EXECUTIVE SUMMARY

Physicians, federal and state governments, health plans and other health care stakeholders are engaging in unprecedented efforts to transform how health care is delivered in this country. One of the core areas of focus of the American Medical Association’s (AMA) five-year strategic plan is shaping payment and delivery reform models in ways that enhance physician satisfaction and practice sustainability.

The Council reviewed the body of AMA policy pertaining to the following key issues of delivery reform:

- care coordination and transitions;
- data and health information technology infrastructure; and
- quality and performance assessment and improvement.

In its review, the Council identified several policy gaps and ways to update existing policies to guide AMA advocacy in the evolving health care delivery environment. The report concludes by making seven recommendations that include additions, modifications and rescissions to AMA policy in order to strengthen AMA policy related to delivery reform.
Innovations in health care delivery and payment with the goals of improving care coordination and quality while reducing the rate of growth in health care spending are now occurring in both the private sector as well as within the government programs of Medicare and Medicaid. States, physicians, health plans and other health care stakeholders are engaging in efforts to transform how health care is delivered in this country. One of the core areas of focus of the American Medical Association’s (AMA) five-year strategic plan is enhancing physician satisfaction and practice sustainability by shaping payment and delivery reform models. The Council has reviewed the body of AMA policy pertaining to delivery reform and believes it is important to remove inconsistencies and close gaps in AMA policy, which guides AMA advocacy efforts.

Consistent with the focus on delivery reform, this report provides background on delivery reform, and highlights key issues for physicians and patients in delivery reform: care coordination and transitions, data and health information technology infrastructure, and quality and performance assessment and improvement. This report also outlines and analyzes relevant AMA policy, and presents policy recommendations.

BACKGROUND

The health care delivery system is undergoing changes to be more effective and efficient, provide better health outcomes and population health, improve quality and patient safety, and slow the growth in health care spending. The integration of physicians and health care delivery systems and the transformation of physician practices into patient-centered medical homes are examples. It has also become more common for physicians to enter into employment relationships with hospitals, group practices, and other health care organizations and delivery systems. The federal government began moving in this direction through demonstration projects authorized in a variety of bipartisan pieces of legislation, beginning in 2000 with the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act, which authorized the Physician Group Practice Demonstration; the Medicare Modernization Act of 2003, which authorized the Acute Care Episode Bundled Payment Demonstration; and the Deficit Reduction Act of 2005, which authorized a gainsharing demonstration. Building on those efforts, two major federal laws—the American Recovery and Reinvestment Act (ARRA) of 2009 and the Patient Protection and Affordable Care Act (ACA) of 2010—made significant investments in health care delivery reform, and offer new opportunities for physicians to take part in new delivery models.

The ARRA provided significant financial incentives for physicians and other health care providers to adopt health information technology (HIT). Specifically, the ARRA provided approximately $19 billion for HIT, $17 billion of which is for Medicare and Medicaid incentive programs. The ARRA
also charged the Office of the National Coordinator for Health Information Technology within the US Department of Health and Human Services (HHS) to promote the development of a nationwide interoperable HIT infrastructure. The ARRA provided $2 billion to help advance the creation and expansion of health information exchange (HIE) infrastructure and services. The ARRA also contained provisions for financial incentives through the Medicare program to encourage eligible physicians and hospitals to adopt and use certified electronic health records (EHRs) in a meaningful way. Similar incentives were provided for in the ARRA under the Medicaid program for physicians, hospitals and other providers. Physicians cannot take advantage of the incentive payment programs under both the Medicare and Medicaid programs. Physicians who do not meaningfully use a certified HIT system face reductions in their Medicare fee schedule starting in 2015. The AMA has repeatedly raised the concerns of physicians regarding the imposition of penalties associated with the Medicare meaningful use EHR program and has offered recommendations for improving the program.

