-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality excel file

Specialty vascular surgery	Frequency	Percentage	%
----------------------------	-----------	------------	---

Specialty general surgery	Frequency	Percentage	%
---------------------------	-----------	------------	---

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34805

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 34705      Tracking Number   U5

Original Specialty Recommended RVU: **32.28**Presented Recommended RVU: **29.58**

Global Period: 090

RUC Recommended RVU: **29.58**

CPT Descriptor: Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-biiliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm. Endovascular repair is performed by deployment of an aorto-biiliac endograft and all required proximal infrarenal extension(s) and all distal extension(s) to the level of the iliac artery bifurcation, as necessary.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 15% , Overnight stay-more than 24 hours 85%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 72%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact measurements of the aneurysm and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery, but it must be completed several days prior to surgery in order to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is one of the primary determinants of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where 3D software is applied permitting iterative modelling of a virtual device within the aorta in multiplanar views and center line of flow analysis. The physician needs to manually adjust modelling for altered anatomy which is tortuous or thrombus laden. Orthogonal center-line imaging is used to determine diameter measurements of the aorta, iliac and femoral arteries for appropriate sizing of the main body endograft and limbs with extensions as needed. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence and stenosis require consideration as they may impact device delivery. Cross section, longitudinal and center line of flow measurements, with manual adjustments where needed, are utilized to map the distances between the lowest renal artery and the distal seal zone depending on the extent and involvement of the distal aorta and iliac segments. A stretched/straightened view permits manual validation of the computer-generated lengths.

Pre-service work necessarily includes review of surgical indication, physical exam findings, current medications and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the operating room after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine and ACT testing. In addition, the surgeon ensures all

technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for ready viewing during the operative procedure. The surgeon supervises appropriate patient positioning on the OR table, ensures fluoroscopy is functional and that desired imaging angles are attainable with equipment at hand. The surgeon dons radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile prep of access site(s) and subsequent draping. The surgeon leads the pre-procedural "time-out."

Description of Intra-Service Work: Deployment of this prosthesis is accomplished from bilateral femoral or iliac access sites, and intra-arterial catheterization is performed from both sides. Performance of an aorto-bi-iliac graft requires additional considerations and steps related to treatment of both iliac arteries. This is more work, more steps, and more devices than required for the aorto-aortic endograft, or the aorto-uni-iliac endograft.

Catheter placement is bundled in this procedure. Under fluoroscopic guidance, an introducer needle is used to access the vessel. A series of graded guidewires, vascular sheaths and catheters is introduced flush aortography is performed to confirm the location of the renal arteries and the aorto-iliac anatomy. In a similar manner, catheterization of the aorta from the contralateral femoral or iliac artery is performed. The patient is then systemically anticoagulated. A rigid wire is inserted through catheters to provide secure tracking of the large introducer sheaths for the main body and limbs of the endograft. The first component of the endograft is loaded onto the guidewire and advanced through the access vessel into the aorta. The main body is positioned and deployed under fluoroscopic guidance with intermittent angiographic control imaging. Additional limbs and extensions are implanted as required to obtain coverage of diseased aorta and both common iliacs. A large compliant balloon is placed over the wire into the endograft to perform balloon dilation at the proximal and distal seal zones of the endograft. Both iliac limbs undergo balloon expansion. An aortogram is performed for adequacy of the graft position, patency of adjacent branch vessels (renals and hypogastrics), presence or absence of endoleaks, and type of endoleak if present. The patency of collateral vessels (lumbar or inferior mesenteric arteries) that may contribute to persistent endoleaks is also assessed. Adjunctive balloon angioplasty is performed for endoleak treatment, as necessary. Extensions are placed to achieve fixation and seal as required. When the graft is in appropriate position and free of endoleaks on angiogram, the catheters and guidewires are removed.

Description of Post-Service Work: Hospital: Apply sterile dressings. Assist transfer of patient from operating table to gurney. Monitor patient for hemodynamic stability in transit and ensure adequate perfusion to the lower extremities. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate formal operative report and copy referring physician. Review post-operative imaging.

Post-operative in-hospital visits require interval history-taking for new complaints of pain or neurovascular compromise. Exam requires close monitoring for abdominal or lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are necessary as is neurologic evaluation for any signs of spinal cord ischemia. Lower extremities are checked for emboli. Hemoglobin and coagulation labs are monitored daily. The need for routine or advanced imaging is assessed daily. Post-op CT scans are obtained, either during the inpatient stay or early in the post-discharge time period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily.

Discharge day management includes communicating with all support services such as visiting nurses, referring physicians, review interval chart notes, answer patient and family questions, evaluate all pre-discharge labs, evaluate and redress the incisions, assess pain score, and perform medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, solicit an interval history for ongoing or new symptoms; examine the abdomen for tenderness, examine arterial access sites and surgical incisions for inflammation, drainage, wound infection; examine lower extremities for adequate perfusion. Order diagnostic blood tests and/or imaging studies based on findings. Review post-op CT scans and ultrasounds for possible endoleak. Make clinical decisions regarding need for repeat surgical intervention. Provide wound care as needed. Remove staples and sutures as indicated. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician (verbal and written). Dictate/type progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**34705 Elective Aorto-Bi-Iliac Repair:**

We recommend a crosswalk to CPT code 33641 (*Repair atrial septal defect, secundum, with cardiopulmonary bypass, with or without patch*) with a value of 29.58 RVW. This represents a **decrease of 15.2%** from current value of 34.92 RVWs by current coding convention.

Comparison to existing codes is a complex process due to bundling of the new codes, to include pre-service planning, all radiologic S&I, and variable use of extensions with the previous codes. To calculate the true current RVW using current coding convention, utilization percentages are first used to “weight” the three main body codes (34802, 34803, 34804) that will be consolidated into the new code 34705. The work of bilateral non-selective catheterization is added by multiplying the RVW for 36200 by 1.5 to account for the bilaterality and then multiply by 0.5 for the multiple procedure reduction. The radiologic supervision and interpretation for EVAR is then added. All proximal and distal extensions from the level of the renal arteries down to the level of the iliac bifurcations is now included in the work of 34705. To account for this work, we multiplied the RVW for 34825 by a utilization weighted average of the percentage of time that 34825 is billed together with 34802, 34803, and 34804 and adjusted for multiple procedure reduction. Finally, the radiologic supervision and interpretation for extensions was multiplied by this same weighted billed together data to calculate the final existing RVW for this code set. Comparing this computed existing value with our proposed value for 34705 results in a **15.2% reduction** in existing value. The following table is a graphic explanation of this comparison.

Existing EVAR Aorto-Bi-Iliac Graft	Work RVU	Adjustment	Adjusted Work RVU
34802 Main body, 1 docking limb	23.79	Utilization (58%)	13.89
34803 Main body, 2 docking limbs	24.82	Utilization (25%)	6.31
34803 Unibody bifurcated device	23.79	Utilization (16%)	3.85
36200-50 Bilateral catheter in aorta	3.02	Bilaterality & MPPR	2.27
75952 Rad S&I code for main body	4.49	None	4.49
34825 Extension	12.80	MPPR & Billed together (53%)	3.38
75953 Rad S&I for extension	1.36	Billed together	0.72

		(53%)	
<b>Total existing coding sequence</b>			<b>34.92</b>
<b>New Code</b>			
34705 Aorto-Bi-Iliac EVAR	32.28	None	<b>29.58</b>
<b>Change Existing to New</b>			<b>-15.2%</b>

### Comparison to Crosswalk

Below is a tabular comparison to CPT code 33641 (*Repair atrial septal defect, secundum, with cardiopulmonary bypass, with or without patch*)

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
33641	29.58	0.094	562	60	15	20	164	40	91, 33, 32, 31, 38	14
<b>34705</b>	<b>29.58</b>	<b>0.130</b>	<b>512</b>	<b>110</b>	<b>20</b>	<b>20</b>	<b>150</b>	<b>40</b>	<b>33, 32, 38</b>	<b>13, 12</b>

### Comparison with Key Reference Services

The codes that were chosen most often as key reference services for 34705 are:

- 35131, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, iliac artery (common, hypogastric, external)*
- 35081, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, abdominal aorta*

The following table incorporates our recommended RVW for 34705 along with the key reference services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35131 KRS	26.40	0.099	528	105			150	40	32x2, 31x3, 38	13, 12x2
<b>34705</b>	<b>29.58</b>	<b>0.130</b>	<b>512</b>	<b>110</b>	<b>20</b>	<b>20</b>	<b>150</b>	<b>40</b>	<b>33, 32, 38</b>	<b>13, 12</b>
35081 KRS	33.53	0.079	677	60	15	15	210	30	91, 32x3, 31x2, 38	14, 13, 12

### Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. We offer the following codes as brackets for our recommendations:

- MPC 33641, *Repair atrial septal defect, secundum, with cardiopulmonary bypass, with or without patch*
- MPC 33426, *Valvuloplasty, mitral valve, with cardiopulmonary bypass; with prosthetic ring*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
33641 MPC	29.58	0.094	562	60	15	20	164	40	91, 33, 32, 31, 38	14
<b>34705</b>	<b>29.58</b>	<b>0.130</b>	<b>512</b>	<b>110</b>	<b>20</b>	<b>20</b>	<b>150</b>	<b>40</b>	<b>33, 32, 38</b>	<b>13, 12</b>
33426 MPC	43.28	0.111	776	60	15	20	205	40	91, 33x3, 32 x2, 31, 38	14, 13

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34802

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 34706      Tracking Number   U6

Original Specialty Recommended RVU: **50.00**Presented Recommended RVU: **45.00**

Global Period: 090

RUC Recommended RVU: **45.00**

CPT Descriptor: Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-biiliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for rupture including temporary aortic and/or iliac balloon occlusion when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with a ruptured infrarenal abdominal aortic aneurysm. Endovascular repair is performed by deployment of an aorto-biiliac endograft and all required proximal infrarenal extension(s) and all distal extension(s) to the level of the iliac artery bifurcation, as necessary.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 83%

Description of Pre-Service Work: Preservice endograft planning for a ruptured aneurysm must be thorough, but must also be performed as quickly as possible. The speed required for these subsequent steps depends on the patient's hemodynamic stability.

Careful assessment of available imaging studies is required to determine whether the patient is an endovascular repair candidate. Exact measurements of the aneurysm diameter and length must be undertaken quickly. This is necessary because an accurate preoperative choice of component diameters and lengths is a primary determinant of endovascular procedural success. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed, and if patient stability permits, uploaded rapidly to a workstation, where 3D software is applied permitting iterative modelling of the aorta and device in multiplanar views and center line of flow analysis. The physician must adjust modelling for altered anatomy which is tortuous or thrombus laden. Axial imaging is used to determine diameter measurements of the aorta, iliac and femoral arteries for appropriate sizing of the main body endograft plus all limbs and extensions that will be needed. The iliac and femoral diameters also determine the success of the device delivery. Tortuosity, calcification, thrombus presence and stenoses require consideration as they may impact on device delivery. Cross section, longitudinal and center line of flow measurements, with manual adjustments where needed, are utilized to map the distances between the lowest renal artery and the distal seal zone depending on the extent and involvement of the distal aorta and iliac segments. Stretched and straightened views assist choice of correct endovascular components.

All available laboratory and other diagnostic tests are assessed thoroughly but as quickly as possible. The proposed procedure is discussed expeditiously with the patient (if stable) and family including risks and expected recovery. Informed consent is obtained quickly. Expedited documentation is performed. The access sites are marked. Due to the significant risk of mortality and hemodynamic compromise including hemodynamic shock, the patient's operative treatment course is discussed with the anesthesia team to ensure close coordination of care. The blood bank is also informed regarding potential need for extensive amounts of blood and blood products. The endograft, catheters, and introducer sheaths are

brought into the operating room after verification of appropriate diameters and lengths. Aortic balloon occlusion catheters are prepared for emergent use. The surgeon ensures all technical personnel are familiar with the operative plan and required devices, helps position patient on OR table, ensures or assists with placement of large-bore intravenous access, ensures or assists with monitoring device placement, and confirms fluoroscopy function. The surgeon dons radiation protection gear and confirms that all in OR do likewise. Finally, supervise sterile prep of access sites, skin prep and sterile draping. Perform pre-procedural "time-out." At any time in this process the surgeon inserts an aortic occlusion balloon if cardiovascular collapse occurs.

Description of Intra-Service Work: Deployment of this prosthesis is accomplished through bilateral femoral or iliac access. Performance of an aorto-bi-iliac graft requires additional considerations and steps related to treatment of both iliac arteries, above and beyond that required for an aorto-aortic endograft or an aorto-uni-iliac endograft.

Under fluoroscopic guidance, introducer needles are used to access bilateral vessels. A series of graded guidewires, vascular sheaths and catheters are introduced, and flush aortography is performed to confirm the location of the renal arteries and the aortoiliac anatomy. A large sheath is placed as needed in the suprarenal aorta for stabilization of an aortic occlusion balloon. At any time in this process, the aortic occlusion balloon may be inflated if the patient suffers hemorrhagic shock.

The patient may be systemically anticoagulated. Rigid wires are inserted through bilateral catheters to provide secure tracking of the large introducer sheaths. The main body endograft is loaded onto a guidewire and advanced through the access vessel into the aorta. The main body is positioned and deployed under fluoroscopic guidance with intermittent angiographic control imaging. Additional limbs and extensions are implanted bilaterally, as needed, to obtain coverage of diseased aorta and common iliac arteries. A large compliant balloon is placed over the wire into the endograft to perform balloon dilation at the proximal and distal seal zones of the endograft. An aortogram is performed for adequacy of the graft position, patency of adjacent branch vessels (renals and hypogastries), presence or absence of endoleaks, and type of endoleak if present. The patency of collateral vessels (lumbar or inferior mesenteric arteries) that may contribute to persistent endoleaks is also assessed. Adjunctive balloon angioplasty is performed for endoleak treatment, as necessary (not separately reportable). When the graft is in appropriate position and free of endoleak on angiogram, the catheters and guidewires are removed.

Description of Post-Service Work: Hospital: Apply sterile dressings. Assist in transfer of patient from operating table to gurney. Monitor patient for hemodynamic stability during transit to ICU. In ICU, assess immediately for abdominal compartment syndrome and any sign of acute mesenteric ischemia. Direct immediate and ongoing resuscitation. Order and review results of frequent and multiple blood tests. Ensure adequate perfusion to the lower extremities. Make decision regarding need for return to surgery for any signs of extensive hemorrhage or abdominal compartment syndrome. Assess lower extremities for adequate post-op perfusion. Assess for vital organ system failure, in particular, postoperative shock, renal failure, hepatic failure and/or respiratory failure. Perform multiple iterative exams to identify life threatening deterioration. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate operative report and copy referring physician(s). Communicate frequently with ICU nurses and consultants. Review post-operative imaging. Write orders for discharge to ICU.

Post-operative in-hospital visits require history-taking for any complaints of pain or neurovascular compromise. Exam require close monitoring for tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Close maintenance of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are necessary as is neurologic evaluation for any signs of spinal cord ischemia. Lower extremities are checked for emboli. Hemoglobin and coagulation labs are monitored daily. The need for routine or advanced imaging is assessed daily. Post-op CT scans are commonly obtained. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants is performed daily.

Discharge day management includes communicating with all support services such as visiting nurses, referring physicians, review interval chart notes, answer patient and family questions, evaluate all pre-discharge labs, evaluate and redress the incisions, assess pain score, and perform medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and complete all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, the surgeon take a history for any ongoing or new symptoms. Examine the abdomen for tenderness, examine arterial access sites and surgical incisions for inflammation, drainage, wound infection. Order

diagnostic blood tests and/or imaging studies based on findings. Review post-op CT scans and ultrasounds for presence or absence of endoleak. Make clinical decisions regarding need for repeat surgical intervention. Provide wound care as needed. Remove staples and sutures as indicated. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**34706 Ruptured Aorto-Uni-Iliac Repair:**

We recommend the median survey value of 45.00 RVW.

Ruptured aortic aneurysms are a catastrophic event with mortality rates as high as 90%. In fact, half of all patients that suffer a ruptured iliac aneurysm will die before they can ever reach a hospital for definitive treatment. The mortality for surgical repair ranges from 40-60% for patients who are able to present for repair. Without rapid treatment, death is certain. These patients present in varying degrees of hemorrhagic shock and are typically plagued by multisystem organ failure post-operatively. Despite advances in detection and treatment of aneurysmal disease, the rupture rate has remained relatively constant over the past two decades at roughly 15%.

For the purposes of work consideration, it is important to note that patients who die in the operating room would be coded with the -53 modifier "discontinued procedure" which typically results in a 50% payment reduction (e.g. WPS 2016 payment policy).

EVAR for rupture offers a less invasive approach for treatment but remains an extremely intense service in an attempt to save the life of an actively dying patient. As stated above, this is a new code to capture the significantly different work and extremely high intensity compared to an elective aneurysm repair.

This procedure, endovascular repair of a ruptured aortic aneurysm, was never imagined in 2000 when the original EVAR codes were valued but this concept of differential work for elective and ruptured aneurysm repair exists in CPT codes for open surgical repair. These new EVAR codes for rupture include the additional work of temporary balloon aortic occlusion as needed for hemodynamic instability and the significantly different, more complex and longer post-operative care.

This code includes a complex urgently performed pre-planning, all radiologic supervision and interpretation, all routine catheterization, almost all currently placed extensions, and the extension S&I into codes that better describe the current practice of EVAR and conform with current concepts in code creation and valuation.

**Comment on Postoperative Visit Pattern**

The visit pattern for 34706 has been changed following discussion with the Pre-facilitation Committee. This committee questioned whether the operating surgeons actually provide critical care level visits, and our answer is yes. Particularly, when it comes to providing immediate post-operative care for ruptured aortic aneurysms, the vascular surgeon is the captain of the ship. Questions of whether hypotension should be treated with volume or vasopressors is a clinical judgment best handled by the surgeon. Questions of whether a ruptured aneurysm patient is failing because he/she needs a decompressive laparotomy vs more volume or more vasopressors is a highest level and most complex decision makeable only by the operating surgeon. Nevertheless, we appreciate the concern of the pre-facilitation committee, and we are responding to their recommendation by reducing one 99291 critical visit to 99233 and one 99233 to 99232.

### Comparison with Key Reference Services

There codes that were chosen most often as key reference services for 34706 are:

- 35082, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for ruptured aneurysm, abdominal aorta*
- 35103, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for ruptured aneurysm, abdominal aorta involving iliac vessels (common, hypogastric, external)*

The following table incorporates our recommended RVW for 34706 along with the key reference services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35082 KRS	42.09	0.098	792	60			180	60	91x2, 33, 32 x3, 31x3, 38	14, 13, 12
35103 KRS	43.62	0.117	740	60			180	60	91x2, 32x3, 31x4, 38	13x2, 12
<b>34706</b>	<b>45.00</b>	<b>0.141</b>	<b>747</b>	<b>75</b>	<b>20</b>	<b>20</b>	<b>178</b>	<b>60</b>	<b>91, 33x2, 32x2, 31, 38</b>	<b>14, 13, 12</b>

### Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. We offer the following codes as brackets for our recommendations:

- MPC 33426, *Valvuloplasty, mitral valve, with cardiopulmonary bypass; with prosthetic ring*
- MPC 33863, *Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
33426 MPC	43.28	0.111	776	60	15	20	205	40	91, 33x3, 32 x2, 31, 38	14, 13
<b>34706</b>	<b>45.00</b>	<b>0.141</b>	<b>747</b>	<b>75</b>	<b>20</b>	<b>20</b>	<b>178</b>	<b>60</b>	<b>91, 33x2, 32x2, 31, 38</b>	<b>14, 13, 12</b>
33863 MPC	58.79	0.121	905	60	15	20	287	40	91x2, 33x3, 32x2, 31, 38	14

### Additional Rationale

This family was surveyed by a multispecialty group. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in our recommendations of median survey RVW of 36.50 for code 34X08. This extremely intense service merits the relatively high IWPUT of 0.139. The following short table demonstrates IWPUTs of highly intense services. We believe the intensity of ruptured iliac aneurysm repair is equal or greater than any of the following.

CPT	Descriptor	IWPUT	RVW	INTRA	Total Time
-----	------------	-------	-----	-------	------------

CPT	Descriptor	IWPUT	RVW	INTRA	Total Time
22864	Removal of total disc arthroplasty (artificial disc), anterior approach, single interspace; cervical	0.1335	29.40	150	457
47130	Hepatectomy, resection of liver; total right lobectomy	0.1338	57.19	240	870
22861	Revision including replacement of total disc arthroplasty (artificial disc), anterior approach, single interspace; cervical	0.1345	33.36	180	477
33681	Closure of single ventricular septal defect, with or without patch;	0.1369	32.34	150	507
61798	Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); 1 complex cranial lesion	0.1372	19.85	120	225
22856	Total disc arthroplasty (artificial disc), anterior approach, including discectomy with end plate preparation (includes osteophyctomy for nerve root or spinal cord decompression and microdissection); single interspace, cervical	0.1386	24.05	120	367
22551	Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophyctomy and decompression of spinal cord and/or nerve roots; cervical below C2	0.1403	25.00	120	395
43313	Esophagoplasty for congenital defect (plastic repair or reconstruction), thoracic approach; without repair of congenital tracheoesophageal fistula	0.1741	48.45	178	713
45126	Pelvic exenteration for colorectal malignancy, with proctectomy (with or without colostomy), with removal of bladder and ureteral transplantations, and/or hysterectomy, or cervicectomy, with or without removal of tube(s), with or without removal of ovary(s), or any combination thereof	0.1983	49.10	120	755
43314	Esophagoplasty for congenital defect (plastic repair or reconstruction), thoracic approach; with repair of congenital tracheoesophageal fistula	0.2021	53.43	178	713

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and

accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

34802  
34803  
34804  
75952  
34825  
75953  
36200

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:  
Procedures

BETOS Sub-classification:  
Major procedure

BETOS Sub-classification Level II:

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34802

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 34707      Tracking Number   U7

Original Specialty Recommended RVU: **24.00**Presented Recommended RVU: **22.28**

Global Period: 090

RUC Recommended RVU: **22.28**

CPT Descriptor: Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting when performed, unilateral; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic unilateral iliac artery aneurysm. Endovascular repair is performed by deployment of an ilio-iliac tube endograft and all required proximal and distal iliac artery extension(s), as necessary.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 13% , Overnight stay-more than 24 hours 87%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 70%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact measurements of the aneurysm and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery, but it must be completed several days prior to surgery in order to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is one of the primary determinants of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where 3D software is applied permitting iterative modelling of a virtual device within the aorta in multiplanar views and center line of flow analysis. The physician needs to manually adjust modelling for altered anatomy which is tortuous or thrombus laden. Orthogonal center-line imaging is used to determine diameter measurements of the proximal aorta, the involved iliac, and downstream femoral arteries for appropriate sizing of the main body endograft with extensions as needed. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence and stenosis require consideration as they may impact device delivery. Cross section, longitudinal and center line of flow measurements, with manual adjustments where needed, are utilized to map the distances between the distal aorta and the distal seal zone beyond the iliac aneurysm. A stretched/straightened view permits manual validation of the computer-generated lengths.

Pre-service work necessarily includes review of surgical indication, physical exam findings, current medications and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the operating room after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine and ACT testing. In addition, the surgeon ensures all

technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for ready viewing during the operative procedure. The surgeon supervises appropriate patient positioning on the OR table, ensures fluoroscopy is functional and that desired imaging angles are attainable with equipment at hand. The surgeon dons radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile prep of access site(s) and subsequent draping. The surgeon leads the pre-procedural "time-out."

Description of Intra-Service Work: Deployment of this prosthesis is accomplished from one femoral access site, but intra-arterial catheterization is typically performed from both sides in order to allow imaging from one side while device deployment is performed on the opposite side.

Catheter placement is bundled in this procedure and radiologic supervision and interpretation is bundled in this service. Under fluoroscopic guidance, an introducer needle is used to access the vessel. A series of graded guidewires, vascular sheaths and catheters is introduced, and angiography is performed to confirm the location of the aortic bifurcation and the iliac anatomy. The patient is then systemically anticoagulated. A rigid wire is inserted through catheters to provide secure tracking of the large introducer sheaths for the endograft. The primary component of the endograft is loaded onto the guidewire and advanced through the access vessel to correct position within the proximal common iliac artery. The main component is positioned and deployed under fluoroscopic guidance with intermittent angiographic control imaging.

Additional extensions are implanted as required to obtain coverage of the iliac aneurysm. Extensions from the aortic bifurcation to the common iliac bifurcation are bundled in this service. A large compliant balloon is then placed over the wire into the endograft to perform balloon dilation at the proximal and distal seal zones of the endograft. An angiogram is performed for adequacy of the graft position, patency of outflow branches, presence or absence of endoleaks, and type of endoleak if present. Adjunctive balloon angioplasty is performed for endoleak treatment, as necessary. When the graft is in appropriate position and free of endoleaks on angiogram, the catheters and guidewires are removed.

Description of Post-Service Work: Hospital: Apply sterile dressings. Assist transfer of patient from operating table to gurney. Monitor patient for hemodynamic stability in transit and ensure adequate perfusion to the lower extremities. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate formal operative report and copy referring physician. Review post-operative imaging.

Post-operative in-hospital visits require interval history-taking for new complaints of pain or neurovascular compromise. Exam requires close monitoring for abdominal or lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are necessary as is neurologic evaluation for any signs of spinal cord ischemia. Lower extremities are checked for emboli. Hemoglobin and coagulation labs are monitored daily. The need for routine or advanced imaging is assessed daily. Post-op CT scans are obtained, either during the inpatient stay or early in the post-discharge time period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily.

Discharge day management includes communicating with all support services such as visiting nurses, referring physicians, review interval chart notes, answer patient and family questions, evaluate all pre-discharge labs, evaluate and redress the incisions, assess pain score, and perform medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, solicit an interval history for ongoing or new symptoms; examine the abdomen for tenderness, examine arterial access sites and surgical incisions for inflammation, drainage, wound infection; examine lower extremities for adequate perfusion. Order diagnostic blood tests and/or imaging studies based on findings. Review post-op CT scans and ultrasounds for possible endoleak. Make clinical decisions regarding need for repeat surgical intervention. Provide wound care as needed. Remove staples and sutures as indicated. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician (verbal and written). Dictate/type progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**34707 Elective Repair Iliac Aneurysm:**

We recommend a direct crosswalk to CPT code 37660 (*Ligation of common iliac vein*), for the work value of this code. The RVW of 37660 is 22.28 which is less than the 25<sup>th</sup> percentile survey value of 24.00 RVW. This recommendation is slightly less than the existing value of 22.37 RVW as detailed below.

Comparison to existing codes is a complex process due to the fact that the new codes bundle:

- all radiologic Supervision & Interpretation
- all routine catheterization
- almost all extensions
- all radiologic Supervision & Interpretation for extensions.

To calculate the current RVW of this service using current 2016 coding convention, one would begin with the existing work of 34900. The work of bilateral non-selective catheterization is added by multiplying the RVW for 36200 by 1.5 to account for the bilaterality and then multiply by 0.5 for the multiple procedure reduction. The radiologic S&I for iliac EVAR is then added. All proximal and distal extensions from the level of the aortic bifurcation down to the level of the iliac bifurcation are now included in the work of 34707. To account for this work, we multiplied the RVW for 34825 by the percentage of time that 34825 is billed together with 34900 and then applied the multiple procedure reduction. Finally, the radiologic supervision and interpretation for extensions was multiplied by this same billed together data to calculate the final existing RVW for 34707. The following table is a graphic explanation of this comparison.

Existing EVAR Aorto-Aortic Graft	Work RVU	Adjustment	Adjusted Work RVU
34900 Iliac-iliac graft	16.85	None	16.85
36200-50 Bilateral catheter in aorta	3.02	Bilaterality & MPPR	2.27
75954 Rad S&I code for iliac	2.25	None	2.25
34825 Extension	12.80	MPPR & Billed	0.83

		together (13%)	
75953 Rad S&I for extension	1.36	Billed together (13%)	0.18
<b>Total existing coding sequence</b>			<b>22.37</b>
<b>New Code</b>			
34707 Iliac-iliac EVAR	22.28	None	<b>22.28</b>
<b>Change Existing to New</b>			<b>-0.4%</b>

### Comparison to Crosswalk

Below is a tabular comparison to CPT code 37660 (*Ligation of common iliac vein*)

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
<b>34707</b>	<b>22.28</b>	<b>0.102</b>	<b>482</b>	<b>110</b>	<b>20</b>	<b>20</b>	<b>120</b>	<b>40</b>	<b>33, 32, 38</b>	<b>13, 12</b>
37660	22.28	0.113	397	60			120	25	33, 32, 31, 38	13, 12

### Comparison with Key Reference Services

The codes that were chosen most often as key reference services for 34707 are:

- 35131, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, iliac artery (common, hypogastric, external)*
- 35081, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, abdominal aorta*

The following table incorporates our recommended RVW for 34707 along with the key reference services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
<b>34707</b>	<b>22.28</b>	<b>0.102</b>	<b>482</b>	<b>110</b>	<b>20</b>	<b>20</b>	<b>120</b>	<b>40</b>	<b>33, 32, 38</b>	<b>13, 12</b>
35131 KRS	26.40	0.099	528	105			150	40	32x2, 31x3, 38	13, 12x2
35081 KRS	33.53	0.079	677	60	15	15	210	30	91, 32x3, 31x2, 38	14, 13, 12

### Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. We offer the following codes as brackets for our recommendations:

- MPC 35301, *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision*
- MPC 33641, *Repair atrial septal defect, secundum, with cardiopulmonary bypass, with or without patch*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35301 MPC	21.16	0.104	404	40	15	20	120	30	33, 32, 38	13x2

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
<b>34707</b>	<b>22.28</b>	<b>0.102</b>	<b>482</b>	<b>110</b>	<b>20</b>	<b>20</b>	<b>120</b>	<b>40</b>	<b>33, 32, 38</b>	<b>13, 12</b>
33641 MPC	29.58	0.094	562	60	15	20	164	40	91, 33, 32, 31, 38	14

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34900

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code:34708      Tracking Number    U8

Original Specialty Recommended RVU: **36.50**  
Presented Recommended RVU: **36.50**  
RUC Recommended RVU: **36.50**

Global Period: 090

CPT Descriptor: Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting when performed, unilateral; for rupture including temporary aortic and/or iliac balloon occlusion when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with a ruptured unilateral iliac artery aneurysm. Endovascular repair is performed by deployment of an ilio-iliac tube endograft and all required proximal and distal iliac artery extension(s), as necessary.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 81%

Description of Pre-Service Work: Preservice endograft planning for a ruptured aneurysm must be thorough, but must also be performed as quickly as possible. The speed required for these subsequent steps depends on the patient's hemodynamic stability.

Careful assessment of available imaging studies is required to determine whether the patient is an endovascular repair candidate. Exact measurements of the aneurysm diameter and length must be undertaken quickly. This is necessary because an accurate preoperative choice of component diameters and lengths is a primary determinant of endovascular procedural success. Cross-sectional imaging from the aorta to femoral vessels with fine cuts are reviewed, and if patient stability permits, uploaded rapidly to a workstation, where 3D software is applied permitting iterative modelling of the aorta and device in multiplanar views and center line of flow analysis. The physician must adjust modelling for altered anatomy which is tortuous or thrombus laden. Axial imaging is used to determine diameter measurements of the aorta, iliac and femoral arteries for appropriate sizing of the main body endograft plus all limbs and extensions that will be needed. The external iliac and femoral diameters also determine the success of the device delivery. Tortuosity, calcification, thrombus presence and stenosis require consideration as they may impact on device delivery. Cross section, longitudinal and center line of flow measurements, with manual adjustments where needed, are utilized to map the distances between the lowest renal artery and the distal seal zone depending on the extent and involvement of the distal aorta and iliac segments. Stretched and straightened views assist choice of correct endovascular components.

All available laboratory and other diagnostic tests are assessed thoroughly but as quickly as possible. The proposed procedure is discussed expeditiously with the patient (if stable) and family including risks and expected recovery. Informed consent is obtained quickly. Expedited documentation is performed. The access sites are marked. Due to the significant risk of mortality and hemodynamic compromise including hemodynamic shock, the patient's operative treatment course is discussed with the anesthesia team to ensure close coordination of care. The blood bank is also informed regarding potential need for a massive transfusion protocol. The endograft, catheters, and introducer sheaths are brought into the operating room after verification of appropriate diameters and lengths. Aortic balloon occlusion catheters are prepared for

emergent use. The surgeon ensures all technical personnel are familiar with the operative plan and required devices, helps position patient on OR table, ensures or assists with placement of large-bore intravenous access, ensures or assists with monitoring device placement, and confirms fluoroscopy function. The surgeon dons radiation protection gear and confirms that all in OR do likewise. Finally, supervise sterile prep of access sites, skin prep and sterile draping. Perform pre-procedural "time-out." At any time in this process the surgeon inserts an aortic occlusion balloon if cardiovascular collapse occurs.

Description of Intra-Service Work: Rapid entry is achieved with a needle and wire. A catheter is inserted into the aorta over the wire and manipulated into the abdominal aorta. A rigid wire is exchanged for the entry wire. A large sheath is placed in the entry vessel. A large sheath is placed as needed in the suprarenal aorta for stabilization of an aortic occlusion balloon. At any time in this process, the aortic occlusion balloon may be inflated if the patient suffers hemorrhagic shock.

Fluid resuscitation and appropriate adjunct measures are performed in coordination with the anesthesia team to best stabilize the critical patient. The patient is systemically anticoagulated. Under fluoroscopic guidance, an introducer needle is used to access the vessel. A guidewire is introduced and the needle is exchanged for a vascular sheath. A multi-sidehole catheter is placed and flush aorto-iliac angiography is performed. The iliac endograft is loaded, advanced, positioned under fluoroscopic guidance, and deployed. A large compliant balloon is placed over the wire into the iliac endograft to perform balloon dilation at the proximal and distal seal zones of the endograft. An aortogram is performed for adequacy of the graft position, patency of adjacent branch vessels (hypogastric, external iliac), presence or absence of endoleaks, and type of endoleak if present. The patency of collateral vessels (lumbar, hypogastric) that may contribute to persistent endoleaks is also assessed. Any and all required proximal and distal iliac artery extensions deployed from the aortic bifurcation to the common iliac bifurcation are bundled in this service. Adjunctive balloon angioplasty is performed for endoleak treatment, as necessary. When the graft is in appropriate position and free of endoleak on angiogram, the catheters and guidewires are removed.

Description of Post-Service Work: Hospital: Apply sterile dressings. Assist transfer of patient from operating table to gurney. Monitor patient for hemodynamic stability in transit and ensure adequate perfusion to the lower extremities. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate formal operative report and copy referring physician. Review post-operative imaging.

Post-operative in-hospital visits require interval history-taking for new complaints of pain or neurovascular compromise. Exam requires close monitoring for abdominal or lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are necessary as is neurologic evaluation for any signs of spinal cord ischemia. Lower extremities are checked for emboli. Hemoglobin and coagulation labs are monitored daily. The need for routine or advanced imaging is assessed daily. Post-op CT scans are obtained, either during the inpatient stay or early in the post-discharge time period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily.

Discharge day management includes communicating with all support services such as visiting nurses, referring physicians, review interval chart notes, answer patient and family questions, evaluate all pre-discharge labs, evaluate and redress the incisions, assess pain score, and perform medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, solicit an interval history for ongoing or new symptoms; examine the abdomen for tenderness, examine arterial access sites and surgical incisions for inflammation, drainage, wound infection; examine lower extremities for adequate perfusion. Order diagnostic blood tests and/or imaging studies based on findings. Review post-op CT scans and ultrasounds for possible endoleak. Make clinical decisions regarding need for repeat surgical intervention. Provide wound care as needed. Remove staples and sutures as indicated. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician (verbal and written). Dictate/type progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**34708 Ruptured Iliac Aneurysm Repair:**

We recommend the median survey RVW of 36.50.

Ruptured iliac aneurysms are a catastrophic event with mortality rates as high as 90%. In fact, half of all patients that suffer a ruptured iliac aneurysm will die before they can ever reach a hospital for definitive treatment. The mortality for surgical repair ranges from 40-60% for patients who are able to present for repair. Without rapid treatment, death is certain. These patients present in varying degrees of hemorrhagic shock and are typically plagued by multisystem organ failure post-operatively. Despite advances in detection and treatment of aneurysmal disease, the rupture rate has remained relatively constant over the past two decades at roughly 15%.

For the purposes of work consideration, it is important to note that patients who die in the operating room would be coded with the -53 modifier "discontinued procedure" which typically results in a 50% payment reduction (e.g. WPS 2016 payment policy).

EVAR for rupture offers a less invasive approach for treatment but remains an extremely intense service in an attempt to save the life of an actively dying patient. As stated above, this is a new code to capture the significantly different work and extremely high intensity compared to an elective aneurysm repair.

This procedure, endovascular repair of a ruptured iliac aneurysm, was never imagined in 2000 when the original EVAR codes were valued but this concept of differential work for elective and ruptured aneurysm repair exists in CPT codes for open surgical repair. These new EVAR codes for rupture include the additional work of temporary balloon aortic occlusion as needed for hemodynamic instability and the significantly different, more complex and longer post-operative care.

This code includes a complex urgently performed pre-planning, all radiologic supervision and interpretation, all routine catheterization, almost all currently placed extensions, and the extension S&I into codes that better describe the current practice of EVAR and conform with current concepts in code creation and valuation.

**Comment on Postoperative Visit Pattern**

The visit pattern for 34708 has been changed following discussion with the Pre-facilitation Committee. This committee questioned whether the operating surgeons actually provide critical care level visits, and our answer is yes. Particularly, when it comes to providing immediate post-operative care for ruptured aortic aneurysms, the vascular surgeon is the captain of the ship. Questions of whether hypotension should be treated with volume or vasopressors is a clinical judgment best handled by the surgeon. Questions of whether a ruptured aneurysm patient is failing because he/she needs a decompressive laparotomy vs more volume or more vasopressors is a highest level and most complex decision makeable only by the operating surgeon. Nevertheless, we appreciate the concern of the pre-facilitation committee, and we are responding to their recommendation by reducing one 99291 critical visit to 99233 and one 99233 to 99232.

**Comparison with Key Reference Services**

The codes that were chosen most often as key reference services for 34708 are:

- 35131, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, iliac artery (common, hypogastric, external)*
- 35103, *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for ruptured aneurysm, abdominal aorta involving iliac vessels (common, hypogastric, external)*

The following table incorporates our recommended RVW for 34708 along with the key reference services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35131 KRS	26.40	0.099	528	105			150	40	32x2, 31x3, 38	13, 12x2
<b>34708</b>	<b>36.50</b>	<b>0.139</b>	<b>687</b>	<b>70</b>	<b>20</b>	<b>20</b>	<b>120</b>	<b>60</b>	<b>91, 33x2, 32x2, 31, 38</b>	<b>14, 13, 12</b>
35103 KRS	43.62	0.117	740	60			180	60	91x2, 32x3, 31x4, 38	13x2, 12

**Comparison to MPC codes**

There are limited MPC codes in the RVW range of these complex procedures. We offer the following codes as brackets for our recommendations:

- MPC 33641, *Repair atrial septal defect, secundum, with cardiopulmonary bypass, with or without patch*
- MPC 33426, *Valvuloplasty, mitral valve, with cardiopulmonary bypass; with prosthetic ring*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
33641 MPC	29.58	0.094	562	60	15	20	164	40	91, 33, 32, 31, 38	14
<b>34708</b>	<b>36.50</b>	<b>0.139</b>	<b>687</b>	<b>70</b>	<b>20</b>	<b>20</b>	<b>120</b>	<b>60</b>	<b>91, 33x2, 32x2, 31, 38</b>	<b>14, 13, 12</b>
33426 MPC	43.28	0.111	776	60	15	20	205	40	91, 33x3, 32 x2, 31, 38	14, 13

**Additional Rationale**

This family was surveyed by a multispecialty group. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in our recommendations of median survey RVW of 36.50 for code 34708. This extremely intense service merits the relatively high IWPUT of 0.139. The following short table demonstrates IWPUTs of highly intense services. We believe the intensity of ruptured iliac aneurysm repair is equal or greater than any of the following.

CPT	Descriptor	IWPUT	RVW	INTRA	Total Time
-----	------------	-------	-----	-------	------------

CPT	Descriptor	IWPUT	RVW	INTRA	Total Time
22864	Removal of total disc arthroplasty (artificial disc), anterior approach, single interspace; cervical	0.1335	29.40	150	457
47130	Hepatectomy, resection of liver; total right lobectomy	0.1338	57.19	240	870
22861	Revision including replacement of total disc arthroplasty (artificial disc), anterior approach, single interspace; cervical	0.1345	33.36	180	477
33681	Closure of single ventricular septal defect, with or without patch;	0.1369	32.34	150	507
61798	Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); 1 complex cranial lesion	0.1372	19.85	120	225
22856	Total disc arthroplasty (artificial disc), anterior approach, including discectomy with end plate preparation (includes osteophyctomy for nerve root or spinal cord decompression and microdissection); single interspace, cervical	0.1386	24.05	120	367
22551	Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophyctomy and decompression of spinal cord and/or nerve roots; cervical below C2	0.1403	25.00	120	395
43313	Esophagoplasty for congenital defect (plastic repair or reconstruction), thoracic approach; without repair of congenital tracheoesophageal fistula	0.1741	48.45	178	713
45126	Pelvic exenteration for colorectal malignancy, with proctectomy (with or without colostomy), with removal of bladder and ureteral transplantations, and/or hysterectomy, or cervicectomy, with or without removal of tube(s), with or without removal of ovary(s), or any combination thereof	0.1983	49.10	120	755
43314	Esophagoplasty for congenital defect (plastic repair or reconstruction), thoracic approach; with repair of congenital tracheoesophageal fistula	0.2021	53.43	178	713

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

34900

75954

34825

75953

36200

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34900

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34709      Tracking Number   U9

Original Specialty Recommended RVU: **6.50**  
Presented Recommended RVU: **6.50**  
RUC Recommended RVU: **6.50**

Global Period: ZZZ

CPT Descriptor: Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting when performed, per vessel treated (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD undergoes an endovascular repair of an infrarenal aortic aneurysm performed by deployment of an aorto-(bi)iliac endograft. After deployment of the endograft, completion angiography reveals an endoleak, dissection, or false aneurysm at the proximal and/or distal fixation and seal zone of the treatment area. This requires placement of a prosthesis extension proximal to the renal arteries and/or distal extension distal to the level of the iliac artery bifurcation. Note: This add-on code only includes the additional work of nonselective catheterization and placing an additional extension endoprosthesis.]

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Measurements are made from the pre-operative and intra-operative imaging studies to assess the affected arterial segment and determine exactly the diameter and length of the extension required to successfully seal the endoleak, repair the dissection, or cover the false aneurysm. In this situation, the measurement work is an intra-service element because need for an extension of this type is typically unknown until the situation presents itself in the midst of the operation. The diseased arterial segment must be treated, but with maintenance of patency and distal perfusion. A rigid wire is inserted through the imaging catheter to provide secure tracking of the large introducer sheath necessary for the extension. The extension is loaded onto the guidewire and advanced through the access vessel. It is then positioned above the level of the renal artery and/or below the level of the iliac artery bifurcation and deployed under fluoroscopic guidance. A large compliant balloon is placed over the wire into the extension to perform balloon dilation at the proximal and/or distal seal zones. An aortogram is performed for adequacy of position, presence or absence of endoleaks, type of endoleak if present, dissection, or false aneurysm. Adjunctive balloon angioplasty is performed for endoleak treatment, as necessary. When the graft is in appropriate position and free of endoleak on angiogram, the catheters and guidewires are removed.

Description of Post-Service Work: N/A

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34709 Placement of Extension Prosthesis at Initial Procedure:**

We recommend the 25<sup>th</sup> percentile survey value of 6.50 RVW.

Code +34709 describes the placement of proximal and/or distal extensions at the time of the initial procedure. The previous codes for extensions did not specify at what setting they were performed leading to overlap in pre and post-service work and multiple procedure reductions if they were done at the same time as the original procedure. To overcome this problem, separate codes were created to describe the work of extensions performed at the same setting as the initial procedure. Appropriate global periods for each code were assigned.

**Compelling Evidence**

As stated above, under current coding convention, there is no distinction as to the timing of proximal and/or distal endografts extensions. Furthermore, the treatment zone itself was ill defined. Current billed together and utilization data indicate that an initial extension (34825) is *typical* (53%) at the time of the initial procedure. As such, the new base codes (34X01-34X08) were created with specific extension and extension radiologic supervision & interpretation bundled. The treatment zone has been specifically defined such that clinical scenarios that were previous billed with 34825 in the proximal aorta below the lowest renal artery and in the common iliac arteries are now part of the base procedure. The residual patients who require extensions beyond the treatment zone represent a new patient population and different work than the previous codes. We feel this meets compelling evidence standards.

