs of the fellow eye, returning to the eye of interest for peripheral survey fields if necessary. The photographer monitors and assesses the patient's response to the injection, responding to any adverse reactions experienced by the patient.
    - The mid-phase photographs are taken approximately 10 minutes post injection. As the ICG signal increases through the procedure, the photographer has to reduce the gain in order to keep an accurate signal.
    - The photographer then performs fluorescein angiography (FA).
    - The camera is switched back to the settings for FA, and the photographer makes preparations for the IV fluorescein injection, engages the exciter and barrier filters, sets the flash power, positions the patient for the procedure with arm extended. The photographer establishes fixation with fixation device, aligns the illumination beam within the pupil of the eye, focuses on the designated field of view, takes a control photograph to confirm the absence of pseudofluorescence, then cues the injector to begin and starts the timer concurrent with the administration of dye.
    - The photographer then begins the pre-planned FA photographic sequence, taking early transit photographs rapidly for the first 40 seconds.
    - The photographer then captures posterior pole photographs of the fellow eye, returning to the eye of interest for peripheral survey fields if necessary. The photographer monitors

and assesses the patient's response to the injection, responding to any adverse reactions experienced by the patient.
    - The mid-phase FA photographs are then taken a few minutes post fluorescein injection, with the late phase FA photographs taken several minutes after the injection. In order to take the late phase photographs, the photographer must increase the flash setting or camera gain settings for adequate late exposure.
    - The photographer then re-adjusts the camera settings for the late phase ICG imaging, which is taken up to 60 minutes after the first injection.
    - Following the completion of the procedure, the patient's IV is removed, and the patient's status is assessed prior to their leaving the room. The equipment is cleaned and IV equipment properly disposed of.
- Label & file photos/slides w/ patient chart: 3 min
    - This time is spent uploading and ordering photographs from the procedure into the medical record.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Closure of Paravalvular Leak

935X1 ***Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve***
CPT code 935X1 is a new code to describe the work of closing a paravalvular leak in a previously placed mechanical mitral valve. The RUC reviewed the survey results from 52 cardiologists that perform transcatheter structural heart procedures and determined that the specialty society recommendation of 25.00 work RVUs, which was the survey 25th percentile and median, was not appropriate. The specialty revised their recommendation based on an increment of intensity to 20.04 work RVUs. The RUC noted that it was not the value of 20.04, but instead the methodology used to obtain the value that was not appropriate. The RUC was concerned that there is a lack of other 000 day global codes with a similar work RVU range and it would not be possible to find an appropriate crosswalk. The RUC determined an alternate approved methodology was needed to ensure an accurate valuation. The RUC noted that CPT code 935X1 contains the work of 935X2 with the addition of a transseptal puncture (CPT code 93462 *Left heart catheterization by transseptal puncture through intact septum or by transapical puncture*, work RVU= 3.73). Therefore, the RUC added the incremental work of add-on code 93462 (work RVU= 3.73) to the RUC approved value of 17.97 for CPT code 935X2 to arrive a work RVU of 21.70 for 935X1. The RUC determined that a work RVU of 21.70, below the 25th percentile appropriately accounts for the work required to perform this service. The RUC compared the surveyed code to key reference services 93581 *Percutaneous transcatheter closure of a congenital ventricular septal defect with implant* (work RVU = 24.39, intra-service time of 180) and 33477 *Transcatheter pulmonary valve implantation, percutaneous approach, including pre-stenting of the valve delivery site, when performed* (work RVU = 25.00, intra-service time of 180) and noted that the intra-service time is greater justifying the greater work value.

The RUC recommends 40 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 15 minutes scrub/dress/wait time, 135 minutes intra-service time and 30 minutes immediate post-service time. The RUC noted that the typical patient receiving this service has e had previous cardiac surgeries. This service is a low volume code that is exclusively performed in a hospital and the patient is sent home several days later. The specialty society explained that this service is similar to 935X2, but is a much more complex service technically, primarily because of the location of the mitral valve, and it requires more time and intensity to perform. The RUC noted that there is 15 minute intra-service difference between 935X1 and 935X2. If you multiply the 15 minutes of intra-service by the IWPUT of 935X2 (0.135), the resulting work RVU of 2.03 can then be added to the recommended value of 17.97 for 935X2 to arrive at a work RVU of 20.00. Given this additional support, the RUC was confirmed that a work RVU of 21.70 is appropriate. **The RUC recommends a work RVU of 21.70 for CPT code 935X1.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

935X2 ***Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve***
CPT code 935X2 is a new code to describe the work of closing a paravalvular leak in a previously placed mechanical aortic valve. The RUC reviewed the survey results from 50 cardiologists that perform transcatheter structural heart procedures and determined that a work RVU of 17.97, below the 25th percentile appropriately accounts for the work required to perform this service. This value is a direct crosswalk to CPT code 93580 *Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant* (work RVU= 17.97). The RUC recommends 40 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 15 minutes scrub/dress/wait time, 120 minutes intra-service time and 30 minutes immediate post-service time. The RUC noted that the typical patients has had a least two cardiac surgeries, are considered at risk for another cardiac surgery and are very ill patients.. This service is a low volume code that is exclusively performed in a hospital and the patient is sent home several days later. The RUC compared the surveyed code to key reference services 93581 *Percutaneous transcatheter closure of a congenital ventricular septal defect with implant* (work RVU = 24.39, intra-service time of 180) and noted that the intra-service time is greater justifying the greater work value. **The RUC recommends a work RVU of 17.97 for CPT code 935X2 a direct crosswalk to CPT code 93580.**

935X3 ***Percutaneous transcatheter closure of paravalvular leak; each additional occlusion device (list separately in addition to code for primary service)***
CPT code 935X3 is a new add-on code to describe the additional work of closing a paravalvular leak in a previously placed mechanical aortic valve. The RUC reviewed the survey results from 51 cardiologists that perform transcatheter structural heart procedures and determined that a work RVU of 8.00, the survey 25th percentile appropriately accounts for the work required to perform this service.

The RUC recommends 60 minutes intra-service time.. The RUC noted that the survey data was strong and that the survey 25th percentile appropriately captures the time and intensity of this service. For additional support the RUC compared 935X3 to 33884 *Placement of proximal extension prosthesis for endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); each additional proximal extension (List separately in addition to code for primary procedure)* (work RVU = 8.20, 60 minutes total time). **The RUC recommends a work RVU of 8.00 for CPT code 935X3.**

Practice Expense
CPT codes 935X1 and 935X2 are both 000 day global, facility only services. The specialty recommended that they be allocated 30 minutes of pre-service time for extensive use of clinical staff time. The PE Subcommittee discussed the complexity of the patient and the amount of work that the clinical staff in the office have to do prior to these procedures and agreed with the time. The RUC reviewed and recommends the practice expense inputs as submitted by the specialty and approved by the PE Subcommittee.

New Technology
CPT codes 935X1, 935X2 and 935X3 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and specifically review utilization trends.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Repair of Structural Heart Defect **Transcatheter Closure of Paravalvular Leak** Codes 935X1, 935X2, 935X3 are used to report transcatheter closure of paravalvular leak (PVL). Codes 935X1, 935X2, include when performed, ~~of~~ percutaneous access, placing the access sheath(s), advancing the delivery system to the paravalvular leak, positioning the closure device, repositioning the closure device as needed, and deploying the device. Codes 935X1, 935X2 include, when performed, fluoroscopy (76000), angiography, radiological supervision, and interpretation services performed to guide the PVL closure (eg, guiding the device placement and documenting completion of the intervention). Code 935X1 includes transseptal puncture, and left heart catheterization/left ventriculography (93452, 93453, 93458, 93459, 93460, 93461, 93531, 93532, 93533, 93565), when performed. Transapical left heart catheterization (93462) may be reported separately, when performed. Code 935X2 includes, when performed, supravalvular aortography (93567), left heart catheterization/left ventriculography (93452, 93453, 93458, 93459, 93460, 93461, 93531, 93532, 93533, 93565). Transapical left heart catheterization (93462) may be reported separately, when performed. Diagnostic right heart catheterization codes (93451, 93456, 93457, 93530) and diagnostic coronary angiography codes (93454, 93455, 93456, 93457, 93563, 93564) may be reported with 935X1, 935X2, representing separate and distinct services from PVL closure, if: 1. No prior study is available and a full diagnostic study is performed, or 2. A prior study is available, but as documented in the medical record: a. There is inadequate visualization of the anatomy and/or pathology, or b. The patient's condition with respect to the clinical indication has changed since the prior study, or c. There is a clinical change during the procedure that requires new evaluation. Other cardiac catheterization services may be reported separately when performed for diagnostic purposes not intrinsic to PVL closure. For same session/same day diagnostic cardiac catheterization services, report the appropriate diagnostic cardiac catheterization code(s) appended with modifier 59 indicating separate and distinct procedural service from PVL closure.				
●935X1	X1	Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve (Do not report 935X1 in conjunction with 93462 for transseptal puncture) (For transapical puncture performed in conjunction with 935X1, use 93462)	000	21.70

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●935X2	X2	initial occlusion device, aortic valve (For transseptal or transapical puncture done in conjunction with 935X2, use 93462)	000	17.97
✚●935X3	X3	each additional occlusion device (List separately in addition to code for primary service) (Use 935X3 in conjunction with 935X1, 935X2)	ZZZ	8.00

CPT Descriptor: Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female with prior mechanical mitral valve replacement on two occasions now presents with New York Heart Association (NYHA) Class III heart failure, hemolysis and renal insufficiency. Echocardiography demonstrates severe paravalvular regurgitation around the prosthetic mitral valve. Due to multiple comorbidities, a third mitral valve replacement is considered high risk.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. Informed consent is obtained. The operative plan is reviewed with the anesthesiologist. The patient is positioned on the procedural table. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient.

Description of Intra-Service Work: Mark and ensure all potential access sites are scrubbed and draped. Perform pre-procedural "time-out." Appropriate multi-channel hemodynamic monitoring is verified. The patient is intubated and general anesthesia is administered by a separate physician. Foley catheter is inserted and both groin sites are prepped. Transesophageal echocardiography probe is inserted and positioned by a separate physician. Venous and arterial access is obtained. An angiographic catheter is advanced aver a wire to the ascending aorta and then across the aortic valve into the left ventricle. Left ventriculography is performed to assess the degree of mitral paravalvular leak. A wire is advanced from the right femoral vein to the superior vena cava for placement of the transseptal sheath and needle. The transseptal sheath and needle are now inserted over the wire, and using echocardiographic guidance entry into the right atrium is confirmed. Transseptal puncture is performed with echo verification of correct puncture location. Often this requires several attempts. Heparinize patient and check the activated clotting time [ACT] level at the appropriate time interval to obtain ACT ~300 seconds. Continue to check ACT every 30 min and readminister heparin during the procedure and check ACT to verify the patient is prophylactically anticoagulated. A stiff guide wire in placed through the transseptal sheath into the left atrium and then pulmonary vein.

A steerable sheath and dilator are prepared on the back table. This system is advanced over the wire into the left atrium in the dilator and wire is removed. The catheter is carefully aspirated to remove all air and flushed to prevent thrombosis. A telescope system of a wire placed through a diagnostic catheter which is through a guide catheter is then advanced through the steerable sheath into the left atrium. Using angiography and echocardiographic imaging for guidance, this system is manipulated to steer the wire across the paravalvular leak. This generally requires biplane fluoroscopy and 3-dimensional TEE. This process requires prolonged manipulation of the system to direct the wire to the paravalvular leak and to cross. Exquisite care is given to avoid entrapping the wire in the prosthetic valve, as this could cause sudden valve dysfunction with hemodynamic collapse. Once the wire is across the paravalvular leak into the left ventricle, the diagnostic catheter is carefully advanced over the wire into the ventricle. This generally requires careful manipulation of the catheter, ensuring that it enters the left ventricle but does not perforate the apex of the ventricle. Next, the guide catheter is telescoped over the diagnostic catheter into the left ventricle.

With this system in the left ventricle, the wire is manipulated out from the left ventricle across the aortic valve into the aortic arch. Typically, this causes significant ventricular ectopy or ventricular tachycardia, causing temporary hemodynamic instability. The wire is then manipulated down into the descending aorta. From the femoral arterial access, a snare catheter is advanced up into the descending aorta. The snare was used to capture the wire. This requires multiple manipulations of the snare and the wire in order to achieve capture. Once the wire is captured, the wire is carefully withdrawn by the snare back through the femoral arterial sheath while simultaneously advancing the wire from the femoral venous sheath. This is done slowly and with great care in order to avoid any trauma to the atrial septum or subvalvular mitral apparatus.

The steerable sheath is now removed over the wire and replaced with a less rigid delivery sheath and dilator. This is advanced from the femoral venous access site over the wire, across the interatrial septum, across the paravalvular leak, and into the left ventricle. The dilator is removed over the wire and the sheath is then aspirated and flushed carefully to avoid air embolization or thrombosis. With the wire in place to anchor the sheath in position, a closure device is advanced from the femoral venous access site through the sheath into the left ventricle. The sheath and the device are pullback gradually to the level of the mitral valve annulus. Using both fluoroscopy and echocardiography to identify the positioning of the system, the closure device is positioned at the level of the paravalvular leak. The ventricular aspect of the closure device is extruded from the sheath, the sheath is pulled back in the atrial aspect of the device is now extruded. Echocardiography is used to assess the effectiveness of closure of the paravalvular leak and to assess the function of the mitral valve leaflets. In addition, fluoroscopy is used in multiple views to assess the function of the mitral valve leaflets. If the evaluation is favorable the device is released in a series of steps. After final release the patient is again evaluated by angiographic, hemodynamic and echocardiographic criteria for suitability of the paravalvular leak repair and to ensure no complications. If there is no need for an additional device, the delivery system is withdrawn and removed from the body. The anchoring wire is carefully removed, ensuring no disruption of the position of the closure device. Left heart catheterization may be performed with left ventriculography to assess the adequacy of paravalvular leak closure as well.

The patient's arterial pressure, EKG waveforms, and oxygen saturation are constantly monitored throughout the procedure. Images are reviewed to ensure no additional views are required before leaving the procedure suite. The groin site is closed per physician and institutional practices. Anesthesia is reversed and the patient is extubated as appropriate by the anesthesia team. Hypertension, hypotension, bleeding, arrhythmias, and oxygen desaturation are potential complications and are treated accordingly with medications and/or oxygen as needed during the procedure. The patient is transferred to the recovery suite for additional monitoring.

Description of Post-Service Work: The patient’s procedural outcome is communicated to family and to the referring physician(s). The physician writes orders and dictates an operative report. Prior to disposition the patient is observed carefully to ensure no bleeding from the access site and no hemodynamic or rhythm instability to suggest a procedural complication. Patient is transferred to routine care once stable.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.83	0.95
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.03	1.11
Urgency of medical decision making	0.28	0.68
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.14	1.32
Physical effort required	1.10	1.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.83	1.05
Outcome depends on the skill and judgment of physician	0.97	1.05
Estimated risk of malpractice suit with poor outcome	0.62	0.26

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.24	1.32

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

935X1 is a new code to describe the work of closing a paravalvular leak in a previously placed mechanical mitral valve. This service is currently reported using unlisted code 93799. After review by the Research Subcommittee, this service was surveyed as a targeted sample of a subpopulation of society members who indicate through their membership information that they perform transcatheter structural heart procedures.

A joint RVS panel of ACC and SCAI members reviewed the survey data. The panel reviewed the preservice time and selected package 4 for a difficult patient/procedure with sedation, removing 5 minutes of SDW time to align with the survey data. The service is performed general anesthesia. We recommend postservice package 9B for a complex procedure with 3 minutes removed to align with the survey response. The service is exclusively performed in a hospital and the patient is sent home several days later.

The key reference service is 93581, transcatheter closure of a congenital ventricular septal defect. The key reference was selected by 29 survey respondents, or 56% of respondents. The second key reference is another transcatheter congenital service. Nineteen respondents, or 37%, selected transcatheter pulmonary valve implantation as a reference code. Respondents who selected the key reference services indicated 935X1 to be more intense/complex than the key reference services in all metrics.

We have included on the SOR the highest 0-day global MPC code (52353 at 7.50 work RVUs).

Consistent with the survey, the societies recommend the 25th-precentile work RVU of 25.00 with 58 minutes of preservice time from package 4 after 5 minutes of SDW time is removed, 135 minutes intraservice time, and 30 minutes postservice time from package 9B after 3 minutes is removed to align with the survey response of 30 minutes postservice time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93799 was billed to Medicare 988 times in 2014.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Rarely

Specialty interventional cardiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 350
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Advisors estimate this service is provided 6 times a year at roughly 50 facilities in the Medicare population and once a year in the non-Medicare population.

Specialty cardiology Frequency 175 Percentage 50.00 %

Specialty interventional cardiology Frequency 175 Percentage 50.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 300
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Advisors estimate this service is provided an average of 6 times a year at roughly 50 facilities in the Medicare population.

Specialty cardiology Frequency 150 Percentage 50.00 %

Specialty interventional cardiology Frequency 150 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

CPT Descriptor: Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male with prior mechanical aortic valve replacement on two occasions now presents with NYHA Class III heart failure, hemolysis and renal insufficiency. Echocardiography demonstrates severe paravalvular regurgitation around the prosthetic aortic valve. Due to multiple comorbidities, a third aortic valve replacement is considered high risk.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. Informed consent is obtained. The operative plan is reviewed with the anesthesiologist. The patient is positioned on the procedural table. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient.

Description of Intra-Service Work: Mark and ensure all potential access sites are scrubbed and draped. Perform pre-procedural "time-out." Appropriate multi-channel hemodynamic monitoring is verified. The patient is intubated and general anesthesia is administered by a separate physician. Foley catheter is inserted and both groin sites are prepped. Transesophageal echocardiography probe is inserted and positioned by a separate physician. Arterial access is obtained. An angiographic catheter is advanced aver a wire to the ascending aorta. Supravalvular aortography is performed to assess the aortic paravalvular leak. Heparinize patient and check the activated clotting time [ACT] level at the appropriate time interval to obtain ACT ~300 seconds. Continue to check ACT every 30 min and readminister heparin during the procedure and check ACT to verify the patient is prophylactically anticoagulated.

A telescope system of a wire placed through a diagnostic catheter, which is through a guide catheter is advanced to the ascending aorta. Using angiography and echocardiographic imaging for guidance, this system is manipulated to steer the wire across the paravalvular leak. This generally requires biplane fluoroscopy and 3-dimensional TEE. This process requires prolonged manipulation of the system to direct the wire to the paravalvular leak and to cross. Exquisite care is

given to avoid entrapping the wire in the prosthetic valve, as this could cause sudden valve dysfunction with hemodynamic collapse. Once the wire is across the paravalvular leak into the left ventricle, the diagnostic catheter is carefully advanced over the wire into the ventricle. This generally requires careful manipulation of the catheter, ensuring that it enters the left ventricle but does not perforate the apex of the ventricle. Next, the guide catheter is telescoped over the diagnostic catheter into the left ventricle. Typically, this causes significant ventricular ectopy or ventricular tachycardia, causing temporary hemodynamic instability.

The diagnostic catheter is removed over the wire and the sheath is then aspirated and flushed carefully to avoid air embolization or thrombosis. With the wire in place to anchor the sheath in position, a closure device is advanced from the femoral arterial access site through the sheath into the left ventricle. The sheath and the device are pullback gradually to the level of the aortic valve annulus. Using both fluoroscopy and echocardiography to identify the positioning of the system, the closure device is positioned at the level of the paravalvular leak. The ventricular aspect of the closure device is extruded from the sheath, the sheath is pulled back in the atrial aspect of the device is now extruded. Echocardiography is used to assess the effectiveness of closure of the paravalvular leak and to assess the function of the mitral valve leaflets. In addition, fluoroscopy is used in multiple views to assess the function of the mitral valve leaflets. If the evaluation is favorable the device is released in a series of steps. After final release the patient is again evaluated by angiographic, hemodynamic and echocardiographic criteria for suitability of the paravalvular leak repair and to ensure no complications. If there is no need for an additional device, the delivery system is withdrawn and removed from the body. The anchoring wire is carefully removed, ensuring no disruption of the position of the closure device. Supravalvular aortography may be performed to assess the adequacy of paravalvular leak closure as well.

The patient's arterial pressure, EKG waveforms, and oxygen saturation are constantly monitored throughout the procedure. Images are reviewed to ensure no additional views are required before leaving the procedure suite. The groin site is closed per physician and institutional practices. Anesthesia is reversed and the patient is extubated as appropriate by the anesthesia team. Hypertension, hypotension, bleeding, arrhythmias, and oxygen desaturation are potential complications and are treated accordingly with medications and/or oxygen as needed during the procedure. The patient is transferred to the recovery suite for additional monitoring.

Description of Post-Service Work: The patient’s procedural outcome is communicated to family and to the referring physician(s). The physician writes orders and dictates an operative report. Prior to disposition the patient is observed carefully to ensure no bleeding from the access site and no hemodynamic or rhythm instability to suggest a procedural complication. Patient is transferred to routine care once stable.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

935X2 is a new code to describe the work of closing a paravalvular leak in a previously placed mechanical aortic valve. This service is currently reported using unlisted code 93799. After review by the Research Subcommittee, this service was surveyed as a targeted sample of a subpopulation of society members who indicate through their membership information that they perform transcatheter structural heart procedures.

A joint RVS panel of ACC and SCAI members reviewed the survey data. The panel reviewed the preservice time and selected package 4 for a difficult patient/procedure with sedation, removing 5 minutes of SDW time to align with the survey data. The service is performed general anesthesia. We recommend postservice package 9B for a complex procedure with 3 minutes removed to align with the survey response. The service is exclusively performed in a hospital and the patient is sent home several days later.

The key reference service is 93581, transcatheter closure of a congenital ventricular septal defect. The key reference was selected by 29 survey respondents, or 58% of respondents. The second key reference is another transcatheter congenital service. Twelve respondents, or 24%, selected closure of an atrial septal defect as a reference code. Respondents who selected the key reference services indicated 935X2 to be more intense/complex than the key reference services in all metrics.

We have included on the SOR the highest 0-day global MPC code (52353 at 7.50 work RVUs).

Consistent with the survey, the societies recommend the 25th-precentile work RVU of 20.00 with 58 minutes of preservice time from package 4 after 5 minutes of SDW time is removed, 135 minutes intraservice time, and 30 minutes postservice time from package 9B after 3 minutes is removed to align with the survey response of 30 minutes postservice time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93799 was billed to Medicare 988 times in 2014.

Description of Pre-Service Work:

Description of Intra-Service Work: A telescope system of a wire placed through a diagnostic catheter, which is through a guide catheter is advanced to the ascending aorta. Using angiography and echocardiographic imaging for guidance, this system is manipulated to steer the wire across the paravalvular leak. This generally requires biplane fluoroscopy and 3-dimensional TEE. This process requires prolonged manipulation of the system to direct the wire to the paravalvular leak and to cross. Exquisite care is given to avoid entrapping the wire in the prosthetic valve, as this could cause sudden valve dysfunction with hemodynamic collapse. Once the wire is across the paravalvular leak into the left ventricle, the diagnostic catheter is carefully advanced over the wire into the ventricle. This generally requires careful manipulation of the catheter, ensuring that it enters the left ventricle but does not perforate the apex of the ventricle. Next, the guide catheter is telescoped over the diagnostic catheter into the left ventricle. Typically, this causes significant ventricular ectopy or ventricular tachycardia, causing temporary hemodynamic instability.

The diagnostic catheter is removed over the wire and the sheath is then aspirated and flushed carefully to avoid air embolization or thrombosis. With the wire in place to anchor the sheath in position, a closure device is advanced from the femoral arterial access site through the sheath into the left ventricle. The sheath and the device are pullback gradually to the level of the aortic valve annulus. Using both fluoroscopy and echocardiography to identify the positioning of the system, the closure device is positioned at the level of the paravalvular leak. The ventricular aspect of the closure device is extruded from the sheath, the sheath is pulled back in the atrial aspect of the device is now extruded. Echocardiography is used to assess the effectiveness of closure of the paravalvular leak and to assess the function of the mitral valve leaflets. In

addition, fluoroscopy is used in multiple views to assess the function of the mitral valve leaflets. If the evaluation is favorable the device is released in a series of steps. After final release the patient is again evaluated by angiographic, hemodynamic and echocardiographic criteria for suitability of the paravalvular leak repair and to ensure no complications. If there is no need for an additional device, the delivery system is withdrawn and removed from the body. The anchoring wire is carefully removed, ensuring no disruption of the position of the closure device. Supravalvular aortography may be performed to assess the adequacy of paravalvular leak closure as well.

The patient's arterial pressure, EKG waveforms, and oxygen saturation are constantly monitored throughout the procedure. Images are reviewed to ensure no additional views are required before leaving the procedure suite.

Description of Post-Service Work:

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2016		
Presenter(s):	Richard Wright, MD; Cliff Kavinsky, MD, PhD; Thad Waites, MD		
Specialty(s):	ACC, SCAI

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.55	0.33
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.79	0.42
Urgency of medical decision making	0.45	0.17
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.90	0.75
Physical effort required	0.86	0.75

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.52	0.67
Outcome depends on the skill and judgment of physician	0.69	0.58
Estimated risk of malpractice suit with poor outcome	0.38	0.50

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.93	0.83

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

935X3 is a new code to describe the work of closing a paravalvular leak in a previously placed mechanical aortic valve. This service is currently reported using unlisted code 93799. After review by the Research Subcommittee, this service was surveyed as a targeted sample of a subpopulation of society members who indicate through their membership information that they perform transcatheter structural heart procedures.

A joint RVS panel of ACC and SCAI members reviewed the survey data. The key reference service is 33257, operative tissue ablation and reconstruction of atria during another cardiac surgery procedure. The key reference was selected by 16 survey respondents, or 31% of respondents. The second key reference is a insertion of a venous pacing electrode. Thirteen respondents, or 25%, selected this reference code. Respondents who selected the key reference services indicated 935X3 to be more intense/complex than the key reference services in all metrics.

We have included on the SOR the highest ZZZ global MPC code (57267 at 4.88 work RVUs).

Consistent with the survey, the societies recommend the 25th-precentile work RVU of 8.00 with 60 minutes intraservice time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93799 was billed to Medicare 988 times in 2014.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Rarely

Specialty interventional cardiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 180
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Advisors estimate that an additional device will be deployed to repair a paravalvular leak 30% of the time.

Specialty cardiology Frequency 90 Percentage 50.00 %

Specialty interventional cardiology Frequency 90 Percentage 50.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 150
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Advisors estimate that an additional device will be deployed to repair a paravalvular leak 30% of the time.

Specialty cardiology Frequency 75 Percentage 50.00 %

Specialty interventional cardiology Frequency 75 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93581

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation

Global Period: 000, ZZZ Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: A specialty panel representing cardiology, cardiac electrophysiology, and interventional cardiology discussed the practice expense inputs for 935X1 and 935X2. 935X3 is an add-on and will not have PE.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: The Panel selected the survey key reference code 93581 as a PE reference code due to its clinical similarities and its 0-day global period.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: We recommend the PE Subcommittee standards for a 0-day facility service with extensive use of clinical staff time, similar to key reference code 93581.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
-Complete pre-service diagnostic and referral forms
-Coordinate pre-service surgery services
-Schedule space and equipment in facility
-Provide pre-service education/obtain consent
-Follow-up phone calls and prescriptions

Intra-Service Clinical Labor Activities:

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Application of On-body Injector with Subcutaneous Injection

At the October 2015 panel meeting the CPT Editorial Panel created a new code, CPT code 963XX *application of on-body injector (includes cannula insertion) for timed subcutaneous injection*, for the administration of neupogen following chemotherapy. The manufacturer of the on-body injector that administers the medication submitted the code proposal and presented to the Panel. Although the specialty society did not develop the code proposal they are strongly supportive of the application. The drug cannot be administered until 24 hours after chemotherapy and often patients are required to return to the office for administration. This is a considerable burden for those who live in rural areas and may have to travel hundreds of miles for such treatment and the specialty supports the service as it is an important method of administration for this drug.

As the specialty society prepared to survey CPT code 963XX, it was determined that a targeted sample was necessary to appropriately survey this code. This type of survey needs to be approved by the Research Subcommittee; however the deadline for approval had already passed. In a letter to the RUC the specialty requested that the survey be delayed to the April 2016 RUC meeting. Subsequent to that letter being submitted the specialty determined that there are other infusion codes 96372, 96374, 96375 are part of the same family as the new codes and that the codes should be surveyed together. The specialty also learned that other services in the family, 96372, 96374, 96375, are high volume and have been identified by the Relativity Assessment Workgroup for surveyed and review by the RUC at the October 2016 RUC meeting. It will be necessary to gain involvement from other specialty societies that perform infusion services. The societies that perform these services will review potential changes to the overall family of infusion codes and provide revised introductory material for the CPT book. The specialties plan to survey the entire family of infusion services for the October 2016 RUC meeting.

The RUC considered the recommendation of the specialty and agreed that the new service along with three other codes in the family, CPT codes 96372, 96374 and 96375 should be surveyed for the October 2016 RUC meeting. The RUC also agreed with the recommendation that the new service 963XX should be carrier priced for 2017. **The RUC recommends survey of CPT codes 96372, 96374, 96375 and 963XX for review at the October 2016 RUC meeting and recommends to carrier price CPT code 963XX for 2017.**

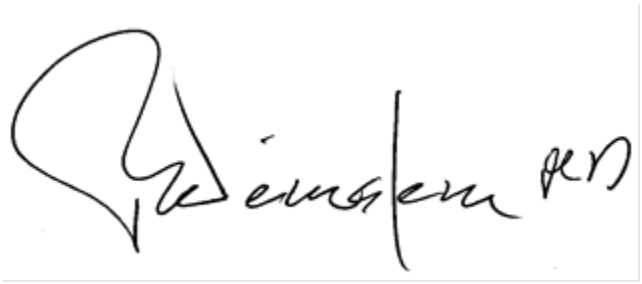
Peter Smith, MD
Chair
Relative Value Scale Update Committee

Dear Dr. Smith:



The American Society of Hematology (ASH) is writing regarding the code 963XX, the application of on-body injector (Tracking Code YY1). This code arose after a presentation made by the manufacturer of the device at the October 2015 CPT Editorial Panel Meeting. Although ASH did not write or present the application, the organization was strongly supportive of the application as this service is being used more and more for patients requiring the drug neupogen following chemotherapy. Since this drug may not be administered for 24 hours following chemotherapy, patients had been required to return to the office for administration. This was not a significant issue for those who live near where the drug was administered but a considerable burden for those who live in rural areas and may have to travel hundreds of miles for such treatment. As such, this is an important method of administration for this drug.

ASH supported the recommendation but did not learn of the decision of CPT on this issue until shortly before a survey would be required to start. At the same time, the organization was reviewing potential changes to the overall family of codes in which this would be placed. Following these discussions, we had planned to proceed with a survey but determined it would be better to use a targeted survey which would require the approval of the Research Subcommittee. By the time of this decision, the deadline for submission to the Research Subcommittee had passed.

ASH requests that this service be reviewed as part of the April 2016 meeting of the RUC. We know that the cycle of the RUC has changed so that these submissions will be considered for the 2018 cycle, however we recommend that the service be carrier-priced for 2017. We understand that there have been previous cases in which a specialty society not surveying a service resulted in that code being deleted in retroactive decision by the CPT Editorial Panel. We have serious concerns about such an approach. The CPT Editorial Panel reviewed the rationale for creating the service and determined that it met the standards for use and utility. In the normal course of events, the RUC would value this service on the basis of recommendations made by the relevant specialty societies. However, there may be times where a specialty society is unable to make these recommendations. This does not make the code less important or the decision of the CPT Editorial Panel invalid.

ASH sincerely apologizes for the errors that made the organization unable to survey the code under the existing schedule. However, we still believe the code has value and encourage that the decision of the CPT Editorial Panel not be reversed. We therefore request that this service be reviewed in April.

Sincerely,

Robert Weinstein, MD
RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

Parent, Caregiver-focused Health Risk Assessment – PE Only

The CPT Editorial Panel added two new codes 961X0 *administration of patient-focused health risk assessment instrument (eg, health hazard appraisal) with scoring and documentation, per standardized instrument* and 961X1 *administration of caregiver-focused health risk assessment instrument (eg, depression inventory) for the benefit of the patient, with scoring and documentation, per standardized instrument* to be added to the Medicine section of CPT. Based on the permanence principle, which states that proposed revisions that constitute a meaningful change to a CPT code should be deleted and renumbered, 99420 will not be resequenced, instead it will be deleted from the Evaluation and Management (E/M) section.

The specialty societies originally requested 15 minutes of intra-service clinical staff time for the *Medical/Technical Assistant* (L026A). This request was based on the RUC recommendation of 15 minutes of intra-service clinical staff time for CPT code 96127 *Brief emotional/behavioral assessment (eg, depression inventory, attention-deficit/hyperactivity disorder [ADHD] scale), with scoring and documentation, per standardized instrument* at the April 2014 RUC meeting. The intra-service time for 96127 was subsequently refined by CMS to 7 minutes for the *Medical/Technical Assistant* (L026A). Although the PE Subcommittee purported that 96127 is very different than the new codes that are being reviewed, the specialties countered that this is not the case. In fact, the specialties noted that the assessments included in 96127, 961X0 and 961X1 are typically provided to an at-risk patient/caregiver more than once. More importantly, the specialties explained how subsequent administrations continue to require that the clinical staff explain the response choices in addition to scoring and documenting the instrument, since the questions included on the instruments rarely, if ever, become rote to at-risk patients/caregivers.

The PE Subcommittee countered that the new codes are replacing 99420 *Administration and interpretation of health risk assessment instrument (eg, health hazard appraisal),* which will be deleted for 2017. 99420 has 15 minutes of time in the service period, but much of this time is duplicative of an E/M service, and the code only has 5 minutes of intra-service clinical staff time in the service period. Therefore, for 961X0 and 961X1, the PE Subcommittee believes that the fact that the clinical staff typically performs one of the two assessments each time an at-risk patient or caregiver returns to the office over the course of the patient's illness means that the clinical staff would only need to explain the purpose of the instrument and the response choices to the patient and/or family member the first time that the assessment is administered in addition to scoring and documenting the instrument. The PE Subcommittee assumed that on subsequent visits the patient or caregiver would already know the purpose of the assessment and would fill the assessment out independently. Based on its assumptions, the Subcommittee determined that if the assessment is typically repeated at each visit and requires little explanation after the first administration, the PE inputs should represent the typical clinical staff work, which would be the scoring and documentation portion of the assessment only. The Subcommittee also discussed that this service will typically be reported with an E/M service. For these reasons the PE Subcommittee concluded that the recommended time of 15

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

minutes for the *Medical/Technical Assistant (L026A)* is not appropriate for these services and the appropriate time should be slightly lower than the clinical staff intra-service time for the reference code 96127. The PE Subcommittee reviewed the recommended direct PE inputs for these services and reduced the clinical staff time to 5 minutes.

The Subcommittee also discussed the *Beck Depression Inventory, Second Edition (BDI-II),* a new supply that the specialty societies recommended, and determined that the supply is appropriate for 961X1,as this is the caregiver focused health risk assessment and calls for a depression inventory in the CPT descriptor. The Subcommittee determined that this supply input is not appropriate for 961X0, as this is the patient focused health risk assessment and calls for a health hazard appraisal in the CPT descriptor. The PE subcommittee recommends 4 sheets of *paper, laser printing (each sheet) (SK057)* for 961X0 to print and administer the appropriate assessment tool for the patient focused code.

When presenting to the RUC, the specialty societies recommended that this family of codes be surveyed for practice expense. The specialty societies used an expert panel to determine the staff time and medical supplies, the same process that is used for most PE recommendations. PE surveys have been utilized on occasion, and it would be possible for a PE survey to be created for this service. The specialty societies noted their concern that 5 minutes of clinical staff time undervalues the service and would like the data of a PE survey in order to either verify the PE Subcommittee's reduction or indicate that more time is appropriate. The RUC agreed that this is an important service and it is critical to get the PE inputs correct. **The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the PE Subcommittee. The recommended inputs will be submitted to CMS as interim for the CPT 2017 cycle. The specialty will administer a survey and present practice expense recommendations based on the survey at the April 2016 RUC meeting for the CPT 2018 cycle.**

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

961X0 Administration of patient-focused health risk assessment (eg, health hazard appraisal), with scoring and documentation, per standardized instrument

Global Period: **XXX** Meeting Date: **January 2016**

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **A joint AAP-AAFP expert panel formulated direct practice expense input recommendations for code 961X0 utilizing the RUC-approved inputs for 99420 (March 2003 PEAC) and key reference code 96127.**

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference code.

Reference Codes: **99420 and 96127**

Rationale: **Code 96127 describes a brief standardized assessment for emotional and behavioral disorders, where the instrument is scored/documented by the clinical staff. This is a directly comparable model of care as described by code 961X0. 99420 is the predecessor code to this new service and will be deleted and replaced with both 961X0 and 961X1**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: **N/A**

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: **We are recommending four (4) sheets of SK057 [*paper, laser printing (each sheet)*] to allow printing of health risk assessment tool, which is typically forwarded to the provider by the insurance carrier at no cost. The tools typically range between 3-5 pages in length. This is lieu of the patient education booklet (SK062) currently allowed for code 99420.**

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: **N/A**

Intra-Service Clinical Labor Activities: **The clinical staff person prints the health risk assessment instrument and prepares it for completion by the patient. The clinical staff person explains the purpose of the instrument to the patient. The clinical staff person**

instructs the patient on how to complete the instrument. After the patient completes the health risk assessment instrument, the clinical staff person scores it and records the results. The clinical staff person provides summarizing feed-back to the patient regarding instrument scoring and also provides the physician with the results.

Post-Service Clinical Labor Activities: **N/A**

American Psychological Association
Office of Health Care Finance
750 First Street, NE
Washington, DC 20002

January 4, 2016

Peter K. Smith, MD
Chair, AMA/Specialty Society RVS Update committee
Relative Value Systems, American Medical Association
330 N. Wabash Ave., Suite 39300
Chicago, IL 60611

Dear Dr. Smith:

The American Psychological Association wishes to submit its comments on the RUC recommendations for the **Parent, Caregiver-focused Health Risk Assessment – Tab 24.**

961X1 *Administration of caregiver-focused health risk assessment instrument (eg, depression inventory) for the benefit of the patient, with scoring and documentation*

We believe that some psychologists will report this code, as they often see the parents and caregivers of their patients – and administer caregiver-focused health risk assessments.

The American Psychological Association coding committee and I reviewed the recommendations; our comment is that we view the practice expense inputs as appropriate to the services. Because the recommendations are for practice expense inputs only, we are not commenting on work value rank order.

The American Psychological Association is pleased to participate in the relative value update process.

Sincerely,

Randy Phelps, Ph.D.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS Request - NPRM for 2016

January 2016

Anesthesia for Intestinal Endoscopic Procedures

In the Final Rule for 2016, CMS stated that the anesthesia procedure codes 00740 *Anesthesia for procedure on gastrointestinal tract using an endoscope* and 00810 *Anesthesia for procedure on lower intestine using an endoscope* are used for anesthesia furnished in conjunction with lower GI procedures. In reviewing Medicare claims data, CMS noted that a separate anesthesia service is now reported more than 50 percent of the time when several types of colonoscopy procedures are reported. Given the significant change in the relative frequency with which anesthesia codes are reported with colonoscopy services, CMS believes the base units of the anesthesia services should be reexamined. Therefore, CMS proposed to identify CPT codes 00740 and 00810 as potentially misvalued. The RUC added CPT codes 00740 and 00810 to the list of potentially misvalued services to review for the January 2016 meeting.

The specialty society provided an overview of the anesthesia codes and how the base units were developed as well explained each quintile comparable to work RVUs as explained in the April 2007 Anesthesia Workgroup report.

Three important points that the RUC emphasized regarding anesthesia services are:

1) Anesthesia codes are not like the other codes in the RBRVS, the RUC cannot crosswalk from one anesthesia code to another because each anesthesia code may represent the anesthesia work for 40-100 different procedures.
2) The Post-Induction Period Procedure Anesthesia (PIPPA) intensity is the single differential measure for comparison of all anesthesia base codes. The correlation between the procedure and the anesthesia service is not strict.
3) Time is calculated outside of the base unit and cannot be used as a comparator in the same way that the RUC uses intra-service time.

The RUC agreed that a base unit is not the same as a work RVU but there is a formula to convert base units to work RVUs to provide the RUC with an idea where these services would fall within the RBRVS. The specialty society presented the comparison calculations as follows:

000740 ***Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum***

0.88	Pre-Anesthesia Time
0.21	Preparation Time
0.76	Post Time
0.42	Induction Period
+ 0.59	PIPPA (time x intensity)
2.86	Equivalent wRVU for Base Unit

÷0.48	(Anesthesia CF ÷ MFS CF) x Anesthesia work portion
5.96	Base Anesthesia Unit

00810 ***Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum***

0.88	Pre-Anesthesia Time
0.21	Preparation Time
0.76	Post Time
0.42	Induction Period
+ 0.88	PIPPA (time x intensity)
3.15	Equivalent wRVU for Base Unit
÷0.48	(Anesthesia CF ÷ MFS CF) x Anesthesia work portion
6.56	Base Anesthesia Unit

Next, the RUC reviewed the 19 Index Codes surveyed and examined by the 2007 RUC Anesthesia Workgroup to identify appropriate comparison codes. The data for the comparison codes in relation to the codes under discussion actually supports an increased value for each code; however, the society has no compelling evidence for requesting an increase and their recommendation is to maintain the current value of 5 base units for each code.

The Committee compared 00740 and 00810 PIPPA intensity based on the surveyed levels intensity (see description of levels and percentages in Table 1) and noted that the crosswalk to the Index Codes also supports a higher base unit than 5. However, the specialty society and the RUC did not believe there was compelling evidence to justify a higher value for the anesthesia care as currently indicated by the survey respondents for 00740 and 00810.

Lastly, the Committee noted that a comparison to the RUC recommended values for moderate sedation services,991X4 *Moderate sedation services provided by a physician or other qualified health care professional other than the physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports; initial 15 minutes of intra-service time, patient age 5 years or older* and 991X6 *Moderate sedation services provided by a physician or other qualified health care professional other than the physician or other qualified health care professional performing the diagnostic or therapeutic service that the sedation supports; each additional 15 minutes intra-service time (List separately in addition to code for primary service)* produces a work RVU equivalent that is only slightly higher than the recommended moderate sedation service for the same number of minutes. Therefore, to recommend less than 5 anesthesia units for 00740 would value it at less than 991X4 (moderate sedation) and thus create a rank order anomaly.

CPT code	Base Unit	Time (min)	Time units (15 min units)	Total Anesthesia units	Work RVU equivalent	Total wRVU from moderate sedation different provider
00740	5	24	1.60	6.60	3.17	3.09
00810	5	28	1.87	6.87	3.30	3.09

00740 ***Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum***
Although 77% of the survey respondents determined that the vignette was typical, the RUC could not accept the typical patient was anesthesia for therapeutic ERCP. The RUC recommends resurveying 00740 after the vignette is revised for a patient receiving anesthesia for an esophagogastroduodenoscopy (EGD). The Committee recommends resurveying 00740 to determine the correct intensity of 00740. In response to RUC concerns that the vignette in the SOR is not representative of current practice, ASA indicated they will submit a new vignette for Research Subcommittee review and approval prior to resurveying the code. **The RUC recommends an interim base unit of 5 for CPT code 00740.**

00810 ***Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum***
The RUC determined that the vignette for code 00810 should be revised and resurveyed with 00740. **The RUC recommends an interim base unit of 5 for CPT code 00810.**

The RUC recommends:

1) **An interim base unit of 5 for code 00740 and 00810 and notes the comparison to the RUC recommended values for moderate sedation, 991X4 and 991X6, results in a work RVU equivalent that is only slightly higher than moderate sedation service of the same number of minutes.**
2) **Referral to the Research Subcommittee for review of the vignettes and to develop a method on how to review the survey data to value these services. The specialty societies should revise the vignette for the typical patient receiving anesthesia for an EGD for 00740 and for a patient receiving anesthesia for a colonoscopy (45378) for 00810.**
3) **Resurvey 00740 and 00810 for the April 2016 RUC meeting.**

Table 1. Comparison of PIPPA Weighted Intensities with Codes from 19 Index Codes and Survey of 00740 and 00810

	code	Base Value	PIPPA Intensity (weighted Average)	Level 1 %	Level 2 %	Level 3%	Level 4%	Level 5%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:00740 Tracking Number: Original Specialty Recommended Base Unit Value: **5**
Presented Recommended Base Unit Value: **5**
Global Period:XXX RUC Recommended Base Unit Value: **5**

CPT Descriptor: Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old patient presents with abdominal pain and abnormal laboratory tests (aspartate aminotransferase [AST], alanine aminotransferase [ALT], alkaline phosphatase, total bilirubin, amylase). Imaging studies show an apparent retained common bile duct stone. Anesthesia for therapeutic ERCP with stone removal is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 77.00%

Description of Pre-Service Work: Obtain a thorough medical history. Perform a physical examination with special attention to patient's comorbidities, medications, allergies, and cardiac and pulmonary status. In addition, perform a thorough airway examination and auscultation of the heart and lungs. Review pertinent data along with results from electrocardiogram (ECG), chest X rays, and other tests that may be significant in this patient population. Discuss anesthesia care including anxiolysis, analgesia, general anesthesia, and intubation with patient and/or family. Prepare anesthesia equipment and drugs. Review and assess patient's medical record and any other interim data as necessary. Discuss possible risks from anesthesia and obtain informed consent.

Description of Intra-Service Work: Start a peripheral intravenous catheter, administer an anxiolytic, and transport patient to the operating room (OR) or GI suite. In the OR, confirm placement of standard monitors (ECG, pulse oximetry, noninvasive blood pressure [NIBP], end-tidal CO2 [carbon dioxide]). Participate in presurgical review, confirming correct patient will have correct procedure. Place nasal cannula or facemask on patient to provide supplemental oxygen (O2) during sedation and procedure. Position patient as necessary, which may be supine, lateral or in the prone position, as determined by the physician performing the procedure. The resulting position along with the presence of the endoscope may compromise access to the airway should it be necessary to assist ventilation during the procedure. Administer sedation agents to provide comfort and anxiolysis while still maintaining spontaneous ventilation and hemodynamic stability throughout the procedure. Carefully titrate sedation and analgesia to allow the patient to awaken quickly to a cogent but analgesic state. At the end of the procedure, transfer patient to the postanesthetic care unit where she will be cared for by the recovery room nursing staff until discharge.

Description of Post-Service Work: Order appropriate analgesic and/or anti-emetic for postprocedure discomfort as necessary. Dispose of anesthesia equipment and drugs consistent with The Joint Commission (TJC) standards. Make a postoperative evaluation in the postanesthesia care unit to determine satisfactory recovery from anesthetic care and determine whether any anesthetic-related complications have occurred. Discharge patient from the unit.

Level 4 Presenting Problems are moderate to high severity; Medical decision making of moderate to high complexity and treatment of high complexity	9.80
Level 5 Presenting problems are of high severity; Medical decision making and treatment of high complexity; Critically ill or critically injured patient	7.00
Total (must total 100%)	100.00%

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

In the Proposed Rule for 2016, CMS noted that it appeared the practice patterns for endoscopic procedures have changed and that anesthesia is increasingly reported with these procedures. Medicare claims data indicate that anesthesia is being separately reported in conjunction with lower GI procedures more than 50% of the time. Given this increase in relative frequency, CMS felt that the relative values of 00740 and 00810 needed to be reviewed as potentially misvalued codes. ASA disagrees with the conclusion that the increased utilization is indicative of potential misvaluation, but rather attributes this increase to a very successful public campaign encouraging patients to have screening colonoscopies to detect possible colon malignancies earlier. This increase can also be attributed to a change in CMS policy that eliminated cost-sharing for Medicare beneficiaries when anesthesia services are furnished in conjunction with screening colonoscopies, and to the increasing expectations among patients that these procedures be performed under anesthesia, associated with a reluctance to undergo screening exams if not provided under anesthesia. That said, any

discussion of anesthesia code values requires an explanation as to how anesthesia services are valued and paid, which is different than other physician services in which each code is associated with a number of Relative Value Units (RVUs).

The Medicare Claims Processing Manual Chapter 12 Section 50 states "The fee schedule amount for physician anesthesia services furnished on or after January 1, 1992 is . . . based on allowable base and time units multiplied by an anesthesia conversion factor specific to that locality. The base unit for each anesthesia procedure is communicated to the Part B Contractors by means of the HCPCS file released annually. The public can access the base units on the CMS homepage through the anesthesiologist's center. The way in which time units are calculated is described in §50.G. CMS releases the conversion factor annually

Unlike other services valued under RBRVS, time is not a factor that is considered when determining a base unit value. The formula for determining anesthesia payments is (Base Units + Time Units) X Conversion Factor. The base unit value comes from the CPT code that describes the anesthesia service. For anesthesia claims, time is separately calculated for each case and is submitted in actual minutes. CMS converts reported minutes into time units when determining payment. CMS uses a 15 minute unit and calculates time units to 1 decimal place. For example, anesthesia CPT code 00740 currently has 5 base units. If the reported anesthesia time is 35 minutes, this is converted to 2.3 time units (35/15 = 2.3) and the payment calculation would be (5 base units + 2.3 time units) x $22.44 per unit = $163.81.

Attached is a spreadsheet with all anesthesia CPT codes, their code descriptors and base unit values. The first spreadsheet has the codes in numerical order, demonstrating how these codes are organized on the basis of anatomical regions. The second spreadsheet rank orders all anesthesia codes by increasing base unit values. Base units range from a low of 3 units to a high of 30 base units with the exception of two add-on codes.

This is a robust survey with 118 responses. There is widespread agreement on the relative value of CPT code 00740 with a 25th percentile value of 5 base units, a median value of 6 base units and a 75th percentile of 6 base units. The current value is 5 base units. Almost 60% of respondents chose one of two Key Reference Codes, one with a base unit value of 6, and the other a base unit value of 5. When comparing 00740 to the Key Reference Codes, respondents rated the survey code as having somewhat greater intensity and complexity compared to either of the Key Reference Codes, further supporting current value. Because anesthesia codes are valued differently than other CPT codes, the anesthesia codes do not appear on the MPC list and there are no applicable non-anesthesia codes on the MPC list.

The CMS acknowledges that just because a code is on a potentially misvalued list, does not mean it is in fact misvalued. We believe that this is the case with 00740. This code is not misvalued.

The specialty society is recommending that this code maintain its current value of 5 base units.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 00740

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3,907,206
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is estimated at 3 times Medicare frequency.

Specialty Anesthesiology Frequency 1,933,285 Percentage 49.48%

Specialty CRNA Frequency 1,910,233 Percentage 48.89%

Specialty Frequency Percentage

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,302,402 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Anesthesiology Frequency 644,429 Percentage 49.48%

Specialty CRNA Frequency 636,744 Percentage 48.89%

Specialty Frequency Percentage

Do many physicians perform this service across the United States? Yes

Median Intra-Service Time		45.00	0.00
Induction Period	5.00		
Post-Induction Period	25.00		
Median Post-service Time	5.00	30.00	0.00
Median Total Time	**51.00**	**90.00**	**55.00**

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.46	0.45
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.29	0.35
Urgency of medical decision making	0.38	0.55
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.13	0.35
Physical effort required	0.21	0.40
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.54	0.50
Outcome depends on the skill and judgment of physician	0.38	0.20

Estimated risk of malpractice suit with poor outcome	0.46	0.50

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.38	0.50

Post-Induction Anesthesia Time-Intensity Allocation

	Percentage of Time (%)
Level 1 Presenting Problems are self-limited or minor; Straightforward medical decision making and treatment	48.80
Level 2 Presenting Problems are of low severity; Medical decision making and treatment of low complexity	24.00
Level 3 Presenting Problems are of moderate severity; Medical decision making of moderate complexity and treatment of high complexity	12.71
Level 4 Presenting Problems are moderate to high severity; Medical decision making of moderate to high complexity and treatment of high complexity	8.00
Level 5 Presenting problems are of high severity; Medical decision making and treatment of high complexity; Critically ill or critically injured patient	5.60
Total (must total 100%)	100.00%

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

In the Proposed Rule for 2016, CMS noted that it appeared the practice patterns for endoscopic procedures have changed and that anesthesia is increasingly reported with these procedures. Medicare claims data indicate that anesthesia is being separately reported in conjunction with lower GI procedures more than 50% of the time. Given this increase in relative frequency, CMS felt that the relative values of 00740 and 00810 needed to be reviewed as potentially misvalued codes. ASA disagrees with the conclusion that the increased utilization is indicative of potential misvaluation, but rather attributes this increase to a very successful public campaign encouraging patients to have screening colonoscopies to detect possible colon malignancies earlier. This increase can also be attributed to a change in CMS policy that eliminated cost-sharing for Medicare beneficiaries when anesthesia services are furnished in conjunction with screening colonoscopies, and to the increasing expectations among patients that these procedures be performed under anesthesia, associated with a reluctance to undergo screening exams if not provided under anesthesia. That said, any discussion of anesthesia code values requires an explanation as to how anesthesia services are valued and paid, which is different than other physician services in which each code is associated with a number of Relative Value Units (RVUs).

The Medicare Claims Processing Manual Chapter 12 Section 50 states "The fee schedule amount for physician anesthesia services furnished on or after January 1, 1992 is . . . based on allowable base and time units multiplied by an anesthesia conversion factor specific to that locality. The base unit for each anesthesia procedure is communicated to the Part B Contractors by means of the HCPCS file released annually. The public can access the base units on the CMS homepage through the anesthesiologist's center. The way in which time units are calculated is described in §50.G. CMS releases the conversion factor annually."

Unlike other services valued under RBRVS, time is not a factor that is considered when determining a base unit value. The formula for determining anesthesia payments is (Base Units + Time Units) X Conversion Factor. The base unit value comes from the CPT code that describes the anesthesia service. For anesthesia claims, time is separately calculated for each case and is submitted in actual minutes. CMS converts reported minutes into time units when determining payment. CMS uses a 15 minute unit and calculates time units to 1 decimal place. For example, anesthesia CPT code 00740 currently has 5 base units. If the reported anesthesia time is 35 minutes, this is converted to 2.3 time units (35/15 = 2.3) and the payment calculation would be (5 base units + 2.3 time units) x $22.44 per unit = $163.81.

Attached is a spreadsheet with all anesthesia CPT codes, their code descriptors and base unit values. The first spreadsheet has the codes in numerical order, demonstrating how these codes are organized on the basis of anatomical regions. The second spreadsheet rank orders all anesthesia codes by increasing base unit values. Base units range from a low of 3 units to a high of 30 base units with the exception of two add-on codes.

This is a robust survey with 104 responses. There is widespread agreement on the relative value of CPT code 00810 with a 25th percentile value of 5 base units, a median value of 5 base units and a 75th percentile of 5 base units. The current value is 5 base units. Over 40% of respondents chose one of two Key Reference Codes, each with a base unit value of 5. When comparing 00810 to the Key Reference Codes, respondents rated the survey code as having somewhat greater intensity and complexity compared to either of the Key Reference Codes, further supporting current value. Because anesthesia codes are valued differently than other CPT codes, the anesthesia codes do not appear on the MPC list and there are no applicable non-anesthesia codes on the MPC list.

The CMS acknowledges that just because a code is on a potentially misvalued list, does not mean it is in fact misvalued. We believe that this is the case with 00740. This code is not misvalued.

The specialty society is recommending that this code maintain its current value of 5 base units.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 00810

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4,806,927
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is estimated at 3 times Medicare frequency.

Specialty CRNA Frequency 2,701,010 Percentage 56.19%

Specialty Anesthesiology Frequency 2,047,270 Percentage 42.59%

Specialty Frequency Percentage

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,602,308 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty CRNA Frequency 900,337 Percentage 56.19%

Specialty Anesthesiology Frequency 682,423 Percentage 42.59%

Specialty Frequency Percentage

Do many physicians perform this service across the United States? Yes

SS Rec Summary

INSTRUCTIONS

Insert information and data into all applicable cells except TOTAL TIME. These cells will automatically calculate.

Hide columns and rows that do not contain data.

1st REF = Top Key Reference code data

2st REF = Second Highest Key Reference code data

CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.

SVY = Survey data - as it appears on the Summary of Recommendation form.

REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

00740 - Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum

00810 - Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum

Global Period: XXX Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

We are requesting the standard anesthesia PE package.

> *CMS requested the PERC discuss the appropriateness of direct practice expense of clinical labor employed by the physician as a cost in the facility setting. The PERC carefully discussed the recommendation by the American Society of Anesthesiology of 11 minutes and agreed that this was a direct practice expense however 8 minutes of clinical labor time was more appropriate. The PERC recommends 8 minutes of clinical labor time for all anesthesia codes consisting of 3 minutes of anesthesia scheduling and 5 minutes of case assignment, scheduling coordination, and completion of forms.*

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

3 minutes – anesthesia scheduling

5 minutes – case assignment, scheduling coordination, and completion of forms

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Biopsy of Skin Lesion

In the Final Rule for 2016, CMS re-ran screen for the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT codes 11100 *Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed; single lesion* (work RVU=0.81) and11101 *Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed; each separate/additional lesion (List separately in addition to code for primary procedure)* (work RVU=0.41) were identified by this screen to be reviewed at the January 2016 RUC meeting.

Prior to the January 2016 RUC meeting, the specialty society notified the RUC that their survey data displayed a bimodal distribution of responses with more outliers than usual. The specialty explained that the code descriptions do not distinguish between different types of biopsies and thus they would like to bring the biopsy of skin lesion codes back to the CPT Editorial Panel in May 2016 for refinement of the codes. In addition, the Specialty noted that certain diagnoses or services require larger and deeper biopsies, such as pigmented lesions, squamous cell carcinomas, biopsies for drug allergies, GVHD or obtaining DNA samples for genetic studies. The Specialty noted their anticipation that CPT will create a new code set, differentiating by the depth of the skin lesion necessary. **The RUC recommends referring CPT codes 11100 and 11101 to the CPT Editorial Panel for expected Panel review during the May 2016 CPT meeting and subsequent RUC review at the October 2016 RUC meeting.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
11100	Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed; single lesion	000	Referral to CPT May 2016

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

11101	Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed; each separate/additional lesion (List separately in addition to code for primary procedure)	ZZZ	Referral to CPT May 2016

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Peter Smith, MD
Chair, RVU Update Committee
American Medical Association

Subject: Biopsy of Skin, CPT Codes 11100 and 11101

Date: December 7, 2015

Dear Dr. Smith,

This letter is to inform the RUC that the American Academy of Dermatology Association (AADA) has decided to bring the Biopsy of skin codes *11100 and 11101 back to CPT Editorial Panel,* at the May 2016 meeting, for further clarification and modification.

Early on in the survey process, it became apparent to the expert panel that there was a bimodal distribution of responses and more outliers than usual.

The existing code descriptions are generic and do not distinguish between the different types of biopsies types of biopsies. The process of obtaining tissue for pathologic examination involves different techniques requiring different work, time and effort.

Due to these reasons, we felt the best remedy was to take these codes back to CPT. We look forward resurveying and presenting the codes once CPT makes the appropriate distinctions.

Thank you for your consideration and guidance.

Sincerely,

Daniel M. Siegel, M.D.
AADA RUC advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Injection of Tendon Sheath

In the Final Rule for 2016, CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 20550 was identified by this screen. This service was presented for review of physician work and practice expense at the January 2016 RUC meeting.

The RUC reviewed the survey responses from 266 surgeons and physicians and determined that the survey median work RVU of 0.75 appropriately accounts for the work required to perform CPT code 20550. In addition, the survey time and work RVU confirm the results from the RUC's 2002 survey and recommendation. The RUC recommends 11 minutes pre-service time, 5 minutes intra-service time, and 5 minutes immediate post-service time. The RUC agreed that pre-time package 6A (*Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect*) is appropriate. The RUC also agreed with the specialty recommendation to subtract 12 minutes from the package time of 23 minutes to account for overlap in time with an Evaluation and Management (E/M) service that is reported more than 50% of time with 20550. The RUC noted that the recommended total pre-time of 11 minutes is consistent with the current pre-time of 10 minutes from the previous survey.

The RUC also agreed that the work value of 0.75 for 20550 fits well between the key reference services. Key reference code 20526, *Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel* (work RVU=0.94 and 5 minutes intra-service time) is more intense than 20550 because of the increased risk/intensity/complexity when injecting near the median nerve. When compared with key reference code 20600, *Arthrocentesis, aspiration and/or injection, small joint or bursa (eg, fingers, toes); without ultrasound guidance* (work RVU=0.66 and 5 minutes intra-service time), the RUC agreed that injecting into the tendon sheath (20550) is technically more difficult than injecting or aspirating from a joint (20600). The RUC agreed that the work RVUs for codes 20600 and 29526 correctly bracket the work RVU for 20550. For additional support, the RUC referenced MPC code 67820 *Correction of trichiasis; epilation, by forceps only* (work RVU=0.71 and 5 minutes intra-service time) and agreed that injection of a tendon sheath was more complex/intense than removing aberrant eyelashes. Finally, the RUC considered 13 RUC reviewed injection/aspiration codes with 5 minutes of intra-service time and agreed that the work RVU of 0.75 appropriate places code 20550 relative to similar procedures, taking into consideration difference in work intensity. **The RUC recommends a work RVU of 0.75 for CPT code 20550.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense

The Practice Expense Subcommittee had an extensive discussion concerning the E/M visit that is billed on the same day. The Practice Expense Subcommittee reviewed and revised the clinical staff time inputs to ensure that any duplicative times with the E/M visit were removed. Additionally, he Practice Expense Subcommittee corrected the equipment minutes. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

CPT Descriptor: Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
Patient 1: A 50-year-old female presents with stenosing tenosynovitis of the right index finger, which is treated with a steroid injection into its flexor tendon sheath.

Patient 2: A 46-year-old female diagnosed with plantar fasciitis, who has failed to respond to NSAIDs, modifications in shoe gear, and stretching exercises, presents with plantar fasciitis of the right foot, which is treated with a steroid injection into the plantar fascia.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review prior images as indicated. Explain procedure to patient and family, and discuss possible complications and obtain consent. Verify that all required instruments and supplies are available. Put on gloves and prepare syringes; one with local anesthetic and one with mixed anesthetic and steroid. Position patient and extremity on sterile barrier and confirm injection site. Prepare injection site and infiltrate local anesthetic.

Description of Intra-Service Work:
Patient 1: Locate proximal edge of the A-1 pulley of the right index finger. Place needle into the tendon sheath and confrim by having patient gently flex digit. Inject medication while slowly withdrawing the needle to confirm correct placement.
Patient 2: Palpate medial and lateral tubercles of the calcaneus and identify point of maximum tenderness. Localize medial and central bands of the plantar fascia. Utilize a medial approach and give injection superficial to the plantar fascia.

Description of Post-Service Work: Cleanse the injection area and apply a bandage. Monitor the patient for any potential complications from the injection. To ascertain whether the pharmaceuticals have been delivered to the appropriate location, put the injected area through passive range of motion and perform appropriate provocative testing. Instruct patient and/or caregiver on appropriate activities and home care, including bathing restrictions. Advise the patient regarding signs related to increased pain at the injection site , which may occur within 24 to 48 hours, and the appropriate treatment if pain occurs.