The ACA included a variety of provisions to test, implement and support voluntary health care delivery reforms as a complement to its provisions to expand health insurance coverage and improve access to care. Notably, the ACA authorized $10 billion over 10 years to develop and implement both delivery system and payment reforms through the Center for Medicare & Medicaid Innovation (CMMI), which is housed within the Centers for Medicare & Medicaid Services. Additional provisions of the ACA that relate to delivery reform include:

- Implementing Accountable Care Organizations (ACOs);
- Developing primary care practices into medical homes;
- Identifying, updating, and expanding quality measures as well as the development of the National Strategy for Health Care Quality;
- Testing models for improving care transitions from the hospital to other settings;
- Patient-centered outcomes research (comparative effectiveness research); and
- Grants to support community-based collaborative care networks, which are consortia of health care providers with a joint governance structure that provides comprehensive coordinated and integrated health care services for low-income populations.

Innovative delivery and payment reforms are also currently underway in the private sector and within state Medicaid programs. State Medicaid programs have been and will continue to be laboratories for innovation and will continue to play a key role in establishing innovative delivery and payment models across the country. For example, in Arkansas, the Payment Improvement Initiative was established, which is a multi-payer, system-wide initiative aimed at improving the quality of care provided to patients while reducing overall costs. For the state’s Medicaid program, the initiative includes an episode-based care payment model as well as care coordination through medical homes and health homes. In Massachusetts is also tackling Medicaid delivery and payment reform, including having its Office of Medicaid develop alternative payment methodologies, including, but not limited to, bundled payments, global payments and shared savings. In Oregon, legislation was enacted to create Coordinated Care Organizations (CCOs) within Oregon’s Health Plan (OHP). As outlined in the law, CCOs are local health care partnerships that govern and administer the care provided to OHP members, including dual eligibles, within their community. Each CCO has its own budget that grows at a fixed rate and each CCO is accountable for the health outcomes of the members it serves, including physical and mental health. In the private sector, CareFirst BlueCross Blue Shield (MD, VA, DC) launched a patient-centered medical home program in 2011. The program provides additional fee-based compensation to primary care physicians who volunteer to carry out the program objectives. The program requires
that the primary care physicians only have internet access and does not have any special systems or operating requirements that involve hardware, software, or staff upgrade costs.\(^4\) Also, under the DIAMOND Initiative organized by the Institute for Clinical Systems Improvement in Minnesota in 2008, psychiatrists agree to be paid for consulting with primary care practices on the best way to manage patients with depression, which has resulted in dramatic improvements in patient outcomes. The program uses care managers and health care teams to assess condition severity, monitor care through a computerized registry, provide relapse and exacerbation prevention, intensify or change treatment as warranted, and transition beneficiaries to self-management.\(^5\)

**KEY ISSUES IN DELIVERY REFORM**

As delivery reforms continue to be tested and implemented, several issues will be critical to physicians and their patients. All health care stakeholders have been involved and have key roles in testing and implementing delivery system reforms and innovations, including federal, state, and local governments; public and private insurers; health care delivery organizations; health insurance exchanges; physicians and other health care professionals; employers and patients.

*Care Coordination and Transitions*

One of the main aims of delivery reform is to deliver the right care in the right place at the right time. Part of this aim has been to refocus the delivery system toward preventive and primary care, and prioritizing the management of chronic disease. However, these efforts cannot occur without advances in care coordination and transitions, without which care can be fragmented, leading to patients possibly receiving care too late or care that is duplicative or unnecessary. With the development and implementation of new payment and delivery models, many of which have received funding from CMMI, there has been increased incentive to coordinate care across an episode of care, or groups of episodes of care, in addition to coordinating care around defined conditions. The term “episode of care” refers to a defined period of care during which a patient’s illness or condition is present and is being managed, including the diagnosis and treatment stages.

For an acute condition, the episode of care includes all services a patient receives for the condition from the time at which the patient is first evaluated to the completion of care for the condition. Episodes of care for chronic conditions are typically either a calendar year or the fiscal year of the respective patient’s health plan, as these conditions do not have a finite end.\(^6\)

In addition, there are improvements to be made in patient transitions between care settings for patients who receive care from multiple physicians and other health professionals practicing in different care settings. Ineffective care transition processes can jeopardize patient safety, as well as lead to poorer health outcomes. Poor care transition processes have contributed to medication errors, duplicative or unnecessary care, higher rates of hospital readmissions, and other healthcare-associated conditions.\(^7\) While a primary focus on improving care transitions has been on the experience following hospital discharge, challenges in transitions of care to less traditional health care settings have been cited, including those involving long-term care, mental health and substance abuse care facilities.