**Comparison with Key Reference Services**

There were two codes that were chosen most often as key reference services for +34709. They are:

- +37237, *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)*
- +37235, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*

The following tables incorporate our recommended RVW for +34709 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+37237 KRS	4.25	0.093	47	1	45	1
<b>+34709</b>	<b>6.50</b>	<b>0.108</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>
37235 KRS	7.80	0.097	82	1	60	1

### **Comparison to MPC codes**

There are only 10 ZZZ global MPC codes for comparison, all of which are lower values than our recommendations for +34709. We offer the following code for comparison:

- MPC 57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+37237 MPC	4.88	0.108	45	0	45	0
<b>+34709</b>	<b>6.50</b>	<b>0.108</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>

---

### **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

### **FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 34826, 75953

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery

How often? Sometimes

Specialty general surgery

How often? Sometimes

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34826

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 34710      Tracking Number   U10

Original Specialty Recommended RVU: **17.00**Presented Recommended RVU: **17.00**

Global Period: 090

RUC Recommended RVU: **15.00**

CPT Descriptor: Delayed placement of distal or proximal extension prosthesis for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, endoleak, or endograft migration, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting when performed; initial vessel treated

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old male with COPD and CAD who underwent endovascular repair of 6 cm diameter AAA six months ago has pre-procedural imaging demonstrating an endoleak. Due to inadequate exclusion of the aneurysm sac, revision of the original stentgraft is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 24% , Overnight stay-more than 24 hours 76%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 73%

Description of Pre-Service Work: required to determine the exact measurements of the arterial site needing repair and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery, but it must be completed several days prior to surgery to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is one of the primary determinants of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where 3D software is applied permitting iterative modelling of a virtual device within the aorta in multiplanar views and center line of flow analysis. The physician needs to manually adjust modelling for altered anatomy which is tortuous or thrombus laden. Orthogonal center-line imaging is used to determine diameter measurements of the aorta, iliac and femoral arteries for appropriate sizing of the main body endograft and limbs with extensions as needed. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence and stenosis require consideration as they may impact device delivery. Cross section, longitudinal and center line of flow measurements, with manual adjustments where needed, are utilized to map the distances between the lowest renal artery and the distal seal zone depending on the extent and involvement of the distal aorta and iliac segments. A stretched/straightened view permits manual validation of the computer-generated lengths.

Pre-service work necessarily includes review of surgical indication, physical exam findings, current medications and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the operating room after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine and ACT testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for ready viewing during the

operative procedure. The surgeon supervises appropriate patient positioning on the OR table, ensures fluoroscopy is functional and that desired imaging angles are attainable with equipment at hand. The surgeon dons radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile prep of access site(s) and subsequent draping. The surgeon leads the pre-procedural "time-out."

Description of Intra-Service Work: Deployment of this prosthesis is accomplished from one femoral or iliac access site, but intra-arterial catheterization is typically performed from both sides to allow imaging from one side while the device deployment occurs on the opposite side. Performance of extension graft requires special consideration of the previously placed endograft components. This is special and unique work associated with knowledge of the physical characteristics, lengths and diameters of the prior endograft.

Catheter placement is bundled in this procedure. Under fluoroscopic guidance, an introducer needle is used to access the vessel. A series of graded guidewires, vascular sheaths and catheters is introduced, and flush aortography is performed to confirm the location in which the extension is to be placed. In a similar manner, catheterization of the aorta from the contralateral femoral or iliac artery is performed. The patient is then systemically anticoagulated. A rigid wire is inserted through deployment side catheter to provide secure tracking of the large introducer sheaths for the main component of the endograft. The primary component is loaded onto the guidewire and advanced through the access vessel to the target site. The endograft is positioned and deployed under fluoroscopic guidance with intermittent angiographic control imaging. Additional extensions are implanted as required to obtain successful coverage of this target lesion. A large compliant balloon is placed over the wire into the endograft to perform balloon dilation at the proximal and distal seal zones of the endograft. An aortogram is performed for adequacy of the graft position, patency of adjacent branch vessels (renals and hypogastrics), presence or absence of endoleaks, and type of endoleak if present. Adjunctive balloon angioplasty is performed for endoleak treatment, as necessary. When the graft is in appropriate position and free of endoleaks on angiogram, the catheters and guidewires are removed.

Description of Post-Service Work: Hospital: Apply sterile dressings. Assist transfer of patient from operating table to gurney. Monitor patient for hemodynamic stability in transit and ensure adequate perfusion to the lower extremities. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate formal operative report and copy referring physician. Review post-operative imaging.

Post-operative in-hospital visits require interval history-taking for new complaints of pain or neurovascular compromise. Exam requires close monitoring for abdominal or lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are necessary as is neurologic evaluation for any signs of spinal cord ischemia. Lower extremities are checked for emboli. Hemoglobin and coagulation labs are monitored daily. The need for routine or advanced imaging is assessed daily. Post-op CT scans are obtained, either during the inpatient stay or early in the post-discharge time period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily.

Discharge day management includes communicating with all support services such as visiting nurses, referring physicians, review interval chart notes, answer patient and family questions, evaluate all pre-discharge labs, evaluate and redress the incisions, assess pain score, and perform medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, solicit an interval history for ongoing or new symptoms; examine the abdomen for tenderness, examine arterial access sites and surgical incisions for inflammation, drainage, wound infection; examine lower extremities for adequate perfusion. Order diagnostic blood tests and/or imaging studies based on findings. Review post-op CT scans and ultrasounds for possible endoleak. Make clinical decisions regarding need for repeat surgical intervention. Provide wound care as needed. Remove staples and sutures as indicated. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician (verbal and written). Dictate/type progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**34710 Delayed Placement of Extension Prosthesis:**

We recommend the median survey value of 17.00 RVW.

34710 describes the placement of a proximal or distal infrarenal aortic or iliac artery extension in a delayed fashion at a separate setting from the original main body graft deployment. The previous codes for extensions did not specify at what setting they were performed leading to overlap in pre and post-service work and multiple procedure reductions if they were done at the same time as the original procedure. If extensions are performed in a delayed fashion, there is additional pre-procedure planning time similar to the base codes that need to be taken into consideration. To overcome this problem, separate codes were created to describe the work of extensions performed at the same setting as the initial procedure and those performed in a delayed fashion. Appropriate global periods for each code were assigned.

**Compelling Evidence**

There has been a change in the patient population for codes 34710. As stated above, under current coding convention, there is no distinction as to the timing of proximal and/or distal endograft extensions. Furthermore, the treatment zone itself was ill defined. Current billed together and utilization data indicate that an initial extension is *typical* (53%) at the time of the initial procedure. As such, the new base codes (34X01-34X08) were created with the initial extension and extension radiologic supervision & interpretation bundled. The treatment zone has been specifically defined such that clinical scenarios that were previously billed with 34825 are now part of the base procedure. The residual patients who require extensions beyond the treatment zone represent a new patient population and different work than the previous codes. The patients who have delayed proximal and/or distal extensions placed also represent a new patient population that is significantly different work from what was previously captured with 34825, +34826, and 75953. We therefore feel that compelling evidence has been met for codes 34710.

**Pre-Service Time (34710)**

When a patient needs to return to the operating room for placement of a proximal and/or distal endograft extension, there has been failure of the initial endograft requiring corrective action. This results in significant additional pre-service time and work. Multiple images (including CT angiogram, duplex, and possibly arteriogram) are reviewed to diagnose the problem, available devices are reviewed, and an operative plan is developed. This service is provided after evaluation in the office, but more than 24 hours prior to the procedure. We received approval from the Research Subcommittee to add

an additional question to the 34710 survey to capture time spent for planning. This is consistent with the code descriptor which includes the phrase "including pre-procedure sizing and device selection." The additional planning time is therefore included in the total evaluation minutes and becomes part of the pre-service work for 34710.

Pre-service package 4 is appropriate for 34710 with adjustment to the times. Surveyed planning times have been added to the pre-service evaluation time for 34710. The survey respondents also identified varying addition minutes for evaluation. We believe this to be related to the additional work the day before and the day of the procedure to ensure that all necessary supplies are available for the operation and to ensure that the radiologic equipment is operational and prepared for the procedure.

The survey respondents identified additional minutes of positioning time for these codes. This is to account for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patient during surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. A total of 15 minutes is recommended for 34710. The survey respondents also reported 5 minutes less scrub, dress, and wait time for 34710 than exists in pre-service package 4. We recommend accepting the survey results and subtracting 5 minutes of SDW time for 34710.

### **Post-Service Time (34710)**

Post-service time package 9B would apply for these complex procedures, however, this package only allows 5 minutes for "operative note" which is not sufficient time for endovascular procedures that have radiologic supervision & interpretation bundled into the code. There is significantly more time involved to review all images and cines, annotate appropriate images, dictate radiologic findings, and document radiation exposure and contrast volumes. We therefore recommend accepting the survey values for immediate post-service time.

### **Comparison with Key Reference Services**

There were two codes that were chosen most often as key reference services for 34710. They are:

- 37218, *Transcatheter placement of intravascular stent(s), intrathoracic common carotid artery or innominate artery, open or percutaneous antegrade approach, including angioplasty, when performed, and radiological supervision and interpretation*
- 37217, *Transcatheter placement of intravascular stent(s), intrathoracic common carotid artery or innominate artery by retrograde treatment, open ipsilateral cervical carotid artery exposure, including angioplasty, when performed, and radiological supervision and interpretation*

The following tables incorporates our recommended RVW for 34710 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
37218 KRS	15.00	0.106	265	33	5	5	90	28	31, 38	13x2
<b>34710</b>	<b>17.00</b>	<b>0.095</b>	<b>397</b>	<b>110</b>	<b>15</b>	<b>15</b>	<b>90</b>	<b>30</b>	<b>32, 31, 38</b>	<b>13, 12</b>
37217 KRS	20.38	0.098	403	40	14	20	120	30	33, 32, 38	13x2

### **Comparison to MPC codes**

We offer the following codes as brackets for our recommendations for 34710:

- MPC 52601, *Transurethral electrosurgical resection of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included)*
- MPC 37215, *Transcatheter placement of intravascular stent(s), cervical carotid artery, open or percutaneous, including angioplasty, when performed, and radiological supervision and interpretation; with distal embolic protection*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
52601 MPC	15.26	0.088	355	35	10	15	75	40	32, 31x2, 38	13x2, 12
<b>34710</b>	<b>17.00</b>	<b>0.095</b>	<b>397</b>	<b>110</b>	<b>15</b>	<b>15</b>	<b>90</b>	<b>30</b>	<b>32, 31, 38</b>	<b>13, 12</b>
37215 MPC	18.00	0.121	322	40	8	15	90	30	33, 38	13x2

### Additional Rationale for Specific Codes

This represents a slight increase from the current value of 16.43 by current coding convention which is determined by adding the RVWs for 34825 and its corresponding radiologic supervision & interpretation 75953, and the work of bilateral non-selective catheterization is added by multiplying the RVW for 36200 by 1.5 to account for the bilaterality and then multiplying by 0.5 for the multiple procedure reduction. The following table is a graphic explanation of this comparison.

Existing Extension	Work RVU	Adjustment	Adjusted Work RVU
34825 Extension	12.80	None	12.80
36200-50 Bilateral catheter in aorta	3.02	Bilaterality & MPPR	2.27
75953 Rad S&I for extension	1.36	None	1.36
<b>Total existing coding sequence</b>			<b>16.43</b>
<b>New Code</b>			
34710 Delayed Extension	17.00	None	<b>17.00</b>
<b>Change Existing to New</b>			<b>3.5%</b>

Compelling evidence as detailed above justifies this slight increase in value for this new code compared to existing as it represents significantly different work from the existing codes. Comparison to KRS, MPC and family further support our recommendation.

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

34825

75953

36200

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery

How often? Sometimes

Specialty general surgery

How often? Sometimes

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%

-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34825

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34711      Tracking Number   U11

Original Specialty Recommended RVU: **6.00**  
Presented Recommended RVU: **6.00**  
RUC Recommended RVU: **6.00**

Global Period: ZZZ

CPT Descriptor: Delayed placement of distal or proximal extension prosthesis for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, endoleak, or endograft migration, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting when performed; each additional vessel treated (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with COPD and CAD who underwent endovascular repair of 6 cm diameter AAA six months ago has pre-procedural imaging demonstrating a second endoleak. Placement of an extension prosthesis for endovascular repair of the infrarenal abdominal aorta is performed. [Note: This add-on code only includes the additional work of nonselective catheterization and placing an additional extension endoprosthesis.]

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A rigid wire is inserted through the imaging catheter to provide secure tracking of the large introducer sheath necessary for the extension. The extension is loaded onto the guidewire and advanced through the access vessel. It is then positioned carefully and deployed under fluoroscopic guidance. A large compliant balloon is placed over the wire into the extension to perform balloon dilation at the proximal and/or distal seal zones. An aortogram is performed for adequacy of position, presence or absence of endoleaks, type of endoleak if present, dissection, or false aneurysm. Adjunctive balloon angioplasty is performed for endoleak treatment, as necessary. When the graft is in appropriate position and free of endoleak on angiogram, the catheters and guidewires are removed.

Description of Post-Service Work: N/A

------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34711 Delayed Placement of Additional Extension Prosthesis:**

We recommend the 25<sup>th</sup> percentile survey value of 6.00 RVW.

Code +34711 describes the placement of proximal and/or distal extensions in a delayed fashion. The previous codes for extensions did not specify at what setting they were performed leading to overlap in pre and post-service work and multiple procedure reductions if they were done at the same time as the original procedure. Appropriate global periods for each code were assigned.

**Additional Rationale**

As stated above, under current coding convention, there is no distinction as to the timing of proximal and/or distal endografts extensions. Furthermore, the treatment zone itself was ill defined. Current billed together and utilization data indicate that an initial extension is *typical* (53%) at the time of the initial procedure. As such, the new base codes (34X01-34X08) were created with the initial extension and extension radiologic supervision & interpretation bundled. The treatment zone has been specifically defined such that clinical scenarios that were previous billed with 34825 in the proximal aorta below the lowest renal artery and in the common iliac arteries are now part of the base procedure. The residual patients who require extensions beyond the treatment zone represent a new patient population and different work than the previous codes. The patients who have these distal extensions placed represent a new patient population that is significantly different work from what was previously captured with 34825, +34826, and 75953. 34X09 represents a blend of 34825 and 34826 with the corresponding radiology S&I 75953

**Comparison with Key Reference Services**

There were two codes that were chosen most often as key reference services for +34711. They are:

- +37237, *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)*
- +37235, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*

The following tables incorporate our recommended RVW for +34711 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+37237 KRS	4.25	0.093	47	1	45	1
<b>+34711</b>	<b>6.00</b>	<b>0.100</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>
+37235 KRS	7.80	0.097	82	1	60	1

### Comparison to MPC codes

There are only 10 ZZZ global MPC codes for comparison, all of which are lower values than our recommendations for +34711. We offer the following code for comparison:

- MPC 57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+57267 MPC	4.88	0.108	45	0	45	0
<b>+34711</b>	<b>6.00</b>	<b>0.100</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>

### Additional Rationale for Specific Codes

This represents an increase from current value of 5.48 RVWs by current coding convention. This value is lower than the value for +34X09 which is a very similar service; however, clinically speaking, the additional endograft extension placed in a delayed fashion could be within the previous treatment zone of the initial endograft placement and is therefore less intense than an extension placed at the time of initial endografts deployment. For example, a patient who has had a previous EVAR for aneurysm repair is found to have bilateral type 1B endoleaks at the distal limbs in the common iliac arteries bilaterally. There is enough landing zone within the common iliac arteries to seal the leaks with bilateral extensions to the common iliac bifurcation without extending into the external iliac arteries. This scenario would be reported with 34X10 and +34711 in the delayed setting but if these extensions were performed at the time of the original procedure, these extensions are within the treatment zone and bundled into the base code.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 34826, 75953

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality Excel file.

Specialty vascular surgery	Frequency	Percentage	%
----------------------------	-----------	------------	---

Specialty general surgery	Frequency	Percentage	%
---------------------------	-----------	------------	---

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34826

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34712      Tracking Number   U12

Original Specialty Recommended RVU: **14.00**Presented Recommended RVU: **12.00**

Global Period: 090

RUC Recommended RVU: **12.00**

CPT Descriptor: Transcatheter delivery of enhanced fixation device(s) to the endograft (eg, anchor, screw, tack) and all associated radiological supervision and interpretation

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with COPD and CAD who previously underwent endovascular repair of 6 cm diameter AAA now presents with a proximal endoleak. Transcatheter delivery of anchors/screws to seal the endo-leak is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 24% , Overnight stay-more than 24 hours 76%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 73%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact fixation device, and the deployment location of the individual anchors required to stabilize the endograft. This work is unique in that it must be performed several days prior to surgery in order to ensure that all required devices are ordered and have arrived on site before surgery begins. Cross-sectional imaging of the involved arterial segment and endograft with fine cuts are reviewed and uploaded to a workstation, where 3D software is applied permitting iterative modelling of anchor placement. The physician needs to manually adjust modelling for altered anatomy which is tortuous or thrombus laden. Orthogonal center-line imaging is used to determine diameter measurements of the aorta, iliac and femoral arteries for appropriate sizing of the anchors. The iliac and femoral diameters also determine the success of the device delivery. Tortuosity, calcification, thrombus presence and stenosis require consideration as they may impact device delivery. Cross section, longitudinal and center line of flow measurements, with manual adjustments where needed, are utilized to map the required anchor locations.

Pre-service work necessarily includes review of surgical indication, physical exam findings, current medications and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The fixation device and introducer sheaths are brought into the operating room after verification of appropriate sizes. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine and ACT testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for ready viewing during the operative procedure. The surgeon supervises appropriate patient positioning on the OR table, ensures fluoroscopy is functional and that desired imaging angles are attainable with equipment at hand. The surgeon dons radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile prep of access site(s) and subsequent draping. The surgeon leads the pre-procedural "time-out."

Description of Intra-Service Work: Under fluoroscopic guidance, an introducer needle is used to access the vessel. A guidewire is introduced and the needle is exchanged for a vascular sheath. A multi-sidehole catheter is placed and flush aortogram is performed. The patient is systemically anticoagulated. The endovascular fixation anchor delivery guide is

placed in the aortic endograft over stiff wire access. Contrast imaging confirms appropriate delivery guide position within aortic endograft. The endovascular fixation anchor delivery system is then constrained, loaded with an endovascular fixation anchor and placed within the delivery guide into the aortic endograft. Under contrast injection and fluoroscopy, the endovascular fixation anchor position is confirmed and then deployed. Additional endovascular fixation anchors are placed as needed in the proximal extent of the aortic graft and aortic wall. Contrast injection to confirm endovascular fixation anchor placement and treatment of endoleak is performed. Additional wires, sheaths and catheters are removed.

Description of Post-Service Work: Hospital: Apply sterile dressings. Assist transfer of patient from operating table to gurney. Monitor patient for hemodynamic stability in transit and ensure adequate perfusion to the lower extremities. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate formal operative report and copy referring physician. Review post-operative imaging.

Post-operative in-hospital visits require interval history-taking for new complaints of pain or neurovascular compromise. Exam requires close monitoring for abdominal or lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are necessary. Lower extremities are checked for emboli. Hemoglobin and coagulation labs are monitored daily. The need for routine or advanced imaging is assessed daily. Post-op CT scans are obtained, either during the inpatient stay or early in the post-discharge time period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily.

Discharge day management includes communicating with all support services such as visiting nurses, referring physicians, review interval chart notes, answer patient and family questions, evaluate all pre-discharge labs, evaluate and redress the incisions, assess pain score, and perform medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, solicit an interval history for ongoing or new symptoms; examine the abdomen for tenderness, examine arterial access sites and surgical incisions for inflammation, drainage, wound infection; examine lower extremities for adequate perfusion. Order diagnostic blood tests and/or imaging studies based on findings. Review post-op CT scans and ultrasounds for possible endoleak. Make clinical decisions regarding need for repeat surgical intervention. Provide wound care as needed. Remove staples and sutures as indicated. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician (verbal and written). Dictate/type progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**34712 Enhanced Fixation Device:**

We recommend the 25<sup>th</sup> percentile survey value of 12.00 RVW.

34712 describes the transcatheter delivery of enhanced fixation device(s) to the endograft (e.g., anchor, screw, tack) and all associated radiological supervision and interpretation. Code 34712 represents new technology and new work that was not present previously. This new code describes the work of transcatheter delivery of enhanced fixation device(s) to the endograft (eg, anchor, screw, tack) and all associated radiological supervision and interpretation. The work of this procedure was previously coded with unlisted vascular or unlisted cardiac codes depending on the location of the endograft. This will be a low volume code estimated to be used in less than 2% of EVARs.

**Pre-Service Time (34712)**

When a patient needs to return to the operating room for delivery of an enhanced fixation device, there has been failure of the initial endograft requiring corrective action. This results in significant additional pre-service time and work. Multiple images (including CT angiogram, duplex, and possibly arteriogram) are reviewed to diagnose the problem, available devices are reviewed, and an operative plan is developed.

Pre-service package 4 is appropriate for 34712 with adjustment to the times. The survey respondents also identified varying addition minutes for evaluation. We believe this to be related to the additional work the day before and the day of the procedure to ensure that all necessary supplies are available for the operation and to ensure that the radiologic equipment is operational and prepared for the procedure.

The survey respondents identified additional minutes of positioning time for these codes. This is to account for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patient during surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. Pre-service time is a total of 20 minutes for 34712.

**Post-Service Time (34712)**

Post-service time package 9B would apply for these complex procedures, however, this package only allows 5 minutes for “operative note” which is not sufficient time for endovascular procedures that have radiologic supervision & interpretation bundled into the code. There is significantly more time involved to review all images and cines, annotate appropriate images, dictate radiologic findings, and document radiation exposure and contrast volumes. We therefore recommend accepting the survey values for immediate post-service time.

### Comparison with Key Reference Services

There were two codes that were chosen most often as key reference services for 34X10 and 34712. They are:

- 37218, *Transcatheter placement of intravascular stent(s), intrathoracic common carotid artery or innominate artery, open or percutaneous antegrade approach, including angioplasty, when performed, and radiological supervision and interpretation*
- 37217, *Transcatheter placement of intravascular stent(s), intrathoracic common carotid artery or innominate artery by retrograde treatment, open ipsilateral cervical carotid artery exposure, including angioplasty, when performed, and radiological supervision and interpretation*

The following tables incorporate our recommended RVW for 34712 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
<b>34712</b>	<b>12.00</b>	<b>0.082</b>	<b>307</b>	<b>40</b>	<b>20</b>	<b>20</b>	<b>60</b>	<b>30</b>	<b>32, 31, 38</b>	<b>13, 12</b>
37218 KRS	15.00	0.106	265	33	5	5	90	28	31, 38	13x2
37217 KRS	20.38	0.098	403	40	14	20	120	30	33, 32, 38	13x2

### Comparison to MPC codes

We offer the following codes as brackets for our recommendations for 34712:

- MPC 54437, *Repair of traumatic corporeal tear(s)*
- MPC 57288, *Sling operation for stress incontinence (eg, fascia or synthetic)*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
MPC 54437	11.50	0.087	264	33	3	15	60	30	38	13x3,12
<b>34712</b>	<b>12.00</b>	<b>0.082</b>	<b>307</b>	<b>40</b>	<b>20</b>	<b>20</b>	<b>60</b>	<b>30</b>	<b>32, 31, 38</b>	<b>13, 12</b>
MPC 57288	12.13	0.108	246	33	7	15	60	27	38	13x3,12

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) New work not previously reported or reported with 33999 or 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality Excel file.

Specialty vascular surgery	Frequency	Percentage	%
----------------------------	-----------	------------	---

Specialty general surgery	Frequency	Percentage	%
---------------------------	-----------	------------	---

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34826

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34713      Tracking Number   U13

Original Specialty Recommended RVU: **2.50**  
Presented Recommended RVU: **2.50**  
RUC Recommended RVU: **2.50**

Global Period: ZZZ

CPT Descriptor: Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 french or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm and undergoes endovascular repair by percutaneous access (reported separately). Prior to placement of a large sheath in the artery, two closure devices are inserted in pre-close fashion to secure access site hemostasis at the termination of the procedure. [Note: This add-on code only includes the additional work of ultrasound guidance to establish vascular access and placing two closure devices.]

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Percutaneous access and initial catheter based vascular assessment is performed. Next, a guidewire is placed through the catheter and the catheter is removed. A vascular closure device is placed into the femoral artery over the guidewire. Placement within the artery is checked and the guidewire is removed. The device is pre-deployed and secured at the skin surface with hemostats. The guidewire is reinserted into the first device. The first closure device is removed. A second vascular closure device is inserted over the guidewire which is then removed. The second closure device is pre-deployed in a different orientation and secured at the skin surface with hemostats. A guidewire is then placed into the closure device prior to removal to assure continued access for subsequent endovascular procedure. Once the endograft has been deployed, the skin and subcutaneous tissue are dissected with a hemostat. The delivery system, wire, and sheath are removed. The first closure device sutures are tied using the remote knot mobilizer to initially close the arteriotomy. The second closure device sutures are tied using the remote knot mobilizer to ultimately secure the arteriotomy and all excess sutures are cut. The site is inspected for hemostasis and secure closure of the artery.

Description of Post-Service Work: N/A

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34713 Percutaneous Access and Closure:**

We recommend using a crosswalk to CPT code +15152 for a value of 2.50 RVW.

Percutaneous access and closure for EVAR requires significant work to close the access artery as the sheath size for delivery of the EVAR devices are quite large. Percutaneous repair is achieved with a “pre-closure” technique of placing suture mediated closure devices under ultrasound guidance (included). These closure devices are designed for smaller sized sheaths. The arteriotomy is then dilated to the necessary size for placement of the delivery sheath which can be as large as 24 French. At the completion of the procedure, the large sheaths are removed slowly over a dilator and the sutures are tied to close the large arteriotomy. Manual pressure is then held for hemostasis. Failure to achieve hemostasis requires surgical cutdown and repair of the vessel.

Our expert panel agreed that the 25<sup>th</sup> percentile and median survey value for +34713 was too high and not consistent with the work. We agree that the work and intensity for +34713 is similar to CPT code +15152, *Tissue cultured skin autograft, trunk, arms, legs; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)*, and therefore recommend an RVW of 2.50.

	<b>RVW</b>	<b>IWP/UT</b>	<b>Total Time</b>	<b>Pre</b>	<b>INTRA</b>	<b>Post</b>
+15152	2.50	0.124	20	0	20	0
<b>+34713</b>	<b>2.50</b>	<b>0.124</b>	<b>20</b>	<b>0</b>	<b>20</b>	<b>0</b>

**Comparison with Key Reference Services**

The reference services selected by the survey respondents most commonly for +34713 are:

- +37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*

- +36476, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
<b>+34713</b>	<b>2.50</b>	<b>0.125</b>	<b>20</b>	<b>0</b>	<b>20</b>	<b>0</b>
+36476 KRS	2.65	0.088	30	0	30	0
+37222 KRS	3.73	0.092	42	1	40	1

### Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following codes for comparison:

- MPC +99292, *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)*
- MPC +63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equine and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the MPC services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+36227 MPC	2.09	0.139	15	0	15	0
<b>+34713</b>	<b>2.50</b>	<b>0.124</b>	<b>20</b>	<b>0</b>	<b>20</b>	<b>0</b>
+63048 MPC	3.47	0.077	45	0	45	0

CPT Descriptor: Open femoral artery exposure for delivery of endovascular prosthesis by groin incision, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm. Open femoral artery exposure for the delivery of the endovascular prosthesis by groin incision is performed. [Note: This add-on code only includes the additional work of open femoral artery exposure by groin incision and closure of the wound.]

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A groin incision is made with respect to anatomic landmarks. The subcutaneous tissue is dissected until the common femoral artery is located. The femoral sheath and inguinal ligament are identified. Care is taken to avoid injury to the femoral nerve and femoral vein which lie in close proximity. The common, superficial, and deep femoral arteries, in addition to the distal external iliac artery are sharply dissected and encircled with vessel loops. Retraction and/or division of the inguinal ligament is performed, if required. The vessels are assessed for caliber and suitability for introduction of the guidewires, sheaths and endograft. Once the endograft has been deployed and the wires and sheaths have been removed (reported separately), hemostatic clamps are applied to the proximal and distal vessels. The arteriotomy is closed with fine monofilament suture. The vascular clamps are removed and vessel patency is assessed. After achieving hemostasis, the wound is irrigated and closed in several layers. The skin is closed with staples or suture, as appropriate.

Description of Post-Service Work: N/A

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34812 Open Femoral Exposure:**

We recommend the 25<sup>th</sup> percentile survey value of 4.13 RVW.

This is an existing code for femoral artery exposure for the purpose of delivery of endografts. The existing code is a 000-day global and was captured in the RAW screen for pre-service time in excess of standard packages. The global period was changed to ZZZ as this procedure is never performed as a stand-alone service. The current value of 34812 can be converted into a ZZZ valued by multiplying the existing intra-service time by the IWP/UT which predicts a value of 4.39 RVW for 34812 if it were an add-on code. This compares favorably with our recommendation for the 25<sup>th</sup> percentile at 4.13 RVW for +34812.

**Comparison with Key Reference Services**

The key reference services selected by the survey respondents most commonly when making their recommendations for +34812 are:

- +37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*
- +35600, *Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	<b>RVW</b>	<b>IWP/UT</b>	<b>Total Time</b>	<b>Pre</b>	<b>INTRA</b>	<b>Post</b>
+37222 KRS	3.73	0.092	42	1	40	1
<b>+34812</b>	<b>4.13</b>	<b>0.103</b>	<b>40</b>	<b>0</b>	<b>40</b>	<b>0</b>
+35600 KRS	4.94	0.124	40	0	40	0

## Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following codes for comparison:

- MPC +63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equine and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*
- MPC +57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the MPC services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+63048 MPC	3.47	0.077	45	0	45	0
<b>+34812</b>	<b>4.13</b>	<b>0.103</b>	<b>40</b>	<b>0</b>	<b>40</b>	<b>0</b>
+57267 MPC	4.88	0.108	45	0	45	0

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 34812

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery

How often? Sometimes

Specialty general surgery

How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality Excel file.

Specialty vascular surgery	Frequency	Percentage	%
----------------------------	-----------	------------	---

Specialty general surgery	Frequency	Percentage	%
---------------------------	-----------	------------	---

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 34812

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34714      Tracking Number   U15

Original Specialty Recommended RVU: **6.13**  
Presented Recommended RVU: **5.25**  
RUC Recommended RVU: **5.25**

Global Period: ZZZ

CPT Descriptor: Open femoral artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by groin incision, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm. His femoral artery is too small in diameter and calcified to accommodate passage of an endovascular device. Open femoral artery exposure with placement of a femoral conduit is performed to enable endovascular aortic aneurysm repair. [Note: This add-on code only includes the additional work of open femoral artery exposure and placement of a prosthetic conduit by groin incision and closure of the wound.]

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A groin incision is made with respect to anatomic landmarks. The subcutaneous tissue is dissected until the common femoral artery is located. The femoral sheath and inguinal ligament are identified. Care is taken to avoid injury to the femoral nerve and femoral vein which lie in close proximity. The common, superficial, and deep femoral arteries, in addition to the distal external iliac artery are sharply dissected and encircled with vessel loops. Retraction and/or division of the inguinal ligament is performed, if required. The vessels are assessed for caliber and suitability for introduction of the guidewires, sheaths and endograft. The patient is systemically anticoagulated and an appropriate sized prosthetic graft is selected. Hemostatic clamps are placed on the vessels, and an end-to-side anastomosis between the graft and the artery is created with monofilament suture. The prosthetic conduit is then used to provide catheter, sheath and endograft access. Once the endograft has been deployed and the wires and sheaths have been removed (reported separately), hemostatic clamps are applied to the proximal and distal vessels. The prosthetic graft is then divided and oversewn with fine monofilament suture. The vascular clamps are removed and vessel patency is assessed. After achieving hemostasis, the wound is irrigated and closed in several layers. The skin is closed with staples or suture, as appropriate

Description of Post-Service Work: N/A

The number of possible diagnosis and/or the number of management options that must be considered		
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed		
Urgency of medical decision making		

**Technical Skill/Physical Effort (Mean)**

Technical skill required		
Physical effort required		

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality		
Outcome depends on the skill and judgment of physician		
Estimated risk of malpractice suit with poor outcome		

**INTENSITY/COMPLEXITY MEASURES****Top Key  
Ref Code****2<sup>nd</sup> Key  
Ref Code****Time Segment (Mean)**

Overall intensity/complexity	0.43	0.38
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34714 Open Femoral Exposure with Conduit:**

We recommend the 25<sup>th</sup> percentile survey value of 5.25 RVW.

The survey respondents identified 20 more intra-service minutes for the additional work of sewing an artificial conduit onto the femoral artery for this new code compared to the work of exposure of the femoral artery (+34812). Our expert panel reviewed this data and agree that 1.12 RVW is accurate for this incremental work of sewing a conduit to the femoral artery. We reviewed CPT +33987, *Arterial exposure with creation of graft conduit (eg, chimney graft) to facilitate arterial perfusion for ECMO/ECLS (List separately in addition to code for primary procedure)*, which describes the same work for a different indication. Code +33987 has an intra-service time of 45 minutes and RVW of 4.04. This equates to a value of 0.09 RVW per minute. Therefore the increase of 1.12 RVW equates to a 12 minute incremental increase in work. We therefore reduced the intra-service time for +34714 by 8 minutes to 52 minutes from survey median of 60 minutes to reflect this increment. We attempted to maintain this increment of 1.12 RVW and 12 minutes intra-service time for the subsequent conduit pairs of iliac exposure (+34820) to iliac with conduit (+34833) and axillary/subclavian exposure (+34X19) to axillary/subclavian with conduit (+34X20).

**Comparison with Key Reference Services**

The key reference services selected by the survey respondents most commonly when making their recommendations for +34714 are:

- +35600, *Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure (List separately in addition to code for primary procedure)*
- +35682, *Bypass graft; autogenous composite, 2 segments of veins from 2 locations (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	<b>RVW</b>	<b>IWP/UT</b>	<b>Total Time</b>	<b>Pre</b>	<b>INTRA</b>	<b>Post</b>
+35600	4.94	0.124	40	0	40	0

	RVW	IWPUT	Total Time	Pre	INTRA	Post
KRS						
<b>+34714</b>	<b>5.25</b>	<b>0.101</b>	<b>52</b>	<b>0</b>	<b>52</b>	<b>0</b>
+35682 KRS	7.19	0.092	78	0	78	0

### Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following code for comparison:

- MPC +57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the MPC service identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+57267 MPC	4.88	0.108	45	0	45	0
<b>+34714</b>	<b>5.25</b>	<b>0.101</b>	<b>52</b>	<b>0</b>	<b>52</b>	<b>0</b>

---

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) New work not previously reported or reported with 33999 or 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality Excel file.

Specialty vascular surgery	Frequency	Percentage	%
----------------------------	-----------	------------	---

Specialty general surgery	Frequency	Percentage	%
---------------------------	-----------	------------	---

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34826

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34820      Tracking Number   U16

Original Specialty Recommended RVU: **7.00**Presented Recommended RVU: **7.00**

Global Period: ZZZ

RUC Recommended RVU: **7.00**

CPT Descriptor: Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm. His bilateral distal external iliac and common femoral arteries are too small in diameter to accommodate passage of an endovascular device. Open iliac artery exposure by abdominal or retroperitoneal incision is performed to provide a suitable entry site for placement of an endoprosthesis. [Note: This add-on code only includes the additional work of open iliac artery exposure by abdominal or retroperitoneal incision and closure of the wound.]

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: NA/

Description of Intra-Service Work: A skin incision is made in the lower abdomen or retroperitoneum. The tissue is dissected deep into the pelvis until the iliac artery is located. A retracting system is inserted to ensure adequate exposure. The adjacent ureter, veins and nerves are identified and protected. The iliac artery is isolated free of surrounding tissue, and circumferential vascular loops are applied. Following endograft deployment, and after the wires and sheaths have been removed (reported separately), hemostatic clamps are applied to the proximal and distal vessels. The arteriotomy is closed with fine monofilament suture. The vascular clamps are removed and vessel patency is assessed. After achieving hemostasis, the wound is irrigated and closed in several layers. The skin is closed with skin staples or absorbable suture.

Description of Post-Service Work: N/A

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34820 Open Iliac Exposure:**

We recommend the 25<sup>th</sup> percentile survey value of 7.00 RVW.

This is an existing code for iliac artery exposure for the purpose of delivery of endografts. The global period was changed to ZZZ as this procedure is never performed as a stand-alone service. The current value of 34820 can be converted into a ZZZ valued by multiplying the existing intra-service time by the IWP/UT which predicts a value of 7.05 RVW for 34820 if it were an add-on code. This compares favorably with our recommendation for the 25<sup>th</sup> percentile at 7.00 RVW for +34820.

**Comparison with Key Reference Services**

The key reference services selected by the survey respondents most commonly when making their recommendations for +34820 are:

- +35682, *Bypass graft; autogenous composite, 2 segments of veins from 2 locations (List separately in addition to code for primary procedure)*
- +35572, *Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery) (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	<b>RVW</b>	<b>IWP/UT</b>	<b>Total Time</b>	<b>Pre</b>	<b>INTRA</b>	<b>Post</b>
+35572 KRS	6.81	0.114	60	0	60	0
<b>+34820</b>	<b>7.00</b>	<b>0.117</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>
+35682 KRS	7.19	0.092	78	0	78	0

### Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following code for comparison:

- MPC +57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the MPC services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+57267 MPC	4.88	0.108	45	0	45	0
<b>+34820</b>	<b>7.00</b>	<b>0.117</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 34820

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 34820

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34833      Tracking Number   U17

Original Specialty Recommended RVU: **9.00**  
Presented Recommended RVU: **8.16**  
RUC Recommended RVU: **8.16**

Global Period: ZZZ

CPT Descriptor: Open iliac artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm. His bilateral iliac arteries are too small in diameter and calcified to accommodate passage of an endovascular device. Open iliac artery exposure with placement of an iliac conduit by abdominal or retroperitoneal incision is performed to provide a suitable entry site for placement of an endoprosthesis. [Note: This add-on code only includes the additional work of open iliac artery exposure by abdominal or retroperitoneal incision and closure of the wound.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A skin incision is made in the lower abdomen or retroperitoneum. The tissue is dissected deep into the pelvis until the iliac artery is located. A retracting system is inserted to ensure adequate exposure. The adjacent ureter, veins and nerves are identified and protected. The common, external and internal iliac arteries are dissected and encircled with vessel loops. The iliac artery is found to be diseased and not suitable for endograft access. The patient is systemically anticoagulated and an appropriate sized prosthetic graft is selected. Hemostatic clamps are placed on the iliac vessels and an end to side anastomosis between the graft and the iliac artery is created with monofilament suture. The prosthetic conduit is then used to obtain catheter, sheath and endograft access. Once the endograft has been deployed and the wires and sheaths have been removed (reported separately), hemostatic clamps are applied to the proximal and distal iliac vessels. The prosthetic conduit is then divided and oversewn with fine monofilament suture. The vascular clamps are removed and vessel patency is assessed. After achieving hemostasis, the wound is irrigated and closed in several layers. The skin is closed with skin staples or absorbable suture.

Description of Post-Service Work: N/A

**INTENSITY/COMPLEXITY MEASURES****Top Key  
Ref Code****2<sup>nd</sup> Key  
Ref Code****Time Segment (Mean)**

Overall intensity/complexity	0.91	0.57
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34833 Open Iliac Exposure with Conduit:**

We recommend a crosswalk to CPT code +22634 (*Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; each additional interspace and segment (List separately in addition to code for primary procedure)*) with a value of 8.16 RVW.

The survey respondents did not report any additional intra-service time for the additional work of placing an iliac conduit compared to +34820. The expert panel agreed that this is physically impossible and would create an anomaly for this pair of codes. The existing values for 34820 and 34833 have a differential of 2.24 RVW and a differential intra-service time of 25 minutes. This is consistent with our previous value of 0.09 RVW per minute of intra-service time. With the goal of preserving this incremental difference of 1.12 RVW and 12 minutes of intra-service time for the incremental work of adding a conduit, we recommend crosswalking code +22634 and adding 12 minutes of intra-service time to +34833 for a total time of 72 minutes.

**Comparison with Key Reference Services**

The key reference services selected by the survey respondents most commonly when making their recommendations for +34833 are:

- +35572, *Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery) (List separately in addition to code for primary procedure)*
- +22845, *Anterior instrumentation; 2 to 3 vertebral segments (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	RVW	IWP/UT	Total Time	Pre	INTRA	Post
--	-----	--------	------------	-----	-------	------

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+35572 KRS	6.81	0.114	60	0	60	0
<b>+34833</b>	<b>8.16</b>	<b>0.113</b>	<b>72</b>	<b>0</b>	<b>72</b>	<b>0</b>
+22845 KRS	11.94	0.133	90	0	90	0

### Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following code for comparison:

- MPC +57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the MPC services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+57267 MPC	4.88	0.108	45	0	45	0
<b>+34833</b>	<b>8.16</b>	<b>0.113</b>	<b>72</b>	<b>0</b>	<b>72</b>	<b>0</b>

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 34833

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality Excel file.

Specialty vascular surgery	Frequency	Percentage	%
----------------------------	-----------	------------	---

Specialty general surgery	Frequency	Percentage	%
---------------------------	-----------	------------	---

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 34833

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34834      Tracking Number   U18

Original Specialty Recommended RVU: **2.65**  
Presented Recommended RVU: **2.65**  
RUC Recommended RVU: **2.65**

Global Period: ZZZ

CPT Descriptor: Open brachial artery exposure for delivery of endovascular prosthesis, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm and tortuous iliac arteries. Open brachial artery exposure is performed to enable endovascular repair. [Note: This add-on code only includes the additional work of open brachial artery exposure and closure of the wound.]

Percentage of Survey Respondents who found Vignette to be Typical: 85%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: An incision is made in the arm. The subcutaneous tissue and fascia are divided. The brachial artery is identified and dissected free of surrounding tissue. The median nerve and brachial vein are identified and protected. sharply dissected and encircled with vessel loops. Once the endograft has been deployed and the wires and sheaths have been removed (reported separately), hemostatic clamps are applied to the proximal and distal brachial artery. The arteriotomy is closed with fine monofilament suture. The vascular clamps are removed and vessel patency is assessed. After achieving hemostasis, the wound is irrigated and closed in several layers. The skin is closed with skin staples or absorbable suture.

Description of Post-Service Work: N/A

**INTENSITY/COMPLEXITY MEASURES**

*(of those that selected Key Reference codes)*

*Survey respondents are rating the survey code relative to the key reference code.*

**Intensity & Complexity Rating Scale:** (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

**Top Key  
Ref Code**

**2<sup>nd</sup> Key  
Ref Code**

**Mental Effort and Judgment (Mean)**

The number of possible diagnosis and/or the number of management options that must be considered		
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed		
Urgency of medical decision making		

**Technical Skill/Physical Effort (Mean)**

Technical skill required		
--------------------------	--	--

Physical effort required		
<b><u>Psychological Stress (Mean)</u></b>		
The risk of significant complications, morbidity and/or mortality		
Outcome depends on the skill and judgment of physician		
Estimated risk of malpractice suit with poor outcome		

**INTENSITY/COMPLEXITY MEASURES****Top Key  
Ref Code****2<sup>nd</sup> Key  
Ref Code****Time Segment (Mean)**

Overall intensity/complexity	0.67	0.20
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34834 Open Brachial Exposure:**

We recommend using a crosswalk to CPT +36476 for value of 2.65 RVW.

This is an existing code for brachial artery exposure for the purpose of delivery of endografts. The existing code is a 000-day global. The global period was changed to ZZZ as this procedure is never performed as a stand-alone service. The current value of 34834 can be converted into a ZZZ valued by multiplying the existing intra-service time by the IWPUT which predicts a value of 2.35 RVW for 34833 if it were an add-on code. This existing ZZZ-based value is below the minimum response from our survey respondents and we therefore cannot accept it as valid. An alternative consideration for the existing value of 34834 would be to apply the multiple procedure payment reduction model which produces a "real world" value of 2.67 RVW. This calculation strongly supports our proposed crosswalk to CPT +36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* for a value of 2.65 RVW for +34834.

**Comparison with Key Reference Services**

The key reference services selected by the survey respondents most commonly when making their recommendations for +34834 are:

- +36476, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*
- +37237, *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+36476 KRS	2.65	0.088	30	0	30	0
<b>+34834</b>	<b>2.65</b>	<b>0.088</b>	<b>30</b>	<b>0</b>	<b>30</b>	<b>0</b>
+37237 KRS	4.25	0.093	47	1	45	1

### Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following codes for comparison:

- MPC +99292, *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)*
- MPC +63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equine and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the MPC services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+99292 MPC	2.25	0.075	30	0	30	0
<b>+34834</b>	<b>2.65</b>	<b>0.088</b>	<b>30</b>	<b>0</b>	<b>30</b>	<b>0</b>
+63048 MPC	3.47	0.077	45	0	45	0

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
-

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 34834

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality Excel file.

-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:  
Procedures

BETOS Sub-classification:  
Major procedure

BETOS Sub-classification Level II:

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 34834

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code:34715      Tracking Number   U19

Original Specialty Recommended RVU: **6.00**Presented Recommended RVU: **6.00**

Global Period: ZZZ

RUC Recommended RVU: **6.00**

CPT Descriptor: Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm. His iliac arteries are tortuous and too small in diameter to accommodate passage of an endovascular device. Open axillary exposure through an infraclavicular incision is performed to enable endovascular repair. [Note: This add-on code only includes the additional work of open axillary artery exposure by infraclavicular incision and closure of the wound.]