Counsel patient on the risk of infection. Document the procedure in the patient's medical record and send a copy to the primary care physician and insurance.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.06	0.04
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.27	-0.18
Urgency of medical decision making	-0.05	-0.10
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.04	0.06
Physical effort required	0.04	0.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.24	-0.02
Outcome depends on the skill and judgment of physician	0.26	0.02
Estimated risk of malpractice suit with poor outcome	-0.19	0.22

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	-0.07	0.16

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and E/M services and services reviewed since CY 2010. In the rule, CMS noted that *the criteria for many misvalued code screens, including this one, are designed to prioritize codes that **may** be misvalued not to identify codes that **are** misvalued.* Further CMS believes that supporting evidence for the accuracy of current values for particular codes is best considered as part of the review of individual codes through the misvalued code process. Code 20550 was identified through this screen.

Survey Sample and Process

The survey request was sent to a random selection from the membership database for all participating societies. The American Academy of Orthopaedic Surgeons (AAOS), American Academy of Physical Medicine & Rehabilitation (AAPM&R), American College of Rheumatology (ACR), American Podiatric Medical Association (APMA), and American Society for Surgery of the Hand (ASSH) conducted a RUC survey using the two typical patient vignettes from the RUC database; one for upper extremity and one for lower extremity. As with the previous survey, respondents were allowed to choose their typical patient by checking one of the patients. They were instructed to respond to survey questions based on the typical patient they chose. For this survey, 129 of the respondents chose the upper extremity vignette and 137 chose the lower extremity vignette. As shown on the RUC Summary table, the median work RVU and median intra-time were identical for the two vignettes.

Pre-time Package 6A

We recommend pre-time package 6A (*Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect*), but have reduced the package evaluation time from 17 minutes to 5 minutes to account for overlap in time with an E/M service that is reported more than 50% of time with 20550. The

recommended total pre-time of 11 minutes is consistent with the current pre-time of 10 minutes from the previous survey.

Key Reference Codes

The value for 20550 fits well between the key reference services. KRS1 20526 is more intense than 20550 because of the increased risk/intensity/complexity when injecting near the median nerve. This is supported by the I/C measures, including the overall I/C measure (-0.07) that indicates 20550 is less complex/intense than 20926. Injecting into the tendon sheath (20550) is technically more difficult than injecting or aspirating from a joint (KRS2 20600). This is supported by the I/C measures, including the overall I/C measure (+0.16) that indicates 20550 is more complex/intense than 20600.

MPC Comparison

MPC	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST
67820	Correction of trichiasis; epilation, by forceps only	**0.71**	0.100	**15**	8	**5**	2
20550	Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")	**0.75**	0.083	**20**	11	**5**	5
12001	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less	**0.84**	0.059	**22**	7	**10***	5

*Intra-time includes time for drape/prep and inject local anesthetic, which should be included in pre-time category.

Other Comparison Codes

CPT	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST
20600	Arthrocentesis, aspiration and/or injection, small joint or bursa (eg, fingers, toes); without ultrasound guidance	**0.66**	0.075	**21**	11	**5**	5
20605	Arthrocentesis, aspiration and/or injection, intermediate joint or bursa (eg, temporomandibular, acromioclavicular, wrist, elbow or ankle, olecranon bursa); without ultrasound guidance	**0.68**	0.079	**21**	11	**5**	5
20612	Aspiration and/or injection of ganglion cyst(s) any location	**0.70**	0.073	**20**	10	**5**	5
65205	Removal of foreign body, external eye; conjunctival superficial	**0.71**	0.097	**15**	5	**5**	5
67820	Correction of trichiasis; epilation, by forceps only	**0.71**	0.100	**15**	8	**5**	2
20551	Injection(s); single tendon origin/insertion	**0.75**	0.083	**20**	10	**5**	5
20550	Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")	**0.75**	0.083	**20**	11	**5**	5
64450	Injection, anesthetic agent; other peripheral nerve or branch	**0.75**	0.083	**20**	10	**5**	5
64455	Injection(s), anesthetic agent and/or steroid, plantar common digital nerve(s) (eg, Morton's neuroma)	**0.75**	0.083	**20**	10	**5**	5
20610	Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); without ultrasound guidance	**0.79**	0.101	**21**	11	**5**	5
64405	Injection, anesthetic agent; greater occipital nerve	**0.94**	0.112	**22**	7	**5**	10
67515	Injection of medication or other substance into Tenon's capsule	**1.40**	0.208	**21**	11	**5**	5
67028	Intravitreal injection of a pharmacologic agent (separate procedure)	**1.44**	0.226	**22**	12	**5**	5
67500	Retrobulbar injection; medication (separate procedure, does not include supply of medication)	**1.44**	0.213	**25**	15	**5**	5

Recommendation - 20550

We recommend maintaining the work RVU of 0.75 for 20550. The work to perform this procedure has not changed since this code was last reviewed (2002) and the survey data support this. This value maintains the RUC and specialty accepted intensity/complexity rank order and relativity for code 20550 with many other

injection codes and procedures requiring 5 minutes of intra-service time. This survey provides supporting evidence for the accuracy of the current value for 20550.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Typically reported with an EM service.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. For Medicare patients, code 20550 is typically reported with an office EM service (99201-99205, 99211-99215)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20550

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Commonly

Specialty orthopaedic and hand surgery How often? Commonly

Specialty rheumatology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 803,728 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare utilization and specialty distribution is not expected to change. There is insufficient room below to identify all specialties who submit claims for this procedure. Please refer to the most current RUC database or CMS utilization file for Medicare specialty utilization data.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 20550

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:
20550 Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")

Global Period: 000 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 20550 and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. Current inputs for 20550 are used as reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff: N/A

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
20550 Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")

Global Period: 000 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 20550 and made adjustments as appropriate.

2. You must provide reference code(s) for comparison on your spreadsheet. Current inputs for 20550 are used as reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: This procedure will require additional time related to preparing the procedure supplies. This work and time is not included in the time included in an EM service and has been added:

Prepare room, equipment, supplies	The 2 minutes included with an EM service does not include setting up supplies for the injection which will include logging out medications and setting up syringes, needles, drapes, etc. Although the 2 minutes would be included in the E/M that is typically billed with this procedure, 3 minutes additional time is recommended for setting up the injection materials.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: We are requesting the addition of an exam table and light. We do not understand why these items were not included in the original submission as both would be typical in the procedure room.

5. Please describe in detail the clinical activities of your staff:

Pre-Service : no time recommended

ROW	SERVICE PERIOD ACTIVITY	REC	Activity Description
23	Provide pre-service education/obtain consent	3	After the patient has decided to have the injection, the clinical staff will explain in more detail what the procedure involves and answer any questions. Then consent will be obtained.

ROW	SERVICE PERIOD ACTIVITY	REC	Activity Description
24	Prepare room, equipment, supplies	**3**	The 2 minutes that is included with an EM service does not include setting up supplies for the injection which will include logging out medications and setting up syringes, needles, drapes, etc. Although the 2 minutes would be included in the E/M that is typically billed with this procedure, 3 minutes additional time is recommended for setting up the injection supplies.
30	Assist physician in performing procedure	**5**	Clinical staff will assist physician 100% of intra-service time. This is a sterile procedure and the assistant will remain with the physician throughout the procedure to assist as a circulator in the event additional supplies are needed or the patient has an untoward event.
34	Monitor pt. following service/check tubes, monitors, drains (not related to moderate sedation)	**3**	The patient will be monitored after the injection for signs of a reaction to the medications and/or procedure. This time is separate from the physician's assessment of patient after the injection.
40	Check dressings & wound/ home care instructions /coordinate office visits /prescriptions	**3**	Before the patient leaves the office, the clinical staff will provide written and verbal reinforcement of the physicians instructions on care of the injection site and activity restrictions.

Post-Service : no time recommended

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Injection of Trigger Points

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT codes 20552-20553 were identified by this screen. These services were presented for review of physician work and practice expense at the January 2016 RUC meeting.

20552 ***Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)***

The RUC reviewed the survey responses from 64 physicians and determined that the survey 25th percentile work RVU of 0.66, which is also the current value, appropriately accounts for the work required to perform CPT code 20552. The RUC recommends 11 minutes pre-service time, 5 minutes intra-service time, and 5 minutes immediate post-service time. The RUC agreed that pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate. The RUC also agreed with the specialties recommendation to subtract 12 minutes from the 23 minutes of pre-time in package 6A to account for overlap in time with an Evaluation and Management (E/M) service that is reported more than 50% of the times with 20552. Additionally, the RUC discussed the inclusion of 5 minutes of scrub, dress, and wait time. Although the procedure was previously designated as sterile, the previous survey was conducted prior to the creation of pre-service time packages, which standardized the physician work of procedures like this. Furthermore, the specialties indicated that practice has changed such that physicians have become more cognizant of the patient safety need to be cautious and ensure the fields remain completely sterile, which accounts for the appropriate inclusion of time for the sterile procedure.

The RUC noted that the work value of 0.66 for 20552 fits well between the key reference services. The RUC agreed that key reference codes 20600 *Arthrocentesis, aspiration and/or injection, small joint or bursa (eg, fingers, toes); without ultrasound guidance* (work RVU=0.66 and 5 minutes intra-service time) and 20612 *Aspiration and/or injection of ganglion cyst(s) any location* (work RVU=0.70 and 5 minutes intra-service time), required the same intra-service time and comparable physician work. For additional support the RUC referenced MPC code 12001 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less* (work RVU=0.84 and 10 minutes intra-service time). Finally, the RUC considered 11 RUC reviewed injection/aspiration codes with 5 minutes of intra-service time and agreed that the work RVU of 0.66 appropriately places code 20552 relative to similar procedures, taking into consideration difference in work intensity. **The RUC recommends a work RVU of 0.66 for CPT code 20552.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

20553 ***Injection(s); single or multiple trigger point(s), 3 or more muscle(s)***

The RUC reviewed the survey responses from 62 physicians and determined that the current work RVU of 0.75 appropriately accounts for the work required to perform CPT code 20553. The RUC recommends 12 minutes pre-service time, 10 minutes intra-service time, and 5 minutes immediate post-service time. The RUC agreed that pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate. The RUC also agreed with the specialty recommendation to subtract 11 minutes from the package time of 23 minutes to account for overlap in time with an E/M service that is reported more than 50% of time with 20553. Additionally, the RUC discussed the inclusion of 5 minutes of scrub, dress, and wait time. Although the procedure was previously designated as sterile, the previous survey was conducted prior to the creation of pre-service time packages, which standardized the physician work of procedures like this. Furthermore, the specialties indicated that practice has changed such that physicians have become more cognizant of the patient safety need to be cautious and ensure the fields remain completely sterile, which accounts for the appropriate inclusion of time for the sterile procedure.

The RUC compared the surveyed code to similar services 20605 *Arthrocentesis, aspiration and/or injection, intermediate joint or bursa (eg, temporomandibular, acromioclavicular, wrist, elbow or ankle, olecranon bursa); without ultrasound guidance* (work RVU=0.68) and 20526 *Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel* (work RVU=0.94) and the RUC determined that these services required comparable physician work. For additional support the RUC referenced MPC code 12001 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less* (work RVU=0.84 and 10 minutes intra-service time). Finally, the RUC considered 11 RUC reviewed injection/aspiration codes with 10 minutes of intra-service time and agreed that the work RVU of 0.75 appropriately places code 20553 relative to similar procedures, taking into consideration difference in work intensity. **The RVU recommends a work RUC of 0.75 for CPT code 20553.**

Practice Expense

The Practice Expense Subcommittee had an extensive discussion concerning the E/M visit that is billed on the same day. The Practice Expense Subcommittee reviewed and revised the clinical staff time inputs to ensure that any duplicative times with the E/M visit were removed. Additionally, the supply list was reviewed and revised to reflect actual supplies utilized instead of using the basic injection pack. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20552 Tracking Number Original Specialty Recommended RVU: **0.66**
Presented Recommended RVU: **0.66**
Global Period: 000 RUC Recommended RVU: **0.66**

CPT Descriptor: Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female presents with a three-month history of pain in the low left back above the posterior iliac crest with radiation of pain into the left buttock. Muscle relaxants, NSAIDs, and physical therapy have been ineffective in relieving her pain. She undergoes injection of the trigger point in the multifidus muscle left of the L5 spinous process.

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review records, communicate with other professionals, patient, and family; and obtain consent. The pre-operative work also includes dressing, scrubbing, and waiting before the procedure; preparing the patient and equipment for the procedure; positioning the patient in the sitting position; identifying and marking the trigger points; and prepping the skin with a betadine solution.

Description of Intra-Service Work: A time out is performed. The location of the trigger point in the multifidus muscle to the left of the L5 spinous process is reconfirmed. A needle is inserted through the skin into the muscle. The needle is advanced until the area of maximum tenderness is encountered and the patient's pain is reproduced or a muscle twitch is observed. If any complaints of paresthesia are encountered, the needle is withdrawn slightly until the complaints stop. After aspiration for blood and CSF is negative, the injectant solution is delivered into the trigger point. The Injection needle is removed, pressure is applied to the injection site if needed to stop bleeding and a bandage is applied.

Description of Post-Service Work: The patient is observed post-procedure for pain relief, any hemodynamic changes or new, unexpected neurologic deficits. The physician communicates findings with the patient and other professionals (including written and telephone reports and orders).

Urgency of medical decision making	-0.22	-0.09
Technical Skill/Physical Effort (Mean)		
Technical skill required	-0.22	0.09

Physical effort required	0.11	0.09

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.44	-0.09
Outcome depends on the skill and judgment of physician	0.28	0.55
Estimated risk of malpractice suit with poor outcome	-0.44	-0.36

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	-0.06	0.36

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and E/M services and services reviewed since CY 2010. In the rule, CMS noted that the criteria for many misvalued code screens, including this code, are designed to prioritize codes that **may** be misvalued not to identify codes that **are** misvalued. Further CMS believes that supporting evidence for the accuracy of current values for particular codes is best considered as part of the review of individual codes through the misvalued code process. Code 20552 was identified through this screen.

Survey Sample and Process

The survey request was sent to a random selection from the membership database for all participating societies. The American Academy of Physical Medicine & Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), and American College of Rheumatology (ACR), conducted a RUC survey using the typical patient vignette from the RUC database.

Pre-time Package 6A

We recommend pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect), but have reduced the package evaluation time from 17 minutes to 5 minutes to account for overlap in time with an E/M service that is reported more than 50% of time with 20552. CPT code 20552 was last evaluated by the RUC before the development of the pre-times packages, the recommended total pre-time of 11 minutes is consistent with current 5 minutes of evaluation from the previous survey and the inclusion of the pre-time package times for positioning and scrub, dress, wait.

Key Reference Codes

The value for 20552 fits well at the same value of the top key reference services and below the second key reference service. It also fits well with other injection codes with similar IWPUTs, total time, and intra time.

MPC Comparison

MPC	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST
29540	Strapping; ankle and/or foot	**0.39**	0.021	**18**	7	**9**	2
20552	Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)	**0.66**	0.075	**21**	11	**5**	5
12001	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less	**0.84**	0.059	**22**	7	**10***	5

*Intra-time includes time for drape/prep and inject local anesthetic, which should be included in pre-time category.

Other Comparison Codes

CPT	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST
11720	Debridement of nail(s) by any method(s); 1 to 5	**0.32**	0.024	**14**	7	**5**	2

29280	Strapping; hand or finger	**0.39**	0.021	**18**	7	**9**	2
20552	Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)	**0.66**	0.075	**21**	11	**5**	5
20600	Arthrocentesis, aspiration and/or injection, small joint or bursa (eg, fingers, toes); without ultrasound guidance	**0.66**	0.075	**21**	11	**5**	5
20605	Arthrocentesis, aspiration and/or injection, intermediate joint or bursa (eg, temporomandibular, acromioclavicular, wrist, elbow or ankle, olecranon bursa); without ultrasound guidance	**0.68**	0.079	**21**	11	**5**	5
20612	Aspiration and/or injection of ganglion cyst(s) any location	**0.70**	0.073	**20**	10	**5**	5
20551	Injection(s); single tendon origin/insertion	**0.75**	0.083	**20**	10	**5**	5
64450	Injection, anesthetic agent; other peripheral nerve or branch	**0.75**	0.083	**20**	10	**5**	5
20610	Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); without ultrasound guidance	**0.79**	0.101	**21**	11	**5**	5
20526	Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunn	**0.94**	0.139	**16**	6	**5**	5

Recommendation

We recommend maintaining the work RVU of 0.66 for 20552. The work to perform this procedure has not changed since this code was last reviewed (2002) and the survey data support this. This value maintains the RUC and specialty accepted intensity/complexity rank order and relativity for code 20552 with many other injections codes requiring 5 minutes of intra-service time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20552

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physical Medicine and Rehabilitation How often? Commonly

Specialty Anesthesiology How often? Commonly

Specialty Rheumatology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not avilable

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 335,235 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare utilization and specialty distribution is not expected to change.

Specialty Physical Medicine and Rehabilitation Frequency 60342 Percentage 17.99 %

Specialty Anesthesiology Frequency 31847 Percentage 9.49 %

Specialty Rheumatology Frequency 28160 Percentage 8.40 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 20552

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:20553 Tracking Number Original Specialty Recommended RVU: **0.75**
Presented Recommended RVU: **0.75**
Global Period: 000 RUC Recommended RVU: **0.75**

CPT Descriptor: Injection(s); single or multiple trigger point(s), 3 or more muscles

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male presents with chronic left neck and upper right back pain resulting from cervical degenerative disk disease and myofascial pain syndrome. Patient has already completed a trial of physical therapy and NSAID therapy, but without relief of his pain. He undergoes injection of the trigger points in the left multifidus muscle, the left trapezius muscle, and the right levator scapular muscle.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review records, communicate with other professionals, patient, and family; and obtain consent. The pre-operative work also includes dressing, scrubbing, and waiting before the procedure; preparing the patient and equipment for the procedure; positioning the patient in the sitting position; identifying and marking the trigger points; and prepping the skin with a betadine solution.

Description of Intra-Service Work: A time out is performed. The locations of the trigger points in the three muscles are reconfirmed. A needle is inserted through the skin into the muscle and advanced until the area of maximum tenderness is identified and either the pain is reproduced or a muscle twitch is observed. The patient is observed for any complaints of paresthesias. If any complaints of paresthesia or unusual pain are encountered, the needle is withdrawn slightly until the complaints stop. The needle is aspirated prior to injection to observe for evidence of blood, air or CSF. If aspiration is negative, the injection solution is delivered into the trigger point and the needle is removed. The same procedure is repeated for each of the trigger points in the other muscles. The injection sites are observed for bleeding and bandages are applied over each injection site.

Description of Post-Service Work: The patient is observed post-procedure for pain relief, any hemodynamic changes or new, unexpected neurologic deficits. The physician communicates findings with the patient and other professionals (including written and telephone reports and orders).

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.40	1.08
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.27	0.83
Urgency of medical decision making	0.07	0.08
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.27	0.25
Physical effort required	0.40	0.58

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.13	0.00
Outcome depends on the skill and judgment of physician	0.67	0.83
Estimated risk of malpractice suit with poor outcome	-0.20	0.08

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.27	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the Final Rule for 2016, CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and E/M services and services reviewed since CY 2010. In the rule, CMS noted that the criteria for many misvalued code screens, including this code, are designed to prioritize codes that **may** be misvalued not to identify codes that **are** misvalued. Further, CMS believes that supporting evidence for the accuracy of current values for particular codes is best considered as part of the review of individual codes through the misvalued code process. Code 20553 was identified through this screen.

Survey Sample and Process

The survey request was sent to a random selection from the membership database for all participating societies. The American Academy of Physical Medicine & Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), and American College of Rheumatology (ACR), conducted a RUC survey using the typical patient vignette from the RUC database.

Pre-time Package 6A

We recommend pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect), but have reduced the package evaluation time from 17 minutes to 5 minutes to account for overlap in time with an E/M service that is reported more than 50% of time with 20553. CPT code 20553 was last evaluated by the RUC before the development of the pre-times packages. The recommended total pre-time of 12 minutes is consistent with current 7 minutes of evaluation from the previous survey and the inclusion of the pre-time package times for positioning and scrub, dress, wait. We are recommending an additional minute of positioning time because this procedure is for multiple trigger points of 3 or more muscles and requires repositioning of the patient to inject all of the sites to achieve the most effective clinical outcome.

Key Reference Codes

The value for 20553 fits well at the same value of the top key reference services and below the second key reference service. It also fits well with other injection codes with similar IWPUTs, total time, and intra time.

MPC Comparison

MPC	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST
29540	Strapping; ankle and/or foot	**0.39**	0.021	**18**	7	**9**	2
20553	Injection(s); single or multiple trigger point(s), 3 or more muscles	**0.75**	0.044	**27**	12	**5**	5
12001	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less	**0.84**	0.059	**22**	7	**10***	5

*Intra-time includes time for drape/prep and inject local anesthetic, which should be included in pre-time category.

Other Comparison Codes

CPT	Descriptor	RVW	IWPUT	Time	PRE	INTRA	POST
11720	Debridement of nail(s) by any method(s); 1 to 5	**0.32**	0.024	**14**	7	**5**	2

67515	Injection of medication or other substance into Tenon's capsule	**1.40**	0.208	**21**	11	**5**	5

Recommendation

We recommend maintaining the work RVU of 0.75 for 20553. The work to perform this procedure has not changed since this code was last reviewed (2002) and the survey data support this. This value maintains the RUC and specialty accepted intensity/complexity rank order and relativity for code 20553 with many other injections codes requiring 5 minutes of intra-service time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 237,045 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare utilization and specialty distribution is not expected to change.

Specialty Physical Medicine and Rehabilitation Frequency 59671 Percentage 25.17 %

Specialty Anesthesiology Frequency 29038 Percentage 12.24 %

Specialty Rheumatology Frequency 9718 Percentage 4.09 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 20553

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)

Global Period: 000 Meeting Date: January 2016

1. **Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:** The Advisors from the participating specialties reviewed the current PE details for 20552 and made adjustments as appropriate.

2. **You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:** Current inputs for 20552 are used as reference.

3. **If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:** N/A

4. **If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:** N/A

5. **Please describe in detail the clinical activities of your staff:** N/A

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)

Global Period: 000 Meeting Date: January 2016

1. **Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:** The Advisors from the participating specialties reviewed the current PE details for 20552 and made adjustments as appropriate.

2. **You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Current inputs for 20552 are used as reference.

3. **If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:** This procedure will require additional time related to the preparing of the procedure supplies. This work and time is not included in the time included in an EM service and has been added for the following two service period activity categories:

Prepare room, equipment, supplies: The 2 minutes included with an EM service does not include setting up supplies for the injection which will include logging out medications and setting up syringes, needles, drapes, etc. Three minutes additional time is recommended for these activities.

4. **If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

- Non-sterile gloves: we are requesting a pair of non-sterile gloves for the assistant, the assistant may come in contact with blood and will dispose of contaminated supplies.
- Syringe 5-6ml: We are requesting 2 sterile syringes to account for the number of trigger point injections being performed. To contain the amount of medication that is injected into the site.
- Needle 18-27g: We are requesting 2 needles for the injectate, 1 for each syringe.
- Band-Aids: 2 band-aids are used to cover each of the injection sites to prevent infection and bleeding on the patient's clothes.

We are requesting the addition of an exam table and light. These are office equipment that is required to perform the procedure and are typical in procedure rooms.

5. **Please describe in detail the clinical activities of your staff:**

Pre-Service Period Clinical Labor Activities:

Service Period Clinical Labor Activities:

Pre-service

During the service period clinical staff, will prepare the room, equipment and supplies. The 2 minutes included with an E/M service does not include setting up supplies for the injection which will include logging out medications and setting up syringes, needles, drapes, etc. Three minutes additional time is recommended for these activities.

Intra-service
Clinical staff assists the physician for 100% of the intra-service time.

Post-service
Per the request of the AMA RUC PE Subcommittee, we have created a new line (line 35) for monitoring of the patient following service/check tubes, monitors, drains (not related to moderate sedation). Line 35 represents one-to-one clinical staff monitoring of the patient following the procedure and replaces the monitoring time typically represented on Line 34. We are requesting the standard 3 minutes of one-to-one monitoring. Clinical staff will monitor the patient following the injection for signs of a reaction to the medications and/or procedure.

Clinical staff will also check the injection site, provide written and verbal reinforcement of the physician's instructions on care of the injection site and activity restrictions. This time is not included in the performance of an EM service that is performed on the same day and we are requesting 3 minutes for this service.

Post-Service Period Clinical Labor Activities:

CPT Code: 20553
Specialty Society('s) AAPM&R, ACR(rheumatology), ASA

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Injection(s); single or multiple trigger point(s), 3 or more muscles

Global Period: 000 Meeting Date: January 2016

1. **Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:** The Advisors from the participating specialties reviewed the current PE details for 20553 and made adjustments as appropriate.

2. **You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:** Current inputs for 20553 are used as reference.

3. **If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:** This procedure will require additional time related to the preparing and disposing of the procedure supplies. This work and time is not included in the time included in an E/M service and has been added for the following two service period activity categories:

Prepare room, equipment, supplies: The 2 minutes included with an E/M service does not include setting up supplies for the injection which will include logging out medications and setting up syringes, needles, drapes, etc. Three minutes additional time is recommended for these activities.

Prepare and position patient: Typically if you have to do 3 trigger points, there are typically more than 3 that must be released to achieve the most effective clinical outcome. This requires positioning and then repositioning of the patient to inject the correct sites.

Clean room/equipment by physician staff: The 2 minutes included with an EM service does not include setting up supplies for the injection which will include logging out medications and setting up syringes, needles, drapes, etc. Three minutes additional time is recommended for these activities.

4. **If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:** We are requesting the addition of an exam table and light. These are office equipment that is required to perform the procedure and are typical in procedure rooms. We are also requesting the basic injection pack and 1 5-6 ml syringe. All of the items included in the basic injection pack are required to perform the procedure in a sterile environment.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Period Clinical Labor Activities:

Service Period Clinical Labor Activities:

Pre-service

During the service period clinical staff, will prepare the room, equipment and supplies. The 2 minutes included with an E/M service does not include setting up supplies for the injection which will include logging out medications and setting up syringes, needles, drapes, etc. Three minutes additional time is recommended for these activities. This requires positioning and then repositioning of the patient to inject the correct sites.

Intra-service
Clinical staff assists the physician for 100% of the intra-service time.

Post-service
Clinical staff, will monitor the patient following the injection for signs of a reaction to the medications and/or procedure. Clinical staff also cleans the room and the equipment, the 3 minutes included with an EM service to dispose of table paper and gown and clean surfaces does not include disposal of hazardous waste from the injection procedure and logging medication used. Three minutes additional time is recommended for these activities. Finally, clinical staff will check the injection site, provide written and verbal reinforcement of the physician's instructions on care of the injection site and activity restrictions.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Endotracheal Intubation

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 31500 *Intubation, endotracheal, emergency procedure* (work RVU=2.33) was identified by this screen. This service was presented for review of physician work and practice expense at the January 2016 RUC meeting.

Compelling Evidence
The specialty societies presented compelling evidence to suggest that the current work RVU is undervalued, as there were incorrect assumptions made in the previous valuation of the service based on a misleading vignette. Specifically, the previous vignette was not based on the typical patient being emergent, even though emergency physicians are the dominant provider of this service. The appropriate vignette has allowed for an accurate survey assessment and a more proper valuation reflecting proper time and intensity. The RUC agreed with the compelling evidence for this procedure.

The RUC reviewed the survey responses from 150 emergency physicians and anesthesiologists and determined that the survey 25th percentile work RVU of 3.00 appropriately accounts for the work required to perform CPT code 31500. The RUC recommends 12 minutes pre-service time, 10 minutes intra-service time, and 10 minutes immediate post-service time. The RUC noted that given the unique, emergent nature of this procedure, there are few direct work RVU and physician time-based comparisons within the RBRVS. However, this does not mean the work RVU of 3.00 is not appropriate. First, this service is one of the most immediate, intense services physicians can perform. Second, the survey median intra-service time is 10 minutes, representing a doubling of the current time. Thus, 3.00 work RVUs is a reasonable increase over the current work RVU of 2.33, given both the prior survey deficiencies and the increase in time. It is also important to note that even with the increase in time, this service appropriately remains one of the foremost intense procedure in the RBRVS (RUC recommended IWPUT = 0.252). The RUC compared the surveyed code to similar services 92950 *Cardiopulmonary resuscitation (eg, in cardiac arrest)* (work RVU=4.00) and noted that while the physician time for 92950 is quite a bit longer than for the surveyed code, the physician work is comparable. However, the work of code 31500 is quite a bit more intense as the time is immediately intense, without ramp up or down time, which is the case with 92950. Therefore, the recommended value of 3.00 appropriately places the surveyed code below this reference code. 52332 *Cystourethroscopy, with insertion of indwelling ureteral stent (eg, Gibbons or double-J type)* (work RVU=2.82) For additional support the RUC referenced code 52332

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Cystourethroscopy, with insertion of indwelling ureteral stent (eg, Gibbons or double-J type) (work RVU=2.82), MPC code 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands* (work RVU=2.82) and 62267 *Percutaneous aspiration within the nucleus pulposus, intervertebral disc, or paravertebral tissue for diagnostic purposes* (work RVU=3.00). The RUC again agreed that while the times for these reference codes are not identical to the surveyed code, the physician work is similar and, due to the unique, intense nature of code 31500, the recommended value is appropriate. **The RUC recommends a work RVU of 3.00 for CPT code 31500.**

CPT Assistant
The RUC also discussed the unique patient population treated with CPT code 31500. The specialty described that typically the same physician will report this on the same day as a critical care code (>50% of the time) but that this will not impact critical care code reporting. The specialty explained that underlying medical issues which caused the need for a patient to receive the intubation of CPT code 31500 and communication with family around the care of these issues is categorized within critical care time but time spent on this intubation would not count toward the critical care time. Given that you need at least 30 minutes for proper coding of critical care for patients, the RUC recommends that the specialty societies develop a CPT Assistant article to clarify when to report this service. The article will help ensure providers understand the times for these two services do not overlap.

Practice Expense
There are no direct practice expense inputs for this service because it is an emergent service that is only performed in the facility setting and does not have any clinical staff pre-service time because the dominant specialty is emergency medicine.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
31500	Intubation, endotracheal, emergency procedure	000	3.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31500 Tracking Number Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: 000 RUC Recommended RVU: **3.00**

CPT Descriptor: Intubation, endotracheal, emergency procedure

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67 year old male with pneumonia and respiratory failure requires emergency endotracheal intubation.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 90%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 38%

Description of Pre-Service Work: Evaluate patient's clinical condition and hemodynamics, and assess airway anatomy. Determine equipment needed for tracheal intubation and bring to patient's bedside. Review patient's directive regarding such intervention—if previously determined. Select and prepare drugs to facilitate manipulation of the airway. Select oxygen delivery system, resuscitation bag and mask, and suction device and check for proper functioning. Explain the anticipated procedure to the patient and/or family. Inform patient of benefits and possible complications and risks of procedure to the degree possible in view of the emergent nature of the situation. Position patient in the sniffing position.

Description of Intra-Service Work: Administer oxygen via resuscitation bag and mask. Apply cricoid pressure. Following confirmation of a clear airway, administer drugs for patient sedation and muscle relaxation. Insert laryngoscope into the airway and identify the vocal cords. Insert the appropriate size endotracheal tube (ET) into the trachea, inflate the cuff, and confirm proper position by clinical examination and capnography.

Description of Post-Service Work: Confirm the position of the ET tube by clinical examination and chest X ray. Provide mechanical ventilatory support as appropriate to ensure both oxygenation and ventilation based on clinical status. Observe the patient until certain that ven-tilation is adequate. Confirm that the ET tube remains in proper position after resuscitation or patient transferred to gurney or bed. Write a procedure note in the patient's chart and an order for a chest X ray. Review the chest X ray for proper ET tube placement and make adjustments as necessary. Discuss procedure and outcome with family members who may be available on site.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.26	1.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.30	0.17
Urgency of medical decision making	0.38	2.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.02	1.17
Physical effort required	0.38	0.67

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.78	1.50
Outcome depends on the skill and judgment of physician	1.04	1.33
Estimated risk of malpractice suit with poor outcome	1.27	1.67

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.64	1.67

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

ADDITIONAL RATIONALE

We are presenting survey data for code 31500, emergency endotracheal intubation. This code was identified along with 117 others from a CMS screen for codes with Medicare allowed charges of $10 million or more, excluding 010- and 090-day global services, anesthesia, E&M services and services reviewed since CY 2010. Code 31500 was last reviewed by the RUC in 2005.

This service was reported 286,430 times in 2014 according to the 2016 RUC database with emergency medicine being the dominant specialty at 45.94% and anesthesiology second at 15.27%. The procedure is done in the inpatient hospital setting 53.29 percent of the time and 45.45 percent in the ED, totaling almost 99% for these two settings.

This survey resulted in a robust response rate of over 5%, with 150 responses from the 2886 surveys sent at random to providers. The work value recommendations for this survey are higher than the current work RVU of 2.33, which has times of 4/5/10 and an IWPUT of 0.4061. The median work RVU of this survey is 4.00 with times of 18/10/15 and an IWPUT of 0.330.
We are recommending the 25th percentile of 3.00 work RVU with times of 12/10/10 and an IWPUT of 0.252.
We believe that there is compelling evidence to consider a higher work RVU value, including:

1. **Incorrect assumptions of previous valuation based on misleading vignette**. We were able to modify the vignette in this survey to more accurately reflect the emergency department as the site of service and emergency physicians as the dominant provider. The previous vignette described a patient presenting for an elective lithotripsy and developing a complication requiring intubation. This vignette suggested a much more controlled circumstance, which is a surgical patient, with pre-op evaluation and NPO, and anesthesia as the primary provider. The vignette as modified in our survey more accurately depicts an unprepared patient presenting emergently and survey responses reflect this.

2. **Change in Patient population -**

    a. **More difficult intubations in the ED than previously** – Over the past ten years there has been an increase in the number of EMS intubations in the field. This has resulted in the straight forward cases of intubation being completed prior to arrival in the emergency department. However, it also means that failed intubation attempts by EMS personnel create more difficult conditions on arrival in the

emergency department as the airway after prior failed attempts will be edematous, and/or bloody. Literature suggests that in cases with 2 or more previous failed attempts, the risks that the physician cannot intubate, cannot ventilate and will have other complications increase significantly.

b. **Sicker patients being intubated** - Intubation and tracheal tube ventilation are measures of last resort in patients with respiratory difficulty as non-invasive positive pressure ventilation (NIPPV) and high quality medical management of COPD and CHF can often permit management without intubation. Therefore, only the sickest patients with CHF and COPD are intubated in the ED or ICU. Those intubations are harder related to rapid hypercarbia and hypoxemia and more fragile hemodynamics in response to sedation and paralysis as opposed to airway anatomy related issues.

c. **Obesity in intubated patients** - BMI greater than or equal to 35 kg/m2 increases the risk of difficult intubation and the ASA closed claim database shows that 35% of patients with airway related complications were obese. The unprepared, emergent intubation of an obese patient is a very high-risk procedure. These patients have difficult airways and they also become hypoxic very rapidly.

Despite an increase in the number of patients in the Medicare database and severity of illness generally, the claims for 31500 have been the same or decreased slightly for several years, supporting the claim that a smaller percentage of critically ill patients require intubation.

Other Rationale:

The top key reference service 92950 *Cardiopulmonary resuscitation (eg, in cardiac arrest)* was chosen by 80.6% of the respondents. The second key reference code 64447 *Injection, anesthetic agent; femoral nerve, single* was chosen by only 6 respondents, or 4.0%. The third key reference code 62267 *Percutaneous aspiration within the nucleus pulposus, intervertebral disc, or paravertebral tissue for diagnostic purposes* had one less respondent at 5.

The intensity/complexity ratings of 31500 were slightly higher than that of code 92950 with the exceptions of **the technical skilled required** with a 1.02 rating, **outcome depends on the skill and judgment of physician** at 1.04, and **estimated risk of malpractice suit with poor outcome** at 1.27, all of which are between somewhat more and much more intense or complex than 92950. The intensity/complexity ratings of 31500 were higher than 64447.

The intra-service work of this procedure is of very high intensity. The typical patient is critically ill and then is given sedation with resulting risk of hypotension and paralyzed such that if an airway is not established and the patient cannot be supported with bagging, the best outcome is emergent crichothrotomy. If these events occur in these critically ill patients, anoxic brain injury and death are possible. While complications in the elective intubation, such as during surgical anesthesia, are relatively rare, cited in literature as approximately 1 complication per 2000 attempts, the emergency intubation in the ED, ICU or pre-hospital setting has a complication rate of approximately 1 in 100, or 20 times more often. The circumstance of “cannot intubate, cannot ventilate” occurs in approximately 1 in 5000 elective intubations but as frequently as 1 in 500 emergent intubations.

We believe the longer pre-service time in our surveys reflects the experience of providers in preparing for this procedure in response to EMS notification. This includes gathering equipment that is routinely available now that was not routinely in use in 2005, such as new rescue airways and video laryngoscopes. Also, changes in practice have led to longer pre-oxygenation periods including the use of non-invasive positive pressure ventilation to temporize and optimize patients for intubation.

As is reflected in our survey with a change in vignette, an emergency physician typically receives patients from home or possible skilled nursing facility by ambulance, with limited available information, no prior physician care, a greater likelihood of a full stomach, clothed, bloody, or in other ways ill prepared for a high risk medical procedure. This unprepared patient requires rapid but productive pre-service work and leads to a high intensity intra-service period.

Literature review suggests that failure to intubate and other complications of emergent intubation are most strongly correlated failure to prepare, including poor assessment of the airway and aspiration risk, lack of an orderly response to failure, that is lack of adjuncts or rescue techniques, and failure to communicate with the team responsible for patient care. All of these activities fall into the pre-service time and provider understanding of the need to prepare the patient, equipment, adjunct medications, and care team justify an increase in the pre-service time. While some airways are indeed “crash intubations” with limited preparations, the typical emergent patient requires expeditious but orderly pre-service planning and work.

The survey data indicates that moderate sedation is inherent in this procedure. While 89.6% of our respondents indicated that moderate sedation was typical for this procedure, we maintain that it is not inherent to the procedure. Instead, deep sedation and induced paralysis is inherent in these procedures, not moderate sedation. Survey respondents may have confused the two.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The service is on the Modifier 51 exempt list as it is typically provided adjunctive to another service or procedure.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31500

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Emergency Medicine How often? Commonly

Specialty Anesthesiology How often? Commonly

Specialty Pulmonary How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 859290
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National frequency is estimated at 3 times Medicare frequency.

Specialty Emergency Medicine Frequency 394758 Percentage 45.94 %

Specialty Anesthesiology Frequency 131214 Percentage 15.27 %

Specialty Pulmonary Frequency 114114 Percentage 13.28 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 286,430 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Emergency Medicine Frequency 131586 Percentage 45.94 %

Specialty Anesthesiology Frequency 43738 Percentage 15.27 %

Specialty Pulmonary Frequency 38040 Percentage 13.28 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Insertion of Arterial Catheter

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 36620 *Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous* (work RVU=1.15) was identified by this screen and was to be presented at the January 2016 RUC meeting.

Prior to the January 2016 RUC meeting, the specialty societies notified the RUC that CPT code 36556 *Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older* (work RVU=2.50) was to be reviewed by the RUC at the October 2016 meeting. The specialty requested that codes 93503 *Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes* (work RVU=2.91) and 36620 be postponed to the October 2016 meeting so that they could survey all three codes together. **The RUC recommends deferring CPT codes 36556, 93503, and 36620 to the October 2016 RUC meeting.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
36620	Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous	000	Survey with Related Codes and Refer to RUC Oct 2016
36556	Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older	000	Survey with Related Codes and Refer to RUC Oct 2016
93503	Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes	000	Survey with Related Codes and Refer to RUC Oct 2016

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Chicago, IL 60610

RE: Reviewing Code 36620 for October 2015 RUC Meeting

Dear Dr. Smith:

In reviewing the CMS Requests and Relativity Assessment status report, ASA noted that code **36556** *Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older* was to be reviewed by the RUC at the October 2016 meeting. We requested in an email to AMA RUC staff that codes **93503** *Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes* and **36620** *Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous* be postponed to the October 2016 meeting as our RUC advisors, Drs. Leib and Rosenquist felt we would receive a stronger and more coherent survey response by surveying these three codes together. AMA RUC staff indicated that it would not be an issue.

As such, ASA will survey these three codes for the October 2016 RUC meeting.

Sincerely,

Marc Leib, MD
RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Bone Marrow Aspiration and Biopsy

In the NPRM for 2016, CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 38221 was one of the services identified in this screen.

Prior to the January 2016 RUC meeting, the specialty societies notified the RUC of their plan to submit a code change application to the CPT Editorial Panel to revise these services. The societies indicated their plan to improve nomenclature for these codes (ie diagnostic vs therapeutic use) and to create a CPT code to replace G code G0364. **The RUC recommends referring CPT codes 38221, 38220 and G0364 to the CPT Editorial Panel.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
38221	Bone marrow; biopsy, needle or trocar	XXX	Refer to CPT Feb 2016, RUC April 2016
38220 (f)	Bone marrow; aspiration only	XXX	Refer to CPT Feb 2016, RUC April 2016
G0364 (f)	Bone marrow aspiration performed with bone marrow biopsy through the same incision on the same date of service	ZZZ	Refer to CPT Feb 2016, RUC April 2016

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Dr. Peter Smith
RUC Chair
American Medical Association
AMA Plaza
330 N. Wabash Ave., Suite 39300
Chicago, IL 60611-5885

Dear Dr. Smith,

ASCO and other interested specialty societies (ASH and ASBMT) requested that 38221, along with CPT code 38220 and G0364 be sent to CPT for creation of a bundled code and editorial. The Code Change Application will be submitted for the February 2016 CPT meeting and if passed surveyed for the April 2016 RUC meeting.

CPT 38221 *Bone marrow; biopsy, needle or trocar* was identified by CMS as a high volume service in the 2016 NPRM. As the societies reviewed the family of codes for a potential survey, we identified nomenclature clarifications (diagnostic vs therapeutic uses) and a G0364 *Bone marrow aspiration performed with bone marrow biopsy through the same incision on the same date of service code* that would be helpful to move to a CPT category I code prior to survey. Additionally, the RUC database did not list vignettes or physician work for these services.

If you have any questions, please contact Allison Hirschorn (ASCO staff) at (571) 483-1653.

Sincerely,

David H. Regan, MD
American Society of Clinical Oncology
RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Bladder Catheter

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT codes 51700 and 51702 were identified via this screen and CPT codes 51701 and 51703 were added as part of this family of services.

51700 ***Bladder irrigation, simple, lavage and/or instillation***
The RUC reviewed the survey responses from 99 urologists and determined that the survey 25th percentile work RVU of 0.60 appropriately accounts for the work required to perform this service. The RUC recommends the surveyed physician time of 15 minutes pre-service time, 5 minutes intra-service time and 5 minutes immediate post-service time. The RUC compared the surveyed code to key reference service 51705 *Change of cystostomy tube; simple* (work RVU = 0.90 and 10 minutes intra-service time) and noted that 51700 requires half the amount of intra-service time and the survey respondents indicated less intense on all of the psychological stress intensity measures, thus is appropriately valued lower. The RUC compared CPT code 51700 to 000-day global MPC code 67028 *Correction of trichiasis; epilation, by forceps only* (work RVU = 0.71 and 5 minutes intra-service time) and determined that the intra-service work is the same, thus valued similarly. For additional support, the RUC referenced similar 000-day global service 20550 *Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")* (work RVU = 0.75 and 5 minutes of intra-service time). **The RUC recommends a work RVU of 0.60 for CPT code 51700.**

51701 ***Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)***
The RUC noted that CPT codes 51701, 51702 and 51703 were last valued as a direct crosswalk for physician work and time and the values and times were not based on a survey. These codes were flagged as not to be used to validate physician work. Therefore, the current work and time does not have any specific validity to use in comparison to the new survey data.

The RUC reviewed the survey responses from 108 urologists and determined that the survey 25th percentile work RVU of 0.50, and current work RVU, appropriately accounts for the work required to perform this service. The RUC recommends the surveyed physician time of 14 minutes pre-service time, 5 minutes intra-service time and 5 minutes immediate post-service time. The RUC noted that 51701 is typically reported with an Evaluation and Management service. The specialty society indicated and the RUC agreed that the pre-service time of 14 minutes does not overlap with an E/M service. The physician is choosing the catheter and deciding whether to give prophylactic antibiotics dependent on patient history whether there is an order for culture or cytology. The RUC compared the surveyed code to key reference service 51705 *Change of cystostomy*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

tube; simple (work RVU = 0.90 and 10 minutes intra-service time) noting that 51701 requires half the amount of intra-service time and the survey respondents indicated is overall less intense and complex on all of the psychological stress intensity measures, thus is appropriately valued lower. The RUC compared CPT code 51701 to MPC code 20552 *Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)* (work RVU = 0.66 and 5 minutes of intra-service time) and similar service 46600 *Anoscopy; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)* (work RVU = 0.55 and 5 minutes intra-service time), both of which support the survey 25th percentile work RVU of 0.50. **The RUC recommends a work RVU of 0.50 for CPT code 51701.**

51702 ***Insertion of temporary indwelling bladder catheter; simple (eg, Foley)***
The RUC noted that CPT codes 51701, 51702 and 51703 were last valued as a direct crosswalk for physician work and time and the values and times were not based on a survey. These codes were flagged as not to be used to validate physician work. Therefore, the current work and time does not have any specific validity to use in comparison to the new survey data.

The RUC reviewed the survey responses from 115 urologists and determined that the current work RVU of 0.50 appropriately accounts for the work required to perform this service. The RUC determined that the physician work for the insertion of indwelling bladder catheter (CPT code 51702) and insertion of the non-dwelling catheter (CPT code 51701) is the same. The RUC recommends the surveyed physician time of 15 minutes pre-service time, 5 minutes intra-service time and 5 minutes immediate post-service time. The RUC compared the surveyed code to key reference service 51705 *Change of cystostomy tube; simple* (work RVU = 0.90 and 10 minutes intra-service time) noting that 51702 requires half the amount of intra-service time, thus is appropriately valued lower. The RUC compared CPT code 51702 to MPC code 20552 *Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)* (work RVU = 0.66 and 5 minutes of intra-service time) and similar service 46600 *Anoscopy; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)* (work RVU = 0.55 and 5 minutes intra-service time), both of which support a work RVU of 0.50. **The RUC recommends a work RVU of 0.50 for CPT code 51702.**

51703 ***Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)***
The RUC noted that CPT codes 51701, 51702 and 51703 were last valued as a direct crosswalk for physician work and time and the values and times were not based on a survey. These codes were flagged as not to be used to validate physician work. Therefore, the current work and time does not have any specific validity to use in comparison to the new survey data.

The RUC reviewed the survey responses from 112 urologists and determined that the current work RVU of 1.47 appropriately accounts for the work required to perform this service. The survey 25th percentile of 1.50 work RVUs supports maintaining the current work RVU. The RUC recommends the surveyed physician time of 20 minutes pre-service time, 15 minutes intra-service time and 10 minutes immediate post-service time. The RUC noted that the work required to perform this complicated insertion of catheter is appropriate relative to the simple insertion of a catheter. This service requires the physician to perform multiple attempts at catheter placement, often times there is a broken catheter that can not be removed, the patient is awake and uncomfortable with urine retention for some time. The RUC noted the pre-service evaluation time for this service is 5 minutes longer than for 51702 because the physician must take time to assess what was performed in the previous initial failed

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

attempts to catheter. Additionally, 5 more minutes of immediate post-service time are required for this service versus 51702 in order to manage the patient's medication and determine how long the catheter should remain in place. The RUC compared the surveyed code to the second top key reference service 53855 *Insertion of a temporary prostatic urethral stent, including urethral measurement* (work RVU = 1.64 and 15 minutes intra-service time) noting that these services require the same intra-service time and similar intensity and complexity to perform. The RUC compared CPT code 51703 to MPC codes 12004 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm* (work RVU = 1.44 and 17 minutes of intra-service time) and 57452 *Colposcopy of the cervix including upper/adjacent vagina;* (work RVU = 1.50 and 15 minutes intra-service time) and similar service 15271 *Application of skin substitute graft to trunk, arms, legs, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area* (work RVU = 1.50 and 15 minutes intra-service time) all of which support a work RVU of 1.47. **The RUC recommends a work RVU of 1.47 for CPT code 51703.**

Practice Expense
The Practice Expense Subcommittee eliminated any duplication in the pre-service time associated with other services reported with these services, added the standard catheter insertion kit, removed any supplies included in that kit and corrected the equipment minutes. The Subcommittee noted that the monitoring time following the procedure for these services is not a 1:4 ratio as with other monitoring time, rather it is a 1:1 ratio. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
51700	Bladder irrigation, simple, lavage and/or instillation	000	0.60
51701 (f)	Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)	000	0.50 (No Change)
51702	Insertion of temporary indwelling bladder catheter; simple (eg, Foley)	000	0.50 (No Change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

51703 (f)	Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)	000	1.47 (No Change)

SUMMARY OF RECOMMENDATION

CPT Code:51700 Tracking Number

Original Specialty Recommended RVU: **0.88**
Presented Recommended RVU: **0.60**
RUC Recommended RVU: **0.60**

Global Period: 000

CPT Descriptor: Bladder irrigation, simple, lavage and/or instillation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old female with a long history of a female urethral syndrome and interstitial cystitis is treated with dimethyl sulfoxide (DMSO).

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 15%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 15%

Description of Pre-Service Work: Obtain and review records or previous history, laboratory studies, and urologic X rays before the procedure. Communicate with other health care professionals (eg, family physician, anesthesiologist). Communicate with the patient to explain the procedure and operative risks and benefits; obtain informed consent. Dress for surgery, position patient in dorsal lithotomy on cystoscopy table , prepare, and drape patient, and scrub. Prepare and check needed equipment for surgery or procedure and any other non-skin-to-skin work in the OR or procedure suite.

Description of Intra-Service Work: Place a urinary catheter and drain the bladder. Place 50 cc of DMSO or other medication in the bladder and clamp the catheter. Then drain the bladder and remove the catheter.

Description of Post-Service Work: Postoperative work includes all post-procedure care on the day of the procedure and, if applicable, patient stabilization, postoperative orders, communication (including written and telephone reports) with the patient and/or family and referring physician, and other non-skin-to-skin work in the procedure suite; and other follow-up care, including prescriptions before the patient is discharged, if applicable.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99212	XXX	0.48	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Typically, 10 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
67820	000	0.71	**RUC Time**	276,248

CPT Descriptor 1 Correction of trichiasis; epilation, by forceps only

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
43760	000	0.91	**RUC Time**	57,700

CPT Descriptor 2 Change of gastrostomy tube, percutaneous, without imaging or endoscopic guidance

Other Reference CPT Code	Global	Work RVU	Time Source
20550	000	0.75	**RUC Time**

CPT Descriptor Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 36 **% of respondents:** 36.3 **%**

Number of respondents who choose 2nd Key Reference Code: 10 **% of respondents:** 10.1 **%**

TIME ESTIMATES (Median)

	CPT Code: 51700	**Top Key Reference CPT Code:** 51705	**2nd Key Reference CPT Code:** **99212**
Median Pre-Service Time	15.00	12.00	2.00
Median Intra-Service Time	5.00	10.00	10.00
Median Immediate Post-service Time	5.00	10.00	4.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00

Median Total Time	**25.00**	**32.00**	**16.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.39	-0.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.53	0.00
Urgency of medical decision making	0.03	0.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.06	-0.10

Physical effort required	0.25	0.20

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.11	-0.10
Outcome depends on the skill and judgment of physician	-0.17	0.10
Estimated risk of malpractice suit with poor outcome	-0.22	0.00

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.08	-0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) surveyed CPT code 51700. The AUA requested a random sample of approximately 1200 urologists from our general membership database. The survey was sent to 1,200 individuals and of those individuals, 99 responses were received for a response rate of 8.2%. In 2014, 177,461 of these procedures were performed in the Medicare population. The RUC requires 50 respondents as the minimum survey sample size for this code.

The AUA's Expert Panel reviewed the results and the respondents stated that the median service time was 5 minutes to complete this procedure - a reduction of 15 minutes from the intraservice time in 1995 of 20 minutes.

This procedure is performed in an office setting 84.35% of the time and is so a pre-service time package of 6A was selected by the expert panels. Five minutes of positioning time is recorded for the patient to be placed in the dorsal lithotomy position. The time has been established to be standard of care for positioning of patients during urologic procedures in the dorsal lithotomy position.

The current work RVU is 0.88. The median work value from the survey is 0.90 and the 25th percentile of work RVU is 0.60.

Code	Descriptor	Pre	Intra	Post	Total	IWPUT	RVU	RUC Reviewed
20550	Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")	10.00	5.00	5.00	20.00	0.0828	0.75	April 2002
64405	Injection, anesthetic agent; greater occipital nerve	7.00	5.00	10.00	22.0	0.1118	0.94	Oct. 2010

Series of Urethral Catheterization Codes for Presentation at January 2016 RUC Meeting

CPT Code	Descriptor	Survey Time – Intra	Current RVU	Survey Median	Survey 25th percentile
51701	Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)	5	0.50	0.90	0.50
51702	Insertion of temporary indwelling bladder catheter; simple (eg, Foley)	5	0.50	0.91	0.83
51700	Bladder irrigation, simple, lavage and/or instillation	5	0.88	0.90	0.60
51720	Bladder instillation of anticarcinogenic agent (including retention time)	5	1.50	1.27	0.87
51703	Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)	15	1.47	1.93	1.50

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51700

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data is not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 177,461 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Claims data from RUC database

Specialty Urology Frequency 136680 Percentage 77.01 %

Specialty Frequency 0 Percentage 0.00 %

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:51701 Tracking Number Original Specialty Recommended RVU: **0.50**
Presented Recommended RVU: **0.50**
Global Period: 000 RUC Recommended RVU: **0.50**

CPT Descriptor: Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old patient presents with incomplete bladder emptying. A post void residual urine by straight catheterization is performed to determine amount of urine left in bladder.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 12%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 14%

Description of Pre-Service Work: Obtain and review records or previous history, lab studies, and x rays. Before the procedure, communicate with the patient to explain the procedure and the benefits. Based on patient history, decide on catheter of choice. Put the patient into the dorsal lithotomy position, prepare the patient, and clean the genitals using sterile technique. Surgeon changes into scrub clothes, washes hands, and dons sterile garb. Inject local anesthetic jelly into the urethra

Description of Intra-Service Work: Insert catheter per urethra into the bladder. Drain urine from bladder into graduated cylinder. Measure the residual urine in milliliters. Remove the temporary catheter from the patients' bladder/urethra. Discard the catheter and clean the scrub solution from the patient's genitalia.

Description of Post-Service Work: Assist in the transfer of the patient from the exam/procedure table to wash and get dressed. Write postoperative orders and prescriptions. Discuss procedure and findings with patient. Call referring physician regarding outcome of procedure and any unusual aspects of postoperative care (cardiac disease, diabetes management). Dictate detailed operative narrative. Schedule the next appointment.

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	-0.02	-0.31

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) surveyed CPT code 51701. The AUA requested a random sample of approximately 1200 urologists from our general membership database. The survey was sent to 1,200 individuals and of those individuals, 108 responses were received for a response rate of 9.0%. In 2014, 176,731 of these procedures were performed in the Medicare population so the number of responses to this survey meets the RUC criteria of 50 respondents as the minimum survey sample size for this code.

The AUA's Expert Panel reviewed the results and the respondents stated that the median service time was 5 minutes to complete this procedure – a reduction of 4 minutes from the intraservice time in 2002 of 9 minutes.

This procedure is performed in an office setting 91.66% of the time and is so a pre-service time package of 6A was selected by the expert panels. Five minutes of positioning time is recorded for the patient to be placed in the dorsal lithotomy position. The time has been established to be standard of care for positioning of patients during urologic procedures in the dorsal lithotomy position.

The current work RVU is 0.50. The median work value from the survey is 0.90 and the 25th percentile of work RVU is 0.50. The expert panel requests to maintain current value for CPT code 51701.

Series of Urethral Catheterization Codes for Presentation at January 2016 RUC Meeting

CPT Code	Descriptor	Survey Time – Intra	Current RVU	Survey Median	Survey 25th percentile
51701	Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)	5	0.50	0.90	0.50
51702	Insertion of temporary indwelling bladder catheter; simple (eg, Foley)	5	0.50	0.91	0.83
51700	Bladder irrigation, simple, lavage and/or instillation	5	0.88	0.90	0.60
51720	Bladder instillation of anticarcinogenic agent (including retention time)	5	1.50	1.27	.087
51703	Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)	15	1.47	1.93	1.50

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 15%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 14%

Description of Pre-Service Work: Obtain and review records or previous history, lab studies, and x rays. Before the procedure, communicate with the patient to explain the procedure and the benefits. Based on patient history, decide on catheter of choice. Put the patient into the dorsal lithotomy position, prepare the patient, and clean the genitals using sterile technique. Surgeon changes into scrub clothes, washes hands, and dons sterile garb.Inject local anesthetic jelly into the urethra.

Description of Intra-Service Work: Insert catheter per urethra into the bladder. Inflate the balloon of the catheter to ensure it does not fall out. Drain the urine from bladder into the Foley bag. Measure the residual urine in milliliters. Secure the catheter to the patient's suprapubic region or inner thigh with a catheter secure device. Discard the remaining catheter supplies and clean the scrub solution from the patient's genitalia.

Description of Post-Service Work: Assist in the transfer of the patient from the exam/procedure table to wash and get dressed. Write postoperative orders and prescriptions. Discuss procedure and findings with patient. Call referring physician regarding outcome of procedure and any unusual aspects of postoperative care (cardiac disease, diabetes management). Dictate detailed operative narrative. Schedule the next appointment.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
51705	000	0.90	**RUC Time**

CPT Descriptor Change of cystostomy tube; simple

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99238	XXX	1.28	**RUC Time**

CPT Descriptor Hospital discharge day management; 30 minutes or less

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
29540	000	0.39	**RUC Time**	254,352

CPT Descriptor 1 Strapping; ankle and/or foot

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
20552	000	0.66	**RUC Time**	337,565

CPT Descriptor 2 Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)

Other Reference CPT Code	Global	Work RVU	Time Source
46600	000	0.55	**RUC Time**

CPT Descriptor Anoscopy; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 73 **% of respondents:** 63.4 **%**

Number of respondents who choose 2nd Key Reference Code: 9 **% of respondents:** 7.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 51702	Top Key Reference CPT Code: 51705	2nd Key Reference CPT Code: **99238**
Median Pre-Service Time	15.00	12.00	8.00

Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	**25.00**	**32.00**	**38.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.16	0.33
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.26	0.11
Urgency of medical decision making	0.48	0.78
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.29	0.78
Physical effort required	0.21	1.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.11	0.78
Outcome depends on the skill and judgment of physician	0.18	0.67
Estimated risk of malpractice suit with poor outcome	0.21	0.67

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.19	0.44

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) surveyed CPT code 51702. The AUA requested a random sample of approximately 1200 urologists from our general membership database. The survey was sent to 1,200 individuals and of those individuals, 115 responses were received for a response rate of 9.5%%. In 2014, 218,967 of these procedures were performed in the Medicare population so the number of responses to this survey meets the RUC criteria of 50 respondents as the minimum survey sample size for this code.

The AUA's Expert Panel reviewed the results and the respondents stated that the median service time was 5 minutes to complete this procedure – a reduction of 3 minutes from the intraservice time in 2002 of 8 minutes.

This procedure is performed in an office setting 82.88% of the time and is so a pre-service time package of 6A was selected by the expert panels. Five minutes of positioning time is recorded for the patient to be placed in the dorsal lithotomy position. The time has been established to be standard of care for positioning of patients during urologic procedures in the dorsal lithotomy position.

The current work RVU is 0.50. The median work value from the survey is 0.91 and the 25th percentile of work RVU is 0.83. The expert panel requests to maintain current value for CPT code 51702.

Series of Urethral Catheterization Codes for Presentation at January 2016 RUC Meeting

CPT Code	Descriptor	Survey Time – Intra	Current RVU	Survey Median	Survey 25th percentile
51701	Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)	5	0.50	0.90	0.50
51702	Insertion of temporary indwelling bladder catheter; simple (eg, Foley)	5	0.50	0.91	0.83
51700	Bladder irrigation, simple, lavage and/or instillation	5	0.88	0.90	0.60
51720	Bladder instillation of anticarcinogenic agent (including retention time)	5	1.50	1.27	0.87
51703	Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)	15	1.47	1.93	1.50

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51702

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National claims data not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 218,967 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 claims data from RUC database

Specialty Urology Frequency 174320 Percentage 79.61 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 51702

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:51703 Tracking Number Original Specialty Recommended RVU: **1.47**
Presented Recommended RVU: **1.47**
Global Period: 000 RUC Recommended RVU: **1.47**

CPT Descriptor: Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old male presents retention of urine. An attempt to pass a catheter fails due to a suspected bladder neck contracture. After multiple attempts, an indwelling catheter with bag is finally passed to allow bladder drainage.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 35%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 19%

Description of Pre-Service Work: Obtain and review records and previous history, lab studies, and x rays, including details of techniques used in previous attempts at catheterization, complications of those attempts, and patient response (such as blood per urethra). This can also include direct discussion with providers who performed previous attempts. Before the procedure, communicate with the patient and family to explain the procedure and the benefits and the risk associated with this more complex catheter placement. Based on patient history, decide on catheter of choice and have avialable other options if first choice catheter cannot be passed safely. Put the patient into the dorsal lithotomy position, prepare the patient, and clean the genitals using sterile technique. Surgeon changes into scrub clothes, washes hands, and dons sterile garb. Inject local anesthetic jelly into the urethra.

Description of Intra-Service Work: Insert catheter per urethra into the bladder. Once there is return of urine, irrigate with a syringe to ensure catheter irrigates quantitatively and is correctly positioned within the bladder. Inflate the balloon of the catheter to ensure it does not fall out. Drain the urine from bladder into the Foley bag. Measure the residual urine in milliliters. Secure the catheter to the patient's suprapubic region or inner thigh with a catheter secure device. Discard the remaining catheter supplies and clean the scrub solution from the patient's genitalia..

Description of Post-Service Work: Assist in the transfer of the patient from the exam/procedure table to wash and get dressed. Based on results of procedure, determine need for post-procedure antibiotics, duration of catheter placement, and schedule for catheter removal or exchange or other procedures. Write postoperative orders including prescriptions. Discuss procedure and findings with patient and family and councel about implication of this procedure on future catherization

attempts. Call referring physician regarding outcome of procedure and any unusual aspects of postoperative care (cardiac disease, diabetes management). Dictate detailed operative narrative. Schedule the next appointment.

Technical skill required	1.06	1.11
Physical effort required	1.33	1.33

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.17	1.06
Outcome depends on the skill and judgment of physician	1.06	1.39
Estimated risk of malpractice suit with poor outcome	1.17	1.06

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.22	1.39

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) surveyed CPT code 51703. The AUA requested a random sample of approximately 1200 urologists from our general membership database. The survey was sent to 1,200 individuals and of those individuals, 112 responses were received for a response rate of 9.3%. In 2014, 56,516 of these procedures were performed in the Medicare population so the number of responses to this survey meets the RUC criteria of 30 respondents as the minimum survey sample size for this code.

The AUA's Expert Panel reviewed the results and the respondents stated that the median service time was 15 minutes to complete this procedure – a reduction of 14 minutes from the intraservice time in 2002 of 29 minutes.

This procedure is performed in an office setting 60.84% of the time and is so a pre-service time package of 6A was selected by the expert panels. Five minutes of positioning time is recorded for the patient to be placed in the dorsal lithotomy position. The time has been established to be standard of care for positioning of patients during urologic procedures in the dorsal lithotomy position.

The current work RVU is 1.47. The median work value from the survey is 1.93 and the 25th percentile of work RVU is 1.50. The expert panel requests to maintain current value for CPT code 51703.