Improving care coordination and transitions has focused on how to structure delivery systems to accommodate new payment models, encourage provider-provider communication, maximize practice efficiency and effectiveness, and support the patient-physician relationship. Organizational structures will need to vary based on practice sizes and specialties, geographic location, and patient characteristics. Health care stakeholders have several options to consider in structuring health care delivery systems to improve care coordination and transitions, as well as health outcomes, including:
• Integrated physician-led groups, with an employed staff;
• Independent physician associations and physician networks;
• Physician-hospital organizations;
• Accountable Care Organizations; and
• Patient-centered medical homes that include virtually integrated small practices.

Analysis of Relevant AMA Policies

AMA Policy H-425.997 encourages the development of policies and mechanisms to assure the continuity, coordination and continuous availability of patient care. AMA policy also recognizes the need to improve transitions of care (Policies D-160.944, H-160.942 and D-160.945). There are also numerous policies addressing the need to manage chronic disease (e.g., Policies H-285.944, H-160.938, D-155.995, D-450.968, D-285.976 and H-425.972). Policy H-160.943 supports care being coordinated around defined conditions, diseases and organ systems.

Defining physician roles in coordinating care, Policy H-160.951 states that a patient’s access to primary and principal care services provided by a physician is not limited by the specialty or subspecialty designation of the physician, but should be determined by the training, competence, and experience of the physician to provide primary or principal care services. Policy H-160.952 encourages primary care and other medical specialty organizations to collaborate in developing guidelines to delineate the clinical circumstances under which treatment by primary care physicians, referral for initial or ongoing specialist care, and direct patient self-referral to other specialists are appropriate, timely and cost-effective. Several AMA policies address scope of practice issues, which delineate the AMA’s strong support of the physician-led team approach to patient care, with each member of the team playing a clearly defined role in patient care, as determined by his or her education and training (e.g., Policies D-35.985 and H-160.912).

AMA policy addresses the various options for structuring health care delivery systems and how such structures must support various physician payment reforms. To support the operation of health care delivery systems, and ensure care coordination and transitions, Policy H-285.954 outlines physician responsibilities for decision-making in health care systems. Other policies provide principles for specific organizational structures such as ACOs (Policy H-160.915), patient-centered medical homes (Policy H-160.919); physician involvement in health plans and integrated delivery systems (Policy H-285.931), and physician employment (Policy H-225.950). Several policies support antitrust reform, which would allow certain organizational structures to more effectively operate (Policies H-383.992, H-383.990, H-380.987, H-385.976, H-385.973, H-165.833 and H-160.915). A more overarching policy outlining principles for Medicare physician payment reforms, Policy H-390.849, includes a set of 11 principles to guide the development, adoption and implementation of physician payment reforms. While initially drafted for the Medicare program, these principles have provided the AMA with a sound foundation on which to base its advocacy efforts directed at both private and public payer payment reforms. The Council believes that simple amendments to the policy can ensure that it is more directly applicable to private health plans, as well as other public health plans including Medicaid, and can be used in the assessment of any innovative payment reform moving forward.

Data and Health Information Technology Infrastructure

The success of health care delivery reforms is contingent upon a strong data and HIT infrastructure, which entails the full continuum from developing a strong clinical evidence base to delivering clinical research results at the point of care, to using relevant clinical data for quality assessment and performance improvement activities. A strong clinical evidence base requires not only the
collection and analysis of de-identified patient data, but also investment in comparative
effectiveness research.

Clinical and financial data can be used to improve outcomes and population health, the health care
delivery system and quality of care. At the practice level, clinical data can be used by physicians to
monitor and manage care, analyze their patient populations and identify areas for improvement.
The analysis of clinical data may point to ways in which care may be delivered more efficiently
and effectively. Clinical data, along with research findings and practice guidelines, can be
aggregated and organized in several ways, including their incorporation into clinical and
administrative databases, usable clinical registries, and health information exchanges. The Council
notes that once organized, data should be interconnected through technology tools, such as
interoperable EHRs or cloud-based data sharing systems that foster computerized physician order
entry (CPOE) and other decision support capabilities.