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: An incision is made below the clavicle. The subcutaneous tissue and fascia are divided. The axillary artery is identified, sharply dissected, and encircled with vessel loops. The large adjacent nerves and axial vein are identified and protected. Once the endograft has been deployed and the wires and sheaths have been removed (reported separately), hemostatic clamps are applied to the proximal and distal axillary artery. The arteriotomy is closed with fine monofilament suture. The vascular clamps are removed and vessel patency is assessed. After achieving hemostasis, the wound is irrigated and closed in several layers. The skin is closed with skin staples or absorbable suture.

Description of Post-Service Work: N/A

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34715 Open Axillary/Subclavian Exposure:**

We recommend the 25<sup>th</sup> percentile survey value of 6.00 RVW.

This is a new code to describe the work of exposing the axillary/subclavian artery for delivery of endografts. The survey respondents identified 60 minutes of intra-service time for the performance of this service which is comparable to the time identified for the performance of iliac artery exposure (+34820). Our expert panel agree that this is appropriate as the axillary/subclavian artery can be difficult to expose. In addition, the subclavian artery is one of the most friable arteries in the body and requires additional care in its dissection to prevent injury. We therefore agree that the 25<sup>th</sup> percentile survey value of 6.00 RVW is appropriate for +34715.

**Comparison with Key Reference Services**

The key reference services selected by the survey respondents most commonly when making their recommendations for +34715 are:

- +35572, *Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery) (List separately in addition to code for primary procedure)*
- +35683, *Bypass graft; autogenous composite, 3 or more segments of vein from 2 or more locations (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	RVW	IWP/UT	Total Time	Pre	INTRA	Post
<b>+34715</b>	<b>6.00</b>	<b>0.100</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+35572 KRS	6.81	0.114	60	0	60	0
+35683 KRS	8.49	0.094	90	0	90	0

### Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following code for comparison:

- MPC +57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for the code along with the MPC services identified for the code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+57267 MPC	4.88	0.108	45	0	45	0
<b>+34715</b>	<b>6.00</b>	<b>0.100</b>	<b>60</b>	<b>0</b>	<b>60</b>	<b>0</b>

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) New work not previously reported or reported with 33999 or 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 34716      Tracking Number   U20

Original Specialty Recommended RVU: **8.00**  
Presented Recommended RVU: **7.19**  
RUC Recommended RVU: **7.19**

Global Period: ZZZ

CPT Descriptor: Open axillary/subclavian artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old male with CAD and COPD presents with asymptomatic infrarenal abdominal aortic aneurysm. His iliac arteries are tortuous and too small in diameter and calcified to accommodate passage of an endovascular device. Open axillary exposure through an infraclavicular incision with placement of a prosthetic conduit is performed to enable endovascular repair. [Note: This add-on code only includes the additional work of open axillary artery exposure by infraclavicular incision, placement of a prosthetic conduit and closure of the wound.]

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: An incision is made below the clavicle. The subcutaneous tissue and fascia are divided. The axillary artery is sharply dissected and encircled with vessel loops. The adjacent veins and nerves are identified and protected. The axillary artery is very soft and friable, not suitable for endograft access. The patient is systemically anticoagulated and an appropriate sized prosthetic graft is selected. Hemostatic clamps are placed on the artery and an end-to-side anastomosis between the graft and the axillary artery is created with monofilament suture. The prosthetic conduit is then used to obtain catheter, sheath and endograft access. Once the endograft has been deployed and the wires and sheaths have been removed (reported separately), hemostatic clamps are applied to the proximal and distal axillary artery. The prosthetic conduit is then divided and oversewn with fine monofilament suture. The vascular clamps are removed and vessel patency is assessed. After achieving hemostasis, the wound is irrigated and closed in several layers. The skin is closed with skin staples or absorbable suture.

Description of Post-Service Work: N/A

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**TOP KEY REFERENCE SERVICE:**

Key CPT Code	Global	Work RVU	Time Source
35683	ZZZ	8.49	RUC Time

CPT Descriptor Bypass graft; autogenous composite, 3 or more segments of vein from 2 or more locations (List separately in addition to code for primary procedure)

**SECOND HIGHEST KEY REFERENCE SERVICE:**

Key CPT Code	Global	Work RVU	Time Source
35306	ZZZ	9.25	RUC Time

CPT Descriptor Thromboendarterectomy, including patch graft, if performed; each additional tibial or peroneal artery (List separately in addition to code for primary procedure)

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
57267	ZZZ	4.88	RUC Time	6,947

CPT Descriptor 1 Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
	ZZZ	0.00	RUC Time	

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor**RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 11      % of respondents: 22.4 %

Number of respondents who choose 2<sup>nd</sup> Key Reference Code: 10      % of respondents: 20.4 %

**TIME ESTIMATES (Median)**

	CPT Code: <u>34716</u>	Top Key Reference CPT Code: <u>35683</u>	2nd Key Reference CPT Code: <u>35306</u>

------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**+34716 Open Axillary/Subclavian Exposure, with Conduit:**

We recommend a crosswalk to CPT code +35682 (*Bypass graft; autogenous composite, 2 segments of veins from 2 locations (List separately in addition to code for primary procedure)*) with a value of 7.19 RVW for +34716.

This is a new code to describe the work of exposing the axillary/subclavian artery with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass. The survey respondents did not report any additional intra-service time for the additional work of placing an axillary/subclavian conduit compared to +34X19. The expert panel agree this is physically impossible and would create an anomaly for this code pair. With the goal of maintaining our increment of 1.12 RVW and 12 minutes intra-service time for the additional work of adding a conduit, we chose code +35682 as a crosswalk codes and then added an additional 12 intra-service minutes for a total of 72 intra-service minutes for +34716.

**Comparison with Key Reference Services**

The key reference services selected by the survey respondents most commonly when making their recommendations for +34716 are:

- +35683, *Bypass graft; autogenous composite, 3 or more segments of vein from 2 or more locations (List separately in addition to code for primary procedure)*
- +35306, *Harvest of femoropopliteal vein, 1 segment, for vascular reconstruction procedure (eg, aortic, vena caval, coronary, peripheral artery) (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the key reference services identified for this code arranged in ascending order of RVW.

	RVW	IWP/UT	Total Time	Pre	INTRA	Post
--	-----	--------	------------	-----	-------	------

	RVW	IWPUT	Total Time	Pre	INTRA	Post
<b>+34716</b>	<b>7.19</b>	<b>0.100</b>	<b>72</b>	<b>0</b>	<b>72</b>	<b>0</b>
+35683 KRS	8.49	0.094	90	0	90	0
+35306 KRS	9.25	0.103	90	0	90	0

### Comparison to MPC codes

There are a limited number of ZZZ global MPC codes for comparison, most of which are lower values than our recommendations for this group of codes. We offer the following code for comparison:

- MPC +57267, *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for this code along with the MPC services identified for this code arranged in ascending order of values.

	RVW	IWPUT	Total Time	Pre	INTRA	Post
+57267 MPC	4.88	0.108	45	0	45	0
<b>+34716</b>	<b>7.19</b>	<b>0.100</b>	<b>72</b>	<b>0</b>	<b>72</b>	<b>0</b>

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) New work not previously reported or reported with 33999 or 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty vascular surgery                      How often? Sometimes

Specialty general surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. See budget neutrality Excel file.

Specialty vascular surgery	Frequency	Percentage	%
----------------------------	-----------	------------	---

Specialty general surgery	Frequency	Percentage	%
---------------------------	-----------	------------	---

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 34826

**Global Period:** 090

**34701** Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)

**34702** Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for rupture including temporary aortic and/or iliac balloon occlusion when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)

**34703** Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-uniiliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)

**34704** Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-uniiliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for rupture including temporary aortic and/or iliac balloon occlusion when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)

**34705** Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-biiliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)

**34X06** Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-biiliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for rupture including temporary aortic and/or iliac balloon occlusion when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)

**34X07** Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting when performed, unilateral; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation)

**34X08** Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting when performed,

**CPT Code:** 34701-34716, 34812, 34820, 34833, 34834  
**Specialty Society(‘s):** SVS, SIR, ACS, STS, AATS, ACC, and SCAI

unilateral; for rupture including temporary aortic and/or iliac balloon occlusion when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)

**34710** Delayed placement of distal or proximal extension prosthesis for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, endoleak, or endograft migration, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting when performed; initial vessel treated

**34712** Transcatheter delivery of enhanced fixation device(s) to the endograft (eg, anchor, screw, tack) and all associated radiological supervision and interpretation

**34713** Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 French or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure)

---

**Global Period:** ZZZ

**34709** Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting when performed, per vessel treated

**34711** each additional vessel treated

**34812** Open femoral artery exposure for delivery of endovascular prosthesis by groin incision, unilateral

**34714** Open femoral artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by groin incision, unilateral

**34820** Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion by abdominal or retroperitoneal incision, unilateral

**34833** Open iliac artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by abdominal or retroperitoneal incision, unilateral

**34834** Open brachial artery exposure for delivery of endovascular prosthesis unilateral

**34715** Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral

**34716** Open axillary/subclavian artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by infraclavicular or supraclavicular incision, unilateral

---

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

SVS, SIR, ACS, STS, AATS, ACC, and SCAI convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this family of EVAR codes. The specialties are not making direct practice expense input recommendations for CPT Codes 34709, 34X11, 34712, 34713, 34812, 34714, 34820, 34833, 34834, 34715 or 34716..

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

The specialties included CPT Code 35081 *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm, pseudoaneurysm, and associated occlusive disease, abdominal aorta* as the reference code for the standard 090 day services.

The specialties also included CPT Code 35082 *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for ruptured aneurysm, abdominal aorta* as the reference code for the emergent 090 day services. (Note: CMS file still has the standard 090 day inputs. RUC to f/u with CMS.)

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

N/A

**5. Please describe in detail the clinical activities of your staff:**

**Pre-Service Clinical Labor Activities:**

CPT Codes 34701, 34703, 34705, 34707, 34710 and 34712

The standard inputs for 090-day codes have been recommended for these procedures.

CPT Codes 34702, 34704, 34706 and 34708

These four procedures are 'rupture' codes. The specialties are recommending 20 minutes of clinical time consistent with the 'emergent procedure' inputs.

**Intra-Service Clinical Labor Activities:**

The standard time for discharge day management has been recommended for this procedure.

**Post-Service Clinical Labor Activities:**

CPT Codes 34701, 34703, 34705, 34707, 34710 and 34712 AND 34702, 34704, 34706 and 34708 are 090 day procedures. The post service clinical labor time recommendations relate to the post-operative evaluation and management visits.

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2017

### Treatment of Incompetent Veins

In September 2016, the CPT Editorial Panel created four new Category I codes, revised codes 36468, 36470, and 36471, and revised the guidelines and instructions for reporting treatment for incompetent veins, including deletion of parenthetical notes and guidelines.

#### **36468 *Injection(s) of sclerosant for spider veins (telangiectasia), limb or trunk***

CPT code 36468 was revised at the September 2016 CPT Editorial Panel meeting. The specialty societies indicated that this service contractor priced and restricted by Medicare and they did not conduct a survey. **The RUC does not have a recommendation for CPT code 36468.**

#### **36470 *Injection of sclerosant; single incompetent vein (other than telangiectasia)***

The RUC reviewed the survey results from 57 physicians and determined that the survey 25<sup>th</sup> percentile work RVU of 0.75 appropriately accounts for the work required to perform this service. The RUC recommends 9 minutes pre-service evaluation time, 1 pre-service minute scrub/dress/wait time, 15 minutes pre-service intra-service time and 5 minutes immediate post service time. The RUC indicated that 2 minutes were added to pre-evaluation time for preparation of sclerosant and to mark the site for injection and 1 minute subtracted from scrub/dress/wait time because there is no local anesthesia but added 1 minute back to scrub hands and put on sterile gloves.

The RUC noted that this service was changed from a 010-day global period to a 000-day global period to provide consistency within the family of treatment for venous insufficiency. During pre-facilitation the RUC noted that the survey respondents indicated that the physician intra-service time is the same, however, the work of the post-operative 99212 office visit is no longer included. Therefore, the specialty societies indicated that the survey 25<sup>th</sup> percentile work RVU of 0.75 appropriately decreases the work RVU for the post-operative visit that is no longer included in the global period for this service. The RUC compared the surveyed code to the second top key reference service 20612 *Aspiration and/or injection of ganglion cyst(s) any location* (work RVU = 0.70 and 5 minutes intra-service time) and determined that the surveyed service required more physician time and work and was indicated as more intense and complex on all measures examined. For additional support, the RUC referenced MPC codes 23350 *Injection procedure for shoulder arthrography or enhanced CT/MRI shoulder arthrography* (work RVU = 1.00 and 15 minutes intra-service time) and 12013 *Injection procedure for shoulder arthrography or enhanced CT/MRI shoulder arthrography* (work RVU = 1.22 and 15 minutes intra-service time) and noted that the MPC codes require the same intra-service time but are more intense. **The RUC recommends a work RVU of 0.75 for CPT code 36470.**

**36471 Injection of sclerosant; multiple incompetent veins (other than telangiectasia), same leg**

The RUC reviewed the survey results from 57 physicians and determined that the survey 25<sup>th</sup> percentile work RVU of 1.50 appropriately accounts for the work required to perform this service. The RUC recommends 12 minutes pre-service evaluation time, 1 pre-service minute scrub/dress/wait time, 30 minutes intra-service time and 10 minutes immediate post service time. The RUC indicated that 5 minutes were added to pre-evaluation time for preparation of sclerosant and to mark all sites for injection and 1 minute subtracted from scrub/dress/wait time because there is no local anesthesia but added 1 minute back to scrub hands and put on sterile gloves.

The RUC noted that this service was changed from a 010-day global period to a 000-day global period to provide consistency within the family of treatment for venous insufficiency. During pre-facilitation the RUC noted that the survey respondents indicated that the physician intra-service time is the same, however, the work of the post-operative 99212 office visit is no longer included. Therefore, the specialty societies indicated that the survey 25<sup>th</sup> percentile work RVU of 1.50 appropriately decreases the work RVU for the post-operative visit that is no longer included in the global period for this service. The RUC compared the surveyed code to the second top key reference service 49185 *Sclerotherapy of a fluid collection (eg, lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (eg, ultrasound, fluoroscopy) and radiological supervision and interpretation when performed* (work RVU = 2.35 and 30 minutes intra-service time) and determined that this service required more total time (67 minutes versus 53) and work to perform. For additional support the RUC referenced MPC code 32405 *Biopsy, lung or mediastinum, percutaneous needle* (work RVU = 1.68 and 30 minutes intra-service time) and noted that this code requires more total time (75 minutes versus 53) and work. **The RUC recommends a work RVU of 1.50 for CPT code 36471.**

**36465 Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; single incompetent extremity truncal vein (eg, great saphenous vein, accessory saphenous vein)**

The RUC reviewed the survey results from 53 physicians and determined that the survey 25<sup>th</sup> percentile work RVU of 2.35 appropriately accounts for the work required to perform this service. The RUC recommends 17 minutes pre-service evaluation time, 4 minutes pre-service positioning, 10 minutes pre-service scrub/dress/wait time, 25 minutes intra-service time and 10 minutes immediate post service time. The RUC indicated that 3 minutes were added to positioning time to adequately adjust the patient's extremity for access to the saphenous vein and 5 minutes added to the scrub/dress/wait time as a sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, which requires scrubbing and sterile gown, mask and gloves for the physician and clinical staff. The RUC noted that these same pre-time adjustments were recommended for 36473 (MOCA) in January 2015 and were accepted by the RUC and CMS.

The RUC pre-facilitation reviewers commented that the specialty societies proposed the same work RVU as code 36482 however 36465 requires 10 minutes less intra-service time. Therefore, the specialty society amended its recommendation to the survey 25<sup>th</sup> percentile work RVU of 2.35. The RUC compared the surveyed code to the top key reference service 49185 *Sclerotherapy of a fluid collection (eg, lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (eg, ultrasound, fluoroscopy) and radiological supervision and interpretation when performed* (work RVU = 2.35 and 30 minutes intra-service time) and these service require the

same physician work and total time (66 versus 67 minutes) to perform. For additional support the RUC referenced MPC codes 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU = 2.78 and 30 minutes intra-service time) and 64483 *Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level* (work RVU = 1.90 and 15 minutes intra-service time) and noted these services appropriately bracket the surveyed service and demonstrate the appropriate relativity across the payment schedule. **The RUC recommends a work RVU of 2.35 for CPT code 36465.**

***36466 Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; multiple incompetent truncal veins (eg, great saphenous vein, accessory saphenous vein), same leg***

The RUC reviewed the survey results from 49 physicians and determined that the survey 25<sup>th</sup> percentile work RVU of 3.00 appropriately accounts for the work required to perform this service. The RUC recommends 17 minutes pre-service evaluation time, 4 minutes pre-service positioning, 10 minutes pre-service scrub/dress/wait time, 35 minutes intra-service time and 10 minutes immediate post service time. The RUC indicated that 3 minutes were added to positioning time to adequately adjust the patient for access to the saphenous vein and 5 minutes added to the scrub/dress/wait time as a sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, which requires scrubbing and sterile gown, mask and gloves for the physician and clinical staff. The RUC noted that these same pre-time adjustments were recommended for 36473 (MOCA) in January 2015 and were accepted by the RUC and CMS.

The RUC pre-facilitation reviewers commented that original specialty societies proposed recommendation of median work RVU of 4.00 resulted in a higher intensity and the initial proposed increment between 36465 and 36466 was not adequate, therefore the specialty adjusted the recommendation to the survey 25<sup>th</sup> percentile work RVU of 3.00. The RUC noted that although 36466 and 36482 require similar physician time to complete, 36466 is slightly less intense than 36482 because 36482 typically requires manipulation of a long catheter from the puncture site to the termination of the vein to be treated, while 364C6 does not include this more intense and complex step. In addition, the total time of 36482 is 5 minutes longer than 36466. The RUC compared the surveyed code to the top key reference service 49185 *Sclerotherapy of a fluid collection (eg, lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (eg, ultrasound, fluoroscopy) and radiological supervision and interpretation when performed* (work RVU = 2.35 and 30 minutes intra-service time) noted that the surveyed code requires 5 more minutes of intra-service time and is more intense and complex on all but one of the measures surveyed. For additional support the RUC referenced MPC codes 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU = 2.78 and 30 minutes intra-service time) and 52441 *Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant* (work RVU = 4.50 and 30 minutes intra-service time) and noted these services appropriately bracket the surveyed code and demonstrate the appropriate relativity across the payment schedule. **The RUC recommends a work RVU of 3.00 for CPT code 36466.**

**36482 Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; first vein treated**

The RUC reviewed the survey results from 35 physicians and determined that the survey 25<sup>th</sup> percentile work RVU of 3.50 appropriately accounts for the work required to perform this service. The RUC recommends 17 minutes pre-service evaluation time, 4 minutes pre-service positioning, 10 minutes pre-service scrub/dress/wait time, 35 minutes intra-service time and 15 minutes immediate post service time. The RUC indicated that 3 minutes were added to positioning time to adequately adjust the patient's extremity for access to the saphenous vein and 5 minutes added to the scrub/dress/wait time as a sterile operating room technique is maintained for this procedure when performed in an office procedure/surgery suite, which requires scrubbing and sterile gown, mask and gloves for the physician and clinical staff. The RUC noted that these same pre-time adjustments were recommended for 36473 (MOCA) in January 2015 and were accepted by the RUC and CMS.

The RUC noted that although 36466 and 36482 require similar physician time to complete, 36466 is slightly less intense than 36482 because 36482 typically requires manipulation of a long catheter from the puncture site to the termination of the vein to be treated, while 36466 does not include this more intense and complex step. In addition, the total time of 36482 is 5 minutes longer than 36466. The RUC compared the surveyed code to a similar service that was recently reviewed, code 36473 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated* (work RVU = 3.50 and 30 minutes intra-service time) and noted that these service require the same physician work. For additional support the RUC referenced MPC code 52441 *Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant* (work RVU = 4.50 and 30 minutes intra-service time) and noted that this service demonstrates the appropriate cross specialty relativity. **The RUC recommends a work RVU of 3.50 for CPT code 36482.**

**36483 Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 30 physicians and surgeons and determined that the survey 25<sup>th</sup> percentile work RVU of 2.14 was too high and instead recommends a work RVU of 1.75. The specialty societies indicated and the RUC agreed that the work of this add-on is half of that of the base code 36482 (recommended work RVU = 3.50). The RUC recommends 20 minutes of intra-service time for 36483. The RUC notes when CMS finalized the values for MOCA codes 36473 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated* (work RVU = 3.50) and 36474 (work RVU = 1.75) *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*, CMS did not accept the RUC recommended work RVU for 36474 but instead applied a 50 percent reduction to the work RVU for 36473. The RUC recommends the same value for 36483 as the MOCA add-on 36474.

The RUC compared the surveyed add-on code to MPC codes 64480 *Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, each additional level (List separately in addition to code for primary procedure)* (work RVU = 1.20 and 15 minutes intra-service time) and 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 2.25 and 30 minutes intra-service time) and noted these services appropriately bracket the surveyed service and demonstrate the appropriate relativity across the payment schedule. **The RUC recommends a work RVU of 1.75 for CPT code 36483.**

### **Affirmation of RUC Recommendations**

The RUC affirmed the recent RUC recommendations for CPT codes 36473, 36475, 36476, 36478 and 36479 previously submitted after review in this coding cycle. The relativity within the family remains correct.

### **Practice Expense**

The Practice Expense Subcommittee made minor modifications to the direct practice expense inputs removing 2 minutes of clinical staff time to *Set-up scope* for CPT codes 36470 and 36471. The Subcommittee maintained 2 minutes to *Set-up scope* for CPT codes 36482, 36465, 36466, which is a proxy to set-up the ultrasound equipment. The PE Subcommittee discussed the number of clinical staff needed to assist the physician with this service and agreed with the specialty societies that the standard for an additional circulator used in interventional radiology services apply to these codes. The standard includes one staff to assist the physician and a separate staff represented by two clinical staff types to act as a circulator. For these services it is an RN/LPN (L042A), “hip to hip” with the physician to assist during the procedure and a vascular technologist, L054A (75%) and a RN/LPN/MTA, L037D (25%) to circulate. The RUC noted that the specialty is requesting new high priced supply items and noted 0.33 of a vial of the new foam supply item is used for the procedure for CPT codes 36465 and 36466. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

### **Work Neutrality**

The RUC’s recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

### **New Technology**

CPT codes 36482, 36483, 36465 and 36466 will be placed on the New Technology list to be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<p><b>Surgery</b>  <b>Cardiovascular System</b>  <b>Arteries and Veins</b>  <b>Vascular Injection Procedures</b>  <b>Venous</b></p> <p><i>Venipuncture, needle or...</i></p> <p>36460              <i>Transfusion, intrauterine, fetal</i>  <i>(Do not report modifier 63 in conjunction with 36460)</i>  <i>(For radiological supervision and interpretation, use 76941)</i></p> <p><del>Codes 36468, 36470, 36471 describe sclerotherapy of telangiectasia and/or incompetent veins. Ultrasound guidance, when performed, is not included and may be reported separately. When performed in the office setting, all required supplies and equipment are inherent to the procedure and not separately reportable.</del></p> <p><u>Codes 36468, 36470, 36471 describe injection(s) of a sclerosant for sclerotherapy of telangiectasia and/or incompetent vein(s). Code 36468 may only be reported once per extremity per session, regardless of the number of needle injections performed. Codes 36471, 36466 may only be reported once per extremity, regardless of the number of veins treated. Ultrasound guidance (76942), when performed, is not included in 36468, 36470, 36471 and may be reported separately.</u></p> <p><u>Codes 36465, 36466 describe injection(s) of a non-compounded foam sclerosant into an extremity truncal vein (eg, great saphenous vein, accessory saphenous vein) using ultrasound-guided compression of the junction of the central vein (saphenofemoral junction or saphenopopliteal junction) to limit the dispersion of injectate. Do not report 36465, 36466 for injection of compounded foam sclerosant(s).</u></p> <p><u>Compounding is a practice in which a qualified healthcare professional (eg, pharmacist, physician) combines, mixes, or alters ingredients of a drug to create a medication tailored to the needs of an individual patient.</u></p>				

When performed in the office setting, all required supplies and equipment are included in 36468, 36470, 36471, 36465, 36466 and may not be separately reported. In addition, application of compression dressing(s) (eg, compression bandages/stockings) is included of 36468, 36470, 36471, 36465, 36466, when performed, and may not be reported separately.

▲36468	V1	<p><del>Single or multiple injection(s) of sclerosing solutions, sclerosant for spider veins (telangiectasia), limb or trunk</del></p> <p><u>(For ultrasound imaging guidance performed in conjunction with 36468, use 76942)</u></p> <p><u>(Do not report 36468 in conjunction with 29581)</u></p> <p><u>(Do not report 36468 more than once per extremity)</u></p> <p><i>(Do not report 36468 in conjunction with 37241 in the same surgical field)</i></p> <p><i>(36469 has been deleted)</i></p>	000	Non-Covered Medicare Service No Recommendation

▲36471	V3	<p>multiple <u>incompetent</u> veins <u>(other than telangiectasia)</u>, same leg</p> <p><u>(For ultrasound imaging guidance performed in conjunction with 36470, 36471, use 76942)</u></p> <p><u>(Do not report 36470, 36471 in conjunction with 29581)</u></p> <p><u>(Do not report 36471 more than once per extremity)</u></p>	<del>010</del> 000	1.50

		<p><u>(If the targeted vein is an extremity truncal vein and injection of non-compounded foam sclerosant with ultrasound guided compression maneuvers to guide dispersion of the injectate is performed, see 36465, 36466)</u></p> <p><del>(For vascular embolization and occlusion procedures, see 37241, 37242, 37243, 37244)</del></p> <p><i>(Do not report 36470, 36471 in conjunction with 37241 in the same surgical field)</i></p>		
●36465	V4	<p>Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; single incompetent extremity truncal vein (eg, great saphenous vein, accessory saphenous vein)</p>	000	2.35
●36466	V5	<p>multiple incompetent truncal veins (eg, great saphenous vein, accessory saphenous vein), same leg</p> <p><u>(For extremity truncal vein injection of compounded foam sclerosant[s], see 36470, 36471)</u></p> <p><u>(Do not report 36465, 36466 in conjunction with 29581)</u></p> <p><u>(For injection of a sclerosant into an incompetent vein without compression maneuvers to guide dispersion of the injectate, see 36470, 36471)</u></p> <p><u>(For endovenous ablation therapy of incompetent vein[s] by transcatheter delivery of a chemical adhesive, see 36482, 36483)</u></p>	000	3.00

		<p><u>(For vascular embolization and occlusion procedures, see 37241, 37242, 37243, 37244)</u></p> <p>(Do not report 36470, 36471, <u>36465, 36466</u> in conjunction with 37241 in the same surgical field)</p>		
<p><del>Codes 36473, 36474, 36475, 36476, 36478, 36479 describe endovascular ablation therapy of incompetent extremity vein(s). Codes 36473, 36474 (mechanochemical ablation) are performed under local anesthesia and involve concomitant use of an intraluminal device that mechanically disrupts/abrades the venous intima and infusion of a physician-specified medication in the target vein(s). Sclerosant injection by either needle or catheter followed by a compression technique is not mechanochemical vein ablation. Codes 36475, 36476 (radiofrequency ablation) and 36478, 36479 (laser ablation) are performed under tumescent anesthesia. All imaging guidance and monitoring is inherent to all six endovascular ablation therapy codes. In addition, when performed in the office setting, all required supplies and equipment are inherent to the procedure and not separately reportable. The add-on codes for subsequent vein(s) treated in the same extremity may only be reported once per extremity, regardless of the number of additional vein(s) treated.</del></p> <p><u>Codes 36473, 36474, 36482, 36483, 36475, 36476, 36478, 36479 describe endovascular ablation therapy of incompetent extremity vein(s), including all necessary imaging guidance and monitoring. Sclerosant injection(s) of vein(s) by needle or mini-catheter (36468, 36470, 36471) followed by a compression technique is not endovascular ablation therapy. Codes 36473, 36474, 36482, 36483 can be performed under local anesthesia without the need for tumescent (peri-saphenous) anesthesia. Codes 36475, 36476, 36478, 36479 are performed using adjunctive tumescent anesthesia.</u></p> <p><u>Codes 36473, 36474 involve concomitant use of an intraluminal device that mechanically disrupts/abrades the venous intima and infusion of a physician-specified medication in the target vein(s).</u></p> <p><u>Codes 36482, 36483 involve positioning an intravenous catheter the length of an incompetent vein, remote from the percutaneous access site, with subsequent delivery of a chemical adhesive to ablate the incompetent vein. This often includes ultrasound compression of the outflow vein to limit the dispersion of the injected solution.</u></p> <p><u>Codes 36475, 36476 involve advancing a radiofrequency device the length of an incompetent vein, with subsequent delivery of radiofrequency energy to ablate the incompetent vein.</u></p> <p><u>Codes 36478, 36479 involve advancing a laser device the length of an incompetent vein, with subsequent delivery of thermal energy to ablate the incompetent vein.</u></p>				

Codes 36474, 36483, 36476, 36479 for subsequent vein(s) treated in the same extremity may only be reported once per extremity, regardless of the number of additional vein(s) treated.

When performed in the office setting, all required supplies and equipment are included in 36473, 36474, 36482, 36483, 36475, 36476, 36478, 36479 and may not be separately reported. In addition, application of compression dressing(s) (eg, compression bandages/stockings) is included in the work of 36473, 36474, 36482, 36483, 36475, 36476, 36478, 36479, when performed, and may not be reported separately.

(f) 36473	V6	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated	000	3.50  (Affirm January 2016 RUC recommendation)
(f) +36474	V7	<p>subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)</p> <p>(Use 36474 in conjunction with 36473)</p> <p>(Do not report 36474 more than once per extremity)</p> <p>(Do not report 36473, 36474 in conjunction with 29581, <del>29582</del>, 36000, 36002, 36005, 36410, 36425, 36475, 36476, 36478, 36479, 37241, 75894, 76000, 76001, 76937, 76942, 76998, 77022, 93970, 93971 in the same surgical field)</p> <p><del>(For catheter injection of sclerosant without concomitant endovascular mechanical disruption of the vein intima, use 37799)</del></p> <p><del>(For catheter injection of an adhesive, use 37799)</del></p>	ZZZ	1.75  (CMS 2017 Final Value)

●36482	V8	Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; first vein treated	000	3.50

December 12, 2016

Peter Smith, MD  
Chair, RVS Update Committee (RUC)  
The American Medical Association (AMA)  
330 North Wabash Ave.  
Chicago, IL 60611-5885

Re: Tab 11 Treatment of Incompetent Veins (36470-71, 36475, 364X3-X6)

Dear Dr. Smith,

The CPT Editorial panel created four new Category I codes, revised CPT Codes 36468, 36470, and 36471, and revised the guidelines and instructions for reporting treatment for incompetent veins, including deletion of parenthetical notes and guidelines approved by the CPT Editorial Panel for the 2017 code set. Attached are the multispecialty consensus panel (ACPh, ACS, SCAI, SIR and SVS) RUC recommendations for CPT Code 36470-1, 364X5-X6 and 364X3-X4.

**Reaffirm Values**

The consensus panel requests that the RUC reaffirm values for the recently reviewed procedures in this vein family:

- 364X1 (36473) 364X2 (36474) MOCA – RUC reviewed January 2016. Values will go into effect January 2018.
- 36475 & 36476 RFA Veins – RUC reviewed April 2014
- 36478 & 36479 Laser Veins – RUC reviewed April 2014

**NonCoverage**

Treatment of telangiectases (CPT code 36468) is a non-covered service for Medicare. As such, the specialty societies did not conduct a RUC survey for this procedure.

We look forward to presenting our recommendations at the upcoming RUC meeting in January.

Sincerely,

A handwritten signature in black ink, appearing to read 'Matthew Sideman', with a large, sweeping flourish at the end.

Matthew Sideman, MD  
SVS RUC Advisor

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

---

CPT Code: 36470      Tracking Number    V2

Original Specialty Recommended RVU: **1.10**Presented Recommended RVU: **0.75**

Global Period: 000

RUC Recommended RVU: **0.75**

CPT Descriptor: Single or multiple iInjection(s) of sclerosing solutions, sclerosant for spider veins (telangiectasia), limb or trunk (For ultrasound imaging guidance performed in conjunction with 36468, use 76942) (Do not report 36468 in conjunction with 29581) (Do not report 36468 more than once per extremity) (Do not report 36468 in conjunction with 37241 in the same surgical field) (36469 has been deleted)

---

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 35-year-old woman presents with a single symptomatic varicose vein on her left lower extremity. She complains of burning and aching with standing. The left greater saphenous vein has previously been surgically ablated. A trial of compression stockings has failed to provide relief. Compressive injection sclerotherapy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

---

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and informed consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at the access site prior to treatment needle insertion, and additional doses of local anesthesia are injected as needed throughout procedure.

Description of Intra-Service Work: Under loupe magnification, the feeder vein is identified. The feeder vein is accessed with a 30-G needle attached to a syringe that contains sclerosant. The sclerosant is injected into the feeder vein at multiple sites to sufficiently purge the blood from the vessel. The needle is removed while pressure is held over the treated area. Pressure is maintained at the site until hemostasis is assured.

Description of Post-Service Work: The extremity is elevated and a compression wrap or pressure dressing is applied from the toes up to a point above the level of injection. Desired outcome of primary treated vessel and any thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate compression stocking is applied to the extremity. Permanent reports are created for the medical record and copies are sent to the patient's referring physician.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Four new CPT codes were created to describe the work of endovenous ablation of incompetent veins by transcatheter delivery of a chemical adhesive and injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate. Editorial changes were also made to existing sclerotherapy codes, 36470 & 36471. The new CPT codes and changes to the existing codes were approved at the CPT Panel meeting in September 2016.

**Survey Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, SIR, and the American College of Phlebology (ACP). The survey results were reviewed by the multispecialty group and felt to be valid reflection of the physician work for these services.

**Work RVU Recommendation**

We recommend the median survey value of 1.10 RVW for 36470 which happens to also be the current value.

There has been ongoing flawed methodology in the creation of the current values for 36470. This code was originally valued by a Harvard with a survey of only 6 general surgeons. No post-op visits were included in this original evaluation. Several years later, some of the post-service time was arbitrarily converted by CMS into a piece of an office visit, 0.5 of a 99211. This code was reviewed as part of the 4<sup>th</sup> 5-year review, which resulted in surveys that had substantially higher values, but the specialty societies chose not to provide compelling evidence at that time, and the current RVW was retained. The survey times and visit were accepted into the database thereby serving to codify the inappropriate conversion of Harvard time into visits and inappropriately lowering the intensity of the procedure to 0.019. As part of the current effort, a global period change has been made from 10-day to 000 day for codes 36470 and 36471 in order to provide

consistency within the family of treatment for venous insufficiency. We therefore believe that compelling evidence is present, based on flawed methodology used to convert Harvard post-service time to one-half of a 99211 visit, and then to one full 99212 visit.

### **Pre-service Package**

Pre-time package 5 (Procedure with minimal anesthesia care) is appropriate with additional time as outlined below.

Evaluation – An additional 2 minutes for preparation of sclerosant and to mark the site for injection.

Scrub, Dress, and Wait – Subtraction of 1 minute as there is no local anesthesia but addition of 1 minute to don sterile gloves.

### **Comparison to key reference codes**

The key reference codes chosen by the majority of the survey respondents were 49185 *Sclerotherapy of a fluid collection (eg, lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (eg, ultrasound, fluoroscopy) and radiological supervision and interpretation when performed* (21%) and 20612 *Aspiration and/or injection of ganglion cyst(s) any location* (19%). The table below shows how 36470 correlates with the KRS:

<b>CPT</b>	<b>RVW</b>	<b>IWPUT</b>	<b>Total Time</b>	<b>Eval</b>	<b>Posit</b>	<b>SDW</b>	<b>INTRA</b>	<b>IM-post</b>
<b>20612 Key Ref</b>	0.70	0.073	20	10			5	5
<b>36470</b>	1.10	0.052	30	9		1	15	5
<b>49185 Key Ref</b>	2.35	0.054	67	13	3	6	30	15

### **Comparison to MPC codes**

MPC 23350 (*Injection procedure for shoulder arthrography or enhanced CT/MRI shoulder arthrography*) and MPC 12013 (*Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm*) are both 000-day global MPC services with similar times and intensity to 36470. The table below compares the MPC codes and our recommended value for 36470.

<b>CPT</b>	<b>RVW</b>	<b>IWPUT</b>	<b>Total Time</b>	<b>Eval</b>	<b>Posit</b>	<b>SDW</b>	<b>INTRA</b>	<b>IM-post</b>
<b>23350 MPC</b>	1.00	0.049	28	5	1	2	15	5
<b>36470</b>	1.10	0.052	30	9		1	15	5
<b>12013 MPC</b>	1.22	0.064	27	5	1	1	15	5

### **Additional Rationale**

The table below looks at the whole family of treatment of incompetent veins ranging from sclerotherapy to ablation including codes surveyed for this RUC meeting as well as the codes that have been surveyed and valued over the past 3 years.

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
36468	Sclero; spider veins	0.00		0			
<b>36470</b>	<b>Sclero; single vein</b>	<b>1.10</b>	<b>0.052</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>
<b>+36483</b>	<b>Chemical adhesive ablation; subsequent veins</b>	<b>1.75</b>	<b>0.088</b>	<b>20</b>		<b>20</b>	
+36474	Mechanochemical ablation (MOCA) subsequent veins	1.75	0.058	30		30	
<b>36471</b>	<b>Sclero; multiple veins</b>	<b>2.49</b>	<b>0.066</b>	<b>53</b>	<b>13</b>	<b>30</b>	<b>10</b>
+36476	Radiofrequency ablation; second and subsequent veins	2.65	0.088	30		30	
+36479	Laser ablation; second and subsequent veins	2.65	0.088	30		30	
<b>36465</b>	<b>Foam sclerosant; single truncal vein</b>	<b>3.50</b>	<b>0.109</b>	<b>66</b>	<b>31</b>	<b>25</b>	<b>10</b>
<b>36482</b>	<b>Chemical adhesive ablation; first vein</b>	<b>3.50</b>	<b>0.075</b>	<b>81</b>	<b>31</b>	<b>35</b>	<b>15</b>
36473	Mechanochemical ablation (MOCA); first vein	3.50	0.087	76	31	30	15
<b>36466</b>	<b>Foam sclerosant; multiple truncal veins</b>	<b>4.00</b>	<b>0.092</b>	<b>76</b>	<b>31</b>	<b>35</b>	<b>10</b>
36475	Radiofrequency ablation; first vein treated	5.30	0.097	94	35	45	15
36478	Laser ablation; first vein treated	5.30	0.097	94	35	45	15

### Conclusion

CPT code 36470 describes the work of sclerotherapy of a single incompetent vein. We recommend the median survey value of 1.10 RVW for 36470. Comparison with the selected key reference services, two MPC codes, and the family as a whole further supports our recommendation for 36470.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is

involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36470

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery                      How often? Commonly

Specialty General Surgery                      How often? Commonly

Specialty Cardiology                      How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

13,029 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Please explain the rationale for this estimate. Current 2015 Medicare data in the RUC database.

Specialty Vascular Surgery	Frequency 3775	Percentage 28.97 %
----------------------------	----------------	--------------------

Specialty General Surgery	Frequency 1805	Percentage 13.85 %
---------------------------	----------------	--------------------

Specialty Cardiology	Frequency 1289	Percentage 9.89 %
----------------------	----------------	-------------------

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36470

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

RUC Recommended RVU: **1.50**

CPT Descriptor: Injection of sclerosant: multiple incompetent veins (other than telangiectasia), same leg

(For ultrasound imaging guidance performed in conjunction with 36470, 36471, use 76942) (Do not report 36470, 36471 in conjunction with 29581) (Do not report 36471 more than once per extremity) (If the targeted vein is an extremity truncal vein and injection of non-compounded foam sclerosant with ultrasound guided compression maneuvers to guide dispersion of the injectate is performed, see 36465, 36466) (For vascular embolization and occlusion procedures, see 37241, 37242, 37243, 37244) (Do not report 36470, 36471 in conjunction with 37241 in the same surgical field)

---

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 35-year-old female presents with multiple symptomatic varicosities on her left lower extremity. She complains of burning and aching when standing. The left greater saphenous vein has been surgically ablated previously. A trial of compression stockings has failed to bring relief. Compressive injection sclerotherapy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

---

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and informed consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at the access site prior to treatment needle insertion, and additional doses of local anesthesia are injected as needed throughout procedure.

Description of Intra-Service Work: Under loupe magnification, the feeder vein is identified. The feeder vein is accessed with a 30-G needle attached to a syringe that contains sclerosant. The sclerosant is injected into the feeder vein at multiple sites to sufficiently purge the blood from the vessel. The needle is removed while pressure is held over the treated area. Pressure is maintained at the site until hemostasis is assured. This process is repeated for all symptomatic veins.

Description of Post-Service Work: The extremity is elevated and a compression wrap or pressure dressing is applied from the toes up to a point above the level of injection. Desired outcome of primary treated vessel and any thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate compression stocking is applied to the extremity. Permanent reports are created for the medical record and copies are sent to the patient's referring physician.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Four new CPT codes were created to describe the work of endovenous ablation of incompetent veins by transcatheter delivery of a chemical adhesive and injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate. Editorial changes were also made to existing sclerotherapy codes, 36470 & 36471. The new CPT codes and changes to the existing codes were approved at the CPT Panel meeting in September 2016.

**Survey Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, SIR, and the American College of Phlebology (ACP). The survey results were reviewed by the multispecialty group and felt to be valid reflection of the physician work for these services.

**Work RVU Recommendation**

We recommending the median survey value of 2.49 RVW for 36471.

**Compelling Evidence**

There has been ongoing flawed methodology in the creation of the current value for 36471. This code was originally valued by a Harvard survey of only 8 general surgeons. No post-op visits were included in this original evaluation. Several years later, some of the post-service time was converted by CMS to 1.5 x 99212 visits. This code was reviewed as part of the 4<sup>th</sup> 5-year review, which resulted in surveys that had higher median work values, but the specialty societies chose not to provide compelling evidence at that time. The

survey times and visits were accepted into the database thereby serving to codify the inappropriate conversion of Harvard time into visits and inappropriately lowering the intensity of the procedure to 0.019. As part of the current effort, a global period change has been made from 10-day to 000 day global for 36470 & 36471 for consistency within the family of treatment for venous insufficiency. We therefore believe that compelling evidence is present, based on flawed methodology that converted Harvard post-service time to 1.5 99212 office visits and then to one full 99212 visit.

### **Pre-service Package**

Pre-time package 5 (Procedure with minimal anesthesia care) is appropriate with additional time as outlined below.

**Evaluation** – An additional 5 minutes for preparation of sclerosant and to mark all sites for injection.

**Scrub, Dress, and Wait** – Subtraction of 1 minute as there is no local anesthesia but addition of 1 minute to don sterile gloves.

### **Comparison to key reference codes**

The key reference codes chosen by the majority of the survey respondents were 32555 *Thoracentesis, needle or catheter, aspiration of the pleural space; with imaging guidance* (21%) and 49185 *Sclerotherapy of a fluid collection (eg, lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (eg, ultrasound, fluoroscopy) and radiological supervision and interpretation when performed* (19%). The table below shows how 36471 correlates with the KRS:

<b>CPT</b>	<b>RVW</b>	<b>IWPUT</b>	<b>Total Time</b>	<b>Eval</b>	<b>Posit</b>	<b>SDW</b>	<b>INTRA</b>	<b>IM-post</b>
<b>32555 Key Ref</b>	2.27	0.076	57	13	3	6	20	15
<b>49185 Key Ref</b>	2.35	0.054	67	13	3	6	30	15
<b>36471</b>	2.49	0.066	53	12		1	30	10

### **Comparison to MPC codes**

MPC 52005 (*Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service;*) and MPC 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*) are both 000-day global MPC services with similar times and intensity to 36471. The table below compares the MPC codes and our recommended value for 36471.

<b>CPT</b>	<b>RVW</b>	<b>IWPUT</b>	<b>Total Time</b>	<b>Eval</b>	<b>Posit</b>	<b>SDW</b>	<b>INTRA</b>	<b>IM-post</b>
<b>52005 MPC</b>	2.37	0.045	79	19	5	5	30	20
<b>36471</b>	2.49	0.066	53	12		1	30	10
<b>31622 MPC</b>	2.78	0.068	66	13	3	5	30	15

**Additional Rationale**

The table below looks at the whole family of treatment of incompetent veins ranging from sclerotherapy to ablation including codes surveyed for this RUC meeting as well as the codes that have been surveyed and valued over the past 3 years.