Other comparison code

Code	Descriptor	Pre	Intra	Post	Total	IWPUT	RVU	RUC Reviewed
65800	Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous	18	5.00	5.00	28.0	0.2173	1.53	April 2012

Series of Urethral Catheterization Codes for Presentation at January 2016 RUC Meeting
This chart shows the physician work current and survey results of all catheterization codes presented for January 2016 and the requested specialty society RVUs are highlighted

CPT Code	Descriptor	Survey Time – Intra	Current RVU	Survey Median	Survey 25th percentile
51701	Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)	5	0.50	0.90	0.50
51702	Insertion of temporary indwelling bladder catheter; simple (eg, Foley)	5	0.50	0.91	0.83
51700	Bladder irrigation, simple, lavage and/or instillation	5	0.88	0.90	0.60
51720	Bladder instillation of anticarcinogenic agent (including retention time)	5	1.50	1.27	0.87
51703	Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)	15	1.47	1.93	1.50

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51703

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National claims data not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 56,516 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Claims data from RUC database

Specialty Urology Frequency 51062 Percentage 90.34 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 51703

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Bladder irrigation, simple, lavage and/or instillation

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

   The recommendations were developed by a Panel consisting of six physicians who represents urologic practices from across the United States in single specialty groups in suburban and urban settings.The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 51700 Bladder irrigation, simple, lavage and/or instillation was the key reference code that was selected from survey respondents.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Service Period Start Clinical Labor Activities:

- Charts are reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patients are greeted and a gown is provided.
- Patient education and consent is obtained.
- The nursing staff reviews with patient each step of the treatment and enables patient to ask questions.
- Obtains vitals

- Sets up the equipment and sets up the supplies needed for the procedure.
- Performs a time-out with physician to make sure proper procedure and proper patient is being treated
- Assist the physician with positioning and padding of patient in the dorsal lithotomy position.
- Assist the physician with the preparation and draping of the patient.
- Assist the physician with the anesthesia prior to the procedure.

Intra Service:

- Clinical staff person hands supplies and equipment to the physician during procedure.
- Assist the physician with removing padding and repositioning patient after procedure.

Post-Service Clinical Labor Activities:

- Clean the room and disinfect equipment in proper sterilizing equipment and according to sterilization protocols.
- Provide follow up information to patient.
- Discuss any adverse reaction at insertion site.
- Confers with the MD verbally for any last minute instructions for patient.
- Next appointment is set up for patient while checking out.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

   The recommendations were developed by a Panel consisting of six physicians who represents urologic practices from across the United States in single specialty groups in suburban and urban settings. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 51701 Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine) was the key reference code that was selected from survey respondents.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: RUC database did not indicate service period times when reviewed previously. The clinical staff does perform all functions indicated on the spreadsheet according to clinical protocol.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: Specialty pack was added since there were no supplies listed for patient such as a gown, table paper, etc.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Service Period Start Clinical Labor Activities:

- Charts are reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patients are greeted and a gown is provided.
- Patient education and consent is obtained.

- The nursing staff reviews with patient each step of the treatment and enables patient to ask questions.
- Obtains vitals

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Treatment of Bladder Lesion

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 51720 *Bladder instillation of anticarcinogenic agent (including retention time)* was identified via this screen.

The RUC reviewed the survey responses from 50 urologists and determined that the survey 25th percentile work RVU of 0.87 appropriately accounts for the work required to perform this service. The RUC recommends 9 minutes pre-service time, 5 minutes intra-service time and 5 minutes immediate post-service time. The RUC noted that the intra-service time significantly decreased since the last RUC review and agreed that for this specific service, a commensurate decrease in the recommended work is appropriate. The RUC compared the surveyed code to the key reference code 51705 *Change of cystostomy tube; simple* (work RVU = 0.90 and 10 minutes intra-service time) and noted that physician work is similar but 51720 requires less time and is slightly more intense and complex to perform than 51705. For additional support the RUC referenced MPC code 43760 *Change of gastrostomy tube, percutaneous, without imaging or endoscopic guidance* (work RVU = 0.91 and 10 minutes intra-service time) and similar service 20550 *Injection(s); single tendon sheath, or ligament, aponeurosis (eg, plantar "fascia")* (work RVU = 0.75 and 5 minutes intra-service time). **The RUC recommends a work RVU of 0.87 for CPT code 51720.**

Practice Expense
The Practice Expense Subcommittee eliminated some of clinical staff pre-service time because it istypically only performed on first of five sequential times done for this service. The PE Subcommittee added the clinical staff time to set up and mix Bacillus Calmette-Guerin (BCG), added the appropriate catheter insertion tray, removed associated duplicative supplies and corrected the equipment minutes. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
51720	Bladder instillation of anticarcinogenic agent (including retention time)	000	0.87

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:51720 Tracking Number Original Specialty Recommended RVU: **1.27**
Presented Recommended RVU: **0.87**
Global Period: 000 RUC Recommended RVU: **0.87**

CPT Descriptor: Bladder instillation of anticarcinogenic agent (including retention time)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male underwent transurethral resection (TUR) of a noninvasive transitional carcinoma of the bladder four weeks ago. He is a candidate for intravesical Bacillus Calmette-Guerin (BCG) therapy. BCG is reconstituted and placed in the bladder per BCG protocol. Possible side effects of the BCG treatment are carefully reviewed with the patient.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 8%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 10%

Description of Pre-Service Work: Check to be sure the chemotherapeutic drug is available. (BCG is the most commonly used drug; less commonly used are Thiotepa, Interferon, and Mitomycin.) Check schedule for following day. Check with scheduling staff to see if patient was notified about procedure, as drug has been ordered. Review laboratory studies (eg, complete blood cell count [CBC] if Thiotepa is used). Review procedure and post-procedure recovery with patient and/or family. Answer patient and/or family questions; be sure informed consent is documented in record. Review voiding instructions after BCG instilled. Review urinalysis result; must be infection free. Ensure guidelines are followed when drug is mixed and prepared. Place patient in supine position on examination table. Prepare genitalia. Instill local anesthetic into urethra.

Description of Intra-Service Work: Place a straight catheter. Follow OSHA guidelines. Drain any residual urine. Allow drug (most commonly BCG) to flow from syringe by gravity slowly into bladder. Remove catheter. Carefully dispose of all items in a ziplock bag per OSHA guidelines; place bag into a chemotherapy waste container.

Description of Post-Service Work: Assist patient off of the examination table. Carefully record drug lot number in medical record. Discuss the planned retention time (eg, two hours for BCG). Meet with patient and/or family and discuss the immediate expected signs and symptoms. Conduct postoperative pain assessment. Write orders and/or prescriptions as necessary. Dictate detailed office note.

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
51705	000	0.90	**RUC Time**

CPT Descriptor Change of cystostomy tube; simple

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99203	XXX	1.42	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Typically, 30 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

Median Total Time	**19.00**	**32.00**	**29.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.89	-0.75
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.95	0.75
Urgency of medical decision making	0.47	0.75
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.16	0.50

Physical effort required	0.37	0.75

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.42	1.75
Outcome depends on the skill and judgment of physician	0.79	0.25
Estimated risk of malpractice suit with poor outcome	1.11	1.50

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	0.89	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) surveyed CPT code 51720. The AUA requested a random sample of approximately 1000 urologists from our general membership database. The survey was sent to 1,200 individuals and of those individuals, 50 responses were received for a response rate of 4.1%. In 2014, 178,765 of these procedures were performed in the Medicare population so the number of responses to this survey meets the RUC criteria of 50 respondents as the minimum survey sample size for this code.

The AUA's Expert Panel reviewed the results and the respondents stated that the median service time was 5 minutes to complete this procedure - a reduction of 7 minutes from the intraservice time in 2005 of 12 minutes.

This procedure is performed in an office setting 90.02% of the time and is so a pre-service time package of 6A was selected by the expert panels.

The current work RVU is 1.50. The median work value from the survey is 1.27 and the 25th percentile of work RVU is 0.87.

Code	Descriptor	Pre	Intra	Post	Total	IWPUT	RVU	RUC Reviewed
67500	Retrobulbar injection; medication (separate procedure, does not include supply of medication)	10	5	5	25	0.2127	1.44	8/2005

Series of Urethral Catheterization Codes for Presentation at January 2016 RUC Meeting
This chart shows the physician work current and survey results of all catheterization codes presented for January 2016 and the requested specialty society RVUs are highlighted

CPT Code	Descriptor	Survey Time – Intra	Current RVU	Survey Median	Survey 25th percentile

51701	Insertion of non-indwelling bladder catheter (eg, straight catheterization for residual urine)	5	0.50	0.90	0.50
51702	Insertion of temporary indwelling bladder catheter; simple (eg, Foley)	5	0.50	0.91	0.83
51700	Bladder irrigation, simple, lavage and/or instillation	5	0.88	0.90	0.60
51720	Bladder instillation of anticarcinogenic agent (including retention time)	5	1.50	1.27	0.87
51703	Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)	15	1.47	1.93	1.50

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51720

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data is not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 178,765 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 claims data from RUC database

Specialty Urology Frequency 163802 Percentage 91.62 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 51720

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Bladder instillation of anticarcinogenic agent (including retention time)

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

   The recommendations were developed by a Panel consisting of three physicians who represents urologic practices from across the United States in single specialty groups in suburban and urban settings. They represent the states of Washington, Illinois, Florida and North Carolina. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 51720 Bladder instillation of anticarcinogenic agent (including retention time) was the key reference code that was selected from survey respondents.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Intra-Service Clinical Labor Activities:

- Charts are reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patients are greeted and a gown is provided.
- Patient education and consent is obtained.
- The nursing staff reviews with patient each step of the treatment and enables patient to ask questions.

- Obtains vitals
- Sets up the equipment and sets up the supplies needed for the procedure.
- Performs a time-out with physician to make sure proper procedure and proper patient is being treated Assist the physician with positioning and padding of patient in the dorsal lithotomy position.
- Assist the physician with the preparation and draping of the patient.
- Assist the physician with the anesthesia prior to the procedure.

- Clinical staff person hands supplies and equipment to the physician during procedure.
- Assist the physician with removing padding and repositioning patient after procedure.

Post-Service Clinical Labor Activities:

- Clean the room and disinfect equipment in proper sterilizing equipment and according to sterilization protocols.
- Provide follow up information to patient.
- Discuss any adverse reaction at insertion site.
- Confers with the MD verbally for any last minute instructions for patient.
- Next appointment is set up for patient while checking out.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Electromyography Studies (EMG)

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 51784 *Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique* was identified via this screen.

The RUC reviewed the survey results from 80 physicians and determined that the survey median work RVU of 0.75 appropriately accounts for the work required to perform CPT code 51784. The RUC recommends 15 minutes pre-service time, 20 minutes intra-service time and 10 minutes immediate post-service time. The RUC noted that while the survey times are nearly identical to the current times, the median survey work RVU is less than half of the current work RVU (1.53). The specialty confirmed and the RUC agreed that with 80 survey respondents, the survey is valid and an appropriate sample of the physicians who perform this service. The RUC noted that while this value results in a low IWPUT, the intensity of this procedure is low and compares well to other codes with similar physician time and work: 11310 *Shaving of epidermal or dermal lesion, single lesion, face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 0.5 cm or less* (work RVU= 0.80 and 20 minutes intra-service time) and 43752 *Naso- or oro-gastric tube placement, requiring physician's skill and fluoroscopic guidance (includes fluoroscopy, image documentation and report)* (work RVU= 0.81 and 20 minutes intra-service time). **The RUC recommends a work RVU of 0.75 for CPT code 51784.**

Practice Expense
The Practice Expense Subcommittee recommended the following modification: eliminated duplicative clinical staff time because this service is typically performed with another service, added a couple minutes for consent, deleted some supplies and corrected the equipment minutes. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
51784	Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique	000	0.75

CPT Descriptor: Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 63- year-old patient presents with complaints of urinary symptoms. An EMG is performed to determine urinary sphincter activity in order to guide additional therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Obtain and review records or previous history, laboratory studies and urologic x-rays before the procedure; Communicate with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; Positioning, prep and drape the patient, and scrub; Prepare and check needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Calibrate electronic equipment.

Description of Intra-Service Work: Place self-adhesive electrodes perianally to determine whether the muscles are coordinated during filling and voiding. Read the graphic recordings measuring electromyography (EMG) activity during a series of filling and voiding trails. Ensure the signal is reliable at all times by replacing electrodes as necessary. Interpret the level of activity and determines whether the muscle activity is increasing and decreasing at appropriate times.

Description of Post-Service Work: All post procedure care on the day of the procedure, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; Coordinate other follow-up care, prescriptions before the patient is discharged, if applicable. Review, interpret and dictate results of the diagnostic study.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2016		
Presenter(s):	Thomas Turk, MD, James Dupree, MD, Phil Wise, MD, Daniel Rukstalis, MD, Mitchell Schuster, MD and George Hill, MD		
Specialty(s):	Urology, Obstetrics/Gynecology		
CPT Code:	51784		
Sample Size:	3341	**Resp N:** 80	**Response:** 2.3 %
Description of Sample:	AUA - 1000 random selected US/MD members ACOG – 1000 randomly selected US/MD members AUGS – Research Subcommittee approved targeted sample. Survey was sent to urogynecology subspecialty – 1341 US/MD members		

	Low	25th pctl	Median*	75th pctl	High
Service Performance Rate	0.00	12.00	**30.00**	92.00	1000.00

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
64566	000	0.60	**RUC Time**

CPT Descriptor Posterior tibial neurostimulation, percutaneous needle electrode, single treatment, includes programming

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
51741	XXX	0.17	**RUC Time**

CPT Descriptor Complex uroflowmetry (eg, calibrated electronic equipment)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
20552	000	0.66	**RUC Time**	337,565

CPT Descriptor 1 Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
51705	000	0.90	**RUC Time**	132,540

CPT Descriptor 2 Change of cystostomy tube; simple

Other Reference CPT Code	Global	Work RVU	Time Source
43752	000	0.81	**RUC Time**

CPT Descriptor Naso- or oro-gastric tube placement, requiring physician's skill and fluoroscopic guidance (includes fluoroscopy, image documentation and report)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 23 **% of respondents:** 28.7 **%**

Number of respondents who choose 2nd Key Reference Code: 21 **% of respondents:** 26.2 **%**

TIME ESTIMATES (Median)

	CPT Code: 51784	Top Key Reference CPT Code: 64566	2nd Key Reference CPT Code: **51741**
Median Pre-Service Time	15.00	5.00	0.00
Median Intra-Service Time	20.00	5.00	5.00
Median Immediate Post-service Time	10.00	5.00	2.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00

Median Total Time	**45.00**	**15.00**	**7.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.70	0.29
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.91	0.24
Urgency of medical decision making	0.39	0.24
Technical Skill/Physical Effort (Mean)		
Technical skill required	-0.04	0.38

Physical effort required	0.13	0.48
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	-0.13	-0.29
Outcome depends on the skill and judgment of physician	0.48	0.14
Estimated risk of malpractice suit with poor outcome	-0.04	-0.10

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.35	0.24

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) and the American Congress of Obstetrics and Gynecology (ACOG) jointly surveyed 51784. The AUA requested a random sample of approximately 1000 urologists from its general membership database and ACOG requested 1000 members from their general membership database. The American Urogynecologic Society (AUGS) a subset of ACOG, requested 1341 members from their general database. Since this is recognized as a targeted subset, the use of the subset of urogynecologists was approved by the Research Subcommittee on October 20, 2015. The survey was sent to 3,341 individuals and of those individuals, the societies received a combined number of 80 responses for a response rate of 2.3%.

In 2014, 167,174 of these procedures were performed in the Medicare population so the number of responses to this survey meets the RUC criteria of 30 respondents as the minimum survey sample size for this code.

Both societies reviewed the results and the respondents stated that the median service time was 20 minutes to complete this procedure. The current intraservice time is 20 minutes as well, so there was no decrease in intraservice time.

This procedure is performed in an office setting 98.95% of the time and is so a pre-service time package of 6A was selected by the expert panels. Five minutes of positioning time is required for the patient to be adequately positioned in the dorsal lithotomy position and prepped with placement of multiple electrodes placed in the anal or urethral sphincter and also a ground electrode placed on the knee.

The current work RVU is 1.53. The median work value from the survey is 0.75 and the 25th percentile of work RVU is 0.50. The expert panels for both societies both agree that the median RVU of 0.75 is appropriate for CPT code 51784.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Patients who present with specific clinical situations may require a battery of diagnostic testing to determine the proper diagnosis. The components of the testing are different and determined by the physician based on the clinical situation specific to the patient and their presenting problems. The tests perfromed are required ro evaluate the urethra and bladder as a part of the urodynamics study.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See table at end of SOR

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 51784

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Obstetrics/Gynecology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National Data is not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 167,174 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Claims data from RUC Database

Specialty Urology Frequency 111706 Percentage 66.82 %

Specialty Obstetrics/Gynecology Frequency 39002 Percentage 23.33 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 51784

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Question #2: Procedures reported with several CPT codes. (Not all CPT codes are reported during an encounter) Components of the testing are reported based on clinical situations. Codes billed together are subject to multiple procedure reduction if appropriate.

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Multiple Procedure Reduction	50% RVU
51726	Complex cystometrogram (ie, calibrated electronic equipment);	000	1.71	25	30	15	N	
51727	Complex cystometrogram (ie, calibrated electronic equipment); with urethral pressure profile studies (ie, urethral closure pressure profile), any technique	000	2.11	20	35	10	N

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The recommendations were developed by a Panel consisting of six physicians who represents urologic and gynecologic practices from across the United States in single specialty groups in suburban and urban settings. They represent the states of Washington, Illinois, Florida and North Carolina. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

51784 Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-service surgery services
- Schedule space and equipment in facility
- Provide pre-service education/obtain consent

Intra-Service Clinical Labor Activities:

- None

Post-Service Clinical Labor Activities:

- Follow-up phone calls and prescriptions

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

   The recommendations were developed by a Panel consisting of nine physicians who represents urologic and gynecologic practices from across the United States in single specialty groups in suburban and urban settings. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 51784: Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique was the key reference code that was selected from survey respondents.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: 51784 was a Harvard code and has not been reviewed by the RUC since its implementation. In reviewing the old Harvard medical supplies, we identified 1 erroneous line. For line 65, we would recommend two alcohol swab pads. The alcohol pads are used to ensure an adequate connection of the electrode pads to the skin. A solid connection is required for an accurate reading. The electrodes are first placed on the anus and one alcohol pad is required to clean the anus before the pads are placed. A second alcohol pad is required to clean the knee for the grounding electrode, since the pad used on the anus is not to be wiped on the knee. For line 61, additional set of sterile gloves are necessary to perform this procedure.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The specialties recommend extensive use of clinical staff time.

Intra-Service Clinical Labor Activities:

- Charts are reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patients are greeted and a gown is provided.
- Patient education and consent is obtained.
- The nursing staff reviews with patient each step of the treatment and enables patient to ask questions.
- Obtains vitals
- Sets up the equipment and sets up the supplies needed for the procedure.
- Performs a time-out with physician to make sure proper procedure and proper patient is being treated Assist the physician with positioning and padding of patient in the dorsal lithotomy position.
- Assist the physician with the preparation and draping of the patient.
- Assist the physician with the anesthesia prior to the procedure.

- Clinical staff person hands supplies and equipment to the physician during procedure.
- Assist the physician with removing padding and repositioning patient after procedure.

Post-Service Clinical Labor Activities:

- Clean the room and disinfect equipment in proper sterilizing equipment and according to sterilization protocols.
- Provide follow up information to patient.
- Discuss any adverse reaction at insertion site.
- Confers with the MD verbally for any last minute instructions for patient.
- Next appointment is set up for patient while checking out.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Cystourethroscopy

In the Final Rule for 2016, CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 52000 *Cystourethroscopy (separate procedure)* was identified via this screen.

The RUC reviewed the survey responses from 162 physicians and determined that the survey 25th percentile work RVU of 1.75 appropriately accounts for the work required to perform CPT 52000. The RUC recommends 20 minutes pre-service time, 10 minutes intra-service time and 10 minutes immediate post-service time. The RUC noted that the decrease in intra-service time by 5 minutes from when it was last surveyed directly correlates to the recommended reduction in the work RVU. The RUC compared the surveyed code to the top key reference service 52005 *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service;* (work RVU = 2.37 and 30 minutes intra-service time) and noted that the physician time, work and intensity and complexity required to perform 52005 is much greater, thus the recommended RVU is appropriate. The RUC compared the surveyed code to the second key reference service 57420 *Colposcopy of the entire vagina, with cervix if present;* (work RVU = 1.60 and 19 minutes intra-service time) and noted the physician time is slightly higher, but the survey respondents indicated that CPT code 52000 is slightly more intense and complex to perform for all measures (mental effort, technical skill and psychological stress) and thus is appropriately valued slightly higher than 57420. For additional support the RUC referenced MPC code 54150 *Circumcision, using clamp or other device with regional dorsal penile or ring block* (work RVU = 1.90 and 15 minutes intra-service time) and similar service 53620 *Dilation of urethral stricture by passage of filiform and follower, male; initial* (work RVU = 1.62 and 10 minutes intra-service time). **The RUC recommends a work RVU of 1.75 for CPT code 52000.**

Practice Expense
The Practice Expense Subcommittee made substantial reductions in pre-service clinical staff time and eliminated duplicative staff time as this service is typically reported with another procedure or Evaluation and Management service. The clinical staff time for cleaning the room was maintained because typically a different room is used for cystourethroscopy. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
52000	Cystourethroscopy (separate procedure)	000	1.75

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:52000 Tracking Number Original Specialty Recommended RVU: **2.00**
Presented Recommended RVU: **1.75**
Global Period: 000 RUC Recommended RVU: **1.75**

CPT Descriptor: Cystourethroscopy (separate procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old patient presents with gross hematuria. A diagnostic cystourethroscopy is performed to evaluate the bladder.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 53%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 12%

Description of Pre-Service Work: Check video equipment; Check schedule for following day; Be sure necessary instruments and personnel will be available; Check with scheduling staff to see if patient was notified; Review laboratory studies; Be sure necessary imaging studies are available for review at time of planned procedure. Change into scrub clothes; Review surgical procedure, post-op recovery with patient and family; Answer patient and family questions, be sure informed consent is in record; Evaluate patient need for antibiotics; Take "time out" for patient identification; Position patient in dorsal lithotomy position on cystoscopy table; Prep and drape patient. Inject local anesthetic jelly into the urethra; Assemble endoscopic equipment, connect video system, apply defogger to lenses & video source; Connect irrigation source; Connect light source and white balance.

Description of Intra-Service Work: Insert endoscope into urethra; Inspect relevant urethral anatomy; Inspect external urinary sphincter; Assess the bladder neck; Inspect trigone; Identify the ureteral orifices (size, location); Check for efflux of urine from each ureteral orifice; Inspect the bladder mucosa (trabeculation, cellules, diverticuli, lesions, stones); Assess bladder capacity, compliance and sensation; Retroflex scope if flexible to inspect the dome of bladder; Drain bladder; Remove endoscope

Description of Post-Service Work: Disconnect video equipment and light source, assist in transfer of patient from cystoscopy table; Assist in transfer of patient to recovery area; Conduct post-op pain assessment; Write post-op orders/prescriptions; Discuss procedure and findings with patient; Communicate findings to referring physician (verbal, text, email); Fill out and complete bladder mapping diagram; Dictate detailed operative narrative; Enter note in EMR; Schedule follow-up appointment.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.07	0.83
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.03	0.62
Urgency of medical decision making	-0.03	0.36
Technical Skill/Physical Effort (Mean)		
Technical skill required	-0.38	0.72

Physical effort required	-0.25	0.09

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.38	0.62
Outcome depends on the skill and judgment of physician	-0.05	0.45
Estimated risk of malpractice suit with poor outcome	-0.03	0.34

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	-0.28	0.66

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) and the American Congress of Obstetrics and Gynecology (ACOG) jointly surveyed 52000. The AUA requested a random sample of approximately 1000 urologists from its general membership database and ACOG requested 1000 members from their general membership database. The American Urogynecologic Society (AUGS) a subset of ACOG, requested 1341 members from their general database. Since this is recognized as a targeted subset, the use of the subset of urogynecologists was approved by the Research Subcommittee on October 20, 2015. The survey was sent to 3,341 individuals and of those individuals, the societies received a combined number of 162 responses for a response rate of 4.8%.

In 2014, 919,548 of these procedures were performed in the Medicare population so the number of responses to this survey meets the RUC criteria of 50 respondents as the minimum survey sample size for this code.

Both societies reviewed the results and the respondents stated that the median service time was now 10 minutes to complete this procedure. The current intraservice time is 15 minutes which reduces the intraservice time by 5 minutes.

This procedure is performed in an office setting 76.86% of the time and is so a pre-service time package of 6A was selected by the expert panels. Five minutes of positioning time is recorded for the patient to be placed in the dorsal lithotomy position. The time has been established to be standard of care for positioning of patients during urologic procedures in the dorsal lithotomy position.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 52000

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Obstetrics/Gynecology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data is not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 919,548 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Claims data from RUC database

Specialty Urology Frequency 885433 Percentage 96.29 %

Specialty Obstetrics/Gynecology Frequency 25839 Percentage 2.80 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Endoscopy

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 52000

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Cystourethroscopy (separate procedure)

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

   The recommendations were developed by a Panel consisting of nine physicians who represents urologic and gynecologic practices from across the United States in single specialty groups in suburban and urban settings. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 52000 is an existing code. As such, we included the current direct practice expense inputs on the PE spreadsheet as a reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are recommending 'extensive use of clinical staff" for the non-facility setting to complete the procedure according to current clinical protocols for performance and clean up after procedure.

4. **If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

Line 30 Assist Physician – We are requesting clinical time equal to100% physician survey time. This is an increase from the existing 67%. We believe it is appropriate to have 100% physician time now. The specialties believe that there was an error in the PE materials at the time of the last RUC meeting. Clinical staff needs to be present to assist the physician during the entire procedure.

- Line 64 - Despite the presence of sterile gloves in the urology cystoscopy visit pack (SA058), two additional sterile gloves are needed for the RN/LPN/MTA to prepare the equipment prior to patient entry into the room and then to assist the physician when handling the sterile cystoscope.

- Line 63 – Provides a mayo stand drape by RN/LPN/MTA. After the patient is positioned and draped, the cystoscope is placed on the sterile mayo stand at the foot of the patient's bed for easy access to the light source and video equipment during the procedure.
- Line 67 provides a penile clamp that is used in male patients to ensure that the lidocaine jelly remains in the urethra to provide anesthesia to the length of the male urethra.
- Line 68 provides a Toomey syringe necessary for bladder washes for specimens sent to for cytologic examination (part of the work-up for hematuria or irritative voiding symptoms), and for removing bloody urine from the bladder to improve visualization.
- Line 69 provides lidocaine jelly that is applied directly to the length of the cystoscopy to ease passage of the cystoscope through the urethra and increase patient comfort with the procedure.
- Line 70 provides patient education brochure that is important for providing patient-centered care

Over the past 10 years, there have been vast improvements in video systems for endoscopy and a proliferation of the technology. We are recommending 28 minutes in line 76 for endoscopic video systems, a technology that was not nearly as prevalent in 2006, when this 52000 was last reviewed.

Note: We believe the supply items we are adding were inappropriately left off the supply list in 2006.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The specialties recommend extensive use of clinical staff time.

Intra-Service Clinical Labor Activities:

- Charts are reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patients are greeted and a gown is provided.
- Patient education and consent is obtained.
- The nursing staff reviews with patient each step of the treatment and enables patient to ask questions.
- Obtains vitals
- Sets up the equipment (cystoscope, video, etc.) and sets up the supplies needed for the procedure.
- Performs a time-out with physician to make sure proper procedure and proper patient is being treated
- Assist the physician with positioning and padding of patient in the dorsal lithotomy position.
- Assist the physician with the preparation and draping of the patient.

- Assist the physician with the anesthesia prior to the procedure.

- Clinical staff person hands supplies and equipment to the physician during procedure. *(100% of physician survey time)*
- Assist the physician with removing padding and repositioning patient after procedure.

- Clean the room and disinfect cystoscope in proper sterilizing equipment and according to sterilization protocols.
- Provide follow up information to patient.
- Discuss any adverse reaction at insertion site.
- Confers with the MD verbally for any last minute instructions for patient.
- Next appointment is set up for patient while checking out.

Post-Service Clinical Labor Activities:

- Follow up phone call

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Cystourethroscopy (separate procedure)

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The recommendations were developed by a Panel consisting of six physicians who represents urologic and gynecologic practices from across the United States in single specialty groups in suburban and urban settings. They represent the states of Washington, Illinois, Florida and North Carolina. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 52000 Cystourethroscopy (separate procedure); was the key reference code that was selected from survey respondents.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-service surgery services
- Schedule space and equipment in facility
- Provide pre-service education/obtain consent

Intra-Service Clinical Labor Activities:

None

Post-Service Clinical Labor Activities:

- Follow-up phone calls and prescriptions

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Biopsy of Prostate

In the Final Rule for 2016, CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 55700 *Biopsy, prostate; needle or punch, single or multiple, any approach* was identified via this screen.

The RUC reviewed the survey responses from 51 urologists and determined that the survey 25th percentile work RVU of 2.50 appropriately accounts for the work required to perform CPT code 55700. The RUC recommends 15 minutes pre-service time, 15 minutes intra-service time and 5 minutes immediate post-service time. The RUC noted that the intra-service time of 15 minutes indicated by the survey respondents confirms the current intra-service time of 15 minutes. The RUC compared the surveyed code to similar services 93503 *Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes* (work RVU = 2.91 and 15 minutes intra-service time) and 36556 *Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older* (work RVU = 2.50 and 15 minutes intra-service time) and the RUC determined that these services required the same intra-service time and comparable physician work. For additional support the RUC referenced MPC code 54150 *Circumcision, using clamp or other device with regional dorsal penile or ring block* (work RVU = 1.90 and 15 minutes intra-service time). **The RUC recommends a work RVU of 2.50 for CPT code 55700.**

Practice Expense
The Practice Expense Subcommittee reduced and modernized the clinical staff pre-service time and adjusted the post-service time for cleaning, added supply item *SA042 pack, cleaning and disinfecting, endoscope* and corrected the equipment minutes. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
55700	Biopsy, prostate; needle or punch, single or multiple, any approach	000	2.50

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:55700 Tracking Number Original Specialty Recommended RVU: **2.50**
Presented Recommended RVU: **2.50**
Global Period: 000 RUC Recommended RVU: **2.50**

CPT Descriptor: Biopsy, prostate; needle or punch, single or multiple, any approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male has a persistent elevation of his prostate-specific antigen (PSA) level. Multiple sector biopsies of the prostate are performed under local anesthesia. Expectations and potential finding of the biopsies are discussed.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 43%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 9%

Description of Pre-Service Work: Check schedule for following day. Be sure necessary instruments and personnel will be available. Be sure ultrasound machine is available and working. Check with scheduling staff to see if patient was notified. Review laboratory studies. Review risk factors related to post-biopsy infection and ensure appropriate prophylactic antibiotics were ordered. Review previous biopsy results. Be sure necessary imaging studies are available for review at time of planned procedure. Change into scrub clothes. Review rationale and steps of procedure and postoperative recovery with patient and family. Answer patient and family questions; be sure informed consent is documented in record. Check to be sure patient has taken enema and appropriate preoperative antibiotics. Check to be sure patient is off of anticoagulants and/or nonsteroidal anti-inflammatory medications. Check pre-procedure vital signs. Ensure ultrasound probe has been properly set up and prepared. Position patient on examination/ultrasound table. Wash hands and put on gloves.

Description of Intra-Service Work: Perform time out for patient identification. Position patient on his left side with knees flexed (for a right-handed urologist). Perform digital rectal examination and dilate the anus. Apply topical anesthetic to colonic mucosa overlying prostate and allow time for anesthetic to take effect. Introduce the transrectal probe into the rectum. Identify the relevant anatomy on the ultrasound, including the junction of the seminal vesicles. Infiltrate local anesthetic into the base of each seminal vesicle and around both sides of the prostatic capsule and at both apices of the prostate. Wait to ensure anesthetic has taken effect. Prepare the patient for sounds and sensations of the individual biopsies. Fire the biopsy gun to take the first biopsy. Remove the biopsy gun from the transrectal probe (which remains in the rectum). Remove the prostate specimen core from the biopsy needled and place on a sterile pad. Re-cock the gun and re-insert through probe for the next biopsy. Repeat this process 12 times to take a total of 12 sector biopsies from the apex, base, peripheral zone, central zone, and specific hypoechoic areas on both the right and left sides of the prostate. Place each of the 12 prostate biopsy samples in a formalin-filled container and label each container appropriately (patient

identification information and location of biopsy). Remove the rectal probe. Apply rectal pressure for an appropriate amount of time.

Description of Post-Service Work: Assist in transfer of patient from operating table to postoperative stretcher. Review recovery area care and medications with staff. Check post-procedure vital signs and manage any immediate complications. Meet with patient and/or family. Discuss the procedure, expected outcome, signs and symptoms to watch for in subsequent days, and planned postoperative care. Conduct postoperative pain assessment. Discuss with patient and/or family what the pathologist will do with the tissue and when the biopsy results will be available. Complete paperwork required for pathology specimen submission and evaluation. Call referring physician regarding outcome of procedure and any unusual aspects of postoperative care (eg, cardiac disease, diabetes management). Dictate operative report.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
52224	000	4.05	**RUC Time**

CPT Descriptor Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
52287	000	3.20	**RUC Time**

CPT Descriptor Cystourethroscopy, with injection(s) for chemodenervation of the bladder

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
54150	000	1.90	**RUC Time**	208

CPT Descriptor 1 Circumcision, using clamp or other device with regional dorsal penile or ring block

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31622	000	2.78	**RUC Time**	68,721

CPT Descriptor 2 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
93503	000	2.91	**RUC Time**

CPT Descriptor Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 15 **% of respondents:** 29.4 **%**

Number of respondents who choose 2nd Key Reference Code: 8 **% of respondents:** 15.6 **%**

TIME ESTIMATES (Median)

	CPT Code: 55700	Top Key Reference CPT Code: 52224	2nd Key Reference CPT Code: **52287**
Median Pre-Service Time	15.00	29.00	22.00
Median Intra-Service Time	15.00	30.00	21.00
Median Immediate Post-service Time	5.00	20.00	15.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	**35.00**	**79.00**	**58.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.80	1.25
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.60	0.75
Urgency of medical decision making	0.20	0.25
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.73	0.38
Physical effort required	0.73	0.25

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.73	1.25
Outcome depends on the skill and judgment of physician	0.60	0.38
Estimated risk of malpractice suit with poor outcome	0.47	1.00

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.00	0.88

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Urological Association (AUA) surveyed CPT code 55700. The AUA requested a random sample of approximately 1200 urologists from our general membership database. The survey was sent to 1,200 individuals and of those individuals, 51 responses were received for a response rate of 4.2%. In 2014, 132,923 of these procedures were performed in the Medicare population so the number of responses to this survey meets the RUC criteria of 50 respondents as the minimum survey sample size for this code.

The AUA's Expert Panel reviewed the results and the respondents stated that the median service time was 15 minutes to complete this procedure which did not change from the intraservice time in 2005 which was 15 minutes.

This procedure is performed in an office setting 69.08% of the time and is so a pre-service time package of 6A was selected by the expert panels. The panel also believes that five minutes of positioning time is required for the patient to be placed in the left lateral decubitus position.

The current work RVU is 2.58. The median work value from the survey is 3.30 and the 25th percentile of work RVU is 2.50. The expert panel agreed that the 25th percentile RVU of 2.50 is appropriate for CPT code 55700 since this procedure has not changed since last surveyed in 2005.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☒ Other reason (please explain) This procedure can be billed with a transrectal ultrasound (76872) prior to the biopsy as a diagnostic tool to evaluate the size and symmetry of the prostate. It can also be used to look for suspicious lesions or hypoechoic areas. Depending on the results of the transrectal ultrasound, the physician may or may not proceed with the prostate biopsy. If a prostate biopsy is required, the 76942 is billed to report the ultrasonic guidance for needle placement in the prostate to obtain tissue specimens.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See table at end of SOR

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 55700

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Diagnostic Radiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data is not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 132,923 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Claims Data from the RUC Database

Specialty Urology Frequency 130331 Percentage 98.04 %

Specialty Diagnostic Radiology Frequency 798 Percentage 0.60 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 55700

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Question #2: Procedures reported with several CPT codes.

CPT Code	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time
76872	Ultrasound, transrectal;	XXX	0.69	10	15	10
76942	Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation	XXX	0.67	7	15	5

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Biopsy, prostate; needle or punch, single or multiple, any approach

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The recommendations were developed by a Panel consisting of six physicians who represents urologic practices from across the United States in single specialty groups in suburban and urban settings. They represent the states of Washington, Illinois, Florida and North Carolina. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 55700 Biopsy, prostate; needle or punch, single or multiple, any approach ; was the key reference code that was selected from survey respondents.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-service surgery services
- Schedule space and equipment in facility
- Provide pre-service education/obtain consent

Intra-Service Clinical Labor Activities:

None

Post-Service Clinical Labor Activities:

- Follow-up phone calls and prescriptions

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Biopsy, prostate; needle or punch, single or multiple, any approach

Global Period: 000 Meeting Date: January 13-16, 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

   The recommendations were developed by a Panel consisting of six physicians who represents urologic practices from across the United States in single specialty groups in suburban and urban settings. They represent the states of Washington, Illinois, Florida and North Carolina. The panel reviews current information, makes recommendations and these recommendations are submitted to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 55700 Biopsy, prostate; needle or punch, single or multiple, any approach; was the key reference code that was selected from survey respondents.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

This is a sterile procedure, these items were inadvertently omitted in the previous survey of 2001. Lines added to PE spreadsheet are numbered below:

69. sterile drape for Mayo stand
72. having a fully "informed patient" is mandatory
73. necessary to lubricate the probe before placing through the anal sphincter and into the rectum
75. necessary to preserve the specimens
76. contains the formalin in which to place the specimens

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Intra-Service Clinical Labor Activities:

- Charts are reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patients are greeted and a gown is provided.
- Patient education and consent is obtained.
- The nursing staff reviews with patient each step of the treatment and enables patient to ask questions.
- Obtains vitals
- Sets up the equipment and sets up the supplies needed for the procedure.
- Performs a time-out with physician to make sure proper procedure and proper patient is being treated.
- Assist the physician with positioning and padding of patient in the left lateral decubitus position.
- Assist the physician with the preparation and draping of the patient.
- Assist the physician with the anesthesia prior to the procedure.

- Clinical staff person hands supplies and equipment to the physician during procedure.
- Assist the physician with removing padding and repositioning patient after procedure.

Post-Service Clinical Labor Activities:

- Clean the room and disinfect equipment in proper sterilizing equipment and according to sterilization protocols.
- Provide follow up information to patient.
- Discuss any adverse reaction at insertion site.
- Confers with the MD verbally for any last minute instructions for patient.
- Next appointment is set up for patient while checking out.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Hysteroscopy

In the NPRM for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 58558 was identified by this screen and 58559-58563 were included as part of the family. These services were presented for review of physician work and practice expense at the January 2016 RUC meeting.

58555 ***Hysteroscopy, diagnostic***
The RUC reviewed the survey results from 61 practicing gynecologists and agreed with the following time components: pre-service time of 56 minutes, intra-service time of 20 minutes and immediate post-service time of 20 minutes. The RUC agreed to add 5 minutes of positioning time to place the patient in the dorsal lithotomy position.

The RUC reviewed the survey respondents' physician work values and agreed that the appropriate value is between the median value (work RVU= 3.45) and 25th percentile (work RVU= 2.65). The RUC noted a 5 minute decrease in the survey intra-service time from the current time and therefore agreed that the current work RVU of 3.33 should be lower. The RUC compared the surveyed code to CPT code 43250 *Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps* (work RVU= 3.07, intra time= 20 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC agreed to directly crosswalk the work RVUs from code 43250 to CPT code 58555. To justify a work RVU of 3.07, the RUC reviewed CPT code 41530 *Submucosal ablation of the tongue base, radiofrequency, 1 or more sites, per session* (work RVU= 3.50, intra time= 20 minutes). Finally, the RUC noted that while the intra-service time has decreased the resulting work RVU should not be equivalently lowered. Since the last survey in 1997, the equipment has advanced so that more of the intra-service time is spent actually performing the surgery and not trying to clean the blood, mucus or air out of the uterus. Additionally, the equipment allows for higher flow volumes, which must be monitored closely to ensure the patient doesn't get overloaded. **The RUC recommends a work RVU of 3.07 for CPT code 58555.**

58558 ***Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C***
The RUC reviewed the survey results from 66 practicing gynecologists and agreed with the following time components: pre-service time of 56 minutes, intra-service time of 30 minutes and immediate post-service time of 20 minutes. The RUC agreed to add 5 minutes of positioning time to place the patient in the dorsal lithotomy position.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' physician work values and agreed that the appropriate value is between the median value (work RVU= 4.63) and 25th percentile (work RVU= 3.14). To determine an appropriate value, the RUC compared the surveyed code to CPT code 43243 *Esophagogastroduodenoscopy, flexible, transoral; with injection sclerosis of esophageal/gastric varices* (work RVU= 4.37, intra time= 30 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC agreed to directly crosswalk the work RVUs from code 43243 to CPT code 58558. To justify a work RVU of 4.37, the RUC reviewed CPT codes 45385 *Colonoscopy, flexible; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique* (work RVU= 4.67, intra time= 30 minutes) and 52234 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; SMALL bladder tumor(s) (0.5 up to 2.0 cm)* (work RVU= 4.62, intra time= 30 minutes) and agreed that both services provide strong support for the recommended value. **The RUC recommends a work RVU of 4.37 for CPT code 58558.**

***58559 Hysteroscopy*, surgical; with lysis of intrauterine adhesions (any method)**

The RUC reviewed the survey results from 32 practicing gynecologists and agreed with the following time components: pre-service time of 56 minutes, intra-service time of 40 minutes and immediate post-service time of 20 minutes. The RUC agreed to add 5 minutes of positioning time to place the patient in the dorsal lithotomy position.

The RUC reviewed the survey respondents' physician work values and agreed that the appropriate value is between the median value (work RVU= 6.28) and 25th percentile (work RVU= 3.65). To determine an appropriate value, the RUC compared the surveyed code to CPT code 93455 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with catheter placement(s) in bypass graft(s) (internal mammary, free arterial, venous grafts) including intraprocedural injection(s) for bypass graft angiography* (work RVU= 5.54, intra time= 40 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC agreed to directly crosswalk the work RVUs from code 93455 to CPT code 58559. To justify a work RVU of 5.54, the RUC reviewed CPT code 36222 *Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral extracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed* (work RVU= 5.53, intra time= 40 minutes) and MPC code 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* (work RVU= 5.44, intra time= 45 minutes) and agreed that both services provide strong support for the recommended value. **The RUC recommends a work RVU of 5.54 for CPT code 58559.**

***58560 Hysteroscopy*, surgical; with division or resection of intrauterine septum (any method)**

The RUC reviewed the survey results from 31 practicing gynecologists and agreed with the following time components: pre-service time of 56 minutes, intra-service time of 40 minutes and immediate post-service time of 20 minutes. The RUC agreed to add 5 minutes of positioning time to place the patient in the dorsal lithotomy position.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' physician work values and agreed that the appropriate value is between the median value (work RVU= 6.90) and 25th percentile (work RVU= 4.05). To determine an appropriate value, the RUC compared the surveyed code to CPT code 93456 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with right heart catheterization* (work RVU= 6.15, intra time= 40 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC agreed to directly crosswalk the work RVUs from code 93456 to CPT code 58560. To justify a work RVU of 6.15, the RUC reviewed the top key reference code 52282 *Cystourethroscopy, with insertion of permanent urethral stent* (work RVU= 6.39, intra time= 50 minutes) and CPT code 36222 *Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral extracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed* (work RVU= 5.53, intra time= 40 minutes) and agreed that both services provide strong support for the recommended value. Finally, the RUC noted that while this service has identical times to 58559, code 58560 is a more intense procedure and the recommended value maintains the appropriate relativity as established since this code family has existed. **The RUC recommends a work RVU of 6.15 for CPT code 58560.**

58561 ***Hysteroscopy, surgical; with removal of leiomyomata***
The RUC reviewed the survey results from 48 practicing gynecologists and agreed with the following time components: pre-service time of 56 minutes, intra-service time of 45 minutes and immediate post-service time of 20 minutes. The RUC agreed to add 5 minutes of positioning time to place the patient in the dorsal lithotomy position.

The RUC reviewed the survey respondents' physician work values and agreed that the median work RVU of 7.00 accurately values the physician work involved in CPT code 58561. To justify a work RVU of 7.00, the RUC compared the surveyed code to CPT codes 52344 *Cystourethroscopy with ureteroscopy; with treatment of ureteral stricture (eg, balloon dilation, laser, electrocautery, and incision)* (work RVU= 7.05, intra time= 45 minutes) and MPC code 52352 Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included) (work RVU= 6.75, intra time= 45 minutes) and agreed that both services provide strong support for the recommended value. **The RUC recommends a work RVU of 7.00 for CPT code 58561.**

58562 ***Hysteroscopy, surgical; with removal of impacted foreign body***
The RUC reviewed the survey results from 57 practicing gynecologists and agreed with the following time components: pre-service time of 56 minutes, intra-service time of 25 minutes and immediate post-service time of 20 minutes. The RUC agreed to add 5 minutes of positioning time to place the patient in the dorsal lithotomy position.

The RUC reviewed the survey respondents' physician work values and agreed that the appropriate value is between the median value (work RVU= 4.50) and 25th percentile (work RVU= 3.20). To determine an appropriate value, the RUC compared the surveyed code to CPT code 45384 *Colonoscopy, flexible; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps* (work RVU= 4.17, intra time= 28 minutes) and noted that while the reference code has slightly more intra-service time, code 58562 has more total time, 101 minutes compared to 70 minutes.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Therefore, the RUC agreed to directly crosswalk the work RVUs from code 45384 to CPT code 58562. To justify a work RVU of 4.17, the RUC reviewed CPT code 15277 *Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children* (work RVU= 4.00, intra time= 25 minutes) and the second key reference code 57461 *Colposcopy of the cervix including upper/adjacent vagina; with loop electrode conization of the cervix* (work RVU= 3.43, intra time= 28 minutes) and agreed that both services provide strong support for the recommended value. **The RUC recommends a work RVU of 4.17 for CPT code 58562.**

58563 ***Hysteroscopy, surgical; with endometrial ablation (eg, endometrial resection, electrosurgical ablation, thermoablation)***
The RUC reviewed the survey results from 44 practicing gynecologists and agreed with the following time components: pre-service time of 56 minutes, intra-service time of 30 minutes and immediate post-service time of 20 minutes. The RUC agreed to add 5 minutes of positioning time to place the patient in the dorsal lithotomy position.

The RUC reviewed the survey respondents' physician work values and agreed that the appropriate value is between the median value (work RVU= 4.50) and 25th percentile (work RVU= 3.20). To determine an appropriate value, the RUC compared the surveyed code to CPT code 52234 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; SMALL bladder tumor(s) (0.5 up to 2.0 cm)* (work RVU= 4.62, intra time= 30 minutes) and noted that both services have identical intra-service time and comparable physician work. Therefore, the RUC agreed to directly crosswalk the work RVUs from code 52234 to CPT code 58563. To justify a work RVU of 4.62, the RUC reviewed MPC code 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU= 4.71, intra time= 30 minutes) and CPT code 52224 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy* (work RVU= 4.05, intra time= 30 minutes) and agreed that both services provide strong support for the recommended value. Finally, the RUC noted that while this procedure has identical time components to the family code 58558, CPT code 58563 is a more intense procedure due to the increased risk of injury to other pelvic organs, notably bladder and bowel. The risk of injury to bladder is increased, since the previous valuation, due to the higher rate of cesarean delivery with a subsequent increase in non-union or thinness of the hysterotomy scar. **The RUC recommends a work RVU of 4.62 for CPT code 58563.**

Practice Expense:
The RUC approved the direct practice expense inputs modifications as approved by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
58555	Hysteroscopy, diagnostic (separate procedure)	000	3.07
58558	Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C	000	4.37
58559 (f)	Hysteroscopy, surgical; with lysis of intrauterine adhesions (any method)	000	5.54
58560 (f)	Hysteroscopy, surgical; with division or resection of intrauterine septum (any method)	000	6.15
58561 (f)	Hysteroscopy, surgical; with removal of leiomyomata	000	7.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58555 Tracking Number Original Specialty Recommended RVU: **3.33**
Presented Recommended RVU: **3.33**
Global Period: 000 RUC Recommended RVU: **3.07**

CPT Descriptor: Hysteroscopy, diagnostic (separate procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: .A 55 year old Peri-menopausal women presents with abnormal uterine bleeding. She is referred for diagnostic hysteroscopy.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 43%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 16%

Description of Pre-Service Work: Review previous work-ups. Update history and physical examination. Communicate with the patient and/or family to explain the indications for the procedure, as well as the operative risks and benefits, and to obtain informed consent. Verify all necessary equipment and supplies are available and compatible. Confirm proper positioning (high dorsal lithotomy). Scrub, dress and wait. Time out is performed.

Description of Intra-Service Work: A bimanual pelvic examination is performed to assess uterine size, position, and mobility. The adnexa and posterior cul de sac are palpated for the presence of masses or nodularity. The bladder is drained with a catheter. The cervix is exposed, grasped, and dilated slightly larger than the scope. The uterine sound is passed. The scope is inserted and the physician confirms proper pressure setting of the pump or gravity flow to adequately distend the endometrial cavity. The entire endometrial cavity is examined, including the anterior, posterior, fundal, and lateral walls. The endocervical canal is examined. A submucosal myoma is found with atrophic endometrium. The hysteroscope is removed from the uterus. The cervix is checked for bleeding from a puncture site or laceration. If found, bleeding is controlled by suture, pressure or fulguration. All instruments are removed fromthe vagina and cervix. The patient is transferred to a stretcher and escorted to the recovery room.

Description of Post-Service Work: Monitor patient's stability in the recovery room. Write orders. Dictate operative report. Communicate with patient, family, and other health care professionals. Pay careful attention to fluid volume and electrolyte status. Order/manage medications. Discharge management includes the physician's final examination of the patient, instructions for continuing care, and preparation of discharge records.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2016		
Presenter(s):	George Hill, MD and Jon Hathaway, MD		
Specialty(s):	Obstetrics/Gynecology and Gynecology/Oncology		
CPT Code:	58555		
Sample Size:	3045	**Resp N:** 61	**Response:** 2.0 %
Description of Sample:	The Research Subcommittee approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs: • AAGL – 1000 randomly selected US/MDs • SGO – 1045 all US/MD membership • ACOG – 1000 randomly selected US/MDs

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.50	0.70
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.10	-0.30
Urgency of medical decision making	0.10	0.00

Technical Skill/Physical Effort (Mean)

Technical skill required	0.00	-0.20
Physical effort required	0.00	-0.10

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.40	-0.30
Outcome depends on the skill and judgment of physician	0.10	-0.10
Estimated risk of malpractice suit with poor outcome	0.40	0.60

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.40	-0.10

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY2010. CPT Code 58555 *hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D&C* was one of the codes identified by CMS review.

Methodology

ACOG identified CPT Codes 58555, 58559, 58560, 58561, 58562 and 58563 as part of the family. The Research Subcommittee approved updated vignettes for this family of codes. The RS also approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs:

- AAGL – 1000 randomly selected US/MDs
- SGO – 1045 all US/MD membership
- ACOG – 1000 randomly selected US/MDs

Intensity

A significant change in technology and the patient population has occurred since these codes were last valued at the RUC. Hysterectomy rates both open and minimally invasive continue to decline yearly in the United States. This statistic is directly related to improvements in both medical and surgical technology. Most significantly, advances in hysteroscopic technology allow us now to treat women with this uterine sparing procedure who would have had a hysterectomy in 1997. In addition, advances in endometrial ablative techniques allow us to provide relief to women from dysfunctional bleeding, a leading cause of hysterectomy.

Specifically, improvements to optics, and pump inflation systems allow greater and more accurate visualization. While this is likely to decrease intraservice time, it is also likely to allow us to attempt to manipulate and correct larger more clinically significant lesions. This may decrease surveyed intraservice times, but increases the intensities during the same or lessor time frames. Second, improvements in design and safety of instruments to be used for resection, allow us to attempt removal of larger more complex

lesions, in more difficult and challenging locations. Third, with the advent of improved pump systems, the risk of significant injury due to intravasation of fluid has increased and this can lead to electrolyte disturbances, cerebral edema and cardiovascular collapse.

Therefore, while technology has allowed intraservice time to decrease, the cases we are doing and patients we are caring for have become more complex and therefore the intensity is higher.

We are recommending the current value of 3.33 for CPT Code 58555. We believe our recommendation compares favorably within our specialty and maintains relativity within the fee schedule.

Pre and Post Service Time Packages

We recommend pre-service package 3 *straightforward patient/difficult procedure* and post-service package 9B *General Anesthesia or Complex Regional Block/Complex Procedure*. We included 5 additional minutes in positioning time for the Dorsal Lithotomy position.

Reference Service Codes

Our recommendation compares favorably to our reference service codes 52287 *Cystourethroscopy, with injection(s) for chemodenervation of the bladder* and 57155 *Insertion of uterine tandem and/or vaginal ovoids for clinical brachytherapy*.

The most commonly selected reference code was a cystourethroscopy procedure (52287) with a wRVU of 3.2. 52287 has a lower total time (58 minutes vs. 96 minutes) compared to the survey code 58555. The total service time for the survey code 58555 is 40% longer. The intraservice times are almost identical, 21 minutes vs. 20 minutes. 58555 typically requires dilating the cervix while 52287 requires an injection component. The increased intensity of work in 52287 most likely reflects the injection component of the procedure. This data supports a slightly higher wRVU for 58555 of 3.33 to reflect the additional work when compared to 52287.

The second reference code selected was 57155. This code requires dilation of the cervix with subsequent application of tandem and ovoids. The intraservice time and total time for 57155 are both longer, however the intensity is less. The recommended wRVU for 58555 is approximately 60% of 57155, the total time is approximately 70% of 57155 and the intraservice time is approximately 33% of 57155.

MPCs

Our recommendations compare favorably to MPC codes 15002 *Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, trunk, arms, legs; first 100 sq cm or 1% of body area of infants and children* and 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands.*

The MPC code 15002 with RVU 3.65 is comparable to the survey code 58555 because both have identifical intra service times and similar IWPUTs. The work intensity for 15002 is a bit lower due to external location of the procedure versus the intracavitary location for code 58555 that requires cervical dilatation. CPT Code 15002 has a higher wRVU. That can be attributed to the slightly higher total time.

Other Comparisons

Our recommendation also compares to CPT Code 16035 *Escharotomy; initial incision* and anchor our recommendations well. Code 16035 has a wRVU of 3.74 compared to our recommendation of 3.33 for survey code 58555. The intra times line us nicely for the two services. The IWPUT for CPT Code 16035 is much higher than our IWPUT for surveyed code 58555. Our surveyed code has more total time.

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
Reference	52287	3.20	58	*7*	*5*	*10*	21	*15*	0.120
SURVEYED	58555	3.33	96	*33*	*8*	*15*	20	*20*	0.092
MPC	52214	3.50	79	*19*	*5*	*5*	30	*20*	0.083
MPC	15002	3.65	115	*45*	*15*	*15*	20	*20*	0.087
Other	16035	3.74	70	*30*	*0*	*0*	20	*20*	0.131
Reference	57155	5.40	133	*33*	*5*	*5*	60	*30*	0.064

Based on all of these factors we believe a work value of 3.33 is appropriate for CPT Code 58555.

Conclusion

The Society makes the following recommendations based on survey data and relativity within the specialty and the overall fee schedule:

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
Reference	52287	3.20	58	*7*	*5*	*10*	21	*15*	0.120

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58555

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/gynecology How often? Commonly

Specialty gynecology/oncology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,627
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare Data

Specialty obstetrics/gynecology Frequency 1547 Percentage 95.08 %

Specialty gynecology/oncology Frequency 50 Percentage 3.07 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 58555

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58558 Tracking Number Original Specialty Recommended RVU: **4.63**
Presented Recommended RVU: **4.63**
Global Period: 000 RUC Recommended RVU: **4.37**

CPT Descriptor: Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old perimenopausal female presented with abnormal uterine bleeding. She has an endometrial polyp. A hysteroscopy with removal of the polyp and D&C is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 36%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 11%

Description of Pre-Service Work: Review previous work-ups. Update history and physical examination. Communicate with the patient and/or family to explain the indications for the procedure, as well as the operative risks and benefits, and to obtain informed consent. Verify all necessary equipment and supplies are available and compatible. Confirm proper positioning (high dorsal lithotomy). Scrub, dress and wait. Time out is performed.

Description of Intra-Service Work: Perform a bimanual pelvic examination to assess uterine size, position, and mobility. Palpate the adnexa and posterior cul de sac for the presence of masses or nodularity. Drain the bladder with a catheter. Expose, grasp, and dilate the cervix to accommodate the diagnostic hysteroscope. The uterine sound is passed. Insert the hysteroscope and confirm proper pressure setting of the pump or gravity flow to adequately distend the endometrial cavity. Examine the entire endometrial cavity, including the anterior, posterior, fundal, and lateral walls and both tubal ostia. Examine the endocervical canal. An irregular polypoid mass is identified. Further dilate the cervix to admit the operative hysteroscope and excise the entire lesion(s). Fluid volumes are continuously monitored. Coagulate bleeding points. Remove the hysteroscope from the uterus. Curettage of the endometrial cavity is performed. Replace hysteroscope for visual re-inspection of the entire cavity. Check the cervix for bleeding from a puncture site or laceration. All instruments are removed from the vagina and cervix.

Description of Post-Service Work: The patient is transferred to a stretcher and escorted to the recovery room. Monitor patient's stability in the recovery room. Write orders. Dictate operative report. Communicate with patient, family, and other health care professionals. Pay careful attention to fluid volume and electrolyte status. Order/manage medications.

Discharge management includes the physician’s final examination of the patient, instructions for continuing care, and preparation of discharge records.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

Mental Effort and Judgment (Mean)

	Top Key Ref Code	**2nd Key Ref Code**
The number of possible diagnosis and/or the number of management options that must be considered	0.69	0.64
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.25	0.43
Urgency of medical decision making	0.19	0.43

Technical Skill/Physical Effort (Mean)

Technical skill required	0.38	0.64
Physical effort required	0.31	0.43

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.31	0.71
Outcome depends on the skill and judgment of physician	0.44	0.71
Estimated risk of malpractice suit with poor outcome	0.38	0.79

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.56	0.79

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY2010. CPT Code 58555 *hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D&C* was one of the codes identified by CMS review.

Methodology

ACOG identified CPT Codes 58555, 58559, 58560, 58561, 58562 and 58563 as part of the family. The Research Subcommittee approved updated vignettes for this family of codes. The RS also approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs:

- AAGL – 1000 randomly selected US/MDs
- SGO – 1045 all US/MD membership
- ACOG – 1000 randomly selected US/MDs

Intensity

A significant change in technology and the patient population has occurred since these codes were last valued at the RUC. Hysterectomy rates both open and minimally invasive continue to decline yearly in the United States. This statistic is directly related to improvements in both medical and surgical technology. Most significantly, advances in hysteroscopic technology allow us now to treat women with this uterine sparing procedure who would have had a hysterectomy in 1997. In addition, advances in endometrial ablative techniques allow us to provide relief to women from dysfunctional bleeding, a leading cause of hysterectomy.

Specifically, improvements to optics, and pump inflation systems allow greater and more accurate visualization. While this is likely to decrease intraservice time, it is also likely to allow us to attempt to manipulate and correct larger more clinically significant lesions. This may decrease surveyed intraservice times, but increases the intensities during the same or lessor time frames. Second, improvements in design and safety of instruments to be used for resection, allow us to attempt removal of larger more complex

lesions, in more difficult and challenging locations. Third, with the advent of improved pump systems, the risk of significant injury due to intravasation of fluid has increased and this can lead to electrolyte disturbances, cerebral edema and cardiovascular collapse.

Therefore, while technology has allowed intraservice time to decrease, the cases we are doing and patients we are caring for have become more complex and therefore the intensity is higher.

We are recommending the median survey value of 4.63 for CPT code 58558. We believe our recommendations compare favorably within our specialty and maintain relativity within the fee schedule.

Pre and Post Service Time Packages

We recommend pre-service package 3 *straightforward patient/difficult procedure* and post-service package 9B *General Anesthesia or Complex Regional Block/Complex Procedure.* We included 5 additional minutes in positioning time for the Dorsal Lithotomy position.

Reference Codes

Our recommendation compares favorably to our reference service codes 52282 *Cystourethroscopy, with insertion of permanent urethral stent* and 57461 *Colposcopy of the cervix including upper/adjacent vagina; with loop electrode conization of the cervix.*

CPT Code 52282 is similar to surveyed code 58558. CPT Code 52282 has 20 additional minutes of intraservice time with a wRVU of 6.39, and 14 additional minutes of total time. The intraservice time for 58558 is about 60% of 52282, the total time of 58558 is 88% of 52282 and the recommended wRVU of 58558 is 72% of 52282. These ratios of work and time supports our recommendation of 4.63 for 58558.

The second reference service, 57461 has a wRVU of 3.43. 58558 has 2 additional minutes of intraservice time and almost twice as much total time. The intensity of 58558 is higher than the intensity of 57461. Both the higher intensity of 58558 and the longer total time support the wRVU of 4.63 compared to 3.43.

MPCs

Our recommendations compare favorably to MPC codes 52224 *Cystouretroscopy with fulguration of a MINOR (less than 0.5cm) lesion(s) with or without biopsy* and CPT Code 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiologic supervision and interpretation, intra-procedural road-mapping, and image guidance (ultrasound and fluoroscopy), when performed.*

CPT Code 52224 has an intra-service time of 30 minutes and total time of 79 minutes. The work RVUs are 4.05 with an IWPUT of 0.1008. The procedure involves similar type of procedure using a cystoscope rather than hysteroscopy. Hysteroscopy involves dilation of the cervix in order to do the visualization and resection as compared to doing a natural orifice surgery for the 52224. With a hysteroscopy there needs to be continuous fluid monitoring to prevent intravascular extravasation of the distending media. Both are done with anesthesia in a lithotomy position. For 52224 the fulguration or biopsy is for a very small lesion and endometrial polyps are usually much larger than 5mm.

The second MPC code is 37191 has an intra-service time of 30 minutes and a total time of 83 minutes. The IWPUT is higher for this case (0.1198) but the work RVUs are higher at 4.71, despite a 20% reduction in total time. 37191 is usually done as a percutaneous procedure, it can be done in a procedure suite rather than an OR. No special positioning is required.

Other Comparisons

Our recommendations compare favorably to CPT codes 52234 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; SMALL bladder tumor(s) (0.5 up to 2cm)* and CPT Code 52275 *Cystourethroscopy with internal urethrotomy; male.*

CPT Code 52234 has a work RVU of 4.62 with intra/post/total times of 30/20/79 minutes. This procedure is very similar to the 58558 but no dilation or fluid monitoring is required.

The second comparator is 52275 which as a work RVUs of 4.69 with intra/post/total times of times of 30/30/90 minutes. This procedure is also very similar to 58558 but doesn't require cervical dilation or fluid monitoring.

Recommendations within this Code Set

Our recommendation of 4.63 for surveyed code 58558 compares favorably to our work recommendation of 4.62 for 58563 as well. These codes were both surveyed with a total time of 106 minutes and 30 minutes of intra service time. Both involve hysteroscopy with either excision of endometrial lesion or ablation of the endometrium.