HIT interoperability is essential to deliver coordinated care, impact care delivery and improve care
transitions. Individuals and systems must have the capacity to communicate with each other, share
clinically relevant data and information, and report risk-stratified outcomes and resource
utilization. The Congressional Budget Office estimates that as a result of the ARRA, roughly 90
percent of physicians and 70 percent of hospitals will adopt HIT by 2019.9 As of the drafting of this
report, roughly 40 percent of physicians and 44 percent of hospitals are using at least a “basic”
EHR. 9,10 While physicians and hospitals are increasingly adopting HIT resulting from the ARRA
incentives, HIT interoperability remains in the nascent stages. In fact, many HIT systems being
adopted are not interoperable, and many physicians and other health care providers have cited
usability concerns. Efforts to enable HIT interoperability are ongoing, including in the areas of
identity authorization, consent management, data validation, and privacy and security issues. In
addition, improvements need to be made to HIT, including EHRs, to ensure patient safety and
minimize medical errors resulting from EHR design and software flaws.

In order to promote the interoperability of the HIT infrastructure, there is increasing support for the
creation and development of health insurance exchanges (HIEs), which “bring together health care
stakeholders within a defined geographic area and govern HIEs among them for the purpose of
improving health and care in that community; the entity that provides services enabling the
electronic sharing of health information.”11 HIEs can be either private or public organizations that
connect physicians and other participating providers and facilitate the transmission and exchange
of electronic clinical information from EHRs.

Analysis of Relevant AMA Policies

Policy H-450.938 states that physicians should have easy access to and consider the best available
evidence at the point of decision-making, to ensure that the chosen intervention is maximally
effective in reducing morbidity and mortality. To do so, the policy states that physicians should
seek opportunities to improve their HIT infrastructures to include new and innovative technologies
to facilitate increased access to needed and useable evidence and information at the point of
decision-making. Several policies address the need to implement an interoperable HIT
infrastructure, including H-478.992 and D-478.996. Policy D-478.996 also supports the
development, adoption and implementation of HIT standards, overlapping the primary focus area
of Policy H-478.995. However, Policy H-478.995 also stipulates that the development, adoption
and implementation of HIT standards should be consistent with “current efforts to set health
information technology standards for use by the federal government.” As the policy was drafted
before the enactment of ARRA, as well as the development of the stages and requirements for
meaningful use of EHRs, the Council believes that it is a strong candidate for rescission.
Policies H-480.971, H-315.973 and H-478.981 address the privacy, security and appropriate use of information within EHRs, as well as the secure exchange of data between EHR and other HIT systems. As also outlined in Board of Trustees Report 17, Data Ownership and Access to Clinical Data in Health Information Exchanges, being considered at this meeting, there is a considerable body of AMA policy that addresses the access and use of clinical data—key issues in ensuring the protection of data from any potential source, including HIEs (Policies H-315.973, H-315.974, H-315.983, H-406.991). At this early stage of HIE development and implementation, with HIEs varying widely in terms of structures, capabilities and services, the Council believes there is a need for additional AMA policy addressing the basic and foundational priorities of physicians concerning HIE establishment, including governance, cost, and mandatory versus voluntary participation.

Concerning clinical decision support systems and CPOE, Policy D-478.995 advocates for continued research and physician education on CPOE user interface design, and on CPOE and clinical decision support systems and vendor accountability for the efficacy, effectiveness, and safety of these systems. Policy H-435.944 supports legislation that would create a “safe harbor” for physicians who use a consensus-based drug-drug interaction list in their clinical decision support software package. Policy H-450.935 states that any practice guidelines, parameters, best practices models, or similar set of principles or clinical recommendations, including those that result from any CER, do not establish standard of care or create specific requirements for physicians that restrict the exercise of their clinical judgment.

Quality and Performance Assessment and Improvement

A key focus of delivery system reform has been to incorporate quality and performance assessment and improvement. In particular, a variety of delivery reform efforts attempt to coordinate care around defined conditions, episodes of care, or groups of episodes of care and have therefore sought to refocus quality assessment and performance improvement efforts on these models.