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
36468	Sclero; spider veins	0.00		0			
<b>36470</b>	<b>Sclero; single vein</b>	<b>1.10</b>	<b>0.052</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>
<b>+36483</b>	<b>Chemical adhesive ablation; subsequent veins</b>	<b>1.75</b>	<b>0.088</b>	<b>20</b>		<b>20</b>	
36474	Mechanochemical ablation (MOCA) subsequent veins	1.75	0.058	30		30	
<b>36471</b>	<b>Sclero; multiple veins</b>	<b>2.49</b>	<b>0.066</b>	<b>53</b>	<b>13</b>	<b>30</b>	<b>10</b>
36476	Radiofrequency ablation; second and subsequent veins	2.65	0.088	30		30	
36479	Laser ablation; second and subsequent veins	2.65	0.088	30		30	
<b>36465</b>	<b>Foam sclerosant; single truncal vein</b>	<b>3.50</b>	<b>0.109</b>	<b>66</b>	<b>31</b>	<b>25</b>	<b>10</b>
<b>36482</b>	<b>Chemical adhesive ablation; first vein</b>	<b>3.50</b>	<b>0.075</b>	<b>81</b>	<b>31</b>	<b>35</b>	<b>15</b>
36473	Mechanochemical ablation (MOCA); first vein	3.50	0.087	76	31	30	15
<b>36466</b>	<b>Foam sclerosant; multiple truncal veins</b>	<b>4.00</b>	<b>0.092</b>	<b>76</b>	<b>31</b>	<b>35</b>	<b>10</b>
36475	Radiofrequency ablation; first vein treated	5.30	0.097	94	35	45	15
36478	Laser ablation; first vein treated	5.30	0.097	94	35	45	15

**Conclusion**

CPT code 36471 describes the work of sclerotherapy of multiple incompetent veins. We recommend the median survey value of 2.49 RVW for 36471. Comparison with the selected key reference services, two MPC codes, and the family as a whole further supports our recommendation for 36471.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.

BETOS Sub-classification Level II:

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 36465      Tracking Number   V4

Original Specialty Recommended RVU: **3.50**Presented Recommended RVU: **2.35**

Global Period: 000

RUC Recommended RVU: **2.35**

CPT Descriptor: Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; single incompetent extremity truncal vein (eg, great saphenous vein, accessory saphenous vein)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. She chooses to undergo foam chemical ablation of the great saphenous vein under local anesthesia.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and informed consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at the access site prior to treatment needle insertion, and additional doses of local anesthesia are injected as needed throughout procedure.

Description of Intra-Service Work: Ultrasound guidance is utilized to localize the primary target truncal vein (eg, great saphenous vein) as well as map and mark entire length of this target vein. The target vein is accessed under ultrasound guidance (not separately reportable). A guidewire is introduced using Seldinger technique. A dilator is advanced over the guidewire, and the dilator is exchanged for a sheath. Guidewire is removed, and sheath is flushed. With the leg elevated, non-compounded foam sclerosant is injected through the sheath with ultrasound monitoring to identify arrival at the saphenofemoral junction. Manual compression is performed to prevent flow of foam sclerosant into the common femoral vein. Chemical agent administration is stopped. The treated vein is observed with ultrasound to ensure appropriate localization of non-compounded foam sclerosant. Repeat ultrasound is performed to confirm successful vein ablation. After a period of continued compression, the catheter and sheath are removed. The injected volume of non-compounded foam is recorded.

Description of Post-Service Work: Desired outcome of primary treated vessel and any thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate compression stocking is applied to the extremity. Permanent reports are created for the medical record and copies are sent to the patient's referring physician.

Overall intensity/complexity	0.46	0.13
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Four new CPT codes were created at the September 2016 CPT Panel meeting to describe the work of endovenous ablation therapy by transcatheter delivery of a chemical adhesive (2 new codes) and by injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate (2 new codes). This SOR reports our recommendation for 36465, Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; single incompetent extremity truncal vein (eg, great saphenous vein, accessory saphenous vein)

**Survey Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, SIR, and the American College of Phlebology (ACP). The survey results were reviewed by the multispecialty group and felt to be valid reflection of the physician work for these services.

**Pre-service Package**

Pre-time package 6 (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with additional time as outlined below.

1. **Positioning:** The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably

in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.

2. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

These same pre-time adjustments were recommended for 36473 (MOCA) in January 2015 and were accepted by the RUC and CMS.

### Comparison to key reference codes

The key reference codes chosen by the majority of the survey respondents were 49185 *Sclerotherapy of a fluid collection (eg, lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (eg, ultrasound, fluoroscopy) and radiological supervision and interpretation when performed* (25%) and 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (15%). The table below shows how 36465 correlates with the KRS:

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>49185 KRS Sclerotherapy Lymphocele</b>	2.35	0.054	67	13	3	6	30	15
<b>36465 Inject Non-compnded foam sclerosant</b>	2.35	0.063	66	17	4	10	25	10
<b>37191 KRS Insert Vena Cava Filter</b>	4.71	0.120	83	30	3	5	30	15

### Comparison to MPC codes

MPC 31622 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)*) and MPC 52441 (*Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant*) are both 000-day global MPC services with similar times and intensity to 36465. The table below compares the MPC codes and our recommended value for 36465.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>36465 Inject Non-compounded foam sclerosant</b>	2.35	0.063	66	17	4	10	25	10
<b>31622 MPC Cysto with Fulguration</b>	2.78	0.069	65	10	5	5	30	15
<b>52441 MPC Cysto w/ Implant</b>	4.50	0.113	93	17	5	20	30	21

**Additional Rationale**

The tables below look at the family of ‘treatment of incompetent veins’ surveyed for this meeting as well as the vein codes surveyed over the past 3 years.

**Sorted by Intensity:**

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
<b>36470</b>	<b>Sclero; single vein</b>	<b>0.62</b>	<b>0.020</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>

**Conclusion**

The multispecialty panel recommends the 25<sup>th</sup> percentile of 2.35 for CPT Code 364X5.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery                      How often? Sometimes

Specialty Interventional Radiology                      How often? Sometimes

Specialty Cardiology                      How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,500

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. A one year Medicare national estimate is challenging

Specialty Vascular Surgery	Frequency 1000	Percentage 40.00 %
----------------------------	----------------	--------------------

Specialty Interventional Radiology                      Frequency 1000                      Percentage 40.00 %

Specialty Cardiology                      Frequency 250                      Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

---

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36475

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 36466      Tracking Number   V5

Original Specialty Recommended RVU: **4.00**Presented Recommended RVU: **3.00**

Global Period: 000

RUC Recommended RVU: **3.00**

CPT Descriptor: Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; multiple incompetent truncal veins (eg, great saphenous vein, accessory saphenous vein), same leg

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein and small saphenous vein insufficiency with resultant superficial varicosities. She chooses to undergo foam chemical ablation of the great saphenous and anterior accessory saphenous veins under local anesthesia.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and informed consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at the access site prior to treatment needle insertion, and additional doses of local anesthesia are injected as needed throughout procedure.

Description of Intra-Service Work: Ultrasound guidance is utilized to localize the primary target truncal vein (eg, great saphenous vein) as well as map and mark entire length of target vein. The target vein is accessed under ultrasound guidance (not separately reportable). A guidewire is introduced using Seldinger technique. A dilator is advanced over the guidewire, and the dilator is exchanged for a sheath. The guidewire is removed, and the sheath is flushed. With the leg elevated, non-compounded foam sclerosant is injected through the sheath with ultrasound monitoring to identify arrival at the saphenofemoral junction. Manual compression is performed to prevent the flow of foam sclerosant into the common femoral vein. Chemical agent administration is stopped. The treated vein is observed with ultrasound to ensure successful ablation. After a period of continued compression of the outflow vein, the catheter and sheath are removed. The injected volume of non-compounded foam sclerosant is recorded. This process is repeated entirely for a second truncal vein (eg anterior accessory saphenous vein).

Description of Post-Service Work: Desired outcome of primary treated vessel and any thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate compression stocking is applied to the extremity. Permanent reports are created for the medical record and copies are sent to the patient's referring physician.

------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Four new CPT codes were created at the September 2016 CPT Panel meeting to describe the work of endovenous ablation therapy by transcatheter delivery of a chemical adhesive (2 codes) and by injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate (2 codes). This SOR reports our recommendation for new 0-day global code 36466, Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; multiple incompetent truncal veins (eg, great saphenous vein, accessory saphenous vein), same leg

**Survey Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, SIR, and the American College of Phlebology (ACP). The survey results were reviewed by the multispecialty group and felt to be valid reflection of the physician work for these services.

**Pre-service Package**

Pre-time package 6 (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with additional time as outlined below.

1. **Positioning:** The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably

in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.

2. Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

These same pre-time adjustments were recommended for 36473 (MOCA) in January 2015 and were accepted by the RUC and CMS.

### Comparison to key reference codes

The key reference codes chosen by the majority of the survey respondents were 49185 *Sclerotherapy of a fluid collection (eg, lymphocele, cyst, or seroma), percutaneous, including contrast injection(s), sclerosant injection(s), diagnostic study, imaging guidance (eg, ultrasound, fluoroscopy) and radiological supervision and interpretation when performed* (20%) and 36246 *Selective catheter placement, arterial system; initial second order abdominal, pelvic, or lower extremity artery branch, within a vascular family* (18%). The table below shows how 36466 correlates with the KRS:

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>49185 KRS Sclerotherapy Lymphocele</b>	2.35	0.088	67	13	3	6	30	15
<b>36466 Inject Non-compnded Foam sclerosant multiple sites</b>	3.00	0.064	76	17	4	10	35	10
<b>36246 KRS Selective arterial cath Placement 2<sup>nd</sup> order</b>	5.27	0.088	106	33	3	5	45	20

### Comparison to MPC codes

MPC 31622 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)*) and MPC 52441 (*Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant*) are both 000-day global MPC services with similar times and intensity to 36466. The table below compares the MPC codes and our recommended value for 36466.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>31622 MPC Cysto with Fulguration</b>	2.78	0.069	65	10	5	5	30	15
<b>36466 Inject Non-compounded Foam sclerosant Multiple sites</b>	3.00	0.064	76	17	4	10	35	10
<b>52441 MPC Cysto w/ Implant</b>	4.50	0.113	93	17	5	20	30	21

**Additional Rationale**

The tables below look at the family of ‘treatment of incompetent veins’ surveyed for this meeting as well as the vein codes surveyed over the past 3 years.

**Sorted by Intensity:**

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
<b>36470</b>	<b>Sclero; single vein</b>	<b>0.62</b>	<b>0.020</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>

**Conclusion**

The multispecialty group recommends the 25<sup>th</sup> percentile of 3.00 for CPT Code 36466.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery

How often? Sometimes

Specialty Interventional Radiology

How often? Sometimes

Specialty Cardiology

How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,500

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimating a national one year Medicare number is challenging

Specialty Vascular Surgery	Frequency 600	Percentage 40.00 %
Specialty Intervetional Radiology	Frequency 600	Percentage 40.00 %
Specialty Cardiology	Frequency 150	Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

---

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

Original Specialty Recommended RVU: **3.50**Presented Recommended RVU: **3.50**

Global Period: 000

RUC Recommended RVU: **3.50**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; first vein treated

---

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. She chooses to undergo chemical adhesive endovenous ablation therapy of the great saphenous vein under local anesthesia.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

---

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and informed consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at the access site prior to treatment needle insertion, and additional doses of local anesthesia are injected as needed throughout procedure.

Description of Intra-Service Work: A confirmatory ultrasound is performed to identify the target vein and note tributary branches. An access point is identified, and the overlying skin is injected with local anesthetic. Using ultrasound guidance and the Seldinger technique, intravascular access is obtained in the target vein. A catheter is then introduced and guided along the vein. The ultrasound probe is used for manual pressure to compress the outflow of the vein, confirming apposition of the walls. The chemical adhesive is injected under ultrasound visualization. After a period of continued compression of the outflow vein, the catheter and sheath are removed.

Description of Post-Service Work: Desired outcome of primary treated vessel and any thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate compression stocking is applied to the extremity. Permanent reports are created for the medical record and copies are sent to the patient's referring physician.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Four new CPT codes were created at the September 2016 CPT Panel meeting to describe the work of endovenous ablation therapy by transcatheter delivery of a chemical adhesive (2 new codes) and by injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate (2 new codes). This SOR reports our recommendation for 36482, Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; first vein treated

**Survey Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, SIR, and the American College of Phlebology (ACP). The survey results were reviewed by the multispecialty group and felt to be valid reflection of the physician work for these services.

**Work RVU Recommendation**

We are recommending the 25<sup>th</sup> percentile survey results of 3.50 RVW for 36482.

**Pre-service Package**

Pre-time package 6 (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with additional time as outlined below.

1. **Positioning:** The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.
2. **Scrub, dress, and wait:** An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

These same pre-time adjustments were recommended for 36473 (MOCA) in January 2015 and were accepted by the RUC and CMS.

### **Comparison to key reference codes**

The key reference codes chosen by the majority of the survey respondents were 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (31%) and 36246 *Selective catheter placement, arterial system; initial second order abdominal, pelvic, or lower extremity artery branch, within a vascular family* (23%). The table below shows how the correlation of the KRS and 36482.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>36246 KRS 2<sup>nd</sup> order arterial cath</b>	5.27	0.088	106	33	3	5	45	20
<b>37191 KRS Insert IVC Filter</b>	4.71	0.120	83	30	3	5	30	15
<b>36482 transcath chemical adhesive</b>	3.50	0.075	81	17	4	10	35	15

### **Comparison to MPC codes**

MPC 31622 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)*) and MPC 52441 (*Cystourethroscopy, with insertion of permanent adjustable transprostatic implant; single implant*) are both 000-day global MPC services with similar times and intensity to 36482. The table below compares the MPC codes and our recommended value for 36482.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>31622 MPC Cysto w/ fulgurate</b>	2.78	0.069	65	10	5	5	30	15
<b>36482 Transcath chemical Adhesive</b>	3.50	0.075	81	17	4	10	35	15

<b>52441 MPC Cysto w/ implant</b>	4.50	0.113	93	17	5	20	30	21
---	------	-------	----	----	---	----	----	----

### Additional Rationale

The tables below looks at the family of ‘treatment of incompetent veins’ surveyed for this meeting as well as the vein codes surveyed over the past 3 years.

#### Sorted by Intensity:

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
<b>36470</b>	<b>Sclero; single vein</b>	<b>0.62</b>	<b>0.020</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>
<b>36471</b>	<b>Sclero; multiple veins</b>	<b>1.30</b>	<b>0.027</b>	<b>53</b>	<b>13</b>	<b>30</b>	<b>10</b>
36474	Mechanochemical ablation (MOCA) subsequent veins	1.75	0.058	30		30	
<b>36465</b>	<b>Foam sclerosant; single truncal vein</b>	<b>2.35</b>	<b>0.063</b>	<b>66</b>	<b>31</b>	<b>25</b>	<b>10</b>
<b>36466</b>	<b>Foam sclerosant; multiple truncal veins</b>	<b>3.00</b>	<b>0.064</b>	<b>76</b>	<b>31</b>	<b>35</b>	<b>10</b>
<b>36482</b>	<b>Chemical adhesive ablation; first vein</b>	<b>3.50</b>	<b>0.075</b>	<b>81</b>	<b>31</b>	<b>35</b>	<b>15</b>
36473	Mechanochemical ablation (MOCA); first vein	3.50	0.087	76	31	30	15
<b>+36483</b>	<b>Chemical adhesive ablation; subsequent veins</b>	<b>1.75</b>	<b>0.088</b>	<b>20</b>		<b>20</b>	
36476	Radiofrequency ablation; second and subsequent veins	2.65	0.088	30		30	
36479	Laser ablation; second and subsequent veins	2.65	0.088	30		30	
36475	Radiofrequency ablation; first vein treated	5.30	0.097	94	35	45	15
36478	Laser ablation; first vein treated	5.30	0.097	94	35	45	15
36468	Sclero; spider veins	C					

#### Sorted in CPT order:

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
36468	Sclero; spider veins	C					
<b>36470</b>	<b>Sclero; single vein</b>	<b>0.62</b>	<b>0.020</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>
<b>36471</b>	<b>Sclero; multiple veins</b>	<b>1.30</b>	<b>0.027</b>	<b>53</b>	<b>13</b>	<b>30</b>	<b>10</b>
36473	Mechanochemical ablation (MOCA); first vein	3.50	0.087	76	31	30	15
36474	Mechanochemical ablation (MOCA) subsequent veins	1.75	0.058	30		30	
36475	Radiofrequency ablation; first vein treated	5.30	0.097	94	35	45	15
36476	Radiofrequency ablation; second and subsequent veins	2.65	0.088	30		30	
36478	Laser ablation; first vein treated	5.30	0.097	94	35	45	15
36479	Laser ablation; second and subsequent veins	2.65	0.088	30		30	
<b>+36483</b>	<b>Chemical adhesive ablation; subsequent veins</b>	<b>1.75</b>	<b>0.088</b>	<b>20</b>		<b>20</b>	
<b>36482</b>	<b>Chemical adhesive ablation; first vein</b>	<b>3.50</b>	<b>0.075</b>	<b>81</b>	<b>31</b>	<b>35</b>	<b>15</b>
<b>36465</b>	<b>Foam sclerosant; single truncal vein</b>	<b>2.35</b>	<b>0.063</b>	<b>66</b>	<b>31</b>	<b>25</b>	<b>10</b>
<b>36466</b>	<b>Foam sclerosant; multiple truncal veins</b>	<b>3.00</b>	<b>0.064</b>	<b>76</b>	<b>31</b>	<b>35</b>	<b>10</b>

**Conclusion**

The multispecialty panel agree that the physician work for code 36482 is the same as the new MOCA vein ablation code, 36473, which supports our recommendation of the 25<sup>th</sup> percentile value. Comparison with the selected key reference services, two MPC codes, and the family as a whole further supports our recommendation for 36482.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery                      How often? Sometimes

Specialty Interventional Radiology                      How often? Sometimes

Specialty Cardiology                      How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,000  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimating the Medicare utilization for this new procedure is challenging.

Specialty Vascular Surgery	Frequency 400	Percentage 40.00 %
Specialty Interventional Radiology	Frequency 400	Percentage 40.00 %
Specialty Cardiology	Frequency 100	Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

---

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36475

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 36483      Tracking Number   V9

Original Specialty Recommended RVU: **1.75**Presented Recommended RVU: **1.75**

Global Period: ZZZ

RUC Recommended RVU: **1.75**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great and small saphenous vein insufficiency with resultant superficial varicosities. She chooses to undergo chemical adhesive endovenous ablation therapy of the great and small saphenous vein under local anesthesia.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and informed consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at the access site prior to treatment needle insertion, and additional doses of local anesthesia are injected as needed throughout procedure.

Description of Intra-Service Work: After performing endovascular ablative therapy of a first vein with chemical adhesive (separately reported), a second target vein is identified using ultrasound, noting tributary branches. An access point is identified, and the overlying skin is injected with local anesthetic. Using ultrasound guidance and the Seldinger technique, intravascular access is obtained in the target vein. A catheter is then introduced and guided along the vein. The ultrasound probe is used for manual pressure to compress the outflow of the vein, confirming apposition of the walls. The chemical adhesive is injected under ultrasound visualization. After a period of continued compression of the outflow vein, the catheter and sheath are removed.

Description of Post-Service Work: Desired outcome of primary treated vessel and any thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate compression stocking is applied to the extremity. Permanent reports are created for the medical record and copies are sent to the patient's referring physician.

------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Four new CPT codes were created at the September 2016 CPT Panel meeting to describe the work of endovenous ablation therapy by transcatheter delivery of a chemical adhesive (2 codes) and by injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate (2 codes). This SOR reports our recommendation for ZZZ Add-on code 36483, Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

**Survey Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, SIR, and the American College of Phlebology (ACP). The survey results were reviewed by the multispecialty group and felt to be valid reflection of the physician work for these services.

**Work RVU Recommendation**

We are recommending that the value for the ZZZ add-on additional vein ablation by delivery of a chemical adhesive, CPT 36483, be set at one half the value of 36382. This results in a value of 1.75 RVW for 36483. This value is below our 25<sup>th</sup> percentile survey value and directly correlates to the value that CMS finalized for CPT 36474 (MOCA, additional vein) in the Final Medicare Physicians Fee Schedule Rule for 2017.

**Comparison to key reference codes**

The key reference codes chosen by the majority of the survey respondents were 37239 *Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; each additional vein (List separately in addition to code for primary procedure)* (30%) and 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (27%). The table below shows the correlation of the KRS and 36483.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37239 KRSSStent in additional vein</b>	2.97	0.098	32	1			30	1
<b>36227 KRS Selective Cath External Carotid</b>	2.09	0.139	15				15	
<b>36483 Additional Vein Transcath Chemical Adhesive</b>	1.75	0.088	20				20	

**Comparison to MPC codes**

MPC 64480 (*Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, each additional level (List separately in addition to code for primary procedure)*) and MPC 99292 (*Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)*) are both ZZZ global MPC services with similar times and intensity to 36483. The table below compares the MPC codes and our recommended value for 36483.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>64480 MPC Additional Anesth Injection</b>	1.20	0.080	15				15	
<b>36483 Additional Vein Transcath Chemical Adhesive</b>	1.75	0.088	20				20	
<b>99292 MPC Critical Care Additional 30 min</b>	2.25	0.075	30				30	

**Additional Rationale**

The tables below look at the family of ‘treatment of incompetent veins’ surveyed for this meeting as well as the vein codes surveyed over the past 3 years.

Sorted by Intensity:

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
<b>36470</b>	<b>Sclero; single vein</b>	<b>0.62</b>	<b>0.020</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>
<b>36471</b>	<b>Sclero; multiple veins</b>	<b>1.30</b>	<b>0.027</b>	<b>53</b>	<b>13</b>	<b>30</b>	<b>10</b>
36474	Mechanochemical ablation (MOCA) subsequent veins	1.75	0.058	30		30	
<b>36465</b>	<b>Foam sclerosant; single truncal vein</b>	<b>2.35</b>	<b>0.063</b>	<b>66</b>	<b>31</b>	<b>25</b>	<b>10</b>
<b>36466</b>	<b>Foam sclerosant; multiple truncal veins</b>	<b>3.00</b>	<b>0.064</b>	<b>76</b>	<b>31</b>	<b>35</b>	<b>10</b>
<b>36482</b>	<b>Chemical adhesive ablation; first vein</b>	<b>3.50</b>	<b>0.075</b>	<b>81</b>	<b>31</b>	<b>35</b>	<b>15</b>
36473	Mechanochemical ablation (MOCA); first vein	3.50	0.087	76	31	30	15
<b>+36483</b>	<b>Chemical adhesive ablation; subsequent veins</b>	<b>1.75</b>	<b>0.088</b>	<b>20</b>		<b>20</b>	
36476	Radiofrequency ablation; second and subsequent veins	2.65	0.088	30		30	
36479	Laser ablation; second and subsequent veins	2.65	0.088	30		30	
36475	Radiofrequency ablation; first vein treated	5.30	0.097	94	35	45	15
36478	Laser ablation; first vein treated	5.30	0.097	94	35	45	15
36468	Sclero; spider veins	C					

Sorted in CPT order:

CPT	Short Descriptor	RVW	IWPUT	Total Time	Pre	INTRA	Post
36468	Sclero; spider veins	C					
<b>36470</b>	<b>Sclero; single vein</b>	<b>0.62</b>	<b>0.020</b>	<b>30</b>	<b>10</b>	<b>15</b>	<b>5</b>
<b>36471</b>	<b>Sclero; multiple veins</b>	<b>1.30</b>	<b>0.027</b>	<b>53</b>	<b>13</b>	<b>30</b>	<b>10</b>
36473	Mechanochemical ablation (MOCA); first vein	3.50	0.087	76	31	30	15
36474	Mechanochemical ablation (MOCA) subsequent veins	1.75	0.058	30		30	
36475	Radiofrequency ablation; first vein treated	5.30	0.097	94	35	45	15
36476	Radiofrequency ablation; second and subsequent veins	2.65	0.088	30		30	
36478	Laser ablation; first vein treated	5.30	0.097	94	35	45	15
36479	Laser ablation; second and subsequent veins	2.65	0.088	30		30	
<b>+36483</b>	<b>Chemical adhesive ablation; subsequent veins</b>	<b>1.75</b>	<b>0.088</b>	<b>20</b>		<b>20</b>	
<b>36482</b>	<b>Chemical adhesive ablation; first vein</b>	<b>3.50</b>	<b>0.075</b>	<b>81</b>	<b>31</b>	<b>35</b>	<b>15</b>
<b>36465</b>	<b>Foam sclerosant; single truncal vein</b>	<b>2.35</b>	<b>0.063</b>	<b>66</b>	<b>31</b>	<b>25</b>	<b>10</b>
<b>36466</b>	<b>Foam sclerosant; multiple truncal veins</b>	<b>3.00</b>	<b>0.064</b>	<b>76</b>	<b>31</b>	<b>35</b>	<b>10</b>

Conclusion

We recommend valuing the ZZZ add-on code, CPT 36483, at one half the value of the base code, 36482. This recommendation will mirror the values for the recently valued MOCA codes which we feel have identical

work to these new codes. Comparison with the selected key reference services, two MPC codes, and the family as a whole further supports our recommendation of 1.75 RVW for 36483.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery                      How often? Sometimes

Specialty Interventional Radiology                      How often? Sometimes

Specialty Cardiology                      How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 500  
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimating a one year Medicare number is challenging.

Specialty Vascular Surgery	Frequency 200	Percentage 40.00 %
----------------------------	---------------	--------------------

Specialty Interventional Radiology

Frequency 200

Percentage 40.00 %

Specialty Cardiology

Frequency 50

Percentage 10.00 %

Do many physicians perform this service across the United States? Yes

---

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36475

### Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

**Meeting Date:** January 2017

**Global Period:** 000

36470 Injection of sclerosant; single incompetent vein (other than telangiectasia)

36471 Injection of sclerosant; multiple incompetent veins (other than telangiectasia), same leg

(For ultrasound imaging guidance performed in conjunction with 36470, 36471, use 76942)

(Do not report 36470, 36471 in conjunction with 29581)

(Do not report 36471 more than once per extremity)

(If the targeted vein is an extremity truncal vein and injection of non-compounded foam sclerosant with ultrasound guided compression maneuvers to guide dispersion of the injectate is performed, see 36465, 36466)

(Do not report 36470, 36471 in conjunction with 37241 in the same surgical field)

36465 Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; single incompetent extremity truncal vein (eg, great saphenous vein, accessory saphenous vein)

36466 Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; multiple incompetent truncal veins (eg, great saphenous vein, accessory saphenous vein), same leg

(For extremity truncal vein injection of compounded foam sclerosant[s], see 36470, 36471)

(Do not report 36465, 36466 in conjunction with 29581)

(For injection of a sclerosant into an incompetent vein without compression maneuvers to guide dispersion of the injectate, see 36470, 36471)

(For endovenous ablation therapy of incompetent vein[s] by transcatheter delivery of a chemical adhesive, see 36482, 36483)

(For vascular embolization and occlusion procedures, see 37241, 37242, 37243, 37244)

(Do not report 36470, 36471, 36465, 36466 in conjunction with 37241 in the same surgical field)

36482 Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous;

**Meeting Date:** January 2017

**Global Period:** ZZZ

36483 Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

(Use 36483 in conjunction with 36482)

(Do not report 36483 more than once per extremity)

(Do not report 36482, 36483 in conjunction with 29581, 36000, 36002, 36005, 36410, 36425, 36475, 36476, 36478, 36479, 37241, 75894, 76000, 76001, 76937, 76942, 76998, 77022, 93970, 93971 in the same surgical field)

---

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

SVS, SIR, ACC, SCAI, ACS and ACPH convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this family of incompetent vein codes.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes.**  
**Reference Code Rationale:**

The multispecialty group included the direct practice expense inputs from the recently reviewed and MOCA vein codes (going into effect 1/1/2017). The spreadsheet also includes the current direct PE inputs for 36470 and 36471.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

The societies are requesting 12 minutes of pre time for their clinical staff to (1) complete diagnostic and referral forms, (2) coordinate pre-surgery services, (3) complete pre-procedure education/consent and (4) complete pre-procedure phone calls and prescriptions. The recommendation of 12 minutes lines up with the recently approved MOCA codes (also in the vein family).

The society is also requesting 2 minutes to set up the U/S equipment. We have included it in the "Set Up Scope" line, as this is where the PE Subcommittee put this task for the recently approved MOCA tab (also in the vein family).

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

**CPT Code:** 36470-71, 36482-83, 36465-66

**Specialty Society('s):** SVS, SIR, ACC, SCAI, ACS and ACPH

The societies are requesting 3 minutes in the post op period to conduct patient communication for CPT Codes 36470 & 36471. Those codes don't currently have a phone call included but it is post procedure patient communication is standard practice with all of these vein procedures.

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic & referral forms  
Coordinate pre-surgery services  
Provide pre-service education/obtain consent  
Availability of prior images confirmed and reviewed  
Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocolled by radiologist

Intra-Service Clinical Labor Activities:

Prepare room, equipment, supplies  
Patient is greeted, gowned and escorted into procedure room  
Vital signs obtained  
Prepare and position patient prone on table / obtain vitals / set up IV / monitor patient  
Sterile prep performed and draping of target site  
Assist physician in performing procedure  
Monitor pt. following service/check tubes, monitors, drains (*not related to moderate sedation*)  
Clean room/equipment by physician staff  
Technologist archives and QC's images to/in PACS, checking for all images and dose page  
Review examination with interpreting MD  
Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

## **SUPPLIES**

- pack, minimum multi-specialty visit (36470-71, 364x3, x5, x6)
  - exam paper, gloves NS(2), patient gown, pillow case, and thermometer cover

### **Supplies needed for staff/MD (non-sterile):**

- cap, surgical
  - Needed for each staff member in the room
    - (1) for MD (36470-71, 364x3, x5, x6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
    - (1) for nurse blend (364x3, x5, x6)
- mask, surgical with face shield
  - Needed for each staff member in the room
    - (1) for MD (36470-71, 364x3-6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
    - (1) for nurse blend (364x3, x5, x6)
- shoe covers, surgical
  - Needed for each staff member in the room
    - (1) for MD (36470-71, 364x3-6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
    - (1) for nurse blend (364x3, x5, x6)
- gloves, non-sterile (364x3, x5, x6)
  - Needed for staff to clean room post-procedure.
- gown, staff, impervious (36470-71)
  - This procedure is performed in a “clean” environment, MD performing will wear non-sterile gown during procedure.

### **Supplies needed for staff/MD (sterile):**

- gloves, sterile
  - needed for each person scrubbed in to the procedure
    - (1) for MD (364x3, x5, x6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
- gown, surgical, sterile
  - needed for each person scrubbed in to the procedure
    - (1) for MD (364x3, x5, x6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)

### **Supplies needed for sterile patient prep/surgical field:**

- drape, sterile, barrier 16inx29in (36470-71, 364x3, x5, x6)
  - drape to create sterile field
- drape, sterile, femoral (364x3, x5, x6)
  - drape to create sterile field surrounding entire leg, abdomen
- drape, towel-sterile 18inx26in (364x3, x5, x6)
  - (4) to act as absorbent towel in sterile field. Placed to secure a sterile border at target site.
- scalpel with blade, surgical (364x3, x5, x6)
  - to make skin nick prior to insert thermal probe(s)
- Providone soin (Betadine) (36470-71, 364x3, x5, x6)
  - (60 ml) For sterile, circumferential skin prep of the entire lower extremity

**CPT Code: 36470-71, 36482-83, 36465-66**  
**Specialty Society('s): SVS, SIR, ACC, SCAI, ACS and ACPH**

- Swab-pad, alcohol (36470-71, 364x3, x5, x6)
  - (2) Used for wiping multi-use vials

**Ancillary supplies need for the procedure:**

- sheath-cover, sterile (transducer) (364x3, x5, x6)
  - ablation procedures are performed under sterile technique and ultrasound guidance, this is the sterile cover to cover the US probe so it may be used on the sterile field.
- syringe-needle, 3ml 22-26g (36470-71, 364x3, x5, x6)
  - Used for administration of lidocaine
- kit, guidewire introducer (micro-stick) (364x3, x5, x6)
  - Needed to gain access into the veins for the procedure. This is a kit with an ultrasonic needle tip, microintroducer catheter and microwire. All used for initial access before sheath placement
- vascular sheath (364x3-364x6)
  - after access is gained in to the vein, a vascular sheath is put in place to maintain access into the vein. This allows for wire and treatment catheter exchange
    - (1) (364x3, x5, x4) *These codes are all treatment of a single vein, therefore only one sheath is needed*
    - (2) (364x6) *This code is treatment of multiple vines, therefore more than one sheath is needed*
- guidewire, hydrophilic (364x3, x5, x6)
  - hydrophilic coated guidewire used to navigate tortious varicosities and gain access into veins for ablation treatment, wire access across must be achieved before ablation catheter is advanced
- guidewire bowl w-lid, sterile (364x3, x5, x6)
  - placed on the surgical prep tray, saline placed in bowl and used to wipe wires, sheaths and catheters down
- guaze, sterile 4in x 4in (36470-71, 364x3, x5, x6)
  - used through out the procedure to dab access sites and used to dress access sites post procedure
- ultrasound transmission gel (364x3, x5, x6)
  - multiple packets of sterile gel are needed throughout the procedure, on the sterile field, as continuous US guidance and monitoring are performed
- Site marking pen (364x3, x5, x6)
  - During ultrasound evaluation, site marking is performed so that treatment zones are visualized

**Supplies specific to treatment:**

- lidocaine 1%-2% inj
  - (20ml) (36470) *this code is a single vein treated, but multiple access sites are made into this single vein for treatment, therefore additional lidocaine is administered for local anesthesia*
  - (40ml) (36471) *this code is for multiple veins treated in one session, and multiple access sites are made into these multiple veins for treatment, therefore additional lidocaine is administered at each access site for local anesthesia*
  - (10ml) (364x3, x5) *these codes both have a single access site, therefore only one site will be locally anesthetized*

**CPT Code: 36470-71, 36482-83, 36465-66**  
**Specialty Society(s): SVS, SIR, ACC, SCAI, ACS and ACPH**

- (15ml) (364x6) this code includes treatment of multiple veins, but each vein is only accessed once, therefore incremental additional lidocaine is needed to be administered for local anesthesia at two sites
- (5ml) (364x4) this code is an add-on code for an additional vein treated, therefore only a small amount of additional lidocaine is needed for local anesthesia
- sodium bicarbonate 8.4% inj w-needle (364x3, x5, x6)
  - (2) used to buffer with lidocaine for local anesthetic
- Sclerosing solution inj
  - (10ml) (36470) sclerosing agent is used to obliterate the incompetent vein, this code is a single vein treated
  - (20ml) (36471) sclerosing agent is used to obliterate the incompetent vein, this code multiple veins are treated
- Varithena (foam) (364x5, x6)
  - The typical foam canister has 3 'doses' and a shelf life of 1 month. We are recommending 33% of one canister for X5 and X6.
- Varithena (admin pack) (364x5, x6)
  - One admin pack for each patient. If you are doing multiple veins you would only need one admin kit. The admin pack contains the following items:
    - 1 x Varithena Transfer Unit
    - 3 x Low-Silicone Syringes
    - 2 x Compression Pads
    - 1 x Manometer Tubing
- VenaSeal Device (364x3)
  - We are recommending one venaseal (bottle of glue) for X4. The amount of glue needed for the add on procedure will vary depending on the actual size of the veins. If the add on procedure is done the physician will use the remaining portion of the glue from X4. He/she may need another bottle. However, we do not feel it is typical to use another bottle at this time – so we are not recommending another bottle for the add on code.
- VenaSeal Add-on Code (364x4)
  - 364X4 is an add-on procedure, which requires additional access. The societies are recommending additional supplies for a 2<sup>nd</sup> access site (i.e. lidocaine, sheath, etc)

**Supplies used immediately post-procedure:**

- Elastic wrap bandages, 4in & 6in
  - (1) 36470-71 : We need one of each size for these codes to wrap the patient's leg post procedure. Wrapping starts at the ankle and goes to injection site (approximately mid leg)
  - (2) 364x3, x5, x6: We need two of each size for these codes to wrap the patient's entire leg post procedure. Wrapping starts at the ankle and goes to injection site (mid to upper thigh)
- dressing, 4in x 4.75in (tegaderm)
  - to dress access site post procedure
    - (1) (364x3, x5, x4) These codes are all treatment of a single vein, therefore only one tegaderm is needed
    - (2) (364x6) This code is treatment of multiple vines, therefore more than one tegaderm are needed
    -

**Supplies used to clean equipment & room:**

- disinfectant, surface (Envirocide, Sanizide) (36470-71, 364x3, x5, x6)
  - to clean CT table and room equipment
- sanitizing cloth (patient) (36470-71, 364x3, x5, x6)

**CPT Code:** 36470-71, 36482-83, 36465-66

**Specialty Society('s):** SVS, SIR, ACC, SCAI, ACS and ACPH

- used to wipe patient leg clean following procedure (betadine, US gel, blood)
- sanitizing cloth (surface, instruments, equipment) (36470-71, 364x3, x5, x6)
  - additional sanitizing cloth used to wipe US machine

### **Equipment**

The specialty society recommendations include the equipment time calculation for 'non highly technical' equipment. As CMS did with the MOCA codes, we summed all the clinical time in the service period MINUS the assist physician time for the additional clinical staff and the recovery/post op time.

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Non Facility Direct Inputs**

**Meeting Date:** January 2017

**Global Period:** 000

36470 Injection of sclerosant; single incompetent vein (other than telangiectasia)

36471 Injection of sclerosant; multiple incompetent veins (other than telangiectasia), same leg

(For ultrasound imaging guidance performed in conjunction with 36470, 36471, use 76942)

(Do not report 36470, 36471 in conjunction with 29581)

(Do not report 36471 more than once per extremity)

(If the targeted vein is an extremity truncal vein and injection of non-compounded foam sclerosant with ultrasound guided compression maneuvers to guide dispersion of the injectate is performed, see 36465, 36466)

(Do not report 36470, 36471 in conjunction with 37241 in the same surgical field)

36465 Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; single incompetent extremity truncal vein (eg, great saphenous vein, accessory saphenous vein)

36466 Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; multiple incompetent truncal veins (eg, great saphenous vein, accessory saphenous vein), same leg

(For extremity truncal vein injection of compounded foam sclerosant[s], see 36470, 36471)

(Do not report 36465, 36466 in conjunction with 29581)

(For injection of a sclerosant into an incompetent vein without compression maneuvers to guide dispersion of the injectate, see 36470, 36471)

(For endovenous ablation therapy of incompetent vein[s] by transcatheter delivery of a chemical adhesive, see 36482, 36483)

(For vascular embolization and occlusion procedures, see 37241, 37242, 37243, 37244)

(Do not report 36470, 36471, 36465, 36466 in conjunction with 37241 in the same surgical field)

36482 Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous;

**Meeting Date:** January 2017

**Global Period:** ZZZ

36483 Endovenous ablation therapy of incompetent vein, extremity, by transcatheter delivery of a chemical adhesive (eg, cyanoacrylate) remote from the access site, inclusive of all imaging guidance and monitoring, percutaneous; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

(Use 36483 in conjunction with 36482)

(Do not report 36483 more than once per extremity)

(Do not report 36482, 36483 in conjunction with 29581, 36000, 36002, 36005, 36410, 36425, 36475, 36476, 36478, 36479, 37241, 75894, 76000, 76001, 76937, 76942, 76998, 77022, 93970, 93971 in the same surgical field)

---

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

SVS, SIR, ACC, SCAI, ACS and ACPH convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this family of incompetent vein codes.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes.  
Reference Code Rationale:**

The multispecialty group included the direct practice expense inputs from the recently reviewed and MOCA vein codes (going into effect 1/1/2017). The spreadsheet also includes the current direct PE inputs for 36470 and 36471.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

The societies are requesting 12 minutes of pre time for their clinical staff to (1) complete diagnostic and referral forms, (2) coordinate pre-surgery services, (3) complete pre-procedure education/consent and (4) complete pre-procedure phone calls and prescriptions. The recommendation of 12 minutes lines up with the recently approved MOCA codes (also in the vein family).

The society is also requesting 2 minutes to set up the U/S equipment. We have included it in the “Set Up Scope” line, as this is where the PE Subcommittee put this task for the recently approved MOCA tab (also in the vein family).

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

**CPT Code:** 36470-71, 36482-83, 36465-66

**Specialty Society('s):** SVS, SIR, ACC, SCAI, ACS and ACPH

The societies are requesting 3 minutes in the post op period to conduct patient communication for CPT Codes 36470 & 36471. Those codes don't currently have a phone call included but it is post procedure patient communication is standard practice with all of these vein procedures.

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic & referral forms  
Coordinate pre-surgery services  
Provide pre-service education/obtain consent  
Availability of prior images confirmed and reviewed  
Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocolled by radiologist

Intra-Service Clinical Labor Activities:

Prepare room, equipment, supplies  
Patient is greeted, gowned and escorted into procedure room  
Vital signs obtained  
Prepare, set-up and start IV, initial positioning and monitoring of patient  
Sterile prep performed and draping of target site  
Assist physician in performing procedure  
Monitor pt. following service/check tubes, monitors, drains (*not related to moderate sedation*)  
Clean room/equipment by physician staff  
Technologist archives and QC's images to/in PACS, checking for all images and dose page  
Review examination with interpreting MD  
Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

## **SUPPLIES**

- pack, minimum multi-specialty visit (36470-71, 364x3, x5, x6)
  - exam paper, gloves NS(2), patient gown, pillow case, and thermometer cover

### **Supplies needed for staff/MD (non-sterile):**

- cap, surgical
  - Needed for each staff member in the room
    - (1) for MD (36470-71, 364x3, x5, x6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
    - (1) for nurse blend (364x3, x5, x6)
- mask, surgical with face shield
  - Needed for each staff member in the room
    - (1) for MD (36470-71, 364x3-6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
    - (1) for nurse blend (364x3, x5, x6)
- shoe covers, surgical
  - Needed for each staff member in the room
    - (1) for MD (36470-71, 364x3-6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
    - (1) for nurse blend (364x3, x5, x6)
- gloves, non-sterile (364x3, x5, x6)
  - Needed for staff to clean room post-procedure.
- gown, staff, impervious (36470-71)
  - This procedure is performed in a “clean” environment, MD performing will wear non-sterile gown during procedure.