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
Reference	52287	3.20	58	*7*	*5*	*10*	21	*15*	0.120
Reference	57461	3.43	58	15			28	15	0.099
MPC	52224	4.05	79	*19*	*5*	*5*	30	*20*	0.101
Other	52234	4.62	79	*19*	*5*	*5*	30	*20*	0.120
SURVEYED	58563	4.62	106	*33*	*8*	*15*	30	*20*	0.104
SURVEYED	58558	4.63	106	*33*	*8*	*15*	30	*20*	0.105
Other	52275	4.69	90	*30*	*0*	*0*	30	*30*	0.112
MPC	37191	4.71	83	*30*	*3*	*5*	30	*15*	0.120

Based on all of these factors we believe a work value of 4.63 is appropriate for CPT Code 58558.

Conclusion

The Society makes the following recommendations based on survey data and relativity within the specialty and the overall fee schedule:

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58558

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/gynecology How often? Commonly

Specialty gynecology/oncology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 41,539 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare Data

Specialty obstetrics/gynecology Frequency 39047 Percentage 94.00 %

Specialty gynecology/oncology Frequency 2077 Percentage 5.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 58558

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:58559 Tracking Number Original Specialty Recommended RVU: **6.16**
Presented Recommended RVU: **6.16**
Global Period: 000 RUC Recommended RVU: **5.54**

CPT Descriptor: Hysteroscopy, surgical; with lysis of intrauterine adhesions (any method)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32 year old G3P0030 female has had 3 first trimester spontaneous abortions, all of which required a D&C. Her evaluation revealed multiple think irregular filling defects within the endometrial cavity suggestive of intrauterine adhesions. A hysteroscopy with lysis of intrauterine adhesions is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 38%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: Review previous work-ups. Update history and physical examination. Communicate with the patient and/or family to explain the indications for the procedure, as well as the operative risks and benefits, and to obtain informed consent.. Verify all necessary equipment and supplies are available and compatible. Confirm proper positioning (high dorsal lithotomy). Scrub, dress and wait. Time out is performed.

Description of Intra-Service Work: A bimanual pelvic examination is performed to assess uterine size, position, and mobility. The adnexa and posterior cul de sac are palpated for the presence of masses or nodularity. The bladder is drained with a catheter. The cervix is exposed, grasped, and dilated to accommodate the diagnostic hysteroscope. The uterine sound is passed. The hysteroscope is inserted and the physician confirms proper pressure setting of the pump or gravity flow to adequately distend the endometrial cavity. The entire endometrial cavity is examined, including the anterior, posterior, fundal, and lateral walls and both tubal ostia. The endocervical canal is examined. Inspection of the endometrial cavity confirms the presence of intrauterine adhesions. The cervix is further dilated to admit the operative hysteroscope and the adhesions are lysed. Fluid volumes are continuously monitored. Bleeding points are coagulated. At the conclusion of the case, the cavity appears normal. The hysteroscope is removed from the uterus. A device (eg, Foley catheter) is placed into the cavity to separate the walls of the endometrial cavity. The cervix is checked for bleeding from a puncture site or laceration. All instruments are removed from the vagina and cervix.

Description of Post-Service Work: The patient is transferred to a stretcher and escorted to the recovery room. Monitor patient's stability in the recovery room. Write orders. Dictate operative report. Communicate with patient, family, and other health care professionals. Pay careful attention to fluid volume and electrolyte status. Order/manage medications.

Discharge management includes the physician’s final examination of the patient, instructions for continuing care, and preparation of discharge records.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

Mental Effort and Judgment (Mean)

	Top Key Ref Code	**2nd Key Ref Code**
The number of possible diagnosis and/or the number of management options that must be considered	0.55	0.67
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.64	0.33
Urgency of medical decision making	0.00	0.00

Technical Skill/Physical Effort (Mean)

Technical skill required	0.64	1.33
Physical effort required	0.73	0.67

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.64	0.33
Outcome depends on the skill and judgment of physician	0.73	0.67
Estimated risk of malpractice suit with poor outcome	0.73	-0.17

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.00	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY2010. CPT Code 58555 *hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D&C* was one of the codes identified by CMS review.

Methodology

ACOG identified CPT Codes 58555, 58559, 58560, 58561, 58562 and 58563 as part of the family. The Research Subcommittee approved updated vignettes for this family of codes. The RS also approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs:

- AAGL – 1000 randomly selected US/MDs
- SGO – 1045 all US/MD membership
- ACOG – 1000 randomly selected US/MDs

Intensity

A significant change in technology and the patient population has occurred since these codes were last valued at the RUC. Hysterectomy rates both open and minimally invasive continue to decline yearly in the United States. This statistic is directly related to improvements in both medical and surgical technology. Most significantly, advances in hysteroscopic technology allow us now to treat women with this uterine sparing procedure who would have had a hysterectomy in 1997. In addition, advances in endometrial ablative techniques allow us to provide relief to women from dysfunctional bleeding, a leading cause of hysterectomy.

Specifically, improvements to optics, and pump inflation systems allow greater and more accurate visualization. While this is likely to decrease intraservice time, it is also likely to allow us to attempt to manipulate and correct larger more clinically significant lesions. This may decrease surveyed intraservice times, but increases the intensities during the same or lessor time frames. Second,

improvements in design and safety of instruments to be used for resection, allow us to attempt removal of larger more complex lesions, in more difficult and challenging locations. Third, with the advent of improved pump systems, the risk of significant injury due to intravasation of fluid has increased and this can lead to electrolyte disturbances, cerebral edema and cardiovascular collapse.

Therefore, while technology has allowed intraservice time to decrease, the cases we are doing and patients we are caring for have become more complex and therefore the intensity is higher.

We are recommending the current value of 6.16 for CPT code 58559. We believe our recommendations compare favorably within our specialty and maintain relativity within the fee schedule.

Pre and Post Service Time Packages

We recommend pre-service package 3 *straightforward patient/difficult procedure* and post-service package 9B *General Anesthesia or Complex Regional Block/Complex Procedure*. We included 5 additional minutes in positioning time for the Dorsal Lithotomy position.

Reference Codes

Our recommendations compare favorably to reference service codes 52282 *Cystourethroscopy, with insertion of permanent urethral stent* and 59072 *Fetal umbilical cord occlusion, including ultrasound guidance.*

CPT Code 52282 is similar to surveyed code 58559. CPT Code 52282 has 10 additional minutes of intraservice time with a wRVU of 6.39, but the procedures have almost identical total times. 58559 involves lysis of adhesions within the uterine cavity which may be quite distorted with loss of the usual landmarks, making this procedure more intense than 52282. An intrauterine stent of some type would be placed after the completion of the lysis of adhesions. The higher intensity of 58559 along with a lower intraservice time supports our recommendation of 6.16 for 58559.

CPT Code 59072 the second most commonly selected reference code, has 60 minutes of intraservice time (wRVU 8.99) compared to 40 minutes for 58559. While 59072 has more preservice and postservice time, their intensities are similar. This represents an approximate 33% reduction in work compared to the reference and therefore the wRVU recommendation for 58559 of 6.16 is appropriate compared to the wRVU of 59072.

MPCs

Our recommendations compare favorably to MPC codes 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included)* and 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm).*

CPT Code 52352 has a wRVU of 6.75 with slightly more (5 minutes) of intraservice time. Both 58559 and 52352 have similar total times and intensity, therefore the lower intraservice time for 58559 results in a lower wRVU recommendation of 6.16. In fact, if one subtracts the intraservice time with intensity from 52352 [6.75-(5 x 0.1184 = 0.59)] the resulting wRVU is 6.16, and this supports our recommendation.

CPT Code 52235 has an intraservice time of 45 minutes, but less total time than 58559. 52235 is also less intense. 52235 requires the removal of a medium size bladder tumor whereas 58559 involves lysis of adhesions within a distorted uterine cavity associated with the loss of usual landmarks and an attempt at restoration of normal anatomy. At the conclusion of the procedure, 58559 requires the introduction of a stent to try to maintain the restored anatomy and prevent the reformation of adhesions. The increased intensity and longer total time of 58559 compared to 52352 justifies the higher wRVU.

Other Comparisons

Our recommendations also compare favorably to CPT Code 93456 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with right heart catheterization.*

Both codes have 40 minutes of intraservice time and almost identical total times (116 vs. 118). The wRVU of 93456 is 6.15, which supports the recommendation of 6.16 for 58559.

Recommendations within this Code Set

Our recommendations of 6.16 work RVUs for CPT Code 58559 also maintains relativity with our work recommendation of 6.90 for CPT Code 58560. There are significant differences in the level of intensity of 58559 and 58560 that justify the difference in RVU, even though they have the same time. In fact, when they were last surveyed 18 years ago, the RUC came to the same conclusion, with no differences in time, as the current survey shows. While we may be faster at these procedures now due to today's technology and improved expertise, there are still differences in the primary physiology of the pathology that proves the prior conclusion on increased intensity and increased IWPUT. In both, the division can easily result in intravasation of large volumes of fluid—either in uterine perforation or vascular interruption. However, the division of a septum is more fibrous and more difficult. Second, both procedures require the post-operative presence of a balloon to keep the cavity open, but in the septum removal, the balloon is also used to tamponade the bleeding vascular—arterial and venous—bed within the myometrium. Third, the division of adhesions is the

surface restoration of a pathologic state, but the removal of a septum is a fundamental developmental defect. Thus, the intensity of the procedure, the inherent risk to the patient and the fundamental flaw are different for these two procedures.

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
MPC	52235	5.44	94	*19*	*5*	*5*	45	*20*	0.098
Other	93456	6.15	118	*40*	*3*	*5*	40	*30*	0.112
SURVEYED	58559	6.16	116	*33*	*8*	*15*	40	*20*	0.117
Reference	52282	6.39	120	40			50	30	0.096
MPC	52352	6.75	118	*33*	*5*	*15*	45	*20*	0.118
SURVEYED	58560	6.90	116	*33*	*8*	*15*	40	*20*	0.135
Reference	59072	8.99	175	*40*	*30*	*15*	*60*	*30*	0.111

Based on all of these factors we believe a work value of 6.16 is appropriate for CPT Code 58559.

Conclusion

The Society makes the following recommendations based on survey data and relativity within the specialty and the overall fee schedule:

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58559

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/gynecology How often? Commonly

Specialty gynecology/oncology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 149
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare Data

Specialty obstetrics/gynecology Frequency 136 Percentage 91.27 %

Specialty gynecology/oncology Frequency 5 Percentage 3.35 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:58560 Tracking Number Original Specialty Recommended RVU: **6.90**
Presented Recommended RVU: **6.90**
Global Period: 000 RUC Recommended RVU: **6.15**

CPT Descriptor: Hysteroscopy, surgical; with division or resection of intrauterine septum (any method)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32 year old G3P0 woman with three spontaneous pregnancy losses presented for evaluation. Her evaluation revealed a thick uterine septum. A hysteroscopy with resection of the uterine septum is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 35%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: Review previous work-ups. Update history and physical examination. Communicate with the patient and/or family to explain the indications for the procedure, as well as the operative risks and benefits, and to obtain informed consent. Verify all necessary equipment and supplies are available and compatible. Confirm proper positioning (high dorsal lithotomy). Scrub, dress and wait. Time out is performed.

Description of Intra-Service Work: A bimanual pelvic examination is performed to assess uterine size, position, and mobility. The adnexa and posterior cul de sac are palpated for the presence of masses or nodularity. The bladder is drained with a catheter. The cervix is exposed, grasped, and dilated to accommodate the diagnostic hysteroscope. The uterine sound is passed. The diagnostic hysteroscope is inserted and the physician confirms proper pressure setting of the pump or gravity flow to adequately distend the endometrial cavity. The entire endometrial cavity is examined, including the anterior, posterior, fundal, and lateral walls and bilateral tubal ostia. The endocervical canal is examined. The septum is identified and resected in the avascular midline to the level of the uterine fundus. Fluid volumes are continuously monitored. Following resection, hemostasis is secured by fulguration and/or by insertion of a Foley catheter for tamponade. The hysteroscope is removed from the uterus. A device (eg, Foley catheter) is placed into the cavity to separate the walls of the endometrial cavity. The cervix is checked for bleeding from a puncture site or laceration. All instruments are removed from the vagina and cervix.

Description of Post-Service Work: The patient is transferred to a stretcher and escorted to the recovery room. Monitor patient's stability in the recovery room. Write orders. Dictate operative report. Communicate with patient, family, and other health care professionals. Pay careful attention to fluid volume and electrolyte status. Order/manage medications. Discharge management includes the physician's final examination of the patient, instructions for continuing care, and preparation of discharge records.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.82	0.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.82	0.17
Urgency of medical decision making	0.18	-0.17

Technical Skill/Physical Effort (Mean)

Technical skill required	0.73	1.17
Physical effort required	1.00	0.83

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.09	0.33
Outcome depends on the skill and judgment of physician	1.00	0.67
Estimated risk of malpractice suit with poor outcome	0.73	-0.33

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.36	0.67

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY2010. CPT Code 58555 *hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D&C* was one of the codes identified by CMS review.

Methodology

ACOG identified CPT Codes 58555, 58559, 58560, 58561, 58562 and 58563 as part of the family. The Research Subcommittee approved updated vignettes for this family of codes. The RS also approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs:

- AAGL – 1000 randomly selected US/MDs
- SGO – 1045 all US/MD membership
- ACOG – 1000 randomly selected US/MDs

Intensity

A significant change in technology and the patient population has occurred since these codes were last valued at the RUC. Hysterectomy rates both open and minimally invasive continue to decline yearly in the United States. This statistic is directly related to improvements in both medical and surgical technology. Most significantly, advances in hysteroscopic technology allow us now to treat women with this uterine sparing procedure who would have had a hysterectomy in 1997. In addition, advances in endometrial ablative techniques allow us to provide relief to women from dysfunctional bleeding, a leading cause of hysterectomy.

Specifically, improvements to optics, and pump inflation systems allow greater and more accurate visualization. While this is likely to decrease intraservice time, it is also likely to allow us to attempt to manipulate and correct larger more clinically significant lesions. This may decrease surveyed intraservice times, but increases the intensities during the same or lessor time frames. Second,

improvements in design and safety of instruments to be used for resection, allow us to attempt removal of larger more complex lesions, in more difficult and challenging locations. Third, with the advent of improved pump systems, the risk of significant injury due to intravasation of fluid has increased and this can lead to electrolyte disturbances, cerebral edema and cardiovascular collapse.

Therefore, while technology has allowed intraservice time to decrease, the cases we are doing and patients we are caring for have become more complex and therefore the intensity is higher.

We are recommending the current value of 6.90 for CPT code 58560. We believe our recommendations compare favorably within our specialty and maintain relativity within the fee schedule.

Pre and Post Service Time Packages

We recommend pre-service package 3 *straightforward patient/difficult procedure* and post-service package 9B *General Anesthesia or Complex Regional Block/Complex Procedure*. We included 5 additional minutes in positioning time for the Dorsal Lithotomy position.

Reference Codes

Our recommendations compare favorably to reference service codes 52282 *Cystourethroscopy, with insertion of permanent urethral stent* and 59072 *Fetal umbilical cord occlusion, including ultrasound guidance.*

CPT Code 52282 is a similar procedure to surveyed code 58560. CPT Code 52282 has 10 additional minutes of intraservice time with a wRVU of 6.39, but the procedures have almost identical total times. 58560 involves resecting a uterine septum and restoring normal anatomy to the uterine cavity. An intrauterine stent of some type would be placed after the completion of the resection of the septum. CPT code 58560 is more intense than CPT Code 52282. While they both involve the placement of a stent after the procedure, the 58560 will typically require the resection of a larger area of fibrous tissue to restore the normal endometrial cavity as opposed to dilating the urethral stricture and placing a stent.

CPT Code 59072, the second most commonly selected reference code, has 60 minutes of intraservice time (wRVU 8.99) compared to 40 minutes for 58560. While 59072 has more preservice and postservice time, their intensities are similar. This represents an approximate 33% reduction in time compared to the reference, however 58960 is more intense and therefore the wRVU recommendation for 58560 of 6.90 is appropriate compared to the wRVU of 59072. This recommendation also maintains rank order with 58559 and the family of codes.

MPCS

Our recommendations compare favorably to MPC code 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included).* The codes have almost identical total time while 52352 has 5 additional minutes of intraservice time. 58560 is more intense than 52352. 58560 will typically require the resection of a larger area of fibrous tissue to restore the normal endometrial cavity as opposed to removal or manipulation of a calculus.

Other Comparisons

Our recommendations compare favorably to CPT code 52344 *Cystourethroscopy with ureteroscopy; with treatment of ureteral stricture (eg, balloon dilation, laser, electrocautery, and incision).* CPT Code 58560 has less total time (116 vs 125) and 5 minutes less intraservice time, which supports a slightly lower wRVU for 58560 of 6.90 vs 7.05.

Recommendations within this Code Set

Our recommendation of 6.90 work RVUs for CPT Code 58560 also maintains relativity with our work recommendation of 6.16 for CPT Code 58559. There are significant differences in the level of intensity of 58559 and 58560 that justify the difference in RVU, even though they have the same time. In fact, when they were last surveyed 18 years ago, the RUC came to the same conclusion, with no differences in time, as the current survey shows. While we may be faster at these procedures now due to today's technology and improved expertise, there are still differences in the primary physiology of the pathology that proves the prior conclusion on increased intensity and increased IWPUT. In both, the division can easily result in intravasation of large volumes of fluid—either in uterine perforation or vascular interruption. However, the division of a septum is more fibrous and more difficult. Second, both procedures require the post-operative presence of a balloon to keep the cavity open, but in the septum removal, the balloon is also used to tamponade the bleeding vascular—arterial and venous—bed within the myometrium. Third, the division of adhesions is the surface restoration of a pathologic state, but the removal of a septum is a fundamental developmental defect. Thus, the intensity of the procedure, the inherent risk to the patient and the fundamental flaw are different for these two procedures.

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
SURVEYED	58559	6.16	116	*33*	*8*	*15*	40	*20*	0.117
Reference	52282	6.39	120	40			50	30	0.096

MPC	52352	6.75	118	*33*	*5*	*15*	45	*20*	0.118
SURVEYED	58560	6.90	116	*33*	*8*	*15*	40	*20*	0.135
Other	52344	7.05	125	*40*	*10*	*10*	45	*20*	0.120
Reference	59072	8.99	175	*40*	*30*	*15*	*60*	*30*	0.111

Based on all of these factors we believe a work value of 6.90 is appropriate for CPT Code 58560.

Conclusion

The Society makes the following recommendations based on survey data and relativity within the specialty and the overall fee schedule:

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
Reference	52287	3.20	58	*7*	*5*	*10*	21	*15*	0.120

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58560

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/gynecology How often? Commonly

Specialty gynecology/oncology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 53 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare Data

Specialty obstetrics/gynecology Frequency 50 Percentage 94.33 %

Specialty gynecology/oncology Frequency 2 Percentage 3.77 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 58560

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58561 Tracking Number Original Specialty Recommended RVU: **7.00**
Presented Recommended RVU: **7.00**
Global Period: 000 RUC Recommended RVU: **7.00**

CPT Descriptor: Hysteroscopy, surgical; with removal of leiomyomata

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old nulligravid woman presented with menorrhagia. Her evaluation suggests a submucosal leiomyomata. A hysteroscopy with removal of leiomyomata is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 46%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 8%

Description of Pre-Service Work: Review previous work-ups. Update history and physical examination. Communicate with the patient and/or family to explain the indications for the procedure, as well as the operative risks and benefits, and to obtain informed consent. Verify all necessary equipment and supplies are available and compatible. Confirm proper positioning (high dorsal lithotomy). Scrub, dress and wait. Time out is performed.

Description of Intra-Service Work: A bimanual pelvic examination is performed to assess uterine size, position, and mobility. The adnexa and posterior cul de sac are palpated for the presence of masses or nodularity. The bladder is drained with a catheter. The cervix is exposed, grasped, and dilated to accommodate the diagnostic hysteroscope. The uterine sound is passed. The hysteroscope is inserted and the physician confirms proper pressure setting of the pump or gravity flow to adequately distend the endometrial cavity. The entire endometrial cavity is examined, including the anterior, posterior, fundal, and lateral walls and bilateral tubal ostia. The endocervical canal is examined. Hysteroscopy reveals submucous myomas. The myomas are resected. Fluid volumes are continuously monitored. Hemostasis is secured by fulguration and/or by insertion of a Foley catheter for tamponade. The hysteroscope is removed from the uterus. The cervix is checked for bleeding from a puncture site or laceration. All instruments are removed from the vagina and cervix.

Description of Post-Service Work: The patient is transferred to a stretcher and escorted to the recovery room. Monitor patient's stability in the recovery room. Write orders. Dictate operative report. Communicate with patient, family, and other health care professionals. Pay careful attention to fluid volume and electrolyte status. Order/manage medications. Discharge management includes the physician's final examination of the patient, instructions for continuing care, and preparation of discharge records.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.94	0.64
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.75	0.55
Urgency of medical decision making	0.44	0.09

Technical Skill/Physical Effort (Mean)

Technical skill required	1.00	1.36
Physical effort required	1.00	1.36

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.13	0.64
Outcome depends on the skill and judgment of physician	1.00	1.18
Estimated risk of malpractice suit with poor outcome	1.00	0.45

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.38	1.27

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY2010. CPT Code 58555 *hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D&C* was one of the codes identified by CMS review.

Methodology

ACOG identified CPT Codes 58555, 58559, 58560, 58561, 58562 and 58563 as part of the family. The Research Subcommittee approved updated vignettes for this family of codes. The RS also approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs:

- AAGL – 1000 randomly selected US/MDs
- SGO – 1045 all US/MD membership
- ACOG – 1000 randomly selected US/MDs

Intensity

A significant change in technology and the patient population has occurred since these codes were last valued at the RUC. Hysterectomy rates both open and minimally invasive continue to decline yearly in the United States. This statistic is directly related to improvements in both medical and surgical technology. Most significantly, advances in hysteroscopic technology allow us now to treat women with this uterine sparing procedure who would have had a hysterectomy in 1997. In addition, advances in endometrial ablative techniques allow us to provide relief to women from dysfunctional bleeding, a leading cause of hysterectomy.

Specifically, improvements to optics, and pump inflation systems allow greater and more accurate visualization. While this is likely to decrease intraservice time, it is also likely to allow us to attempt to manipulate and correct larger more clinically significant lesions. This may decrease surveyed intraservice times, but increases the intensities during the same or lessor time frames. Second, improvements in design and safety of instruments to be used for resection, allow us to attempt removal of larger more complex

lesions, in more difficult and challenging locations. Third, with the advent of improved pump systems, the risk of significant injury due to intravasation of fluid has increased and this can lead to electrolyte disturbances, cerebral edema and cardiovascular collapse.

Therefore, while technology has allowed intraservice time to decrease, the cases we are doing and patients we are caring for have become more complex and therefore the intensity is higher.

We are recommending the median survey value of 7.00 for CPT Code 58561. Despite a 40% decrease in intraservice time when compared to the 1997 RUC survey, our median value of 7.00 wRVUs represents a 30% decrease in value, we feel strongly that our arguments fully explains an increase in intensity which supports this recommended value. We also believe our recommendation compares favorably within our specialty and maintains relativity within the fee schedule.

Pre and Post Service Time Packages

We recommend pre-service package 3 *straightforward patient/difficult procedure* and post-service package 9B *General Anesthesia or Complex Regional Block/Complex Procedure*. We included 5 additional minutes in positioning time for the Dorsal Lithotomy position.

Reference Codes

Our recommendation compares favorably to our reference codes 52282 *Cystourethroscopy, with insertion of permanent ureteral stent* and 59072 *Fetal umbilical cord occlusion, including ultrasound guidance*.

The CPT code 52282 with RVU 6.39 is comparable to the survey code 58561 because both are zero day global procedures with the same total time and similar intraop time in a clinically stable patient. Both procedures involve operating inside a hollow cavity through a narrow channel. Although the intraoperative time for 52282 is longer by 5 minute the work intensity is higher with 58561 because the potential for perforation of the uterus is present every time the electrode is activated for resection. In addition, the visualization is frequently challenging with 58561.

The work intensity for 59072 is similar as the surgery is performed under ultrasound control whereas the visualization in 58561 is challenging in a difference sense as explained above with higher risk of uterine perforation for patient. The approach to the site of surgery is similar with instruments being passed through a narrow channel and surgery being performed on a structure within the uterine cavity.

MPCs

Our recommendation compares favorably to MPC codes 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included).* MPC code 52352 is very similar to our recommendation with similar total time and intraoperative time. The procedures are also similar with surgery taking place inside a cavity approached through a narrow channel.

Other Comparisons

Our recommendation compares favorably to CPT code 52344 *Cystourethroscopy with ureteroscopy; with treatment of ureteral stricture (eg, balloon dilation, laser, electrocautery, and incision)* and 52345 *Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision).* CPT Code 52344 is also very similar in total work time, intraoperative time as well as the intensity and type of work performed. 52344 is similar to 58561 in that electrocautery is used to resect structure with attendant risk of perforation.

Recommendations within this Code Set

Our recommendation of 7.00 work RVUs for CPT Code 58561 also maintains relativity with our work recommendation of 6.90 for CPT Code 58560. There is increase intra-operative time with this procedure as opposed to 58560 because the chips of fibroids have to be removed from the uterine cavity frequently to maintain visualization and every time the hysteroscope is removed and re-inserted, visualization is lost and time is spent in obtaining good visualization again. Even with the new technology of hysteroscopic morcellation, the procedure is slow as the morcellator resects the fibroid systematically. The total time taken therefore is similar for both hysteroscopic morcellation and hysteroscopic resection in the end. In addition, the intensity during the procedure is higher than with division of the septum as bleeding is more common thus obscuring vision, chips of resected fibroid add to decreased visualization and the potential for uterine perforation is much higher. All this makes the procedure more time consuming and challenging than division of septum with higher risks for the patient.

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
Reference	52282	6.39	120	40			50	30	0.096
MPC	52352	6.75	118	*33*	*5*	*15*	45	*20*	0.118
SURVEYED	58561	7.00	121	*33*	*8*	*15*	45	*20*	0.122

Other	52344	7.05	125	*40*	*10*	*10*	45	*20*	0.120
Other	53445	7.55	135	*45*	*10*	*15*	45	*20*	0.128
Reference	59072	8.99	175	*40*	*30*	*15*	*60*	*30*	0.111

Based on all of these factors we believe a work value of 7.00 is appropriate for CPT Code 58561.

Conclusion

The Society makes the following recommendations based on survey data and relativity within the specialty and the overall fee schedule:

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58561

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/gynecology How often? Commonly

Specialty gynecology/oncology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,960
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare Data

Specialty obstetrics/gynecology Frequency 1902 Percentage 97.04 %

Specialty gynecology/oncology Frequency 40 Percentage 2.04 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 58561

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58562 Tracking Number Original Specialty Recommended RVU: **4.50**
Presented Recommended RVU: **4.50**
Global Period: 000 RUC Recommended RVU: **4.17**

CPT Descriptor: Hysteroscopy, surgical; with removal of impacted foreign body

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 34 year old woman presents with an impacted IUD that could not be removed by her office based physician. A hysteroscopy with resection of impacted foreign body is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 42%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 16%

Description of Pre-Service Work: Review previous work-ups. Update history and physical examination. Communicate with the patient and/or family to explain the indications for the procedure, as well as the operative risks and benefits, and to obtain informed consent. Verify all necessary equipment and supplies are available and compatible. Confirm proper positioning (high dorsal lithotomy). Scrub, dress and wait. Time out is performed.

Description of Intra-Service Work: A bimanual pelvic examination is performed to assess uterine size, position, and mobility. The adnexa and posterior cul de sac are palpated for the presence of masses or nodularity. The bladder is drained with a catheter. The cervix is exposed, grasped, and dilated to accommodate the hysteroscope. The uterine sound is passed. The hysteroscope is inserted and the physician confirms proper pressure setting of the pump or gravity flow to adequately distend the endometrial cavity. The entire endometrial cavity is examined, including the anterior, posterior, fundal, and lateral walls and bilateral tubal ostia. The endocervical canal is examined. The intrauterine device is located and noted to be partially imbedded in the wall of the uterus. The IUD is dissected out of the uterine wall and removed from the uterine cavity. Fluid volumes are continuously monitored. The hysteroscope is removed from the uterus. The cervix is checked for bleeding from a puncture site or laceration. All instruments are removed from the vagina and cervix.

Description of Post-Service Work: The patient is transferred to a stretcher and escorted to the recovery room. Monitor patient's stability in the recovery room. Write orders. Dictate operative report. Communicate with patient, family, and other health care professionals. Pay careful attention to fluid volume and electrolyte status. Order/manage medications. Discharge management includes the physician's final examination of the patient, instructions for continuing care, and preparation of discharge records.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.27	0.30
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.33	0.30
Urgency of medical decision making	0.07	0.50

Technical Skill/Physical Effort (Mean)		
Technical skill required	0.67	0.60
Physical effort required	0.53	0.40
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.60	0.50
Outcome depends on the skill and judgment of physician	0.67	0.60
Estimated risk of malpractice suit with poor outcome	0.47	1.10

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.73	0.80

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY2010. CPT Code 58555 *hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D&C* was one of the codes identified by CMS review.

Methodology

ACOG identified CPT Codes 58555, 58559, 58560, 58561, 58562 and 58563 as part of the family. The Research Subcommittee approved updated vignettes for this family of codes. The RS also approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs:

- AAGL – 1000 randomly selected US/MDs
- SGO – 1045 all US/MD membership
- ACOG – 1000 randomly selected US/MDs

Intensity

A significant change in technology and the patient population has occurred since these codes were last valued at the RUC. Hysterectomy rates both open and minimally invasive continue to decline yearly in the United States. This statistic is directly related to improvements in both medical and surgical technology. Most significantly, advances in hysteroscopic technology allow us now to treat women with this uterine sparing procedure who would have had a hysterectomy in 1997. In addition, advances in endometrial ablative techniques allow us to provide relief to women from dysfunctional bleeding, a leading cause of hysterectomy.

Specifically, improvements to optics, and pump inflation systems allow greater and more accurate visualization. While this is likely to decrease intraservice time, it is also likely to allow us to attempt to manipulate and correct larger more clinically significant lesions. This may decrease surveyed intraservice times, but increases the intensities during the same or lessor time frames. Second, improvements in design and safety of instruments to be used for resection, allow us to attempt removal of larger more complex

lesions, in more difficult and challenging locations. Third, with the advent of improved pump systems, the risk of significant injury due to intravasation of fluid has increased and this can lead to electrolyte disturbances, cerebral edema and cardiovascular collapse.

Therefore, while technology has allowed intraservice time to decrease, the cases we are doing and patients we are caring for have become more complex and therefore the intensity is higher.

We are recommending the median survey value of 4.50 for CPT Code 58562. We believe our recommendation compares favorably within our specialty and maintains relativity within the fee schedule.

Pre and Post Service Time Packages

We recommend pre-service package 3 *straightforward patient/difficult procedure* and post-service package 9B *General Anesthesia or Complex Regional Block/Complex Procedure*. We included 5 additional minutes in positioning time for the Dorsal Lithotomy position.

Reference Codes

Our recommendation compares favorably to our reference codes 52282 *Cystourethroscopy, with insertion of permanent urethral stent* and 57461 *Colposcopy of the cervix including upper/adjacent vagina; with loop electrode conization of the cervix.*

CPT code 52282 involves using a similar scope to introduce a foreign body, which is similar to CPT code 58562. The work RVU is higher, consistent with the higher intra service time, post service time, total time but lower IWPUT. The dilation and placement of the stent is similar to the dilation of the cervix to place the scope and the removal of the foreign body in our code adds to the complexity of our code, including the disruption of normal tissue to remove the implanted foreign body.

CPT code 57461 uses the same positioning, but does not go beyond the vagina. The work RVU is lower, consistent with a lower pre service time, post service time and total time. The intensity is also lower as there is no placement of a scope through the cervix or risk of major complication.

MPCs

Our recommendation compares favorably to MPC codes 52224 *Cystoscopy with fulgaration of a minor (<5mm) lesion with or without biopsy* and 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed*

CPT Code 52224 has a slightly longer intraservice time of 30 minutes, a shorter total time of 79 minutes and an lower IWPUT of 0.1008, and is valued lower at 4.05. CPT Code 37191 also has an intraservice time of 30 minutes and a slightly longer total time of 83 minutes and an higher IWPUT of 0.1198 and is valued higher at 4.71. Our procedure requires the dilation of the cervix before placing the scope which is an extra step when compared with cystoscopy. Because the uterus can vary in position, the correct path to dilate will also vary and perforation is not uncommon. This procedure requires removing an embedded object, usually an IUD, which is specifically designed to be difficult to come out, even when placed properly. This procedure is done in the OR due to the elevated risk of complication. Thus the increased IWPUT is justifiable.

CPT Code 37191 is usually done as a percutaneous procedure, it can be done in a procedure suite rather than an OR. No special positioning is required. The intensity is higher and thus this code is valued higher.

Other Comparisons

Our recommendation compares favorably to CPT Codes 43243 *Esophagogastroduodenoscopy, flexible, transoral; with injection sclerosis of esophageal/gastric varices* and 52441 *Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant.*

CPT Code 43243 has slightly more intraservice time (30 minutes vs 25 minutes) but lower total time (91 minutes vs 115 minutes) and has a similar IWPUT of 0.1025. Similar to our code, a scope is used to visualize and correct pathology and is usually done in the hospital in the outpatient setting. Unlike ours, no dilation is necessary and no special positioning is needed. As such, it has a slightly lower work RVU of 4.37.

CPT code 52441 has the same work RVU and slightly less total time. It does have more intraservice time but less intensity. It also uses a scope to visualize and correct pathology. This code most closely matches what we do.

Recommendations within this Code Set

There are significant differences in the level of intensity of 58558 (Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C) and 58562 (Hysteroscopy, surgical; with removal of impacted foreign body) that justify the difference in RVU, even though they have the same time. In fact, when they were last surveyed 18 years ago, the RUC came to the same conclusion, with no differences in time, as the current survey shows. While we may be faster at these procedures now due to today's technology and improved expertise, there are still differences in the primary physiology of the pathology that proves the prior conclusion on increased intensity and increased IWPUT. First, the removal of a polyp is the trimming of the endometrial overgrowth back to the normal state, but removal of an impacted foreign body requires the disruption of normal tissue. Also, the basic physiology of the endometrium allows for the physiologic and mechanical disruption of the vascularity, but the myometrium is not designed for mechanical or physiologic disruption. Removal of foreign bodies can sometimes result in significant myometrial vascular disruption and require a balloon to tamponade the injured myometrium.

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
Reference	57461	3.43	58	15			28	15	0.099
MPC	52224	4.05	79	*19*	*5*	*5*	30	*20*	0.101
Other	43243	4.37	91	*33*	*3*	*5*	30	*20*	0.103
SURVEYED	58562	4.50	101	*33*	*8*	*15*	25	*20*	0.120
Other	52441	4.50	93	*17*	*5*	*20*	30	*21*	0.113
SURVEYED	58558	4.63	106	*33*	*8*	*15*	30	*20*	0.105
MPC	37191	4.71	83	*30*	*3*	*5*	30	*15*	0.120
Reference	52282	6.39	120	40			50	30	0.096

Based on all of these factors we believe a work value of 4.50 is appropriate for CPT Code 58562.

Conclusion

The Society makes the following recommendations based on survey data and relativity within the specialty and the overall fee schedule:

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58562

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/gynecology How often? Commonly

Specialty gynecology/oncology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 201
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare Data

Specialty obstetrics/gynecology Frequency 195 Percentage 97.01 %

Specialty gynecology/oncology Frequency 5 Percentage 2.48 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 58562

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58563 Tracking Number Original Specialty Recommended RVU: **4.62**
Presented Recommended RVU: **4.62**
Global Period: 000 RUC Recommended RVU: **4.62**

CPT Descriptor: Hysteroscopy, surgical; with endometrial ablation (eg, endometrial resection, electrosurgical ablation, thermoablation)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 44 year old woman presents for management of menorrhagia, unresponsive to medical management. A hysteroscopy with endometrial ablation is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 45%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 14%

Description of Pre-Service Work: Review previous work-ups. Update history and physical examination. Communicate with the patient and/or family to explain the indications for the procedure, as well as the operative risks and benefits, and to obtain informed consent. Verify all necessary equipment and supplies are available and compatible. Confirm proper positioning (high dorsal lithotomy). Scrub, dress and wait. Time out is performed.

Description of Intra-Service Work: A bimanual pelvic examination is performed to assess uterine size, position, and mobility. The adnexa and posterior cul de sac are palpated for the presence of masses or nodularity. The bladder is drained with a catheter. The cervix is progressively dilated to accommodate the diagnostic hysteroscope. The hysteroscope is inserted and the physician confirms proper pressure setting of the pump or gravity flow to adequately distend the endometrial cavity. The entire endometrial cavity is examined, including the anterior, posterior, fundal, and lateral walls and bilateral tubal ostia. The endocervical canal is examined. A curettage may be performed. The entire endometrium is ablated. Fluid volumes are continuously monitored. The hysteroscope is removed from the uterus. The cervix is checked for bleeding from a puncture site or laceration. All instruments are removed from the vagina and cervix.

Description of Post-Service Work: The patient is transferred to a stretcher and escorted to the recovery room. Monitor patient's stability in the recovery room. Write orders. Dictate operative report. Communicate with patient, family, and other health care professionals. Pay careful attention to fluid volume and electrolyte status. Order/manage medications. Discharge management includes the physician's final examination of the patient, instructions for continuing care, and preparation of discharge records.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.93	0.57
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.64	0.29
Urgency of medical decision making	0.29	0.43

Technical Skill/Physical Effort (Mean)

Technical skill required	0.14	1.29
Physical effort required	0.21	1.14

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.57	0.71
Outcome depends on the skill and judgment of physician	0.29	0.71
Estimated risk of malpractice suit with poor outcome	0.43	1.00

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.57	0.71

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY2010. CPT Code 58555 *hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D&C* was one of the codes identified by CMS review.

Methodology

ACOG identified CPT Codes 58555, 58559, 58560, 58561, 58562 and 58563 as part of the family. The Research Subcommittee approved updated vignettes for this family of codes. The RS also approved the use of targeted samples for this family of codes. The 'targeted samples' were sub-specialty organizations (i.e. the American Association of Gynecologic Laparoscopists and the Society of Gynecologic Oncology). The surveys were sent to 3045 US practicing MDs:

- AAGL – 1000 randomly selected US/MDs
- SGO – 1045 all US/MD membership
- ACOG – 1000 randomly selected US/MDs

Intensity

A significant change in technology and the patient population has occurred since these codes were last valued at the RUC. Hysterectomy rates both open and minimally invasive continue to decline yearly in the United States. This statistic is directly related to improvements in both medical and surgical technology. Most significantly, advances in hysteroscopic technology allow us now to treat women with this uterine sparing procedure who would have had a hysterectomy in 1997. In addition, advances in endometrial ablative techniques allow us to provide relief to women from dysfunctional bleeding, a leading cause of hysterectomy.

Specifically, improvements to optics, and pump inflation systems allow greater and more accurate visualization. While this is likely to decrease intraservice time, it is also likely to allow us to attempt to manipulate and correct larger more clinically significant lesions. This may decrease surveyed intraservice times, but increases the intensities during the same or lessor time frames. Second,

improvements in design and safety of instruments to be used for resection, allow us to attempt removal of larger more complex lesions, in more difficult and challenging locations. Third, with the advent of improved pump systems, the risk of significant injury due to intravasation of fluid has increased and this can lead to electrolyte disturbances, cerebral edema and cardiovascular collapse.

Therefore, while technology has allowed intraservice time to decrease, the cases we are doing and patients we are caring for have become more complex and therefore the intensity is higher.

We are recommending a crosswalk value of 4.62 for CPT Code 58563. We believe our recommendation compares favorably within our specialty and maintains relativity within the fee schedule.

Pre and Post Service Time Packages

We recommend pre-service package 3 *straightforward patient/difficult procedure* and post-service package 9B *General Anesthesia or Complex Regional Block/Complex Procedure.* We included 5 additional minutes in positioning time for the Dorsal Lithotomy position.

Crosswalk Recommendation

The specialty society is recommending a crosswalk value of 4.62 work RVUs for CPT Code 58563. The survey median was 5.73 for CPT Code 58563. The survey's 25th percentile work RVU was 3.98. The consensus panel felt the median value was too high, while the 25th percentile was too low. The consensus panel selected 52234 as a crosswalk value for 58563. This crosswalk code relates to the family as discussed in several of the previous surveyed recommendations and has similar times. The work RVU of 4.62 maintains relativity within this code and lines up nicely with our work recommendation for 58558, which has the same intra time and a work recommendation of 4.63.

Reference Codes

Our recommendation compares favorably to reference codes 52282 *Cystourethroscopy, with insertion of permanent urethral stent* and 59072 *Fetal umbilical cord occlusion, including ultrasound guidance.*

CPT code 52282 involves using a similar scope to introduce a stent, which is similar to CPT code 58563. The work RVU is higher, consistent with the higher intra service time, post service time, total time but lower IWPUT. The dilation and placement of the stent is similar to the dilation of the cervix to place the scope and the ablation device. After placement of the stent, a final look is required to confirm that the stent is in place. After the ablation, a final look to confirm is usually performed.

CPT code 59072 also has a higher work RVU, higher total time but less intensity. It is similar in that a cannula is used to enter the uterus. These two codes are most similar in work to what we do in our code.

MPCs

Our recommendation compares favorably with MPCs 52224 *Cystoscopy with fulgaration of a minor (<5mm) lesion with or without biopsy* and CPT Code 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed.*

CPT Code 52224 has the same intraservice time of 30 minutes, a shorter total time of 79 minutes and an lower IWPUT of 0.1008, and is valued lower at 4.05. CPT Code 37191 also has an intraservice time of 30 minutes, a shorter total time of 83 minutes and an lower IWPUT of 0.1198 and is valued lower at 4.71. Our procedure requires the dilation of the cervix before placing the scope, which is an extra step when compared with cystoscopy. Because the uterus can vary in position, the correct path to dilate will also vary and perforation is not uncommon. This procedure requires either directly resecting the endometrium to the level of myometrium and flushing out the strips of tissue or a global ablation with the associated significant risk of thermal injury to bowel, bladder or vagina. This procedure is done in the OR due to the elevated risk of complications. Thus the increased IWPUT is justifiable.

CPT Code 37191 is usually done as a percutaneous procedure, it can be done in a procedure suite rather than an OR. No special positioning is required. The intensity is higher and thus this code is valued higher. In summary, both codes have the same intraservice time, but significantly less total time and the differences in requested RVU can be tied directly to the intensity of the procedure.

Other Comparisons

Our recommendation compares favorably to CPT Codes 52275 *Cystourethroscopy, with internal urethrotomy; male* and 52234 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; SMALL bladder tumor(s) (0.5 up to 2.0 cm).*

CPT Codes 52275 and 52234 both have the same intraservice time as the surveyed code 58563 but less total time. Similar to our surveyed code, these two other codes require a scope and correct pathologic anatomy. Unlike our code, no dilation of the cervix is necessary. We believe our crosswalk recommendation of 4.62 is appropriate for this surveyed code 58563.

Recommendations within this Code Set

CPT code 58563 is similar to 58558 in how it is performed, it's purpose and the time and intensity thus the internal comparison of work RVU is almost identical as it should be.

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
MPC	52224	4.05	79	*19*	*5*	*5*	30	*20*	0.101
Crosswalk	52234	4.62	79	*19*	*5*	*5*	30	*20*	0.120
SURVEYED	58563	4.62	106	*33*	*8*	*15*	30	*20*	0.104
SURVEYED	58558	4.63	106	*33*	*8*	*15*	30	*20*	0.105
Other	52275	4.69	90	*30*	*0*	*0*	30	*30*	0.112
MPC	37191	4.71	83	*30*	*3*	*5*	30	*15*	0.120
Reference	52282	6.39	120	40			50	30	0.096
Reference	59072	8.99	175	*40*	*30*	*15*	*60*	*30*	0.111

Based on all of these factors we believe a work value of 4.62 is appropriate for CPT Code 58563.

Conclusion

The Society makes the following recommendations based on survey data and relativity within the specialty and the overall fee schedule:

	CPT Code	Work RVU	Total Time	Pre Eval Time	Pre Pos Time	SDW	Intra Time	Post Time	IWPUT
Reference	52287	3.20	58	*7*	*5*	*10*	21	*15*	0.120

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58563

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/gynecology How often? Commonly

Specialty gynecology/oncology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,525
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare Data

Specialty obstetrics/gynecology Frequency 4479 Percentage 98.98 %

Specialty gynecology/oncology Frequency 48 Percentage 1.06 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 59563

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

58560 ***Hysteroscopy, surgical; with division or resection of intrauterine septum (any method)***

58561 ***Hysteroscopy, surgical; with removal of leiomyomata***

58562 ***Hysteroscopy, surgical; with removal of impacted foreign body***

58563 ***Hysteroscopy, surgical; with endometrial ablation (eg, endometrial resection, electrosurgical ablation, thermoablation)***

Global Period: 000 **Meeting Date:** January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The specialty convened a RUC workgroup to make practice expense recommendations for this set of hysteroscopy codes. It included physicians from ACOG and its subspecialties. The group was representative of various practice settings and geographic locations.

We are making recommendations to continue to price the subset of codes that is currently priced in the office setting. We are also recommending that the codes currently NOT priced (58559, 58560 and 58561) remain not priced.

We noted that the clinical labor times for 58563 do not line up with the other codes in the family. We have researched this issue with the AMA staff and have included the current rolled up times on the spreadsheet. We are making clinical time recommendations on typical practice patterns (as are in the other codes).

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

This set is a set of exiting hysteroscopy codes. As such, we included the existing inputs on the practice expense sheet as a reference.

AT MEETING

CPT Code: 58555-58563
Specialty Society('s): ACOG

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are requesting extensive use of clinical staff time in the non-facility setting (which is what is currently assigned to this codes).

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We are making supply/equipment changes to CPT Code 58558 based on new technology. We are adding a disposable blade to the supply list for 58558. We are also adding a H/S system and a fluid management system to 58558. An invoice is attached for your reference.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
**Extensive use of clinical staff time*

- Complete pre-service diagnostic and referral forms: During this time frame, the staff must obtain the referral from the patient's physician and obtain pre-authorization from the 3rd party payer. Pre-authorization requires providing all of the demographic data on the patient as well as the proposed procedure and diagnosis that necessitates performing the procedure. The patient is then notified of her procedure date and time.
- Coordinate pre-service surgery: The staff must ensure that all pertinent from diagnostic testing previously performed is available to the physician performing the procedure. This may include the pathology report if an endometrial biopsy has been performed or the imaging reports from a transvaginal ultrasound or saline infusion sonohysterogram.
- Provide pre-education/obtain consent: The staff will answer additional questions that the patient may have regarding her procedure or additional questions that the patient may have regarding the risks and benefits of the procedure.
- Follow-up phone calls and prescriptions: The staff makes sure that the patient has obtained any pre-medication that has been ordered and understands when to take the medication, and that she understands all of her preoperative instructions (NPO, when to arrive, what to expect post-operatively).

Formatted: Superscript

Intra-Service Clinical Labor Activities:

- Greet/gown patient
- Vital signs
- Prepare room/equipment
- Set-up scope
- Prepare and position patient
- Assist Physician – 100%
- Clean room
- Clean scope
- Check dressings

Post-Service Clinical Labor Activities:

AT MEETING

CPT Code: 58555-58563
Specialty Society(‘s): ACOG

- Follow up phone call

Global Period: 000 **Meeting Date:** January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The specialty convened a RUC workgroup to make practice expense recommendations for this set of hysteroscopy codes. It included physicians from ACOG and its subspecialties. The group was representative of various practice settings and geographic locations.

We are making recommendations to continue to price the subset of codes that is currently priced in the office setting. We are also recommending that the codes currently NOT priced (58559, 58560 and 58561) remain not priced.

We noted that the clinical labor times for 58563 do not line up with the other codes in the family. We have researched this issue with the AMA staff and have included the current rolled up times on the spreadsheet. We are making clinical time recommendations on typical practice patterns (as are in the other codes).

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

This set is a set of exiting hysteroscopy codes. As such, we included the existing inputs on the practice expense sheet as a reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are requesting extensive use of clinical staff time in the facility setting (which is what is currently assigned to this codes). We continue to believe that these surgical procedures, although assigned zero day global periods, still require the clinical staff pre-time as surgical procedures with 010/090 as the tasks are the same.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
New and Revised Issue Carried over from October 2015 RUC meeting

January 2016

Intracranial Endovascular Intervention

In February 2015, the CPT Editorial Panel created three new codes to describe percutaneous endovascular revascularization of occluded cerebral vessels and intracranial prolonged infusion of agents that do not involve thrombolytic agents. CPT codes 61640-61642 were identified as part of that family of services. The specialty societies indicated the balloon dilatation of intracranial vasospasm codes are not part of the family of services. These services are of the same anatomic distribution but a completely different intervention and are not commonly used. Additionally, these codes assume that a separate diagnostic angiography is reported prior to the intervention. The specialty societies indicated that this would be very confusing for surveyees to value the variable coding techniques for both sets of services. The RUC determined that although CPT codes 61640-61642 may present difficulties in conducting a survey, it has been nearly 10 years since their last RUC review and they should be surveyed. The RUC recommended that CPT codes 61640-61642 be surveyed for October 2015.

At the October 2015 RUC meeting the specialty societies indicated they had used the wrong survey instrument. The specialty societies believe that the patients receiving these services will return to the ICU after the procedure and additional Evaluation and Management (E/M) work at the bedside and in the ICU later the same day will be necessary. The specialty society agreed to survey with the Research Committee approved 000-day global survey instrument modified with the site of service and same day E/M questions to determine the typical work on the day of the procedure. CPT codes 61645, 61650 and 61651 were surveyed with a modified 000-day global period survey and a post-operative visit was included in the RUC recommended values. The specialty requested that CPT 61640 be resurveyed with the modified survey instrument for January 2016. Since CPT code 61640 is the base code for 61641 and 61642, the RUC requested that the specialty societies resurvey all three codes for the January 2016 RUC meeting.

61640 ***Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel***
The RUC agreed that there was compelling evidence that the current value may not be appropriate due to flawed methodology in the previous valuation of these services. Originally this service was surveyed as a 090-day global and then a building block methodology was used to recommend the current work RVU.

The RUC reviewed the survey results from 73 physicians and determined that the survey 25th percentile work RVU of 13.00 appropriately accounts for the work required to perform this service. The RUC recommends 58 minutes pre-service time, 90 minutes intra-service time, 30 minutes immediate post-service time and one99233. During the intra-service period, typically there is a single waiting period, but if there is rebound stenosis period the physician would have to further intervene. The RUC understood that the patient is assessed over 4-6 hours and can

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

deteriorate quickly in a short amount of time and must be assessed frequently. The specialty society noted that the physician performing the procedure will conduct a 99233 hospital visit to assess the efficacy of the procedure neurologically, review radiographic images to determine if stroke has been extended or hemorrhage occurred, and manage ICP issues of this hyper-dynamic critically ill patient. Because vasospasm is progressive, the physician must continually assess if patient requires further intervention. The RUC reviewed the survey data and noted that the diagnostic angiography is reported separately and that work is not included in this service. The RUC compared the surveyed code to the top two key reference services 37231 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 15.00 and 135 minutes intra-service time) and 92941 *Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single vessel* (work RVU = 12.56 and 70 minutes intra-service time) and noted that the surveyed service falls in between these two services regarding the physician work and time required. Therefore, the survey 25th percentile work RVU of 13.00 is appropriate relative to similar services. **The RUC recommends a work RVU of 13.00 for CPT code 61640.**

61641 ***Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 73 physicians and determined that the median and survey 25th percentile work RVUs are too high, noting the top two key reference services chosen required more physician work and time and were not comparable. The RUC recommends maintaining the work RVU of 4.33 for CPT code 61641. The RUC recommends 30 minutes intra-service time, as was indicated by the survey respondents. For additional support, the RUC referenced CPT code 36228 *Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure)* (work RVU = 4.25 and 30 minutes intra-service time) and the RUC noted that CPT code 61641 actually includes the work of 36228 plus somewhat more. **The RUC recommends a work RVU of 4.33 for CPT Code 61641.**

61642 ***Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 69 physicians and determined that the median and survey 25th percentile work RVUs are too high, noting the top two key reference services chosen required more physician work and time and were not comparable. The RUC recommends directly crosswalking 61642 to CPT code 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for separate procedure)* (work RVU = 6.50 and 45 minutes intra-service time). The RUC recommends 45 minutes intra-service time for 61642, as was indicated by the survey respondents. For additional support the RUC referenced CPT code 22614 *Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)* (work RVU = 6.43 and 40 minutes intra-service time). **The RUC recommends a work RVU of 6.50 for CPT code 61642.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
These services are performed in the facility only. The RUC does not recommend any direct practice expense inputs.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
61640	Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel	000	13.00
61641	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)	ZZZ	4.33
61642	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)	ZZZ	6.50

CPT Descriptor: Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old female with recent subarachnoid hemorrhage deteriorates clinically. She undergoes complete cerebral angiography (separately reportable even if performed on the same day), which demonstrates significant spasm of the supraclinoid segment of the right internal carotid artery. After reporting this finding to the attending neurosurgeon, he/she requests balloon dilatation of the spastic segment.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 77%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Perform a targeted H&P. Review imaging and current medications. Review the surgical procedure, postoperative recovery in and out of the hospital, and expected outcome(s) with the patient/family. Sign and mark the operative site. Obtain informed consent. Verify that all necessary surgical instruments, supplies, and devices are available. Review the length and type of anesthesia with the anesthesiologist. Monitor supine positioning on the angiographic table, attachment of monitoring equipment, and insertion of a radial arterial line and Foley catheter. Supervise prepping/draping of the femoral region. Scrub and gown. Perform a time out to confirm patient and procedure with the OR staff.

Description of Intra-Service Work: The common femoral artery is accessed and a sheath is placed under sterile conditions. A bolus dose of intravenous heparin is administered. The ACT is checked. Additional heparin is given as necessary throughout the procedure, and the ACTs are monitored at appropriate intervals. Pressurized, continuous heparin/saline flush systems are prepared. Meticulous examination of these systems is performed by the physician to exclude the possibility of residual air bubbles. Right common carotid artery is selectively catheterized with 5 Fr catheter. Biplane AP and lateral angiograms of the cervical common carotid artery are obtained. If necessary, oblique views are obtained to profile the carotid bifurcation. Biplane AP and lateral (and possibly oblique) angiograms of the intracranial vessels are also obtained to determine that no interval change has occurred since the original diagnostic angiogram. Advance catheter into the external carotid artery over a steerable guidewire. Utilizing an exchange wire placed into the external carotid artery, a neuroguide catheter is placed into the common carotid artery. A common carotid artery angiogram is obtained to confirm appropriate positioning of the guide catheter below the carotid bifurcation and to exclude the possibility of arterial spasm, dissection or thromboembolus during guide catheter placement. The guide catheter is then advanced into the internal

carotid artery over a steerable guide wire. A cervical internal carotid artery angiogram is obtained to confirm appropriate positioning of the guide catheter and to exclude the possibility of arterial spasm, dissection or thromboembolus. Guide catheter is placed on continuous heparin flush utilizing a flow control Y-connector. Biplane AP, lateral and oblique angiograms of the cerebral vessels are obtained. High magnification biplane angiograms are then obtained, centered upon the arterial stenosis. The target lesion must be carefully reassessed for subtle changes that indicate the development of subacute intraluminal thrombus. Precise, quantitative measurements of the stenotic artery are obtained to determine the proper diameter and length of the angioplasty balloon to be used. External reference markers may be placed on the skin in order to calculate the precise dimensions. Prepare appropriate size angioplasty balloon. Meticulous preparation is performed by the physician to eliminate air within the balloon. Advance a steerable micro-guidewire and a low profile microcatheter through the guide catheter into the intracranial arteries using an angiographic roadmap. Gently advance micro-guidewire and microcatheter across the arterial stenosis. Remove the guidewire and replace with an exchange length wire, leaving the wire tip beyond the stenotic area. Remove microcatheter. Advance micro-angioplasty balloon over the exchange wire and across the stenosis. Slowly inflate balloon to dilate the lesion under fluoroscopic control while monitoring balloon pressure. Deflate balloon and withdraw into the internal carotid artery, leaving the guidewire across the stenosis. Obtain post-angioplasty angiograms by injecting contrast through the guide catheter to confirm satisfactory dilation of vessel lumen and antegrade filling of distal blood vessels. Wait fifteen minutes and repeat angiogram to exclude the possibility of hyperacute thrombotic occlusion or rebound stenosis. If evidence of rebound stenosis, replace balloon to re-dilate the lesion or exchange for a larger angioplasty balloon if needed. Again wait fifteen minutes and repeat angiogram to exclude the possibility of hyperacute thrombotic occlusion or rebound stenosis. After a fifteen-minute period of observation with no further evidence of restenosis or acute arterial occlusion, remove the balloon and wire; then obtain final angiograms of the regional circulation to check for possible embolic complications. Remove guide catheter. All fluoroscopy, contrast injection, angiography and image interpretation associated with the arterial stenosis treated is included in the procedure up to this point.

Description of Post-Service Work: Appropriate femoral access care orders are entered into the electronic medical record. The procedure is documented in the chart. A formal procedural report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record. The procedural findings and treatment plans are discussed with the family and referring medical team. During the recovery from anesthesia, hemodynamic parameters are closely evaluated to control hypertension in order to minimize the risk of intracranial hemorrhage. Once the patient has adequately emerged from anesthesia, a complete neurologic assessment is performed. If the patient's neurologic condition (in particular the NIHSS) is significantly lower than the pre-procedure condition, the patient is emergently sent to CT to rule out intracranial or subarachnoid hemorrhage. Appropriate orders for intensive care unit and/or the stroke unit are written. The patient's neurologic condition is relayed to the team and nurses monitoring the patient after the procedure; again to immediately diagnose hemorrhage in the post-procedural period. Specific instructions regarding hemodynamic parameters are also given in order to minimize the risk of hemorrhage. If the patient is uncooperative secondary to her neurologic condition, appropriate sedation and management orders are given with care again to be able to monitor the patient neurologically to diagnose intracranial hemorrhage. The physician will perform an EM later the same day to assess the patient's neurologic condition, review interval chart notes, and update orders as necessary. The patient's progress is recorded. ICU/stroke unit team questions are answer. Family questions are answered. Postoperative imaging studies are ordered.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.19	0.64
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.52	0.79
Urgency of medical decision making	1.76	0.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.76	0.93

Physical effort required	1.19	0.29

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.90	1.43
Outcome depends on the skill and judgment of physician	1.71	1.07
Estimated risk of malpractice suit with poor outcome	1.71	0.86

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.76	1.21

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – 61640, 61641, 61642

For 2005, the CPT Editorial Panel approved new CPT codes (61640, 61641, 61642) to describe procedures involving intracranial angioplasty. Prior to the Panel's action, there were no codes to describe this treatment of patients with impaired cerebral circulation due to arterial narrowing. Angioplasty of the arteries supplying the brain is more complex than peripheral and coronary angioplasty cases necessitating the separate code family. The three codes were surveyed and the RUC submitted recommendations for work and practice expense to CMS. In the MPFS final rule for CY 2005, CMS stated: " *We are assigning a status indicator of N for these services because they are noncovered under Medicare due to a National Coverage Decision (NCD).*" The NCD for these codes remains in effect for CY 2016.

In February 2010, the RAW identified two arterial thrombolysis codes through the 75% reported together screen (37201 and 75896). In October of 2011, the specialty societies presented to the CPT Editorial Panel a code change proposal to bundle these services resulting in four new codes to describe non-coronary transcatheter therapy for thrombolysis bundled with radiologic S&I and E/M services. At that time, 37201 was deleted and 75896 was modified to prohibit its use for thrombolysis. Although the new codes specify non-coronary thrombolysis, the codes were developed and valued to address peripheral thrombolysis, not intracranial interventions. Because no codes were available in the MPFS that adequately described the physician work and intensity of intracranial thrombolysis and thrombectomy, the neurosurgery and radiology societies created three new bundled codes (61645, 61650, 61651) which were approved in February 2015 for CY 2016.

The Level of Interest Form associated with the three new codes for intracranial thrombolysis and mechanical thrombectomy, identified codes 61640-61642 as part of the "family" requiring survey along with the new codes. The specialty societies disagreed and pointed out that the balloon dilatation of intracranial vasospasm is not part of the intracranial thrombolysis family of services. These services are of the same anatomic distribution but a completely different intervention often in a different patient population. Further, we pointed out that 61640-61642 and are not commonly used as they are non-covered services for Medicare beneficiaries. Additionally, these codes assume that a separate diagnostic angiography is reported prior to the intervention. We indicated that this would be very confusing to value the variable coding techniques for both sets of services. The RUC determined that although CPT codes 61640-

61642 may present difficulties in conducting a survey, it has been nearly 10 years since their last RUC review and they should be surveyed.

61640-61642 were surveyed for the October 2015 RUC meeting. While reviewing the survey data for 61640, the specialties noted that the wrong 0-day global survey instrument had been used. These patients will have inpatient status and will return to the ICU after the procedure and additional E/M work at the bedside and in the ICU later the same day will be necessary. Therefore, we requested to resurvey code 61640 using a modified 0-day survey instrument that asks the question about site of service and same day E/M work that is standard for the 10 and 90 day global survey instruments. The RUC approved the request to resurvey and instructed the specialties to resurvey all 3 codes (61640-61642) and to present the data from the previous survey in addition to the new survey data.

Compelling Evidence – 61640, 61641, 61642

The specialty societies are recommending an increase in value concordant with our survey and supported by the following compelling evidence discussion:

Flawed methodology for previous valuation. When new code 61640 was approved by the CPT Editorial Panel in 2005, it was assigned a 90-day global period by CMS and surveyed as a 90-day global using the 90-day global survey instrument and 90-day reference codes. After conducting the survey, the specialties (AANS, CNS, ASNR, SIR) determined that a 90-day global assignment would be inappropriate. The RUC and CMS subsequently agreed that a 90-day global was inappropriate for 61640. To facilitate a recommendation, the societies used reverse building block to back out all visits from the survey data and used that information to calculate an IWPUT and develop a RUC recommendation. The RUC agreed with the intensity recommended by the specialty and the changes in pre-service time. At that time, the RUC used a building block approach to establish a work relative value for code 61640.

For add-on codes 61641 and 61642, the RUC agreed that the intensity for the codes was justified as there is no surgical rescue for procedural complications that occur in the cerebral vasculature. The RUC agreed that based on the specialty society's survey results indicating a very high intensity, and the RUC used a comparison service with and intensity of 0.144 multiplied by the survey time to arrive at a relative work value for each code. The RUC believed the resulting work RVUs were appropriate even though they were below the median survey work RVU results.

Although the circumstances were unusual with a late change in global period and insufficient time to resurvey for the code implementation, the current RUC approved methodology for valuing services does not allow reverse building block or building block. We therefore believe we have compelling evidence that there was a flawed methodology in the previous valuation.

Survey Process – 61640, 61641, 61642

The Research Subcommittee approved ACR survey 50% random sample from ACR entire membership and a non-overlapping 50% random sample from relevant self-identified ACR subspecialties (neuro imaging, neurointerventional, interventional radiology). No responses were received from the random sample from ACR entire membership. SIR, ASNR, and AANS/CNS surveyed a random sample from their entire membership. The Research Subcommittee approved use of a modified 0-day survey instrument that added the question for site of service and E/M on the same day that is standard in the 10 and 90 day global survey.

Recommendation - 61640

We recommend the survey 25th percentile work RVU of 13.00 for code 61640.

Pre-Time Package 4

Evaluation: No change in package time of 40 minutes.
Positioning: No change in package time of 3 minutes.
Scrub, dress, wait: Subtract 5 minutes (total = 15 minutes) to be consistent with the median survey time.