There are currently several sources of measures to use in the evolving quality assessment and performance improvement infrastructure, including:

- The AMA-convened Physician Consortium for Performance Improvement (PCPI);
- The National Quality Forum;
- Specialty societies that own and/or operate clinical registries;
- The National Committee for Quality Assurance, which owns the Healthcare Effectiveness Data and Information Set (HEDIS);
- The Joint Commission; and
- Several Medicare initiatives including the EHR incentive program and the Physician Quality Reporting System (PQRS).

Defined outcomes and composite measures targeted for episodes of care or team-based care will be needed as delivery reform evolves. The Council notes that the timely development of defined outcomes and composite measures requires committed public and private sector funding. These measures must involve physician experts, and include the development of appropriate risk-adjustment and attribution methodologies. Performance benchmarks will also need to have the capacity to be applied across providers and settings.

The Council believes that a key challenge in measuring performance for coordinating care will be how to attribute performance and outcomes, particularly when a team of health care professionals
is involved in delivering care. Therefore, new delivery system organizational structures will need to have the capacity to reliably assign and measure the accountability of care among providers and specify clear lines of attribution.

Analysis of Relevant AMA Policies

Policy H-450.975 defines quality of care as the degree to which care services influence the probability of optimal patient outcomes. Many policies state that the AMA will be actively involved in private and public sector efforts to evaluate and enhance quality of care (H-450.946, H-450.941, H-450.939 and D-450.978). Specifically, Policies H-450.939, D-450.978 and D-450.983 support the role of the PCPI as the measure developer for physician-level performance improvement.

Policy H-410.960 encourages all physicians to be open to the development and broader utilization of evidence-based quality improvement guidelines and indicators for measurement of quality practice. Policy D-450.988 outlines continued AMA support for the appropriate use of evidence-based clinical performance measures. Policy H-450.966 advocates principles to be used to guide the development and evaluation of quality and performance standards and measures under federal and state health system reform efforts, but does not reflect the current lack of outcomes and composite measures available for episodes of care, as well as team-based care. In addition, the policy does not reflect the need to establish performance benchmarks across settings and providers, to ensure that performance measures have valid comparators, and that performance scores are objective.

Regarding attribution, Policy H.390.849 states that Medicare physician payment reforms should have attribution processes that emphasize voluntary agreements between patients and physicians, minimize the use of algorithms or formulas, provide attribution information to physicians in a timely manner, and include formal mechanisms to allow physicians to verify and correct attribution data as necessary. Policy H-160.915 supports the inclusion of an appropriate attribution methodology as part of an ACO quality reporting program. Policy H-406.991 states that the data and methodologies used in profiling physicians, including the use of representative and statistically valid sample sizes, statistically valid risk-adjustment methodologies and statistically valid attribution rules produce verifiably accurate results that reflect the quality and cost of care provided by the physicians. However, full implementation of policies calling for the use of accurate and valid risk adjustment methodologies, including H-406.991 and H-390.849, cannot occur without additional financial resources being directed toward the validation of statistical models used for risk adjustment.

AMA ACTIVITY

The AMA has been actively engaged with the Administration, Congress, state governments, and other key stakeholders, such as private payers, patient organizations, business coalitions, hospitals and multi-stakeholder collaboratives, in advocating delivery reforms and has developed resources for its membership. As outlined in the appendix to this report, resources developed for AMA members include issue briefs, model state legislation, and documents providing answers to frequently asked questions. Concerning the implementation of provisions of the ACA related to delivery reform, the AMA submitted comments on a range of issues, including ACOs, administrative simplification, HIT and EHR incentives and penalties, comparative effectiveness research, and the National Health Care Quality Strategy and Plan. Additional examples of AMA activities related to delivery reform are outlined in the appendix of this report.
In addition, in 2011, the AMA, partnered with a small group of state and specialty medical societies to form the Innovators Committee, an advisory group of physicians with hands-on experience in the development and management of innovative delivery and payment models. The Innovators Committee has begun to develop a series of resources offering practical guidance to physicians on how to implement delivery reforms, which are outlined in the appendix in more detail.