### **Supplies needed for staff/MD (sterile):**

- gloves, sterile
  - needed for each person scrubbed in to the procedure
    - (1) for MD (364x3, x5, x6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)
- gown, surgical, sterile
  - needed for each person scrubbed in to the procedure
    - (1) for MD (364x3, x5, x6)
    - (1) for “hip to hip” technologist (364x3, x5, x6)

### **Supplies needed for sterile patient prep/surgical field:**

- drape, sterile, barrier 16inx29in (36470-71, 364x3, x5, x6)
  - drape to create sterile field
- drape, sterile, femoral (364x3, x5, x6)
  - drape to create sterile field surrounding entire leg, abdomen
- drape, towel-sterile 18inx26in (364x3, x5, x6)
  - (4) to act as absorbent towel in sterile field. Placed to secure a sterile border at target site.
- scalpel with blade, surgical (364x3, x5, x6)
  - to make skin nick prior to insert thermal probe(s)
- Providone soin (Betadine) (36470-71, 364x3, x5, x6)
  - (60 ml) For sterile, circumferential skin prep of the entire lower extremity

- Swab-pad, alcohol (36470-71, 364x3, x5, x6)
  - (2) Used for wiping multi-use vials

**Ancillary supplies need for the procedure:**

- sheath-cover, sterile (transducer) (364x3, x5, x6)
  - ablation procedures are performed under sterile technique and ultrasound guidance, this is the sterile cover to cover the US probe so it may be used on the sterile field.
- syringe-needle, 3ml 22-26g (36470-71, 364x3, x5, x6)
  - Used for administration of lidocaine
- kit, guidewire introducer (micro-stick) (364x3, x5, x6)
  - Needed to gain access into the veins for the procedure. This is a kit with an ultrasonic needle tip, microintroducer catheter and microwire. All used for initial access before sheath placement
- vascular sheath (364x3-364x6)
  - after access is gained in to the vein, a vascular sheath is put in place to maintain access into the vein. This allows for wire and treatment catheter exchange
    - (1) (364x3, x5, x4) *These codes are all treatment of a single vein, therefore only one sheath is needed*
    - (2) (364x6) *This code is treatment of multiple vines, therefore more than one sheath is needed*
- guidewire, hydrophilic (364x3, x5, x6)
  - hydrophilic coated guidewire used to navigate tortious varicosities and gain access into veins for ablation treatment, wire access across must be achieved before ablation catheter is advanced
- guidewire bowl w-lid, sterile (364x3, x5, x6)
  - placed on the surgical prep tray, saline placed in bowl and used to wipe wires, sheaths and catheters down
- guaze, sterile 4in x 4in (36470-71, 364x3, x5, x6)
  - used through out the procedure to dab access sites and used to dress access sites post procedure
- ultrasound transmission gel (364x3, x5, x6)
  - multiple packets of sterile gel are needed throughout the procedure, on the sterile field, as continuous US guidance and monitoring are performed
- Site marking pen (364x3, x5, x6)
  - During ultrasound evaluation, site marking is performed so that treatment zones are visualized

**Supplies specific to treatment:**

- lidocaine 1%-2% inj
  - (20ml) (36470) *this code is a single vein treated, but multiple access sites are made into this single vein for treatment, therefore additional lidocaine is administered for local anesthesia*
  - (40ml) (36471) *this code is for multiple veins treated in one session, and multiple access sites are made into these multiple veins for treatment, therefore additional lidocaine is administered at each access site for local anesthesia*
  - (10ml) (364x3, x5) *these codes both have a single access site, therefore only one site will be locally anesthetized*

**CPT Code: 36470-71, 36482-83, 36465-66**  
**Specialty Society('s): SVS, SIR, ACC, SCAI, ACS and ACPH**

- (15ml) (364x6) this code includes treatment of multiple veins, but each vein is only accessed once, therefore incremental additional lidocaine is needed to be administered for local anesthesia at two sites
- (5ml) (364x4) this code is an add-on code for an additional vein treated, therefore only a small amount of additional lidocaine is needed for local anesthesia
- sodium bicarbonate 8.4% inj w-needle (364x3, x5, x6)
  - (2) used to buffer with lidocaine for local anesthetic
- Sclerosing solution inj
  - (10ml) (36470) sclerosing agent is used to obliterate the incompetent vein, this code is a single vein treated
  - (20ml) (36471) sclerosing agent is used to obliterate the incompetent vein, this code multiple veins are treated
- Varithena (foam) (364x5, x6)
  - The typical foam canister has 3 'doses' and a shelf life of 1 month. We are recommending 33% of one canister for X5 and X6.
- Varithena (admin pack) (364x5, x6)
  - One admin pack for each patient. If you are doing multiple veins you would only need one admin kit. The admin pack contains the following items:
    - 1 x Varithena Transfer Unit
    - 3 x Low-Silicone Syringes
    - 2 x Compression Pads
    - 1 x Manometer Tubing
- VenaSeal Device (364x3)
  - We are recommending one venaseal (bottle of glue) for X4. The amount of glue needed for the add on procedure will vary depending on the actual size of the veins. If the add on procedure is done the physician will use the remaining portion of the glue from X4. He/she may need another bottle. However, we do not feel it is typical to use another bottle at this time – so we are not recommending another bottle for the add on code.
- VenaSeal Add-on Code (364x4)
  - 364X4 is an add-on procedure, which requires additional access. The societies are recommending additional supplies for a 2<sup>nd</sup> access site (i.e. lidocaine, sheath, etc)

**Supplies used immediately post-procedure:**

- Elastic wrap bandages, 4in & 6in
  - (1) 36470-71 : We need one of each size for these codes to wrap the patient's leg post procedure. Wrapping starts at the ankle and goes to injection site (approximately mid leg)
  - (2) 364x3, x5, x6: We need two of each size for these codes to wrap the patient's entire leg post procedure. Wrapping starts at the ankle and goes to injection site (mid to upper thigh)
- dressing, 4in x 4.75in (tegaderm)
  - to dress access site post procedure
    - (1) (364x3, x5, x4) These codes are all treatment of a single vein, therefore only one tegaderm is needed
    - (2) (364x6) This code is treatment of multiple vines, therefore more than one tegaderm are needed
    -

**Supplies used to clean equipment & room:**

- disinfectant, surface (Envirocide, Sanizide) (36470-71, 364x3, x5, x6)
  - to clean CT table and room equipment
- sanitizing cloth (patient) (36470-71, 364x3, x5, x6)

**CPT Code:** 36470-71, 36482-83, 36465-66

**Specialty Society('s):** SVS, SIR, ACC, SCAI, ACS and ACPH

- used to wipe patient leg clean following procedure (betadine, US gel, blood)
- sanitizing cloth (surface, instruments, equipment) (36470-71, 364x3, x5, x6)
  - additional sanitizing cloth used to wipe US machine

### **Equipment**

The specialty society recommendations include the equipment time calculation for 'non highly technical' equipment. As CMS did with the MOCA codes, we summed all the clinical time in the service period MINUS the assist physician time for the additional clinical staff and the recovery/post op time.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2016

**Mechanochemical (MOCA) Vein Ablation**

At the October 2015 CPT meeting, the CPT Editorial Panel established two Category I codes for reporting venous mechanochemical ablation.

***36473 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated***

The RUC reviewed the survey results from 91 physicians and agreed with the following physician time components: pre-service time of 31 minutes (standard pre-time package 6A with 3 minutes added to positioning and 5 minutes added to scrub/dress/wait), intra-service time of 30 minutes, and post-service time of 15 minutes (standard post-time package 7A minus 3 minutes).

The RUC reviewed the survey respondents' physician work values for CPT code 36473 and agreed with the specialty that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 36473, the RUC reviewed MPC code 52214 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands* (work RVU= 3.50, intra-service time of 30 minutes, total time of 79 minutes) and noted that both services have identical intra-service time, as well as similar physician work and total time. Given these similarities, the RUC recommends a work RVU of 3.50, which is a direct crosswalk to CPT code 52214. To justify a work RVU of 3.50, the RUC reviewed CPT code 45380 *Colonoscopy, flexible; with biopsy, single or multiple* (work RVU= 3.66, intra-service time of 28 minutes, total time of 70 minutes) and noted that the survey code has more intra-service and total time, while also involving a similar amount of physician work. **The RUC recommends a work RVU of 3.50 for CPT code 36473.**

***36474 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 74 physicians and agreed with the following physician time components: intra-service time of 30 minutes.

The RUC reviewed the survey respondents' physician work values for CPT code 36474 and agreed with the specialty that the survey respondents overvalued the work involved in performing this service. To determine an appropriate work value for 36474, the RUC reviewed CPT code 49435 *Insertion of subcutaneous extension to intraperitoneal cannula or catheter with remote chest exit site (List separately in addition to code for primary procedure)* (work RVU= 2.25, intra-service time of 30 minutes) and noted that both services have identical intra-service time and involve

a similar amount of physician work. Given these similarities, the RUC recommends a work RVU of 2.25, which is a direct crosswalk to CPT code 49435. To justify a work RVU of 2.25, the RUC reviewed MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU= 2.25, intra-service time of 30 minutes) and noted that both services have identical intra-service time and a similar amount of physician work. In addition, the RUC observed that, compared to the radiofrequency ablation (RFA) and endovascular laser treatment (EVLT) families of services, the total time ratio between the base code and add-on code for MOCA vein ablation is much smaller. This distinction supports a narrower RVU differential for the MOCA base code and add-on code, when compared to the larger gap between the RFA/EVLT base and add-on codes. **The RUC recommends a work RVU of 2.25 for CPT code 36474.**

***36475 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated***

The RUC briefly discussed CPT code 36475, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 5.30 for CPT code 36475.**

***36476 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***

The RUC briefly discussed CPT code 36476, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 2.65 for CPT code 36476.**

***36478 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated***

The RUC briefly discussed CPT code 36478, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 5.30 for CPT code 36478.**

***36479 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)***

The RUC briefly discussed CPT code 36479, noting that it was last surveyed for the April 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. **The RUC reaffirmed the work RVU of 2.65 for CPT code 36479.**

**New Technology**

CPT codes 36473 and 36474 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and specifically review utilization trends.

## Practice Expense

The RUC reviewed and approved the direct practice expense inputs with the minor modifications as approved by the Practice Expense Subcommittee.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Vascular Injection Procedures</b>				
<b>Venous</b>				
<i>Venipuncture, needle or...</i>				
36460		<i>Transfusion, intrauterine, fetal (Do not report modifier 63 in conjunction with 36460) (For radiological supervision and interpretation, use 76941)</i>		
<u>Codes 36468, 36470, and 36471 describe sclerotherapy of telangiectasia and/or incompetent veins. Ultrasound guidance, when performed, is not included and may be reported separately. When performed in the office setting, all required supplies and equipment are inherent to the procedure and not separately reportable.</u>				
36468		<i>Single or multiple injections of sclerosing solutions, spider veins (telangiectasia), limb or trunk (Do not report 36468 in conjunction with 37241 in the same surgical field) (36469 has been deleted)</i>		
36470		<i>Injection of sclerosing solution; single vein</i>		
36471		<i>multiple veins, same leg (For vascular embolization and occlusion procedures, see 37241, 37242, 37243, 37244) (Do not report 36470, 36471 in conjunction with 37241 in the same surgical field)</i>		
<u>Codes 36473-36479 describe endovascular ablation therapy of incompetent extremity vein(s). Codes 36473 and 36474 (mechanochemical ablation) are performed under local anesthesia and involve concomitant use of an intraluminal device that mechanically disrupts/abrades the venous intima and infusion of a physician-specified medication in the target vein(s). Sclerosant injection by either needle or catheter followed by a compression technique is not mechanochemical vein ablation. Codes 36475 and 36476 (radiofrequency ablation) and 36478 and 36479 (laser ablation) are performed under tumescent anesthesia. All imaging guidance and monitoring is inherent to all six endovascular ablation therapy codes. In addition, when performed in the office setting, all required supplies and equipment are inherent to the procedure and not separately reportable. The add-on codes for subsequent vein(s) treated in the same extremity may only be reported once per extremity, regardless of the number of additional vein(s) treated.</u>

October 15, 2015

M. Douglas Leahy, MD  
Chair, Research Subcommittee  
AMA – RUC  
645 N Michigan Ave, Suite 800  
Chicago, IL 60611

Re: RSL Review

Dear Dr. Leahy:

The CPT Editorial Panel recently approved two new CPT codes to describe Mechanochemical (MOCA) Vein Ablation. CPT Codes 364X1, 364X2 were recently included on the January 2016 RUC meeting new/revised LOI form. CPT Code 36475, 36476, 36478 and 36479 were included on the LOI as part of the family codes to be reviewed. Those four vein codes were recently surveyed in April 2014. The specialty societies do not plan to re-survey those codes for the upcoming meeting. We plan to use those codes on our reference service list for the MOCA RUC survey.

We request a research subcommittee review of the RSL we plan to use for the MOCA survey. Attached is the RSL with all the requested data points. Thank you for reviewing our request. We look forward to discussing this on the October 20<sup>th</sup> conference call.

Sincerely,

A handwritten signature in black ink, appearing to read 'Matthew Sideman', with a stylized, flowing script.

Matthew Sideman, MD

cc: Michael Morrow  
Robert Zwolak, MD  
Michael Hall, MD

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 36473      Tracking Number   Q1

Original Specialty Recommended RVU: **3.50**Presented Recommended RVU: **3.50**

Global Period: 000

RUC Recommended RVU: **3.50**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. She chooses to undergo mechanochemical ablation therapy under local anesthesia utilizing an intraluminal device that mechanically disrupts/abrades the venous intima and disperses a physician-selected medication into the insufficient great saphenous vein.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's medical history, physical exam, and laboratory studies, are reviewed and consent is obtained. Relevant preoperative diagnostic imaging studies are retrieved and reviewed. A time out is performed. The patient is placed supine and the leg is positioned to allow access to the vein to be treated. Local anesthesia is instilled at access site prior to vein access and continue local anesthesia as needed throughout procedure.

Description of Intra-Service Work: Ultrasound guidance is utilized to localize primary target vein (eg, great saphenous vein) as well as map and mark entire length of target vein. Vein is accessed under ultrasound guidance (not separately reportable). Guidewire is introduced using Seldinger technique. Dilator is advanced over guidewire. Dilator is exchanged for sheath. Treatment catheter is advanced under ultrasound guidance to treatment area. Mechanochemical ablation is initiated through the catheter. This involves the use of an intraluminal device that infuses a physician-specified medication in the target vein as well as mechanically disrupts the venous intima. The catheter and sheath are removed.

Description of Post-Service Work: Desired outcome of primary treated vessel and any possible thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate type of compression stocking is applied to the entire extremity. The patient is transported to recovery. Permanent reports are created for the medical record and copies of the reports are sent to the patient's referring physician

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Mechanochemical endovenous ablation (MOCA) of incompetent veins represent a new technology in the treatment of venous insufficiency. The procedure is similar to endovenous thermal ablation (e.g. radiofrequency, laser) in that a catheter is inserted into the vein to be treated under ultrasound guidance. It differs from thermal ablation in that it uses mechanical irritation and chemical infusion to achieve ablation of the treated vein without the need for tumescent anesthesia. Two new codes were created by CPT to capture the work of MOCA. They are 36473 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated* and 36474 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure).*

**Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the SVS, SIR, and the American College of Phlebology (ACP). The codes for endovenous thermal ablation of incompetent veins were recently reviewed by the RUC and approved by CMS. With the approval of the research subcommittee, these codes were placed on the reference service list for use as potential comparators.

**Results of Survey**

A total of 2676 survey requests were sent out with 91 responses received for a survey response rate of 3%. The results of the survey showed an extremely tight distribution with no statistical differences between the median and 25<sup>th</sup> percentile for both codes. Furthermore, the recommended RVU for both codes was identical to the RVU of the thermal ablation codes, despite 1/3<sup>rd</sup> less intra-service time for 36473. The expert panel

convened to discuss these results and decided that the survey respondents had been inadvertently misled by the RSL and failed to consider the differences in time and intensity when making their recommendations. They overwhelmingly decided that the work of treating incompetent veins was the same regardless of technique. We therefore decided to set aside the survey results and make RVU recommendations base on crosswalks.

### **Work RVU Recommendation**

We are recommending a crosswalk to CPT code 52214 for a value of 3.50\*\*\* RVW for 36473.

### **Pre-service and post-service time**

Pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with addition time added as outlined below. Post-service time package 7A is appropriate for these procedures.

1. **Positioning:** The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.
2. **Scrub, dress, and wait:** An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

### **Comparison to crosswalk code**

The crosswalk code chosen by expert panel is CPT code 52214 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) of trigone, bladder neck, prostatic fossa, urethra, or periurethral glands*). This crosswalk code is similar to 36473 in that they have identical intra-service times and very similar overall times and intensities. We feel this code represents a very accurate crosswalk for 36473 and recommend the value of 3.50 RVW.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36473	3.50	0.087	76	17	4	10	30	15
52214	3.50	0.082	79	19	5	5	30	20

### **Comparison to key reference codes**

The key reference codes chosen by the majority of the survey respondents were 36475 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated* (49%) and 36478 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated* (33%). These key references are similar to 36473 in the sense that they are all endoluminal venous procedures to treat venous insufficiency. The primary difference between 36473, 36475 and 36478 is in the intra-service time and intensity. CPT 36473 has 1/3<sup>rd</sup> less intra-service time than the key reference codes. Clinically, this is accounted for in the need for tumescence in the key reference codes. The pre-service and post-service times are almost identical. Subtracting 1/3<sup>rd</sup> of the RVW to account for the lesser intra-service time in 36473 would

predict an RVW of 3.53. This comparison thus favorably supports our crosswalk recommendation value of 3.50 for CPT 36473.

<b>CPT</b>	<b>RVW</b>	<b>IWPUT</b>	<b>Total Time</b>	<b>Eval</b>	<b>Posit</b>	<b>SDW</b>	<b>INTRA</b>	<b>IM-post</b>
<b>36475 Key Ref</b>	5.30	0.097	94	20	4	10	45	15
<b>35478 Key Ref</b>	5.30	0.097	94	20	4	10	45	15
<b>36473</b>	3.50	0.087	76	17	4	10	30	15

### **Comparison to MPC codes**

#### **Comparison with MPC List Code, 31622**

MPC 31622 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)*) is a 0-day global MPC service with similar intra-service time and intensity to 36473. Both 31622 and 36473 require technical skill to complete successfully. MPC 31622 and 36473 have identical intra-service times and almost identical intensities. The pre- and post-service times have minor variations. In conclusion, comparison with this MPC code justifies our recommended crosswalk value of 3.50 RVW for 36473.

#### **Comparison with MPC List Code, 37191**

MPC 37191 (*Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed*) is a 0-day global MPC service with similar times and intensity to 36473. Both 36473 and 37191 are endoluminal venous procedures that require technical skill to complete successfully. They have identical intra-service times but different intensities accounting for the different RVWs. Comparison with MPC 37191 supports our recommendation for the crosswalk value of 3.50 RVW for 36473.

<b>CPT</b>	<b>RVW</b>	<b>IWPUT</b>	<b>Total Time</b>	<b>Eval</b>	<b>Posit</b>	<b>SDW</b>	<b>INTRA</b>	<b>IM-post</b>
<b>31622 MPC</b>	2.78	0.069	65	10	5	5	30	15
<b>36473</b>	3.50	0.087	76	17	4	10	30	15
<b>37191 MPC</b>	4.71	0.120	83	30	3	5	30	15

### **Conclusion**

Comparison with our crosswalk code of 52214, key reference services, and comparison with two MPC codes supports our crosswalk recommendation of 3.50 RVW for CPT code 36473.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery                      How often? Commonly

Specialty Interventional Radiology                      How often? Commonly

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 25000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Thermal ablation of an incompetent vein is a common procedure, with a Medicare incidence in 2014 of 177,903 claims for the initial vein (CPT 36475 and 36478) and 21,478 for the secondary vein (CPT 36476 and 36479). Mechanochemical ablation (364X1, 364X2) will be performed based on provider and patient preference in lieu of other ablation techniques, and therefore, utilization is difficult to estimate. Information provided by the manufacturer indicates a 2015 national (both Medicare and non-Medicare) projected utilization above 25,000.

Specialty Vascular Surgery                      Frequency 6752                      Percentage 27.00 %

Specialty Interventional Radiology                      Frequency 2500                      Percentage 10.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Thermal ablation of an incompetent vein is a common procedure, with a Medicare incidence in 2014 of 177,903 claims for the initial vein (CPT 36475 and 36478) and 21,478 for the secondary vein (CPT 36476 and 36479). Mechanochemical ablation (364X1, 364X2) will be performed based on provider and patient preference in lieu of other ablation techniques, and therefore, utilization is difficult to estimate. Information provided by the manufacturer indicates a 2015 national (both Medicare and non-Medicare) projected utilization above 25,000.

Specialty Vascular Surgery	Frequency 0	Percentage 0.00 %
Specialty Interventional Radiology	Frequency 0	Percentage 0.00 %

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent vein(s) treated in a single extremity, each through separate access sites

---

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great and small saphenous vein insufficiency with resultant superficial varicosities. She chooses to undergo mechanochemical ablation therapy under local anesthesia utilizing an intraluminal device that mechanically disrupts/abrades the venous intima and disperses physician-selected medication into the insufficient great and small saphenous veins.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

**Site of Service (Complete for 010 and 090 Globals Only)**

---

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

---

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

---

**Description of Pre-Service Work:**

Description of Intra-Service Work: Ultrasound guidance is utilized to localize a second primary target vein access site. Local anesthetic is injected at access site. Ultrasound guidance is utilized to map and mark entire length of target vein. Vein is accessed under ultrasound guidance (not separately reportable). Guide wire is introduced using Seldinger technique. Dilator is advanced over guidewire. Dilator is exchanged for sheath. Treatment catheter is advanced under ultrasound guidance to treatment area. Mechanochemical ablation is initiated through the catheter. This involves the use of an intraluminal device that infuses a physician-specified medication in the target vein as well as mechanically disrupts the venous intima. The catheter and sheath are removed. Desired outcome of primary treated vessel and any possible thrombus extension is documented with ultrasound. Blood flow status is documented. Simple dressing is applied to access site. Neurovascular status is checked. Appropriate type of compression stocking is applied to the entire extremity.

**Description of Post-Service Work:**

Overall intensity/complexity	0.22	0.07
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Mechanochemical endovenous ablation (MOCA) of incompetent veins represent a new technology in the treatment of venous insufficiency. The procedure is similar to endovenous thermal ablation (e.g. radiofrequency, laser) in that a catheter is inserted into the vein to be treated under ultrasound guidance. It differs from thermal ablation in that it uses mechanical irritation and chemical infusion to achieve ablation of the treated vein without the need for tumescent anesthesia. Two new codes were created by CPT to capture the work of MOCA. They are 36473 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated* and 36474 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure).*

**Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the SVS, SIR, and the American College of Phlebology (ACP). The codes for endovenous thermal ablation of incompetent veins were recently reviewed by the RUC and approved by CMS. With the approval of the research subcommittee, these codes were placed on the reference service list for use as potential comparators.

**Results of Survey**

A total of 2676 survey requests were sent out with 74 responses received for a survey response rate of 3%. The results of the survey showed an extremely tight distribution with no statistical differences between the median and 25<sup>th</sup> percentile for both codes. Furthermore, the recommended RVU for both codes was identical to the RVU of the thermal ablation codes, despite 1/3<sup>rd</sup> less intra-service time for 36473. The expert panel

convened to discuss these results and decided that the survey respondents had been inadvertently misled by the RSL and failed to consider the differences in time and intensity when making their recommendations. They overwhelmingly decided that the work of treating incompetent veins was the same regardless of technique. We therefore decided to set aside the survey results and make RVU recommendations base on crosswalks.

### **Work RVU Recommendation**

We are recommending a crosswalk to CPT code 49435 for a value of 2.25 RVW for 36474.

### **Comparison to crosswalk code**

The crosswalk code chosen by expert panel is 49435 (*Insertion of subcutaneous extension to intraperitoneal cannula or catheter with remote chest exit site*). This crosswalk code is similar to 36474 in that they are both add on codes with 30 minutes of intra-service time. We feel this code represents a very accurate crosswalk for 36474 and recommend the value of 2.25 RVW

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>36474</b>	2.25	0.075	30				30	
<b>49435 Crosswalk</b>	2.25	0.075	30				30	

### **Comparison to key reference codes**

The key reference codes chosen by the majority of the survey respondents were 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites* (49%) and 36479 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; second and subsequent veins treated in a single extremity, each through separate access sites* (39%). These key references are similar to 36474 in the sense that they are all add on endoluminal venous procedures to treat venous insufficiency. Although the survey respondents indicated 30 minutes of intra-service time, the reference codes also utilize tumescence that 36474 does not. For this reason, we chose the above crosswalk for a recommended value of 2.25 RVW for CPT 36474.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>36476 Key Ref</b>	2.65	0.088	30				30	
<b>35479 Key Ref</b>	2.65	0.088	30				30	
<b>36474</b>	2.25	0.075	30				30	

### **Comparison to MPC codes**

There are only 10 ZZZ MPC codes in the RUC database. The majority of these codes have RVW's below 2.0. There is only one ZZZ MPC code with 30 minutes of intra-service time. Therefore, we have chosen the following MPC codes for comparison.

### **Comparison with MPC List Code, 99292**

MPC 99292 (*Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)*) is a ZZZ MPC service with identical times and intensity to 36474.

### Comparison with MPC List Code, 57267

MPC 57267 (*Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*) is a ZZZ MPC service. It has more intra-service time and a higher intensity compared to 36474.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>99292 MPC</b>	2.25	0.075	30				30	
<b>36474</b>	2.25	0.075	30				30	
<b>57267 MPC</b>	4.88	0.108	45				45	

### Conclusion

Comparison with our crosswalk code of 49435, key reference services, and comparison with two MPC codes supports our crosswalk recommendation value of 2.25 RVW for CPT code 36474.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery

How often? Commonly

Specialty Interventional Radiology

How often? Commonly

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Thermal ablation of an incompetent vein is a common procedure, with a Medicare incidence in 2014 of 177,903 claims for the initial vein (CPT 36475 and 36478) and 21,478 for the secondary vein (CPT 36476 and 36479). Mechanochemical ablation (364X1, 364X2) will be performed based on provider and patient preference in lieu of other ablation techniques, and therefore, utilization is difficult to estimate. Information provided by the manufacturer indicates a 2015 national (both Medicare and non-Medicare) projected utilization above 25,000

Specialty	Frequency 0	Percentage 0.00 %

-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37197

Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**Global Period:** 000

**Meeting Date:** January 2016

*36473 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated*

---

**Global Period:** ZZZ

**Meeting Date:** January 2016

*36474 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent vein(s) treated in a single extremity, each through separate access sites*

---

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

A multispecialty group from SVS, SIR and ACPH convened to make consensus practice expense recommendations. The group included physicians and clinical staff from NF and F settings and various geographic regions.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes.  
Reference Code Rationale:**

This new procedure is currently reported with an unlisted code. As such, we included reference codes on the PE spreadsheet. We included CPT codes 36475 and 36476, which were recently approved by CMS.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

We believe there is extensive use of clinical staff time for 36473. However, we are recommending 12 minutes of nurse blend pre service time instead of the 18 minute standard. We believe our recommendations appropriately reflect the minimal use of clinical staff for these activities.

Complete pre-service diagnostic & referral forms	2
Coordinate pre-surgery services	3
Provide pre-service education/obtain consent	4
Follow-up phone calls & prescriptions	3

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

N/A

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic & referral forms  
Coordinate pre-surgery services  
Provide pre-service education/obtain consent  
Availability of prior images confirmed and reviewed  
Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and exam protocolled by radiologist

Intra-Service Clinical Labor Activities:

Prepare room, equipment, supplies  
Patient is greeted, gowned and escorted into procedure room  
Vital signs obtained  
Prepare and position patient prone on table / obtain vitals / set up IV / monitor patient  
Sterile prep performed and draping of target site  
Assist physician in performing procedure  
Monitor pt. following service/check tubes, monitors, drains (*not related to moderate sedation*)  
Clean room/equipment by physician staff  
Technologist archives and QC's images to/in PACS, checking for all images and dose page  
Review examination with interpreting MD  
Exam documents scanned into PACS. Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

AMA/Specialty Society RVS Update Committee Summary of Recommendations

*High Volume Growth*

April 2014

**Endovenous Ablation**

At the October 2013 meeting, the Relativity Assessment Workgroup reviewed High Volume Growth Services where Medicare utilization increased by at least 100% from 2006 to 2011. The RUC requested that these services be surveyed for physician work and develop practice expense inputs.

***36475 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated***

The RUC reviewed the survey results from 81 physicians for CPT code 36475 and determined that the survey 25<sup>th</sup> percentile work RVU of 5.30 appropriately accounts for the work required to perform this service. The RUC recommends the following physician times: 34 minutes pre-time, 45 minutes intra-service time and 15 minutes immediate post-time. The RUC noted that the physician work and time has decreased for these services since it was last surveyed and therefore the recommended decrease is appropriate. However, the intensity for this service has increased and the RUC determined that is appropriate as the site in which this service is typically performed has changed. This service is now typically performed in the office and is more intense since the physician is on his/her own. Therefore, more mental effort and stress is placed on the physician to perform properly because if a complication occurs the patient must be transferred to the hospital.

The RUC noted that the work for percutaneous radiofrequency and percutaneous laser services, CPT codes 36475 and 36478 is the same. The RUC compared 36475 to the key reference service 35476 *Transluminal balloon angioplasty, percutaneous; venous* (work RVU = 5.10 and intra-service time 35 minutes) and noted both services are endoluminal venous procedures, however, 36475 requires 10 more minutes of intra-service time and is more intense to perform than 35476. Therefore, 36475 is appropriately valued higher than the key reference service. The RUC also referenced MPC codes 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.71) and 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* (work RVU = 5.44). **The RUC recommends a work RVU of 5.30 for CPT code 36475.**

**36476 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 73 physicians for CPT 36476 and determined that the work RVU should be 2.65 work RVUs, half that of the base code 36475 (RUC recommended work RVU = 5.30). The RUC also recommended that the pre-service and post-service time as indicated by the survey respondents be deleted as all work should be accounted for in the base code. The RUC recommends 30 minutes of intra-service time. The RUC referenced similar services 15152 *Tissue cultured skin autograft, trunk, arms, legs; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 2.50) and 15156 *Tissue cultured skin autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; additional 1 sq cm to 75 sq cm (List separately in addition to code for primary procedure)* (work RVU = 2.75), which demonstrate the relativity of CPT code 36476 among other similar services. Lastly, the RUC referenced MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 2.25). **The RUC recommends a work RVU of 2.65 for CPT code 36476.**

**36478 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated**

The RUC reviewed the survey results from 81 physicians for CPT code 36478 and determined that the survey 25<sup>th</sup> percentile work RVU of 5.30 appropriately accounts for the work required to perform this service. The RUC recommends the following physician times: 34 minutes pre-time, 45 minutes intra-service time and 15 minutes immediate post-service time. The RUC noted that the physician work and time has decreased for these services since it was last surveyed and therefore the recommended decrease is appropriate. However, the intensity for this service has increased and the RUC determined that is appropriate as the site in which this service is typically performed has changed. This service is now typically performed in the office and is more intense, since the physician is on his/her own. Therefore, more mental effort and stress is placed on the physician to perform properly because, if a complication occurs, the patient must be transferred to the hospital.

The RUC noted that the work for percutaneous radiofrequency and percutaneous laser services, CPT codes 36475 and 36478 is the same. The RUC compared 36478 to the key reference service 35476 *Transluminal balloon angioplasty, percutaneous; venous* (work RVU = 5.10) and noted both services are endoluminal venous procedures, however, 36478 requires 10 more minutes of intra-service time and is more intense to perform than 35476. Therefore, 36478 is appropriately valued higher than the key reference service. The RUC also referenced MPC codes 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU = 4.71) and 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* (work RVU = 5.44). **The RUC recommends a work RVU of 5.30 for CPT code 36478.**

**36479 Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 75 physicians for CPT 36479 and determined that the work RVU should be 2.65 work RVUs, half that of the base code 36478 (RUC recommended work RVU = 5.30). The RUC also recommended that the pre-service and post-service time as indicated by the survey respondents be deleted as all work should be accounted for in the base code. The RUC recommends 30 minutes of intra-service time. The RUC referenced similar services 15152 *Tissue cultured skin autograft, trunk, arms, legs; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 2.50) and 15156 *Tissue cultured skin autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; additional 1 sq cm to 75 sq cm (List separately in addition to code for primary procedure)* (work RVU = 2.75), which demonstrate the relativity of CPT code 36479 among other similar services. Lastly, the RUC referenced MPC code 99292 *Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)* (work RVU = 2.25). **The RUC recommends a work RVU of 2.65 for CPT code 36479.**

#### **New Technology**

CPT codes 36475, 36476, 36478 and 36479 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and specifically review utilization trends.

#### **Work Neutrality**

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

#### **Practice Expense**

The Practice Expense Subcommittee deleted sedation for the clinical labor staff on line 35, and eliminated the duplicative tilt table from the equipment. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

<b>CPT Code (●New)</b>	<b>CPT Descriptor</b>	<b>Global Period</b>	<b>Work RVU Recommendation</b>

Re: Tab 38 Endovenous Ablation

Dear Dr. Levy:

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

A multi specialty RUC survey was conducted for the April RUC meeting. A survey was sent to all members of the SVS, and to random samples of ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP). After the survey requests were sent out, an inappropriate communication was emailed from a non-RUC participating professional society whose members treat venous disease (see attached email). This communication was emailed to all of their members on March 10<sup>th</sup> and potentially tainted the survey pool because of overlapping membership.

Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10<sup>th</sup> to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded. The spreadsheet also contains segregated data into surveys received by March 9<sup>th</sup> and those received after March 10<sup>th</sup>. The RVU recommendations are made from the aggregate survey data.

We look forward to presenting RUC recommendations for Tab 38 Endovenous Ablation at the upcoming RUC meeting. If you have any additional questions please contact [trishacrishock@gmail.com](mailto:trishacrishock@gmail.com).

Regards,

The Society for Vascular Surgery (SVS)  
The American College of Surgeons (ACS)  
The American College of Radiology (ACR)  
The Society of Interventional Radiology (SIR)  
The American College of Cardiology (ACC)  
The Society for Cardiac Angiography and Interventions (SCAI)  
American College of Phlebology (ACP)

## American Venous Forum

Promoting venous and lymphatic health

Dear American Venous Forum Members,

Last week you may have received a survey request from the Society of Vascular Surgery concerning an RVU update for endovenous ablation. This undoubtedly has great significance to many of our members. If you have not yet completed the survey, please take the time to read this communication and then complete the survey (if you've received it) appropriately. Please be advised that the current RVU for both laser and radiofrequency ablation of the first vein is 6.72 and the RVU for additional vein, same leg is 3.38

The AMA/Specialty Society Relative Value Update Committee (RUC) is a multi-specialty committee which includes many vascular society members. The purpose of the RUC process is to provide recommendations to CMS for use in annual updates to the Medicare relative value scale (RVU). The survey measures physician work involved in performing a procedure to determine an accurate relative value recommendation for setting Medicare physician fee schedules (both new and revisions of CPT codes are surveyed). These recommendations for rate setting are based on data collected from surveys of practicing physicians regarding the time, intensity, and complexity of new and revised CPT codes. The RUC process is incredibly important, requires realistic and accurate data for input, and cannot work without practicing physician participation to ensure that procedures are valued fairly by CMS as well as 3rd party payers who base their rates on a percentage of Medicare's.

As stated above, the RUC makes recommendations based on the direct input through physician RUC surveys. This is an important and valuable opportunity for us to provide direct input into the value of complex, highly technical, and high-risk vascular services. Very Important: When completing a RUC survey, please be realistic about the time it takes to perform a procedure (NOT your fastest time-this is not a competition), the mental effort and judgment needed, the actual physical effort and technical skills needed, and the psychological stress that occurs when an adverse outcome has serious consequences. Also, consider our practice expense and cost of professional liability insurance necessary to provide the service. **DO NOT UNDERVALUE YOUR WORK!!!!** Practicing vascular surgeons have many demands for their time, but the RUC surveys are how we will ensure that our work is highly valued by CMS.

Respectfully Yours,

The American Venous Forum Government Relations Committee

Fedor Lurie, Chair

Michael Vasquez

Harold Welch

#

The American Venous Forum (AVF) is dedicated to improving the care of patients with venous and lymphatic disease through education, research and technology. Membership is open to vascular surgeons, physicians and allied health professionals engaged in the care of patients with venous and lymphatic diseases.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 36475	Tracking Number	Original Specialty Recommended RVU: <b>5.30</b>
		Presented Recommended RVU: <b>5.30</b>
Global Period: 000		RUC Recommended RVU: <b>5.30</b>

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous radiofrequency ablation therapy of the insufficient saphenous vein is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The operating physician reviews the previously obtained diagnostic non-invasive imaging studies, history and physical exam, and lab tests. The procedure is reviewed with the patient, including a final discussion of risks, benefits and alternatives. Informed consent is obtained. The physician checks to ensure presence of sterile drapes, sterile ultrasound probe cover, gel, flush solutions, pressure bag and sterile IV set, local tumescent anesthetic, scalpel, access needle, dilator, vascular sheath, guide wires, sterile Radiofrequency ablation catheter, and other necessary supplies and equipment. Change into surgical scrubs and position patient such that target veins are accessible. Prep and drape patient. Instill local anesthesia at access site prior to vein access and continued local anesthesia as needed throughout procedure.

Description of Intra-Service Work:

- Set up operating field
- Attach pressurized heparin saline drip to the sterile Radiofrequency ablation catheter.
- Test actuation, temperature, and impedance to ensure that all components are connected and operating properly.
- Use ultrasound guidance to find target greater saphenous vein (GSV) access site
- Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
- Use ultrasound guidance to map vein tributaries•
- Access vein under ultrasound guidance (not separately reportable)
- Using Seldinger technique to introduce guide wire
- Advance dilator over guidewire

- Exchange dilator for sheath of appropriate size.
- Remove guidewire and flush sheath.
- Place RF probe through the sheath and advance to the saphenofemoral junction using ultrasound guidance
- Locate tip of probe just below the superficial epigastric tributary vein
- Verify RF probe position by ultrasound
- Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a “halo” of fluid around the GSV from the entry site to the saphenofemoral junction (not separately reportable)
- With patient in Trendelenberg, verify target parameters are within acceptable range
- Reconfirm RF position with ultrasound imaging
- Apply RF energy
- Carefully withdraw probe, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
- Monitor impedance, power and vein wall temperature throughout procedure.
- Record total RF application time
- Repeat ultrasound of the saphenous to confirm successful ablation, capture images
- Capture images of the common femoral vein with and without compression to ensure no thrombus or involvement of the common femoral vein in the ablation.

#### Description of Post-Service Work:

- Elevate extremity and apply sterile dressings.
- Apply compression wrap or stocking starting at foot and ending at most proximal thigh
- Transfer patient to stretcher
- Ensure patient hemodynamic stability and comfort in Recovery area
- Write orders
- Dictate operative note
- Review results with patient's family
- Communicate with referring physician
- Review results with patient after sedation wears off
- Evaluate after recovery interval for discharge suitability
- Provide discharge activity advice to patient/family
- Arrange for follow-up care as required

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### 36475 Rationale for Recommendation

#### **Background**

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

#### **Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

#### **\*\*\*DISCLOSURE\*\*\***

After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treat venous disease. This communication was emailed to all of their members on March 10<sup>th</sup> and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10<sup>th</sup> to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

#### **Results of Survey**

Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a reduction in the RVW from a current value of 6.72 to the 25<sup>th</sup> percentile from our survey data.

#### **Work RVU Recommendation**

We are recommending the 25<sup>th</sup> percentile survey value of 5.30 RVW for 36475.

#### **Pre-time**

Pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with addition time added as outlined below.

Evaluation: An additional 27 minutes of pre-service evaluation time was identified by the survey recipients. The societies recommend adding 3 minutes of evaluation time to check and calibrate the radiofrequency generator as these tasks are not captured in the standard package.

Positioning: An additional 9 minutes of pre-service positioning time was identified by the survey recipients. The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.

Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

### **Comparison to key reference code**

The key reference code chosen by the majority of the survey respondents (19%) was 35476 (*Transluminal balloon angioplasty, percutaneous; venous*). This key reference is similar to 36475 in the sense that they are both endoluminal venous procedures. The primary difference between 35476 and 36475 lies in the intra-service time and intensity. The time of CPT Code 36475 is more than the key reference code but 36475 is slightly less intense. This comparison thus favorably supports our recommendation for the 25<sup>th</sup> percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>Survey</b>	<b>36475</b>	5.30	0.097	94	20	4	10	45	15
<b>Key Ref</b>	<b>35476</b>	5.10	0.118	81	17	4	5	35	20

### **Comparison to MPC codes**

#### **Comparison with MPC List Code, CPT 37191 – RVW 4.71**

37191 (*Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed*) is a 0-day global MPC service with similar times and intensity to 36475. Both 36475 and 37191 are endoluminal venous procedures that require technical skill to complete successfully. 36475 has more intra-service time than 37191 supporting our recommendation for the 25<sup>th</sup> percentile survey RVW of 5.30.

#### **Comparison with MPC List Code, CPT 52235 – RVW 5.44**

52235 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)*) is a 0-day global MPC service with similar intra-service time and intensity to 36475. Both 52235 and 36475 require technical skill to complete successfully. 52235 and 36475 have identical intra-service times and almost identical intensities. The pre- and post-service times have minor variations. In conclusion, comparison with this MPC code justifies our recommendation for the 25<sup>th</sup> percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>MPC</b>	<b>37191</b>	4.71	0.120	83	30	3	5	30	15
<b>Survey</b>	<b>36475</b>	5.30	0.097	94	20	4	10	45	15
<b>MPC</b>	<b>52235</b>	5.44	0.098	94	19	5	5	45	20

### **Conclusion**

Favorable comparison with the key reference service and two MPC codes supports our recommendation of the 25<sup>th</sup> percentile survey value of 5.30 RVW for 36475.

## **SERVICES REPORTED WITH MULTIPLE CPT CODES**

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36475

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery                      How often? Commonly

Specialty Cardiology                      How often? Commonly

Specialty Radiology                      How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
68,276 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery	Frequency 37000	Percentage 54.19 %
Specialty Cardiology	Frequency 14000	Percentage 20.50 %
Specialty Radiology	Frequency 5000	Percentage 7.32 %

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36475

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 36476

Tracking Number

Original Specialty Recommended RVU: **3.00**Presented Recommended RVU: **3.00**

Global Period: ZZZ

RUC Recommended RVU: **2.65**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great and small saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous radiofrequency ablation therapy of the insufficient great and small saphenous veins is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Additional pre-service work includes examining the extra veins to be ablated, review of additional pre-procedural imaging services, extra time positioning the patient such that both the primary vein and the additional vein are accessible for treatment, and instillation of local anesthesia at the new access site prior to vein access and continued local anesthesia as needed throughout procedure. This is important because the typical second vein is the lesser saphenous, which is located directly posterior on the calf. Operators must be able to reach this vein in addition to the primary target, the greater saphenous, which is located medially.

Description of Intra-Service Work:

- Retest actuation, temperature, and impedance to ensure that all components are connected and operating properly.
- Use ultrasound guidance to find target secondary vein access site
- Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
- Use ultrasound guidance to map vein tributaries
- Access vein under ultrasound guidance (not separately reportable)
- Using Seldinger technique to introduce guide wire
- Advance dilator over guidewire
- Exchange dilator for sheath of appropriate size.
- Remove guidewire and flush sheath.

- Place RF probe through the sheath and advance to target endpoint using ultrasound guidance
- Verify RF probe position by ultrasound
- Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a “halo” of fluid around the target vein from the entry site to the endpoint (not separately reportable)
- With patient in Trendelenberg, verify target parameters are within acceptable range
- Reconfirm RF position with ultrasound imaging
- Apply RF energy
- Carefully withdraw probe, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
- Monitor impedance, power and vein wall temperature throughout procedure.
- Record total RF application time
- Repeat ultrasound of the saphenous to confirm successful ablation, capture images
- Capture images of the popliteal vein with and without compression to ensure no thrombus or involvement of the popliteal vein in the ablation.

Description of Post-Service Work:

Additional post-service work over and above that already provided for the primary procedure includes:

- apply additional dressings;
- dictating extra procedural details in the operative report; and
- longer discussion and explanation to patient and family.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### 36476 Rationale for Recommendation

#### Background

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

#### Methodology

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

#### \*\*\*DISCLOSURE\*\*\*

After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treat venous disease. This communication was emailed to all of their members on March 10<sup>th</sup> and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10<sup>th</sup> to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

#### Results of Survey

Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a reduction in the RVW from a current value of 3.38.

#### Comparison to key reference code

The key reference code chosen by the majority of the survey respondents (27%) was 37222 (*Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*). This key reference is similar to 36476 in the sense that they are both endoluminal procedures. The primary difference between 37222 and 36476 lies in the pre-, intra-, and post-service times. 36476 has 10 minutes less of intra-service time supporting the decreased RVW in comparison to the key reference service. This comparison thus favorably supports our recommendation for the 25<sup>th</sup> percentile survey value of 3.00.

	CPT	RVW	IWP/UT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>Survey</b>	<b>36476</b>	2.65	0.088	30	0	0	0	30	0
<b>Key Ref</b>	<b>37222</b>	3.73	0.092	42	1	0	0	40	1

#### Comparison to MPC codes

##### **Comparison with MPC List Code, CPT 99292 – RVW 2.25**

99292 (*Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)*) is a ZZZ global MPC service with similar times and

intensity to 36476. Both 36476 and 99292 are add on codes with 30 minutes of intra-service time. 36476 has a higher intensity and 10 more minutes of total time accounting for the difference in RVW. Therefore, comparison with this MPC code justifies our recommendation for the 25<sup>th</sup> percentile survey value of 3.00.

### Comparison with MPC List Code, CPT 57267 – RVW 4.88

57267 (*Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*) is a ZZZ global MPC service with similar intensity to 36476. 57267 has 15 more minutes of intra-service time accounting for the higher RVW. This MPC code comparison supports our recommendation for the 25<sup>th</sup> percentile survey value of 3.00.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
MPC	99292	2.25	0.075	30	0	0	0	30	0
Survey	36476	2.65	0.088	30	0	0	0	30	0
MPC	57267	4.88	0.108	45	0	0	0	45	0

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36476

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery                      How often? Commonly

Specialty Cardiology                      How often? Commonly

Specialty Radiology                      How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,494  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery	Frequency 4700	Percentage 62.71 %
Specialty Cardiology	Frequency 700	Percentage 9.34 %
Specialty Radiology	Frequency 600	Percentage 8.00 %

Do many physicians perform this service across the United States? Yes

---

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36476

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 36478	Tracking Number	Original Specialty Recommended RVU: <b>5.30</b>
		Presented Recommended RVU: <b>5.30</b>
Global Period: 000		RUC Recommended RVU: <b>5.30</b>

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous laser ablation therapy of the insufficient saphenous vein is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

#### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The operating physician reviews the previously obtained diagnostic non-invasive imaging studies, history and physical exam, and lab tests. The procedure is reviewed with the patient, including a final discussion of risks, benefits and alternatives. Informed consent is obtained. The physician checks to ensure presence of sterile drapes, sterile ultrasound probe cover, gel, flush solutions, pressure bag and sterile IV set, local tumescent anesthetic, scalpel, access needle, dilator, vascular sheath, guide wires, laser fiber, safety goggles for all present during the procedure and any other necessary supplies and equipment. Change into surgical scrubs and position patient such that target veins are accessible. Prep, drape and place safety goggles on patient. Instill local anesthesia at access site prior to vein access and continued local anesthesia as needed throughout procedure.