Post-operative Inpatient Visit

The survey respondents correctly indicated that this patient will have the site of service status of hospital inpatient 100% of the time. Further, 77% of the respondents indicated a visit would be typical later the same day. Providers of this service will typically perform additional E/M work at the bedside and in the ICU later the same day to carefully monitor the patient's neurologic condition and review interval chart notes, record patient progress, write orders for imaging and labs, answer family questions, and discuss ongoing care with the ICU team. We recommend one postoperative same-day inpatient critical care hospital visit (99233) as typical for this patient.

Key Reference Comparison

The mean intensity / complexity measures for code 61640 are significantly greater than the key reference codes.

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN	PRE	INTRA	POST	99233
37231	Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed	15.00	0.099	213	48	135	30	
61640	Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel	13.00	0.103	233	58	90	30	1
92941	Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single vessel	12.56	0.155	149	39	70	40	

MPC Comparison

Although, there are no MPC codes with a 0-global period at this level of work RVU, the similar intensity for the MPC codes in the table below support the work RVU recommendation for 61640.

MPC	DESC	IWPUT
99291	Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes	**0.096**
52235	Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)	**0.098**
64484	Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, each additional level (List separately in addition to code for primary procedure)	**0.100**
67820	Correction of trichiasis; epilation, by forceps only	**0.100**
52224	Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) or treatment of MINOR (less than 0.5 cm) lesion(s) with or without biopsy	**0.101**
61640	Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel	**0.103**
33512	Coronary artery bypass, vein only; 3 coronary venous grafts	**0.103**
64479	Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, single level	**0.108**
57288	Sling operation for stress incontinence (eg, fascia or synthetic)	**0.108**
57267	Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)	**0.108**

Comparison Codes with 90 minutes intra-time and 000-global

The following recently reviewed 000-global codes that have 90 minutes of intra-service time support the recommended work RVU of 13.00.

Year	CPT	Descriptor	RVW	IWPUT	Total	PRE	INTRA	POST	99291	99233

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 61640

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Rarely

Specialty interventional radiology How often? Rarely

Specialty diagnostic radiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 111
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare Physician/Supplier Procedure Summary Master File indicates that 111 claims were submitted for code 61640 with the specialty distribution as shown below. None of these claims were paid. Please note: Thirteen claims (11.71%) were also submitted under neurology, possibly representing interventional neurology which does not have a Medicare specialty designation. There was not sufficient space to show this below.

Specialty neurosurgery Frequency 45 Percentage 40.54 %

Specialty interventional radiology Frequency 15 Percentage 13.51 %

Specialty diagnostic radiology Frequency 38 Percentage 34.23 %

Do many physicians perform this service across the United States? Yes

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 61640

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:61641 Tracking Number W2 Original Specialty Recommended RVU: **5.50**
Presented Recommended RVU: **4.33**
Global Period: ZZZ RUC Recommended RVU: **4.33**

CPT Descriptor: Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male with recent subarachnoid hemorrhage. Complete cerebral angiography (separately reportable even if performed on the same day) demonstrated significant vasospasm in the supraclinoid left internal carotid artery and the M1 segment of the left middle cerebral artery. After reporting this finding to the attending neurosurgeon, he/she requests balloon dilatation of the spastic segments. The internal carotid spasm balloon dilatation is completed (separately reportable) and the M1 segment spasm is now to be balloon dilated.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A second bolus dose of intravenous heparin is administered, as appropriate. The ACT is checked. Additional heparin is given as necessary throughout the procedure, and the ACTs are monitored at appropriate intervals. Biplane AP, lateral and oblique angiograms of the cerebral vessels are obtained. High magnification biplane angiograms are then obtained, centered upon the arterial stenosis. The target lesion must be carefully reassessed for subtle changes that indicate the development of subacute intraluminal thrombus, which is a contraindication to performance of angioplasty. Precise, quantitative measurements of the stenotic artery are obtained to determine the proper diameter and length of the angioplasty balloon to be used. External reference markers may be placed on the skin in order to calculate the precise dimensions. Prepare appropriate size angioplasty balloon. Meticulous preparation is performed by the physician to eliminate the air within the balloon. Advance a steerable micro-guidewire and a low profile microcatheter through the guide catheter into the 2nd target intracranial artery(s) (additional vessel, same vascular family) using an angiographic roadmap. Gently advance micro-guidewire and microcatheter across the arterial stenosis. Remove the guidewire and replace with an exchange length wire, leaving the wire tip beyond the stenotic area. Remove microcatheter. Advance micro-angioplasty balloon over the exchange wire and across the stenosis. Slowly inflate balloon to dilate the lesion under fluoroscopic control while monitoring balloon pressure. Deflate balloon and withdraw into the internal carotid artery, leaving the guidewire across the stenosis. Obtain post-angioplasty angiograms by injecting contrast through the guide catheter to confirm satisfactory dilation of vessel lumen and antegrade filling of distal blood vessels. Wait fifteen minutes

and repeat angiogram to exclude the possibility of hyperacute thrombotic occlusion or rebound stenosis. If evidence of rebound stenosis, replace balloon to re-dilate the lesion or exchange for a larger angioplasty balloon if needed. Again wait fifteen minutes and repeat angiogram to exclude the possibility of hyperacute thrombotic occlusion or rebound stenosis. After a fifteen-minute period of observation with no further evidence of restenosis or acute arterial occlusion, remove the balloon and wire; then obtain final angiograms of the regional circulation to check for possible embolic complications. Remove guide catheter. All fluoroscopy, contrast injection, angiography and image interpretation associated with the arterial stenosis treated is included in the procedure up to this point.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.80	1.13
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.13	1.47
Urgency of medical decision making	1.73	1.80
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.27	1.73

Physical effort required	0.60	1.20
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.00	1.87
Outcome depends on the skill and judgment of physician	1.33	1.67
Estimated risk of malpractice suit with poor outcome	1.33	1.47

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.13	1.87

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – 61640, 61641, 61642

For 2005, the CPT Editorial Panel approved new CPT codes (61640, 61641, 61642) to describe procedures involving intracranial angioplasty. Prior to the Panel's action, there were no codes to describe this treatment of patients with impaired cerebral circulation due to arterial narrowing. Angioplasty of the arteries supplying the brain is more complex than peripheral and coronary angioplasty cases necessitating the separate code family. The three codes were surveyed and the RUC submitted recommendations for work and practice expense to CMS. In the MPFS final rule for CY 2005, CMS stated: " *We are assigning a status indicator of N for these services because they are noncovered under Medicare due to a National Coverage Decision (NCD).*" The NCD for these codes remains in effect for CY 2016.

In February 2010, the RAW identified two arterial thrombolysis codes through the 75% reported together screen (37201 and 75896). In October of 2011, the specialty societies presented to the CPT Editorial Panel a code change proposal to bundle these services resulting in four new codes to describe non-coronary transcatheter therapy for thrombolysis bundled with radiologic S&I and E/M services. At that time, 37201 was deleted and 75896 was modified to prohibit its use for thrombolysis. Although the new codes specify non-coronary thrombolysis, the codes were developed and valued to address peripheral thrombolysis, not intracranial interventions. Because no codes were available in the MPFS that adequately described the physician work and intensity of intracranial thrombolysis and thrombectomy, the neurosurgery and radiology societies created three new bundled codes (61645, 61650, 61651) which were approved in February 2015 for CY 2016.

The Level of Interest Form associated with the three new codes for intracranial thrombolysis and mechanical thrombectomy, identified codes 61640-61642 as part of the "family" requiring survey along with the new codes. The specialty societies disagreed and pointed out that the balloon dilatation of intracranial vasospasm is not part of the intracranial thrombolysis family of services. These services are of the same anatomic distribution but a completely different intervention often in a different patient population. Further, we pointed out that 61640-61642 and are not commonly used as they are non-covered services for Medicare beneficiaries. Additionally, these codes assume that a separate diagnostic angiography is reported prior to the intervention. We indicated that this would be very confusing to value the variable coding techniques for both sets of services. The RUC determined that although CPT codes 61640-

61642 may present difficulties in conducting a survey, it has been nearly 10 years since their last RUC review and they should be surveyed.

61640-61642 were surveyed for the October 2015 RUC meeting. While reviewing the survey data for 61640, the specialties noted that the wrong 0-day global survey instrument had been used. These patients will have inpatient status and will return to the ICU after the procedure and additional E/M work at the bedside and in the ICU later the same day will be necessary. Therefore, we requested to resurvey code 61640 using a modified 0-day survey instrument that asks the question about site of service and same day E/M work that is standard for the 10 and 90 day global survey instruments. The RUC approved the request to resurvey and instructed the specialties to resurvey all 3 codes (61640-61642) and to present the data from the previous survey in addition to the new survey data.

Compelling Evidence – 61640, 61641, 61642

The specialty societies are recommending an increase in value concordant with our survey and supported by the following compelling evidence discussion:
Flawed methodology for previous valuation. When new code 61640 was approved by the CPT Editorial Panel in 2005, it was assigned a 90-day global period by CMS and surveyed as a 90-day global using the 90-day global survey instrument and 90-day reference codes. After conducting the survey, the specialties (AANS, CNS, ASNR, SIR) determined that a 90-day global assignment would be inappropriate. The RUC and CMS subsequently agreed that a 90-day global was inappropriate for 61640. To facilitate a recommendation, the societies used reverse building block to back out all visits from the survey data and used that information to calculate an IWPUT and develop a RUC recommendation. The RUC agreed with the intensity recommended by the specialty and the changes in pre-service time. At that time, the RUC used a building block approach to establish a work relative value for code 61640.

For add-on codes 61641 and 61642, the RUC agreed that the intensity for the codes was justified as there is no surgical rescue for procedural complications that occur in the cerebral vasculature. The RUC agreed that based on the specialty society's survey results indicating a very high intensity, and the RUC used a comparison service with and intensity of 0.144 multiplied by the survey time to arrive at a relative work value for each code. The RUC believed the resulting work RVUs were appropriate even though they were below the median survey work RVU results.

Although the circumstances were unusual with a late change in global period and insufficient time to resurvey for the code implementation, the current RUC approved methodology for valuing services does not allow reverse building block or building block. We therefore believe we have compelling evidence that there was a flawed methodology in the previous valuation.

Survey Process – 61640, 61641, 61642

The Research Subcommittee approved ACR survey 50% random sample from ACR entire membership and a non-overlapping 50% random sample from relevant self-identified ACR subspecialties (neuro imaging, neurointerventional, interventional radiology). No responses were received from the random sample from ACR entire membership. SIR, ASNR, and AANS/CNS surveyed a random sample from their entire membership. The Research Subcommittee approved use of a modified 0-day survey instrument that added the question for site of service and E/M on the same day that is standard in the 10 and 90 day global survey.

Recommendation - 61641

Key Reference Comparison

The mean intensity / complexity measures for code 61641 are appropriately significantly greater than the key reference codes which are both typically performed in an office setting.

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN
61641	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)	4.33	0.144	30
37233	Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)	6.50	0.108	62
37235	Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)	7.80	0.097	82

MPC Comparison

There are no MPC codes with a ZZZ global period at this level of work RVU.

Other Code Comparison

RUC-reviewed codes with a ZZZ global, as shown in the table below, support the recommendation for 61641.

CPT	DESC	IWPUT
33572	Coronary endarterectomy, open, any method, of left anterior descending, circumflex, or right coronary artery performed in conjunction with coronary artery bypass graft procedure, each vessel (List separately in addition to primary procedure)	0.148
67225	Destruction of localized lesion of choroid (eg, choroidal neovascularization); photodynamic therapy, second eye, at single session (List separately in addition to code for primary eye treatment)	0.157
22614	Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)	0.161
61610	Transection or ligation, carotid artery in cavernous sinus, with repair by anastomosis or graft (List separately in addition to code for primary procedure)	0.165
61641	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)	0.144
33924	Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure)	0.183
32501	Resection and repair of portion of bronchus (bronchoplasty) when performed at time of lobectomy or segmentectomy (List separately in addition to code for primary procedure)	0.187
22840	Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)	0.209
33768	Anastomosis, cavopulmonary, second superior vena cava (List separately in addition to primary procedure)	0.267

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 61641 and 61642 in conjunction with 61640)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 61641

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Rarely

Specialty interventional radiology How often? Rarely

Specialty diagnostic radiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. nationale utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 56 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare Physician/Supplier Procedure Summary Master File indicates that 56 claims were submitted for code 61641 with the specialty distribution as shown below. None of these claims were paid. Please note: Seven claims (12.5%) were also submitted under neurology, possibly representing interventional neurology which does not have a Medicare specialty designation. There was not sufficient space to show this below.

Specialty neurosurgery Frequency 33 Percentage 58.92 %

Specialty interventional radiology Frequency 5 Percentage 8.92 %

Specialty diagnostic radiology Frequency 11 Percentage 19.64 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:61642 Tracking Number W3 Original Specialty Recommended RVU: **7.80**
Presented Recommended RVU: **7.80**
Global Period: ZZZ RUC Recommended RVU: **6.50**

CPT Descriptor: Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male with recent subarachnoid hemorrhage. Complete cerebral angiography (separately reportable even if performed on the same day) demonstrated significant vasospasm in the supraclinoid LEFT internal carotid artery and the M1 segment of the RIGHT middle cerebral artery. After reporting this finding to the attending neurosurgeon, he/she requests balloon dilatation of the spastic segments. The LEFT internal carotid spasm balloon dilatation is completed (separately reportable) and the RIGHT M1 segment spasm is now to be dilated.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A second bolus dose of intravenous heparin may be administered. The ACT is checked. Additional heparin is given as necessary throughout the procedure, and the ACTs are monitored at appropriate intervals. Pressurized, continuous heparin/saline flush systems are prepared. Meticulous examination of these systems is performed by the physician to exclude the possibility of residual air bubbles. The left common carotid artery is selectively catheterized with 5 Fr catheter. Biplane AP and lateral angiograms of the cervical common carotid artery are obtained. If necessary, oblique views are obtained to profile carotid the carotid bifurcation. Biplane AP and lateral (and possibly oblique) angiograms of the intracranial vessels are also obtained to determine that no interval change has occurred since the original diagnostic angiogram. Advance catheter into the external carotid artery over a steerable guidewire. Utilizing an exchange wire placed into the external carotid artery, a neuroguide catheter is placed into the common carotid artery. A common carotid artery angiogram is obtained to confirm appropriate positioning of the guide catheter below the carotid bifurcation and to exclude the possibility of arterial spasm, dissection or thromboembolus during guide catheter placement. The guide catheter is then advanced into the internal carotid artery over a steerable guide wire. A cervical internal carotid artery angiogram is obtained to confirm appropriate positioning of the guide catheter and to exclude the possibility of arterial spasm, dissection or thromboembolus. Guide catheter is placed on continuous heparin flush utilizing a flow control Y-connector. Biplane AP, lateral and oblique angiograms of the cerebral vessels are obtained. High magnification biplane angiograms are then obtained, centered upon the arterial stenosis. The target lesion must be carefully reassessed for subtle

changes that indicate the development of subacute intraluminal thrombus, which is a contraindication to performance of angioplasty. Precise, quantitative measurements of the stenotic artery are obtained to determine the proper diameter and length of the angioplasty balloon to be used. External reference markers may be placed on the skin in order to calculate the precise dimensions. Prepare appropriate size angioplasty balloon. Meticulous preparation is performed by the physician to eliminate the air within the balloon. Advance a steerable micro-guidewire and a low profile microcatheter through the guide catheter into the additional vessel, in different vascular family from vessel coated in 6162X3. Gently advance micro-guidewire and microcatheter across the arterial stenosis. Remove the guidewire and replace with an exchange length wire, leaving the wire tip beyond the stenotic area. Remove microcatheter. Advance micro-angioplasty balloon over the exchange wire and across the stenosis. Slowly inflate balloon to dilate the lesion under fluoroscopic control while monitoring balloon pressure. Deflate balloon and withdraw into internal carotid artery, leaving the guidewire across the stenosis. Obtain post-angioplasty angiograms by injecting contrast through the guide catheter to confirm satisfactory dilation of vessel lumen and antegrade filling of distal blood vessels. Wait fifteen minutes and repeat angiogram to exclude the possibility of hyperacute thrombotic occlusion or rebound stenosis. If evidence of rebound stenosis, replace balloon to re-dilate the lesion or exchange for a larger angioplasty balloon if needed. Again wait fifteen minutes and repeat angiogram to exclude the possibility of hyperacute thrombotic occlusion or rebound stenosis. After a fifteen-minute period of observation with no further evidence of restenosis or acute arterial occlusion, remove the balloon and wire; then obtain final angiograms of the regional circulation to check for possible embolic complications. Remove guide catheter. All fluoroscopy, contrast injection, angiography and image interpretation associated with the arterial stenosis treated is included in the procedure up to this point.

Description of Post-Service Work: N/A

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2016

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.70	0.89
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.30	1.47
Urgency of medical decision making	1.70	1.74
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.57	1.63

Physical effort required	0.96	0.89
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	1.96	1.89
Outcome depends on the skill and judgment of physician	1.48	1.58
Estimated risk of malpractice suit with poor outcome	1.39	1.58

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.65	1.79

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – 61640, 61641, 61642

For 2005, the CPT Editorial Panel approved new CPT codes (61640, 61641, 61642) to describe procedures involving intracranial angioplasty. Prior to the Panel's action, there were no codes to describe this treatment of patients with impaired cerebral circulation due to arterial narrowing. Angioplasty of the arteries supplying the brain is more complex than peripheral and coronary angioplasty cases necessitating the separate code family. The three codes were surveyed and the RUC submitted recommendations for work and practice expense to CMS. In the MPFS final rule for CY 2005, CMS stated: " *We are assigning a status indicator of N for these services because they are noncovered under Medicare due to a National Coverage Decision (NCD).*" The NCD for these codes remains in effect for CY 2016.

In February 2010, the RAW identified two arterial thrombolysis codes through the 75% reported together screen (37201 and 75896). In October of 2011, the specialty societies presented to the CPT Editorial Panel a code change proposal to bundle these services resulting in four new codes to describe non-coronary transcatheter therapy for thrombolysis bundled with radiologic S&I and E/M services. At that time, 37201 was deleted and 75896 was modified to prohibit its use for thrombolysis. Although the new codes specify non-coronary thrombolysis, the codes were developed and valued to address peripheral thrombolysis, not intracranial interventions. Because no codes were available in the MPFS that adequately described the physician work and intensity of intracranial thrombolysis and thrombectomy, the neurosurgery and radiology societies created three new bundled codes (61645, 61650, 61651) which were approved in February 2015 for CY 2016.

The Level of Interest Form associated with the three new codes for intracranial thrombolysis and mechanical thrombectomy, identified codes 61640-61642 as part of the "family" requiring survey along with the new codes. The specialty societies disagreed and pointed out that the balloon dilatation of intracranial vasospasm is not part of the intracranial thrombolysis family of services. These services are of the same anatomic distribution but a completely different intervention often in a different patient population. Further, we pointed out that 61640-61642 and are not commonly used as they are non-covered services for Medicare beneficiaries. Additionally, these codes assume that a separate diagnostic angiography is reported prior to the intervention. We indicated that this would be very confusing to value the variable coding techniques for both sets of services. The RUC determined that although CPT codes 61640-

61642 may present difficulties in conducting a survey, it has been nearly 10 years since their last RUC review and they should be surveyed.

61640-61642 were surveyed for the October 2015 RUC meeting. While reviewing the survey data for 61640, the specialties noted that the wrong 0-day global survey instrument had been used. These patients will have inpatient status and will return to the ICU after the procedure and additional E/M work at the bedside and in the ICU later the same day will be necessary. Therefore, we requested to resurvey code 61640 using a modified 0-day survey instrument that asks the question about site of service and same day E/M work that is standard for the 10 and 90 day global survey instruments. The RUC approved the request to resurvey and instructed the specialties to resurvey all 3 codes (61640-61642) and to present the data from the previous survey in addition to the new survey data.

Compelling Evidence – 61640, 61641, 61642

The specialty societies are recommending an increase in value concordant with our survey and supported by the following compelling evidence discussion:
Flawed methodology for previous valuation. When new code 61640 was approved by the CPT Editorial Panel in 2005, it was assigned a 90-day global period by CMS and surveyed as a 90-day global using the 90-day global survey instrument and 90-day reference codes. After conducting the survey, the specialties (AANS, CNS, ASNR, SIR) determined that a 90-day global assignment would be inappropriate. The RUC and CMS subsequently agreed that a 90-day global was inappropriate for 61640. To facilitate a recommendation, the societies used reverse building block to back out all visits from the survey data and used that information to calculate an IWPUT and develop a RUC recommendation. The RUC agreed with the intensity recommended by the specialty and the changes in pre-service time. At that time, the RUC used a building block approach to establish a work relative value for code 61640.

For add-on codes 61641 and 61642, the RUC agreed that the intensity for the codes was justified as there is no surgical rescue for procedural complications that occur in the cerebral vasculature. The RUC agreed that based on the specialty society's survey results indicating a very high intensity, and the RUC used a comparison service with and intensity of 0.144 multiplied by the survey time to arrive at a relative work value for each code. The RUC believed the resulting work RVUs were appropriate even though they were below the median survey work RVU results.

Although the circumstances were unusual with a late change in global period and insufficient time to resurvey for the code implementation, the current RUC approved methodology for valuing services does not allow reverse building block or building block. We therefore believe we have compelling evidence that there was a flawed methodology in the previous valuation.

Survey Process – 61640, 61641, 61642

The Research Subcommittee approved ACR survey 50% random sample from ACR entire membership and a non-overlapping 50% random sample from relevant self-identified ACR subspecialties (neuro imaging, neurointerventional, interventional radiology). No responses were received from the random sample from ACR entire membership. SIR, ASNR, and AANS/CNS surveyed a random sample from their entire membership. The Research Subcommittee approved use of a modified 0-day survey instrument that added the question for site of service and E/M on the same day that is standard in the 10 and 90 day global survey.

Recommendation - 61642

Key Reference Comparison

The mean intensity / complexity measures for code 61642 are appropriately significantly greater than the key reference code 37235 which is typically performed in an office setting and appropriately higher than code 33884 (electively placing a prosthetic extension for an endoleak of a previous endovascular repair).

CPT	DESCRIPTOR	RVW	IWPUT	TOT MIN
61642	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)	6.50	0.144	45
37235	Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)	7.80	0.097	82
33884	Placement of proximal extension prosthesis for endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); each additional proximal extension (List separately in addition to code for primary procedure)	8.20	0.137	60

MPC Comparison

There are no MPC codes with a ZZZ global period at this level of work RVU.

Other Code Comparison

RUC-reviewed codes with a ZZZ global, as shown in the table below, support the recommendation for 61642.

CPT	DESC	IWPUT
33572	Coronary endarterectomy, open, any method, of left anterior descending, circumflex, or right coronary artery performed in conjunction with coronary artery bypass graft procedure, each vessel (List separately in addition to primary procedure)	0.148
67225	Destruction of localized lesion of choroid (eg, choroidal neovascularization); photodynamic therapy, second eye, at single session (List separately in addition to code for primary eye treatment)	0.157
22614	Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)	0.161
61610	Transection or ligation, carotid artery in cavernous sinus, with repair by anastomosis or graft (List separately in addition to code for primary procedure)	0.165
61642	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)	0.144
33924	Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure)	0.183
32501	Resection and repair of portion of bronchus (bronchoplasty) when performed at time of lobectomy or segmentectomy (List separately in addition to code for primary procedure)	0.187
22840	Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)	0.209
33768	Anastomosis, cavopulmonary, second superior vena cava (List separately in addition to primary procedure)	0.267

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 61641 and 61642 in conjunction with 61640)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 61642

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Rarely

Specialty interventional radiology How often? Rarely

Specialty diagnostic radiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 31 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare Physician/Supplier Procedure Summary Master File indicates that 31 claims were submitted for code 61642 with the specialty distribution as shown below. None of these claims were paid. Please note: Two claims (6.45%) were also submitted under neurology, possibly representing interventional neurology which does not have a Medicare specialty designation. There was not sufficient space to show this below.

Specialty neurosurgery Frequency 12 Percentage 38.70 %

Specialty interventional radiology Frequency 6 Percentage 19.35 %

Specialty diagnostic radiology Frequency 11 Percentage 35.48 %

Do many physicians perform this service across the United States? Yes

---

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT	DESCRIPTOR	GLOBAL
61640	Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel	**000**
61641	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)	ZZZ
61642	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)	ZZZ

Meeting Date April 2015

These patients will be inpatient prior to and after these procedures 100% of the time.
No clinical staff time, supplies or equipment is recommended.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: N/A

Intra-Service Clinical Labor Activities: N/A

Post-Service Clinical Labor Activities: N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

MRI Face and Neck

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 70543 was identified by this screen and 70540 and 70542 were included as part of the family. These services were presented for review of physician work and practice expense at the January 2016 RUC meeting.

Prior to reviewing the survey results for these MRI face and neck codes, the RUC discussed the physician time components and evolving physician work for the entire family. First, the RUC noted that the current physician time components are flawed. CPT code 70540 has CMS/Other time of 28 minutes, which as the RUC has noted previously, is not surveyed time and is the result of a single CMS official assigning time in rulemaking over 20 years ago. Also, for codes 70542 and 70543, last surveyed in 2000, the intra-service time for these procedures is identical. In every other MRI family, there are services for "with contrast" and "with and without contrast" which have an incremental increase in intra-service time for the most complex work "with and without contrast." These current surveys correct that error.

Second, although the specialty societies did not present compelling evidence, the physician work involved in these procedures has changed substantially since the last the last valuation over 15 years ago. Modern pulse sequences allow thinner slice profiles, leading to an increase in the number of images typically acquired. The thinner slice profile has led to the detection of subtle abnormalities not visible with older techniques. This includes detection of perineural inflammation, perineural tumor spread, tumor cellularity and vascularity, as well as intracranial extension via skull base foramen.

Given these arguments, the RUC agreed that while the surveys show changes in the physician times for these procedures, the current work RVUs, which are appropriately aligned relative to the other MRI brain and spine families, should remain the same.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

70540 ***Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s)***
The RUC reviewed the survey results from 56 practicing radiologists and neuroradiologists and agreed with the following survey median times: pre-service evaluation time of 5 minutes, intra-service time of 19 minutes and immediate post-service time of 5 minutes.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overvalued the procedure with a 25th percentile work RVU of 1.55. Therefore, the RUC recommended the current work RVU of 1.35 for CPT code 70540. To justify a work RVU of 1.35, the RUC compared the surveyed code to the top two key reference codes 70551 *Magnetic resonance (eg, proton) imaging, brain (including brain stem); without contrast material* (work RVU= 1.48, intra time= 18 minutes) and 72141 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, cervical; without contrast material* (work RVU= 1.48, intra time= 20 minutes) and agreed that since the MRI of the face and neck is a less complex procedure compared to the equivalent brain and spine codes, the recommended value is appropriately less than these reference points. To further validate the recommended value, the RUC reviewed the other two spine MRI codes 72146 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, thoracic; without contrast material* (work RVU= 1.48) and 72148 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, lumbar; without contrast material* (work RVU= 1.48). **The RUC recommends a work RVU of 1.35 for CPT code 70540.**

70542 ***Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material(s)***
The RUC reviewed the survey results from 56 practicing radiologists and neuroradiologists and agreed with the following survey median times: pre-service evaluation time of 5 minutes, intra-service time of 20 minutes and immediate post-service time of 5 minutes.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overvalued the procedure with a 25th percentile work RVU of 1.80. Therefore, the RUC recommended the current work RVU of 1.62 for CPT code 70542. To justify a work RVU of 1.62, the RUC compared the surveyed code to the top two key reference codes 70552 *Magnetic resonance (eg, proton) imaging, brain (including brain stem); with contrast material(s)* (work RVU= 1.78, intra time= 20 minutes) and 72142 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, cervical; with contrast material(s)* (work RVU= 1.78, intra time= 23 minutes) and agreed that since the MRI of the face and neck is a less complex procedure compared to the equivalent brain and spine codes, the recommended value is appropriately less than these reference points. To further validate the recommended value, the RUC reviewed the other two spine MRI codes 72147 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, thoracic; with contrast material(s)* (work RVU= 1.78) and 72149 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, lumbar; with contrast material(s)* (work RVU= 1.78). **The RUC recommends a work RVU of 1.62 for CPT code 70542.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

70543 ***Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s), followed by contrast material(s) and further sequences***

The RUC reviewed the survey results from 56 practicing radiologists and neuroradiologists and agreed with the following survey median times: pre-service evaluation time of 5 minutes, intra-service time of 25 minutes and immediate post-service time of 5 minutes.

The RUC reviewed the survey respondents' physician work values and agreed that the survey results overvalued the procedure with a 25th percentile work RVU of 2.28. Therefore, the RUC recommended the current work RVU of 2.15 for CPT code 70543. To justify a work RVU of 2.15, the RUC compared the surveyed code to the top two key reference codes 70553 *Magnetic resonance (eg, proton) imaging, brain (including brain stem); without contrast material, followed by contrast material(s) and further sequences* (work RVU= 2.29, intra time= 25 minutes) and 72156 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, without contrast material, followed by contrast material(s) and further sequences; cervical* (work RVU= 2.29, intra time= 25 minutes) and agreed that since the MRI of the face and neck is a less complex procedure compared to the equivalent brain and spine codes, the recommended value is appropriately less than these reference points. To further validate the recommended value, the RUC reviewed the other two spine MRI codes 72157 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, without contrast material, followed by contrast material(s) and further sequences; thoracic* (work RVU= 2.29) and 72158 *Magnetic resonance (eg, proton) imaging, spinal canal and contents, without contrast material, followed by contrast material(s) and further sequences; lumbar* (work RVU= 2.29). **The RUC recommends a work RVU of 2.15 for CPT code 70543.**

Practice Expense:
The Practice Expense Subcommittee set a new precedent to include a professional work station in addition to the currently included PACS work station. The time allocated to this work station, for these codes, includes the pre and intra-service time, specifically for the physician to review and prepare the report.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:70540 Tracking Number Original Specialty Recommended RVU: **1.35**
Presented Recommended RVU: **1.35**
Global Period: XXX RUC Recommended RVU: **1.35**

CPT Descriptor: Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An older patient with a palpable lump in the parotid region and chronic renal insufficiency. CT of the neck without contrast was negative. MRI Neck without IV contrast requested to assess for mass.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 8%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 8%

Description of Pre-Service Work: Review the request for appropriateness, and review the clinical history as well as any prior applicable studies. Confirm that there is no contraindication for an MRI. Communicate the protocol to the technologist.

Description of Intra-Service Work: Determine whether contrast-enhanced sequences are necessary. Interpret the images and evaluate the parotid glands, submandibular glands, thyroid gland, paranasal sinuses, orbits (globes, orbital fat, extraocular muscles, lacrimal glands, optic nerves), nasal cavity, nasopharynx, oropharynx, oral cavity, hypopharynx and larynx. Evaluate parapharyngeal and carotid spaces, neck muscles, and lymph nodes. Evaluate cervical spine, facial bones, and visualized brain/brainstem/cranial nerves. Evaluate for etiologies of patient's symptoms such as swelling, mass, pain, difficulty swallowing, painful swallowing, cranial nerve palsies and visual abnormalities. Count and measure masses and/or enlarged lymph nodes.

Compare the current imaging to all pertinent available prior studies. Dictate a report.

Description of Post-Service Work: Review and sign the final report. Communicate the findings with the referring physician and/or patient.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.71	1.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.71	0.67
Urgency of medical decision making	0.06	0.33
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.88	0.67
Physical effort required	0.35	0.50

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.35	0.00
Outcome depends on the skill and judgment of physician	0.76	0.83
Estimated risk of malpractice suit with poor outcome	0.47	0.67

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.82	0.83

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

General Comments

Background

CPT Code 70543 *(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s), followed by contrast material(s) and further sequences)* was among the codes identified by CMS in the CY2016 NPRM, Table 8 - high expenditure by specialty screen.
The American College of Radiology (ACR) and American Society of Neuroradiology (ASNR) surveyed the expanded family to include CPT codes 70540 (*Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material)* and 70542 *(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material(s))*. The specialties convened an expert panel of physicians familiar with the services to review the survey data.
The service period times for 70540 have a CMS/Other source in the RUC database, while 70542 and 70543 have previously been reviewed by the RUC.

The three codes and their existing values are as follows:

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT	RUC Meeting
70540	MRI orbit, face, and/or neck w/o cont	1.35				28		CMS/Other
70542	MRI orbit, face and/or neck w cont	1.62	8	15	10	33	0.081	Apr 2000
70543	MRI orbit, face and/or neck w/o & w cont	2.15	8	15	10	33	0.117	Apr 2000

Work RVU Recommendations

The expert panel recommends maintaining current values for all three codes in the family.

Pre, Intra, and Post Service Times

The panel recommends the median survey service period times for all three codes as summarized in the following table:

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	**MRI orbit, face, and/or neck w/o cont**	**1.35**	**5**	**19**	**5**	**29**	**0.059**
70542	MRI orbit, face and/or neck w cont	1.62	5	20	5	30	0.070
70543	MRI orbit, face and/or neck w/o & w cont	2.15	5	25	5	35	0.077

Compelling Evidence

While our societies are not submitting compelling evidence arguments for an increase in value, we would point out the revolutionary changes in MR technology since this procedure was originally valued. Modern pulse sequences allow thinner slice profiles, leading to an increase in the number of images typically acquired. The thinner slice profile has led to the detection of subtle abnormalities not visible with older techniques. This includes detection of perineural inflammation, perineural tumor spread, tumor cellularity and vascularity, as well as intracranial extension via skull base foramen.

Codes 70540, 70542, and 70543 are invaluable tools in investigating a diverse set of pathologies, which range from minor to life threatening. They are pivotal tools in investigating neck pain, swelling, masses, dysphagia/odynophagia, orbital pathologies as well as the location/type/extent of a known infectious/inflammatory/neoplastic process involving the orbit/face/neck. Not only is a positive result significant, a negative result is also pertinent in patient management, in relieving patient anxiety, and in providing assurance to ordering physicians. They are technically challenging examinations to interpret. Subtle findings, combined with motion artifact created by swallowing or respiration, require meticulous attention to detail in order to provide proper interpretation. Each MR pulse sequence is interpreted in conjunction with the other sequences, as the differential diagnosis will drastically change depending on how pathology looks on each sequence (no one sequence is diagnostic in isolation). A combination of its utility (as a positive and negative predictor of pathology), intensity, and the amount of technical training necessary to accurately interpret led us to believe that this procedure is appropriately valued as above.

Comparison to other RUC reviewed MR codes

72158	MRI spine w/o & w cont ; lumbar	2.29	5	25	5	35	0.083

Code Specific Comments

Summary of Recommendation for CPT Code 70540 (*Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material)*
Our expert panel recommends maintaining the current value of 70540 at 1.35 RVU with median service period times of 5, 19, and 5 minutes. Our RVU recommendation is less than the survey 25th percentile, supporting maintaining current value.

Key Reference Service (KRS) for 70540
Our recommendation compares favorably to the most commonly chosen KRS, 70551 *(Magnetic resonance (eg, proton) imaging, brain (including brainstem); without contrast material)*. Our recommended RVU of 1.35 is 0.13 RVU less than 70551. The pre and post times are identical between 70540 and 70551. Our intra-service time recommendation of 19 minutes is 1 minute greater than the intra-service time for 70551. The one minute longer intra-service time likely reflects the larger number of pulse sequences for 70540 vs 70551, and the greater overall surface area of imaging for 70540 (neck) vs. 70551 (head). Intensity and complexity measures were similar for 70551 and 70540; however, 70551 is performed in the inpatient and ER setting to a greater extent than 70540. The higher IWPUT for 70551 is acceptable given the differences in site of service. In summary, the lower IWPUT relates to site of service differences, balanced by the longer intra-service time for 70540 compared to KRS 70551, and supports our work recommendation.

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	**MRI orbit, face, and/or neck w/o cont**	**1.35**	**5**	**19**	**5**	**19**	**0.059**
70551	MRI brain w/o cont	1.48	5	18	5	18	0.070

MPC Code for 70540

Our recommendation compare favorably to MPC code, 99203 *(Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Typically, 30 minutes are spent face-to-face with the patient and/or family.)*, demonstrating similar work RVUs, intra-service time, total time, and IWPUT.

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	**MRI orbit, face, and/or neck w/o cont**	**1.35**	**5**	**19**	**5**	**29**	**0.059**
99203	Office/outpatient new (Low Complexity)	1.42	4	20	5	29	0.061

Summary

Our expert panel recommends maintaining the current value of 70540 at 1.35 RVU, with median service period times of 5, 19, and 5 minutes. We believe this compares favorably with the key reference service, 70551, and MPC code, 99203. Relativity is also appropriate across the 3 codes for MR of the orbit/face/neck, as well as across the larger family of MR codes.

Summary Table

CPT Code	Short Descriptor	Proposed RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	MRI orbit, face, and/or neck w/o cont	1.35	5	19	5	29	0.059
70542	MRI orbit, face, and/or neck w cont	1.62	5	20	5	30	0.070
70543	MRI orbit, face, and/or neck w/o & w cont	2.15	5	25	5	35	0.077

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 70540

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 31902
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 70540 provided nationally in a one-year period is estimated to be 31,902.

Specialty Diagnostic Radiology Frequency 27817 Percentage 87.19 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,634 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare data estimates that CPT code 70540 was billed approximately 10,634 times for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 9272 Percentage 87.19 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Advanced imaging

BETOS Sub-classification Level II:
MRI/MRA: Brain/Head/Neck

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 70540

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Presented Recommended RVU: **1.62**
Global Period: XXX RUC Recommended RVU: **1.62**

CPT Descriptor: Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material(s)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An older patient with biopsy proven carcinoma of a palpable nodal neck mass. Patient submits outside MRI of the neck obtained without contrast. MRI Neck with IV contrast ordered for primary cancer localization and staging.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 8%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: Review the request for appropriateness, and review the clinical history as well as any prior applicable studies. Confirm that there is no contraindication for an MRI. The physician reviews laboratory studies to assess renal function (and requests a renal consult, if necessary) and also reviews the medical record for allergy history, absence of contraindications to contrast injection, and factors predisposing the patient to nephrogenic systemic fibrosis. The physician adjusts the contrast product and amount to be injected. The physician discusses the nature and risks of contrast reaction to the patient and obtains informed consent where applicable. The physician supervises the IV placement and communicates the protocol to the technologist.

Description of Intra-Service Work: Supervise gadolinium contrast injection, monitoring for contrast reaction and extravasation, and interpret the images. Review contrast-phase MR images and consider obtaining delayed-phase MR images. Interpret triplanar postcontrast images of the neck.
Interpret the images and evaluate the parotid glands, submandibular glands, thyroid gland, paranasal sinuses, orbits (globes, orbital fat, extraocular muscles, lacrimal glands, optic nerves), nasal cavity, nasopharynx, oropharynx, oral cavity, hypopharynx, and larynx. Evaluate parapharyngeal and carotid spaces, neck muscles, and lymph nodes. Evaluate cervical spine, facial bones, cranial nerves, and visualized brain/brainstem/cranial nerves. Evaluate for etiologies of patient's symptoms such as swelling, mass, pain, difficulty swallowing, painful swallowing, and visual abnormalities. Count and measure masses and/or enlarged lymph nodes.

Compare the current imaging to all pertinent available prior studies. Dictate a report.

Description of Post-Service Work: The physician confirms lack of complication from contrast agent such as allergic reaction or extravasation of contrast. Review and sign the final report. Communicate the findings with the referring physician and/or patient.

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.80	0.71
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.80	0.57
Urgency of medical decision making	0.13	0.14
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.93	0.29
Physical effort required	0.60	0.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.53	0.29
Outcome depends on the skill and judgment of physician	0.73	0.57
Estimated risk of malpractice suit with poor outcome	0.53	0.71

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.87	0.43

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

General Comments

Background

CPT Code 70543 *(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s), followed by contrast material(s) and further sequences)* was among the codes identified by CMS in the CY2016 NPRM, Table 8 - high expenditure by specialty screen.
The American College of Radiology (ACR) and American Society of Neuroradiology (ASNR) surveyed the expanded family to include CPT codes 70540 (*Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material)* and 70542 *(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material(s))*. The specialties convened an expert panel of physicians familiar with the services to review the survey data.
The service period times for 70540 have a CMS/Other source in the RUC database, while 70542 and 70543 have previously been reviewed by the RUC.

The three codes and their existing values are as follows:

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT	RUC Meeting
70540	MRI orbit, face, and/or neck w/o cont	1.35				28		CMS/Other
70542	MRI orbit, face and/or neck w cont	1.62	8	15	10	33	0.081	Apr 2000
70543	MRI orbit, face and/or neck w/o & w cont	2.15	8	15	10	33	0.117	Apr 2000

Work RVU Recommendations

The expert panel recommends maintaining current values for all three codes in the family.

Pre, Intra, and Post Service Times
The panel recommends the median survey service period times for all three codes as summarized in the following table:

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	MRI orbit, face, and/or neck w/o cont	1.35	5	19	5	29	0.059
70542	**MRI orbit, face and/or neck w cont**	**1.62**	**5**	**20**	**5**	**30**	**0.070**
70543	MRI orbit, face and/or neck w/o & w cont	2.15	5	25	5	35	0.077

Compelling Evidence
While our societies are not submitting compelling evidence arguments for an increase in value, we would point out the revolutionary changes in MR technology since this procedure was originally valued. Modern pulse sequences allow thinner slice profiles, leading to an increase in the number of images typically acquired. The thinner slice profile has led to the detection of subtle abnormalities not visible with older techniques. This includes detection of perineural inflammation, perineural tumor spread, tumor cellularity and vascularity, as well as intracranial extension via skull base foramen.

Codes 70540, 70542, and 70543 are invaluable tools in investigating a diverse set of pathologies, which range from minor to life threatening. They are pivotal tools in investigating neck pain, swelling, masses, dysphagia/odynophagia, orbital pathologies as well as the location/type/extent of a known infectious/inflammatory/neoplastic process involving the orbit/face/neck. Not only is a positive result significant, a negative result is also pertinent in patient management, in relieving patient anxiety, and in providing assurance to ordering physicians. They are technically challenging examinations to interpret. Subtle findings, combined with motion artifact created by swallowing or respiration, require meticulous attention to detail in order to provide proper interpretation. Each MR pulse sequence is interpreted in conjunction with the other sequences, as the differential diagnosis will drastically change depending on how pathology looks on each sequence (no one sequence is diagnostic in isolation). A combination of its utility (as a positive and negative predictor of pathology), intensity, and the amount of technical training necessary to accurately interpret led us to believe that this procedure is appropriately valued as above.

Comparison to other RUC reviewed MR codes

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	**MRI orbit, face, and/or neck w/o cont**	**1.35**	**5**	**19**	**5**	**29**	**0.059**

Code Specific Comments

Summary of Recommendation for CPT Code 70542 ***(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material)***
Our expert panel recommends maintaining the current value of 70542 at 1.62 RVU with median service period times of 5, 20, and 5 minutes. Our RVU recommendation is less than the survey 25th percentile, supporting maintaining current value.

Key Reference Service (KRS) for 70542
Our recommendation compares favorably to the most commonly chosen KRS, 70552 *(Magnetic resonance (eg, proton) imaging, brain (including brainstem); with contrast material)*. Our recommended RVU of 1.62 is 0.16 RVU less than 70552. The pre and intra times are identical between 70542 and 70552. Both 70552 and 70542 have a similar number and type of MRI pulse sequences to review. Intensity and complexity measures were generally higher for 70542, likely reflecting the more diverse disease processes to consider when reviewing images which often include unrelated anatomic regions such as the orbits, face, and upper neck. In comparison, MRI brain with contrast (70552) mainly revolves around disease processes related to the brain. The total time differences between 70542 and 70552 were solely based on the less intense post service time period, which is more than balanced by the differences in wRVU.

Finally, the societies are aware that the recommended total time for 70542 is less than the current total time in the RUC database from 2001. The total time differences were not the result of any reduction in the most intense service period (intra-service), but a reduction in the less intense service periods of pre- and post-service time. In fact, the most intense service period (intra-service time) increased in time according to our survey respondents. The increase in intra-service time likely reflects the increased resolution of MRI technology coupled with the advances in pulse sequences leading to an expansion of sensitivity and specificity of this modality, especially after contrast administration.

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70542 ***current***	**MRI orbit, face and/or neck w**	*1.62*	*8*	*15*	*10*	*33*	*0.081*

70542 ***survey***	**cont**	**1.62**	**5**	**20**	**5**	**30**	**0.070**
70552	MRI brain w cont	1.78	5	20	7	32	0.076

MPC Code for 70542

Our recommendation compares favorably to the MPC code, 93351 *(Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with supervision by a physician or other qualified health care professional)*, demonstrating a nearly identical intra-service time and IWPUT. A proportionally lower wRVU is recommended for 70542 compared to 93351 given the differences in total time, which happen to be based solely on the differences in the less intense post-service period.

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70542	**MRI orbit, face and/or neck w cont**	**1.62**	**5**	**20**	**5**	**29**	**0.070**
93351	Stress TTE complete	1.75	5	20	10	35	0.071

Summary

Our expert panel recommends maintaining the current value of 70542 at 1.62 RVU with median service period times of 5, 20, and 5 minutes. We believe this compares favorably with the key reference service, 70552, and MPC code, 93351. Relativity is also appropriate across the 3 codes for MR of the orbit/face/neck as well as across the larger family of MR codes.

Summary Table

CPT Code	Short Descriptor	Proposed RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	MRI orbit, face, and/or neck w/o cont	1.35	5	19	5	29	0.059
70542	MRI orbit, face, and/or neck w cont	1.62	5	20	5	30	0.070
70543	MRI orbit, face, and/or neck w/o & w cont	2.15	5	25	5	35	0.077

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 70542

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3519
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 70542 provided nationally in a one-year period is estimated to be 3,519.

Specialty Diagnostic Radiology Frequency 3245 Percentage 92.21 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,173
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare data estimates that CPT code 70542 was billed approximately 1,173 times for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 1082 Percentage 92.24 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Advanced imaging

BETOS Sub-classification Level II:
MRI/MRA: Brain/Head/Neck

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 70542

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Presented Recommended RVU: **2.15**
Global Period: XXX RUC Recommended RVU: **2.15**

CPT Descriptor: Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s), followed by contrast material(s) and further sequences

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An older patient with biopsy proven carcinoma of a palpable nodal neck mass. MRI Neck without and with IV contrast ordered for primary cancer localization and staging.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 8%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: Review the request for appropriateness, and review the clinical history as well as any prior applicable studies. Confirm that there is no contraindication for an MRI. The physician reviews laboratory studies to assess renal function (and requests a renal consult, if necessary) and also reviews the medical record for allergy history, absence of contraindications to contrast injection, and factors predisposing the patient to nephrogenic systemic fibrosis. The physician adjusts the contrast product and amount to be injected. The physician discusses the nature and risks of contrast reaction to the patient and obtains informed consent where applicable. The physician supervises the IV placement and communicates the protocol to the technologist.

Description of Intra-Service Work: Supervise gadolinium contrast injection, monitoring for contrast reaction and extravasation, and interpret the images. Review contrast-phase MR images and consider obtaining delayed-phase MR images. Interpret triplanar precontrast images of the neck.
Interpret the images and evaluate the parotid glands, submandibular glands, thyroid gland, paranasal sinuses, orbits (globes, orbital fat, extraocular muscles, lacrimal glands, optic nerves), nasal cavity, nasopharynx, oropharynx, oral cavity, hypopharynx, and larynx. Evaluate parapharyngeal and carotid spaces, neck muscles, and lymph nodes. Evaluate cervical spine, facial bones, cranial nerves, and visualized brain/brainstem/cranial nerves. Interpret triplanar postcontrast images of the neck. Evaluate for etiologies of patient's symptoms such as swelling, mass, pain, difficulty swallowing, painful swallowing, and visual abnormalities. Count and measure masses and/or enlarged lymph nodes.

Compare the current imaging to all pertinent available prior studies. Dictate a report.

Description of Post-Service Work: The physician confirms lack of complication from contrast agent such as allergic reaction or extravasation of contrast. Review and sign the final report. Communicate the findings with the referring physician and/or patient.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

General Comments

Background

CPT Code 70543 *(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s), followed by contrast material(s) and further sequences)* was among the codes identified by CMS in the CY2016 NPRM, Table 8 - high expenditure by specialty screen.

The American College of Radiology (ACR) and American Society of Neuroradiology (ASNR) surveyed the expanded family to include CPT codes 70540 (*Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material)* and 70542 *(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material(s))*. The specialties convened an expert panel of physicians familiar with the services to review the survey data.

The service period times for 70540 have a CMS/Other source in the RUC database, while 70542 and 70543 have previously been reviewed by the RUC.

The three codes and their existing values are as follows:

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT	RUC Meeting
70540	MRI orbit, face, and/or neck w/o cont	1.35				28		CMS/Other
70542	MRI orbit, face and/or neck w cont	1.62	8	15	10	33	0.081	Apr 2000
70543	MRI orbit, face and/or neck w/o & w cont	2.15	8	15	10	33	0.117	Apr 2000

Work RVU Recommendations
The expert panel recommends maintaining current values for all three codes in the family.

Pre, Intra, and Post Service Times
The panel recommends the median survey service period times for all three codes as summarized in the following table:

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	MRI orbit, face, and/or neck w/o cont	1.35	5	19	5	29	0.059
70542	MRI orbit, face and/or neck w cont	1.62	5	20	5	30	0.070
70543	**MRI orbit, face and/or neck w/o & w cont**	**2.15**	**5**	**25**	**5**	**35**	**0.077**

Compelling Evidence
While our societies are not submitting compelling evidence arguments for an increase in value, we would point out the revolutionary changes in MR technology since this procedure was originally valued. Modern pulse sequences allow thinner slice profiles, leading to an increase in the number of images typically acquired. The thinner slice profile has led to the detection of subtle abnormalities not visible with older techniques. This includes detection of perineural inflammation, perineural tumor spread, tumor cellularity and vascularity, as well as intracranial extension via skull base foramen.

Codes 70540, 70542, and 70543 are invaluable tools in investigating a diverse set of pathologies, which range from minor to life threatening. They are pivotal tools in investigating neck pain, swelling, masses, dysphagia/odynophagia, orbital pathologies as well as the location/type/extent of a known infectious/inflammatory/neoplastic process involving the orbit/face/neck. Not only is a positive result significant, a negative result is also pertinent in patient management, in relieving patient anxiety, and in providing assurance to ordering physicians. They are technically challenging examinations to interpret. Subtle findings, combined with motion artifact created by swallowing or respiration, require meticulous attention to detail in order to provide proper interpretation. Each MR pulse sequence is interpreted in conjunction with the other sequences, as the differential diagnosis will drastically change depending on how pathology looks on each sequence (no one sequence is diagnostic in isolation). A combination of its utility (as a positive and negative predictor of pathology), intensity, and the amount of technical training necessary to accurately interpret led us to believe that this procedure is appropriately valued as above.

Comparison to other RUC reviewed MR codes

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT

72158	MRI spine w/o & w cont ; lumbar	2.29	5	25	5	35	0.083

Code Specific Comments

Summary of Recommendation for CPT Code 70543 ***(Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material followed by contrast material)***
Our expert panel recommends maintaining the current value of 70543 at 2.15 RVUs with median service period times of 5, 25, and 5 minutes. Our RVU recommendation is less than the survey 25th percentile, supporting maintaining current value.

Key Reference Service (KRS) for 70543
Our recommendation compares favorably to the most commonly chosen KRS, 70553 *(Magnetic resonance (eg, proton) imaging, brain (including brainstem); without contrast material followed by contrast material)*. Our recommended RVU of 2.15 is 0.14 RVU less than 70553. The pre and intra times are identical between 70543 and 70553. Intensity and complexity measures were generally higher for 70543, likely reflecting the more diverse disease processes to consider when reviewing images, which often include unrelated anatomic regions such as the orbits, face, and upper neck. In comparison, MRI brain without and with contrast (70553) mainly revolves around disease processes related to the brain. The total time differences between 70543 and 70553 were solely based on the less intense post service time period, which is more than balanced by the differences in wRVU.

Finally, the societies are aware that the recommended total time for 70543 is less than the current total time in the RUC database from 2000. The total time differences were not the result of any reduction in the most intense service period (intra-service), but a reduction in the less intense service periods of pre- and post-service time. In fact, the most intense service period (intra-service time) increased in time according to our survey respondents. The increase in intra-service time likely reflects the increased resolution of MRI technology coupled with the advances in pulse sequences leading to an expansion of sensitivity and specificity of this modality especially after contrast administration.

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70543 ***current***	**MRI orbit, face and/or neck w/o & w cont**	*2.15*	*8*	*15*	*10*	*33*	*0.116*

70543 ***survey***		**2.15**	**5**	**25**	**5**	**35**	**0.077**
70552	MRI brain w& w/o cont	2.29	5	25	7	37	0.081

MPC Code for 70543

Our recommendation compares favorably to the MPC code, 99284 *Emergency department visit for the evaluation and management of a patient, which requires these 3 key components: A detailed history; A detailed examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of high severity, and require urgent evaluation by the physician physicians, or other qualified health care professionals but do not pose an immediate significant threat to life or physiologic function.),* demonstrating similar intra-service time, but with a proportional decrease in wRVU for the differences in site of service (70543 outpatient vs 99284 ER) and differences in total time. The IWPUT is also appropriately lower for 70543 given the differences in site of service and post service time.

CPT Code	Short Descriptor	Work RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70543	**MRI orbit, face and/or neck w/o & w cont**	**2.15**	**5**	**25**	**5**	**35**	**0.077**
99284	Emergency dept visit	2.56	5	25	10	40	0.089

Summary

Our expert panel recommends maintaining the current value of 70543 at 2.15 RVU with median service period times of 5, 25, and 5 minutes. We believe this compares favorably with the key reference service, 70553, and MPC code, 99284. Relativity is also appropriate across the 3 codes for MR of the orbit/face/neck as well as across the larger family of MR codes.

Summary Table

CPT Code	Short Descriptor	Proposed RVU	Pre-Service	Intra-Service	Post-Service	Total Time	IWPUT
70540	MRI orbit, face, and/or neck w/o cont	1.35	5	19	5	29	0.059
70542	MRI orbit, face, and/or neck w cont	1.62	5	20	5	30	0.070
70543	MRI orbit, face, and/or neck w/o & w cont	2.15	5	25	5	35	0.077

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 70543

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 153960
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 70543 provided nationally in a one-year period is estimated to be 153,960.

Specialty Diagnostic Radiology Frequency 137518 Percentage 89.32 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 51,320 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2014 Medicare data estimates that CPT code 70543 was billed approximately 51,320 times for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 45839 Percentage 89.31 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Advanced imaging

BETOS Sub-classification Level II:
MRI/MRA: Brain/Head/Neck

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 70543

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Code: 70540, 70542, 70543
Specialty Societies: ACR, ASNR

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

70540	Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s)
70542	Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material(s)
70543	Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; without contrast material(s), followed by contrast material(s) and further sequences

Global Period: XXX Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology (ACR) and the American Society of Neuroradiology (ASNR) convened a consensus panel to finalize the practice expense data for MRI face and/or neck codes 70540, 70542, and 70543.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The societies included the existing PE inputs for codes 70540, 70542, and 70543 on the spreadsheet to serve as a reference. We also included MRI brain codes from the January 2013 RUC which are clinically similar to the surveyed MRI face/neck code family.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

- **Prepare room, equipment, supplies –** The specialties are recommending an increase in time since MR involves strong magnetic fields and ensuring patient safety is important. More specifically, all objects in the room must be MRI compatible. MR exams involve the use of MR coils which vary based on the body part studied and are specifically selected to fit the patient. These coils must be prepared for the intended exam, positioned, and attached to the MR unit. In addition, the examinations involving the use of contrast require setup of the injector apparatus and preparation of the contrast material.
- **Prepare and position patient/ monitor patient/ set up IV** – The specialties are recommending an increase in time to allow for positioning the patient to ensure they are comfortable during the lengthy procedure since motion artifact can degrade the quality of the exam. Pillows are typically positioned under the patient's knees to relieve stress off the back during the long image acquisition period. The patient's face, orbits, and/or neck must be properly placed into the coils. If contrast is being administered, any IV lines must be secured to prevent disengagement. The technologist must confirm the patient has no MR incompatible internal devices (such as metal in or on clothing), personal possessions and even superficial tattoos. These may be dangerous or cause artifacts while the patient is in or around the MRI magnet.

- **Technologist QC's images in PACS, checking for all images, reformats, and dose page**- CMS [2016 MPFS Final Rule] and the RUC [2016 MPFS Final Rule Comment Letter] has acknowledged that this activity may vary based on the complexity of the exam. Thus, no standard exists for this activity. The specialties do acknowledge that our recommendation is an increase over codes reviewed before the 2016 MPFS. The specialties believe that face MR is at the higher end of complexity for radiology services since face MR involves hundreds of images in multiple planes. Interpretation of MRI findings typically requires comparison of multiple sequences. Incomplete, poor quality, or missing sequences can lead to an inconclusive exam. The number of images and importance of QC warrant the four minutes recommended.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Clinical Staff Time:

- **Obtain vital signs** – clinically necessary for 70542 and 70543.
- **Availability of prior images confirmed**- For this code family, CMS proposed a standard of 2 minutes as per Table 5 "Clinical Labor Tasks Associated With Digital Technology" in the CY 2016 MPFS Final Rule.
- **Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocoled by radiologist**- For this code family, CMS proposed a standard of 2 minutes as per Table 5 "Clinical Labor Tasks Associated With Digital Technology" in the CY 2016 MPFS Final Rule.
- **Technologist QC's images in PACS, checking for all images, reformats, and dose page**- Face The specialties believe that face MR is at the higher end of complexity for radiology services since face MR involves hundreds of images in multiple planes. Interpretation of MRI findings typically requires comparison of multiple sequences. Incomplete, poor quality, or missing sequences can lead to an inconclusive exam. The number of images and importance of QC warrant the four minutes recommended.
- **Review examination with interpreting MD**- For this code family, CMS proposed a standard of 2 minutes as per Table 5 "Clinical Labor Tasks Associated With Digital Technology" in the CY 2016 MPFS Final Rule.
- **Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue**- For this code family, CMS proposed a standard of 2 minutes as per Table 5 "Clinical Labor Tasks Associated With Digital Technology" in the CY 2016 MPFS Final Rule.

Supplies:

- **Gloves, non-sterile -** a pair of non-sterile gloves is clinically necessary for 70540. Head and neck cancer patients can often have oral or laryngeal dysfunction and the tech may have to assist with secretions.
- **Gown, patient –** a patient gown is clinically necessary for 70540.
- **Paper, exam table –** exam table paper is clinically necessary for 70540

Equipment:

- **Professional PACS workstation** – in the CY 2016 MPFS Final Rule, CMS acknowledges that the costs of the professional workstation may be analogous to costs previously incorporated as direct PE inputs. The specialties are recommending that this equipment time equal the sum of the physician work pre-service time and intra-service time.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Availability of prior images confirmed
- Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocoled by radiologist

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Acquire images
- Clean room/equipment by physician staff
- Technologist QC's images in PACS, checking for all images, reformats, and dose page
- Review examination with interpreting MD
- Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Radiation Treatment Devices

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010.

The services represent an increment of complexity from the simple to the intermediate to the complex. CPT codes 77333 (intermediate) and 77334 (complex) both include 5 minutes of post-service time. During the post-service time the physician reviews a treatment device checklist that encompasses components to review the accuracy of the indexed coordinates of the treatment device, the accuracy of the treatment device descriptions, proper written documentation of the treatment device construction, proper photographic depiction of the treatment device construction, as well as cross referencing the pictures to the written coordinates and instructions for reproducibility. CPT code 77332 for the simple treatment device includes 3 minutes of post-service time because the checklist is slightly less involved. The work involved with these services describes the physician work associated with the fabrication of the device specifically designed for an individual patient's treatment course. The use of an immobilization device is determined by the clinical judgment of the radiation oncologist based on the clinical circumstances, patient anatomy and disease state. The purpose of the device, the risks involved by its use or non-use, and the complexity of its design determine the complexity level.

77332 ***Treatment devices, design and construction; simple (simple block, simple bolus)***
The RUC reviewed the survey results from 122 radiation oncologists and recommends the following physician time components: pre-service time of 0 minutes, intra-service time of 15 minutes and immediate post-service time of 3 minutes.

For a prostate patient as described by the vignette, the patient is set up on a low attenuating index board. Both arms are positioned across the chest, and the head positioned in a headrest. The treatment device (i.e. knee/foot immobilizer system) is positioned on the rigid fixation device. The patient's legs are then placed into the device. The position, angle, and indexing of the knee/foot immobilizer system is adjusted to correct for the pelvic tilt, rotations, alignment and patient tolerance and musculoskeletal limitations. Once a satisfactory position is obtained, the treatment device is locked into position. The physician assesses stability, potential daily reproducibility and obstructions which could interfere with the delivery of radiation. The physician then directs the measurements from reproducible reference points on the patient's anatomy relative to the immobilization device as well as

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

device location markers to assure the treatment device can be accurately reproduced with the patient in the same set up position within the device. Localization photographs are taken and approved by the physician. The radiation therapist is assisting the physician for 75% of the intra-service time.

The RUC reviewed the survey respondents' work values and agreed that the specialties recommendation to maintain the work value (work RVU= 0.54) below the survey 25th percentile is appropriate for this service. The RUC noted that it is not appropriate to compare the surveyed time to the current CMS/Other source time, which represents time, not derived from a survey, but assigned by CMS over 20 years ago. The RUC compared this service to key reference service CPT code 77280, *Therapeutic radiology simulation-aided field setting; simple* (work RVU = 0.70, intra time of 25 minutes) and noted that the reference code has more intra-service and total time compared to the surveyed code, justifying the greater work value. For additional support the RUC compared 77332 to 77300 *Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician* (work RVU = 0.62, intra-service time of 15 minutes) and noted that the reference code has identical intra-service time and is more intense to perform, justifying the greater work value. **The RUC recommends a work RVU of 0.54 for CPT code 77332.**

77333 ***Treatment devices, design and construction; intermediate (multiple blocks, stents, bite blocks, special bolus)***
The RUC reviewed the survey results from 120 radiation oncologists and recommends the following physician time components: pre-service time of 0 minutes, intra-service time of 20 minutes and immediate post-service time of 5 minutes.

For a breast patient post mastectomy as described by the vignette, the patient is set up based on clinical circumstances, patient anatomy, disease state and physical limitations of the patient. The physician chooses bolus of the appropriate material and thickness. The thickness of bolus applied is dependent on the skin dose required and the angle of incidence of the treatment beams. Different thicknesses of bolus are used to increase dose homogeneity and modify surface dose deposition patterns. Bolus is also used to correct surgical deficits and create tissue equivalents. The physician verifies that the bolus has been heated/cut appropriately and the thickness is as prescribed. The physician shapes the bolus on the patient's chest wall with respect to the medial/lateral/cranial and caudal borders. Additional thickness of bolus is applied by the physician as necessary to modify the surface dose or adjust for post-surgery contour changes. The physician assesses stability and the potential daily reproducibility. He/she marks the bolus and the skin to ensure reproducibility. The physician directs the measurements from reproducible reference points on the patient's anatomy relative to the immobilization device to assist with daily accurate placement and reproducibility of the patient setup in the device. Localization photographs are taken and approved by the physician. The radiation therapist is assisting the physician for 75% of the intra-service time.