Ongoing AMA activities on delivery reform support one of the core areas of focus of the AMA five-year strategic plan: enhancing physician satisfaction and practice sustainability by shaping delivery and payment models. With respect to delivery reform specifically, a main objective is to develop best practices for delivery that improve outcomes and health, increase productivity, improve patient safety and achieve cost savings. As a first step, the AMA, in collaboration with the RAND Corporation, is conducting in-depth field research, sampling approximately 30 physician practices in the coming months. Also, the AMA will carry out quantitative research with a diverse group of physician practices. As of the drafting of this report, initial findings from this effort were expected to be published in the summer or fall of 2013, which could be used as part of AMA advocacy efforts to make key changes in the regulatory process.

DISCUSSION

Within the body of AMA policy pertaining to the key issues in delivery reform—care coordination and transitions, data and health information technology infrastructure, and quality and performance assessment and improvement—the Council has identified several policy gaps and ways to update existing policies to guide AMA advocacy in the evolving health care delivery environment. Carrying out the intent of Policy G-600.111, which recommends rescinding outmoded or duplicative policies, combining policies that relate to the same topic, or modifying policy to update it, the Council believes that the following additions, modifications and rescissions to AMA policy would strengthen AMA policy related to delivery reform.

1. Policy H-390.849 should be modified to ensure it is applicable to the payment reforms of all payers, rather than solely Medicare. Originally drafted to guide the development, adoption and implementation of Medicare physician payment reforms, the principles outlined in H-390.849 have provided the AMA with a sound foundation on which to base its advocacy efforts directed at both private and public payer payment reforms. As such, the proposed amendment makes the policy directly applicable to and useful in evaluating payment reforms of all payers.

2. Policy H-478.995, which advocates for the development, adoption and implementation of HIT standards consistent with current efforts to set health information technology standards for use by the federal government, should be rescinded. The basic premise of the Policy H-478.995, to advocate for the development, adoption and implementation of HIT standards, is also addressed as a main focus area of Policy D-478.996. In addition, the language of the policy stating that the AMA advocates for the development of HIT standards consistent with “current efforts to set health information technology standards for use by the federal government,” can be read to implicitly endorse any “current” effort to set health information technology standards for use by the federal government, including the stages and requirements proposed by the federal government for meaningful use.

3. There is a need for new policy to support physician and patient representation on HIE governance structures, to ensure that their interests are embodied in HIE decision-making processes.
4. There is a need for policy that indicates that physician participation in HIEs should be voluntary and not mandatory as efforts move forward by states, localities, health plans and other entities to establish HIEs.

5. There is a need for new policy addressing the cost of physician participation in HIEs, so as not to discourage their participation or jeopardize the economic viability of their practices. Direct costs of HIE participation vary, and participation fees can be charged per transaction, monthly, annually, or a combination of transaction and subscription fees. In addition, physicians may need to upgrade their HIT systems in order to meet the system requirements of HIEs, as well as alter their workflow processes during the implementation stage.

6. Policy H-450.966 should be amended to reflect the need to develop outcomes and composite measures for episodes of care, as well as team-based care. The policy also should reflect the current need to establish performance benchmarks across providers and settings. AMA policy does not currently reflect the current lack of outcomes and composite measures available for episodes of care, as well as team-based care. These measures are essential to measure the success of many delivery and payment reform efforts. In addition, policy does not reflect the need to establish performance benchmarks across settings and providers, to ensure that performance measures have valid comparators, and that performance scores are objective.

7. There is a need for new policy supporting the establishment of a public-private partnership to validate statistical models used for risk adjustment. Full implementation of policies calling for the use of accurate and valid risk adjustment methodologies, including Policies H-406.991 and H-390.849, cannot occur without additional financial resources being directed toward the validation of statistical models used for risk adjustment. The establishment of a public-private partnership using existing ACA funding appropriated for risk adjustment, in addition to other congressional appropriations or private sector resources, is an essential step in ensuring that risk adjustment methodologies are verifiable, accurate, and based on current data.