Description of Intra-Service Work:

- Set up operating field
- Attach pressurized heparin saline drip to the sterile laser ablation catheter.
- Test actuation, temperature, and impedance to ensure that all components are connected and operating properly.
- Use ultrasound guidance to find target greater saphenous vein (GSV) access site
- Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
- Use ultrasound guidance to map vein tributaries
- Access vein under ultrasound guidance (not separately reportable)
- Using Seldinger technique to introduce guide wire
- Advance dilator over guidewire

- Exchange dilator for sheath of appropriate size.
- Remove guidewire and flush sheath.
- Place laser fiber through the sheath and advance to the saphenofemoral junction using ultrasound guidance
- Locate tip of fiber just below the superficial epigastric tributary vein
- Verify fiber position by ultrasound
- Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a “halo” of fluid around the GSV from the entry site to the saphenofemoral junction (not separately reportable)
- With patient in Trendelenberg, verify target parameters are within acceptable range
- Reconfirm laser fiber position with ultrasound imaging
- Apply laser energy
- Carefully withdraw laser fiber, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
- Monitor impedance, power and vein wall temperature throughout procedure.
- Record total laser application time
- Repeat ultrasound of the saphenous to confirm successful ablation, capture images
- Capture images of the common femoral vein with and without compression to ensure no thrombus or involvement of the common femoral vein in the ablation.

#### Description of Post-Service Work:

- Elevate extremity and apply sterile dressings.
- Apply compression wrap or stocking starting at foot and ending at most proximal thigh
- Transfer patient to stretcher
- Ensure patient hemodynamic stability and comfort in Recovery area
- Write orders
- Dictate operative note
- Review results with patient's family
- Communicate with referring physician
- Review results with patient after sedation wears off
- Evaluate after recovery interval for discharge suitability
- Provide discharge activity advice to patient/family
- Arrange for follow-up care as required

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### 36478 Rationale for Recommendation

#### **Background**

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

#### **Methodology**

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

#### **\*\*\*DISCLOSURE\*\*\***

After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treat venous disease. This communication was emailed to all of their members on March 10<sup>th</sup> and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10<sup>th</sup> to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

#### **Results of Survey**

Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a reduction in the RVW from a current value of 6.72 to the 25<sup>th</sup> percentile from our survey data.

#### **Work RVU Recommendation**

We are recommending the 25<sup>th</sup> percentile survey value of 5.30 RVW for 36478.

#### **Pre-time**

Pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate with addition time added as outlined below.

Evaluation: An additional 27 minutes of pre-service evaluation time was identified by the survey recipients. The societies recommend adding 3 minutes to evaluation time to check and calibrate the laser generator as these tasks are not captured in the standard package.

Positioning: An additional 9 minutes of pre-service positioning time was identified by the survey recipients. The standard package allows for 1 minute to position the patient supine. This position does not provide adequate access to the saphenous vein for the procedure. The patient must be positioned with the leg slightly bent and externally rotated to gain access to the vein. The patient must then be supported comfortably in this position as they need to maintain it for the duration of the procedure. The societies feel that these additional steps in positioning justify adding 3 minutes to the standard package.

Scrub, dress, and wait: An additional 5 minutes has been added to pre-service scrub, dress, and wait time. Although the package includes time for *administer local/topical anesthesia*, there are no minutes for *dress and scrub for procedure*. Sterile OR technique is maintained for this procedure when performed in an office procedure/surgery suite, requiring scrubbing and sterile gown, mask and gloves for the physician and clinical staff. As such, the societies recommend adding 5 minutes to mirror the time allotted for *dress and scrub for procedure* in the facility packages. The total time of 10 minutes is reflected in the survey median.

### **Comparison to key reference code**

The key reference code chosen by the majority of the survey respondents (14%) was 35476 (*Transluminal balloon angioplasty, percutaneous; venous*). This key reference is similar to 36475 in the sense that they are both endoluminal venous procedures. The primary difference between 35476 and 36475 lies in the intra-service time and intensity. The time of CPT Code 36475 is more than the key reference code but 36475 is slightly less intense. This comparison thus favorably supports our recommendation for the 25<sup>th</sup> percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>Survey</b>	<b>36478</b>	5.30	0.097	94	20	4	10	45	15
<b>Key Ref</b>	<b>35476</b>	5.10	0.118	81	17	4	5	35	20

### **Comparison to MPC codes**

#### **Comparison with MPC List Code, CPT 37191 – RVW 4.71**

37191 (*Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed*) is a 0-day global MPC service with similar times and intensity to 36478. Both 36478 and 37191 are endoluminal venous procedures that require technical skill to complete successfully. 36475 has more intra-service time than 37191 supporting our recommendation for the 25<sup>th</sup> percentile survey value of 5.30.

#### **Comparison with MPC List Code, CPT 52235 – RVW 5.44**

52235 (*Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)*) is a 0-day global MPC service with similar intra-service time and intensity to 36478. Both 52235 and 36478 require technical skill to complete successfully. 52235 and 36475 have identical intra-service times and almost identical intensities. The pre- and post-service times have minor variations. In conclusion, comparison with this MPC code justifies our recommendation for the 25<sup>th</sup> percentile survey value of 5.30.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>MPC</b>	<b>37191</b>	4.71	0.120	83	30	3	5	30	15
<b>Survey</b>	<b>36478</b>	5.30	0.097	94	20	4	10	45	15
<b>MPC</b>	<b>52235</b>	5.44	0.098	94	19	5	5	45	20

### **Conclusion**

Favorable comparison with the key reference service and two MPC codes supports our recommendation of the 25<sup>th</sup> percentile survey value of 5.30 RVW for 36478.

### **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36478

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery (V&GS) How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology (D&IR) How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

36,478 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery (V&GS) Frequency 17550 Percentage 48.11 %

Specialty Cardiology Frequency 4800 Percentage 13.15 %

Specialty Radiology (D&IR) Frequency 3700 Percentage 10.14 %

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:  
Minor procedure

BETOS Sub-classification Level II:  
Other

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36478

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 36479

Tracking Number

Original Specialty Recommended RVU: **3.00**Presented Recommended RVU: **3.00**

Global Period: ZZZ

RUC Recommended RVU: **2.65**

CPT Descriptor: Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; second and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman has painful, unilateral leg swelling that increases during the course of the day while at her job which requires her to stand for a significant portion of the day. She has been diagnosed with great and small saphenous vein insufficiency with resultant superficial varicosities. Percutaneous endovenous laser ablation therapy of the insufficient great and small saphenous veins is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Additional pre-service work includes examining the extra veins to be ablated, review of additional pre-procedural imaging services, extra time positioning the patient such that both the primary vein and the additional vein are accessible for treatment, and instillation of local anesthesia at the new access site prior to vein access and continued local anesthesia as needed throughout procedure. This is important because the typical second vein is the lesser saphenous, which is located directly posterior on the calf. Operators must be able to reach this vein in addition to the primary target, the greater saphenous, which is located medially.

### Description of Intra-Service Work:

- Use ultrasound guidance to find target secondary vein access site
- Use ultrasound guidance to map and mark entire length of target vein, noting vein depth and diameter
- Use ultrasound guidance to map vein tributaries
- Access vein under ultrasound guidance (not separately reportable)
- Using Seldinger technique to introduce guide wire
- Advance dilator over guidewire
- Exchange dilator for sheath of appropriate size.
- Remove guidewire and flush sheath.
- Place laser fiber through the sheath and advance to target endpoint using ultrasound guidance
- Verify laser fiber position by ultrasound

- Using ultrasound guidance, infiltrate tumescent anesthesia into the perivenous space to create a “halo” of fluid around the target vein from the entry site to the endpoint (not separately reportable)
- With patient in Trendelenberg, verify target parameters are within acceptable range
- Reconfirm laser fiber position with ultrasound imaging
- Apply laser energy
- Carefully withdraw laser fiber, maintaining target vein wall temperature by varying pullback rate and/or applying compression over the limb
- Monitor impedance, power and vein wall temperature throughout procedure.
- Record total laser application time
- Repeat ultrasound of the saphenous to confirm successful ablation, capture images
- Capture images of the popliteal vein with and without compression to ensure no thrombus or involvement of the poplitea vein in the ablation.

Description of Post-Service Work:

Additional post-service work over and above that already provided for the primary procedure includes:

- apply additional dressings;
- dictating extra procedural details in the operative report; and
- longer discussion and explanation to patient and family.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### 36479 Rationale for Recommendation

#### Background

In April 2013, the RUC assembled a list of all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011. CPT codes 36475, 36478, and 36479 were identified in this screen as potentially misvalued. A coalition of societies including the Society for Vascular Surgery (SVS), American College of Surgeons (ACS), American College of Radiology (ACR), Society for Interventional Radiology (SIR), American College of Cardiology (ACC) and Society for Cardiac Angiography and Interventions (SCAI) recommended surveying the family of codes for endovenous ablation including CPT 36476 with the three codes that were identified in the screen.

#### Methodology

A multispecialty RUC survey was sent to all members of the SVS through an email list-service and to random samples of members from the ACS, ACR, SIR, ACC, and the American College of Phlebology (ACP).

#### \*\*\*DISCLOSURE\*\*\*

After the survey requests were sent out, an inappropriate communication was emailed from a non RUC participating professional society whose members treats venous disease. This communication was emailed to all of their members on March 10<sup>th</sup> and potentially tainted the survey pool due to overlapping membership. Our response to this email was to immediately close the survey until further guidance was given from the AMA RUC staff. Thereafter, a communication question was added to the surveys that were fielded after March 10<sup>th</sup> to determine if respondents had received the inappropriate email. All potentially contaminated surveys were excluded.

#### Results of Survey

Utilization data shows not only an increase in growth for these codes but also a shift in site of service from hospital outpatient to office-based since they were originally presented at the RUC in February 2004. We will be recommending a reduction in the wRVU from a current value of 3.38.

#### Comparison to key reference code

The key reference code chosen by the majority of the survey respondents (25%) was 37239 (*Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; each additional vein (List separately in addition to code for primary procedure)*). This key reference is similar to 36476 in the sense that they are both endoluminal venous procedures. They have identical intra-service times and very similar intensities. This comparison thus favorably supports our recommendation for the 25<sup>th</sup> percentile survey value of 3.00.

#### Comparison to MPC codes

##### Comparison with MPC List Code, CPT 99292 – RVW 2.25

99292 (*Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)*) is a ZZZ global MPC service with similar times and intensity to 36476. Both 36476 and 99292 are add on codes with 30 minutes of intra-service time. 36476 has a higher

intensity and 10 more minutes of total time accounting for the difference in RVW. Therefore, comparison with this MPC code justifies our recommendation for the 25<sup>th</sup> percentile survey value of 3.00.

### Comparison with MPC List Code, CPT 57267 – RVW 4.88

57267 (*Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*) is a ZZZ global MPC service with similar intensity to 36476. 57267 has 15 more minutes of intra-service time accounting for the higher RVW. This MPC code comparison supports our recommendation for the 25<sup>th</sup> percentile survey value of 3.00.

	CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
MPC	99292	2.25	0.075	30	0	0	0	30	0
Survey	36476	2.65	0.088	30	0	0	0	30	0
MPC	57267	4.88	0.108	45	0	0	0	45	0

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36479

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery                      How often? Commonly

Specialty Cardiology                      How often? Commonly

Specialty Radiology                      How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national frequency rate is not available.

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
 11,563 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
 Please explain the rationale for this estimate. 2012 Medicare Frequency from the current RUC database

Specialty Surgery	Frequency 7300	Percentage 63.13 %
-------------------	----------------	--------------------

Specialty Cardiology	Frequency 850	Percentage 7.35 %
----------------------	---------------	-------------------

Specialty Radiology	Frequency 1400	Percentage 12.10 %
---------------------	----------------	--------------------

Do many physicians perform this service across the United States? Yes

---

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36479

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Note: Surveys received after 3/10/14 w/o extra question (eg, SVS,ACS,ACC) or with communication or financial conflict are not included

CPT Long Descriptor:

- 36475** Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **radiofrequency**; **first** vein treated
  
- 36476** Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **radiofrequency**; **second** and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)
  
- 36478** Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **laser**; **first** vein treated
  
- 36479** Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, **laser**; **second** and subsequent veins treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)

Global Period: **36475 & 36478 - 000**  
**36476 & 36479 - ZZZ**

Meeting Date: **April 2014**

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The multispecialty organizations (SVS, ACS, SIR, ACR, ACC, SCAI and ACP) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this procedure. The panel made recommendations based on existing inputs and the new coding conventions.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

We are making recommendations for existing CPT codes. As such, we have included the current direct PE recommendations and not a reference code.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

N/A

**5. Please describe in detail the clinical activities of your staff:**

**CPT Codes 36475 & 36478:**

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms: a clinically trained individual (RN/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. Coordinate pre-surgery services. Clinical staff member ensures that all appropriate labs are drawn and results are acceptable. Schedule space and equipment in facility. Provide pre-service education/obtain consent. Follow-up phone calls and prescriptions: Clinical staff will contact the patient prior to the procedure, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed.

DAY OF Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Conducts phone calls/call in prescription.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

Pre Service Period

Lines 23 & 24 - Added 4 minutes for digital activities. The existing inputs do not include minutes to account for these activities.

Service Period

We have modified the ‘assist physician’ section of the PE recommendations to reflect current PE ‘standard’ for interventional procedures. (Source: carotids, embo, stents).

Line 39 – recommended 75% total physician time for tech to acquire images (current ‘standard’ for interventional procedures)

Line 40 – added RN/LPN/MTA time to account for the 25% circulator

Line 42 – added RN/LPN/MTA time to apply multi-layer comprehensive dressing

Line 44 – increased post procedure monitoring from 3 min to 8 min. The 8 min represents the standard for 30 min of post procedure monitoring.

**5. Please describe in detail the clinical activities of your staff:**

**CPT Codes 36475 & 36478:**

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms: a clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. Coordinate pre-surgery services: Clinical staff member ensures that all appropriate labs are drawn and results are acceptable. Follow-up phone calls and prescriptions: Clinical staff will contact the patient prior to the procedure, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed. Other clinical activities: The vascular technologist prior to the patient’s arrival will retrieve any prior imaging exams, display these exams for the physician to review, verify orders, review the chart to incorporate any relative clinical information.

DAY OF Service Clinical Labor Activities:

Greet patient, provide gowning, and ensure appropriate medical records are available: Patient is greeted by the clinical staff, escorted to the intake area, provided with gowning and given assistance with changing into the gown if needed. Obtain vital signs: blood pressure, heart rate, respiratory rate, temperature, rhythm strip and pulse oximetry, are all obtained. Prepare room, equipment, supplies: Vascular technologist checks imaging equipment to make sure that it is turned on, warmed up, functioning properly, enters the patient demographics, opens the sterile tray and sets it up, goes to the storage room to pull all the supplies that will be used for the procedure, and brings them to the procedure room. Prepare and position patient/Monitor patient/Setup IV. Intra-service Time of varying clinical personnel: a vascular tech is scrubbed next to the physician the entire case, an additional individual who is not scrubbed will assist with

**CPT Code:** 36475, 36476, 36478 and 36479  
**Specialty Society(s):** SVS, ACS, SIR, ACR, ACC, SCAI and ACP

the imaging equipment and opening supplies. Monitor patient following service/Check tubes, monitors, drains. The patients are recovered before being discharged. Check dressings and wound/home care instructions/coordinated office visits/prescriptions. In addition to checking the dressings and reviewing at home instructions the clinical staff will also discuss pain prescriptions for the patients and review the medications with them. Other clinical activities: The vascular tech post procedure annotates the images, processes them, and then either hangs the films for interpretation or sends digital images to PACS and ensures they are received.

Post-Service Clinical Labor Activities:

Conducts phone calls/call in prescription.

**CPT Codes 36476 & 36479:**

Pre-Service Clinical Labor Activities:

N/A

DAY OF Service Clinical Labor Activities:

A vascular tech is scrubbed next to the physician and an additional individual who is not scrubbed will assist with the imaging equipment and opening supplies.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS High Expenditure Procedures Screen*

January 2017

**Therapeutic Apheresis**

In the Proposed Rule for 2016, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated that the code is misvalued because of incorrect direct and indirect practice expense (PE) inputs and an incorrect work RVU. In the Final Rule for CY 2016, CMS continued the desire for specific review of 36516. At the April 2016 RUC meeting, therapeutic apheresis code 36516 was discussed. During the discussion, the Renal Physicians Association (RPA) and the College of American Pathologists (CAP) indicated there is a concern that the service is misplaced within the CPT coding structure and this misplacement may have resulted in recent inaccuracy of coding. Specifically, the service is an extracorporeal therapy that is more akin to dialysis services (CPT codes 90935-90999) than to surgical procedures, and the code may need to reside in the 909XX series of codes within the CPT coding structure. The two specialties indicated they would submit a code change proposal that will address CPT code 36516 as well as any others in the coding family that may be impacted by a change. The RUC referred CPT code 36516 to the CPT Editorial Panel.

In September 2016, the CPT Editorial Panel deleted 36515 and revised 36516 to include immunoabsorption. CPT codes 36511-36514 and 36522 were added as part of this family of services.

**Compelling Evidence**

The specialty societies presented compelling evidence for CPT codes 36511-36514, 36516, and 36522. The specialty societies noted that the current work RVUs undervalue these services, which are supported by the results of the survey. The specialty societies provided evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey. At that time, pathology was the dominant provider for CPT codes 36511, 36512, and a dominant provider for CPT codes 36514, 36516, and 36522, and in 2015 pathology was the dominant provider for CPT codes 36511, 36512, 36514, 36516, and 36522. The specialties added that Pathology's exclusion from the original survey also led to the creation of new vignettes, which were not updated since 2002.

Furthermore, CPT code 36522 has never gone through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies. The dominant provider in 2002 was dermatology. In 2015, the dominant provider was pathology. For code 36522, the specialties noted that the patient population has changed since the code was originally valued. When this was originally valued by the Harvard study, the patients typically had mycosis fungoides; currently, these are bone marrow transplant patients who have graft versus host disease.

The RUC accepted that there is compelling evidence based on the change in dominant provider 36511-36522 and also based on a change in patient population for code 36522.

**36511 Therapeutic apheresis; for white blood cells**

The RUC reviewed the survey results from 59 physicians and agreed with the following physician time components: pre-service time of 40 minutes, intra-service time of 30 minutes, and post-service time of 15 minutes. The specialty societies indicated that the survey respondents overestimated the pre-service time. Therefore, the specialty societies requested and the RUC agreed to maintain the pre-service time at 40 minutes as nothing changed to justify an increase.

For CPT code 36512, the red blood cell apheresis physician workload intra-service time is slightly less in comparison to CPT codes 36511 and 36513 because the procedure runs slightly quicker for red blood cell exchanges than for white blood cells. However, the physician workload intensity for red blood cell exchange is slightly more than that for white blood cell and platelet depletion apheresis because the infusion of replacement packed red blood cells back into a patient is associated with a higher risk for a transfusion reaction.

The RUC reviewed the 25<sup>th</sup> percentile work RVU of 2.00 and agreed that this value appropriately accounts for the physician work involved. The specialty society noted that incorrect assumptions were made in the previous valuation of all of these services. To justify a work RVU of 2.00, the RUC compared the survey code to top key reference code 90947 *Dialysis procedure other than hemodialysis (eg, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies) requiring repeated evaluations by a physician or other qualified health care professional, with or without substantial revision of dialysis prescription* (work RVU= 2.52, intra-service time of 50 minutes, and total time of 70 minutes) and noted that although the reference code includes more intra-service time, the survey code includes more total time. The RUC noted that 96 percent of the survey respondents that selected 90947 as a key reference indicated that the surveyed code is more intense, supporting the work RVU of the survey code at 2.00 RVUs. To further justify the work RVU, the RUC compared the survey code to CPT code 99205 *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family* (work RVU= 3.17, intra-service time of 45 minutes, and total time of 67 minutes) and agreed that the survey code has more total time and that the survey respondents indicated that the survey code involves more intense physician work, supporting the work RVU of the survey code at 2.00. **The RUC recommends a work RVU of 2.00 for CPT code 36511.**

### **36512 Therapeutic apheresis; for red blood cells**

The RUC reviewed the survey results from 62 physicians and agreed with the following physician time components: pre-service time of 40 minutes, intra-service time of 20 minutes, and post-service time of 15 minutes. The specialty societies indicated that the survey respondents overestimated the pre-service time. Therefore, the specialty societies requested and the RUC agreed to maintain the pre-service time at 40 minutes as nothing changed to justify an increase.

For CPT code 36512, the red blood cell apheresis physician workload intra-service time is slightly less in comparison to CPT codes 36511 and 36513 because the procedure runs slightly quicker for red blood cell exchanges than for white blood cells. However, the physician workload intensity for red blood cell exchange is slightly more than that for white blood cell and platelet depletion apheresis because the infusion of replacement packed red blood cells back into a patient is associated with a higher risk for a transfusion reaction.

The RUC reviewed the 25<sup>th</sup> percentile work RVU of 2.00 and agreed that this value appropriately accounts for the physician work involved. To justify a work RVU of 2.00, the RUC compared the survey code to CPT code 19283 *Placement of breast localization device(s) (eg, clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including stereotactic guidance* (work RVU= 2.00, intra-service time of 20 minutes, post-service time of 15 minutes, and total time of 57 minutes) and noted that both codes have identical intra-service times and involve a similar amount of physician work, supporting the work RVU of the survey code at 2.00. To further justify the work RVU, the RUC compared the survey code to CPT code 45337 *Sigmoidoscopy, flexible; with decompression (for pathologic distention) (eg, volvulus, megacolon), including placement of decompression tube, when performed* (work RVU= 2.10, intra-service time of 25 minutes, and total time of 68 minutes) and noted that both services have similar work RVUs, intra-service times, and total times, supporting the work RVU of the survey code at 2.00. **The RUC recommends a work RVU of 2.00 for CPT code 36512.**

### **36513 Therapeutic apheresis; for platelets**

The RUC reviewed the survey results from 36 physicians and agreed with the following physician time components: pre-service time of 40 minutes, intra-service time of 25 minutes, and the existing post-time of 15 minutes. The specialty societies indicated that the survey respondents overestimated the pre-service time. Therefore, the specialty societies requested and the RUC agreed to maintain the pre-service time at 40 minutes as nothing changed to justify an increase.

For CPT code 36512, the red blood cell apheresis physician workload intra-service time is slightly less in comparison to CPT codes 36511 and 36513 because the procedure runs slightly quicker for red blood cell exchanges than for white blood cells. However, the physician workload intensity for red blood cell exchange is slightly more than that for white blood cell and platelet depletion apheresis because the infusion of replacement packed red blood cells back into a patient is associated with a higher risk for a transfusion reaction.

The RUC reviewed the 25<sup>th</sup> percentile work RVU of 2.00 and agreed that this value appropriately accounts for the physician work involved. To justify a work RVU of 2.00, the RUC compared the survey code to CPT code 19283 *Placement of breast localization device(s) (eg, clip, metallic pellet,*

wire/needle, radioactive seeds), percutaneous; first lesion, including stereotactic guidance (work RVU= 2.00, intra-service time of 20 minutes, post-service time of 15 minutes, and total time of 57 minutes) and noted that both codes have similar intra-service times, identical post-service times, and involve a similar amount of physician work, supporting the work RVU of the survey code at 2.00 RVUs. To further justify the work RVU, the RUC compared the survey code to CPT code 36002 *Injection procedures (eg, thrombin) for percutaneous treatment of extremity pseudoaneurysm* (work RVU= 1.96, intra-service time of 30 minutes, post-time of 15 minutes, and total time of 80 minutes) and noted that both services have similar intra-services times, identical post-times and total-times. **The RUC recommends a work RVU of 2.00 for CPT code 36513.**

#### **36514 Therapeutic apheresis; for plasma pheresis**

The RUC reviewed the survey results from 69 physicians and agreed with the following physician time components: pre-service time of 29 minutes, intra-service time of 20 minutes, and post-time of 15 minutes.

The RUC reviewed the 25<sup>th</sup> percentile work RVU of 2.00 and agreed that the survey respondents overvalued the physician work involved in performing this service. To find an appropriate work RVU crosswalk for CPT code 36514, the RUC compared the survey code to CPT code 64446 *Injection, anesthetic agent; sciatic nerve, continuous infusion by catheter (including catheter placement)* (work RVU= 1.81, intra-service time of 20 minutes, and total time of 64 minutes) and noted that both services had identical intra-service times of 20 minutes and involve a similar amount of physician work. Therefore, the RUC recommends a direct RVU crosswalk from code 64446 to 36514. To further support a work RVU of 1.81, the RUC compared the survey code to CPT code 64416 *Injection, anesthetic agent; brachial plexus, continuous infusion by catheter (including catheter placement)* (work RVU= 1.81, intra-service time of 20 minutes, and total time of 60 minutes) and CPT code 45990 *Anorectal exam, surgical, requiring anesthesia (general, spinal, or epidural), diagnostic* (work RVU= 1.80, intra-service time of 20 minutes, and total time of 95 minutes) and noted that both services had similar intra-service times and 64416 has a similar total time, supporting the work RVU of the survey code at 1.81. **The RUC recommends a work RVU of 1.81 for CPT code 36514.**

#### **36516 Therapeutic apheresis; with extracorporeal selective adsorption or selective filtration and plasma reinfusion**

The RUC reviewed the survey results from 35 physicians and agreed with the following physician time components: pre-service time of 25 minutes, intra-service time of 15 minutes, and post-time of 10 minutes. The pre-service time was cross walked from existing pre-times for this code. The specialty societies indicated that the survey respondents overestimated the pre-service time. Therefore, the specialty societies requested and the RUC agreed to maintain the pre-service time at 25 minutes as nothing changed to justify an increase.

The RUC reviewed the 25<sup>th</sup> percentile work RVU of 1.56 and agreed that this value appropriately accounts for the physician work involved. To compare the relativity of other services, the RUC assimilated the overall work of CPT code 90945 *Dialysis procedure other than hemodialysis (eg, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies), with single evaluation by a physician or other qualified health care professional* (work RVU= 1.56, total time of 47 minutes) to 36516. The RUC also justified a work RVU of 1.56, by comparing the survey code to CPT code 45333 *Sigmoidoscopy, flexible; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps* (work RVU= 1.55, intra-service time of 15 minutes, post-time of 10 minutes, and total time of 47 minutes) and noted that both services had identical intra-service and post-

times, and similar total time, supporting the work RVU of the survey code at 1.56 RVUs. To further justify the work RVU, the RUC compared the survey code to CPT code 44386 *Endoscopic evaluation of small intestinal pouch (eg, Kock pouch, ileal reservoir [S or J]); with biopsy, single or multiple* (work RVU= 1.50, intra-service time of 17 minutes, post-time of 10 minutes, and total time of 49 minutes) and noted that both services had similar intra-service times, identical post-times, and similar total times, further supporting the work RVU of the survey code. **The RUC recommends a work RVU of 1.56 for CPT code 36516.**

### **36522 Photopheresis, extracorporeal**

The RUC reviewed the survey results from 36 physicians and agreed on the following physician time components: pre-service time of 33 minutes, intra-service time of 18 minutes, and post-time of 10 minutes. The pre-service time was cross walked from CPT code 50387.

The RUC reviewed the 25<sup>th</sup> percentile work RVU of 1.50 and agreed that this undervalued the physician work involved. To find an appropriate work RVU crosswalk for CPT code 36522, the RUC compared the survey code to CPT code 50387 *Removal and replacement of externally accessible nephroureteral catheter (eg, external/internal stent) requiring fluoroscopic guidance, including radiological supervision and interpretation*. CPT code 50387 was last reviewed by the RUC in April 2005, and for CY 2017 CMS extracted the physician work and time of moderate sedation from this procedure which reduced the work RVU from 2.00 to 1.75 and reduced the pre-service time from 38 minutes to 33. The intra-service time and post-service times are identical to the surveyed code, 18 minutes and 10 minutes respectively. The RUC determined that the overall physician work of CPT code 50387 is identical to 36522 by the multispecialty expert panel and the RUC. **The RUC recommends a work RVU of 1.75 for CPT code 36522.**

### **Practice Expense**

The PE Subcommittee discussed the direct practice expense inputs proposed by the specialty societies and determined that there was duplication between the clinical staff tasks of the pre-service period and the pre-service portion of the service period. The Subcommittee reduced the pre-service time from 18 to 8 minutes. The Subcommittee discussed the significant time needed for the staff to *Assist physician in performing procedure* in the service period and agreed with the specialties that this service is one-on-one with the patient and the RN/LPN (L042A) is not able to multitask during this time. The Subcommittee discussed the significant time needed to prepare the room, equipment, and supplies. The specialties explained that the clinical staff time hadn't been accurately accounted for when it was last reviewed in 2004. The PE Subcommittee also discussed that much of the time requested in the post-service time was duplicative of the monitoring time and removed most of that time while maintaining the specialty recommended 10 minutes for monitoring in the service period. Additionally the PE Subcommittee reduced the time for *Clean room/equipment by physician staff; remove disposables from machine* from 7 in 36514 and 36516 and 5 in 36522 to the standard 3. The Subcommittee discussed the possibility that some of the supply items are separately reportable. The Subcommittee found that *albumin saline* (SH004) which is 5% albumin is separately reportable and new supply item *calcium gluconate* is separately reportable with J code J0610 per 10 ml for the drug along with CPT code 96365 to mix the bag. **The Subcommittee deleted the two supply items and recommends that the specialty societies prepare a CPT assistant article regarding how to report separately for these supplies.** The RUC reviewed and approved the direct practice expense inputs with modifications as approved by the Practice Expense Subcommittee.

### Referral to the CPT Editorial Panel

During the RUC's discussion, an issue was raised regarding miscoding for code 36513 *Therapeutic apheresis; for platelets*. The RUC noted and the specialties concurred that this code is only intended for therapeutic platelet depletion. The 2015 Medicare Claims data suggested that there was a portion of claims with miscoding. When platelets are harvested for other purposes (i.e. for donor collections), it would be inappropriate to use 36513. The RUC refers this issue to the CPT Editorial Panel for consideration of changes to the coding language to prevent the miscoding (i.e. a parenthetical or changes to the introductory language). The RUC noted that the following clinical vignette, which was used to value this service, was appropriate and that 94 percent of respondents had found the vignette to be typical: "A 65 year old man with essential thrombocythemia presents with a markedly elevated platelet count and mental status changes, consistent with poor brain perfusion. Emergent reduction of his platelet count is indicated."

CPT Descriptor: Therapeutic apheresis; for white blood cells

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 40 year old woman with acute leukemia presents with a high blast count and symptoms of leukostasis.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: [to be performed before every apheresis treatment, including the initial treatment]: The apheresis medicine physician evaluates the general clinical status of the patient (including current medications), ascertaining whether he/she remains sufficiently stable to undergo the therapeutic extracorporeal procedure. In addition, the physician reviews the patient's hematological status to confirm that the treatments are having the desired effect on the hyperleukocytosis and whether the patient is clinically improving as expected. This assessment may include reviewing evaluations by other attending physicians including hematologists, nephrologists and intensivists involved in the patient's management. Current diagnostic laboratory studies are reviewed, including complete blood count and differential count, renal and liver function studies, total protein and albumin and other relevant serum chemistry studies. The patient's fluid status including, urine output and the accumulation of edema fluid are assessed. The physician discusses the state of the patient's venous access with, and confirms the initial assessment of, the apheresis nurse. Finally, after determining that the parameters of the treatment (whole blood processing volume, anticoagulant-to-whole blood flow ratio, target extent of leukoreduction, etc.) as reflected in the orders are still appropriate, the physician authorizes that the treatment should proceed.

Pre-service work unique to the first treatment, in addition to all of the above, typically includes reviewing the patient's chest x-ray report to determine proper placement of the venous access device (this is ultimately the responsibility of the apheresis medicine physician), obtaining and reviewing the history and diagnostic studies; an examination of previous study reports; communicating with other professionals prior to the actual performance of the evaluation and procedure; and explaining the procedure to the patient or healthcare proxy and obtaining informed consent.

Description of Intra-Service Work: During the procedure, the apheresis medicine physician is responsible for the wellbeing of the patient on the machine. The physician periodically assesses the clinical status of the patient, paying particular attention to the vital signs flow sheet, the patient's color, urine output, mental status (if patient is awake), and other relevant parameters. The physician monitors the decline in white cell count to determine whether the goals of the procedure are being met by the current treatment parameters as ordered, and ascertains that other formed elements of the blood are not being inappropriately altered as a result of the procedure. Variations in clinical status or vital signs are repeatedly evaluated to determine whether to continue the procedure to its intended extent of whole blood processing. Given the inherent level of acuity of patients undergoing this procedure, the apheresis medicine physician is the first responder in

case of adverse clinical events or emergencies that arise during the procedure. Communications with other physicians and patient care providers during this phase are performed as needed by the apheresis medicine physician predicated on the clinical status of the patient and the need for any changes in the care plan due to clinical instability.

Description of Post-Service Work: At the conclusion of the procedure the apheresis physician reviews final hematological parameters and assesses the extent to which goals for the procedure were met. The apheresis medicine physician, in collaboration with the apheresis nurse ascertains that venous access has been properly de-accessed and that no new problems (hemorrhage, trauma, infection, etc.) have occurred as a result of the procedure. The physician prepares a final written report about the procedure for the medical record, and writes post-procedure orders should they be necessary and not already included in the apheresis orders that have been ordered prior to the treatment series. The apheresis medicine physician typically communicates in writing in the patient's electronic health record, as well as in person and/or by telephone with other healthcare personnel regarding the patient's treatment and may discuss the progress of the series of treatments with the patient's family. The physician assesses the clinical condition of the patient and ascertains that no adverse effects have resulted from the procedure.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
90947	000	2.52	RUC Time

CPT Descriptor Dialysis procedure other than hemodialysis (eg, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies) requiring repeated evaluations by a physician or other qualified health care professional, with or without substantial revision of dialysis prescription

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99205	XXX	3.17	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
64483	000	1.90	RUC Time	991,128

Ref Code****Time Segment (Mean)**

Overall intensity/complexity	1.17	1.15
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background: 36511, 36512, 36513, 36514, 36516, 36522**

Before CY2016, the apheresis code family included 36511, 36512, 36513, 36514, 36515, 36516, and 36522. In the CMS proposed and final physician fee schedule rulings, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated 36516 is misvalued because of inaccurate direct and indirect PE inputs and "that the current work RVU undervalues a physician's time and expertise". After comments, the CMS added CPT code 36516 to the list of potentially misvalued codes. At the September 2016 CPT Editorial Panel meeting, CPT code 36516 was revised to include immunoabsorption and CPT code 36515 was deleted. The family of codes now includes:

36511 – Therapeutic apheresis; for white blood cells

36512 – Therapeutic apheresis; for red blood cells

36513 – Therapeutic apheresis; for platelets

36514 – Therapeutic apheresis; for plasma pheresis

▲ 36516 - Therapeutic apheresis; with extracorporeal immunoabsorption, selective adsorption or selective filtration and plasma reinfusion

36522 - Photopheresis, extracorporeal

(36515 has been deleted. For therapeutic apheresis with extracorporeal immunoabsorption and plasma reinfusion use, 36516)

**Survey Process**

In 2002, CPT codes 36511-36516 were originally developed and surveyed by the American Society of Hematology (ASH) and the Renal Physicians Association (RPA). Although pathology was a dominate provider of these services at that time, no pathologists were included in the survey effort. CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies.

For the January 2017 RUC meeting, the College of American Pathologists led the survey effort with assistance from ASH and RPA. Due to changes in the typical patient and service, revised vignettes were created, reviewed, and approved by the RUC's Research Subcommittee. The Subcommittee also approved a reference service list and minor changes to

question 2 of the zero day global survey instrument. Since the majority of pathologists typically do not perform zero day global services and the references to “surgery” and “operative” procedure was of concern, these terms were either deleted or replaced with the word “procedure” where appropriate.

CAP and RPA conducted a random physician work survey of each society’s membership for all six codes, while ASH conducted a random physician work survey of its membership for codes 36512 and 36522 only. The work surveys asked for respondents to only respond to questions for survey code(s) that they have familiarity with or have experience performing. An expert panel representing all three specialties was formed to address the direct practice expense inputs for the entire family of codes.

### Summary of Recommendations

January 2017 Recommendations	36511: White BC	36512: Red BC	36513: Platelets	36514: Plasma	36516: Extracorp	36522: Photo
Pre Time Total	40	40	40	40	35	40
Intra Time	30	20	25	20	15	18
Post Time	15	15	15	15	10	10
Total Time	85	75	80	75	60	68
Recommended Work RVU	2.00	2.00	2.00	2.00	1.56	1.75
Current WRVU	1.74	1.74	1.74	1.74	1.22	1.67

### Compelling Evidence:

The specialties believe that the current work RVUs undervalue these services, which are supported by the results of the survey. The specialties believe that compelling evidence exists in order to increase the work RVUs from their current values. According to the RUC’s definition, compelling evidence can be met if there is:

- “Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:
  - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;
  - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or
  - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.”

We believe there is indeed evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey. At that time pathology was the dominate provider for codes 36511, 36512, and a dominate provider for codes 36514, 36516, and 36522, and in 2015, pathology was the dominate provider for codes 36511, 36512, 36514, 36516, and 36522. Pathology’s exclusion from the original survey also affected the creation of the vignette, which has been updated since 2002.

Furthermore, CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies, which we believe is a flawed methodology. Therefore the work RVU and physician time are invalid. The dominate provider in 2002 was obstetrics/gynecology. In 2015, the dominate provider was pathology.

Therefore, these facts demonstrate that a flawed methodology used in the previous valuation of these services, which fulfills the requirements of compelling evidence.

### Recommendation for 36511:

**We recommend the survey 25<sup>th</sup> percentile work RVU of 2.00 for code 36511.**

**PRE-TIME Package 4:** The RUC’s physician work instructions directed us to select the package that “best corresponds to the data which was collected in the survey process”. The survey’s indicated pre-service evaluation time above 40 minutes and therefore package 4 was selected.

**Evaluation (total = 40 minutes):** The package accounts for the extensive review of the patient history, diagnostic studies, physical assessments, therapy parameter determinations, and documentation requirements,

**Positioning (total = 0 minutes):** The survey results indicate little or no positioning time. All positioning time has been subtracted from the package time.

**Scrub, dress, wait (total = 0 minutes):** The survey results indicated little or no scrub, dress, and wait time. 5 minutes of scrub, dress, wait time has been subtracted from the package time.

**INTRA TIME:** Survey median of 30 minutes.

#### **POST-TIME Package 7A**

**Total = 15 minutes:** Default to the survey value of 15 minutes which is 3 minutes less than the package time.

#### **MPC 000 Day Global Code Comparisons**

<b>CPT Code</b>	<b>Long Descriptor</b>	<b>Work RVU</b>	<b>Pre Time</b>	<b>Intra Time</b>	<b>Post Time</b>	<b>Total Time</b>	<b>RUC Review</b>	<b>IWPUT</b>

32551	Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open (separate procedure)	3.04	33	20	20	83	Apr12	0.0998
31296	Nasal/sinus endoscopy, surgical; with dilation of frontal sinus ostium (eg, balloon dilation)	3.29	43	30	15	88	Feb10	0.0711

### Summary

The specialties agree that the survey results support a higher relative value for this code, and therefore the specialties recommend the 25<sup>th</sup> percentile RVU of 2.00, which is consistent with other apheresis procedures and presents proper rank order. Compelling evidence indicates a flawed methodology was use in the original valuation of this service. **We recommend a physician work RVU of 2.00 for code 36511.**

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36511

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Sometimes

Specialty Nephrology                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1012

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 253 claims for 2015. Medicare procedures represent approximately 25% of the total volume for these types of procedures (253\*4=1012). Percentages are from the RUC database for the year 2015.

Specialty Pathology	Frequency 488	Percentage 48.22 %
Specialty Nephrology	Frequency 100	Percentage 9.88 %
Specialty	Frequency 0	Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 253

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 253 claims for 2015. Percentages are from the RUC database for the year 2015.

Specialty Pathology	Frequency 122	Percentage 48.22 %
Specialty Nephrology	Frequency 25	Percentage 9.88 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? No

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36511

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Global Period: 000

RUC Recommended RVU: **2.00**

CPT Descriptor: Therapeutic apheresis; for red blood cells

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 21 year old man with sickle cell disease presents with acute chest syndrome. Replacement of his red blood cells with normal donor red blood cells is indicated.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: to be performed before every apheresis treatment, including the initial treatment]: The apheresis medicine physician evaluates the general clinical status of the patient (including current medications), and performs an interval history and brief physical assessment as needed in order to confirm the clinical impression and ascertain whether the patient is medically able to undergo the therapeutic extracorporeal procedure. In addition, the physician typically reviews the patient's current hematological status to create apheresis orders based upon hematocrit, and desired effect on the ratio of hemoglobin (HgbA:HgbS, for example) in the case of sickle cell chest syndrome. This assessment may also include reviewing evaluations by other physicians including hematologists, nephrologists, intensivists and neurologists involved in the patient's management. The physician confirms the adequacy of vascular access and confirms the initial assessment of the apheresis nurse. Current diagnostic laboratory studies available are reviewed, which may include complete blood count and differential count, renal and liver function studies, ionized calcium, and other relevant serum chemistry studies. The physician determines that the patient's blood group, antibody screen and Rh type have been properly determined and that sufficient compatible packed red blood cells have been ordered for the procedure. Finally, the apheresis medicine physician will write orders for the desired parameters of the treatment (whole blood processing volume, anticoagulant-to-whole blood flow ratio, units of red packed red cells to be used, target hemoglobin ratio, final desired hemoglobin and hematocrit, etc.). Additional orders may include calcium replacement and timed laboratory draws.

Pre-service work unique to the first treatment, in addition to all of the above, may include arranging placement of a venous access device and then reviewing the patient's chest x-ray to determine proper placement of the venous access device and confirm that the impression of Chest X-ray findings are consistent with acute sickle chest syndrome. The apheresis medicine physician may also obtain and review other relevant patient history and diagnostic studies given potential co-morbidities. Finally, the apheresis medicine physician determines the suitability of apheresis therapy for that particular patient, documents that impression in the medical record, communicates with other professionals prior to the actual performance of the evaluation and procedure; and explaining the procedure to the patient or healthcare proxy and obtaining informed consent.

Description of Intra-Service Work: During the procedure, the apheresis medicine physician is responsible for the wellbeing of the patient on the machine. The physician typically periodically assesses the clinical status of the patient, which may

include review of vital signs the patient's color, urine output, mental status (if patient is awake), and other relevant parameters. The physician and/or nurse also monitors the patient for hemolysis (as detected in the extracorporeal circuit or in the color of the patient's urine), and carefully monitors the patient for intolerance to the procedure or development of signs and symptoms of a transfusion reaction. In concert with the apheresis nurse, the physician monitors the patient for the development of symptoms of hypocalcemic toxicity and, if necessary, prescribes appropriate treatment. The physician may also have ordered prophylactic measures to mitigate a fall in ionized calcium in the patient's plasma. Variations in clinical status or vital signs are repeatedly evaluated to determine whether to continue the procedure to its intended extent of whole blood processing. Given the inherent potential level of acuity of patients undergoing this procedure, the apheresis medicine physician is the first responder in case of adverse clinical events or emergencies that arise during the procedure.

Description of Post-Service Work: At the conclusion of the procedure the apheresis medicine physician reviews final hematological parameters and assesses the extent to which goals for the procedure were met. This may include ordering post-procedure laboratory tests to be interpreted before the following procedure (*vide supra*). The physician, in collaboration with the apheresis nurse ascertains that venous access has been properly de-accessed and that no new problems (hemorrhage, trauma, infection, etc.) have occurred as a result of the procedure. The physician prepares a final written report about the procedure for the medical record, and, if necessary writes additional post-procedure orders beyond those already included in the main apheresis orders for the treatment series. The physician communicates in writing, in person and/or by telephone with other healthcare personnel regarding the patient's treatment and may discuss the progress of the series of treatments with the patient's family. The physician assesses the clinical condition of the patient and ascertains that no adverse effects have resulted from the procedure.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background: 36511, 36512, 36513, 36514, 36516, 36522**

Before CY2016, the apheresis code family included 36511, 36512, 36513, 36514, 36515, 36516, and 36522. In the CMS proposed and final physician fee schedule rulings, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated 36516 is misvalued because of inaccurate direct and indirect PE inputs and "that the current work RVU undervalues a physician's time and expertise". After comments, the CMS added CPT code 36516 to the list of potentially misvalued codes. At the September 2016 CPT Editorial Panel meeting, CPT code 36516 was revised to include immunoabsorption and CPT code 36515 was deleted. The family of codes now includes:

36511 – Therapeutic apheresis; for white blood cells

36512 – Therapeutic apheresis; for red blood cells

36513 – Therapeutic apheresis; for platelets

36514 – Therapeutic apheresis; for plasma pheresis

▲ 36516 - Therapeutic apheresis; with extracorporeal immunoabsorption, selective adsorption or selective filtration and plasma reinfusion

36522 - Photopheresis, extracorporeal

(36515 has been deleted. For therapeutic apheresis with extracorporeal immunoabsorption and plasma reinfusion use, 36516)

**Survey Process**

In 2002, CPT codes 36511-36516 were originally developed and surveyed by the American Society of Hematology (ASH) and the Renal Physicians Association (RPA). Although pathology was a dominate provider of these services at that time, no pathologists were included in the survey effort. CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies.