The RUC reviewed the survey respondents' estimated work values and agreed that the specialties recommendation to maintain the work value (work RVU= 0.84) below the survey 25th percentile is appropriate for this service. The RUC noted that it is not appropriate to compare the surveyed time to the current time CMS/Other source time, which represents time, not derived from a survey, but assigned by CMS over 20 years ago. The RUC compared the service to key reference service CPT code 77285, *Therapeutic radiology simulation-aided field setting; intermediate* (work RVU = 1.05, intra time of 40 minutes) and noted that the reference code has more intra-service and total time compared to the surveyed

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

code, justifying the greater work value. For additional support the RUC compared 77332 to 77331 *Special dosimetry (eg, TLD, microdosimetry) (specify), only when prescribed by the treating physician* (work RVU = 0.87, intra-service time of 30 minutes) and noted that the reference code has more intra-service time, justifying the greater work value. **The RUC recommends a work RVU of 0.84 for CPT code 77333.**

77334 ***Treatment devices, design and construction; complex (irregular blocks, special shields, compensators, wedges, molds or casts)***
The RUC reviewed the survey results from 131 radiation oncologists and recommends the following physician time components: pre-service time of 0 minutes, intra-service time of 30 minutes and immediate post-service time of 5 minutes.

When CPT code 77334 is used for an immobilization device, it can only be reported once per course of treatment. Other types of treatment devices, for example, beam aperture shaping, may be used and reported. However, no more than one beam aperture device per field or gantry angle may be reported. The RUC noted that this service is typically reported on the same day as a simulation CPT code 77290 *Therapeutic radiology simulation-aided field setting; complex*, which is a simulation code (reported once per course of treatment) and includes outlining all the field edges, determining the isocenter (of the treatment area), analyzing all the CT data sets, applying all the fields to the target areas and adjusting the isocenter, identifying/reviewing "the path of each field through the patient" and ensuring maximum normal tissue spare. The description of physician work for 77290 includes "The patient is positioned after selecting the appropriate breast board and arm position both ipsilateral and contralateral." That refers to the work of creating a treatment device, which is the step prior to the simulation day. The specialty noted and the RUC agreed that there is no duplication of tasks if these services are reported together. The RUC recommends no pre-service time to ensure that there is no duplication in work in pre time when/if these codes are reported together. The RUC recommends 5 minutes of physician post time for the physician to review and approve the device-indexing checklist and documentation to the patient's chart.

The RUC reviewed the survey respondents' work values and agreed that the specialty societies' recommendation to maintain the work value (work RVU= 1.24) below the survey 25th percentile is appropriate for this service. The RUC compared the service to key reference service CPT code 77290, *Therapeutic radiology simulation-aided field setting; complex* (work RVU = 1.56, intra time of 60 minutes) and noted that the reference code has more intra-service and total time compared to the surveyed code, justifying the greater work value. For additional support the RUC compared 77334 to 77306 *Teletherapy isodose plan; simple (1 or 2 unmodified ports directed to a single area of interest), includes basic dosimetry calculation(s)* (work RVU = 1.40, intra-service time of 40 minutes) and noted that the reference code has more intra-service and total time compared to the surveyed code, justifying the greater work value. **The RUC recommends a work RVU of 1.24 for CPT code 77334.**

Practice Expense
The Practice Expense Subcommittee approved compelling evidence for the simple and intermediate codes to increase in clinical staff time, as well as new supplies and equipment. The RUC reviewed and approved the direct practice expense inputs as submitted by the specialty society and approved by the PE Subcommittee.

SUMMARY OF RECOMMENDATION

CPT Code:77332 Tracking Number Original Specialty Recommended RVU: **0.54**
Presented Recommended RVU: **0.54**
Global Period: XXX RUC Recommended RVU: **0.54**

CPT Descriptor: Treatment devices, design and construction; simple (simple block, simple bolus)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74-year-old male presenting with prostate cancer will be treated with radiotherapy with the use of simple treatment device.

Percentage of Survey Respondents who found Vignette to be Typical: 58%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The physician determines the type of device(s) to be used. The patient is set up based on clinical circumstances, patient anatomy, disease state and physical limitations of the patient.

The patient is set up on a low attenuating index board. Both arms are positioned across the chest, and the head positioned in a headrest. The treatment device (i.e. knee/foot immobilizer system) is positioned on the rigid fixation device. The patient's legs are then placed into the device. The position, angle, and indexing of the knee/foot immobilizer system is adjusted to correct for the pelvic tilt, rotations, alignment and patient tolerance and musculoskeletal limitations. Once a satisfactory position is obtained, the treatment device is locked into position.

The physician assesses stability, potential daily reproducibility and obstructions which could interfere with the delivery of radiation.

The physician then directs the measurements from reproducible reference points on the patient's anatomy relative to the immobilization device as well as device location markers to assure the treatment device can be accurately reproduced with the patient in the same set up position within the device. Localization photographs are taken and approved by the physician.

Description of Post-Service Work: The treatment device indexing checklist is reviewed and approved by the physician. The physician documents the patient chart.

The number of possible diagnosis and/or the number of management options that must be considered	0.12	0.30
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.29	0.27
Urgency of medical decision making	0.15	0.15
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.02	0.18
Physical effort required	0.02	0.36

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.15	0.15
Outcome depends on the skill and judgment of physician	0.34	0.42
Estimated risk of malpractice suit with poor outcome	0.29	0.24

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.08	0.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The RUC identified, as part of the CMS High Expenditure Procedures Screen, CPT 77334 (Treatment devices, design and construction; complex). CPT Codes 77332 and 77333 were identified as part of the family. The PC of these codes, describe the physician work associated with the fabrication of the device specifically designed for an individual patient's treatment course. The use of an immobilization device is determined by the clinical judgment of the radiation oncologist based on the clinical circumstances, patient anatomy and disease state. The purpose of the device, the risks involved by its use or non-use, and the complexity of its design determine the complexity level, and is coded with CPT codes 77332-77334.

The Research Subcommittee approved the vignettes for 77332-77334 with slight modifications.

ASTRO conducted a survey, with a 4411 sample size, and collected 122 random surveys (2.7% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining a current RVU of 0.54 for CPT 77332.

Our rationale for this recommendation is based on multiple factors described below.

Radiation Oncology Process of Care
Step 1 Consultation
Step 2 Clinical Treatment Planning
Step 3 Treatment Devices/Special Treatment Procedures
Step 4 Simulation
Step 5 Physics and Dosimetry
Step 6 Delivery and Management
Step 7 F/U Care

Billed Together

It is not uncommon for a physician to create a simple treatment device on the day radiation treatment begins. The current billed together data indicates that CPT Code 77418 is often reported with CPT Code 77332 (57%). The physician work for the simple treatment device includes selecting the device, placing the device, ensuring treatment device reproducibility, indexing, stability and setup documentation. The treatment device (77332) will be completed prior to initiating radiation treatment delivery, as it will be used to allow reproducibility throughout the course of treatment (billed once). CPT Code 77418 is a radiation treatment delivery code and does not have physician work. We are confident there is no duplication of tasks when these two services are reported together.

It is also not uncommon for a simple treatment device to be billed on the same day as a simulation code (i.e. 77280-77290). Although that scenario is not typical and did not appear in the billed together data, it could happen. Therefore we are recommending 0 minutes of pre time for the physician to review the patient's chart, prior imaging, laboratory tests and pertinent studies. We believe this is appropriate and will maintain rank order with our other recommendations for this tab. We are also recommending 3 minutes of physician post time for the physician to review and approve the device-indexing checklist and documentation to the patient's chart.

Vignette

The vignette is a 74-year-old male presenting with prostate cancer will be treated with radiotherapy with the use of simple treatment device. Prostate cancer is the top diagnosis for use of this code in both the facility and non-facility. 58% of our survey respondents felt the vignette was typical.

Time

CPT Code 77332 has an XXX global period, so there is no standard pre or post service package. We are recommending no pre time and we are recommending 3 minutes of post time. Our current surveyed total time was 25 minutes (5, 15, 5). ASTRO is recommending the median survey time for intra (15), which results in a total of 18 minutes. We note that our recommended time is lower than the existing time of 28 minutes. That 28 minutes is from the original fee schedule and flagged as CMS other. If you were to calculate the IWPUT for 28 minutes and 0.54 RVUs it would be 0.019, which is not a realistic IWPUT for this service. We would note that the surveyed time of 25 minutes did come in close to the existing time (28 minutes).

IWPUT

The surveyed code 77332 will have an IWPUT of 0.032. While this is a low IWPUT, the relationship within the family of codes maintains rank order, as well as with the 1st and 2nd reference codes.

CPT	IWPUT
77332	0.032
77333	0.036
77334	0.038

Comparison to the Key Reference Services

The key reference service code was CPT 77280, Therapeutic radiology simulation-aided field setting; simple. This key reference code was most often selected (33.6%) by the survey respondents. This code has a total time of 37 minute (7, 25, 5), an IWPUT of 0.017, and a wRVU of 0.70. The second key reference code 77300, Basic radiation dosimetry calculation was selected by 27%, with a total time of 15 minutes (0, 15, 0), an IWPUT of 0.41, and a wRVU of 0.62. Both codes have similarities, are well understood by membership. We believe that these two reference codes were an appropriate selection by our survey respondents and fits nicely with our survey data.

Relativity

Our recommendation will maintain relativity compared to the reference codes, the other two treatment device codes, and codes within the radiation oncology family. Simple Treatment Device design and construction has an

RVU of 0.54. Intermediate Treatment Device – design and construction has an RVU of 0.84. Complex Treatment Device – design and construction (with a wRVU of 1.24) takes into account the added complexity, time and effort, and correlates nicely with the other to treatment device codes.

Recommendation

We are recommending the current RVUw of 0.54, pre service: 0 minutes, median intra time of 15 minutes, and post service time of 3 minutes, for a total time of 18 minutes. The expert panel believes that our survey supports our recommendation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The current billed together data indiates that CPT Code 77418 is billed 57% of the time with CPT Code 77332. CPT Code 77418 is a treatment delivery code and does not have physician work.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77332

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 112,434 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 reported procedures in the 2014 RUC database

Specialty Radiation Oncology Frequency 84123 Percentage 74.81 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Oncology

BETOS Sub-classification Level II:
Radiation Therapy

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 77332

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female presenting with breast cancer, initially treated with mastectomy, will be treated with post-operative radiation to the chest wall and regional lymph nodes. Fabrication of bolus material is required.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The physician determines the type of device(s) to be used. The patient is set up based on clinical circumstances, patient anatomy, disease state and physical limitations of the patient.

The physician chooses bolus of the appropriate material and thickness. The thickness of bolus applied is dependent on the skin dose required and the angle of incidence of the treatment beams. Different thicknesses of bolus are used to increase dose homogeneity and modify surface dose deposition patterns. Bolus is also used to correct surgical deficits and create tissue equivalents.

The physician verifies that the bolus has been heated/cut appropriately and the thickness is as prescribed. The physician shapes the bolus on the patient's chest wall with respect to the medial/lateral/cranial and caudal borders. Additional thickness of bolus is applied by the physician as necessary to modify the surface dose or adjust for post surgery contour changes.

The physician assesses stability and the potential daily reproducibility. He/she marks the bolus and the skin to ensure reproducibility.

The physician directs the measurements from reproducible reference points on the patient's anatomy relative to the immobilization device to assist with daily accurate placement and reproducibility of the patient setup in the device. Localization photographs are taken and approved by the physician.

Description of Post-Service Work: The treatment device indexing checklist is reviewed and approved by the physician. The physician documents the patient chart.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The RUC identified, as part of the CMS High Expenditure Procedures Screen, CPT 77334 (Treatment devices, design and construction; complex). CPT Codes 77332 and 77333 were identified as part of the family. The PC of these codes, describe the physician work associated with the fabrication of the device specifically designed for an individual patient's treatment course. The use of an immobilization device is determined by the clinical judgment of the radiation oncologist based on the clinical circumstances, patient anatomy and disease state. The purpose of the device, the risks involved by its use or non-use, and the complexity of its design determine the complexity level, and is coded with CPT codes 77332-77334.

The Research Subcommittee approved the vignettes for 77332-77334 with slight modifications.

ASTRO conducted a survey, with a 4411 sample size, and collected 120 random surveys (2.7% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining a current RVU of 0.84 for CPT 77333.

Our rationale for this recommendation is based on multiple factors described below.

Radiation Oncology Process of Care
Step 1 Consultation
Step 2 Clinical Treatment Planning
Step 3 Treatment Devices/Special Treatment Procedures
Step 4 Simulation
Step 5 Physics and Dosimetry
Step 6 Delivery and Management
Step 7 F/U Care

Billed Together

It is not uncommon for a physician to report an intermediate device (77333) on the same day as a simulation (77290) or a treatment planning (77263) code. The current billed together data indicates that CPT Code 77290 is reported approximately 70% of the time with a 77333 and CPT Code 77263 is reported approximately 55% of the time with 77333.

CPT 77290 is a simulation code (billed once per course of treatment) is the 4th step in the radiation oncology 'process'. Simulation includes outlining all the field edges, determining the isocenter (of the treatment area), analyzing all the CT data sets, applying all the fields to the target areas and adjusting the isocenter, identifying/reviewing "the path of each field through the patient" and ensuring maximum normal tissue spare.

In the RUC database description of physician work for 77290 you will see "The patient is positioned after selecting the appropriate breast board and arm position both ipsilateral and contralateral." That refers to the work of creating a treatment device, which is the step prior to simulation day.

Treatment planning (77263) is the second step in the process of care for a radiation oncology patient, the first being the initial consultation with the radiation oncologist. That consultation is where the radiation oncologist has their initial visit with the patient. They do H&P, discuss relevant statistics, discuss general options (i.e. external beam, brachytherapy, etc) and then the patient goes home to consider whether they will pursue radiation or not. Treatment planning starts when the patient decides to move forward with radiation. In this second step of "the process" the radiation oncologist determines the specific type of radiation, the total dose(s), the volumes, the fractionation schedule, whether they will need IGRT, what type of blocking, etc. They will order/review additional imaging studies if needed. They will then meet with the patient, go over the plan, the side effects (i.e. pain, burns, tissue damage, loss of taste, etc), do an informed consent and move forward with the process.

We are confident there is no duplication of tasks if these services are reported together. They have distinct tasks per step (as outlined above). To ensure there is no duplication in work in pre time when/if the codes are reported together, we are not recommending any pre time for the device code (77333). We are recommending 5 minutes of physician post time for the physician to review and approve the device-indexing checklist and documentation to the patient's chart.

Note: 77014 also shows-up on the billed together file with 77333 (N=<75). CPT Code 77014 was bundled into 77290 in 2014. It should not show up on the billed together data moving forward.

Vignette

The vignette is a 65-year-old female presenting with breast cancer, treated with post-operative radiation to the chest wall and regional lymph nodes. Fabrication of bolus material is required. Breast cancer is the top diagnosis for use of this code in both the facility and non-facility. 92% of our survey respondents felt the vignette was typical.

Time

CPT Code 77333 has an XXX global period, so there is no standard pre or post service package. We are recommending 0 minutes of pre time and 5 minutes of post time. Our current surveyed total time was 33 minutes (8, 20, 5). ASTRO is recommending the median survey time for intra (20 minutes), which results in a total of 25 minutes. This is slightly less than the surveyed time (33 minutes) and existing time (33 minutes).

IWPUT

The surveyed code 77333 will have an IWPUT of 0.036. While this is a low IWPUT, the relationship within the family of codes maintains rank order, as well as with the 1st and 2nd reference codes.

CPT	IWPUT
77332	0.032
77333	0.036
77334	0.038

Comparison to the Key Reference Services

The key reference service code was CPT 77285, Therapeutic radiology simulation-aided field setting; intermediate. This key reference code was most often selected (21.6%) by the survey respondents. This code has a total time of 52 minute (7, 40, 5), an IWPUT of 0.020, and a wRVU of 1.05. The second key reference code 77331, Special dosimetry was selected by 18.3%, with a total time of 30 minutes (0, 30, 0), an IWPUT of 0.029, and a wRVU of 0.87. Both codes have similarities, and are well understood by membership. We believe that these two reference codes were an appropriate selection by our survey respondents and fits nicely with our survey data.

Relativity

Our recommendation will maintain relativity compared to the reference codes, the other treatment device codes, and codes within the radiation oncology family. Simple Treatment Device design and construction has an RVU of 0.54. Intermediate Treatment Device – design and construction has an RVU of 0.84. Complex Treatment Device – design and construction has a wRVU of 1.24. Thus the Intermediate Treatment device correlates nicely between the Simple and Complex treatment device codes.

Recommendation

We are recommending the current RVUw of 0.84, pre service: 0 minutes, median intra time of 20 minutes, and post service time of 5 minutes, for a total time of 25 minutes. The expert panel believes that our survey supports our recommendation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The current billed together data indicates that CPT Codes 77290 and 77263 may be billed with 77333.

   XXX 77290 wRVU 1.56, total time 77 (7, 60, 10)
   XXX 77263 wRVU 3.14, total time 75 (intra 75)

Presented Recommended RVU: **1.24**
Global Period: XXX RUC Recommended RVU: **1.24**

CPT Descriptor: Treatment devices, design and construction; complex (irregular blocks, special shields, compensators, wedges, molds or casts)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 61-year-old female non-small cell lung cancer presents for design and construction of a customized immobilization device.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The physician determines the type of device(s) to be used. The patient is set up based on clinical circumstances, patient anatomy, disease state and physical limitations of the patient.

The patient is set up on a low attenuating rigid fixation device. Both arms are positioned above the head using a holding bar. An arm shuttle is then positioned on the rigid fixation device. The physician continuously monitors the patient for tolerance of the treatment position and breathing difficulties. The patient is then assisted out of the fixation device.

After the epoxy is placed into the mold bag, the patient is situated back into the fixation device and the expanding epoxy resin is molded to the patient's back and sides. As the material hardens, the physician adjusts the patient to optimize position for treatment consistent with patient tolerance and physical limitations.

The physician assesses stability and the potential daily reproducibility. (1) Reference marks are drawn on the patient's skin and the epoxy mold. (2) The patient, skin, mold, arm shuttle is indexed to the rigid fixation system.

The physician directs the measurements from reproducible reference points on the patient’s anatomy relative to the immobilization device to assist with daily accurate placement and reproducibility of the patient setup in the device. The physician reviews and approves the localization photographs.

Description of Post-Service Work: The treatment device indexing checklist is reviewed and approved by the physician. The physician documents the patient chart.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.16	0.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.32	0.50
Urgency of medical decision making	0.30	0.44

Technical Skill/Physical Effort (Mean)

Technical skill required	0.36	0.50
Physical effort required	0.34	0.61

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.36	0.50
Outcome depends on the skill and judgment of physician	0.47	0.61
Estimated risk of malpractice suit with poor outcome	0.57	0.50

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.45	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The RUC identified, as part of the CMS High Expenditure Procedures Screen, CPT 77334 (Treatment devices, design and construction; complex). CPT Codes 77332 and 77333 were identified as part of the family. The PC describes the physician work associated with the fabrication of the device specifically designed for an individual patient's treatment course. The use of an immobilization device is determined by the clinical judgment of the radiation oncologist based on the clinical circumstances, patient anatomy and disease state. The purpose of the device, the risks involved by its use or non-use, and the complexity of its design determine the complexity level, and is coded with CPT codes 77332-77334.

The Research Subcommittee approved the vignettes for 77332-77334 with slight modifications.

ASTRO conducted a survey, with a 4411 sample size, and collected 131 random surveys (2.9% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining a current RVU of 1.24 for CPT Code 77334.

Our rationale for this recommendation is based on multiple factors described below.

Radiation Oncology Process of Care
Step 1 Consultation
Step 2 Clinical Treatment Planning
Step 3 Treatment Devices/Special Treatment Procedures
Step 4 Simulation
Step 5 Physics and Dosimetry

Step 6 Delivery and Management
Step 7 F/U Care

Billed Together
It is not uncommon for a physician to report a complex device (77334) on the same day as a simulation (77290). The current billed together data indicates that CPT Code 77290 is reported approximately 55% of the time with a 77334.

CPT 77290 is a simulation code (billed once per course of treatment) is the 4th step in the radiation oncology 'process'. Simulation includes outlining all the field edges, determining the isocenter (of the treatment area), analyzing all the CT data sets, applying all the fields to the target areas and adjusting the isocenter, identifying/reviewing "the path of each field through the patient" and ensuring maximum normal tissue spare.

In the RUC database description of physician work for 77290 you will see "The patient is positioned after selecting the appropriate breast board and arm position both ipsilateral and contralateral." That refers to the work of creating a treatment device, which is the step prior to simulation day.

We are confident there is no duplication of tasks if these services are reported together. They have distinct tasks per step (as outlined above). To ensure there is no duplication in work in pre time when/if the codes are reported together, we are not recommending any pre time for the device code (77334). We are recommending 5 minutes of physician post time for the physician to review and approve the device-indexing checklist and documentation to the patient's chart.

Vignette
The vignette is a *61-year-old female non-small cell lung cancer presents for design and construction of a customized immobilization device.* This procedure is typically billed as a -26 professional component. The top diagnosis for use of this code is lung cancer. 97% of our survey respondents felt the vignette was typical.

Time
CPT Code 77334 has an XXX global period, so there is no standard pre or post service package. We are recommending 0 minutes of pre time and 5 minutes of post time. Our current surveyed total time was 45 minutes (10, 30, 5). ASTRO is recommending the median survey time for intra (30), which results in a total of 35 minutes. This is slightly lower than the total surveyed time and equal to the existing time.

IWPUT
Our recommended IWPUT for this surveyed code will be 0.038. We believe this IWPUT maintains an appropriate the rank order with the family of surveyed codes and the reference codes.

CPT	IWPUT
77332	0.032
77333	0.036
77334	0.038

Comparison to the Key Reference Services
The key reference service code was CPT 77290, *Therapeutic radiology simulation-aided field setting; complex.* This key reference code was most often selected by the survey respondents (34%). This code has a total time of 77 (7, 60, 10), an IWPUT of 0.0197 and a wRVU of 1.56. The second key reference code 77306, *Teletherapy isodose plan; simple (1 or 2 unmodified ports directed to a single area of interest), includes basic dosimetry calculation(s)* was selected 14% of the time by our survey respondents. It has a total time of 46 minutes (3, 40, 3), an IWPUT of 0.0316 and a wRVU of 1.40. Both codes have similarities, are well understood by membership. We believe that these two reference codes were an appropriate selection by our survey respondents and fits nicely with our survey data.

Relativity

Our recommendation will maintain relativity compared to the reference codes, the other treatment device codes, and codes within the radiation oncology family. Simple Treatment Device design and construction has an RVU of 0.54. Intermediate Treatment Device – design and construction has an RVU of 0.84. Complex Treatment Device – design and construction (with a wRVU of 1.24) takes into account the added complexity, time and effort, and correlates nicely with the other to treatment device codes.

Recommendation

We are recommending the current RVUw of 1.24, pre service: 0 minutes, median intra time of 30 minutes, and post service time of 5 minutes, for a total time of 35 minutes. The expert panel believes that our survey supports our recommendation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The current billed together indicate that CPT Code 77290 may be billed with CPT Code 77334. 77290 XXX wRVU 1.56 total time 77 (7, 60, 10)

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

77332 *Treatment devices, design and construction; simple (simple block, simple bolus)*

77333 *Treatment devices, design and construction; intermediate (multiple blocks, stents, bite blocks, special bolus)*

77334 *Treatment devices, design and construction; complex (irregular blocks, special shields, compensators, wedges, molds or casts)*

Global Period: XXX **Meeting Date:** January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ASTRO convened a panel of physicians and clinical staff to develop consensus recommendations for practice expense. The panel included a mix of physicians from various practice settings and geographic regions. They panel reviewed the physician work survey data, the existing direct PE inputs and

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Codes 77332-77334 are existing codes. As such, we included the current direct practice expense inputs as reference on the spreadsheet.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We are recommending an increase in clinical staff time for 77332 & 77333. We are also making recommendations to change the equipment for all three procedures. Historically, beam blocking was performed using discrete blocks constructed of lead or high-density alloy (Cerrobend). Block complexity ranged from simple reusable geometric shapes to complex, custom fabricated patterns unique to each of a patient's multiple fields. CPT code 77332 was used for simple, multi-use blocks that were placed by hand on a blocking tray at the time of treatment. CPT code 77333 was used for pre-made blocks, such as kidney or lung blocks, that were used from patient to patient. The CPT code for complex devices (77334) was typically used for an irregular conformal blocks created for the protection of sensitive vital tissues that were is customized for a specific patient and unique to that particular field. With the change in technology, the use of lead or high-density alloy blocks and block cutting machines have become almost obsolete. As such, we are recommending changes in clinical time and equipment.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

Assist the physician with the procedure: *(Note: 75% of physician time)*

> *77332 Treatment devices, design and construction; simple (simple block, simple bolus)*
> *Fit patient into knee/foot immobilization system and secure the immobilization system to the index board. Repeat for reproducibility. Record and photograph all of the reference points of the immobilization system in relation to both the patient's position and index board. Document in the electronic chart.*
>
> *77333 Treatment devices, design and construction; intermediate (multiple blocks, stents, bite blocks, special bolus)*
> *Fit patient onto breast board. Cut the warm bolus to the approximate shape desired by the physician. Assist the physician with placement. Cut additional bolus on the direction of the physician to modify depth of bolus as well as adjust for post surgical contour changes. Reheat bolus to allow the physician to modify the placement, thickness and conformity. Measure reference points on bolus and patient's skin and record measurements in the patient electronic chart.*
>
> *77334 Treatment devices, design and construction; complex (irregular blocks, special shields, compensators, wedges, molds or casts)*
> *Fit patient into alpha cradle. Assist the physician in taking the patient out of the device. Mix the proper amount of foaming resin and distribute the resin uniformly throughout the bag. Place the bag on the fixation device and assist the physician in re-positioning the patient on the device. As the physician adjusts the patient position, the RTT will press the expanding foam into the appropriate locations to maintain the patient position being held by the physician. Adjustments are made as the foam gradually cures and hardens.*

Perform the procedure:

- Measure the reference point marker locations and record the positions in the patient record. (2 min)
- Take pictures of device and set up. Annotate the photographs. Enter in the patient's electronic chart. Label the device. (3 min)
- Assist the patient out of the immobilization device. (2 min)

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Flow Cytometry Interpretation

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010.

CPT codes 88184 and 88185 are practice expense only codes as they represent the technical component of flow cytometry. Throughout the last decade, flow cytometric analysis has changed in that instead of just utilizing 3 and 4 color flow cytometry, most laboratories are now using 5, 6, 8, or even 10 color flow cytometry. The increase in the number of fluorochromes utilized makes the analysis more complex and each antibody and associated fluorochrome is typically analyzed (compared) to every other antibody/fluorochrome. This results in the need to compare many more antibody combinations for co-expression or mutually exclusive expression, which in turn increases the number of histograms to analyze. All of these changes have caused the services to be more intense and complex than the way it was performed previously. The specialty noted and the RUC agreed that when comparing these services to the surgical pathology services it is important to remember that 88187, 88188 and 88189 are bundled services with multiple markers. The surgical pathology services are not bundled and require more intra-service time but are less intense to perform. The surgical pathology codes are larger specimens requiring grossing which is less intense than microscopic work. The surveyed services do not require grossing and require highly cognitive and intense work. There is software necessary to analyze the data, but the software does not suggest a result or provide an interpretation.

88184 ***Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; first marker***
88185 ***Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; each additional marker (List separately in addition to code for first marker)***
CPT codes 88184 and 88185 were recently reviewed for practice expense (PE) only in April 2014. In the Final Rule for 2015 CMS refined those recommendations. Both the April 2014 RUC recommendation and the CMS refinements are listed on the PE spreadsheet. There is a third column on the spreadsheet that lists the specialty recommendation for this meeting. The specialty had originally recommended some increases over the RUC recommendations from 2014. The PE Subcommittee discussed all three sets of direct PE inputs and determined that it is appropriate to reaffirm the RUC recommendations from April 2014 with the following exceptions:

- supply direct PE inputs, *lysing reagent* (FACS) (SL089) increased from 2 to 3 ml for 88185 only

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

- supply direct PE inputs, *antibody, flow cytometry* (each test) (SL186) increased from 1 to 1.6 for both codes
- equipment direct PE inputs, *flow cytometry analytics software* was added for both codes

Because of changes in technology and increased interpretative sophistication, the PE Subcommittee greatly reduced the amount of lysing reagent, the driver of much of the cost of these services, in April 2014. The specialty explained and the PE Subcommittee agreed that it was appropriate to add 1 ml for 88185 only because the typical patient scenario requires 3 or more ml per marker plus a wastage allotment that is included in 88184. For 88184 the amount is reaffirmed at 3 ml for the first marker and 2 ml of wastage, making 5 ml necessary for 88184 only. For 88185 the amount recommended in 2014 of 2 ml is not adequate as each additional marker requires 3 ml, so the specialty recommendation of 3 ml was accepted. The PE Subcommittee also agreed that 1 antibody as approved in 2014 is not accurate as 1.6 antibodies are needed for each marker analyzed and reported. Although software is generally considered indirect practice expense the RUC recommends the flow cytometry analytics software because it is necessary as multi-dimensional channel and marker interpretation and can be directly attributed to this service and not used for any other service. The RUC reviewed and approved the direct PE inputs as modified by the PE Subcommittee.

88187 ***Flow cytometry, interpretation; 2 to 8 markers***
The RUC reviewed the survey results from 83 pathologists and recommends 20 minutes of intra-service time. The RUC recognized significant time decreases since the RUC survey in 2004 and incorporated these time decreases into the recommendations.

The RUC reviewed the survey respondents' work values and agreed that the specialty societies' recommendation to crosswalk this service to recently reviewed CPT code 88346 *Immunofluorescence, per specimen; initial single antibody stain procedure is appropriate for this service* (work RVU = 0.74, intra-service time of 24 minutes) is appropriate for this service. The RUC compared the service to key reference service CPT code 88305 *Level IV - Surgical pathology, gross and microscopic examination...*(work RVU = 0.75, intra-service time of 25 minutes) and 88307 *Level V - Surgical pathology, gross and microscopic examination…*(work RVU = 1.59, intra-service time of 47 minutes). **The RUC recommends a work RVU of 0.74 for CPT code 88187.**

88188 ***Flow cytometry, interpretation; 9 to 15 markers***
The RUC reviewed the survey results from 82 pathologists and recommends 30 minutes of intra-service time. The RUC recognized significant time decreases since the RUC survey in 2004 and incorporated these time decreases into the recommendations.

The RUC reviewed the survey respondents' work values and determined that a work value of 1.40, the survey 25th percentile is appropriate for this service. The RUC compared the service to key reference service CPT code 88309, *Level VI - Surgical pathology, gross and microscopic examination…*(work RVU = 2.80, intra-service time of 90 minutes) and 88307 *Level V - Surgical pathology, gross and microscopic examination…*(work RVU = 1.59, intra-service time of 47 minutes), noting that the physician work and time is lower for the surveyed service. **The RUC recommends a work RVU of 1.40 for CPT code 88188.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

88189 ***Flow cytometry, interpretation; 16 or more markers***
The RUC reviewed the survey results from 91 pathologists and recommends 36 minutes of intra-service time. The RUC recognized significant time decreases since the RUC survey in 2004 and incorporated these time decreases into the recommendations.

The RUC reviewed the survey respondents' work values and determined that a work value of 1.70, the survey 25th percentile is appropriate for this service. The specialty explained that the utilization of this service has increased significantly since it was last reviewed by the RUC in 2004. This is because it is now the standard of care to classify acute leukemia by flow cytometry where previously it had not been. The RUC compared the service to key reference service CPT code 88309, *Level VI - Surgical pathology, gross and microscopic examination.*…(work RVU = 2.80, intra-service time of 90 minutes) and 88307 *Level V - Surgical pathology, gross and microscopic examination.*…(work RVU = 1.59, intra-service time of 47 minutes). **The RUC recommends a work RVU of 1.70 for CPT code 88189.**

Practice Expense
CPT codes 88187, 88188 and 88189 do not have direct practice expense inputs as they are professional component only services.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation

SUMMARY OF RECOMMENDATION

CPT Code:88187 Tracking Number

Original Specialty Recommended RVU: **1.00**
Presented Recommended RVU: **0.74**
RUC Recommended RVU: **0.74**

Global Period: XXX

CPT Descriptor: Flow cytometry, interpretation; 2 to 8 markers

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56-year-old female has a monoclonal gammopathy of unknown significance. A bone marrow aspiration and biopsy is performed and reveals 6% plasma cells in the bone marrow. Flow cytometry is performed on the bone marrow.

Percentage of Survey Respondents who found Vignette to be Typical: 66%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtain and review specimen order and verify specimen type and patient identifiers. Retrieve and review relevant history and other diagnostic test results, including previous flow cytometry studies, other laboratory tests and morphologic examinations. Perform microscopic examination of laboratory generated slide of the submitted specimen. Review histograms (data displays) from each of the secondary tubes derived from the primary specimen necessary for the analyses of 2 to 8 markers, as well as the viability display. Utilize appropriate flow cytometry specific software for analysis review and recording of the expression of each assayed antibody (i.e. percentage of antigen expressed) for one or more gated populations. Formulate a summary and interpretation for the findings. Compare the current findings to previous findings for the patient. Prepare and summarize the findings and any further recommendations required to achieve a complete diagnosis for the specimen/patient in a report (also requires further use of flow cytometry specific software). Sign-out the final report and release results into a separate laboratory information system and directly into the medical record of the patient.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.09	0.06
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.67	0.44
Urgency of medical decision making	0.67	0.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.95	0.50
Physical effort required	0.05	0.27
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.24	0.33

Outcome depends on the skill and judgment of physician	0.38	0.50
Estimated risk of malpractice suit with poor outcome	-0.19	0.28

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.38	0.67

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the 2016 NPRM, the CMS identified codes 88189-*Flow cytometry, interpretation; 16 or more markers* and *88185 - Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; each additional marker (List separately in addition to code for first marker)*as potentially misvalued.

The RUC requested these services be surveyed for physician work and the practice expense and reviewed at the January, 2016 RUC meeting. For a complete evaluation of this service, the College of American Pathologists (CAP) requested, in addition, a review of codes, 88187 - *Flow cytometry, interpretation; 2 to 8 marker,* 88188 - *Flow cytometry, interpretation; 9 to 15 markers* and 88184 - *Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; first marker.* For review at this RUC meeting, the flow cytometry family contains CPT codes 88187, 88188, and 88189 that represent the flow cytometry family of professional component pathology services, and CPT codes 88184 and 88185 that represent the technical component (Work RVU = 0.00) pathology services.

The RUC's Research Subcommittee approved a change in the current standard physician work survey for flow cytometry, as there is no pre-service or post-service physician work for these services. Therefore, these questions were not used in the survey process. The RUC's Research Subcommittee also approved revised vignettes that reflect the current Medicare utilization for this service.

Flow Cytometry services are widely utilized services that are performed by a large number of pathologists. A random sample of 20% of the CAP's valid practicing membership were surveyed. For CY 2016, 88187 has a Medicare physician fee schedule work RVU of 1.36. Below are the median details of the survey effort.

Random Survey	**88187 83 Responses**		**88188 82 Responses**		**88189 91 Responses**	
Email #	**Median Time**	**Median WRVU**	**Median Time**	**Median WRVU**	**Median Time**	**Median WRVU**
3,500	20	1.25	30	1.60	36	2.30

The CAP convened an expert panel composed of their Economic and Regulatory Affairs Committee members to review the survey results and compare the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, complexities, and intensities.

The majority of the survey respondents (55 respondents) and the expert panel agreed with the similarities of the surveyed codes and the key reference service 88305 and its secondary reference service 88307, with the surveyed code being more intense and complex than the key reference services. Nearly all intensity and complexity measures indicate higher intensities and complexities. The key reference service, 88305, was valued at the April 2010 RUC meeting with a work RVU of 0.75 with 25 minutes of intra-service time. 88307, the secondary key reference code

chosen, was valued at the same time with a work RVU of 1.59 with 47 minutes of intra-service time. 57% of the respondents identified either 88305 or 88307 as comparison codes and indicated 88187 involved more intensity and complexity.

The survey results are consistent with the current standard of practice of how these services are now provided. Throughout the last decade, flow cytometric analysis has changed in that instead of just utilizing 3 and 4 color flow cytometry, most laboratories are now using 5, 6, 8, or even 10 color flow cytometry. The increase in the number of fluorochromes utilized makes the analysis more complex and each antibody and associated fluorochrome is typically analyzed (compared) to every other antibody/fluorochrome. This results in the need to compare many more antibody combinations for coexpression or mutually exclusive expression, which in turn increases the number of histograms to analyze. All of these changes have caused the services to be more intense and complex than the way it was performed previously.

The CAP expert panel and survey respondents agreed that the complexity of flow cytometry code 88187 is more than the key reference code 88305 and code 88307. The expert panel did not agree with the survey median work RVU of 1.25 and believed that the 25th percentile work RVU of 1.00 is more appropriate for this service.

In addition, the CAP expert panel compared the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, and intensities. The group reviewed the following additional services to value CPT code 88187:

1) 74280 - Radiologic examination, colon; air contrast with specific high density barium, with or without glucagon (RUC valued work RVU = 0.99, Total time = 32 minutes. intra-service time = 20 minutes, RUC valued Sept 2011, MPC code)
2) 88121 - Cytopathology, in situ hybridization (eg, FISH), urinary tract specimen with morphometric analysis, 3-5 molecular probes, each specimen; using computer-assisted technology (work RVU = 1.00, intra-service time = 25 minutes, RUC valued October 2009).
3) 88380 - Microdissection (ie, sample preparation of microscopically identified target); laser capture areas (work RVU = 1.14, total time = 33 minutes, RUC reviewed Jan 2014)
4) 94004 - Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; nursing facility, per day (work RVU = 1.00, total time = 35 minutes, 15 minutes intra-service time. RVU reviewed April 2006, MPC code)

The expert panel agreed on the median surveyed physician time of 20 minutes and the 25th percentile work RVU for 88187. The CAP **recommend a work RVU of 1.00 (25th percentile survey result) with an intra-service and total physician time of 20 minutes for CPT code 88187.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88187

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Commonly

Specialty Clinical Laboratory How often? Commonly

Specialty Hematology/Oncology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 67302
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 33,651 claims for 2014. Medicare represents approximately 50% of the total claims. (33,651 x 2 = 67,302). Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 46452 Percentage 69.02 %

Specialty Clinical Laboratory Frequency 18798 Percentage 27.93 %

Specialty Hematology/Oncology Frequency 909 Percentage 1.35 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 33,651 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 33,651 claims for 2014. Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 23226 Percentage 69.02 %

Specialty Clinical Laboratory Frequency 9399 Percentage 27.93 %

Specialty Hematology/Oncology Frequency 454 Percentage 1.34 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 88187

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:88188 Tracking Number

Original Specialty Recommended RVU: **1.60**
Presented Recommended RVU: **1.40**
RUC Recommended RVU: **1.40**

Global Period: XXX

CPT Descriptor: Flow cytometry, interpretation; 9 to 15 markers

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 49-year-old male presents with diffuse lymphadenopathy. Frozen section demonstrates a possible follicular lymphoid neoplasm. A portion of the remaining lymph node is sent for flow cytometry.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtain and review specimen order and verify specimen type and patient identifiers. Retrieve and review relevant history and other diagnostic test results. including previous flow cytometry studies, other laboratory tests and morphologic examinations. Perform microscopic examination of laboratory generated slide of the submitted specimen. Review histograms (data displays) from each of the secondary tubes derived from the primary specimen necessary for the analyses of 9 to 15 markers, as well as the viability display. -Utilize appropriate flow cytometry specific software for analysis review and recording of the expression of each assayed antibody (i.e. percentage of antigen expressed) for one or more gated populations. Formulate a summary and interpretation for the findings. Compare the current findings to previous findings for the patient. Prepare and summarize the findings and any further recommendations required to achieve a complete diagnosis for the specimen/patient in a report (also requires further use of flow cytometry specific software). Sign-out the final report and release results into a separate laboratory information system and directly into the medical record of the patient.

Description of Post-Service Work: N/A

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
88307	XXX	1.59	**RUC Time**

CPT Descriptor Level V - Surgical pathology, gross and microscopic examination

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
88331	XXX	1.19	**RUC Time**

CPT Descriptor Pathology consultation during surgery; first tissue block, with frozen section(s), single specimen

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99348	XXX	1.56	**RUC Time**	581,400

CPT Descriptor 1 Home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 25 minutes are spent face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99304	XXX	1.64	**RUC Time**	360,707

CPT Descriptor 2 Initial nursing facility care, per day, for the evaluation and management of a patient, which requires these 3 key components: A detailed or comprehensive history; A detailed or comprehensive examination; and Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of low severity. Typically, 25 minutes are spent at the bedside and on the patient's facility floor or unit

Other Reference CPT Code	Global	Work RVU	Time Source
78072	XXX	1.60	**RUC Time**

CPT Descriptor Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT), and concurrently acquired computed tomography (CT) for anatomical localization

Median Total Time	**30.00**	**47.00**	**25.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

Mental Effort and Judgment (Mean)

	Top Key Ref Code	2nd Key Ref Code
The number of possible diagnosis and/or the number of management options that must be considered	0.30	0.30
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.67	0.50
Urgency of medical decision making	0.37	0.00

Technical Skill/Physical Effort (Mean)

Technical skill required	0.85	0.50
Physical effort required	0.00	0.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.17	0.40
Outcome depends on the skill and judgment of physician	0.57	0.50
Estimated risk of malpractice suit with poor outcome	0.05	-0.10

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.80	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the 2016 NPRM, the CMS identified codes 88189-*Flow cytometry, interpretation; 16 or more markers* and *88185 - Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; each additional marker (List separately in addition to code for first marker)*as potentially misvalued.

The RUC requested these services be surveyed for physician work and the practice expense and reviewed at the January, 2016 RUC meeting. For a complete evaluation of this service, the College of American Pathologists (CAP) requested, in addition, a review of codes, 88187 - *Flow cytometry, interpretation; 2 to 8 marker,* 88188 - *Flow cytometry, interpretation; 9 to 15 markers* and 88184 - *Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; first marker.* For review at this RUC meeting, the flow cytometry family contains CPT codes 88187, 88188, and 88189 that represent the flow cytometry family of professional component pathology services, and CPT codes 88184 and 88185 that represent the technical component (Work RVU = 0.00) pathology services.

The RUC's Research Subcommittee approved a change in the current standard physician work survey for flow cytometry, as there is no pre-service or post-service physician work for these services. Therefore, these questions were not used in the survey process. The RUC's Research Subcommittee also approved revised vignettes that reflect the current Medicare utilization for this service.

Flow Cytometry services are widely utilized services that are performed by a large number of pathologists. A random sample of 20% of the CAP's valid practicing membership were surveyed. For CY 2016, 88188 has a Medicare physician fee schedule work RVU of 1.69. Below are the median details of the survey effort.

Random Survey	**88187 83 Responses**		**88188 82 Responses**		**88189 91 Responses**	
Email #	**Median Time**	**Median WRVU**	**Median Time**	**Median WRVU**	**Median Time**	**Median WRVU**

3,500	20	1.25	30	1.60	36	2.30

The CAP convened an expert panel composed of their Economic and Regulatory Affairs Committee members to review the survey results and compare the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, complexities, and intensities.

The majority of survey respondents (50 respondents) and the expert panel agreed with the similarities of the surveyed codes and the key reference service 88307 and its tertiary reference service 88309, with the surveyed code being more intense and complex than the key reference services. In addition, nearly all intensity and complexity measures indicate a higher level of intensity and complexity for the surveyed code than the key reference services. The key reference service, 88307, was valued at the April 2010 RUC meeting with a work RVU of 1.59 with 47 minutes of intra-service time. 88309, the tertiary key reference code chosen, was valued at the same time with a work RVU of 2.80 with 90 minutes of intra-service time. 61% of the respondents identified either 88307 or 88309 as comparison codes and indicated 88188 is more intense and complex.

The survey results are consistent with the current standard of practice of how these services are now provided. Throughout the last decade, flow cytometric analysis has changed in that instead of just utilizing 3 and 4 color flow cytometry, most laboratories are now using 5, 6, 8, or even 10 color flow cytometry. The increase in the number of fluorochromes utilized makes the analysis more complex and each antibody and associated fluorochrome is typically analyzed (compared) to every other antibody/fluorochrome. This results in the need to compare many more antibody combinations for coexpression or mutually exclusive expression, which in turn increases the number of histograms to analyze. All of these changes have caused the services to be more intense and complex than the way it was performed previously.

The CAP expert panel and survey respondents thought 88188 was more complex than both 88307 and 88309, and the physician work was greater than 88307 and less than 88309. The expert panel agreed with the survey median work RVU of 1.60 for this service.

In addition, the CAP expert panel compared the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, and intensities. The group reviewed the following additional services to value CPT code 88188:

1) 99348 - Home visit for the evaluation and management of an established patient … (work RVU = 1.56, total time = 44 minutes, 25 minutes intra service time, RUC reviewed April 1997, MPC code)
2) 99304 - Initial nursing facility care, per day, for the evaluation and management of a patient (work RVU = 1.64, total time = 43 minutes, intra service time = 23 minutes, RUC reviewed Feb 2007, MPC code)
3) 94011 - Measurement of spirometric forced expiratory flows in an infant or child through 2 years of age (work RVU = 2.00, Intra-service time = 30, total time = 80, RUC reviewed April 2009)
4) 74178 - Computed tomography, abdomen and pelvis; without contrast material in one or both body regions, followed by contrast material(s) and further sections in one or both body regions (work RVU = 2.01, total time 40 minutes, intra-service time = 30 minutes, RUC reviewed February 2010, MPC code)

The expert panel agreed on the median surveyed physician time of 30 minutes and the median work RVU of 1.60 for 88188. The CAP **recommends a work RVU of 1.60 with an intra-service and total physician time of 30 minutes for CPT code 88188.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88188

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Commonly

Specialty Clinical Laboratory How often? Commonly

Specialty Hematology/Oncology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 56360
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 28,180 claims for 2014. Medicare represents approximately 50% of the total claims. (28,180 x 2 = 56,360). Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 47055 Percentage 83.49 %

Specialty Clinical Laboratory Frequency 7975 Percentage 14.15 %

Specialty Hematology/Oncology Frequency 947 Percentage 1.68 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 28,180 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 28,180 claims for 2014. Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 23527 Percentage 83.48 %

Specialty Clinical Laboratory Frequency 3987 Percentage 14.14 %

Specialty Hematology/Oncology Frequency 473 Percentage 1.67 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

BETOS Sub-classification Level II:

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 88188

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:88189 Tracking Number Original Specialty Recommended RVU: **2.23**
Presented Recommended RVU: **1.70**
Global Period: XXX RUC Recommended RVU: **1.70**

CPT Descriptor: Flow cytometry, interpretation; 16 or more markers

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old female presents with petechiae and pancytopenia. Peripheral blood smear demonstrates numerous blasts. Flow cytometry immunophenotyping is performed to assist in the classification of the acute leukemia.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtain and review specimen order and verify specimen type and patient identifiers. Retrieve and review relevant history and other diagnostic test results, including previous flow cytometry studies, other laboratory tests and morphologic examinations. Perform microscopic examination of laboratory generated slide of the submitted specimen. Review histograms (data displays) from each of the secondary tubes derived from the specimen necessary for the analyses of 16 or more markers, as well as the viability display. Utilize appropriate flow cytometry specific software - for analysis review and recording of the expression of each assayed antibody (ie percentage of antigen expressed) for one or more gated populations. Formulate a summary and interpretation for the findings. Compare the current findings to previous findings for the patient. Prepare and summarize the findings and any further recommendations required to achieve a complete diagnosis for the specimen/patient in a report (also requires further use of flow cytometry specific software). Sign-out the final report and release results into a separate laboratory information system and directly into the medical record of the patient.

Description of Post-Service Work: N/A

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status?

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
88309	XXX	2.80	**RUC Time**

CPT Descriptor Level VI - Surgical pathology, gross and microscopic examination

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
88307	XXX	1.59	**RUC Time**

CPT Descriptor Level V - Surgical pathology, gross and microscopic examination

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
74178	XXX	2.01	**RUC Time**	574,896

CPT Descriptor 1 Computed tomography, abdomen and pelvis; without contrast material in one or both body regions, followed by contrast material(s) and further sections in one or both body regions

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.43	**RUC Time**	9,072,090

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 45 minutes are spent face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
74183	XXX	2.26	**RUC Time**

CPT Descriptor Magnetic resonance (eg, proton) imaging, abdomen; without contrast material(s), followed by with contrast material(s) and further sequences

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 47 **% of respondents:** 51.6 **%**

Number of respondents who choose 2nd Key Reference Code: 26 **% of respondents:** 28.5 **%**

Time Segment (Mean)

Overall intensity/complexity	0.77	0.85

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the 2016 NPRM, the CMS identified codes 88189-*Flow cytometry, interpretation; 16 or more markers* and *88185 - Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; each additional marker (List separately in addition to code for first marker)*as potentially misvalued.

The RUC requested these services be surveyed for physician work and the practice expense and reviewed at the January, 2016 RUC meeting. For a complete evaluation of this service, the College of American Pathologists (CAP) requested, in addition, a review of codes, 88187 - *Flow cytometry, interpretation; 2 to 8 marker,* 88188 - *Flow cytometry, interpretation; 9 to 15 markers* and 88184 - *Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; first marker.* For review at this RUC meeting, the flow cytometry family contains CPT codes 88187, 88188, and 88189 that represent the flow cytometry family of professional component pathology services, and CPT codes 88184 and 88185 that represent the technical component (Work RVU = 0.00) pathology services.

The RUC's Research Subcommittee approved a change in the current standard physician work survey for flow cytometry, as there is no pre-service or post-service physician work for these services. Therefore, these questions were not used in the survey process. The RUC's Research Subcommittee also approved revised vignettes that reflect the current Medicare utilization for this service.

Flow Cytometry services are widely utilized services that are performed by a large number of pathologists. A random sample of 20% of the CAP's valid practicing membership was surveyed. For CY 2016, 88189 has a Medicare physician fee schedule work RVU of 2.23. Below are the median details of the survey effort.

Random Survey	88187 83 Responses		88188 82 Responses		88189 91 Responses	
Email #	**Median Time**	**Median WRVU**	**Median Time**	**Median WRVU**	**Median Time**	**Median WRVU**
3,500	20	1.25	30	1.60	36	2.30

The CAP convened an expert panel composed of their Economic and Regulatory Affairs Committee members to review the survey results and compare the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, complexities, and intensities.

The majority of survey respondents (50 respondents) and the expert panel agreed with the similarities of the surveyed codes and the key reference service 88309 and its secondary reference service 88307. The intensity and complexity measures indicate this relationship as well, whereas all intensity and complexity measures indicate the surveyed code is more intense and complex than the key reference services. The key reference service, 88309, was valued at the April 2010 RUC meeting with a work RVU of 2.80 with 90 minutes of intra-service time. 88307, the secondary key reference code chosen, was valued at the same time with a work RVU of 1.59 with 47 minutes of intra-service time. 61% of the respondents identified either 88309 or 88307 as comparison codes and indicated 88189 is more intense and complex.

The survey results are consistent with the current standard of practice of how these services are now provided. Throughout the last decade, flow cytometric analysis has changed in that instead of just utilizing 3 and 4 color flow cytometry, most laboratories are now using 5, 6, 8, or even 10 color flow cytometry. The increase in the number of fluorochromes utilized makes the analysis more complex and each antibody and associated fluorochrome is typically analyzed (compared) to every other antibody/fluorochrome. This results in the need to compare many more antibody combinations for coexpression or mutually exclusive expression, which in turn increases the number of histograms to analyze. All of these changes have caused the services to be more intense and complex than the way it was performed previously.

The CAP expert panel and survey respondents agreed that the complexity of flow cytometry code 88189 is more than the key reference code 88307 and code 88309. The expert panel did agree that the survey median work RVU of 2.30 approximates the work for this service. The survey median supports the current value of 2.23 RVUs.

In addition, the CAP expert panel compared the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, and intensities. The group reviewed the following additional services to value CPT code 88189:

1) 72158 - Magnetic resonance (eg, proton) imaging, spinal canal and contents, without contrast material, followed by contrast material(s) and further sequences; lumbar (work RVU = 2.29, 25 minutes intra-service, 35 minutes total time, RUC reviewed April 2013, MPC code)
2) 99204 - Office or other outpatient visit for the evaluation and management of a new patient,…(work RVU = 2.43, intra-service time 30 minutes, total time 45 minutes, RUC reviewed February 2006, MPC code)
3) 95810 - Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist (work RVU = 2.50, 66.5 total time, 36.5 minutes intra-service, RUC reviewed April 2010, MPC code)

The expert panel agreed on the median surveyed physician time of 36 minutes and the median work RVU for 88189 supports the existing value of 2.23. The CAP **recommends maintaining the current work RVU of 2.23 with an intra-service and total physician time of 36 minutes for CPT code 88189.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in

the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88189

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Commonly

Specialty Clinical Laboratory How often? Commonly

Specialty Hematology/Oncology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 354334
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 177,167 claims for 2014. Medicare represents approximately 50% of the total claims. (177,167 x 2 = 354,334). Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 201864 Percentage 56.96 %

Specialty Clinical Laboratory Frequency 147509 Percentage 41.62 %

Specialty Hematology/Oncology Frequency 2409 Percentage 0.67 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 177,167 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 177,167 claims for 2014. Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 100932 Percentage 56.96 %

Specialty Clinical Laboratory Frequency 73755 Percentage 41.63 %

Specialty Hematology/Oncology Frequency 1205 Percentage 0.68 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 88189

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
88184 - Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; first marker
88185 - Flow cytometry, cell surface, cytoplasmic, or nuclear marker, technical component only; each additional marker (List separately in addition to code for first marker)

Global Period:_XXX Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The College of American Pathologists (CAP) assembled an expert panel composed of individuals who perform these services or have other expertise in the area. This expert panel was consulted through a series of conference calls in order to develop the now typical practice expense inputs. CAP’s expert panel reviewed the PE inputs and made additional adjustments to the clinical labor, supplies, and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Previous RUC recommended PE direct inputs are used as a reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: No recommendations extend beyond PE Subcommittee standards.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: The recommended values reflect current typical values considering the current technology utilized. These inputs reflect current practice and account for previous errors or items inadvertently omitted from the previous recommendation.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
Laboratory technician accessions the specimen, prepare the specimen for examination, and retrieve previous diagnostic studies.

Intra-Service Clinical Labor Activities:
The CBC is run and cytotechnologists the prepare cytospin or smear, stain, cover slip, examine under microscope for quality, and prepare specimen for manual or automated processing. They also initiate the instrument start-up, quality control functions, calibration, centrifugation, as well as maintain specimen tracking, logs, and labeling. They then load specimen into the flow cytometer, run the specimen, monitor data acquisition, and unload the flow cytometer. Time is also spent using the cytometry analytics software to analyze the data generated from the service on a designated

desktop computer. Finally the cytotechnologists collect the printed out histograms, assemble materials including paperwork, and review histograms and gating with pathologist.

Post-Service Clinical Labor Activities:
Within the flow cytometry lab areas, the laboratory technologists prepare, pack, and transport specimens and records for internal or external storage (where applicable). In addition, they dispose of remaining specimens, spent chemicals or other consumables, and hazardous waste. Laboratory technologists clean the room and equipment following the procedure and perform any additional equipment maintenance that must be done after the procedure. They lastly enter the data into the laboratory information system.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Microslide Consultation

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010.

88321 ***Consultation and report on referred slides prepared elsewhere***
The RUC reviewed the survey results from 52 pathologists and recommends the following physician time components: pre-service time of 0 minute, intra-service time of 50 minutes and immediate post-service time of 0 minute.

The RUC reviewed the survey respondents' estimated work values and agreed that the specialties' recommendation to maintain the current work value of 1.63 is appropriate for this service. The RUC compared the service to key reference service CPT code 88307, *Level V - Surgical pathology, gross and microscopic examination…* (work RVU = 1.59, intra-service time of 47 minutes) and noted that the surveyed service has slightly more intra-service time, justifying the slightly higher work value. For additional support the RUC compared the surveyed code to CPT code 99363 *Anticoagulant management for an outpatient taking warfarin, physician review and interpretation of International Normalized Ratio (INR) testing, patient instructions, dosage adjustment (as needed), and ordering of additional tests; initial 90 days of therapy (must include a minimum of 8 INR measurements)* (work RVU = 1.65, intra-service time of 50 minutes) and noted that the both services have similar intra-service time and intensity and should be valued similarly. **The RUC recommends a work RVU of 1.63 for CPT code 88321.**

88323 ***Consultation and report on referred material requiring preparation of slides***
The RUC reviewed the survey results from 43 pathologists and recommends the following physician time components: pre-service time of 0 minute, intra-service time of 60 minutes and immediate post-service time of 0 minute.

The RUC reviewed the survey respondents' estimated work values and agreed that the specialties' recommendation to maintain the current work value of 1.83 is appropriate for this service. The RUC compared the service to key reference service CPT code 88307, *Level V - Surgical pathology, gross and microscopic examination…* (work RVU = 1.59, intra-service time of 47 minutes) and noted that the surveyed service has more intra-service time, justifying the higher work value. For additional support the RUC compared the surveyed code to CPT code 92607 *Evaluation for prescription for speech-generating augmentative and alternative communication device, face-to-face with the patient; first hour* (work RVU = 1.85,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intra-service time of 60 minutes) and noted that the both services have similar intra-service time and should be valued similarly. **The RUC recommends a work RVU of 1.83 for CPT code 88323.**

88325 *Consultation, comprehensive, with review of records and specimens, with report on referred material*
The specialty explained that this is a low volume code that is only used when diagnosis is very difficult. The RUC reviewed the survey results from 39 pathologists and recommends the following physician time components: pre-service time of 0 minute, intra-service time of 90 minutes and immediate post-service time of 0 minute.

The specialty explained that there is compelling evidence that the technology has changed physician work, since this service was last reviewed in 2005. New technology or the more widespread use of some pathology testing has greatly increased the complexity and amount of materials available for review and interpretation to determine the diagnosis. Further, the consultation is generally for patients that may have been sent to many different pathologists and are difficult cases to diagnose. The RUC agreed that there is compelling evidence that the current work RVU for code 88325 is misvalued.

After consideration of the preliminary RUC reviewer comments, the specialty society revised their recommendation to the survey 50th percentile (work RVU= 2.85). The RUC agreed that a work RVU of 2.85 is appropriate for this code. The RUC compared the service to key reference service CPT code 88309 *Level VI - Surgical pathology, gross and microscopic examination…* (work RVU = 2.80, intra-service time of 90 minutes) and CPT code 88356 *Morphometric analysis; nerve* (work RVU = 2.80, intra-service time of 90 minutes) and noted that both services have the same intra-service time; however 88325 is slightly more intense to perform, justifying the slightly higher work value. For additional support the RUC compared the surveyed code to CPT code 90865 *Narcosynthesis for psychiatric diagnostic and therapeutic purposes (eg, sodium amobarbital (Amytal) interview)* (work RVU = 2.84, intra-service time of 90 minutes). **The RUC recommends a work RVU of 2.85 for CPT code 88325.**

Practice Expense
The RUC reviewed and approved the practice expense inputs without modification as submitted by the specialty and approved by the PE Subcommittee. The PE Subcommittee noted that they reviewed the services with the understanding that slides are part of these consultation codes, however the vignette does not explicitly state this.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
88321	Consultation and report on referred slides prepared elsewhere	XXX	1.63 (No Change)
88323 (f)	Consultation and report on referred material requiring preparation of slides	XXX	1.83 (No Change)
88325 (f)	Consultation, comprehensive, with review of records and specimens, with report on referred material	XXX	2.85

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old female presents with a skin lesion of the posterior neck. Biopsy reveals on routine microscopic examination a tumor composed of poorly differentiated neoplastic cells.. A panel of immunohistochemical stains is not conclusive as to the lineage of the tumor when reviewed by the submitting pathologist. The routine microscopic slides and immunohistochemical stains are referred to a consulting pathologist for evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.58	0.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.75	0.13
Urgency of medical decision making	0.13	-0.13
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.38	-0.63
Physical effort required	0.13	-0.50
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.50	0.25

Outcome depends on the skill and judgment of physician	0.71	0.63
Estimated risk of malpractice suit with poor outcome	0.54	0.25

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.04	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the 2016 NPRM, the CMS identified code 88321- *Consultation and report on referred slides prepared elsewhere* as potentially misvalued. The RUC requested this service be surveyed for physician work and the practice expense reviewed at the January, 2016 RUC meeting. For a complete evaluation of this service, the College of American Pathologists (CAP) and American Society of Cytopathology (ASC) requested codes 88323 - *Consultation and report on referred material requiring preparation of slides* and 88325 - *Consultation, comprehensive, with review of records and specimens, with report on referred material* be reviewed at the same meeting as part of the family. CPT codes 88321, 88323, and 88325 represent the microslide consultation family of pathology services.

The RUC's Research Subcommittee approved a change in the current standard physician work survey for microslide consultations, as there is no pre-service or post-service physician work for these services. Therefore, these questions were not used in the survey process. The RUC's Research Subcommittee also approved the survey population to include a random sample of CAP and ASC members based on revised vignettes due to a shift in the most recent Medicare frequent diagnoses.

Microslide consultation services are common pathology services that are performed by a large number of pathologists. Approximately 20% of the CAP and 20% of ASC's valid practicing membership was surveyed. For CY 2015, 88321 has a Medicare physician fee schedule work RVU of 1.63. Below are the details of the survey effort.

		88321		88323		88325	
Survey List Used	**Email #**	**Time**	**WRVU**	**Time**	**WRVU**	**Time**	**WRVU**
ASC Member Random Sample	300	30	1.73	48	1.93	88	2.87
CAP Member Random Sample	2,500	50	1.65	65	1.90	100	2.80
Total Surveyed and Median results	2,800	50	1.70	60	1.90	90	2.85

CAP and ASC convened an expert panel composed of their Economic and Regulatory Affairs Committee members to review the survey results and compare the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, and intensities. The CAP/ASC expert panel agreed that the combined survey data provides the best assistance in the valuation of 88321. Including all of the survey data from all survey sources allows for a sufficient number of respondents to make a meaningful recommendation. Survey respondents (52 respondents) and the expert panel agreed with the similarities of the surveyed codes and the key reference service 88307, with the surveyed code being more physician work than the key reference service. The intensity and complexity measures indicate this relationship as well, whereas nearly all intensity and complexity measures indicate the surveyed code involves more physician work than the key reference services. The key reference service, 88307, was valued at the April 2010 RUC meeting with a work RVU of 1.59 with 47 minutes of intra-service time.

The survey respondents chose surgical pathology code 88305 as its secondary reference code with 8 responses. This code had a work RVU of 0.75 for CY 2015. Survey respondents also chose surgical pathology codes 88309 (6 respondents, WRVU = 2.80) or 88362 (6 respondents, WRVU = 2.17). The intensity and complexity indicators for these 12 responses indicated 88321 has the identical or more physician work than 88309 or 88362. The CAP/ASC expert panel and survey respondents agreed that microslide consultations code 88321 is more physician work than the key reference code 88307 and less than codes 88309 and 88362.