RECOMMENDATIONS

The Council on Medical Service recommends that the following be adopted and the remainder of the report be filed:

1. That our American Medical Association (AMA) amend Policy H-390.849[1] and its title by deletion to read as follows: “Medicare Physician Payment Reform (1) Our AMA will advocate for the development and adoption of Medicare physician payment reforms that adhere to the following principles: ...” (Modify Current HOD Policy)

2. That our AMA rescind Policy H-478.995. (Rescind HOD Policy)

3. That our AMA support the inclusion of actively practicing physicians and patients in health information exchange governing structures. (New HOD Policy)

4. That our AMA advocate that physician participation in health information exchanges should be voluntary, to support and protect physician freedom of practice. (New HOD Policy)
5. That our AMA advocate that the direct and indirect costs of participating in health information exchanges should not discourage physician participation or undermine the economic viability of physician practices. (New HOD Policy)

6. That our AMA amend Policy H-450.966[6] by addition and deletion to read as follows: “The AMA … (6) advocates that the following principles be used to guide the development and evaluation of quality and performance standards and measures under federal and state health system reform efforts: (a) Standards and measures shall have demonstrated validity and reliability. (b) Standards and measures shall reflect current professional knowledge and available medical technologies. (c) Standards and measures shall be linked to health outcomes and/or access to care. (d) Standards and measures shall be representative of the range of health care services commonly provided by those being measured. (e) Standards and measures shall be representative of episodes of care, as well as team-based care. (f) Standards and measures shall account for the range of settings and practitioners involved in health care delivery. (g) Standards and measures shall recognize the informational needs of patients and physicians. (h) Standards and measures shall recognize variations in the local and regional health care needs of different patient populations. (i) Standards and measures shall recognize the importance and implications of patient choice and preference. (j) Standards and measures shall recognize and adjust for factors that are not within the direct control of those being measured. (k) Data collection needs related to standards and measures shall not result in undue administrative burden for those being measured.” (Modify Current HOD Policy)

7. That our AMA support the development of a public-private partnership for the purpose of validating statistical models used for risk adjustment. (New HOD Policy)

Fiscal Note: Less than $500.

Appendix
Examples of AMA Activities and Resources Related to Delivery Reform

Overarching Activities on Delivery Reform

- In August 2011, the Innovators Committee released “Guiding Principles on Health Care Delivery and Payment Reform,” which can be found online at http://www.ama-assn.org/resources/doc/washington/delivery-and-payment-reform-guiding-principles.pdf. As part of this document, there are guiding principles specifically geared toward delivery reform:

  1. Coordination of care must be clearly demonstrable in the delivery of health care.
  2. Care must be centered on the patient.
  3. Quality Assessment and Performance Improvement processes must become an integral component of both delivery and coordination of care.
  4. Accountability for delivery of care for both acute and chronic conditions must be clearly defined, yet flexible enough to accommodate innovations and local differences in care delivery.
  5. The delivery system should measure, and strive to create, not only quality but also value.
  6. Function must trump form/structure.
  7. Supporting infrastructure and technology must underpin all aspects of care delivery.
  8. Delivery systems should work to eliminate disparities and to address the needs of underserved populations.

- In May 2012, the AMA released the whitepaper titled “The Case for Delivery Reform: Implementing Innovative Strategies in Your Practice,” which can be found online at http://www.ama-assn.org/resources/doc/washington/delivery-reform-white-paper.pdf. The purpose of the whitepaper was to offer practical guidance to practicing physicians to enact delivery reforms. Specifically, the whitepaper addresses improving care coordination and transitions; assessing where physicians can have the most impact; defining conditions to measure and episodes of care; performance targets and thresholds; and outreach and advocacy.

- In the ongoing effort to repeal the Medicare Sustainable Growth Rate (SGR) formula, the AMA and 110 specialty organizations and state medical societies have agreed to “Principles and Core Elements for Transitioning from the SGR to a High Performing Medicare Program.” These principles have been shared widely with Congress, the Administration and other key federal policymakers to inform and shape the ongoing effort to repeal the SGR. These principles state that eliminating the SGR formula is essential to developing a high performing Medicare program. In conjunction with SGR repeal, the following driving principles can provide a foundation for a transition plan that organized medicine can support:

  - Successful delivery reform is an essential foundation for transitioning to a high performing Medicare program that provides patient choice and meets the health care needs of a diverse patient population;
  - The Medicare program must invest and support physician infrastructure that provides the platform for delivery and payment reform; and
  - Medicare payment updates should reflect costs of providing services as well as efforts and progress on quality improvements and managing costs.
Care Coordination and Transitions

- AMA advocacy resulted in a Medicare Accountable Care Organization (ACO) final rule, including Stark law waivers and antitrust guidance, which is very favorable to the formation of physician-led ACOs. As of January 2013, the Centers for Medicare & Medicaid Services (CMS) has announced a total of 220 Shared Savings Program ACOs (including 20 Advanced Payment ACOs), approximately half of which Medicare classifies as physician-led.