For the January 2017 RUC meeting, the College of American Pathologists led the survey effort with assistance from ASH and RPA. Due to changes in the typical patient and service, revised vignettes were created, reviewed, and approved by the RUC's Research Subcommittee. The Subcommittee also approved a reference service list and minor changes to

question 2 of the zero day global survey instrument. Since the majority of pathologists typically do not perform zero day global services and the references to “surgery” and “operative” procedure was of concern, these terms were either deleted or replaced with the word “procedure” where appropriate.

CAP and RPA conducted a random physician work survey of each society’s membership for all six codes, while ASH conducted a random physician work survey of its membership for codes 36512 and 36522 only. The work surveys asked for respondents to only respond to questions for survey code(s) that they have familiarity with or have experience performing. An expert panel representing all three specialties was formed to address the direct practice expense inputs for the entire family of codes.

### Summary of Recommendations

January 2017 Recommendations	36511: White BC	36512: Red BC	36513: Platelets	36514: Plasma	36516: Extracorp	36522: Photo
Pre Time Total	40	40	40	40	35	40
Intra Time	30	20	25	20	15	18
Post Time	15	15	15	15	10	10
Total Time	85	75	80	75	60	68
Recommended Work RVU	2.00	2.00	2.00	2.00	1.56	1.75
Current WRVU	1.74	1.74	1.74	1.74	1.22	1.67

### Compelling Evidence:

The specialties believe that the current work RVUs undervalue these services, which are supported by the results of the survey. The specialties believe that compelling evidence exists in order to increase the work RVUs from their current values. According to the RUC’s definition, compelling evidence can be met if there is:

- “Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:
  - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;
  - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or
  - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.”

We believe there is indeed evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey. At that time pathology was the dominate provider for codes 36511, 36512, and a dominate provider for codes 36514, 36516, and 36522, and in 2015, pathology was the dominate provider for codes 36511, 36512, 36514, 36516, and 36522. Pathology’s exclusion from the original survey also affected the creation of the vignette, which has been updated since 2002.

Furthermore, CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies, which we believe is a flawed methodology. Therefore the work RVU and physician time are invalid. The dominate provider in 2002 was obstetrics/gynecology. In 2015, the dominate provider was pathology.

Therefore, these facts demonstrate that a flawed methodology used in the previous valuation of these services, which fulfills the requirements of compelling evidence.

### Recommendation for 36512:

**We recommend the survey 25<sup>th</sup> percentile work RVU of 2.00 for code 36512.**

**PRE-TIME Package 4:** The RUC’s physician work instructions directed us to select the package that “best corresponds to the data which was collected in the survey process”. The survey’s indicated pre-service evaluation time above 40 minutes and therefore package 4 was selected.

**Evaluation (total = 40 minutes):** The package accounts for the extensive review of the patient history, diagnostic studies, physical assessments, therapy parameter determinations, and documentation requirements,

**Positioning (total = 0 minutes):** The survey results indicate little or no positioning time. All positioning time has been subtracted from the package time.

**Scrub, dress, wait (total = 0 minutes):** The survey results indicated little or no scrub, dress, and wait time. 5 minutes of scrub, dress, wait time has been subtracted from the package time.

**INTRA TIME:** Survey median of 20 minutes.

### **POST-TIME Package 7A**

**Total = 15 minutes:** Default to the survey value of 15 minutes which is 3 minutes less than the package time.

### **MPC 000 Day Global Code Comparisons**

31296	Nasal/sinus endoscopy, surgical; with dilation of frontal sinus ostium (eg, balloon dilation)	3.29	43	30	15	88	Feb10	0.0711

## Summary

The specialties agree that the survey results support a higher relative value for this code, and therefore the specialties recommend the 25<sup>th</sup> percentile RVU of 2.00, which is consistent with other apheresis procedures and presents proper rank order. Compelling evidence indicates a flawed methodology was use in the original valuation of this service. **We recommend a physician work RVU of 2.00 for code 36512.**

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36512

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Sometimes

Specialty Hematology                      How often? Sometimes

Specialty Nephrology                      How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 5728

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 1,432 claims for 2015. Medicare procedures represent approximately 25% of the total volume for these types of procedures (1,432\*4=5,728). Percentages are from the RUC database for the year 2015.

Specialty Pathology	Frequency 2096	Percentage 36.59 %
---------------------	----------------	--------------------

Specialty Hematology	Frequency 1736	Percentage 30.30 %
----------------------	----------------	--------------------

Specialty Nephrology	Frequency 868	Percentage 15.15 %
----------------------	---------------	--------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,432

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 1,432 claims for 2015. Percentages are from the RUC database for the year 2015.

Specialty Pathology	Frequency 524	Percentage 36.59 %
---------------------	---------------	--------------------

Specialty Hematology	Frequency 434	Percentage 30.30 %
----------------------	---------------	--------------------

Specialty Nephrology	Frequency 217	Percentage 15.15 %
----------------------	---------------	--------------------

Do many physicians perform this service across the United States? No

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36512

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 36513      Tracking Number   W3

Original Specialty Recommended RVU: **2.00**Presented Recommended RVU: **2.00**

Global Period: 000

RUC Recommended RVU: **2.00**

CPT Descriptor: Therapeutic apheresis; for platelets

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65 year old man with essential thrombocythemia presents with a markedly elevated platelet count and mental status changes, consistent with poor brain perfusion. Emergent reduction of his platelet count is indicated.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: [to be performed before every apheresis treatment, including the initial treatment]:

The apheresis medicine physician evaluates the general clinical status of the patient (including current medications), ascertaining whether he/she remains sufficiently stable to undergo the therapeutic extracorporeal procedure. In addition, the physician reviews the patient's hematological status to confirm that the treatments are having the desired effect on the thrombocytosis and whether the patient is clinically improving as expected. This assessment may include reviewing evaluations by other attending physicians including hematologists, nephrologists and intensivists involved in the patient's management. Current diagnostic laboratory studies are reviewed, including complete blood count and differential count, renal and liver function studies, total protein and albumin and other relevant serum chemistry studies. The patient's fluid status including, urine output and the accumulation of edema fluid are assessed. The physician discusses and if necessary secures the vascular access and confirms the initial assessment of the apheresis nurse. Finally, after determining that the parameters of the treatment (whole blood processing volume, anticoagulant-to-whole blood flow ratio, target extent of thromboreduction, etc.) as reflected in the orders are appropriate, the physician authorizes that the treatment should proceed.

Pre-service work unique to the first treatment, in addition to all of the above, typically includes reviewing the patient's chest x-ray report to determine proper placement of the venous access device (this is ultimately the responsibility of the apheresis medicine physician), obtaining and reviewing the history and diagnostic studies; an examination of previous study reports; communicating with other professionals prior to the actual performance of the evaluation and procedure; and explaining the procedure to the patient or healthcare proxy and obtaining informed consent.

Description of Intra-Service Work: During the procedure, the apheresis medicine physician is responsible for the wellbeing of the patient on the machine. The physician periodically assesses the clinical status of the patient, paying particular attention to the vital signs flow sheet, the patient's color, urine output, mental status (if patient is awake), and other relevant parameters. The physician monitors the decline in platelet count to determine whether the goals of the procedure are being met by the current treatment parameters as ordered, and ascertains that other formed elements of the blood are not being inappropriately altered as a result of the procedure. Variations in clinical status or vital signs are repeatedly evaluated to determine whether to continue the procedure to its intended extent of whole blood processing. Given the inherent level of

acuity of patients undergoing this procedure, the apheresis medicine physician is the first responder in case of adverse clinical events or emergencies that arise during the procedure. Communications with other physicians and patient care providers during this phase are performed as needed by the apheresis medicine physician predicated on the clinical status of the patient and the need for any changes in the care plan due to clinical instability.

Description of Post-Service Work: At the conclusion of the procedure the apheresis physician reviews final hematological parameters and assesses the extent to which goals for the procedure were met. The apheresis medicine physician, in collaboration with the apheresis nurse ascertains that venous access has been properly closed or removed and that no new problems (hemorrhage, trauma, infection, etc.) have occurred as a result of the procedure. The apheresis medicine physician prepares a final written report about the procedure for the medical record, and writes post-procedure orders should they be necessary and have not already been included in the apheresis orders prior to the start of the intervention. The apheresis medicine physician typically communicates in writing in the patient's electronic health record, as well as in person and/or by telephone with other healthcare personnel regarding the patient's treatment and may discuss the progress of the series of treatments with the patient's family. The physician assesses the clinical condition of the patient and ascertains that no adverse effects have resulted from the procedure.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background: 36511, 36512, 36513, 36514, 36516, 36522**

Before CY2016, the apheresis code family included 36511, 36512, 36513, 36514, 36515, 36516, and 36522. In the CMS proposed and final physician fee schedule rulings, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated 36516 is misvalued because of inaccurate direct and indirect PE inputs and "that the current work RVU undervalues a physician's time and expertise". After comments, the CMS added CPT code 36516 to the list of potentially misvalued codes. At the September 2016 CPT Editorial Panel meeting, CPT code 36516 was revised to include immunoabsorption and CPT code 36515 was deleted. The family of codes now includes:

36511 – Therapeutic apheresis; for white blood cells

36512 – Therapeutic apheresis; for red blood cells

36513 – Therapeutic apheresis; for platelets

36514 – Therapeutic apheresis; for plasma pheresis

▲ 36516 - Therapeutic apheresis; with extracorporeal immunoabsorption, selective adsorption or selective filtration and plasma reinfusion

36522 - Photopheresis, extracorporeal

(36515 has been deleted. For therapeutic apheresis with extracorporeal immunoabsorption and plasma reinfusion use, 36516)

**Survey Process**

In 2002, CPT codes 36511-36516 were originally developed and surveyed by the American Society of Hematology (ASH) and the Renal Physicians Association (RPA). Although pathology was a dominate provider of these services at that time, no pathologists were included in the survey effort. CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies.

For the January 2017 RUC meeting, the College of American Pathologists led the survey effort with assistance from ASH and RPA. Due to changes in the typical patient and service, revised vignettes were created, reviewed, and approved by the RUC's Research Subcommittee. The Subcommittee also approved a reference service list and minor changes to

question 2 of the zero day global survey instrument. Since the majority of pathologists typically do not perform zero day global services and the references to “surgery” and “operative” procedure was of concern, these terms were either deleted or replaced with the word “procedure” where appropriate.

CAP and RPA conducted a random physician work survey of each society’s membership for all six codes, while ASH conducted a random physician work survey of its membership for codes 36512 and 36522 only. The work surveys asked for respondents to only respond to questions for survey code(s) that they have familiarity with or have experience performing. An expert panel representing all three specialties was formed to address the direct practice expense inputs for the entire family of codes.

### Summary of Recommendations

January 2017 Recommendations	36511: White BC	36512: Red BC	36513: Platelets	36514: Plasma	36516: Extracorp	36522: Photo
Pre Time Total	40	40	40	40	35	40
Intra Time	30	20	25	20	15	18
Post Time	15	15	15	15	10	10
Total Time	85	75	80	75	60	68
Recommended Work RVU	2.00	2.00	2.00	2.00	1.56	1.75
Current WRVU	1.74	1.74	1.74	1.74	1.22	1.67

### Compelling Evidence:

The specialties believe that the current work RVUs undervalue these services, which are supported by the results of the survey. The specialties believe that compelling evidence exists in order to increase the work RVUs from their current values. According to the RUC’s definition, compelling evidence can be met if there is:

- “Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:
  - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;
  - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or
  - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.”

We believe there is indeed evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey. At that time pathology was the dominate provider for codes 36511, 36512, and a dominate provider for codes 36514, 36516, and 36522, and in 2015, pathology was the dominate provider for codes 36511, 36512, 36514, 36516, and 36522. Pathology’s exclusion from the original survey also affected the creation of the vignette, which has been updated since 2002.

Furthermore, CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies, which we believe is a flawed methodology. Therefore the work RVU and physician time are invalid. The dominate provider in 2002 was obstetrics/gynecology. In 2015, the dominate provider was pathology.

Therefore, these facts demonstrate that a flawed methodology used in the previous valuation of these services, which fulfills the requirements of compelling evidence.

### Recommendation for 36513:

**We recommend the survey 25<sup>th</sup> percentile work RVU of 2.00 for code 36513.**

**PRE-TIME Package 4:** The RUC’s physician work instructions directed us to select the package that “best corresponds to the data which was collected in the survey process”. The survey’s indicated pre-service evaluation time above 40 minutes and therefore package 4 was selected.

**Evaluation (total = 40 minutes):** The package accounts for the extensive review of the patient history, diagnostic studies, physical assessments, therapy parameter determinations, and documentation requirements,

**Positioning (total = 0 minutes):** The survey results indicate little or no positioning time. All positioning time has been subtracted from the package time.

**Scrub, dress, wait (total = 0 minutes):** The survey results indicated little or no scrub, dress, and wait time. 5 minutes of scrub, dress, wait time has been subtracted from the package time.

**INTRA TIME:** Survey median of 25 minutes.

#### **POST-TIME Package 7A**

**Total = 15 minutes:** 15 minutes which is 3 minutes less than the package time.

#### **MPC 000 Day Global Code Comparisons**

<b>CPT Code</b>	<b>Long Descriptor</b>	<b>Work RVU</b>	<b>Pre Time</b>	<b>Intra Time</b>	<b>Post Time</b>	<b>Total Time</b>	<b>RUC Review</b>	<b>IWPUT</b>

31296	Nasal/sinus endoscopy, surgical; with dilation of frontal sinus ostium (eg, balloon dilation)	3.29	43	30	15	88	Feb10	0.0711

## Summary

The specialties agree that the survey results support a higher relative value for this code, and therefore the specialties recommend the 25<sup>th</sup> percentile RVU of 2.00, which is consistent with other apheresis procedures and presents proper rank order. Compelling evidence indicates a flawed methodology was use in the original valuation of this service. **We recommend a physician work RVU of 2.00 for code 36513.**

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36513

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Sometimes

Specialty Nephrology                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 688

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 344 claims for 2015. Medicare procedures represent approximately 50% of the total volume for these types of procedures ( $344 \times 2 = 688$ ). We do not believe that the percentages in the RUC database for the year 2015 will continue to be accurate in the future, and therefore we have adjusted these percentages to align them better with the rest of the family.

Specialty Pathology	Frequency 274	Percentage 39.82 %
Specialty Nephrology	Frequency 137	Percentage 19.91 %
Specialty	Frequency 0	Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 344

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 344 claims for 2015. We do not believe that the percentages in the RUC database for the year 2015 will continue to be accurate in the future, and therefore we have adjusted these percentages to align them better with the rest of the family.

Specialty Pathology	Frequency 137	Percentage 39.82 %
Specialty Nephrology	Frequency 69	Percentage 20.05 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? No

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:  
Procedures

BETOS Sub-classification:  
Minor procedure

BETOS Sub-classification Level II:  
Other

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. We believe that the specialty utilization mix will change and that the appropriate crosswalk would be CPT Code 36514.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 36514      Tracking Number   W4

Original Specialty Recommended RVU: **2.00**Presented Recommended RVU: **1.81**

Global Period: 000

RUC Recommended RVU: **1.81**

CPT Descriptor: Therapeutic apheresis; for plasma pheresis

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 55 year old man presents with a three-month history of progressive, symmetric weakness in both upper and lower extremities involving proximal and distal muscles, sensory loss, and diminished reflexes. A diagnosis of chronic inflammatory demyelinating polyneuropathy is made.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: [to be performed before every apheresis treatment, including the initial treatment]:

The apheresis medicine physician evaluates the general clinical status of the patient (including current medications), and performs an interval history and brief physical assessment as needed in order to confirm the clinical impression and ascertain whether the patient is medically able to undergo the therapeutic extracorporeal procedure. In addition, the physician reviews disease-specific parameters (when relevant) to confirm that the treatments are having the desired effect. In the case of TTP, for example, particular attention is paid to platelet count, serum LDH and the morphology of the red blood cells on the peripheral blood film. The physician confirms that the patient's blood group has been correctly recorded and that the plasma replacement fluid is compatible with the patient if albumin is not used. . In the case of the patient described in the vignette, the physician assures that human serum albumin is ordered as the colloid replacement fluid. This assessment also includes reviewing evaluations by other attending physicians including hematologists, nephrologists, neurologists and intensivists that may be involved in the patient's management. Current diagnostic laboratory studies are reviewed, which may include complete blood count and differential count, renal and liver function studies, ionized calcium, total protein and albumin and other relevant serum chemistry studies. Urine output and the accumulation of edema fluid may be assessed. The physician discusses the state of the patient's venous access with, and confirms the initial assessment of, the apheresis nurse. When necessary the apheresis orders may include supplemental treatments to be applied during the procedure (for example, H1 and H2 blocking drugs and corticosteroids for patients susceptible to allergic reactions to plasma or colloid replacement fluid, or supplemental intravenous calcium to mitigate hypocalcemic toxicity during the treatment). Finally, after determining that the parameters of the treatment with the nurse operator (whole blood processing volume, anticoagulant-to-whole blood flow ratio, plasma volumes to be exchanged, etc.) as reflected in the orders are still appropriate, the physician ensure apheresis orders are written and authorizes that the treatment should proceed.

Pre-service work unique to the first treatment, in addition to all of the above, may include arranging placement of a venous access device and then reviewing the patient's chest x-ray to determine proper placement of the venous access device, obtaining and reviewing the history and diagnostic studies; an examination of previous study reports; communicating with other professionals prior to the actual performance of the evaluation and procedure; and explaining the procedure to the patient or healthcare proxy and obtaining informed consent.

Description of Intra-Service Work: During the procedure, the apheresis medicine physician is responsible for the wellbeing of the patient on the machine. The physician typically periodically assesses the clinical status of the patient, paying particular attention to the vital signs flow sheet, the patient's color, urine output, mental status (if patient is awake), and other relevant parameters. The physician and/or nurse operator monitors the patient for the development of reactions to the citrate or replacement fluid. Variations in clinical status or vital signs are repeatedly evaluated to determine whether to continue the procedure to its intended extent of whole blood processing. Given the inherent level of acuity of patients undergoing this procedure, the apheresis medicine physician may be the first responder in case of adverse clinical events or emergencies that arise during the procedure.

Description of Post-Service Work: At the conclusion of the procedure the apheresis medicine physician reviews final hematological parameters and assesses the extent to which goals for the procedure were met. The physician, in collaboration with the apheresis nurse ascertains that venous access has been properly de-accessed, and that no new problems (hemorrhage, trauma, infection, etc.) have occurred as a result of the procedure. The physician prepares a final written report about the procedure for the medical record and, if necessary, writes additional post-procedure orders beyond those already included in the main apheresis orders for the treatment series, (such as a culture of a catheter exit site). The physician communicates in writing, in person and/or by telephone with other healthcare personnel regarding the patient's treatment and may discuss the progress of the series of treatments with the patient's family. The physician assesses the clinical condition of the patient and ascertains that no adverse effects have resulted from the procedure.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
90947	000	2.52	RUC Time

CPT Descriptor Dialysis procedure other than hemodialysis (eg, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies) requiring repeated evaluations by a physician or other qualified health care professional, with or without substantial revision of dialysis prescription

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99205	XXX	3.17	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
64483	000	1.90	RUC Time	991,128

CPT Descriptor 1 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
90937	000	2.11	RUC Time	59,798

CPT Descriptor 2 Hemodialysis procedure requiring repeated evaluation(s) with or without substantial revision of dialysis prescription

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
19283	000	2.00	RUC Time

CPT Descriptor Removal and replacement of externally accessible nephroureteral catheter (eg, external/internal stent) requiring fluoroscopic guidance, including radiological supervision and interpretation

### **RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Top Key Reference Code: 25      % of respondents: 36.2 %**

**Number of respondents who choose 2<sup>nd</sup> Key Reference Code: 12      % of respondents: 17.3 %**

### **TIME ESTIMATES (Median)**

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**CHANGES at Presentation are in RED****Background: 36511, 36512, 36513, 36514, 36516, 36522**

Before CY2016, the apheresis code family included 36511, 36512, 36513, 36514, 36515, 36516, and 36522. In the CMS proposed and final physician fee schedule rulings, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated 36516 is misvalued because of inaccurate direct and indirect PE inputs and "that the current work RVU undervalues a physician's time and expertise". After comments, the CMS added CPT code 36516 to the list of potentially misvalued codes. At the September 2016 CPT Editorial Panel meeting, CPT code 36516 was revised to include immunoabsorption and CPT code 36515 was deleted. The family of codes now includes:

36511 – Therapeutic apheresis; for white blood cells

36512 – Therapeutic apheresis; for red blood cells

36513 – Therapeutic apheresis; for platelets

36514 – Therapeutic apheresis; for plasma pheresis

▲36516 - Therapeutic apheresis; with extracorporeal immunoabsorption, selective adsorption or selective filtration and plasma reinfusion

36522 - Photopheresis, extracorporeal

(36515 has been deleted. For therapeutic apheresis with extracorporeal immunoabsorption and plasma reinfusion use, 36516)

**Survey Process**

In 2002, CPT codes 36511-36516 were originally developed and surveyed by the American Society of Hematology (ASH) and the Renal Physicians Association (RPA). Although pathology was a dominate provider of these services at that time, no pathologists were included in the survey effort. CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies.

For the January 2017 RUC meeting, the College of American Pathologists led the survey effort with assistance from ASH and RPA. Due to changes in the typical patient and service, revised vignettes were created, reviewed, and approved by the RUC's Research Subcommittee. The Subcommittee also approved a reference service list and minor changes to question 2 of the zero day global survey instrument. Since the majority of pathologists typically do not perform zero day global services and the references to "surgery" and "operative" procedure was of concern, these terms were either deleted or replaced with the word "procedure" where appropriate.

CAP and RPA conducted a random physician work survey of each society's membership for all six codes, while ASH conducted a random physician work survey of its membership for codes 36512 and 36522 only. The work surveys asked for respondents to only respond to questions for survey code(s) that they have familiarity with or have experience performing. An expert panel representing all three specialties was formed to address the direct practice expense inputs for the entire family of codes.

### Summary of Recommendations

January 2017 Recommendations	36511: White BC	36512: Red BC	36513: Platelets	36514: Plasma	36516: Extracorp	36522: Photo
Pre Time Total	40	40	40	29	25	33
Intra Time	30	20	25	20	15	18
Post Time	15	15	15	15	10	10
Total Time	85	75	80	64	50	61
Recommended Work RVU	2.00	2.00	2.00	1.81	1.56	1.75
Current WRVU	1.74	1.74	1.74	1.74	1.22	1.67

### Compelling Evidence:

The specialties believe that the current work RVUs undervalue these services, which are supported by the results of the survey. The specialties believe that compelling evidence exists in order to increase the work RVUs from their current values. According to the RUC's definition, compelling evidence can be met if there is:

- "Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:
  - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;
  - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or
  - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data."

We believe there is indeed evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey. At that time pathology was the dominate provider for codes 36511, 36512, and a dominate provider for codes 36514, 36516, and 36522, and in 2015, pathology was the dominate provider for codes 36511, 36512, 36514, 36516, and 36522. Pathology's exclusion from the original survey also affected the creation of the vignette, which has been updated since 2002.

Furthermore, CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies, which we believe is a flawed methodology. Therefore the work RVU and physician time are invalid. The dominate provider in 2002 was obstetrics/gynecology. In 2015, the dominate provider was pathology.

Therefore, these facts demonstrate that a flawed methodology used in the previous valuation of these services, which fulfills the requirements of compelling evidence.

### Recommendation for 36514:

**We recommend a crosswalk of the time and the work RVU of CPT code 64416 - Injection, anesthetic agent; brachial plexus, continuous infusion by catheter (including catheter placement) (WRVU = 1.81) to 36514, for code 36514.**

**PRE-TIME Package 3:** The RUC's physician work instructions directed us to select the package that "best corresponds to the data which was collected in the survey process". The survey's indicated pre-service evaluation time above 40 minutes and therefore package 4 was selected initially **however this was changed to package 3 at presentation.**

**Evaluation (total = 29 minutes):** The package accounts for the extensive review of the patient history, diagnostic studies, physical assessments, therapy parameter determinations, and documentation requirements,

**Positioning (total = 0 minutes):** The survey results indicate little or no positioning time. All positioning time has been subtracted from the package time.

**Scrub, dress, wait (total = 0 minutes):** The survey results indicated little or no scrub, dress, and wait time. 5 minutes of scrub, dress, wait time has been subtracted from the package time.

**INTRA TIME:** Survey median of 20 minutes.

#### **POST-TIME Package 7A**

**Total = 15 minutes:** 15 minutes which is 3 minutes less than the package time.

#### **MPC 000 Day Global Code Comparisons**

<b>CPT Code</b>	<b>Long Descriptor</b>	<b>Work RVU</b>	<b>Pre Time</b>	<b>Intra Time</b>	<b>Post Time</b>	<b>Total Time</b>	<b>RUC Review</b>	<b>IWPUT</b>

31296	Nasal/sinus endoscopy, surgical; with dilation of frontal sinus ostium (eg, balloon dilation)	3.29	43	30	15	88	Feb10	0.0711

## Summary

The specialties agree that the survey results support a higher relative value for this code, and therefore the specialties recommend **a crosswalk of the time and WRVU of CPT code 64416 - Injection, anesthetic agent; brachial plexus, continuous infusion by catheter (including catheter placement) to 36514**, which is consistent with other apheresis procedures and presents proper rank order. Compelling evidence indicates a flawed methodology was use in the original valuation of this service. **We recommend a physician work RVU of 1.81 for code 36514.**

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36514

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology

How often? Sometimes

Specialty Nephrology

How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 110768

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 27692 claims for 2015. Medicare procedures represent approximately 25% of the total volume for these types of procedures (27692\*4=110768). Percentages are from the RUC database for the year 2015.

Specialty Pathology	Frequency 48804	Percentage 44.05 %
---------------------	-----------------	--------------------

Specialty Nephrology	Frequency 39267	Percentage 35.44 %
----------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

27,692 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 27692 claims for 2015. Percentages are from the RUC database for the year 2015

Specialty Pathology	Frequency 12201	Percentage 44.05 %
---------------------	-----------------	--------------------

Specialty Nephrology	Frequency 9817	Percentage 35.45 %
----------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:  
Procedures

BETOS Sub-classification:  
Minor procedure

BETOS Sub-classification Level II:  
Other

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36514

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 36516      Tracking Number   W5

Original Specialty Recommended RVU: **1.56**Presented Recommended RVU: **1.56**

Global Period: 000

RUC Recommended RVU: **1.56**

CPT Descriptor: Therapeutic apheresis; with extracorporeal immunoadsorption, selective adsorption or selective filtration and plasma reinfusion

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old man with familial hypercholesterolemia has atherosclerosis and elevated LDL cholesterol that has not been satisfactorily controlled with maximum medical therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: - [to be performed before every apheresis treatment, including the initial treatment]: The apheresis medicine physician evaluates the general clinical status of the patient (including current medications), ascertaining whether he/she remains sufficiently stable to undergo the therapeutic extracorporeal procedure and is clinically responding to treatment as expected. Particular attention is paid to potential symptoms of unstable coronary disease which may have appeared in the interval since the last treatment. In addition, the physician reviews disease-specific parameters (e.g. the total cholesterol and/or triglyceride level) to confirm that the treatments are having the desired effect. This assessment also includes reviewing evaluations by other attending physicians including cardiologists, nephrologists, neurologists and the primary care physician involved in the patient's management, and determining whether the patient has been started on medications, since the previous treatment, that would increase the risk of adverse effects of treatment. Current diagnostic laboratory studies are reviewed, including complete blood count and differential count, renal and liver function studies, total protein and albumin and other relevant serum chemistry studies. The patient's fluid status including urine output and the accumulation of edema are assessed. The physician discusses and if necessary secures the patient's vascular access and confirms the initial assessment of, the apheresis nurse. Finally, after determining that the parameters of the treatment (whole blood processing volume, anticoagulant-to-whole blood flow ratio, plasma volume to be adsorbed, supplements to be added to the crystalloid fluids to be returned to the patient, etc.) as reflected in the orders are still appropriate, the physician authorizes that the treatment should proceed.

Pre-service work unique to the first treatment, in addition to all of the above, typically includes reviewing the patient's chest x-ray report to determine proper placement of the venous access device (this is ultimately the responsibility of the apheresis medicine physician), obtaining and reviewing the history and diagnostic studies; an examination of previous study reports; communicating with other professionals prior to the actual performance of the evaluation and procedure; and explaining the procedure to the patient or healthcare proxy and obtaining informed consent.

Description of Intra-Service Work: During the procedure, the apheresis medicine physician is responsible for the wellbeing of the patient on the machine. The physician periodically assesses the clinical status of the patient, paying particular attention to the vital signs flow sheet, the patient's color, urine output, mental status (if patient is awake), and other relevant parameters. The physician monitors the patient for the development of reactions to the infusion of adsorbed autologous

plasma or for complaints suggestive of active coronary disease and orders supplemental treatments as necessary. Variations in clinical status or vital signs are repeatedly evaluated to determine whether to continue the procedure to its intended extent of whole blood processing. Given the inherent level of acuity of patients undergoing this procedure, the apheresis medicine physician is the first responder in case of adverse clinical events or emergencies that arise during the procedure. Communications with other physicians and patient care providers during this phase are performed as needed by the apheresis medicine physician predicated on the clinical status of the patient and the need for any changes in the care plan due to clinical instability.

Description of Post-Service Work: At the conclusion of the procedure the apheresis medicine physician reviews final fluid parameters and assesses the extent to which goals for the procedure were met. The apheresis medicine physician, in collaboration with the apheresis nurse ascertains that venous access has been properly de-accessed and that no new problems (hemorrhage, trauma, infection, etc.) have occurred as a result of the procedure. The apheresis medicine physician prepares a final written report about the procedure for the medical record, and writes post-procedure orders should they be necessary provided they have not already been included in the apheresis orders written prior for the treatment series. The apheresis medicine physician typically communicates in writing in the patient's electronic health record, as well as in person and/or by telephone with other healthcare personnel regarding the patient's treatment and may discuss the progress of the series of treatments with the patient's family. The physician assesses the clinical condition of the patient and ascertains that no adverse effects have resulted from the procedure.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**CHANGES are in RED****Background: 36511, 36512, 36513, 36514, 36516, 36522**

Before CY2016, the apheresis code family included 36511, 36512, 36513, 36514, 36515, 36516, and 36522. In the CMS proposed and final physician fee schedule rulings, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated 36516 is misvalued because of inaccurate direct and indirect PE inputs and "that the current work RVU undervalues a physician's time and expertise". After comments, the CMS added CPT code 36516 to the list of potentially misvalued codes. At the September 2016 CPT Editorial Panel meeting, CPT code 36516 was revised to include immunoabsorption and CPT code 36515 was deleted. The family of codes now includes:

36511 – Therapeutic apheresis; for white blood cells

36512 – Therapeutic apheresis; for red blood cells

36513 – Therapeutic apheresis; for platelets

36514 – Therapeutic apheresis; for plasma pheresis

▲36516 - Therapeutic apheresis; with extracorporeal immunoabsorption, selective adsorption or selective filtration and plasma reinfusion

36522 - Photopheresis, extracorporeal

(36515 has been deleted. For therapeutic apheresis with extracorporeal immunoabsorption and plasma reinfusion use, 36516)

**Survey Process**

In 2002, CPT codes 36511-36516 were originally developed and surveyed by the American Society of Hematology (ASH) and the Renal Physicians Association (RPA). Although pathology was a dominate provider of these services at that time, no pathologists were included in the survey effort. CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies.

For the January 2017 RUC meeting, the College of American Pathologists led the survey effort with assistance from ASH and RPA. Due to changes in the typical patient and service, revised vignettes were created, reviewed, and approved by the RUC's Research Subcommittee. The Subcommittee also approved a reference service list and minor changes to question 2 of the zero day global survey instrument. Since the majority of pathologists typically do not perform zero day global services and the references to "surgery" and "operative" procedure was of concern, these terms were either deleted or replaced with the word "procedure" where appropriate.

CAP and RPA conducted a random physician work survey of each society's membership for all six codes, while ASH conducted a random physician work survey of its membership for codes 36512 and 36522 only. The work surveys asked for respondents to only respond to questions for survey code(s) that they have familiarity with or have experience performing. An expert panel representing all three specialties was formed to address the direct practice expense inputs for the entire family of codes.

### Summary of Recommendations

January 2017 Recommendations	36511: White BC	36512: Red BC	36513: Platelets	36514: Plasma	36516: Extracorp	36522: Photo
Pre Time Total	40	40	40	29	25	33
Intra Time	30	20	25	20	15	18
Post Time	15	15	15	15	10	10
Total Time	85	75	80	64	50	61
Recommended Work RVU	2.00	2.00	2.00	1.81	1.56	1.75
Current WRVU	1.74	1.74	1.74	1.74	1.22	1.67

### Compelling Evidence:

The specialties believe that the current work RVUs undervalue these services, which are supported by the results of the survey. The specialties believe that compelling evidence exists in order to increase the work RVUs from their current values. According to the RUC's definition, compelling evidence can be met if there is:

- "Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:
  - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;
  - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or
  - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data."

We believe there is indeed evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey. At that time pathology was the dominate provider for codes 36511, 36512, and a dominate provider for codes 36514, 36516, and 36522, and in 2015, pathology was the dominate provider for codes 36511, 36512, 36514, 36516, and 36522. Pathology's exclusion from the original survey also affected the creation of the vignette, which has been updated since 2002.

Furthermore, CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies, which we believe is a flawed methodology. Therefore the work RVU and physician time are invalid. The dominate provider in 2002 was obstetrics/gynecology. In 2015, the dominate provider was pathology.

Therefore, these facts demonstrate that a flawed methodology used in the previous valuation of these services, which fulfills the requirements of compelling evidence.

### Recommendation for 36516:

**We recommend the survey 25<sup>th</sup> percentile work RVU of 1.56 for code 36516.**

**PRE-TIME Package 6:** The RUC's physician work instructions directed us to select the package that "best corresponds to the data which was collected in the survey process". For Medicare beneficiaries, therapeutic apheresis; with extracorporeal immunoabsorption, selective adsorption or selective filtration and plasma reinfusion services are typically

performed in the physician's office. The survey respondents indicated pre-service evaluation time of 35 minutes and therefore package 6 was selected.

**Evaluation (total = 25 minutes):** Additional 8 minutes added to package to account for the extensive review of the patient history, diagnostic studies, physical assessments, therapy parameter determinations, and documentation requirements,

**Positioning (total = 0 minutes):** The survey results indicate little or no positioning time. All positioning time has been subtracted from the package time.

**Scrub, dress, wait (total = 0 minutes):** The survey results indicated little or no scrub, dress, and wait time. 5 minutes of scrub, dress, wait time has been subtracted from the package time.

**INTRA TIME:** Survey median of 15 minutes.

#### **POST-TIME Package 7A**

**Total = 10 minutes:** Default to the survey value of 10 minutes which is 8 minutes less than the package time.

#### **MPC 000 Day Global Code Comparisons**

## Summary

The specialties agree that the survey results support a higher relative value for this code, and therefore the specialties recommend the 25<sup>th</sup> percentile RVU of 1.56, which is consistent with other apheresis procedures and presents proper rank order. Compelling evidence indicates a flawed methodology was used in the original valuation of this service. **We recommend a physician work RVU of 1.56 for code 36516.**

---

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36515 (now deleted) or 36516

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Sometimes

Specialty Nephrology                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7168

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 1792 claims for 2015. Medicare procedures represent approximately 25% of the total volume for these types of procedures (1792\*4=7168). Percentages are from the RUC database for the year 2015.

Specialty Pathology                      Frequency 1412                      Percentage 19.69 %

Specialty Nephrology                      Frequency 888                      Percentage 12.38 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,792

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 1792 claims for 2015. Percentages are from the RUC database for the year 2015.

Specialty Pathology                      Frequency 353                      Percentage 19.69 %

Specialty Nephrology                      Frequency 222                      Percentage 12.38 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: [to be performed before every apheresis treatment, including the initial treatment]: The apheresis medicine physician evaluates the general clinical status of the patient (including current medications), and performs an interval history and brief physical assessment in order to ascertain whether the patient is medically able to undergo the therapeutic extracorporeal procedure.

This assessment may also include reviewing evaluations by other physicians including Bone marrow transplant physicians, hematologists, nephrologists, gastroenterologists, intensivists and neurologists involved in the patient's management (depend on the systems affected by the GVHD). The physician confirms the adequacy of vascular access and confirms the initial assessment of, the apheresis nurse. Current diagnostic laboratory studies are reviewed, including complete blood count and differential count, renal and liver function studies, total protein and albumin and other relevant serum chemistry studies such as lipids. Finally, after determining that the parameters of the treatment (whole blood processing volume, anticoagulant-to-whole blood flow ratio) as reflected in the orders are still appropriate, the physician authorizes that the treatment should proceed.

Pre-service work unique to the first treatment, in addition to all of the above, may include evaluation of the need for the procedure, meaning did the patient fail first line therapy for ECP such as steroids or MMF before being considered for ECP. In addition, arranging placement of a venous access device and then reviewing the patient's chest x-ray to determine proper placement of the venous access device (this is ultimately the responsibility of the apheresis medicine physician), obtaining and reviewing the history and diagnostic studies; an examination of previous study reports; communicating with other professionals prior to the actual performance of the evaluation and procedure; and explaining the procedure to the patient or healthcare proxy and obtaining informed consent.

Description of Intra-Service Work: The physician determines specific apheresis prescription setting treatment parameters and goals, directs the initiation of the treatment and provides procedure oversight. During the procedure the apheresis medicine physician is responsible for the wellbeing of the patient on the machine. The physician periodically assesses the clinical status of the patient, paying particular attention to the vital signs flow sheet, the patient's color, urine output, mental status (if patient is awake), and other relevant parameters. The patient's vascular access is connected to the extracorporeal circuit and blood is actively pumped through the circuit where it is undergoes anticoagulation and separation of the white blood cells from the other blood components. Red cells and plasma are returned to the patient. The white blood cell collection, which contains peripheral lymphocytes, is then incubated with 8-methoxypsoralen and exposed to ultraviolet irradiation extracorporeally. The treated autologous peripheral lymphocytes are then re-infused into the

patient. The patient is actively monitored during the lymphocyte collection period for hemodynamic stability, coagulation parameters, and absence of treatment side effects. The patient is monitored for post-treatment hemodynamic stability and any needed laboratory studies are obtained. A report of the treatment is given to the patient's care providers.

**Description of Post-Service Work:** At the conclusion of the procedure the apheresis medicine physician reviews final hematological parameters and assesses the extent to which goals for the procedure were met. The physician, in collaboration with the apheresis nurse ascertains that venous access has been properly de-accessed, and that no new problems (hemorrhage, trauma, infection, etc.) have occurred as a result of the procedure. The physician prepares a final written report about the procedure for the medical record, and writes post-procedure orders should they be necessary and not already included in the apheresis orders that have already been written (for example: a culture of a catheter exit site). The physician communicates in writing, in person and by telephone with other healthcare personnel regarding the patient's treatment. The physician assesses the clinical condition of the patient and ascertains that no adverse effects have resulted from the procedure. The physician also communicates with the patient and/or family as appropriate.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	01/2017

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
90947	000	2.52	RUC Time

CPT Descriptor Dialysis procedure other than hemodialysis (eg, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies) requiring repeated evaluations by a physician or other qualified health care professional, with or without substantial revision of dialysis prescription

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99205	000	3.17	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
64483	000	1.90	RUC Time	991,128

CPT Descriptor 1 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
90937	000	2.11	RUC Time	59,798

CPT Descriptor 2 Hemodialysis procedure requiring repeated evaluation(s) with or without substantial revision of dialysis prescription

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
57410	000	1.75	RUC Time

CPT Descriptor Removal and replacement of externally accessible nephroureteral catheter (eg, external/internal stent) requiring fluoroscopic guidance, including radiological supervision and interpretation

### **RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Top Key Reference Code: 9      % of respondents: 25.0 %**

**Number of respondents who choose 2<sup>nd</sup> Key Reference Code: 7      % of respondents: 19.4 %**

### **TIME ESTIMATES (Median)**

	<b>CPT Code:</b> <u>36522</u>	<b>Top Key Reference CPT Code:</b> <u>90947</u>	<b>2nd Key Reference CPT Code:</b> <u>99205</u>
Median Pre-Service Time	33.00	10.00	7.00

------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**CHANGES are in RED****Background: 36511, 36512, 36513, 36514, 36516, 36522**

Before CY2016, the apheresis code family included 36511, 36512, 36513, 36514, 36515, 36516, and 36522. In the CMS proposed and final physician fee schedule rulings, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated 36516 is misvalued because of inaccurate direct and indirect PE inputs and "that the current work RVU undervalues a physician's time and expertise". After comments, the CMS added CPT code 36516 to the list of potentially misvalued codes. At the September 2016 CPT Editorial Panel meeting, CPT code 36516 was revised to include immunoabsorption and CPT code 36515 was deleted. The family of codes now includes:

36511 – Therapeutic apheresis; for white blood cells

36512 – Therapeutic apheresis; for red blood cells

36513 – Therapeutic apheresis; for platelets

36514 – Therapeutic apheresis; for plasma pheresis

▲36516 - Therapeutic apheresis; with extracorporeal immunoabsorption, selective adsorption or selective filtration and plasma reinfusion

36522 - Photopheresis, extracorporeal

(36515 has been deleted. For therapeutic apheresis with extracorporeal immunoabsorption and plasma reinfusion use, 36516)

**Survey Process**

In 2002, CPT codes 36511-36516 were originally developed and surveyed by the American Society of Hematology (ASH) and the Renal Physicians Association (RPA). Although pathology was a dominate provider of these services at that time, no pathologists were included in the survey effort. CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies.

For the January 2017 RUC meeting, the College of American Pathologists led the survey effort with assistance from ASH and RPA. Due to changes in the typical patient and service, revised vignettes were created, reviewed, and approved by the RUC's Research Subcommittee. The Subcommittee also approved a reference service list and minor changes to question 2 of the zero day global survey instrument. Since the majority of pathologists typically do not perform zero day global services and the references to "surgery" and "operative" procedure was of concern, these terms were either deleted or replaced with the word "procedure" where appropriate.

CAP and RPA conducted a random physician work survey of each society's membership for all six codes, while ASH conducted a random physician work survey of its membership for codes 36512 and 36522 only. The work surveys asked for respondents to only respond to questions for survey code(s) that they have familiarity with or have experience performing. An expert panel representing all three specialties was formed to address the direct practice expense inputs for the entire family of codes.

### Summary of Recommendations

January 2017 Recommendations	36511: White BC	36512: Red BC	36513: Platelets	36514: Plasma	36516: Extracorp	36522: Photo
Pre Time Total	40	40	40	29	25	33
Intra Time	30	20	25	20	15	18
Post Time	15	15	15	15	10	10
Total Time	85	75	80	64	50	61
Recommended Work RVU	2.00	2.00	2.00	1.81	1.56	1.75
Current WRVU	1.74	1.74	1.74	1.74	1.22	1.67

### Compelling Evidence:

The specialties believe that the current work RVUs undervalue these services, which are supported by the results of the survey. The specialties believe that compelling evidence exists in order to increase the work RVUs from their current values. According to the RUC's definition, compelling evidence can be met if there is:

- "Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:
  - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;
  - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or
  - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data."

We believe there is indeed evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey. At that time pathology was the dominate provider for codes 36511, 36512, and a dominate provider for codes 36514, 36516, and 36522, and in 2015, pathology was the dominate provider for codes 36511, 36512, 36514, 36516, and 36522. Pathology's exclusion from the original survey also affected the creation of the vignette, which has been updated since 2002.

Furthermore, CPT code 36522 has never been through the RUC process for the valuation of physician work. The work RVU and its time components were determined through the Harvard studies, which we believe is a flawed methodology. Therefore the work RVU and physician time are invalid. The dominate provider in 2002 was obstetrics/gynecology. In 2015, the dominate provider was pathology.

Therefore, these facts demonstrate that a flawed methodology used in the previous valuation of these services, which fulfills the requirements of compelling evidence.

### Recommendation for 36522:

**We recommend a work RVU of 1.75 for code 36522.** The median survey RVU is 2.16 which the multispecialty expert panel agreed was too high for the procedure provided and in relation to the rest of the family of apheresis procedures. The panel also agreed that the 25<sup>th</sup> percentile value of 1.50 RVUs is too low to properly value the procedure. In addition, the panel considered the current Harvard generated value of 1.67 WRVUs as invalid. The recommended work RVU of 1.75 is based on a crosswalk to CPT code 50387 - *Removal and replacement of externally accessible nephroureteral catheter (eg, external/internal stent) requiring fluoroscopic guidance, including radiological supervision and interpretation.*

CPT code 50387 was last reviewed by the RUC in April 2005, and for CY 2017 the CMS extracted the physician work and time of moderate sedation from this procedure which reduced the work RVU from 2.00 to 1.75 and reduced the pre-service time from 38 minutes to 33. The intra-service time and post service times are identical to the surveyed code, 18 minutes and 10 minutes respectively. The overall physician work of 50387 is considered to be identical to 36522 by the multispecialty expert panel.