Key Reference Codes	Responses	WRVU
88307	**24**	**1.59**
88305	**8**	**0.75**
88309	**6**	**2.80**
88362	**6**	**2.17**

In addition, the CAP and ASC expert panel compared the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, and intensities. The group reviewed the following additional services to value CPT code 88321:

1) 88348 - Electron microscopy, diagnostic (work RVU = 1.51, intra-service time = 47 minutes, CMS crosswalk)
2) 88355 - Morphometric analysis; skeletal muscle (work RVU = 1.85, intra-service time = 57 minutes, CMS crosswalk)
3) 95861 - Needle electromyography; 2 extremities with or without related paraspinal areas (work RVU = 1.54, total time = 49 minutes, RUC reviewed 2/2012 MPC code)
4) 99221 - Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components:.. 30 minutes (RUC valued work RVU = 1.92, Total time = 50 minutes. intra-service time = 30 minutes, RUC valued Feb 2006)
5) 99460 - Initial hospital or birthing center care, per day, for evaluation and management of normal newborn infant ((work RVU = 1.92, Total time = 50 minutes, RUC reviewed Oct 2010)
6) 94011 - Measurement of spirometric forced expiratory flows in an infant or child through 2 years of age (work RVU = 2.00, Intra-service time = 30, total time = 80, RUC reviewed April 2009)
7) 95810 - Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist (work RVU = 2.50, 36.5 minutes intra-service, 66.5 total time, RUC reviewed April 2010)
8) 99222 - Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: 50 minutes (work RVU = 2.61, 40 minutes intra-service, 75 minutes total time, RUC reviewed Feb 2006)

The expert panel agreed on the median surveyed physician time of 50 minutes for 88321 and agreed that at this time there is no compelling evidence to increase the physician work RVU for this service. Therefore, the CAP and ASC agree to maintain the existing physician work RVU. The CAP and ASC **recommend a work RVU of 1.63 with an intra-service and total physician time of 50 minutes for CPT code 88321.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in

the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88321

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Commonly

Specialty Clinical Laboratory How often? Sometimes

Specialty Dermatology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 353,894
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 176, 947 claims for 2014. Medicare represents approximately 50% of the total claims. (176,947 x 2 = 353,894). Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 233570 Percentage 65.99 %

Specialty Clinical Laboratory Frequency 86562 Percentage 24.45 %

Specialty Dermatology Frequency 32169 Percentage 9.09 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 176,947 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 176, 947 claims for 2014. Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 116785 Percentage 65.99 %

Specialty Clinical Laboratory Frequency 47281 Percentage 26.72 %

Specialty Dermatology Frequency 16085 Percentage 9.09 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 88321

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:88323 Tracking Number Original Specialty Recommended RVU: **1.83**
Presented Recommended RVU: **1.83**
Global Period: XXX RUC Recommended RVU: **1.83**

CPT Descriptor: Consultation and report on referred material requiring preparation of slides

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male presents with a pigmented skin lesion and undergoes biopsy. Microscopic examination reveals a melanocytic neoplasm with the differential diagnosis of dysplastic nevus versus melanoma. The routine microscopic slides and blocks are referred to a consultant pathologist. After examining the submitted microscopic slides, the consultant pathologist orders multiple deeper hematoxylin and eosin stained sections cut from the blocks and examines them with the microscope and renders a diagnosis.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtain and review clinical history and referral information, including referral letter and results of clinical testing. Review gross examination from submitted surgical pathology report. Examine submitted H&E and other immunohistochemical and special stains. Consider additional ancillary tests as well as H&E stained sections. Examine additional deeper H&E stained sections from block(s), and reassess if additional ancillary studies are warranted. Compare to previous study reports, render a diagnosis, and identify clinically meaningful information. Dictate and prepare pathology report. Sign-out report with any concurrent telephone communication with other professionals.

CPT Descriptor Level VI - Surgical pathology

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
92004	XXX	1.82	**RUC Time**	2,213,745

CPT Descriptor 1 Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, 1 or more visits

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99460	XXX	1.92	**RUC Time**	3

CPT Descriptor 2 Initial hospital or birthing center care, per day, for evaluation and management of normal newborn infant

Other Reference CPT Code	Global	Work RVU	Time Source
77317	XXX	1.63	**RUC Time**

CPT Descriptor Brachytherapy isodose plan; intermediate (calculation[s] made from 5 to 10 sources, or remote afterloading brachytherapy, 2-12 channels), includes basic dosimetry calculation(s)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 19 **% of respondents:** 44.1 **%**

Number of respondents who choose 2nd Key Reference Code: 18 **% of respondents:** 41.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 88323	Top Key Reference CPT Code: 88307	2nd Key Reference CPT Code: **88309**
Median Pre-Service Time	0.00	0.00	0.00
Median Intra-Service Time	60.00	47.00	90.00
Median Immediate Post-service Time	0.00	0.00	0.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00

Median Total Time	**60.00**	**47.00**	**90.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.63	0.33
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.68	0.56
Urgency of medical decision making	0.32	0.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.47	0.33
Physical effort required	0.37	0.28
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.58	0.39

Outcome depends on the skill and judgment of physician	0.74	0.61
Estimated risk of malpractice suit with poor outcome	0.42	0.67

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.89	0.89

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the 2016 NPRM, the CMS identified code 88321- *Consultation and report on referred slides prepared elsewhere* as potentially misvalued. The RUC requested this service be surveyed for physician work and the practice expense reviewed at the January, 2016 RUC meeting. For a complete evaluation of this service, the College of American Pathologists (CAP) and American Society of Cytopathology (ASC) requested codes 88323 - *Consultation and report on referred material requiring preparation of slides* and 88325 - *Consultation, comprehensive, with review of records and specimens, with report on referred material* be reviewed at the same meeting as part of the family. CPT codes 88321, 88323, and 88325 represent the microslide consultation family of pathology services.

The RUC's Research Subcommittee approved a change in the current standard physician work survey for microslide consultations, as there is no pre-service or post-service physician work for these services. Therefore, these questions were not used in the survey process. The RUC's Research Subcommittee also approved the survey population to include a random sample of CAP and ASC members based on revised vignettes due to a shift in the most recent Medicare frequent diagnoses.

Microslide consultation services are common pathology services that are performed by a large number of pathologists. Approximately 20% of the CAP and 20% of ASC's valid practicing membership was surveyed. For CY 2015, 88323 has a Medicare physician fee schedule work RVU of 1.83. Below are the details of the survey effort.

		88321		88323		88325	
Survey List Used	**Email #**	**Time**	**WRVU**	**Time**	**WRVU**	**Time**	**WRVU**
ASC Member Random Sample	300	30	1.73	48	1.93	88	2.87
CAP Member Random Sample	2,500	50	1.65	65	1.90	100	2.80
Total / Median Survey Results	2,800	50	1.70	60	1.90	90	2.85

CAP and ASC convened an expert panel composed of their Economic and Regulatory Affairs Committee members to review the survey results and compare the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, and intensities. The CAP/ASC expert panel agreed that the combined survey data provides the best assistance in the valuation of 88323. Including all of the survey data from all survey sources allows for a sufficient number of respondents to make a meaningful recommendation. Survey respondents (43 respondents) and the expert panel agreed with the similarities of the surveyed codes and the key reference service 88307 with the surveyed code having more physician work than the key reference service. The intensity and complexity measures indicate this relationship as well, because all intensity and complexity measures indicate that the surveyed code involves more physician work than the key reference service. The key reference service, 88307, was valued at the April 2010 RUC meeting with a work RVU of 1.59 with 47 minutes of intra-service time.

The survey respondents chose surgical pathology code 88309 as its secondary reference code with 18 responses. This code has a work RVU of 2.80 for CY 2015. The survey respondents clearly indicated that the physician work of 88323

was greater than CPT code 88307. The CAP/ASC expert panel and survey respondents agreed that microslide consultations code 88323 is more work than the key reference code 88307 and less work than 88309.

In addition, the CAP and ASC expert panel compared the physician work to previously RUC valued services and multi-specialty points of comparison codes for the physician work RVUs, time, and intensities. The group reviewed the following additional services to value CPT code 88321:

1) 88348 - Electron microscopy, diagnostic (work RVU = 1.51, intra-service time = 47 minutes, CMS crosswalk)
2) 88355 - Morphometric analysis; skeletal muscle (work RVU = 1.85, intra-service time = 57 minutes, CMS crosswalk)
3) 95861 - Needle electromyography; 2 extremities with or without related paraspinal areas (work RVU = 1.54, total time = 49 minutes, RUC reviewed 2/2012 MPC code)
4) 92004 - Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, 1 or more visits (work RVU = 1.82, total time = 40 minutes, intra-service time = 25 minutes, RUC valued February 2007, MPC code)
5) 99221 - Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components:.. 30 minutes (RUC valued work RVU = 1.92, Total time = 50 minutes. intra-service time = 30 minutes, RUC valued Feb 2006)
6) 99460 - Initial hospital or birthing center care, per day, for evaluation and management of normal newborn infant ((work RVU = 1.92, Total time = 50 minutes, RUC reviewed Oct 2010)
7) 94011 - Measurement of spirometric forced expiratory flows in an infant or child through 2 years of age (work RVU = 2.00, Intra-service time = 30, total time = 80, RUC reviewed April 2009)
8) 95810 - Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist (work RVU = 2.50, 36.5 minutes intra-service, 66.5 total time, RUC reviewed April 2010)
9) 99222 - Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: 50 minutes (work RVU = 2.61, 40 minutes intra-service, 75 minutes total time, RUC reviewed Feb 2006)

The expert panel agreed on the median surveyed physician time of 60 minutes for 88323 and agreed that at this time there is no compelling evidence to increase the physician work RVU for this service. The survey results support the existing RVU. The CAP and ASC **recommend maintaining the current work RVU of 1.83 and with a total physician time of 60 minutes for CPT code 88323.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Clinical Laboratory How often? Commonly

Specialty Pathology How often? Commonly

Specialty Dermatology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 70766
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 35,383 claims for 2014. Medicare represents approximately 50% of the total claims. (35,383 x 2 = 70,766). Percentages are from the RUC database for the year 2014.

Specialty Clinical Laboratory Frequency 42028 Percentage 59.39 %

Specialty Pathology Frequency 24138 Percentage 34.10 %

Specialty Dermatology Frequency 3078 Percentage 4.34 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35,383 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 35,383 claims for 2014. Percentages are from the RUC database for the year 2014.

Specialty Clinical Laboratory Frequency 21014 Percentage 59.39 %

Specialty Pathology Frequency 12069 Percentage 34.10 %

Specialty Dermatology Frequency 1939 Percentage 5.48 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 88323

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:88325 Tracking Number Original Specialty Recommended RVU: **2.50**
Presented Recommended RVU: **2.85**
Global Period: XXX RUC Recommended RVU: **2.85**

CPT Descriptor: Consultation, comprehensive, with review of records and specimens, with report on referred material

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female presents with a liver mass and undergoes needle core biopsy. Microscopic examination reveals a tumor composed of poorly differentiated malignant cells. Immunohistochemical stains are performed to determine the cell of origin but the results are inconclusive. Slides including H&E stained slides and paraffin blocks as well as multiple immunohistochemical stained slides, and medical records including lab and imaging studies and history and physical examination findings are referred to a consulting pathologist who renders a diagnosis.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtain and review clinical history and referral information, including referral letter; radiographic reports and images as applicable; and results of other clinical testing. Review gross examination from submitted surgical pathology report. Examine submitted H&E and other immunohistochemical and special stains. Obtain deeper hematoxylin and eosin stained sections and consider additional ancillary tests. Compare to previous study reports, render a diagnosis, and identify clinically meaningful information. Dictate and prepare pathology report. Sign-out report and conduct any concurrent telephone communication with other professionals, if performed.

Description of Post-Service Work: N/A

Time Segment (Mean)		
Overall intensity/complexity	1.31	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the 2016 NPRM, the CMS identified code 88321- *Consultation and report on referred slides prepared elsewhere* as potentially misvalued. The RUC requested this service be surveyed for physician work and the practice expense reviewed at the January, 2016 RUC meeting. For a complete evaluation of this service, the College of American Pathologists (CAP) and American Society of Cytopathology (ASC) requested codes 88323 - *Consultation and report on referred material requiring preparation of slides* and 88325 - *Consultation, comprehensive, with review of records and specimens, with report on referred material* be reviewed at the same meeting as part of the family. CPT codes 88321, 88323, and 88325 represent the microslide consultation family of pathology services.

The RUC's Research Subcommittee approved a change in the current standard physician work survey for microslide consultations, as there is no pre-service or post-service physician work for these services. Therefore, these questions were not used in the survey process. The RUC's Research Subcommittee also approved the survey population to include a random sample of CAP and ASC members based on revised vignettes due to a shift in the most recent Medicare frequent diagnoses.

Microslide consultation services are common pathology services that are performed by a large number of pathologists. Approximately 20% of the CAP and 20% of ASC's valid practicing membership was surveyed. For CY 2015, 88325 has a Medicare physician fee schedule work RVU of 2.50. Below are the details of the survey effort.

		88321		88323		88325	
Survey List Used	**Email #**	**Time**	**WRVU**	**Time**	**WRVU**	**Time**	**WRVU**
ASC Member Random Sample	300	30	1.73	48	1.93	88	2.87

CAP Member Random Sample	2,500	50	1.65	65	1.90	100	2.80
Total Surveyed/Respondents	2,800	50	1.70	60	1.90	90	2.85

CAP and ASC convened an expert panel composed of their Economic and Regulatory Affairs Committee members to review the survey results and compare the physician work to previously RUC valued services and multi-specialty points of comparison codes for the physician work RVUs, time, and intensities. The CAP/ASC expert panel agreed that the combined survey data provides the best assistance in the valuation of 88325. Including all of the survey data from all survey sources allows for a sufficient number of respondents to make a meaningful recommendation. Survey respondents (39 respondents) and the expert panel agreed with the similarities of the surveyed codes and the key reference service 88309. The intensity and complexity measures indicate this relationship as well, because all intensity and complexity measures indicate the surveyed code involves more physician work than the key reference service. The key reference service, 88309, was valued at the April 2010 RUC meeting with a work RVU of 2.80 with 90 minutes of intra-service time.

The survey respondents chose surgical pathology code 88307 as its secondary reference code with 2 responses. This code had a work RVU of 1.59 for CY 2015. The survey respondents clearly indicated that the physician work of 88325 was greater than CPT code 88307. The CAP/ASC expert panel and survey respondents agreed that microslide consultations code 88325 services is more work than the secondary reference code 88307 and less work than its key reference service 88309.

In addition, the CAP and ASC expert panel compared the physician work to previously RUC valued services and multi-specialty points of comparison codes in regard to the physician work RVUs, time, and intensities. The group reviewed the following additional services to value CPT code 88321:

1) 88348 - Electron microscopy, diagnostic (work RVU = 1.51, intra-service time = 47 minutes, CMS crosswalk)
2) 88355 - Morphometric analysis; skeletal muscle (work RVU = 1.85, intra-service time = 57 minutes, CMS crosswalk)
3) 95861 - Needle electromyography; 2 extremities with or without related paraspinal areas (work RVU = 1.54, total time = 49 minutes, RUC reviewed 2/2012 MPC code)
4) 99221 - Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components:.. 30 minutes (RUC valued work RVU = 1.92, Total time = 50 minutes. intra-service time = 30 minutes, RUC valued Feb 2006)
5) 99460 - Initial hospital or birthing center care, per day, for evaluation and management of normal newborn infant ((work RVU = 1.92, Total time = 50 minutes, RUC reviewed Oct 2010)
6) 94011 - Measurement of spirometric forced expiratory flows in an infant or child through 2 years of age (work RVU = 2.00, Intra-service time = 30, total time = 80, RUC reviewed April 2009)
7) 95810 - Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist (work RVU = 2.50, 36.5 minutes intra-service, 66.5 total time, RUC reviewed April 2010)
8) 99222 - Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: 50 minutes (work RVU = 2.61, 40 minutes intra-service, 75 minutes total time, RUC reviewed Feb 2006)

The expert panel agreed on the median surveyed physician time of 90 minutes for 88323 and agreed that at this time there is no compelling evidence to increase the physician work RVU for this service. The survey results support the existing RVU. The CAP and ASC **recommend maintaining the current work RVU of 2.50 and with a total physician time of 90 minutes for CPT code 88325.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Clinical Laboratory How often? Commonly

Specialty Dermatology How often? Commonly

Specialty Clinical Laboratory How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 14022
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 7,011 claims for 2014. Medicare represents approximately 50% of the total claims. (7,011 x 2 = 14,022). Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 7980 Percentage 56.91 %

Specialty Dermatology Frequency 3283 Percentage 23.41 %

Specialty Clinical Laboratory Frequency 2387 Percentage 17.02 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,011
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2015 RUC Database indicates 7,011 claims for 2014. Percentages are from the RUC database for the year 2014.

Specialty Pathology Frequency 3990 Percentage 56.91 %

Specialty Dermatology Frequency 1647 Percentage 23.49 %

Specialty Clinical Laboratory Frequency 1193 Percentage 17.01 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 88325

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
88321 - Consultation and report on referred slides prepared elsewhere
88323 - Consultation and report on referred material requiring preparation of slides
88325 - Consultation, comprehensive, with review of records and specimens, with report on referred material

Global Period:_XXX Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The College of American Pathologists (CAP) and the American Society of Cytopathology (ASC) assembled an expert panel composed of individuals who perform these services or have other expertise in the area. This expert panel was consulted through a series of conference calls in order to develop the typical practice expense inputs.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Previous April 2014 RUC recommendations and current PE direct inputs are used as a reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: The CAP and ASC are not recommending any increases above what the RUC had recommended in April 2014 or what CMS now has in their 2016 database for these services. It is now typical standard practice for the patient to be fully registered into the laboratory information system (i.e. both Epic and Copath), which are time consuming tasks. It is also typical to have multiple specimen slides for each patient case.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: As these services have evolved through changes in the typical patient (Medicare ICD9 code shifts) the vignettes have been updated and approved by the research subcommittee, and the direct inputs reflect what is typical for the vignette.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
None

Intra-Service Clinical Labor Activities:
Laboratory technicians open shipping packages, remove and sort slides based on outside number, hand prepare labels for outside slides, label outside slides, and distribute slides and paperwork to the pathologist. They will also accession specimen within both the hospital medical records system and the pathology laboratory system(s), and prepare for examination. They will finally perform screening functions

and then send the materials to the histology laboratory.

Histotechnologists will prepare the slide sectioning and recuts, perform quality control functions, and maintain specimen tracking, logs, and labeling. In addition, histotechnologists will prepare the automated stainer with solutions and load microscopic slides. They will set and confirm stainer program and also complete workload recording logs, collate slides, and complete paperwork. The histotechnologist will also make sure the equipment is clean while performing this service. The histotechnologist then assembles and delivers the slides and paperwork to pathologist. Phone calls for clarifications and/or additional materials are also made by the histotechnologist.

Post-Service Clinical Labor Activities:
Laboratory technicians prepare, pack, and transport the specimens and records for storage (internal and/or external where applicable). They also dispose of remaining specimens, recycle or dispose of chemicals, consumables, or hazardous waste. Laboratory technicians clean the room and equipment following procedure and perform any equipment maintenance that must be done after the procedure. Laboratory technicians also securely package and return the outside material as necessary.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Gastrointestinal Tract Imaging

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 91110 was identified by this screen and CPT code 91111 was included as part of the family. These services were presented for review of physician work and practice expense at the January 2016 RUC meeting.

91110 ***Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report***
The RUC reviewed the survey results from 76 gastroenterologists and agreed with the following physician time components: pre-service time of 5 minutes (pre-time package 5 with 2 minutes removed from pre-service evaluation and 1 minute removed from scrub/dress/wait), intra-service time of 45 minutes and post-service time of 15 minutes.

The RUC reviewed the survey 25th percentile work RVU of 2.49 and agreed with the specialty society that this value appropriately accounts for the physician work required to perform this service. The RUC noted that the magnitude of reduction in work RVUs from 3.64 to 2.49 is justified when considering the corresponding reductions in intra-service and total physician time. The RUC compared the survey code to top key reference code 91112 *Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report* (work RVU=2.10, intra-service time of 40 minutes, total time of 60 minutes) and noted that the survey code requires more intra-service time (45 minutes vs. 40 minutes) and somewhat more work, supporting a higher value for the survey code. To further support a work RVU of 2.49, the RUC reviewed MPC code 99336 *Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are spent with the patient and/or family or caregiver* (work RVU= 2.46, intra-service time of 40 minutes, total time of 65) and noted that noted that the survey code requires more intra-service time (45 minutes vs. 40 minutes), identical intra-service time and a similar amount of physician work. **The RUC recommends a work RVU of 2.49 for CPT code 91110.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

91111 ***Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report***
The RUC reviewed the survey results from 34 gastroenterologists and agreed with the following physician time components: pre-service time of 5 minutes (pre-time package 5 with 2 minutes removed from pre-service evaluation and 1 minute removed from scrub/dress/wait), intra-service time of 18 minutes and post-service time of 15 minutes.

The RUC reviewed the survey 25th percentile physician work RVU of 1.50 and agreed with the specialty society that the current value of 1.00 is appropriate for this service. In addition, the specialty society stated that they did not believe there was compelling evidence to increase the existing value of this service. To justify a work RVU of 1.00, the RUC compared the survey code to MPC code 99238 *Hospital discharge day management; 30 minutes or less* (work RVU= 1.28, intra-service time of 20 minutes, total time of 38 minutes) and noted that both services have similar intra-service times, identical total times and involve a similar amount of physician work. The RUC also reviewed MPC code *Debridement, subcutaneous tissue (includes epidermis and dermis, if performed); first 20 sq cm or less* (work RVU= 1.01, intra-service time of 15 minutes, total time of 36 minutes) and noted that the survey code has more intra-service time and total time, further supporting a work RVU of 1.00 for the survey code. **The RUC recommends a work RVU of 1.00 for CPT code 91111.**

Practice Expense
For CPT codes 91110 and 91111 the clinical staff time on line 44 for *Other Clinical Activity: recharge batteries, initiate data download to workstation, create image archive* is distinct from the longer download time captured in the equipment minutes. This time is to start the data process and start downloading images into the workstation. For 91110, line 72, *video system, capsule endoscopy (software, computer, monitor, printer),* at 94 minutes includes a download time of 80 minutes. This is outlined in the Download Time for PillCam SB3 document included in the submission and it is the shortest download time for the video system needed for this service. Line 73, *kit, capsule endoscopy recorder* requires a recording time of 8 hours for the test plus 80 minutes download time. Typically, the patient comes in at 7am and returns at 4pm and multiple patients may return to the office at the same time. The video system (computer) has docking stations for multiple capsule recorders; however, the computer downloads the data from each capsule recorder in sequence because the equipment is not capable of downloading from multiple capsule recorders at the same time. For 91111, line 72, *video system, capsule endoscopy (software, computer, monitor, printer),* at 29 minutes includes a download time of 15 minutes. This is the shortest download time for the video system needed for this service. It is the time that the capsule recorder is synced to the video system. For line 73, *kit, capsule endoscopy recorder*, there is no additional recording time because the patient remains in the office, however, 15 minutes of download time is necessary. The RUC approved the revised direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
91110	Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report	XXX	2.49
91111 (f)	Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report	XXX	1.00 (No Change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:91110 Tracking Number Original Specialty Recommended RVU: **2.49**
Presented Recommended RVU: **2.49**
Global Period: XXX RUC Recommended RVU: **2.49**

CPT Descriptor: Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year old patient with recurrent, obscure gastrointestinal bleeding not diagnosed by other imaging and endoscopic procedures is referred for evaluation. Wireless capsule endoscopy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Assess for possible contraindications such as presence of pacemaker, active bowel obstruction or swallowing disorder. Provide education to patient on the nature of the procedure, why it is being performed and possible complications. Provide instructions to patient on preparation for the procedure—fasting, clothing to wear, etc.

Description of Intra-Service Work: The physician reviews the images with the localization software activated to input the esophagogastric junction, pylorus, and ileocecal valve locations. The physician scans the study and keys anatomic landmarks annotated (e.g., esophagogastric junction, duodenum, ileocecal valve) permitting identification of potentially positive findings and determination of gastric and small bowel emptying times. Once the landmarks have been determined, all the images are viewed. When the physician identifies an abnormality, a "thumbnail" is created. Key findings or abnormalities are noted. Localization is determined by passage of time or by capsule localization software.

Description of Post-Service Work: Upon completion of review of all images and formulating an interpretation, the physician prepares a report. The findings are communicated to the patient and a copy of the report is sent to the referring physician. The referring physician may also be contacted to discuss the findings.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
91112	XXX	2.10	**RUC Time**

CPT Descriptor Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
91117	XXX	2.45	**RUC Time**

CPT Descriptor Colon motility (manometric) study, minimum 6 hours continuous recording (including provocation tests, eg, meal, intracolonic balloon distension, pharmacologic agents, if performed), with interpretation and report

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99336	XXX	2.46	**RUC Time**	1,084,564

CPT Descriptor 1 Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are spent with the patient and/or family or caregiver.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99222	XXX	2.61	**RUC Time**	6,965,104

CPT Descriptor 2 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.96	1.24
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.78	0.76

Urgency of medical decision making	1.04	1.35

Technical Skill/Physical Effort (Mean)

Technical skill required	0.74	0.35
Physical effort required	0.57	0.35

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.57	0.35
Outcome depends on the skill and judgment of physician	0.87	0.82
Estimated risk of malpractice suit with poor outcome	1.04	1.00

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.04	0.88

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The ACG, AGA and ASGE conducted a RUC survey and received 76 responses. The specialty consensus panel spent a significant amount of time reviewing the survey data, comparing the data for GI tract capsule endoscopy code 91110 to similar GI tests.

Pre-time Package 1a

- **Evaluation**: Removal of 8 minutes from the pre-time package – 5 minutes
- **Positioning**: Removal of all positioning time – 0 minutes
- **Scrub, dress, wait:** Removal of all positioning time – 0 minutes

Comparison to Primary Key Reference Code

- Intra and total time is greater for 91110 than the primary key reference service code, 91112
- Surveyees ranked 91110 as more intense and complex than 91112 in all measures

The primary key reference code selected by surveyees was 91112, *Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report*. Code 91112 was surveyed in 2012, has an XXX day global period, 40 minutes intra-service time, and 60 minutes total time. The median values for surveyed code, 91110, are 45 minutes for intra-service time and 78 minutes for total procedure time. All intensity and complexity measures for primary key reference service 91110 indicate that it is "somewhat more" intense and complex than 91112.

wRVU and Time Recommendations

After reviewing the survey data, **we recommend a wRVU of 2.49 for 91110.** This value is equal to the 25th percentile of the survey. We recommend **5 minutes of pre-service time**, 8 minutes less than **Pre-Time Package 1a,** with removal of

time for positioning and scrub, dress, wait as those activities do not occur for this procedure. We recommend the survey median time of **45 minutes of intra-service** and 1**5 minutes of post-service time**.

Comparison To RUC reviewed XXX codes with 45 min IS time valued in the past 10 years

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 91110

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 150000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2014 freqency (~50,000) * 3 = 150,000

Specialty Gastroenterology Frequency 137000 Percentage 91.33 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2014 frequency = ~50,000

Specialty Gastroenterology Frequency 46000 Percentage 92.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 91110

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:91111 Tracking Number Original Specialty Recommended RVU: **1.00**
Presented Recommended RVU: **1.00**
Global Period: XXX RUC Recommended RVU: **1.00**

CPT Descriptor: Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year old patient with cirrhosis and compromised liver function is referred for screening for esophageal varices. Wireless capsule endoscopy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Assess for possible contraindications such as presence of pacemaker, active bowel obstruction or swallowing disorder. Provide education to patient on the nature of the procedure, why it is being performed and possible complications. Provide instructions to patient on preparation for the procedure—fasting, clothing to wear, etc.

Description of Intra-Service Work: The physician reviews the images. The physician scans the entire study and keys anatomic landmarks annotated (e.g., esophagogastric junction). Once the landmarks have been determined, all the images are viewed. When an abnormality is identified, a "thumbnail" is created. The physician notes and records key findings or abnormalities on a localization drawing that may also be used to guide subsequent management of the patient. Localization is determined by passage of time or by capsule localization software.

Description of Post-Service Work: Upon completion of review of all images and formulating an interpretation, the physician prepares a report. The findings are communicated to the patient and a copy of the report is sent to the referring physician. The referring physician may also be contacted to discuss the findings.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
91112	XXX	2.10	**RUC Time**

CPT Descriptor Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99203	XXX	1.42	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Typically, 30 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95991	XXX	0.77	**RUC Time**	14,104

CPT Descriptor 1 Refilling and maintenance of implantable pump or reservoir for drug delivery, spinal (intrathecal, epidural) or brain (intraventricular), includes electronic analysis of pump, when performed; requiring skill of a physician or other qualified health care professional

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99238	XXX	1.28	**RUC Time**	3,702,617

CPT Descriptor 2 Hospital discharge day management; 30 minutes or less

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.18	-0.20
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.35	0.60
Urgency of medical decision making	0.82	0.60

Technical Skill/Physical Effort (Mean)

Technical skill required	0.18	0.80
Physical effort required	-0.18	0.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.53	0.60
Outcome depends on the skill and judgment of physician	0.65	0.80
Estimated risk of malpractice suit with poor outcome	1.06	1.40

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.29	0.60

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The ACG, AGA and ASGE conducted a RUC survey and received 34 responses. The specialty consensus panel spent a significant amount of time reviewing the survey data, comparing the data for esophageal capsule endoscopy code 91111 to similar GI tests.

Code 91111 is a low volume procedure, accounting for just 200 claims submitted to Medicare in 2014, according to the RUC database. As such, a significant number of surveyees reported not having performed the procedure in the past 12 months. We have provided in the summary excel worksheet a breakdown of the survey data for those who have performed the procedures in the past 12 months and those who have not.

Pre-time Package 1a

- **Evaluation**: Removal of 8 minutes from pre-time package – 5 minutes
- **Positioning**: Removal of all positioning time – 0 minutes
- **Scrub, dress, wait:** Removal of all positioning time – 0 minutes

Comparison to Primary Key Reference Code

- The median intra-service time for those reporting experience with 91111 in the past 12 months was 20 minutes and 58 minutes total time compared to 40 minutes of intra-service time and 60 minutes of total time for primary key reference code 91112.
- Surveyees ranked 91111 similar to 91112 in overall intensity and complexity but less so for physician effort and number of diagnoses and/or management options that must be considered.

The primary key reference code selected by surveyees was 91112, *Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report*. Code 91112 was surveyed in 2012, has an XXX day global period, 40 minutes intra-service time, and 60 minutes total time. Because a significant number of surveyees reported not having performed 91111 in the past 12 months, we have provided a breakdown of the time reported by each group below.

Source	CPT	DESC	Resp	Total Time	PRE-TIME EVAL	PRE-TIME POSIT	PRE-TIME SDW	INTRA-TIME MED	IMMD POST	SURVEY EXPERIENCE MIN	25th	MED	75th	MAX
SVY	91111	Esophageal capsule endoscopy	34	48	15			18	15	0	0	0	5	30
Exper	91111	Esophageal capsule endoscopy	16	58	20			20	18	1	2	5	9	30
No Exper	91111	Esophageal capsule endoscopy	18	45	15			15	15	0	0	0	0	0

wRVU and Time Recommendations

After reviewing the collective survey data, **we recommend a wRVU of 1.00 for 91111.** This value is equal to the current wRVU for 91111 and is less than the 25th percentile of the survey (1.50 wRVU). Although intra-service and total time has increased since the previous valuation in 2006, we could find no compelling evidence that the physician work of the procedure has increased since it was last valued. We recommend **5 minutes of pre-service time**, 8 minutes less than **Pre-Time Package 1a,** with removal of time for positioning and scrub, dress, wait as those activities do not occur for this procedure. We recommend the overall survey median time of **18 minutes of intra-service** and 1**5 minutes of post-service time**.

Comparison to RUC reviewed XXX codes with 15-20 min IS & 38-48 min total time valued in the past ~10 years

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these

data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 91111

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2014 freqency (200) * 3 = 600

Specialty Gastroenterology Frequency 550 Percentage 91.66 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 200
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2014 frequency = 200

Specialty Gastroenterology Frequency 182 Percentage 91.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 91111

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

91110 - Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report

91111 - Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report

Global Period: XXX Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACG, AGA, and ASGE convened a group from a broad range of geographic locations with differing practice circumstances and settings who typically perform these services. The committee served as the consensus panel to develop PE recommendations.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

As there have been no significant changes in the practice expense inputs for codes 91110 and 91111, the consensus panel used the same codes as the reference services and the PE direct inputs from the most recent meeting where the codes were reviewed.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

Not applicable

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Not applicable

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities = 8 minutes: (91110-91111) RN/LPN/MTA
5 minutes to complete pre-service diagnostic & referral forms
3 minutes to provide follow-up phone calls & prescriptions

Intra-Service Clinical Labor Activities = 35: (91110) RN/LPN/MTA
3 minutes to greet patient, provide gowning, ensure appropriate medical records are available
3 minutes to provide pre-service education/obtain consent
3 minutes to obtain vital signs

10 minutes to prepare equipment, data recorder, sensors, workstation
6 minutes to connect the equipment, fit belt, put data recorder on patient, sync capsule to each sensor
2 minutes to assist patient with capsule ingestion
2 minutes to observe patient to insure no complications (e.g., not in airway, Zinker's diverticulum, caught in esophageal stricture)
3 minutes to disconnect belt, recorder, and sensor array
3 minutes to clean room/equipment by physician staff

Intra-Service Clinical Labor Activities = 42: (91111) RN/LPN/MTA
3 minutes to greet patient, provide gowning, ensure appropriate medical records are available
3 minutes to provide pre-service education/obtain consent
3 minutes to obtain vital signs
10 minutes to prepare equipment, data recorder, sensors, workstation
6 minutes to connect the equipment, fit belt, put data recorder on patient, sync capsule to each sensor
3 minutes to position patient (assist patient onto table lying down on right side and then into a sitting position after the capsule is swallowed)
8 minutes to give patient 100c water to drink (1 min), observe swallow pillcam and take one sip every 30 seconds (7 min), assist patient to sit upright and take another sip of water and wait 30 seconds
3 minutes to disconnect belt, recorder, and sensor array
3 minutes to clean room/equipment by physician staff

Post-Service Clinical Labor Activities = 4 minutes: (91110-91111) RN/LPN/MTA
4 minutes to recharge batteries, initiate data download to workstation and create image archive

Additional Rationale and Equipment Time (91110)

The clinical staff time on line 44 for *Other Clinical Activity: recharge batteries, initiate data download to workstation, create image archive* is distinct from the longer download time captured in the equipment minutes. This time is to start the data process and start downloading images into the workstation.

Line 72, *video system, capsule endoscopy (software, computer, monitor, printer),* at 94 minutes includes a download time of 80 minutes. This is outlined in the Download Time for PillCam SB3 PDF included in the submission and it is the shortest download time for the video system needed for this service.

Line 73, *kit, capsule endoscopy recorder* requires a recording time of 8 hours for the test plus 80 minutes download time. Typically, the patient comes in at 7am and returns at 4pm and multiple patients may return to the office at the same time. The video system (computer) has docking stations for multiple capsule recorders; however, the computer downloads the data from each capsule recorder in sequence because the equipment is not capable of downloading from multiple capsule recorders at the same time.

Additional Rationale and Equipment Time (91111)

The clinical staff time on line 44 for *Other Clinical Activity: recharge batteries, initiate data download to workstation, create image archive* is distinct from the longer download time captured in the equipment minutes. This time is to start the data process and start downloading images into the workstation.

Line 72, *video system, capsule endoscopy (software, computer, monitor, printer),* at 29 minutes includes a download time of 15 minutes. This is the shortest download time for the video system needed for this service. It is the time that the capsule recorder is synced to the video system.

Line 73, *kit, capsule endoscopy recorder*, no additional recording time is needed because the patient remains in the office, however 15 minutes of download time is necessary.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Fundus Photography

In the NPRM for 2016 CMS, re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 92250 was identified by this screen. This service was presented for review of physician work and practice expense at the January 2016 RUC meeting.

92250 ***Fundus photography with interpretation and report***
The RUC reviewed the survey results from 89 practicing ophthalmologists and optometrists and recommend the following physician time components: pre-service time of 1 minute, intra-service time of 10 minutes and immediate post-service time of 1 minute. The RUC agreed that there is only one minute of both pre- and post-service time because this procedure is typically done on the same date of service as an eye Evaluation and Management visit.

The RUC reviewed the survey respondents' physician work values and agreed that the survey 25th percentile work RVU of 0.40, lower than the current value, is appropriate. To justify a work RVU of 0.40, the RUC compared the surveyed code to the top two key reference codes 92083 *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* (work RVU= 0.50, intra time= 10 minutes) and 92082 *Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)* (work RVU= 0.40, intra time= 8 minutes) and agreed that both these reference services, with similar intra-service time and comparable physician work, offer accurate comparisons to the recommended value. **The RUC recommends a work RVU of 0.40 for CPT code 92250.**

Practice Expense:
The RUC accepted the minor modifications as made and approved by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
92250	Fundus photography with interpretation and report	XXX	0.40

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92250 Tracking Number Original Specialty Recommended RVU: **0.40**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: Fundus Photography with interpretation and report.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old male with type 1 diabetes mellitus of 20 years duration with early renal failure and controlled hypertension presents with decreased vision associated with clinically significant macular edema in both eyes and with disc neovascularization in the right eye and neovascularization elsewhere in the left eye. Color fundus photographs are obtained.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Explain the indications, risks, and benefits of the fundus photography to the patient and/or family.

Description of Intra-Service Work: Evaluate the quality of the study. Interpret the images, determine the presence of lesions that could benefit from treatment. Compare findings with previous studies and other diagnostic modalities to determine disease progression/interval change. Review the findings and discuss with the patient. Select representative images for archiving for future comparison. Prepare and dictate report.

Description of Post-Service Work: Review and sign the final report. Inform referring physician(s) of outcome.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
92083	XXX	0.50	**RUC Time**

CPT Descriptor Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
92082	XXX	0.40	**RUC Time**

CPT Descriptor Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99281	XXX	0.45	**RUC Time**	76,714

CPT Descriptor 1

Emergency department visit for the evaluation and management of a patient, which requires these 3 key components: A problem focused history; A problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
92082	XXX	0.40	**RUC Time**	151,597

CPT Descriptor 2 Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)

Other Reference CPT Code	Global	Work RVU	Time Source
88314	XXX	0.45	**RUC Time**

CPT Descriptor Special stain including interpretation and report; histochemical stain on frozen tissue block

---

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 28 **% of respondents:** 31.4 **%**

Number of respondents who choose 2nd Key Reference Code: 16 **% of respondents:** 17.9 **%**

TIME ESTIMATES (Median)

	CPT Code: 92250	**Top Key Reference CPT Code:** 92083	**2nd Key Reference CPT Code:** **92082**
Median Pre-Service Time	1.00	3.00	3.00
Median Intra-Service Time	10.00	10.00	8.00
Median Immediate Post-service Time	1.00	0.00	0.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	**12.00**	**13.00**	**11.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.11	0.88
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.71	0.69

Urgency of medical decision making	1.00	0.44

Technical Skill/Physical Effort (Mean)

Technical skill required	0.79	0.38
Physical effort required	0.25	0.13

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.68	0.44
Outcome depends on the skill and judgment of physician	0.89	0.63
Estimated risk of malpractice suit with poor outcome	0.86	0.56

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.89	0.63

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT 92250 *Fundus photography with interpretation and report* was targeted by CMS as a potentially misvalued code in the 2016 Medicare physician fee schedule.

A random survey of AAO, ASRS and AOA members had 89 respondents, 79% of whom found the vignette typical. The median WRVU was 0.50 and the 25th percentile was 0.40. Median IST was 10 minutes. The current value of the code is 0.44. The primary reference service, chosen by 31%, was 92083, *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination…* (RUC April 2012) with a WRVU of 0.50 and 10 minutes IST. The second highest reference service, chosen by 18% of respondents, was 92082, *Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination…* (RUC April 2010) with a WRVU of 0.40 and 8 minutes IST. The intensity and complexity metrics for the surveyed code were similar or slightly higher than those of either reference code.

The expert panel of the AAO, ASRS and AOA, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median survey IST of 10 minutes was similar to the current value of 9 minutes. We reduced the pre-evaluation time from the survey median of 5 minutes to 1 minute and eliminated the survey post-time as the procedure is typically done with an office visit. **We recommend the survey's 25th percentile value of 0.40 WRVU.**

This value is supported by MPC code 92082 *Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination…* (RUC April 2010) with 0.40 WRVU, an IST of 8 minutes, and total time of 11 minutes and MPC code 99281 *Emergency department visit for the evaluation and management of a patient… straightforward…* (RUC September 2005) with 0.45 WRVU, an IST of 7 minutes, and total time of 13 minutes. The value is also supported by CPT code 88314, *Special stain including interpretation and report; histochemical stain on frozen tissue block* (RUC February 2011) with 0.45 WRVU, and an IST and total time of 13 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Billed with an office visit.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. E/M or the ophthalmalogic exam codes

3.	CPT Code	Pre-	Intra-	Post-	Total Time	Work RVU	Global Period
4.	92002	5	15	5	25	.88	XXX
5.	92004	5	25	10	40	1.82	XXX
6.	92012	5	15	5	25	.92	XXX
7.	92014	5	24	8	37	1.42	XXX
8.	99212	2	10	4	16	.48	XXX
9.	99213	3	15	5	23	.97	XXX

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Commonly

Specialty Optometry How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4239300
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation Only

Specialty Opthalmology Frequency 2625398 Percentage 61.92 %

Specialty Optometry Frequency 1598640 Percentage 37.70 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,826,200 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Ophthalmology Frequency 1750265 Percentage 61.92 %

Specialty Optometry Frequency 1065760 Percentage 37.70 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92250

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

Fundus photography with interpretation and report.

Global Period: XXX Meeting Date: 01/2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other physicians who have the appropriate expertise as needed. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: **N/A**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: **N/A**

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: **N/A**

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

- Assist physician in performing procedure: 14 min
    - This time is spent performing fundus photography. The patient is escorted over to the camera station. The photographer positions the patient at the camera, establishes fixation with a fixation device, aligns the illumination beam within the pupil, focuses on a designated field of view, uses an astigmatic correction device, then takes color photographs.
    - The camera zoom is utilized, the fixation device adjusted, and the optic disc is brought into focus first, and images are taken. The photographer then uses lateral shift to obtain sequential stereo pairs.

  - Next, the posterior pole is imaged by zooming out to incorporate the disc, macula and vessels of one eye, and by adjusting the fixation device. The photographer then uses lateral shift to obtain sequential stereo pairs.
  - Next, peripheral pathology is brought into focus by adjusting the patient's fixation and the camera settings. Pathology in the periphery is then photographed.
  - The photographer then reviews images for quality and corrects artifacts and adjusts settings accordingly, repeating as needed.
  - The patient is then escorted from the room.
- Label & file photos/slides w/ patient chart: 3 min
  - This time is spent uploading and ordering photographs from the procedure into the medical record. This time would be extended to approximately 10 to 20 minutes when a multi-frame photographic montage is created to show the location of the peripheral pathology for treatment purposes.

Post-Service Clinical Labor Activities:

N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Electroretinography

In the NPRM for 2016, CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 92275 was identified by this screen and to be reviewed at the January 2016 RUC meeting.

The specialty society noted that they became aware of inappropriate use of this code for a less intensive version of this test for diagnosis and indications that are not clinically proven and for which less expensive and less intensive tests already exist. The utilization of CPT code 99275 was appropriately low until 2013 when it suddenly increased by 300%. CPT changes are necessary to ensure that the service for which 92275 was intended is clearly described as well as an accurate vignette and work descriptor is developed. **The RUC recommends that CPT code 92275 be referred to the CPT Editorial Panel at the May 2016 meeting.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
92275	Electroretinography with interpretation and report	XXX	Refer to CPT May 2016

American Medical Association
330 North Wabash Ave., Suite 39300
Chicago IL 60611-5885

Dear Dr. Smith,

The American Academy of Ophthalmology is writing to provide further information and to request that CPT 92275 *Electroretinography* be sent to the CPT Editorial Panel for a descriptor change. The Academy's Health Policy Committee which is responsible for our RUC and CPT activities has found new information regarding this service that we believe indicates that the AMA CPT Editorial Panel consider a descriptor change in order to clarify its appropriate usage. On the website of one of the manufacturers of the equipment utilized for this test, we found guidance about using a less intensive version of the test for diagnosis and indications that are not clinically proven and for which less expensive and less intensive tests already exist.

Electroretinography (ERG) is an eye test used to detect abnormal function of the retina for a limited range of diseases/conditions, typically retinal degenerations and dystrophies. With this test, the light-sensitive cells of the eye, the rods and cones, and their connecting ganglion cells in the retina are examined for their response to light. During the test, an electrode is placed on the cornea of the patient to measure patient provided responses to an array of light stimuli in the back of the eye. The utilization of this service was appropriately low until 2013 when it suddenly increased by 300%

CPT changes are necessary to ensure that service for which 92275 was intended is clearly described as well as an accurate vignette and work descriptor is put into place. We expect to present a less intense ERG code for these new indications at CPT. That should help guide providers on the appropriate billing of this test for its intended usage. Then if the utilization still appears to be higher than warranted, having made the changes will ensure that appropriate work and practice expenses can be established via a future survey.

We appreciate your consideration of our plans for these two codes. Our goal would be to take this code to the May CPT meeting for consideration of new descriptors. If you have any questions or need additional information please contact Ms. Cherie McNett, AAO Health Policy Director at cmcnett@aaodc.org or via phone at 202-737-6662.

Sincerely,

Michael X. Repka, M.D., M.B.A

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Non-invasive Physiologic Studies of Extremity Veins

In the NPRM for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 93965 was identified by this screen. This service was presented for review of physician work and practice expense at the January 2016 RUC meeting.

The specialty societies explained that CPT code 93965 is a physiologic noninvasive vascular test, and the Introductory Comments in the Noninvasive Vascular Diagnostics portion of the CPT Manual clearly state that physiologic studies must be performed on instruments other than a duplex ultrasound scanner. Previously, this service could have been appropriately used in two ways. However, each indication is now obsolete. In the 2000s a test to detect lower extremity deep venous thrombosis employed an instrument called an Impedance Plethysmograph, or IPG. In the 2000s, IPG was replaced by a better test, duplex ultrasound (CPT code 93970). Additionally, duplex scanning has also replaced air plethysmography, which was previously used to test patients for chronic venous insufficiency.

Given the removal of these two indications, the specialty societies explained that they cannot identify a valid indication for the use of CPT code 93965. It is possible that clinicians are using the code to report the additional work of assessing venous valve function when duplex ultrasound is used to assess patients for chronic venous insufficiency. Under this scenario, CPT codes 93970 and 93965 would be used in conjunction on the same date of service, which is the case 50% of the time, according to the Medicare 5% sample file. However, this coding practice is inappropriate if a duplex scanner is used exclusively to perform the test.

The RUC recommends that CPT code 93965 be referred to the CPT Editorial Panel for deletion. In accordance with this deletion, no current CPT code will be used to report this service. Furthermore, CMS should consider a payment policy which removes this service from active status and redistributes the savings for CY 2017.

Re: Tab 47 Non-invasive Physiologic Studies of Extremity Veins (93965)

Dear Dr. Smith:

CPT Code 93965 *Noninvasive physiologic studies of extremity veins, complete bilateral study (eg, Doppler waveform analysis with responses to compression and other maneuvers, phleborheography, impedance plethysmography)* was identified by CMS in the NPRM for 2016 in the high expenditure screen. We believe the procedure described by CPT Code 93965 is no longer appropriate. We recommend this issue be referred to the CPT Editorial Panel to have the code deleted from CPT.

Thank you,

The American Academy of Family Physicians (AAFP)
The American College of Cardiology (ACC)
The American College of Radiology (ACR)
The American College of Surgeons (ACS)
The Society for Cardiovascular Angiography and Interventions (SCAI)
The Society for Vascular Ultrasound (SVU)
The Society for Vascular Surgery (SVS)
The Society of Interventional Radiology (SIR)

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Pulmonary Stress Test

In the NPRM for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 94620 was identified by this screen.

The specialty societies explained that they have submitted a Code Change Application (CCA) for the February 2016 CPT Editorial Panel meeting. CPT codes 94620 and 94621 require revisions that will allow the survey respondents better value these services. Code 94620 describes two different tests commonly performed for evaluation of dyspnea, the six minute walk test as well as pre-exercise and post-exercise spirometry. These tests are entirely different and should be described with two separate codes. In addition, code 94620 describes a "simple" pulmonary exercise test and code 94621 a "complex" pulmonary exercise test. The testing described in 94621 is commonly called a cardiopulmonary exercise test (CPET) and not a complex pulmonary exercise test as it is currently labeled in CPT 2016. Code 94621 includes the measurement of minute ventilation and exhaled gases in addition to heart rate, oximetry and ECG monitoring. As such, it should not be included as part of the family of less complex exercise tests. The RUC will review these services at the April 2016 RUC meeting. **The RUC recommends CPT code 94620 be referred to the CPT Editorial Panel.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
94620	Pulmonary stress testing; simple (eg, 6-minute walk test, prolonged exercise test for bronchospasm with pre- and post-spirometry and oximetry)	XXX	Refer to CPT Feb 2016, RUC April 2016
94621(f)	Pulmonary stress testing; complex (including measurements of CO2 production, O2 uptake, and electrocardiographic recordings)	XXX	Refer to CPT Feb 2016, RUC April 2016

AMA Plaza 330 N. Wabash Ave.,
Suite 39300 Chicago, IL 60611-5885

December 15, 2015

Dear Dr. Smith,

The American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST) submitted a CPT Code Change Application for the AMA CPT Editorial Panel consideration at the February 2016 meeting, currently noted as Tab 39 on the agenda. We believe that CPT 94620 and 94621 requires editorial revisions that would be of benefit to any survey taker for these codes. We have attached the CCP for your information.

Therefore, with the RUC's permission, we are requesting the presentation to the RUC for CPT codes 94620 and 94621 be moved to the April 2015 RUC meeting.

If you have any questions, contact Denise Merlino, ATS and CHEST staff at (978) 283-0940.

Sincerely,

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Antigen Therapy Services

In the NPRM for 2016 CMS re-ran its screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 95165 was identified by this screen and code 95144 was included as part of the family. These services were presented for review of physician work and practice expense at the January 2016 RUC meeting.

Code 95165 is reimbursed on a "per dose" basis and code 95144 is reimbursed on each "single dose" vial prepared. Prior to conducting a survey, the specialty societies noted that the small increment of work and time related to a single dose in a multidose vial or single dose vial would be very difficult to capture on a survey and therefore the specialty societies requested from the Research Subcommittee to use a survey for work and time estimates related to 10 doses/vials. The survey responses would then be divided by 10 to reflect the per dose/vial increment.

95144 ***Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy, single dose vial(s) (specify number of vials)***
The specialty societies indicated and the RUC agreed that the physician work related to code 95144 has not changed since the last RUC review. This was supported by the survey results from 46 allergists and otolaryngologists that resulted in no change in intra-service time (3 minutes). The RUC also reviewed the survey respondents' estimated physician work values and agreed that the survey 25th percentile work RVU of 0.06 per single dose vial, is appropriate and supports no change in work. To justify a work RVU of 0.06, the RUC reviewed other services with lower and higher work RVUs. The RUC agreed that 92285 *External ocular photography with interpretation and report for documentation of medical progress (eg, close-up photography, slit lamp photography, goniophotography, stereo-photography)* (work RVU= 0.05, intra time= 5 minutes) and 95905 *Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study, each limb, includes F-wave study when performed, with interpretation and report* (work RVU= 0.05, intra time= 5 minutes) involved less intensive work to interpret a diagnostic study than 95144 which includes determining which antigens are to be used for therapeutic immunotherapy, the concentration for each antigen, the dosage schedule, and direct supervision for sterile preparation of single dose vials and quality control. The RUC also agreed that 96361 *Intravenous infusion, hydration; each additional hour* (work RVU= 0.09, intra time= 3 minutes) involves more intensive work for supervision and management of a patient than 99144. **The RUC recommends a work RVU of 0.06 for CPT code 95144.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95165 ***Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy; single or multiple antigens (specify number of doses)***

The specialty societies indicated and the RUC agreed that the physician work related to code 95165 has not changed since the last RUC review. This was supported by the survey results from 98 allergists and otolaryngologists that resulted in no change in intra-service time (3 minutes). The RUC also reviewed the survey respondents' estimated physician work values and agreed that the survey 25th percentile work RVU of 0.06 per single dose is appropriate and supports no change in work. To justify a work RVU of 0.06, the RUC reviewed other services with lower and higher work RVUs. The RUC agreed that 92285 *External ocular photography with interpretation and report for documentation of medical progress (eg, close-up photography, slit lamp photography, goniophotography, stereo-photography)* (work RVU= 0.05, intra time= 5 minutes) and 95905 *Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study, each limb, includes F-wave study when performed, with interpretation and report* (work RVU= 0.05, intra time= 5 minutes) involved less intensive work to interpret a diagnostic study than 95165 which includes determining which antigens are to be used for therapeutic immunotherapy, the concentration for each antigen, the dosage schedule, and direct supervision for sterile preparation of multidose vials and quality control. The RUC also agreed that 96361 *Intravenous infusion, hydration; each additional hour* (work RVU= 0.09, intra time= 3 minutes) involves more intensive work for supervision and management of a patient than 99165. **The RUC recommends a work RVU of 0.06 for CPT code 95144.**

Practice Expense:

The specialty societies presented compelling evidence that the direct practice expense inputs have substantively changed since the previous valuation of these services. In 2007, the United States Pharmacopeia (USP), a national non-governmental standard setting organization, issued revised standards to its chapter 797 on sterile compounding that specifically addressed, for the first time, standards for preparation of allergen extracts. These standards became mandatory in 2013, with the passage of the Drug Quality and Security Act (DQSA) (P.L. 113-24).

The USP Ch. 797 sterile compounding standards applicable to allergen extracts require a number of staff activities which were not the standard in 2006 when this code was last reviewed. As a result, beginning in 2013 with the passage of the DQSA, clinical staff has had to change the way they prepare allergen extracts to meet the more stringent USP requirements. Some examples of ways in which staff have had to modify preparation technique include 1) more extensive hand-cleansing procedures; 2) use of hair covers, gowns, and face masks; 3) intermittent glove disinfection with sterile 70% isopropyl alcohol; and 4) more extensive disinfection of ampule necks and vial stoppers.

The RUC agreed that there is compelling evidence to increase both the clinical labor time and supplies associated with these procedures. The RUC approved the direct practice expense inputs as accepted by the Practice Expense Subcommittee.

CPT Descriptor: Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy, single dose vial(s) (specify number of vials)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 12-year-old patient has severe rhinorrhea, sneezing, wheezing, and coughing. Allergy tests have shown positive reactions to animal dander, mold spores, dust mites, and pollens. Because the patient will be receiving immunotherapy injections at an outside clinic, the physician orders and supervises preparation of 10 single dose vials to ensure accuracy of dosing.
[Note: When completing this survey, only the physician's time should be considered. Do NOT include time spent by clinical staff.]

Percentage of Survey Respondents who found Vignette to be Typical: 76%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Physician determines which antigens are to be used for immunotherapy, the concentration for each antigen, and the dosage schedule. The determination of antigens, concentration, and dosage must take into consideration the patient's prior response to immunotherapy (ie, improved, unchanged, or poorly controlled) and whether the patient has had local and/or systemic reactions to the injections. Once the prescription is established, the physician will provided direct supervision for sterile preparation of single dose vials and needed quality control of the product through testing or other means. This work is documented in the patient's medical record.

Description of Post-Service Work: n/a

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 25 minutes are spent face-to-face with the patient and/or family.

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	0.97	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
96153	XXX	0.10	**RUC Time**	33,057

CPT Descriptor 1 Health and behavior intervention, each 15 minutes, face-to-face; group (2 or more patients)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
96375	ZZZ	0.10	**RUC Time**	1,579,005

CPT Descriptor 2 Therapeutic, prophylactic, or diagnostic injection (specify substance or drug); each additional sequential intravenous push of a new substance/drug (List separately in addition to code for primary procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 9 **% of respondents:** 19.5 **%**

Number of respondents who choose 2nd Key Reference Code: 8 **% of respondents:** 17.3 **%**

TIME ESTIMATES (Median)	**CPT Code:** 95144	**Top Key Reference CPT Code:** 99214	**2nd Key Reference CPT Code: 99213**
Median Pre-Service Time	0.00	5.00	3.00
Median Intra-Service Time	3.00	25.00	15.00
Median Immediate Post-service Time	0.00	10.00	5.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	**3.00**	**40.00**	**23.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.56	0.13

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.56	0.25
Urgency of medical decision making	0.22	-0.13

Technical Skill/Physical Effort (Mean)

Technical skill required	1.11	0.13
Physical effort required	0.67	-0.38

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.56	0.88
Outcome depends on the skill and judgment of physician	1.33	0.88
Estimated risk of malpractice suit with poor outcome	1.11	0.88

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.78	0.75

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and E/M services and services reviewed since CY 2010. Code 95165 was identified through this screen and code 95144 was added as a family code.

Code **95144** is reimbursed on per "single dose" vial. The small increment of work and time related to a single dose vial would be very difficult to capture on a survey and therefore the specialty societies requested to use the same survey vignettes and format that was used during the previous review of these codes; specifically to survey for work and time estimates related to 10 single dose vials. The survey responses would then be divided by 10 to reflect the per vial increment. The Research Subcommittee approved this request.

Recommendation - 95144

In the Survey Data table in this SoR, the survey results for 10 single dose vials is shown. **The specialty recommended data in the second table reflect one-tenth – or one vial.** This information is also provided on the RUC Summary Excel file.

Although the current survey data suggests a higher work RVU, we do not have compelling evidence to ask for an increase. Therefore, we recommend **maintaining the current work RVU of 0.06 and service time of 3 minutes per vial for 95144.**

We note that in the final rule for 2016, CMS noted that *the criteria for many misvalued code screens, including this one, are designed to prioritize codes that **may** be misvalued not to identify codes that **are** misvalued.* Further CMS believes that supporting evidence for the accuracy of current values for particular codes is best considered as part of the review of individual codes through the misvalued code process. We believe the current survey data provides supporting evidence for the accuracy of the current value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95144

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ALLERGY/IMMUNOLOGY How often? Sometimes

Specialty OTOLARYNGOLOGY How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 179,371 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC 2016v1 database

Specialty ALLERGY/IMMUNOLOGY Frequency 130000 Percentage 72.47 %

Specialty OTOLARYNGOLOGY Frequency 28000 Percentage 15.61 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

SUMMARY OF RECOMMENDATION

CPT Code:95165 Tracking Number n/a Original Specialty Recommended RVU: **0.06**
Presented Recommended RVU: **0.06**
Global Period: XXX RUC Recommended RVU: **0.06**

CPT Descriptor: Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy; single or multiple antigens (specify number of doses)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 12-year-old patient has severe rhinorrhea, sneezing, wheezing, and coughing. Allergy tests have shown positive reactions to animal dander, mold spores, dust mites, and pollens. The physician orders and supervises preparation of 10 doses of allergen extract immunotherapy to be made in multi-dose vial(s).
[Note: When completing this survey, only the physician's time should be considered. Do NOT include time spent by clinical staff.]

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Physician determines which antigens are to be used for immunotherapy, the concentration for each antigen, and the dosage schedule. The determination of antigens, concentration, and dosage must take into consideration the patient's prior response to immunotherapy (ie, improved, unchanged, or poorly controlled) and whether the patient has had local and/or systemic reactions to the injections. Once the prescription is established, the physician will provided direct supervision for sterile preparation of vial(s) and needed quality control of the product through testing or other means. This work is documented in the patient's medical record.

Description of Post-Service Work: n/a

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.19	0.59

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.41	0.81
Urgency of medical decision making	-0.37	-0.04

Technical Skill/Physical Effort (Mean)

Technical skill required	0.63	0.89
Physical effort required	-0.41	0.22

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.11	1.37
Outcome depends on the skill and judgment of physician	0.85	1.00
Estimated risk of malpractice suit with poor outcome	1.26	1.19

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.85	0.89

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and E/M services and services reviewed since CY 2010. Code 95165 was identified through this screen and code 95144 was added as a family code.

Code **95165** is reimbursed on a "per dose" basis and code **95144** is reimbursed on each "single dose" vial prepared. The small increment of work and time related to a single dose would be very difficult to capture on a survey and therefore the specialty societies requested to use the same survey vignettes and format that was used during the previous review of these codes; specifically to survey for work and time estimates related to 10 doses/vials. The survey responses would then be divided by 10 to reflect the per dose/vial increment. The Research Subcommittee approved this request.

Recommendation - 95165

In the Survey Data table in this SoR, the survey results for 10 doses is shown. **The specialty recommended data in the second table reflect one-tenth – or one dose.** This information is also provided on the RUC Summary Excel file.

Although the current survey data suggests a higher work RVU, we do not have compelling evidence to ask for an increase. Therefore, we recommend **maintaining the current work RVU of 0.06 and service time of 3 minutes per dose for 95165.**

We note that in the final rule for 2016, CMS noted that *the criteria for many misvalued code screens, including this one, are designed to prioritize codes that **may** be misvalued not to identify codes that **are** misvalued.* Further CMS believes that supporting evidence for the accuracy of current values for particular codes is best considered as part of the review of individual codes through the misvalued code process. We believe the current survey data provides supporting evidence for the accuracy of the current value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95165

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty ALLERGY/IMMUNOLOGY How often? Commonly

Specialty OTOLARYNGOLOGY How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,570,792 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC 2016v1 database

Specialty ALLERGY/IMMUNOLOGY Frequency 3057000 Percentage 46.52 %

Specialty OTOLARYNGOLOGY Frequency 2080000 Percentage 31.65 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

95144 Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy, single dose vial(s) (specify number of vials)

95165 Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy; single or multiple antigens (specify number of doses)

Global Period: XXX Meeting Date: January 2016

1. **Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:** The society Advisors and additional physicians familiar with these services reviewed the current PE inputs.

2. **You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:** The current codes were used as references.

3. **If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:** *See discussion below.*
4. **If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:** *See discussion below.*

Compelling Evidence

United States Pharmacopeia (USP), a national non-governmental standard setting organization, issued revised standards to its chapter 797 on sterile compounding in 2007 that specifically addressed, for the first time, standards for preparation of allergen extracts. These standards were voluntary for most physicians and did not have the weight of law. This changed in 2013 with the passage of the Drug Quality and Security Act (DQSA) (P.L. 113-24). That law made the USP standards applicable to physicians compounding drugs in their offices by removing from Section 503A of the Food Drug and Cosmetic Act, which addresses compounding, language determined by the federal courts to be unconstitutional and which had previously made Section 503A of the Act unenforceable. As a result, language in Section 503A which had been there all along and which required in-office compounding by physicians to meet the USP sterile compounding standards became enforceable for the first time.

The USP Ch. 797 sterile compounding standards applicable to allergen extracts require a number of procedures which were not the standard in 2006 when this code was last reviewed. As a result, beginning in 2013 with the passage of the DQSA, physicians have had to change the way their clinical staff prepare allergen extracts to meet the more stringent USP requirements. Some examples of ways in which staff have had to modify preparation technique include 1) more extensive hand-cleansing procedures; 2) use of hair covers, gowns, and face masks; 3) intermittent glove disinfection with sterile 70% isopropyl alcohol; and 4) more extensive disinfection of ampul necks and vial stoppers.