- AMA advocacy directly resulted in the Center for Medicare & Medicaid Innovation (CMMI) introducing the Advanced Payment ACO Initiative, designed to provide smaller ACOs with upfront capital to make infrastructure upgrades. Qualifying groups are: 1) physician-led ACOs that do not include any inpatient facilities and that have less than $50 million in total annual revenue or 2) ACOs in rural areas that have less than $80 million in total revenue. CMMI will recoup the advance payments through the ACO’s earned shared savings in year two. There are a total of 35 Advanced Payment ACOs with April 2012, July 2012, and January 2013 start dates.

- The ARC developed the model bill “Enabling Coordinated Care Organizations with Medical Integrity” Act that addresses coordinated care organizations as well as ACOs (http://www.ama-assn.org/resources/doc/arc/x-ama/coordinate-care-organizations-act.pdf).

- The Chronic Care Coordination Workgroup of the AMA proposed that the CPT Editorial Panel develop new codes to describe Transitional Care Management and Complex Chronic Care Coordination services to be reported for care coordination provided over a 30-day period. After development of these codes in May 2012, the AMA/Speciality Society Relative Value Scale Update Committee (RUC) reviewed the physician work and practice costs associated with the provision of these services and submitted its recommendations to CMS in October. Effective January 1, 2013, Medicare will implement the RUC recommendations and begin payment for CPT codes 99495 and 99496 for the care of transitioning patients from a hospital or skilled nursing facility to the home.

- In February 2013, the AMA Center for Patient Safety released “There And Home Again, Safely,” a report that lists and discusses five responsibilities of ambulatory practices in transitions of care, which can be found online at http://www.ama-assn.org/resources/doc/patient-safety/ambulatory-practices.pdf. Responsibilities of outpatient physicians recommended by the AMA’s Expert Panel on Ambulatory Roles and Responsibilities in Safe Care in the report include assessing the patient’s health; goal-setting to determine desired outcomes; supporting self-management to ensure access to resources the
patient may need; medication management to oversee needed prescriptions; and care coordination to bring together all members of the health care team.

Data and Health Information Technology Infrastructure

- With respect to health information technology, including the meaningful use electronic health record program, the AMA has developed resources for its members on how the American Recovery and Reinvestment Act (ARRA) and subsequent regulations impact their practices, found online at [http://www.ama-assn.org/ama/pub/advocacy/topics/health-information-technology.page](http://www.ama-assn.org/ama/pub/advocacy/topics/health-information-technology.page).

- AMA’s Practice Management Center has developed resources on the benefits and risks of participating in a health information exchange, found online at [http://www.ama-assn.org/go/hie](http://www.ama-assn.org/go/hie).

Quality and Performance Assessment and Improvement

- Improving health outcomes is one of the core areas of focus of AMA’s five-year strategic plan. Toward these goals, the AMA will first identify a focused set of outcomes that would potentially have great impact on the U.S. population, then set a course of innovation and action to develop, enhance, and implement strategies aimed at reducing the disease and cost burden associated with these conditions.

- The AMA has continued to serve as a leader in quality measurement and improvement, through the AMA-convened Physician Consortium for Performance Improvement (PCPI).

- The AMA serves as a member organization in the National Quality Forum (NQF).

- The AMA convened on behalf of the US Department of Health and Human Services (HHS) a stakeholder meeting with physician organizations and officials in HHS on the topic of clinical registries and their role in transforming health care delivery, and the AMA conducted additional meetings with the Federation to garner additional input into this topic.

- As part of its 2009 work plan, the AMA-convened PCPI developed a set of Care Transition measures. Jointly developed with the American College of Physicians, the Society of Hospital Medicine and the ABIM Foundation, these performance measures focus on the key process components of the transition of care for patients discharged from an inpatient facility or an emergency department. NQF endorsed several of these measures, and the AMA continues to promote the use of these measures in both public and private pay for performance programs.