USP 797 includes a section that describes allergen extracts as compounded sterile products (CSPs) that are single-dose and multiple-dose intradermal or subcutaneous injections that are prepared by specially trained physicians and personnel under their direct supervision. The section provides sterile preparation criteria for allergen extracts that is different and more extensive than the standard of practice prior to USP 797, including:

- All allergen extracts as CSPs shall contain appropriate substances in effective concentrations to prevent the growth of microorganisms. Nonpreserved allergen extracts shall comply with the appropriate CSP risk level requirements in the chapter.
- Before beginning compounding activities, personnel perform a thorough hand-cleansing procedure by removing debris from under fingernails using a nail cleaner under running warm water followed by vigorous hand and arm washing to the elbows for at least 30 seconds with either non-antimicrobial or antimicrobial soap and water.
- Compounding personnel don hair covers, facial hair covers, gowns, and face masks.
- Compounding personnel perform antiseptic hand cleansing with an alcohol-based surgical hand scrub with persistent activity.
- Compounding personnel don powder-free sterile gloves that are compatible with sterile 70% isopropyl alcohol (IPA) before beginning compounding manipulations.
- Compounding personnel disinfect their gloves intermittently with sterile 70% IPA when preparing multiple allergen extracts as CSPs.
- Ampul necks and vial stoppers on packages of manufactured sterile ingredients are disinfected by careful wiping with sterile 70% IPA swabs to ensure that the critical sites are wet for at least 10 seconds and allowed to dry before they are used to compound allergen extracts as CSPs.
- The aseptic compounding manipulations minimize direct contact contamination (e.g., from glove fingertips, blood, nasal and oral secretions, shed skin and cosmetics, other nonsterile materials) of critical sites (e.g., needles, opened ampuls, vial stoppers).
- The label of each multiple-dose vial (MDV) of allergen extracts as CSPs lists the name of one specific patient and a BUD and storage temperature range that is assigned based on manufacturers' recommendations or peer-reviewed publications.
- Single-dose allergen extracts as CSPs shall not be stored for subsequent additional use.
- In addition, best practice is to always prepare only one patient's prescription of antigen immunotherapy at a time (ie, no batching of multiple prescriptions).

These standards for aseptic technique that were adopted after the previous review of 95165 and 95144 support increased time and additional supplies required per USP 797 and passage of DQSA.

5. Please describe in detail the clinical activities of your staff:

<u>Pre-Service</u> Clinical Labor Activities:

N/A – this is a non-face-to-face activity that only involves service period time.

<u>Intra-Service</u> Clinical Labor Activities:

The PE spreadsheet activities are meant for face-to-face encounters, however the work related to preparation of antigen immunotherapy is not performed in the presence of a patient. In addition the order of activities in the rows do not relate well to the required activities or order of activities for immunotherapy preparation. **We therefore recommend that all time be collapsed into the intra-service category " *Preparation of antigens for allergen immunotherapy*."**

The original clinical staff times from March 2002 were developed using a survey. For this review, we conducted a similar mini-survey to obtain current information for preparation of multidose vials. We asked our geographically representative expert panel to query several practices that are both small and large about the time it takes their staff to prepare multidose antigen immunotherapy vial(s).

Specifically, we asked the following questions:

1. How many physicians are in the practice?
2. How long does it take the clinical staff to prepare a multi-dose maintenance vial (or vials) for one patient from start to finish? Please include all set-up time, time spent on personal hygiene, time spent preparing the vials, labels, any documentation, and clean up.
3. For each patient's vial preparation that you provide time, please also let us know how many mls of extract were prepared (eg, two 5 ml vials; one 10 ml vial, etc).

Based on a response of 27 small to large practices (1 to 121 physicians), we found the median time to prepare 10 doses of allergen immunotherapy is 30 minutes (mean = 37 minutes). These results confirmed our expert panel's belief that the new standards require more time. **We therefore recommend a total of 30 minutes for 10 doses or 3 minutes per dose for code 95165.**

The clinical staff activities are generally the same for both 95165 and 95144 except that more vials are prepared, labeled, and documented for 95144 and additional documentation will be necessary because the single dose vials will be taken by the patient to a different location/office for therapy. To account for the additional work, the PEAC had previously approved an additional 1 minute per vial. Our expert panel believes that time increment has not changed. **We therefore recommend a total of 40 minutes for 10 vials or 4 minutes per vial for code 95144.**

Row	Clinical Staff Activity	95165		95144	
		per 10 doses	per dose	per 10 doses	per dose
31	Preparation of antigens for allergen immunotherapy	30	3	40	4

1. Open patient electronic health record and review physician order for antigen prescription.
2. Perform calculations for preparing antigen mixture and document in the patient's chart.
3. Prepare patient specific label(s) for vial(s) to include patient name and date of birth, date of preparation, date of expiration, storage temperature range and compounded ingredients listed in descending concentration in volume/volume.
4. When preparing multiple vials, confirm the color-coding and prepared concentration matches.
5. Collect all supplies.
6. Pull and document removal of stock antigens from secure refrigerated storage.
7. Check stock antigens for turbidity or particulate matter and determine if re-suspension or filtering is necessary per manufacturer guidelines.
8. Document patient’s name, extracts used for mixing, mixing date, expiration date and lot numbers into a mixing log. This is important in the event there is a product recall or adverse event investigation.
9. Clean the compounding surface with 70% isopropyl alcohol.
10. Don gown, hair cover and mask with face shield.
11. Perform a thorough hand-cleansing by removing debris from under fingernails followed by vigorous hand and arm washing to the elbows for at least 30 seconds.
12. Perform antiseptic hand cleansing with an alcohol-based surgical hand scrub.
13. Don powder-free sterile gloves that are compatible with sterile 70% isopropyl alcohol so that the gloves can intermittently be disinfected during allergen immunotherapy

Row	Clinical Staff Activity	95165		95144	
		per 10 doses	per dose	per 10 doses	per dose

preparation.

14. Disinfect each stock antigen vial neck and vial stopper with a separate sterile alcohol swab and ensure that the critical sites are wet for at least 10 seconds and allowed to dry.
15. Using separate syringes for each antigen, draw calculated aliquot from antigen stock vial and place syringe next to antigen vial.
16. Verify all drawn doses are correct volume and antigen (ie, time out).
17. Inject contents of all drawn antigens one by one into multidose or single dose vial(s) maintaining aseptic technique. Discard empty syringes immediately into Sharps disposal container.
18. Label vials as they are prepared and disinfect gloves with isopropyl alcohol intermittently to maintain sterility. Prior to affixing label, perform a solution color check, vial color-code check, turbidity/precipitate check and vial integrity check.
19. After all vial(s) for a single patient are prepared, they are placed in a patient specific container (tray, box, envelope) and transferred to a dedicated refrigerator for storage at 4°C.
20. Inspect stock allergen vials prior to returning to refrigerated storage.
21. Document preparation details in patient chart, including name of preparer and date prepared, stock allergen extract manufacturer, lot number and expiration date.
22. Dispose of used hazardous waste (eg, syringe packaging, alcohol pads, gloves, mask).

Post-Service Clinical Labor Activities:

N/A – this is a non-face-to-face activity that only involves service period time.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS Request - NPRM for 2016 and CMS High Expenditure Procedural Codes*

January 2016

Electroencephalogram (EEG)

Following publication of the 2014 Final Rule, the RUC solicited feedback from the specialties societies regarding CPT codes potentially impacted by the OPPS/ASC Payment Cap. Specialty societies indicated an interested in re-reviewing or validating a recent RUC review for PE only, for 58 of the 211 codes identified through the cap. The PE Subcommittee reviewed the codes identified by specialty societies, grouped by families, at the April 2014 RUC meeting and provide CMS with the recommendations as a sample subset of the codes impacted by the cap. CPT codes 95812 and 95813 were included in these recommendations. CMS chose not to implement the RUC recommendations for 2015, but has reviewed and accepted the recommendations with refinement for 2016. CMS expressed concern about the way the services were selected for review and limiting the review to PE only. The RUC understands CMS' concerns about implementing PE inputs without the corresponding work being reviewed. We analyzed the 58 services that the RUC submitted PE recommendations for and determined that one or more of the following is true of many of the codes: frequency less than 10,000; reviewed for work within the last five years; included in the list of proposed potentially misvalued codes identified through high expenditure by specialty screen that CMS included in the proposed rule for 2016. If you apply these criteria only 6 codes remain. The codes are 10021, 30903, 88333, 88334, 95812 and 95813.

In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 95957 was identified by this screen. This service was presented for review of physician work and practice expense at the January 2016 RUC meeting.

95812 ***Electroencephalogram (EEG) extended monitoring; 41-60 minutes***
The RUC reviewed the survey results from 87 practicing neurologists and agreed with the following survey median physician time components: pre-service evaluation time of 5 minutes, intra-service time of 15 minutes and immediate post-service time of 5 minutes. The RUC discussed the inaccurate physician time currently assigned to the code (intra-service time= 55 minutes). The RUC noted that this past survey was conducted in May 1994 and appeared to, at the time, have significant issues. The CPT descriptor at the time for CPT code 95812 was *EEG monitoring; up to one hour*. It is clear from the survey time that the respondents were confused, as they assigned the entire monitoring time to physician work. After the direct practice expenses became resource-based in 1999, this time discrepancy would not have been allowed. Therefore, the RUC agreed that the current physician time for this service is inaccurate and thus should not be used to discount the current work value.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey's 25th percentile work RVU of 1.20 overestimates the physician work of this service. To determine an appropriate value, the RUC noted that there is no compelling evidence that the current value may be inaccurate and recommends the current work RVU of 1.08. To justify a work RVU of 1.08, the RUC compared the surveyed code to the top key reference code 95816 *Electroencephalogram (EEG); including recording awake and drowsy* (work RVU= 1.08, intra time= 15 minutes) and agreed that since both codes have identical intra-service time and comparable physician work, both services should be valued the same. The RUC also reviewed the second key reference code 95805 *Multiple sleep latency or maintenance of wakefulness testing, recording, analysis and interpretation of physiological measurements of sleep during multiple trials to assess sleepiness* (work RVU= 1.20, intra time= 20 minutes) and that since the reference code has 5 additional minutes of intra-service time compared to code 95812, the reference code is accurately valued higher. **The RUC recommends a work RVU of 1.08 for CPT code 95812.**

95813 ***Electroencephalogram (EEG) extended monitoring; greater than 1 hour***
The RUC reviewed the survey results from 87 practicing neurologists and agreed with the following survey median physician time components: pre-service evaluation time of 5 minutes, intra-service time of 25 minutes and immediate post-service time of 5 minutes.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey's 25th percentile work RVU of 1.63, lower than the current value, is appropriate for this code. To justify a work RVU of 1.63, the RUC compared the surveyed code to MPC code 95805 *Multiple sleep latency or maintenance of wakefulness testing, recording, analysis and interpretation of physiological measurements of sleep during multiple trials to assess sleepiness* (work RVU= 1.20, intra time= 20 minutes) and agreed that since code 95813 has more intra-service time, it is appropriately valued higher than the reference code. The RUC also reviewed CPT codes 93295 *Interrogation device evaluation(s) (remote), up to 90 days; single, dual, or multiple lead implantable defibrillator system with interim analysis, review(s) and report(s) by a physician or other qualified health care professional* (work RVU= 1.29, intra time= 22.5) and 95908 *Nerve conduction studies; 3-4 studies* (work RVU= 1.25, intra time= 22 minutes) and agreed that since both these reference services have less intra-service time, the recommended value for 95813 is appropriately valued higher. **The RUC recommends a work RVU of 1.63 for CPT code 95813.**

95957 ***Digital analysis of electroencephalogram (EEG) (eg, for epileptic spike analysis)***
The RUC reviewed the survey results from 54 practicing neurologists and agreed with the following survey median physician time components: pre-service evaluation time of 15 minutes, intra-service time of 30 minutes and immediate post-service time of 10 minutes. The RUC again noted the inaccurate current intra-service time of 60 minutes for this procedure. When this service was last reviewed in May 1994, this service was surveyed as an add-on code; however it was assigned a XXX global period when it was implemented in 1995. Therefore, the current time included pre- and post-service work and time in the intra-service period. Adjusting for these anomalies, the current survey, which separates these times out, represents only a minor reduction in total time. There exists no clinical basis to discount this minor reduction in time from the current work value.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey's 25th percentile work RVU of 2.00 slightly overestimates the physician work of this service. To determine an appropriate value, the RUC noted that there is no compelling evidence that the current value may be inaccurate and recommends the current work RVU of 1.98. To justify a work RVU of 1.98, the RUC compared the surveyed code to the top two key reference codes 95810 *Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist* (work RVU= 2.50, intra time= 36.5 minutes) and 95939 *Central motor evoked potential study (transcranial motor stimulation); in upper and lower limbs* (work RVU= 2.25, intra time= 30 minutes) and agreed that both services, with comparable physician time and work, provide accurate comparisons to ensure the recommended value is accurate. The RUC recommends a work RVU of 1.98 for CPT code 95957.

Practice Expense:
The RUC approved the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
95812	Electroencephalogram (EEG) extended monitoring; 41-60 minutes	XXX	1.08 (No Change)
95813	Electroencephalogram (EEG) extended monitoring; greater than 1 hour	XXX	1.63
95957	Digital analysis of electroencephalogram (EEG) (eg, for epileptic spike analysis)	XXX	1.98 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95812 Tracking Number Original Specialty Recommended RVU: **1.08**
Presented Recommended RVU: **1.08**
Global Period: XXX RUC Recommended RVU: **1.08**

CPT Descriptor: Electroencephalogram (EEG) extended monitoring: 41-60 minutes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient has had recurrent episodes of neurologic symptoms suspected to be seizures. An extended EEG to allow sleep without pharmacological sedation is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 15%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work: Review relevant portions of the patient's medical record to determine if this type of EEG study is most appropriate for the patient. Review the results of any prior EEG tests performed. Instruct the technologist about any special techniques or montages required

Description of Intra-Service Work: Supervise the technologist's preparation and performance of the test. Review the recorded data including remontage and refilter as needed. Review the activation procedures performed including hyperventilation and photic stimulation. Assess the normal and abnormal findings. Interpret the findings considering the clinical context and determine clinical correlation of the findings based on the patient's history. Generate a diagnostic interpretation report with clinical correlations based on the test's findings.

Description of Post-Service Work: Make appropriate recommendations for further management and communicate with the referring physician.

Time Segment (Mean)		
Overall intensity/complexity	0.50	0.76

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As part of the 2014 Proposed Rule, CMS identified several codes (including 95812) as potentially misvalued and proposed reductions to the codes as part of the OPPS / ASC payment cap policy proposal. The proposal was to limit the practice expense payment through the physician payment schedule at the lower of two facility payment schedules, either the OPPS or ASC payment schedule. The RUC solicited feedback from specialty societies who were given the opportunity to develop Practice Expense Recommendations at the April 2014 meeting. The AAN reviewed the Practice Expense inputs for 95812 at that time making downward adjustments due to implementation of electronic medical records and to align with other recently RUC reviewed EEG codes. The RUC accepted the specialty society recommendations. CMS had concerns about implementing PE inputs without the corresponding work being reviewed therefore the RUC requested the specialty society survey and submit recommendations for 95812 at the January 2016 meeting.

An expert consensus panel composed of members of the participating societies familiar with the code in question and the RUC process reviewed the results. The panel confirmed the reliability of the survey and feels the 25th percentile RVW of 1.20 does not accurately represent the physician work, therefore **recommends maintaining the existing RVW of 1.08.** This value is supported by the key reference service, 95816 (Electroencephalogram; including recording awake and drowsy) which was surveyed in 2012.

The panel agrees with the survey median pre-service time of 5 minutes as an accurate representation of the work performed. The survey median post-service time of 10 minutes exceeds the current time and the panel asserts is not an appropriate representation of the post-service, rather the current post-service time of 5 minutes should be maintained. The panel further asserts the survey population likely included the report generation time in their post-service estimation, which should be represented in the intra-service time. It is the recommendation of the panel that the 5 minutes estimated for report generation be moved from the post-service to intra-service time; which is supported by the 75th percentile at 20 minutes. **Therefore, the panel recommendation is 5 minutes pre-service / 20 minutes intra service / 5 minutes post service.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95812

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 72435
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2014 medicare claims reporting data for 95812, which we feel accurately represents the national reporting of this code for one year.

Specialty Neurology Frequency 67365 Percentage 93.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 24,145 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is the 2014 Medicare utilization from the RUC database.

Specialty Neurology Frequency 22455 Percentage 93.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95812

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95813 Tracking Number Original Specialty Recommended RVU: **1.63**
Presented Recommended RVU: **1.63**
Global Period: XXX RUC Recommended RVU: **1.63**

CPT Descriptor: Electroencephalogram (EEG) extended monitoring; greater than 1 hour.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient reports recurrent episodes of staring and confusion multiple times a day. Outpatient EEG with extended monitoring is being performed to capture the spells.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 15%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: Review relevant portions of the patient's medical record to determine that this procedure is medically necessary. Review the results of any prior EEG tests performed. Instruct the technologist about any special techniques or montages required.

Description of Intra-Service Work: Supervise the technologist's preparation and performance of the test. Review the 60 minutes or greater of recorded data assessing for background rhythm, and physiologic and abnormal wave form changes (e.g., sharp waves, spike waves, spindles) during wakefulness and sleep, while adjusting the montage and filter accordingly to reduce artifacts and optimize visualization of various wave forms. Review the wave form changes specifically in response to activation procedures performed. Assess the normal and abnormal findings. Interpret the findings considering the clinical context and determine clinical correlation of the findings based on the patient's history. Generate a diagnostic interpretation report with clinical correlations based on the test's findings

Description of Post-Service Work: Make appropriate recommendations for further management and communicate with the referring physician.

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.50	1.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.79	0.93
Urgency of medical decision making	1.36	1.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.43	1.00

Physical effort required	0.21	0.21

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.43	1.21
Outcome depends on the skill and judgment of physician	0.71	1.14
Estimated risk of malpractice suit with poor outcome	0.79	1.14

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	0.57	1.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As part of the 2014 Proposed Rule, CMS identified several codes (including 95813) as potentially misvalued and proposed reductions to the codes as part of the OPPS / ASC payment cap policy proposal. The proposal was to limit the practice expense payment through the physician payment schedule at the lower of two facility payment schedules, either the OPPS or ASC payment schedule. The RUC solicited feedback from specialty societies who were given the opportunity to develop Practice Expense Recommendations at the April 2014 meeting. The AAN reviewed the Practice Expense of 95813 at that time making downward adjustments to due to implementation of electronic medical records and to align with other recently RUC reviewed EEG codes. The RUC accepted the specialty society recommendations. CMS had concerns about implementing PE inputs without the corresponding work being reviewed therefore the RUC requested the specialty survey and submit recommendations for 95813 at the January 2016 meeting.

An expert consensus panel composed of members of the participating societies familiar with the code in question and the RUC process reviewed the results. The panel confirmed the reliability of the survey and feels the 25th percentile RVW of 1.63 is an accurate representation of the physician work, therefore **recommends the 25th percentile RVW of 1.63.**

The panel agrees with the survey median pre-service time of 5 minutes as an accurate representation of the work performed. The survey median post-service time of 10 minutes is a reduction from the current time which the panel feels could be further reduced as is not an appropriate representation of the post-service activities. The panel further asserts the survey population likely included the report generation time in their post-service estimation, which should be represented in the intra-service time. It is the recommendation of the panel that the 5 minutes estimated for report generation be included in the intra-service time; which is the current time of 30 minutes. **Therefore, the panel recommendation is 5 minutes pre-service / 30 minutes intra service / 5 minutes post service.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95813

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 66846
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2014 medicare claims reporting data for 95813, which we feel accurately represents the national reporting of this code for one year.

Specialty Neurology Frequency 64841 Percentage 97.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 22,282 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is the 2014 Medicare utilization from the RUC database.

Specialty Neurology Frequency 21614 Percentage 97.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95813

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95957 Tracking Number Original Specialty Recommended RVU: **1.98**
Presented Recommended RVU: **1.98**
Global Period: XXX RUC Recommended RVU: **1.98**

CPT Descriptor: Digital analysis of electroencephalogram (EEG) (eg, for epileptic spike analysis)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with intractable localization-related epilepsy is undergoing presurgical evaluation for resection of the epileptogenic region. Previous (separately reported) EEGs interpreted visually and using automated spike detection suggest right hemispheric onsets. In order to localize the seizure focus with greater accuracy, EEG digital analysis of the previously obtained EEGs is ordered using a 3D single dipole source localization analysis of averaged epileptogenic spikes.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 19%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Description of Pre-Service Work: Identify portions of previously performed EEG recordings suitable for analysis based on the presence of sufficient epileptic spikes and relative absence of confounding factors such as muscle activity.

Description of Intra-Service Work: The physician reviews each spike's time markings and categories as have been separated and flagged by the EEG technologist. Outlier spikes are reviewed. For each outlier, the physician decides whether to change the spike's category or eliminate it. Spikes in each final category are averaged together. The physician reviews a three-dimensional map of the spike generator location for each spike category that has been co-registered onto the patient's MRI image or displayed in a similar manner so as to correlate the locations with the patient's anatomical structures. Assess the statistical quality of the analysis, and assure that the locations determined are clinically reliable. Review the patient's medical records for clinical correlations with MRI, PET, MEG, video-EEG recordings, neuropsychometric testing, seizure semiology, and other clinical relevant information. Determine if additional mappings are necessary for additional review. Review the technologist's report that identifies location of each identified epileptic spike generators. Compose a report interpreting the meaning of these results in the clinical context of the patient's presentation.

Description of Post-Service Work: Generate digitial analysis findings for presentation at surgical case conference. Make appropriate recommendations for further management, e.g. impact on location of proposed surgical cortical resection. Communicate with the referring physician and surgeon.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95810	XXX	2.50	**RUC Time**

CPT Descriptor Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95939	XXX	2.25	**RUC Time**

CPT Descriptor Central motor evoked potential study (transcranial motor stimulation); in upper and lower limbs

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95861	XXX	1.54	**RUC Time**	33,081

CPT Descriptor 1 Needle electromyography; 2 extremities with or without related paraspinal areas.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99215	XXX	2.11	**RUC Time**	9,240,506

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99223	XXX	2.00	**RUC Time**

CPT Descriptor Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the

patient is unstable or has developed a significant complication or a significant new problem. Typically, 35 minutes are spent at the bedside and on the patient's hospital floor or unit.

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 21 **% of respondents:** 38.8 **%**

Number of respondents who choose 2nd Key Reference Code: 9 **% of respondents:** 16.6 **%**

TIME ESTIMATES (Median)

	CPT Code: 95957	Top Key Reference CPT Code: 95810	2nd Key Reference CPT Code: **95939**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.52	0.78
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.43	1.33
Urgency of medical decision making	1.10	0.44

Technical Skill/Physical Effort (Mean)

Technical skill required	1.14	1.33
Physical effort required	0.67	1.11

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.00	0.44
Outcome depends on the skill and judgment of physician	1.24	0.67
Estimated risk of malpractice suit with poor outcome	0.95	0.56

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.29	1.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As part of the NPRM for 2016 CMS ran a high expenditure screen across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges. Code 95957 was identified in this screen prompting the specialty societies to survey and develop recommendations for the January 2016 meeting.

An expert consensus panel composed of members of the participating societies familiar with the code in question and the RUC process reviewed the results. The panel confirmed the reliability of the survey and feels the 25th percentile RVW of 2.00 is slightly high representation of the physician work, therefore **recommends maintaining the existing RVW of 1.98.** This value is supported by crosswalk comparison to Subsequent Hospital Care code 99223 which has a work RVW of 2.00 and pre / intra / post-times of 10 / 30 / 15 with an IWPUT of 0.0480.

The panel agrees with the survey median pre-service time of 15 minutes as well as the survey median intra-service time of 30 minutes and the survey median post-service time of 10 minutes, therefore recommends **15 minutes pre-service / 30 minutes intra service / 10 minutes post service.** This recommendation is a reduction to intra-service time of 30 minutes, however an increase to both the pre and post service time. The panel asserts that the current pre / intra / post-service times are not an accurate reflection of the actual service times, specifically as there is no pre or post time currently assigned to the service. The current time allocations across pre / intra / post services times are incorrect due to flawed methodology used to establish time in 1994 when the code was established.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95957

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 166,785
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2014 medicare claims reporting data for 95957, which we feel accurately represents the national reporting of this code for one yeaR.

Specialty Neurology Frequency 156778 Percentage 94.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 55,595 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is the 2014 Medicare utilization from the RUC database.

Specialty Neurology Frequency 52260 Percentage 94.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
Electroencephalogram (EEG) extended monitoring; 41-60 minutes

Global Period:__XXX___ Meeting Date: _January 2016_____

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Advisors and subject matter experts from AAN and ACNS met by phone and via email to review the inputs and make recommendations

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The PE inputs for 95812 were reviewed and accepted by the RUC in April of 2014, however were reduced as part of the PE Refinement process by CMS in the 2016 Final Rule. The revised PE inputs for 95812 were used as starting point, with adjustments made to reaffirm the inputs previously approved by the RUC which the specialty societies feel accurately reflect the service. The CMS rationale for reducing clinical labor inputs for “assist physician in performing procedure” was to *“refine clinical labor time to match physician intra-service time.”* The specialty society expert panel disagrees as a portion of 95812 is performed and attended by the technologist without the physician present and exceeds the physician time; therefore the clinical labor and physician times are not congruent.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

The specialty societies are reaffirming the PE inputs approved by the PE Subcommittee at the April 2014 meeting. The current inputs reflect PE refinements implemented by CMS as part of the 2016 Final Rule. The societies disagree with the CMS rationale and are requesting the previously RUC approved inputs.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Review requisition. Assess for special needs. Give patient/family member instructions for test preparation (e.g. hair preparation instructions, etc.) and what to expect on the day of testing. Prepare room, supplies, and equipment.

Intra-Service Clinical Labor Activities:

Greet and gown patient. Explain procedure. Take a brief history. Have patient use the bathroom; position patient for testing. Measure precise head positions and glue on 25-33 electrodes. Check impedances, and correct impedance problems. Calibrate system. Coach patient on how to relax during the testing, and readjust patient position to minimize muscle tension. Record EEG for 50 minutes. Troubleshoot as needed. Monitor continuously for abnormalities. Adjust filters, montages as needed to define better any abnormalities. Hyperventilate patient for 3 minutes, and observe post-hyperventilation state for another 3 minutes. Position photic stimulator, and deliver photic stimulation at 10 frequencies. Document activation techniques and events. Remove electrodes. Wash paste out of patient’s hair at each electrode site. Review results. Complete worksheets and technical interpretation. Release patient. Give discharge instructions.

Post-Service Clinical Labor Activities:

Prepare technical and coding worksheet reports. Complete Medical Record and EEG log book. Transfer file onto storage disk. Transfer file onto physician’s review station. Restock supplies and clean electrodes.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
Digital analysis of electroencephalogram (EEG) (eg, for epileptic spike analysis)

Global Period:__XXX___ Meeting Date: _January 2016_____

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Advisors and subject matter experts from AAN and ACNS met by phone and via email to review the inputs and make recommendations

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We used the existing PE inputs for 95957, as a starting point and made updates to reflect new time standards and change in technology since that time.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

The expert panel recommends an intra service time of 111 minutes for the clinical labor activities which is an increase from the current inputs of 30 minutes intra time. Please note the recommended *total* clinical labor time is an increase of 6 minutes (105 – 111). The recommendation of 111 minutes was arrived at by polling active US members of the National Association of Epilepsy Centers on the typical amount of minutes the technologist spends on activities for code 95957. The mean response was 111 minutes, 22 for pre-service activities and 89 minutes for intra-service activities.
The expert panel asserts the existing clinical labor inputs are incorrect due to flawed methodology used to establish clinical labor minutes in 1994 when the code was established. Inputs from existing routine electroencephalogram codes were extrapolated to develop the breakout of minutes based upon the accepted practice in use at that time. This is no longer accurate as the work involved in the digital analysis of an EEG is inherently different from that of a routine EEG.
All supply inputs as well as clinical labor minutes allocated to patient interaction (75 minutes) have been removed as the patient is not present for the service. The reduction in minutes does not signify activities that are no longer performed by the technologist, rather the original inputs were incorrect.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Import into the analysis system the EEG recordings identified by the physician as suitable for analysis based on the presence of sufficient epileptic spikes and lack of confounding factors.
- Identify that the EEGs were recorded in a manner technically compatible with the dipole analysis software.
- Obtain medical records for use in the clinical correlation.
- Locate, select and obtain digital access to the patient’s brain MRI images for co-registration.

Intra-Service Clinical Labor Activities:

- Using spike detection software, run an initial dipole analysis on the averaged spikes in each category.
- Separate and identify each spike’s time markings and category for physician review.
- Identify outlier spikes through goodness of fit routines.
- After physician review of outliers, run additional dipole analysis. A three-dimensional map of the spike generator location is created for each spike category.
- Each spike generator location and its dipole direction is co-registered onto the patient’s MRI image or displayed in a similar manner so as to correlate the locations with the patient’s anatomical structures.
- This process is typically repeated at least one additional time pending physician review and request for additional mappings in order to complete additional review.
- Initiate a template report indicating the location of the identified epileptic spike generators.

Post-Service Clinical Labor Activities:

No post service activities

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS Request - NPRM for 2016

January 2016

Electronic Analysis of Implanted Neurostimulator Pulse Generator System

CPT codes 95971-95973 were recently reviewed for CY 2015. Due to significant time changes in the base codes, CMS requested that the entire family should be considered as potentially misvalued and reviewed in a manner consistent with review of CPT codes 95971, 95972 and 95973. The RUC added CPT codes 95970 and 95974-95982 to the list of potentially misvalued services to review based on the CMS request.

In January 2016, the specialty societies indicated they have actively worked with the CPT Assistant Editorial Board to alleviate incorrect reporting of these services, however, confusion remains giving the existing code language. The specialty societies indicated that they will revise the code language to more clearly define what is required for one of the parameters to be considered "changed" as well as correct the reporting of simple programming for cranial neurostimulators. **The RUC refers 95970 and 95974-95982 to the CPT Editorial Panel for revision.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
95970	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); simple or complex brain, spinal cord, or peripheral (ie, cranial nerve, peripheral nerve, sacral nerve, neuromuscular) neurostimulator pulse generator/transmitter, without reprogramming	XXX	Refer to May 2016 CPT
95974	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex cranial nerve neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, with or without nerve interface testing, first hour	XXX	Refer to May 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95975	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex cranial nerve neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, each additional 30 minutes after first hour (List separately in addition to code for primary procedure)	ZZZ	Refer to May 2016 CPT
95978	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; first hour	XXX	Refer to May 2016 CPT
95979	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; each additional 30 minutes after first hour (List separately in addition to code for primary procedure)	ZZZ	Refer to May 2016 CPT
95980	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient measurements) gastric neurostimulator pulse generator/transmitter; intraoperative, with programming	XXX	Refer to May 2016 CPT
95981	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient measurements) gastric neurostimulator pulse generator/transmitter; subsequent, without reprogramming	XXX	Refer to May 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95982	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient measurements) gastric neurostimulator pulse generator/transmitter; subsequent, with reprogramming	XXX	Refer to May 2016 CPT

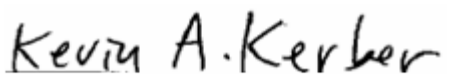
Dear Dr. Smith,

CPT codes 95971, 95972, 95973 were reviewed by the RUC in 2015. Due to significant time changes in the base codes, as part of the NPRM for 2016 CMS requested that the entire family of Neurostimulator analysis and programming codes be considered as potentially misvalued and reviewed including 95970, 95974 – 95982. All were added to the potentially misvalued services list by the RUC.

Neurology is the primary specialty that utilizes codes 95970, 95974, 95975, 95978 and 95979:



95970	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); simple or complex brain, spinal cord, or peripheral (ie, cranial nerve, peripheral nerve, sacral nerve, neuromuscular) neurostimulator pulse generator/transmitter, without reprogramming
95974	; complex cranial nerve neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, with or without nerve interface testing, first hour
95975	; complex cranial nerve neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, with or without nerve interface testing, first hour
95978	Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; first hour
95979	; each additional 30 minutes after first hour (List separately in addition to code for primary procedure)

The American Academy of Neurology (AAN) has actively worked with AMA CPT staff to alleviate incorrect reporting of the services via *CPT Assistant* [1], however confusion remains given the existing code language. The AAN has identified subject matter experts to review and revise the code language for the codes listed above, specifically to more clearly define what is required for one of the parameters to be considered "changed" as well as the correct reporting of simple reprogramming for cranial nerve neurostimulators.

Therefore, the AAN is unable to survey codes **95970, 95974, 95975, 95978 and 95979** for the October RUC meeting. Rather, we request to present revised code language for the May 2016 CPT Editorial Panel meeting. Once the new code language is approved, the AAN will be happy to survey the revised codes as requested by the RUC.

We appreciate the RUC's consideration of the AAN's recommendation and look forward to assisting with the revision and valuation of this code set.

Sincerely,

Kevin A. Kerber, MD

RUC Advisor, AAN

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Psychological and Neuropsychological Testing

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT codes 96101, 96116 and 96118 were identified as part of this screen.

CPT code 96116 had an interest from an MD/DO specialty society and was scheduled to be reviewed by the RUC. The remaining codes in this family had a non-MD interest and were scheduled to be reviewed by the HCPAC. In January 2016, the specialty societies requested that the entire family of codes be referred to the CPT Editorial Panel to be revised. The testing practice has been significantly altered by the growth and availability of technology. The current codes do not reflect the multiple standards of practice and therefore result in confusion about how to report the codes. **The RUC recommends the entire psychological and neuropsychological testing codes be referred to the October 2016 CPT Editorial Panel meeting for revision. CMS also requested that CPT code 96125 and 96127 be added to this family of services for revision/review.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
96101	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg, MMPI, Rorschach, WAIS), per hour of the psychologist's or physician's time, both face-to-face time administering tests to the patient and time interpreting these test results and preparing the report	XXX	Refer to October 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

96102 (f)	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg, MMPI and WAIS), with qualified health care professional interpretation and report, administered by technician, per hour of technician time, face-to-face	XXX	Refer to October 2016 CPT
96103 (f)	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg, MMPI), administered by a computer, with qualified health care professional interpretation and report	XXX	Refer to October 2016 CPT
96116	Neurobehavioral status exam (clinical assessment of thinking, reasoning and judgment, eg, acquired knowledge, attention, language, memory, planning and problem solving, and visual spatial abilities), per hour of the psychologist's or physician's time, both face-to-face time with the patient and time interpreting test results and preparing the report	XXX	Refer to October 2016 CPT
96118	Neuropsychological testing (eg, Halstead-Reitan Neuropsychological Battery, Wechsler Memory Scales and Wisconsin Card Sorting Test), per hour of the psychologist's or physician's time, both face-to-face time administering tests to the patient and time interpreting these test results and preparing the report	XXX	Refer to October 2016 CPT
96119 (f)	Neuropsychological testing (eg, Halstead-Reitan Neuropsychological Battery, Wechsler Memory Scales and Wisconsin Card Sorting Test), with qualified health care professional interpretation and report, administered by technician, per hour of technician time, face-to-face	XXX	Refer to October 2016 CPT
96120 (f)	Neuropsychological testing (eg, Wisconsin Card Sorting Test), administered by a computer, with qualified health care professional interpretation and report	XXX	Refer to October 2016 CPT
96125 (f)	Standardized cognitive performance testing (eg, Ross Information Processing Assessment) per hour of a qualified health care professional's time, both face-to-face time administering tests to the patient and time interpreting these test results and preparing the report	XXX	Refer to October 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

96127 (f)	Brief emotional/behavioral assessment (eg, depression inventory, attention-deficit/hyperactivity disorder [ADHD] scale), with scoring and documentation, per standardized instrument	XXX	Refer to October 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Re: RUC Tab 53, RUC HCPAC Tab 57

Dear Dr. Smith:

The American Psychological Association (APA) and the American Academy of Neurology (AAN) are not able to survey the NPRM-identified CPT codes 96101, 96116, and 96118 at this time. After close review and extended discussions of the multiple issues surrounding these (and related) codes, we are immediately undertaking a complete review of the standards of modern practice for psychological and neuropsychological testing.

Testing practice has been significantly altered by the growth and availability of technology. The codes do not reflect the multiple standards of practice. The result is confusion about how to apply the codes, and the presence of inaccurate guidance in the vendor marketplace. The practice changes leave us with some outmoded CPT code descriptors that are unlikely to garner meaningful data in a RUC survey.

We understand that CMS and the RUC wish for the codes to be reviewed through the AMA process. We do have an action plan:

APA will immediately commission an expert task force to identify and describe the current standards of practice for the profession. When that is completed, we fully expect to revise the CPT codes for psychological and neuropsychological testing. Following the revisions, APA and AAN will survey the revised codes.

We identify the family of codes as:

- 96101 psychological testing, administered by professional
- 96102 psychological testing, administered by technician
- 96103 psychological testing, administered by computer
- 96116 behavioral status exam
- 96118 neuropsychological testing, administered by professional

- 96119 neuropsychological testing, administered by technician
- 96120 neuropsychological testing, administered by computer

We appreciate the opportunity to assist with the maintenance of both the CPT code set and the Medicare Physician Fee Schedule.

Please contact Debra Lansey at the American Psychological Association DLansey@apa.org or (202) 336-5896, if there are questions or concerns.

Sincerely,

Kevin A. Kerber, MD.
Advisor, American Academy of Neurology

Advisor, American Psychological Association

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Special Radiation Treatment

In the Final Rule for 2016 CMS re-ran the screen for high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010.

This service is only reported in situations where significant additional work is required to treat the patient. Proper documentation demonstrating medical necessity is always required with 77470. This code can only be reported once for the entire course of therapy and would not be reported alone. To ensure there is no duplication of work with other services this code is reported with, typically CPT code 77263 *Therapeutic radiology treatment planning; complex,* the specialty society and RUC do not recommend any pre time. The specialty society indicated and the RUC recommends 5 minutes of physician post time for the physician to document the added planning and evaluation work and dictate a note. The specialty society clarified that the physician work includes the fusion of the PET CT with the simulation scan. The radiation therapist must go with the patient and immobilization device in order to obtain the PET CT scan. The radiation therapist does not do this at the same time as the physician work.

77470 ***Special treatment procedure (eg, total body irradiation, hemibody radiation, per oral or endocavitary irradiation)***
The RUC reviewed the survey results from 126 radiation oncologists and recommends the following physician time components: pre-service time of 0 minutes, intra-service time of 50 minutes and immediate post-service time of 5 minutes.

The RUC reviewed the survey respondents' work values and determined that the survey 25th percentile work value of 2.03 appropriately captures the work and complexity of this service. The RUC noted that it is not appropriate to compare the surveyed time to the current CMS/Other source time, which represents time, not derived from a survey, but assigned by CMS over 20 years ago. The RUC compared the service to key reference service CPT code 77307, *Teletherapy isodose plan; complex (multiple treatment areas, tangential ports, the use of wedges, blocking, rotational beam, or special beam considerations), includes basic dosimetry calculation(s)* (work RVU = 2.90, intra time of 80 minutes) and noted that the reference code has more intra-service and total time compared to the surveyed code, justifying the greater work value. For additional support the RUC compared 77470 to 99215 *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

spent face-to-face with the patient and/or family. (work RVU = 2.11, total time of 55 minutes) and noted that the reference code has identical total time and is slightly more intense to perform, justifying the greater work value. **The RUC recommends a work RVU of 2.03 for CPT code 77470.**

Practice Expense
The RUC reviewed and approved the direct practice expense inputs as submitted by the specialty society and approved by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
77470	Special treatment procedure (eg, total body irradiation, hemibody radiation, per oral or endocavitary irradiation)	XXX	2.03

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:77470 Tracking Number Original Specialty Recommended RVU: **2.09**
Presented Recommended RVU: **2.03**
Global Period: XXX RUC Recommended RVU: **2.03**

CPT Descriptor: Special treatment procedure (eg, total body irradiation, hemibody radiation, per oral or endocavitary irradiation)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male with stage IIIA non- small cell lung cancer will be treated with chemo/radiotherapy preoperatively.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The physician incorporates a range of information from the combination of tumor locations derived from multiple imaging and other diagnostic procedures, including the integration of pulmonary function testing. The physician evaluates regions of hypoventilation by reviewing the ventilation perfusion scans to functionally adapt and optimize sparing of ventilated lung. The physician reviews and adjusts the fusion of the ungated and/or gated PET study in the treatment position with the CT images.

To do this he/she modulates the SUV edge detection threshold to improve the clarity of target volume definition and then confirms the presence of an anatomic correlate (parenchymal mass or lymph node) within volumes above the selected threshold (typically SUV >2.5-3). Any discrepancies between the target volume identified in this manner and the target identified using 4D CT imaging must be reconciled by the physician.

The physician considers and then creates an alternate therapeutic treatment contingency, often more than one, if surgery is unable to be performed after the pre-op chemoradiation. Contingencies may include proceeding with full dose RT, switching to a palliative fractionation scheme or the possibility of discontinuing treatment altogether. This work includes reviewing boost plans for full dose RT that also take into consideration the limitations of the surrounding organs at risk such as the spinal cord, esophagus, heart and lungs and their respective tolerance doses. If the patient either elects to decline surgery, restaging studies after the initial chemoradiation show new distant disease, or the tumor proves to be technically unresectable at the time of exploration, the physician commits to one of the contingency plans based on the clinical scenario.

Description of Post-Service Work: The physician verifies and documents the added planning and evaluation work and dictates a note.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
77307	XXX	2.90	**RUC Time**

CPT Descriptor Teletherapy isodose plan; complex (multiple treatment areas, tangential ports, the use of wedges, blocking, rotational beam, or special beam considerations), includes basic dosimetry calculation(s)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99215	XXX	2.11	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99233	XXX	2.00	**RUC Time**	21,880,397

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Typically, 35 minutes are spent at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99215	XXX	2.11	**RUC Time**	9,240,506

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.

Usually, the presenting problem(s) are of moderate to high severity. Typically, 40 minutes are spent face-to-face with the patient and/or family.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.56	0.61

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.67	0.78
Urgency of medical decision making	0.56	0.70

Technical Skill/Physical Effort (Mean)

Technical skill required	0.59	0.74
Physical effort required	0.33	0.61

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.70	1.00
Outcome depends on the skill and judgment of physician	0.74	1.00
Estimated risk of malpractice suit with poor outcome	0.70	1.09

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.76	1.04

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The RUC identified, as part of the CMS High Expenditure Procedures Screen, CPT 77470 (Special radiation treatment procedure), which has both a PC and TC. The PC describes the additional physician effort and work. CPT code 77470 is only reported in situations where significant additional work is required to treat the patient. Proper documentation demonstrating medical necessity is always required with 77470. This code can only be billed once for the entire course of therapy.

The Research Subcommittee approved the vignette for 77470, with slight modifications.

ASTRO conducted a survey, with a 4411 sample size, and collected 126 random surveys (2.8% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining a current wRVU of 2.09 for CPT 77470.

Our rationale for this recommendation is based on multiple factors described below.

Radiation Oncology Process of Care
Step 1 Consultation
Step 2 Clinical Treatment Planning

Step 3 Treatment Devices/Special Treatment Procedures
Step 4 Simulation
Step 5 Physics and Dosimetry
Step 6 Delivery and Management
Step 7 F/U Care

Billed Together

It is not uncommon for a physician to report a treatment planning code (77263) with the special treatment procedure (77470). The current billed together data indicates that CPT code 77263 is reported approximately 60% of the time with 77470.

Treatment planning (77263) is the second step in the process of care for treating a radiation oncology patient, the first being the initial consultation with the radiation oncologist. That consultation is where the radiation oncologist has their initial visit with the patient. They do H&P, discuss relevant statistics, discuss general options (i.e. external beam, brachytherapy, etc) and then the patient goes home to consider whether they will pursue radiation or not. Treatment planning starts when the patient decides to move forward with radiation. In this second step of "the process" the radiation oncologist determines the specific type of radiation, the total dose(s), the volumes, the fractionation schedule, whether they will need IGRT, what type of blocking, etc. They will order/review additional imaging studies if needed. They will then meet with the patient, go over the plan, the side effects (i.e. pain, burns, tissue damage, loss of taste, etc), do an informed consent and move forward with the process.

The work of a special treatment procedure (77470), Step 3 in the 'radiation process', describes the additional physician work for highly complex radiation cases. A common example of that would be preoperative chemo/radiotherapy. Documentation in the chart outlining the medical necessity of 77470 will be in the chart. The specialty society also gives guidance on when it is appropriate to report a 77470.

We are confident there is no duplication of tasks if these services are reported together. They have distinct tasks per step (as outlined above). To ensure there is no duplication in work in pre time when/if the codes are reported together, we are not recommending any pre time for the device code (77470). We are recommending 5 minutes of physician post time for the physician to document the added planning and evaluation work and dictate a note.

Vignette

The vignette is a 68-year-old male with stage IIIA non- small cell lung cancer treated with chemo/radiotherapy preoperatively. Lung cancer is the top diagnosis for use of this code. 91% of our survey respondents felt the vignette was typical.

Time

CPT Code 77470 has an XXX global period. As such, there are no standard pre/post time packages. The specialty is recommending 0 minutes of pre time and 5 minutes of post time. Our current surveyed total time was 80 minutes (15,50, 15). ASTRO is recommending the median survey time for intra (50) for a total of 55 minutes (0, 50, 5). This is lower than the surveyed time (80 minutes), and equal to the existing time (55 minutes).

IWPUT

The surveyed code 77470 will have an IWPUT of 0.040, maintaining rank order relationship within the family of radiation codes, as well as with the 1st (0.035) and 2nd (0.047) reference codes chosen by the respondents.

Comparison to the Key Reference Services

The key reference service code was CPT 77307, Teletherapy isodose plan, complex. This key reference code was most often selected (21.4%) by the survey respondents. This code has a total time of 86 minute (3, 80, 3), an IWPUT of 0.035, and a wRVU of 2.90. The second key reference code 99215, Office or other outpatient visit for the evaluation and management of an established patient was selected by 18.2%, with a total time of 55 minutes (5, 35, 15), an IWPUT of 0.047, and a wRVU of 2.11. Both codes have similarities, and are well understood by membership. We believe that these two reference codes were an appropriate selection by our survey respondents and fits nicely with our survey data.

Relativity

Our recommendation maintains relativity compared to the reference codes, and codes within the radiation oncology family.

Recommendation

We are recommending the current RVUw of 2.09, pre service: 0 minutes, median intra time of 50 minutes, and post service time of 5 minutes, for a total time of 55 minutes. The expert panel believes that our survey supports our recommendation.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The current billed together data indicate that CPT Code 77263 may be billed with 77470. XXX wRVUs 3.14 and total time 75 min (intra).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77470

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is no known.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
102,516 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Medicare data from the current RUC database

Specialty Radiation Oncology	Frequency 99442	Percentage 97.00 %	
Specialty	Frequency 0	Percentage 0.00 %	
Specialty	Frequency 0	Percentage 0.00 %	

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Oncology

BETOS Sub-classification Level II:
Radiation Therapy

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 77470

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

77470 *Special treatment procedure (eg, total body irradiation, hemibody radiation, per oral or endocavitary irradiation)*

Global Period: XXX **Meeting Date:** January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ASTRO convened a panel of physicians and clinical staff to develop consensus recommendations for practice expense. The panel included a mix of physicians from various practice settings and geographic regions. They panel reviewed the physician work survey data and the existing direct PE inputs. The panel put together these consensus recommendations based on current practice patterns.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

CPT Code 77470 is an existing code. As such, we included the current direct practice expense inputs.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

The Radiation Therapist retrieves the patient's individually constructed treatment device from the radiation oncology department per departmental checkout guidelines to establish a chain of custody and ensure the correct device is selected. The device is inspected to ensure it is free of damage. The device is packaged for safe transport. The RT gathers and checks-out all additional materials (chart, set-up photos, markers, clamps, bolts, etc) needed to ensue proper device indexing to the diagnostic table, patient positioning and proper documentation of the patient within the treatment device for the PET/CT scan in the radiology department. (5min)

The radiation therapist meets the patient in the radiology department. The RT discusses the logistics and expectations with the patient of the importance of proper positioning within the treatment device to ensure an accurate scan. (3min)

The RT will inspect the treatment device to ensure there was no damage introduced during transport. The RT will set-up and index the treatment device to the diagnostic table. Once the device is properly indexed and its accuracy ensured, the RT will assist the patient into the treatment device. (10min)

The RT will properly position and align the patient in the treatment device based on a combination of set-up photos, skin markings and localization lasers. Once the RT is satisfied the patient is in a technically correct position required for the scan, the RT the will appropriately document the patient's position within the treatment device. The RT will then notify the radiology imaging technicians the patient is ready for scan. (10min)

The RT will remain with the patient in the radiology department during the entire duration of the scan in the event the patient moves, needs a break, adjustments to the treatment device are needed or any other event arises requiring the expertise of the RT to re-fit the patient into the treatment device in the technically exact position required for the scan. (0min)

After the scan is completed the RT will assist the patient out of the treatment device in a manner consistent to prevent damaging the device. The RT will remove the bolts and clamps required to index the device to the table and then carefully remove the device from the table. The RT will gather all materials previously required and package the device for safe transport back to the radiation oncology department. (10min)

The RT will return the treatment device and all additional materials previously borrowed per the departmental check-in guidelines to ensure the chain of custody is maintained. The treatment device is inspected to ensure it is returned in an undamaged state for storage until the device is required for patient use. (5min)

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Removal of Nail Plate

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 11730 *Avulsion of nail plate, partial or complete, simple; single* (work RVU=1.10) was identified by this screen. This service was presented for review of physician work and practice expense at the January 2016 HCPAC meeting.

The HCPAC reviewed the survey responses from 54 podiatrists and determined that the work RVU of 1.10 appropriately accounts for the work required to perform CPT code 11730. The HCPAC recommends 18 minutes pre-service time, 10 minutes intra-service time, and 5 minutes immediate post-service time. The HCPAC compared the surveyed code to similar services *12002 Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU=1.14 and 15 minutes intra-service time) and 99213 *Office or other outpatient visit for the evaluation and management of an established patient,* (work RVU=0.97 and 15 minutes intra-service time). For additional support the HCPAC referenced MPC code 30901 *Control nasal hemorrhage, anterior, simple (limited cautery and/or packing) any method* (work RVU=1.10 and 10 minutes intra-service time) and the RUC determined that these services required the same intra-service time and comparable physician work. **The HCPAC recommends a work RVU of 1.10 for CPT code 11730.**

Practice Expense
The Practice Expense Subcommittee reduced the medical supplies and corrected the equipment minutes. The HCPAC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
11730	Avulsion of nail plate, partial or complete, simple; single	000	1.10 (No Change)

SUMMARY OF RECOMMENDATION

CPT Code:11730 Tracking Number N/A Original Specialty Recommended RVU: **1.10**
Presented Recommended RVU: **1.10**
Global Period: 000 RUC Recommended RVU: **1.10**

CPT Descriptor: Avulsion of nail plate, partial or complete, simple; single

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32-year-old female presents with a painful, ingrown toenail involving the medial and lateral borders of the right hallux. The decision is made to proceed with avulsion of the complete nail plate (assumes block administered by surgeon).

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review chart with general medical history and surgical history update, including current medications and allergies. Perform physical examination that includes evaluating neurological and vascular status of the patient, along with a dermatologic examination. Discuss operative risks and benefits with patient and obtain informed consent. Verify necessary instruments are available. Place patient in supine position. Stabilize both legs and position the operative leg for clear access to the operative site and surgical instruments. Prepare and drape foot in aseptic manner. Prepare and administer local anesthetic. Apply a digital tourniquet as necessary.

Description of Intra-Service Work: Free ingrown nail borders from overlying skin from distal to proximal. Free proximal extent of nail plate from overlying hyponychium. Insert a blunt instrument beneath nail plate of the medial border, which is freed from distal to proximal. Remove instrument and insert beneath lateral border, which is freed from distal to proximal. Use blunt instrument to separate nail from the underlying nail bed from medial to lateral and from distal to proximal back to and under the eponychium. Grasp the separated nail with an instrument and remove in total, and inspect the nail bed. Remove tourniquet, achieve hemostasis, and apply sterile dressing. Apply appropriate ointment as needed.

Description of Post-Service Work: Evaluate and stabilize patient's neurovascular status. Fit surgical shoe [HCPCS code L3260] on patient. Instruct patient on care of the wound and activity, bathing, and medication restrictions. Complete medical record. Dictate note to primary care (or referring) physician.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
12002	000	1.14	**RUC Time**

CPT Descriptor Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	000	0.97	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
30901	000	1.10	**RUC Time**	107,216

CPT Descriptor 1 Control nasal hemorrhage, anterior, simple (limited cautery and/or packing) any method

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.33	-0.43
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.10	-0.29
Urgency of medical decision making	0.10	0.71
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.10	1.29

Physical effort required	0.05	0.71

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.00	1.14
Outcome depends on the skill and judgment of physician	0.00	0.71
Estimated risk of malpractice suit with poor outcome	-0.05	1.29

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code

Time Segment (Mean)

Overall intensity/complexity	0.14	0.71

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and E/M services and services reviewed since CY 2010. In the rule, CMS noted that the criteria for many misvalued code screens, including this screen, are designed to prioritize codes that **may** be misvalued not to identify codes that **are** misvalued. Further CMS believes that supporting evidence for the accuracy of current values for particular codes is best considered as part of the review of individual codes through the misvalued code process. Code 11730 was identified through this screen.

Survey Sample

The survey request was sent to a random selection of APMA members.

Pre-time Package 6A

An E/M service is not typically reported on the same date as 11730.
Evaluation: Subtract 7 minutes (total = 10 minutes) to be consistent with survey median
Positioning: Add 2 minutes (total = 3 minutes) to account for supine positioning and the additional work to stabilize both legs and position the operative leg for clear access to the operative site and surgical instruments. This is the same time approved in 2014 by the HCPAC and CMS for code 11750, *Excision of nail and nail matrix, partial or complete (eg, ingrown or deformed nail), for permanent removal.*
Scrub, dress, wait: No change to standard package time of 5 minutes

Key Reference Codes

KRS1 12002. The physician work required for 11730 and KRS1 12002 is the same. Code 12002 has less pre-time and more intra-service time than 11730 because 12002 was reviewed before pre-time packages were

developed. The intra-work description for 12002 indicates " *Inject local anesthetic for anesthesia and hemostasis. Wait for the anesthesia to take effect. Cleanse area and apply sterile draping.*" This work and time currently would be allocated to pre-service scrub, dress, wait category. Podiatrists are familiar with both codes and those providers who chose 12002 as a reference service indicated overall similarity in intensity and complexity as shown by the I/C measures.

KRS2 99213. The physician work required for 11730 is greater than KRS2 99213. Although the range of possible diagnoses to consider and the amount and/or complexity of medical records to review are greater for 99213, the technical skill, physical effort, risk of complications, and risk of malpractice with poor outcome are much greater for 11730. We agree with the survey respondents who chose 99213 as a reference code that the overall intensity and complexity of 11730 is greater than 99213.

MPC Codes

CPT	DESC	RVW	IWPUT	TOTAL	PRE	INTRA	POST
MPC 30901	Control nasal hemorrhage, anterior, simple (limited cautery and/or packing) any method	1.10	0.081	26	11	10	5
11730	Avulsion of nail plate, partial or complete, simple; single	1.10	0.066	33	18	10	5
MPC 36620	Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous	1.15	0.092	22	7	10	5

Recommendation

We recommend maintaining the work RVU of 1.10 for 11730. The physician work to perform this procedure has not changed since this code was last reviewed (2005) as supported by the current survey data.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11730

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty podiatry How often? Commonly

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
11730 Avulsion of nail plate, partial or complete, simple; single

Global Period: 000 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
An APMA expert panel reviewed the current PE details for 11750, updating clinical staff time using standards and adjusting supplies and equipment to reflect current practice.

2. You must provide reference code(s) for comparison on your spreadsheet.
Current inputs for 11730 and 11750 are used as references however we are recommending a crosswalk to code 11750 which was just reviewed by the PE Subcommittee and CMS.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:
Code 11730 was reviewed very early in the process of the PEAC review of all codes and zero minutes of pre-service clinical staff was automatically assigned. Prior to arriving for the procedure, the clinical staff will make one phone call (3 minutes) to the patient to confirm which medications to continue or stop and to reinforce appropriate shoes to wear.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:
Pre-time: Prior to arriving for the procedure, the clinical staff will make one phone call (3 minutes) to the patient to confirm which medications to continue or stop and to reinforce appropriate shoes to wear.

Service Period Time: The development of cleaning time and cleaning supplies was added after this code was reviewed in 2002.

Supplies/Equipment: In current practice, the supplies and equipment would be exactly the same as required for 11750. We are crosswalking the recently approved supplies and equipment from 11750, with the exception of items required for the postop visit in 11750.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: The patient is called to confirm which medications to continue or stop and to reinforce appropriate shoes to wear.

Service (day of procedure) Clinical Labor Activities:

	2015 REC
SERVICE PERIOD	
Start: When patient enters office/facility for surgery/procedure:	
Greet patient, provide gowning, ensure appropriate medical records are available *(Reduced to current standard time)*	**3**
Obtain vital signs	**3**
Provide pre-service education/obtain consent	**2**
Prepare room, equipment, supplies *(set up sterile instruments and solutions)*	**2**
Prepare and position patient/ monitor patient/ set up IV *(assist position / pad patient legs, drape, set up anesthetic supplies)*	**2**
Sedate/apply anesthesia *(application of ethyl chloride and assist with digital block of four nerves)*	**2**
Intra-service	
Assist physician in performing procedure *(100% - sterile procedure)*	**10**
Post-Service	
Clean room/equipment by physician staff	**3**
Clean Surgical Instrument Package *(standard for basic pack)*	**10**
Check dressings & wound/ home care instructions /coordinate office visits /prescriptions	**3**

Post-Service Clinical Labor Activities:

Follow-up phone call to answer patient family questions about swelling, bleeding/wound care, and allowed medications.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
FACILITY Direct Inputs

CPT Long Descriptor:
11730 Avulsion of nail plate, partial or complete, simple; single

Global Period: 000 Meeting Date: January 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: An APMA expert panel reviewed the current PE details for 11750, updating clinical staff time using standards and adjusting supplies and equipment to reflect current practice.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale: Current inputs for 11730 and 11750 are used as references however we are recommending a crosswalk to code 11750 which was just reviewed by the PE Subcommittee and CMS.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: Code 11730 is not typically performed in a facility. When a facility is required, it is usually due to comorbidities requiring facility support. In these instances, phone calls between physician clinical staff and insurance / facility staff will be necessary. We are recommending one phone call for each of these activities: complete pre-service diagnostic & referral forms; coordinate pre-surgery services; and schedule space and equipment in facility. In addition, one phone call is made to the patient to confirm which medications to continue or stop and to reinforce appropriate shoes to wear and the need for assistance returning home.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: Pre-Time: Code 11730 is not typically performed in a facility. When a facility is required, it is usually due to comorbidities requiring facility support. In these instances, phone calls between physician clinical staff and insurance / facility staff will be necessary. We are recommending one phone call for each of these activities: complete pre-service diagnostic & referral forms; coordinate pre-surgery services; and schedule space and equipment in facility. In addition, one phone call is made to the patient to confirm which medications to continue or stop and to reinforce appropriate shoes to wear and the need for assistance returning home.

5. Please describe in detail the clinical activities of your staff:
Pre-Service Clinical Labor Activities: Code 11730 is not typically performed in a facility. When a facility is required, it is usually due to comorbidities requiring facility support. In these instances, phone calls between physician clinical staff and insurance / facility staff will be necessary. We are recommending one phone call for each of these activities: complete pre-service diagnostic & referral forms; coordinate pre-surgery services; and schedule space and equipment in facility. In addition, one phone call is made to the patient to confirm which medications to continue or stop and to reinforce appropriate shoes to wear and the need for assistance returning home.

Service (day of procedure) Clinical Labor Activities: N/A

Post-Service Clinical Labor Activities: Follow-up phone call to answer patient family questions about swelling, bleeding/wound care, and allowed medications.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

January 2016

Psychological and Neuropsychological Testing

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT codes 96101, 96116 and 96118 were identified.

CPT code 96116 had an interest from an MD/DO specialty society and was scheduled to be reviewed by the RUC. The remaining codes in this family had an non-MD interest and were scheduled to be reviewed by the HCPAC. In January 2016, the specialty societies requested that the entire family of codes be referred to the CPT Editorial Panel to be revised. The testing practice has been significantly altered by the growth and availability of technology. The current codes do not reflect the multiple standards of practice and therefore result in confusion about how to report the codes. **The HCPAC recommends the entire psychological and neuropsychological testing codes be referred to the October 2016 CPT Editorial Panel meeting for revision. CMS also requested that CPT code 96125 and 96127 be added to this family of services for revision/review.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
96101	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg, MMPI, Rorschach, WAIS), per hour of the psychologist's or physician's time, both face-to-face time administering tests to the patient and time interpreting these test results and preparing the report	XXX	Refer to October 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

96102 (f)	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg, MMPI and WAIS), with qualified health care professional interpretation and report, administered by technician, per hour of technician time, face-to-face	XXX	Refer to October 2016 CPT
96103 (f)	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg, MMPI), administered by a computer, with qualified health care professional interpretation and report	XXX	Refer to October 2016 CPT
96116	Neurobehavioral status exam (clinical assessment of thinking, reasoning and judgment, eg, acquired knowledge, attention, language, memory, planning and problem solving, and visual spatial abilities), per hour of the psychologist's or physician's time, both face-to-face time with the patient and time interpreting test results and preparing the report	XXX	Refer to October 2016 CPT
96118	Neuropsychological testing (eg, Halstead-Reitan Neuropsychological Battery, Wechsler Memory Scales and Wisconsin Card Sorting Test), per hour of the psychologist's or physician's time, both face-to-face time administering tests to the patient and time interpreting these test results and preparing the report	XXX	Refer to October 2016 CPT
96119 (f)	Neuropsychological testing (eg, Halstead-Reitan Neuropsychological Battery, Wechsler Memory Scales and Wisconsin Card Sorting Test), with qualified health care professional interpretation and report, administered by technician, per hour of technician time, face-to-face	XXX	Refer to October 2016 CPT
96120 (f)	Neuropsychological testing (eg, Wisconsin Card Sorting Test), administered by a computer, with qualified health care professional interpretation and report	XXX	Refer to October 2016 CPT
96125 (f)	Standardized cognitive performance testing (eg, Ross Information Processing Assessment) per hour of a qualified health care professional's time, both face-to-face time administering tests to the patient and time interpreting these test results and preparing the report	XXX	Refer to October 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

96127 (f)	Brief emotional/behavioral assessment (eg, depression inventory, attention-deficit/hyperactivity disorder [ADHD] scale), with scoring and documentation, per standardized instrument	XXX	Refer to October 2016 CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Re: RUC Tab 53, RUC HCPAC Tab 57

Dear Dr. Smith:

The American Psychological Association (APA) and the American Academy of Neurology (AAN) are not able to survey the NPRM-identified CPT codes 96101, 96116, and 96118 at this time. After close review and extended discussions of the multiple issues surrounding these (and related) codes, we are immediately undertaking a complete review of the standards of modern practice for psychological and neuropsychological testing.

Testing practice has been significantly altered by the growth and availability of technology. The codes do not reflect the multiple standards of practice. The result is confusion about how to apply the codes, and the presence of inaccurate guidance in the vendor marketplace. The practice changes leave us with some outmoded CPT code descriptors that are unlikely to garner meaningful data in a RUC survey.

We understand that CMS and the RUC wish for the codes to be reviewed through the AMA process. We do have an action plan:

APA will immediately commission an expert task force to identify and describe the current standards of practice for the profession. When that is completed, we fully expect to revise the CPT codes for psychological and neuropsychological testing. Following the revisions, APA and AAN will survey the revised codes.

We identify the family of codes as:

- 96101 psychological testing, administered by professional
- 96102 psychological testing, administered by technician
- 96103 psychological testing, administered by computer
- 96116 behavioral status exam
- 96118 neuropsychological testing, administered by professional

- 96119 neuropsychological testing, administered by technician
- 96120 neuropsychological testing, administered by computer

We appreciate the opportunity to assist with the maintenance of both the CPT code set and the Medicare Physician Fee Schedule.

Please contact Debra Lansey at the American Psychological Association DLansey@apa.org or (202) 336-5896, if there are questions or concerns.

Sincerely,

Kevin A. Kerber, MD.
Advisor, American Academy of Neurology