	36522 Survey Results (Median)	CPT Code 50387
Work RVU	2.16	1.75*
Pre Time	40	33*
Intra Time	18	18
Post Time	10	10

\*The WRVU for 50387 for 2017 is 1.75. In 2016 the value was 2.00. For CY 2017 the CMS finalized work RVUs for 4 new moderate sedation codes and extracted the physician work from codes that contained moderate sedation. The CMS subtracted 0.25 RVUs from 50387 for CY 2017 based on the GI societies' survey data included in RUC recommendations that reported a median valuation of 0.25 work RVUs for moderate sedation furnished by the same person furnishing the base procedure. Pre time was also lowered from 38 minutes to 33 minutes.

We believe that the overall work and time for 50387 and 36522 is very similar, which allows for the WRVU value for 36522 to be crosswalked from code 50387.

**PRE-TIME Package 4:** The RUC's physician work instructions directed us to select the package that "best corresponds to the data which was collected in the survey process". The survey's indicated pre-service evaluation time above 40 minutes and therefore package 4 was selected.

**Evaluation (total = 33 minutes):** The package accounts for the extensive review of the patient history, diagnostic studies, physical assessments, therapy parameter determinations, and documentation requirements,

**Positioning (total = 0 minutes):** The survey results indicate little or no positioning time. All positioning time has been subtracted from the package time.

**Scrub, dress, wait (total = 0 minutes):** The survey results indicated little or no scrub, dress, and wait time. 5 minutes of scrub, dress, wait time has been subtracted from the package time.

**INTRA TIME:** Survey median of 18 minutes.

#### **POST-TIME Package 7A**

**Total = 10 minutes:** Default to the survey value 10 minutes which is 8 minutes less than the package time.

#### **MPC 000 Day Global Code Comparisons**

CPT Code	Long Descriptor	Work RVU	Pre Time	Intra Time	Post Time	Total Time	RUC Review	IWPUT

**BETOS:** CMS lists BETOS for CPT code 36522 as: Procedure, Major Procedure, Other. We recommend that the BETOS for CPT code 36522 be Procedure, Minor Procedure, Other, to be consistent with the other procedures in the family.

### Summary

The specialties agree that the survey results support a higher relative value for this code, and therefore the specialties recommend a crosswalk of CPT code 36522 to 50387. Compelling evidence indicates a flawed methodology was used in the original valuation of this service. **We recommend a physician work RVU of 1.75 for code 36522.**

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 36522

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Sometimes

Specialty Hematology                      How often? Sometimes

Specialty Nephrology                      How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 36220

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 9055 claims for 2015. Medicare procedures represent approximately 25% of the total volume for these types of procedures (9055\*4=36220). Percentages are from the RUC database for the year 2015.

Specialty Pathology                      Frequency 13633                      Percentage 37.63 %

Specialty Hematology                      Frequency 7211                      Percentage 19.90 %

Specialty Nephrology                      Frequency 1521                      Percentage 4.19 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 9,055

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The Medicare volume from the 2016 V2.1 RUC Database indicates 9055 claims for 2015. Percentages are from the RUC database for the year 2015.

Specialty Pathology                      Frequency 3408                      Percentage 37.63 %

Specialty Hematology                      Frequency 1803                      Percentage 19.91 %

Specialty Nephrology                      Frequency 380                      Percentage 4.19 %

Do many physicians perform this service across the United States? Yes

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 36522

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/Specialty Society RVS Update Committee (RUC)  
Financial Disclosure Statement For  
Specialty Society Presenters**

I certify that my personal or my family members'\* direct financial interest in, and my personal or my family members' affiliation with or involvement in any organization or entity with a direct financial interest in the development of relative value recommendations in which I am participating are noted below. Otherwise, my signature indicates I have no such direct financial interest or affiliation with an organization with a direct financial interest, other than providing these services in the course of patient care.

For purposes of this disclosure "direct financial interest" means:

- A financial ownership interest in an organization\*\* of 5% or more; or
- A financial ownership interest in an organization\*\* which contributes materially\*\*\* to your income; or
- Ownership of stock options in an organization\*\*; or
- A position as proprietor, director, managing partner, or key employee in an organization\*\*; or
- Serve as a consultant, researcher, expert witness (excluding professional liability testimony), speaker or writer for an organization\*\* or participate in a clinical trial that involves the services being reviewed, where payment contributes materially\*\*\* to your income.

*\*Family member means spouse, domestic partner, parent, child, brother or sister. Disclosure of family member's interest applies to the extent known by the representative or presenter..*

*\*\* Organization means any entity that makes or distributes the product that is utilized in performing the service, and not the physician group or facility in which you work or perform the service.*

*\*\*\*Materially means \$10,000 or more in income (excluding any reimbursement for expenses) for the past twenty-four months.*

**Include only interests that relate to the specific issue that you are presenting at this RUC meeting.**

Specific Disclosure (i.e., list organization)	Explain relationship between the service(s) that you are presenting and your disclosure	Identify interest for the past 24 months (circle one)	Identify cumulative lifetime interest (circle one)	If disclosure relates to stock, please list number of shares owned, options or warrants

**AMERICAN MEDICAL ASSOCIATION/SPECIALTY SOCIETY  
RELATIVE VALUE SCALE UPDATE COMMITTEE ("RUC")  
CONFLICT OF INTEREST POLICY**

No RUC or other Committee, Subcommittee or Workgroup representative will vote or participate in any deliberation on a specific issue in the event the representative, or the representative's family member, has a direct financial interest in the outcome of the vote or deliberation other than the representative in the course of their practice performing the procedure or service at issue. Every RUC or other Committee, Subcommittee or Workgroup representative shall disclose his or her, or family member's, direct financial interest(s) prior to any vote or deliberation and shall not vote or participate in the deliberation in which he or she has a direct financial interest. Any known disclosure should be made to the RUC chair in writing prior to the meeting.

Any individual who is presenting or discussing relative value recommendations before the RUC shall disclose on a Financial Disclosure Form his or her direct financial interest(s) if any, prior to any presentation(s). The Administrative Subcommittee will review financial disclosure documents in advance of the meeting. If a direct financial interest is identified on the financial disclosure form, the individual may be precluded from presenting.

For purposes of this Policy, direct financial interest means: (i) a financial ownership interest in an organization (i.e., "organization" shall mean any entity with an interest in the development of relative value recommendations) of 5% or more; or (ii) a financial ownership interest in an organization which contributes materially (i.e., "materially" shall mean income *(excluding any reimbursement for expenses)* for the past twenty-four months of at least \$10,000) to your income; or (iii) ownership of stock options in an organization that is related to issues at the RUC, or (iv) a position as proprietor, director, managing partner, or key employee in an organization; or (v) a consultant, expert witness, speaker or writer for an organization, where payment contributes materially to your income.

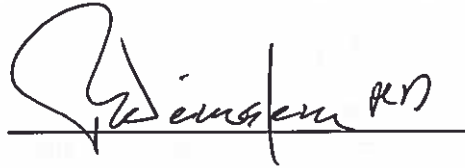

For purposes of the Policy "family member" means spouse, domestic partner, parent, child, brother or sister. Disclosure of a family member's interest applies to the extent known by the representative or presenter.

**STATEMENT OF COMPLIANCE WITH  
RELATIVE VALUE SCALE UPDATE COMMITTEE ("RUC")  
CONFLICT OF INTEREST POLICY**

I understand that I am expected to comply with the Conflict of Interest Policy of the RUC. To my knowledge and belief, I am in compliance with the Conflict of Interest Policy. I will disclose any direct financial interests in specific issues considered by the RUC, or any subcommittee or workgroup of the RUC, and I will recuse myself from deliberation and vote on any issue in which I or any family member have a direct financial interest. I understand that I have a continuing responsibility to comply with the Conflict of Interest Policy, and I will promptly disclose my direct financial interests required to be disclosed under this Policy.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

**36511 - Therapeutic apheresis; for white blood cells**

**36512 - Therapeutic apheresis; for red blood cells**

**36513 - Therapeutic apheresis; for platelets**

**36514 - Therapeutic apheresis; for plasma pheresis**

**36516 - Therapeutic apheresis; with extracorporeal immunoadsorption, selective adsorption or selective filtration and plasma reinfusion**

**36522 - Photopheresis, extracorporeal**

Global Period: \_000 Meeting Date: \_January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The specialty society advisors, apheresis experts, and staff from CAP, RPA, and ASH held a series of conference calls to discuss the details of the practice expense inputs. The inputs were developed with input from physicians, specialty society staff, and clinical staff from a variety of settings.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

Not applicable, current PE inputs for current codes have been used.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: NA

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

**Background: 36511, 36512, 36513, 36514, 36516, 36522**

Before CY2016, the apheresis code family included 36511, 36512, 36513, 36514, 36515, 36516, and 36522. In the CMS proposed and final physician fee schedule rulings, CPT code 36516 was nominated for review as potentially misvalued. The nominator stated 36516 is misvalued because of inaccurate direct and indirect PE inputs and “that the current work RVU undervalues a physician’s time and expertise”. After comments, the CMS added CPT code 36516 to the list of potentially misvalued codes. At the September 2016 CPT Editorial Panel meeting, CPT code 36516 was revised to include immunoabsorption and CPT code 36515 was deleted.

CMS currently has not priced codes 36511, 36512, and 36513 in the non-facility setting, the specialties agreed to provide these inputs for RUC review.

The specialties believe that the current work RVUs and practice expense inputs undervalue these services. According to the RUC’s definition, compelling evidence can be met if there is:

- “Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:
  - a misleading vignette, survey and/or flawed crosswalk assumptions in a previous evaluation;
  - a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values; and/or
  - a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.”

We believe there is indeed evidence that incorrect assumptions were made in the previous valuation of all of these services. The previous survey in 2002 was conducted by two specialties (hematology and nephrology) to obtain the values of 36511-36516, but pathologists were not included in this survey or in the development of the practice expense inputs. At that time pathology was the dominate provider for codes 36511, 36512, and a dominate provider for codes 36514, 36516, and 36522, and in 2015, pathology was the dominate provider for codes 36511, 36512, 36514, 36516, and 36522. Pathology's exclusion from the original survey also affected the creation of the vignette, which has been updated since 2002.

Furthermore, the practice expense for CPT code 36522 was separately reviewed for practice expense at the September 2004 RUC meeting. This review was led by dermatology and hematology. The CMS in its 2006 Final Rule disagreed with the RUC on the assist physician time of 90 minutes and changed the line item time to 135 minutes. The facts that pathology wasn't part of this review and CMS altered the inputs, leads us to believe the PE valuation methodology from 2004 for CPT code 36522 was flawed.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: See spreadsheet notes on right side in addition to these activities.

Complete pre-service diagnostic and referral forms

All pre-service diagnostic and referral forms are reviewed in detail for accuracy. This often entails calling the dialysis service, the blood bank, and the pharmacy.

Coordinate pre-surgery services

The dialysis or pheresis service is called to arrange for patient tunnel catheter (vascular access) as necessary. The blood bank is notified to ensure that red blood cells are available. The pharmacy is called to ensure the availability of albumin and other IV, injectables, and blood are available for the patient.

Pre-service labs are drawn.

Patient charts and laboratory reports are reviewed by medical staff. Specifically, there is review of the hematocrit, plasma volume and calcium.

Provide pre-service education/obtain consent

The nursing staff reviews the consent form with the patient and provides educational information regarding the procedure.

Intra-Service Clinical Labor Activities: See spreadsheet notes on right side in addition to these activities.

Patient is greeted by Nurse and provided with gown. Nurse or other appropriate medical staff ensures that patient is properly gowned for procedure.

Medical staff must also ensure that appropriate medical records are available.

Medical staff obtains patient vital signs including; blood pressure, pulse, temperature, respiration rate, and oxygen saturation.

The medical staff inspects the catheter for integrity, sutures and signs of exit-site infection.

Medical staff prepares room, ensuring that correct equipment and necessary supplies are available.

Medical staff prepares adsorption column in preparation for apheresis procedure.

Patient is properly positioned and IVs is set up.

Nursing staff assists the physician in performing the procedures including;

- Contiguous assessment and monitoring, typically by nurse who is involved during entire procedure,
- Monitor and change replacement fluids, and
- Monitor equipment

Nurse educates the patient on the effects of citrate, including numbness and tingling and advises the patient to notify the nurse if he/she is experiencing these symptoms.

Post-Service Clinical Labor Activities: See spreadsheet notes on right side in addition to these activities.

At the conclusion of the procedure, patient is closely monitored. This includes checking tubes, monitors, drains, vital signs, and access management.

The procedure room is cleaned by physician staff. This includes flushing lines, capping tubing, removing disposables from the machine, wiping down the machine with disinfectant and putting supplies back in cart, etc.

Immediately after the procedure, nursing staff completes diagnostic forms and lab & X-ray requisitions. The medical staff also completes documentation and reporting of procedure including; plasma process and fluid balance. This information is captured on data flow sheets.

The medical staff cleans the catheter exit site, applies a sterile dressing and attaches two new catheter caps to the lumens. The nursing staff provides home care instructions. In addition, the nursing staff coordinates office visits and ensures that patient has all the necessary prescriptions.

The medical staff restocks fluids and blood products.

The machine is calibrated and if needed additional maintenance takes place.

The medical staff ensures that all of the necessary quality assurance tasks are done.

The medical staff develops a patient coordination of care plan and may follow up with patient.

**Updated Invoices and Supplies: See attachments**

The Societies have provided the following supplies and equipment updated and additional invoices:

Supply - kit, photopheresis procedure SA024

Supply - kit, apheresis treatment SA072

Supply - tubing set, plasma exchange SC085

Supply - ACD-A anticoagulant SJ071

Supply - 5% albumin saline, ml bags

Supply - 0.9% sodium chloride (normal saline) IV solution, 500 or 1000 ml bags.

Supply - Calcium gluconate, NS 250 ml

Equipment - blood warmer EQ072

Equipment - cell separator system EQ084

Equipment - photopheresor system EQ206

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2017

**Peri-Prostatic Implantation of Biodegradable Material**

In October 2016, the CPT Editorial Panel deleted CPT Category III code 0438T and created a new CPT code 55874 to report transperineal placement of biodegradable material.

***55874 Transperineal placement of biodegradable material, peri-prostatic, single or multiple injection(s), including image guidance, when performed***

The RUC reviewed the survey results from 175 urologists and radiation oncologists and determined that a work RVU recommendation of 3.03 was appropriate and supported by the 25<sup>th</sup> percentile of the survey. Of the 175 survey respondents, 65 had performed the procedure in the last year which exceeds the survey threshold; these responses were combined with the 110 other respondents who had not performed the procedure in the last year but likely had contributed to the initial clinical trial. The specialty societies confirmed that the final recommendation of the 25<sup>th</sup> percentile reflected the combined survey. The specialty societies also clarified that ultrasound is performed continuously throughout the procedure. Further, they confirmed that the description of intra-service work is correct in that, after the ultrasound probe is placed and anesthesia is conducted, hydrodissection is the initial step in the procedure. Once the hydrodissection is completed, the syringe is removed but the needle is intact; at that time, the biodegradable material is prepped. It is never prepped prior to the procedure but is done after the hydrodissection which is why it is included in the intra-service time.

The RUC recommends 25 minutes pre-service time, 30 minutes intra-service time, and 15 minutes post-service time (total time 70 minutes). The RUC agreed to add five minutes of positioning time above the standard package to account for positioning the patient in the dorsal lithotomy position. The RUC compared the surveyed code to the top key reference service 49411 *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-abdominal, intra-pelvic (except prostate), and/or retroperitoneum, single or multiple* (work RVU = 3.57, intra-service time of 40 minutes, total time 75 minutes) and noted that both services have similar physician IWPOT (0.074 and 0.071 respectively) with the surveyed code being higher due to the shorter intra-service work time. The RUC noted that the second key reference service 55876 *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple*, (work RVU = 1.73 and intra-service time of 20 minutes) requires 10 minutes less intra-service time and is less complex and intense, thus the surveyed code is appropriately valued higher.

For additional support, the RUC compared the surveyed code to CPT code 44389 *Colonoscopy through stoma; with biopsy, single or multiple* (work RVU = 3.02, intra-service time of 30 minutes, total time 65 minutes) and also considered CPT code 50386 *Removal (via snare/capture) of internally*

*dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU = 3.05, intra-service time of 30 minutes, total time 80 minutes). **The RUC recommends a work RVU of 3.03 for CPT code 55874.**

### Practice Expense

Modifications were made to the direct practice expense inputs including substantial decreases in pre-service time. The PE Subcommittee noted that the specialty is requesting a new high priced supply item *Biodegradable Material Kit – PeriProstatic*, and discussed that if there is an application for this item to be separately billable through a HCPCS code the kit will need to be removed from the direct practice expense inputs. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

### New Technology

This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

---

CPT Code: 55874      Tracking Number   X1

Original Specialty Recommended RVU: **3.03**Presented Recommended RVU: **3.03**

Global Period: 000

RUC Recommended RVU: **3.03**

CPT Descriptor: Transperineal placement of biodegradable material, peri-prostatic, single or multiple injection(s), including image guidance, when performed (Do not report 55874 in conjunction with 76942)

---

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 67-year-old male is discovered on digital rectal examination to have a prostate nodule occupying more than one half of the right lobe but no involvement of the left side. Diagnostic workup confirms presence of prostate cancer. To reduce rectal toxicity resulting from radiation therapy, an ultrasound guided transperineal implantation of a biodegradable material is performed to create a space between the prostate and the rectum.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

---

Description of Pre-Service Work: The patient's chart is reviewed and the plan for radiation treatment is confirmed. Ensure bowel prep was performed and prophylactic antibiotics were taken, otherwise provide bowel prep and antibiotics prior to procedure. Confirm that the patient is not taking anticoagulants. The patient is brought to the procedure suite, the patient is positioned in the dorsal lithotomy position and the perineal skin is prepped with alcohol/povidone-iodine per the standard practice. The physician prepares the transrectal ultrasound (TRUS) probe, standoff balloon and stepper for TRUS imaging. Sterile drapes are then placed on the patient legs, genitals, ultrasound probe and the stepper. The ultrasound is inserted into the patient's rectum and secured to the stepper/stabilizer. The physician provides the patient local anesthesia with a bilateral pudendal nerve block under ultrasound guidance using a standard technique (e.g. 1% lidocaine). The skin is numbed with lidocaine and then the physician advances the needle to the mid perineum region and an adequate dose of anesthetic (e.g. lidocaine) is injected. Once the area becomes anesthetized, the needle is advanced until it is proximal to the pudendal nerve, and an additional dose of anesthetic is injected. Once anesthesia is achieved the physician will turn his/her attention to the hydrogel implant.

Description of Intra-Service Work: The hydrogel implant is prepared by the physician. First, saline is drawn into a sterile syringe, which is attached to a needle and primed. This syringe/needle assembly will be used to access and hydrodissect the peri-prostatic implant site. Next, the hydrogel syringe assembly is prepared. This syringe assembly is prepared by injecting the hydrogel diluent into the powder in the vial, shaking until the powder is completely dissolved and setting aside to allow the bubbles to dissipate. Once the bubbles dissipate 5 mL of this precursor solution and 1 cc of air is withdrawn back into the precursor syringe. Next the accelerator syringe is uncapped and the amount of accelerator liquid is prepared at 5 ml liquid/1 cc air. Next the precursor solution syringe and the accelerator syringe are measured to contain the same amount of fluid and air before being assembled to the y-connector, syringe holder, and syringe plunger cap. The syringe assembly is now ready for injecting the hydrogel after the physician identifies and hydrodissects the cavity as described below.

The TRUS probe is repositioned in the rectum and the space between the prostate (mid gland) and rectum is identified and measured. The ultrasound probe will be repositioned to find the minimal probe pressure to maximize the visualization of the prostate without collapsing the periprostatic fat. The probe will be angled to prevent the rectum from being displaced superiorly which would prevent the needle from being introduced without fecal contamination. After appropriate positioning is achieved the saline syringe needle (15 cm 18 G needle) is inserted through the perineal skin under direct ultrasound guidance, through the rectourethralis muscle and past the prostate apex to the perirectal fat between Denonvilliers' fascia at prostate mid-gland and the rectal wall. Care must be taken during needle advancement not to penetrate the rectal lumen with the needle tip to avoid potential introduction of infectious material or injure the rectal wall. Care must also be taken not to transect the prostate. The needle position is confirmed in both the sagittal and axial ultrasound planes, and saline is injected to dissect the space between the Denonvilliers' fascia and anterior rectal wall ("hydrodissection"). Hydrodissection confirms proper needle location and creates space for the injection of the hydrogel material.

Additional axial and sagittal imaging is required to optimize needle position and bilateral saline distribution. While maintaining the desired position, aspiration is performed to ensure that the needle is not in an intravascular space. The saline syringe is then removed and the hydrogel syringe assembly is attached to the same 18G needle with care not to displace the needle. The needle is confirmed not to have moved during assembly on ultrasound imaging. Under ultrasound guidance (sagittal plane) the hydrogel material is then injected to expand the peri-prostatic space between the prostate and rectum. Optimal visualization of the needle during hydrogel administration is maintained at all times. Following injection the needle is removed, and the spent applicator and needle are discarded.

An axial measurement of the space between the prostate (mid gland) and rectum is performed. The TRUS probe is removed from the patient, the stirrups are lowered, and patient is then recovered.

Description of Post-Service Work: The patient is observed to ensure there is no onset of any complications. A procedure note is dictated. The patient is provided a plan to resume pre-procedure medications and to continue with antibiotics if prescribed. Questions about post-op care and the procedure are discussed.

Ref Code****Time Segment (Mean)**

Overall intensity/complexity	0.55	0.60
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

The CPT Editorial Panel has created a new code to report transperineal placement of biodegradable material (55874).

**Billed Together**

Typically no codes are reported on the same day as the new transperineal placement of biodegradable material CPT Code (55874). However, fiducials (CPT Code 55876) could be performed on the same day. The physician work described by this new procedure (i.e. intra work) is distinct work and does not represent any overlap with fiducials. It is important to note that both services (55874 and 55876) are subject to the multiple procedure reduction if both are performed on the same day (000-day global period).

**Positioning Time**

The society requests 5 extra minutes of positioning time to put the patient in the dorsal lithotomy position.

**SPR**

The median service performance rate for the survey was zero. Pursuant to RUC policy, the multispecialty group has submitted three SORs. One for all the survey data, one for the subset with a service performance rate of 0 and one for the subset with a service performance rate of greater than 0. It is important to note that the RUC survey question specifically asks for the respondent to report the number of cases performed in the past year. However, the trial for this service ran from 2012-2013. If a physician participated in that trial but did not perform this procedure in the last year, he/she had to put 0 on the survey.

**New Technology**

The specialty believes this procedure should be flagged for new technology.

**Recommendations**

The specialty societies received 175 completed RUC physician work surveys from physicians. The multispecialty RUC workgroup reviewed the survey data and believes the following physician work recommendations appropriately rank these procedures within the urology and radiation oncology families as well as within the fee schedule. See below:

	<b>CPT</b>	<b>IWPUT</b>	<b>wRVU</b>	<b>Total Time</b>	<b>Pre Time</b>	<b>Intra Time</b>	<b>Post Time</b>
Reference	55876	0.043	1.73	59	29	20	10

Reference	49411	0.072	3.82	85	25	40	20
SPR>0	55874	0.123	4.00	95	60	20	15

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain) While not typical, the possibility exists that peri-prostatic implantation of material may be performed on the same date as placement of fiducial markers (55876).

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0438T or 45999 and 76942

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology                      How often? Sometimes

Specialty Radiation Oncology                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 12000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. According to SEER data, 180,890 new cases of prostate cancer are estimated for 2016. Approximately 1/3 will receive radiation therapy, which is approximately 60,000 patients per year. Of those, approximately 20% are likely to have rectal toxicity (Grodsky, 2015). It is estimated that about 12,000 patients will be ideal candidates for this procedure.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. According to SEER data, 180,890 new cases of prostate cancer are estimated for 2016. Approximately 1/3 will receive radiation therapy, which is approximately 60,000 patients per year. Of those, approximately 20% are likely to have rectal toxicity (Grodsky, 2015). It is estimated that about 12,000 patients will be ideal candidates for this procedure. The specialty estimates approximately 80% of those 12,000 would be in Medicare population (10,000)

Specialty urology	Frequency 6000	Percentage 60.00 %
Specialty radiation oncology	Frequency 4000	Percentage 40.00 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Oncology

BETOS Sub-classification Level II:

Radiation Therapy

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 55876

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

**CPT Long Descriptor:** *Transperineal placement of biodegradable material, peri-prostatic, single or multiple injection(s), including image guidance, when performed (Do not report 55874 in conjunction with 76942)*

**Global Period:** 000

**Meeting Date:** January 2017

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

AUA and ASTRO convened a panel of physicians and clinical staff to develop consensus recommendations for practice expense. The panel included a mix of physicians from various practice settings and geographic regions. They panel reviewed the physician work survey data, the existing direct PE inputs for the reference code and makes the following PE recommendations.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes.  
Reference Code Rationale:**

The multispecialty group included CPT Code 55876 *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple* as the PE reference code. CPT Code 55876 was selected as one of the key reference codes on the physician work side.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

N/A

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services (including test results)
- Schedule space in facility
- Provide pre-service education/obtain consent
  - *Need to be off blood thinners for one week prior (aspirin, aleve, etc)*
  - *Need to be off anti-coagulants for 3 days (Coumadin, pradaxa, etc)*
  - *Antibiotics-taken day before, day of and day after procedure*
  - *Emla cream (apply to skin between testicles & anus 1 hour before procedure)*
  - *Fleets enema*
  - *May have light breakfast*
  - *Take 2 extra strength Tylenol before procedure*
  - *Take regular medications*
  - *Restart blood thinners the next day*
- Complete pre-procedure phone calls and prescription
  - *Rx antibiotic and Emla cream*
  - *Call patient to confirm instructions have been followed*

Intra-Service Clinical Labor Activities:

Post-Service Clinical Labor Activities:

- Conduct patient communications

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**CPT Long Descriptor:** *Transperineal placement of biodegradable material, peri-prostatic, single or multiple injection(s), including image guidance, when performed (Do not report 55874 in conjunction with 76942)*

**Global Period:** 000

**Meeting Date:** January 2017

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

AUA and ASTRO convened a panel of physicians and clinical staff to develop consensus recommendations for practice expense. The panel included a mix of physicians from various practice settings and geographic regions. They panel reviewed the physician work survey data, the existing direct PE inputs for the reference code and makes the following PE recommendations.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes.  
Reference Code Rationale:**

The multispecialty group included CPT Code 55876 *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple* as the PE reference code. CPT Code 55876 was selected as one of the key reference codes on the physician work side.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

The multispecialty group is recommending 5 extra minutes of positioning times to put the patient in dorsal lithotomy.

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

N/A

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
  - Pre-authorization for hydrogel
- Coordinate pre-surgery services (including test results)
  - Review labs
- Provide pre-service education/obtain consent
  - *Need to be off blood thinners for one week prior (aspirin, aleve, etc)*
  - *Need to be off anti-coagulants for 3 days (Coumadin, pradaxa, etc)*
  - *Antibiotics-taken day before, day of and day after procedure*
  - *Emla cream (apply to skin between testicles & anus 1 hour before procedure)*
  - *Fleets enema*
  - *May have light breakfast*
  - *Take 2 extra strength Tylenol before procedure*
  - *Take regular medications*
  - *Restart blood thinners the next day*
- Complete pre-procedure phone calls and prescription
  - *Rx antibiotic and Emla cream*
  - *Call patient to confirm instructions have been followed*

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
  - *Pulse, BP, Temp & PulseOx*
- Prepare room, equipment and supplies
- Prepare, set-up and start IV, initial positioning and monitoring of patient
  - *Standard 2 minutes plus 5 min for dorsal lithotomy*
- Assist physician or other qualified healthcare professional---directly related to physician work time (100% of physician intra-service time)
  - *Nurse scrubbed in. Hip/hip with the physician 100% of the procedure (30 min intra service MD time).*
- Monitor patient following procedure/service, multitasking 1:4
  - *Recovery time 20 minutes (1:4)*
- Clean room/equipment by clinical staff

Post-Service Clinical Labor Activities:

- Conduct patient communications
  - Call referring physician

Supplies

- pack, minimum multi-specialty visit
  - exam paper, gloves NS(2), patient gown, pillow case, and thermometer cover
- drape, sterile, for mayo stand
- drape, sterile, c-arm, fluoro
  - to cover US machine
- drape, sterile barrier
  - for patient, to keep area sterile
- Endocavity Balloon (new item)
  - to cover the US probe
- gloves, sterile
  - (1) for nurse to set up sterile supplies
  - (1) MD to clean the perineum
  - (1) MD for nerve block
  - (1) MD to prepare the kit/material
  - (1) nurse to hand MD kit/material
- non-sterile gloves (2 are in the multispecialty pack – no extras requested)
  - (1) MD for rectal prep
  - (1) for nurse to clean up after procedure
- lidocaine 2% jelly, topical (Xylocaine)
  - *For rectum*
- lidocaine 1%-2% inj (Xylocaine)
  - *For nerve block:*
- Povidone soln (Betadine)
  - *Spray perineum. Repeat.*
- Sodium chloride 0.9% irrigation (500-1000ml uou)
  - *To inflate the balloon to get air out*
- syringe 50-60ml
  - (1) to put lidocaine in rectum
  - (1) to inflate the balloon with water to get air out
- syringe 20ml
  - (1) For nerve block
  - (1) For hydrodissection
- Needle, 18-27g
  - To draw up 20 cc out of syringe
- Needle, spine, sprottle
  - (1) for nerve block
- gauze, sterile 4in x 4in
  - *wipe perineum/betadine, repeat*
  - *clean perineum after procedure*

- swab-pad, alcohol
  - *clean top of lidocaine (R )*
  - *clean top of vial (nerve)*
  - *clean for hydrodissection*
- **Biodegradable Material Kit – PeriProstatic**
  - *Kit includes accelerator syringe, diluent syringe, powder vial, y-connector, syringe clip, plunger cap and needle*
- sanitizing cloth-wipe (patient)
- sanitizing cloth-wipe (surface, instruments, equipment)
  - *For the mount, stepper, and the rest of the US machine*
- glutaraldehyde 3.4% (Cidex, Maxicide, Wavicide)
  - *For U/S transducer*

### **Equipment**

- table, power
  - *Non-highly technical. Total service time. Plus 20 minutes of for recovery. The patient remains on the power table/in the procedure room*
- stepper, stabilizer, template (for brachytherapy treatment)
  - *Non-highly technical. Total service time.*
  - *Used to maintain ultrasound probe in appropriate position for hydrogel placement*
  - *Formula in the spreadsheet populates the wrong price*
- stirrups (for brachytherapy table)
  - *Non-highly technical. Total service time.*
  - *Formula in the spreadsheet populates the wrong price*
- ultrasound unit, portable
  - *Non-highly technical. Total service time.*
- endocavitary rectal US probe
  - *Non-highly technical. Total service time.*
  - *We did not see one on the equipment list, so are providing copies of paid invoices.*

AMA/Specialty Society RVS Update Committee Summary of Recommendations

*\*Site of Service Anomaly – 2015\**

January 2017

**Colporrhaphy with Cystourethroscopy**

In October 2015, CPT code 57240 was identified in which the Medicare data from 2011-2013 indicated that it was performed less than 50% of the time in the inpatient setting, yet include inpatient hospital Evaluation and Management services within the global period. In April 2016, the specialty society indicated they are working with CMS and its contractor NCCI on issues related to the colporrhaphy codes. NCCI instituted edits that prohibit reporting a Cystourethroscopy (CPT code 52000) with these services. NCCI recommended the specialty society address this issue through the CPT process. The RUC recommended 57240, 57250, 57260 and 57265 be referred to the CPT Editorial Panel. In September 2016, the CPT Editorial Panel revised 57240, 57260 and 57265 to preclude separate reporting of follow up cystourethroscopy after colporrhaphy.

***57240 Anterior colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed***

The RUC reviewed the survey results from 115 physicians and agreed on the following physician time components: 33 minutes of pre-service evaluation time, 8 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, intra-service time of 60 minutes, immediate post-time of 30 minutes, a half-day discharge (99238) and 2 99213 post-op office visits.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 12.00 and agreed that the survey respondents somewhat overvalued the physician work involved in performing this service. To find an appropriate work RVU crosswalk for CPT code 57240, the RUC compared the surveyed code to MPC code 53850 *Transurethral destruction of prostate tissue; by microwave thermotherapy* (work RVU of 10.08, intra-service time of 60 minutes and total time of 204) and noted that both services involve a similar amount of physician work and have identical intra-service time and similar total time. Therefore, the RUC recommends a direct RVU crosswalk from code 53850 to 57240. The RUC noted that, with this change, the code would have an IWPUT of 0.096, appropriate relative to the top and 2nd key reference codes. To further support the value, the RUC also noted that the proposed value compared favorably to CPT code 19301 *Mastectomy, partial (eg, lumpectomy, tylectomy, quadrantectomy, segmentectomy)*; (work RVU of 10.13, intra-service time of 60 minutes, total time of 216 minutes). **The RUC recommends a work RVU of 10.08 for CPT code 57240.**

***57250 Posterior colporrhaphy, repair of rectocele with or without perineorrhaphy***

The RUC reviewed the survey results from 115 physicians and agreed on the following physician time components: 33 minutes of pre-service evaluation time, 8 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, intra-service time of 60 minutes, immediate post-time of 30 minutes, a half-day discharge (99238) and 2 99213 post-op office visits.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 11.50 and agreed that the survey respondents somewhat overvalued the physician work involved in performing this service. To find an appropriate work RVU crosswalk for CPT code 57250, the RUC compared the survey code to MPC code 53850 *Transurethral destruction of prostate tissue; by microwave thermotherapy* (work RVU of 10.08, intra-service time of 60 minutes and total time of 204) and noted that both services involve a similar amount of physician work and have identical intra-service time and similar total time. Therefore, the RUC recommends a direct RVU crosswalk from code 53850 to 57250. The RUC noted that, with this change, the code would have an IWPOT of 0.096, appropriate relative to the top and 2nd key reference codes. To further support the value, the RUC also noted that the proposed value compared favorably to CPT code 19301 *Mastectomy, partial (eg, lumpectomy, tylectomy, quadrantectomy, segmentectomy)*; (work RVU of 10.13, intra-service time of 60 minutes, total time of 216 minutes). **The RUC recommends a work RVU of 10.08 for CPT code 57250.**

***57260 Combined anteroposterior colporrhaphy, including cystourethroscopy, when performed;***

The RUC reviewed the survey results from 115 physicians and agreed on the following physician time components: 33 minutes of pre-service evaluation time, 8 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, intra-service time of 90 minutes, immediate post-time of 30 minutes, a half-day discharge (99238) and 2 99213 post-op office visits.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 13.25 and agreed that the survey respondents correctly valued the physician work involved in performing this service. To justify a work RVU of 13.25, the RUC compared the survey code to top key reference code 58570 *Laparoscopy, surgical, with total hysterectomy, for uterus 250 g or less*; (work RVU of 13.36, intra-service time of 90 minutes and total time of 241 minutes) and noted that both services have identical intra-service and total times and both are typically performed in the outpatient setting. To further support a value of 13.25, the RUC compared the surveyed code to CPT Code 58571 *Laparoscopy, surgical, with total hysterectomy, for uterus 250 g or less; with removal of tube(s) and/or ovary(s)* (work RVU of 15.00, intra-service time of 90 minutes, total time of 241 minutes) and noted that both services have identical time components and identical post-op visit components. Both services are typically performed in the hospital outpatient setting, while the reference code involves somewhat more intense intra-service work though supports a value of 13.25 for the survey code. The RUC confirmed that the specialty's original recommendation of 13.25 is appropriate relative to the recommended values for 57240 and 57250. **The RUC recommends a work RVU of 13.25 for CPT code 57260.**

***57265 Combined anteroposterior colporrhaphy, including cystourethroscopy, when performed; with enterocele repair***

The RUC reviewed the survey results from 114 physicians and agreed on the following physician time components: 33 minutes of pre-service evaluation time, 8 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, intra-service time of 120 minutes, immediate post-time of 30 minutes, a half-day discharge (99238) and 2 99213 post-op office visits.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 15.00 and agreed that the survey respondents correctly valued the physician work involved in performing this service. To justify a work RVU of 15.00, the RUC compared the survey code to CPT code 58544 *Laparoscopy,*

*surgical, supracervical hysterectomy, for uterus greater than 250 g; with removal of tube(s) and/or ovary(s)* (work RVU of 15.60, intra-service time of 120 minutes and total time of 271 minutes) and noted that both services have identical intra-service and total times and are both typically performed in the outpatient setting. To further support a work RVU of 15.00, the RUC compared the survey code to top key reference code 58572 *Laparoscopy, surgical, with total hysterectomy, for uterus greater than 250 g;* (work RVU 17.71, intra-service time of 120 minutes and total time of 271 minutes) and noted that both services have identical time components and identical post-op visit components. Both services are typically performed in the hospital outpatient setting, while the reference code involves somewhat more intense intra-service work though supports a value of 15.00 for the survey code. The RUC confirmed that the specialty's original recommendation of 15.00 is appropriate relative to the recommended values for the other codes in the family. **The RUC recommends a work RVU of 15.00 for CPT code 57265.**

### Practice Expense

The RUC reviewed and approved the direct practice expense inputs as approved without modification by the Practice Expense Subcommittee.

### Work Neutrality

The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 57240      Tracking Number    Y1

Original Specialty Recommended RVU: **12.00**Presented Recommended RVU: **12.00**

Global Period: 090

RUC Recommended RVU: **10.08**

CPT Descriptor: Anterior colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed (Do not report 57240 in conjunction with 52000)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old multigravida patient presents with complaints of vaginal pressure and feeling of something protruding from her vagina. Her symptoms are worse when coughing, standing, or lifting. She denies stress urinary incontinence. Additionally she often must reduce the prolapse to complete voiding. On examination, she has an anterior compartment defect that protrudes just beyond the introitus with valsalva. The uterus and posterior vaginal wall are well supported.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 88% , In the ASC 12%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 51% , Overnight stay-less than 24 hours 46% , Overnight stay-more than 24 hours 4%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 40%

Description of Pre-Service Work: The admission history and physical exam is reviewed, signed, dated and updated. Labs and imaging studies are reviewed. The discontinuation of any high risk medication is verified. Appropriate antibiotic coverage is determined consistent with procedure risks, patient's weight and known allergies. Antibiotic administration is synchronized with expected incision time. The method and timing of DVT prophylaxis is considered and implementation is assured. Other appropriate SCIP measures are identified and addressed. The surgical site is identified and marked if required and the procedure is verified. HIPPA contact is confirmed with the patient and any remaining questions are answered. Physician changes into scrub clothes. The instruments and anticipated supplies are checked for completeness and functionality. The patient is transferred to the operating room and positioned on the table. Sequential compressive devices are applied and activated. After collaboration with anesthesia and observation of anesthesia induction, the patient is placed at the appropriate height on the table and adjusted safely into a dorsal lithotomy position while observing for possible neural injury sites. Appropriate padding is performed to minimize neural injury. Surgical lighting is positioned. The extent of surgical prep is delineated. Physician scrubs and gowns. Surgical fire risk is identified. The patient is draped. The surgical timeout is performed.

Description of Intra-Service Work: Examination under anesthesia is performed and prolapse is appropriately staged and recorded. A foley catheter is placed, and the urethrovesical neck and vaginal apex are identified. A weighted speculum is placed into the vagina. Hydro-dissection, if performed, is completed to assist with identification and development of the true vesico-vaginal space. Full thickness incision through the vaginal mucosa is made to expose the space from the urethrovesical junction to the vaginal apex. Sharp and blunt dissection is used to mobilize the vaginal tissue laterally to the descending pubic rami bilaterally and to the vaginal apex superiorly. Identification of fascial defects is completed. Plicating sutures are placed at the level of the urethrovesical junction. Lateral, paravaginal defects, if identified, are individually repaired by suture plication to the fascia over the obturator internus muscle. Midline plication of the deep vaginal tissue is performed with interrupted sutures. Redundant vaginal epithelium is excised. Hemostasis is obtained. The vaginal incision

is closed. If cystoscopy is performed, the video equipment is set up and tested and cystoscopic instruments are assembled. Foley catheter is removed and cystoscopy is performed. Mucosal integrity and bilateral ureteral patency are confirmed. The foley catheter is replaced after cystoscopy completion. Vaginal packing as needed is placed. Instrument and sponge count are confirmed.

Description of Post-Service Work: A surgical debriefing is performed with the circulating nurse for specimen identification, wound classification and procedure verification. The transfer of patient to recovery area is supervised. Vital signs are checked and immediate pain assessment is made. Recovery orders and postoperative medications are completed through computer entry. Appropriate SCIP measures are identified and addressed. Patient condition, operative findings and anticipated outcome is related to HIPPA contact. The anticipated recovery process and criteria for discharge are conveyed. Procedure documentation is created. Labeled images from the procedure are transferred to the medical record. Absence of procedural complications, adequate pain management, urine clarity and output, and volume of fluids input is verified. The patient is informed of procedural findings and anticipated hospital care plan. Vaginal packing and foley catheter are removed and a voiding trial is performed.

#### VISIT 1 (7-14 days)

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, vaginal cuff, lower extremity lymphatics, urethra, and mons pubis. Granulation tissue is addressed if indicated. Pathology and lab results are reviewed and discussed with the patient. Voiding activity is thoroughly reviewed with emphasis on completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function is reviewed. If failed voiding trial in the hospital, retrograde filling of the bladder is performed; Foley catheter is removed and a voiding trial is performed. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any defecatory dysfunction or improve any possible voiding dysfunction.

#### VISIT 2 (4-6 weeks)

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, and vaginal cuff. Voiding activity is thoroughly reviewed with review of completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function is evaluated. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Future therapies for bladder and defecatory function are discussed as needed. Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Colporrhaphy CPT Codes 57240, 57250, 57260 and 57265 were identified in the 2015 site-of-service screen. The specialty society brought this family of colporrhaphy codes to the CPT Editorial Panel to revise the procedures to include cystourethroscopy after colporrhaphy.

**Billed Together**

CPT Codes 57240, 57260 and 57265 are used to report anterior colporrhaphy services. In the past CPT Code 52000 was used to separately report the cystourethroscopy procedure. However, NCCI now precludes the separate reporting of CPT Code 52000 with these colporrhaphy services. The Society believes that payment policy has inappropriately skewed the recent billed together data. It is important to note that it is standard practice to perform cystoscopy to detect for lower urinary tract injury.

**Positioning Time**

The society requests 5 extra minutes of positioning time to put the patient in the dorsal lithotomy position. Confirmation that no compression of nerves in the arms, hands, legs and feet is performed and hip flexion is evaluated for possible nerve stretch injury.

**Intensity**

The society is recommending work RVUs for the new bundled procedure that result in higher IWP/UTs from existing intensities. There are two main clinical explanations for this increase in intensity. First, the plane of dissection in the vesicovaginal space is much closer to the viscous resulting in a greater risk of voiding dysfunction postoperatively and greater risk for viscous injury. Secondly, the extent of dissection is much greater today than when these procedures were originally described (2005).

It is also important to note that the pre service evaluation time has increased, while the mandate to use RUC pre time packages forces the pretime recommendations to decrease from current inputs, thus artificially increasing the overall intensity of the procedure.

**Post Operative Visits**

The society is requesting two level three office visits for these procedures, supported by survey data.

**VISIT 1 (7-14 days)**

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, vaginal cuff, lower extremity lymphatics, urethra, and mons pubis. Granulation tissue is addressed if indicated. Pathology and lab results are reviewed and discussed with the patient. Voiding activity is thoroughly reviewed with emphasis on completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function is reviewed. If failed voiding trial in the hospital, retrograde filling of the bladder is performed; Foley catheter is removed and a voiding trial is performed. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any defecatory dysfunction or improve any possible voiding dysfunction.

**VISIT 2 (4-6 weeks)**

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, and vaginal cuff. Voiding activity is thoroughly reviewed with review of completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function is evaluated. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Future therapies for bladder and defecatory function are discussed as needed. Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

**Recommendations**

ACOG received over 100 completed RUC physician work surveys from physicians. The ACOG RUC workgroup reviewed the survey data and believes the following physician work recommendations appropriately rank these procedures within the obstetrics/gynecology family as well as within the fee schedule. See below:

	CPT	IWPUT	wRVU	Total Time	Pre Time	Intra Time	Post Time	9923 1	9923 8	9921 3	9921 2

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 57240 and 52000

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/Gynecology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national estimate is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based off the current Medicare utilization in the existing RUC database

Specialty Obstetrics/Gynecology                      Frequency 7085                      Percentage 70.85 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Other

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 57250      Tracking Number   Y2

Original Specialty Recommended RVU: **11.50**Presented Recommended RVU: **11.50**

Global Period: 090

RUC Recommended RVU: **10.08**

CPT Descriptor: Posterior colporrhaphy, repair of rectocele with or without perineorrhaphy (For repair of rectocele [separate procedure] without posterior colporrhaphy, use 45560)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 70 year-old G4 P4 presents for evaluation of a bulging mass and difficulty completely evacuating with defecation. She had a hysterectomy 10 yrs ago. This has become worse over the last several months and on exam she has a posterior midline defect, which protrudes past the introitus with valsalva. She has good anterior, apical, and lateral support. A posterior colporrhaphy is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 90% , In the ASC 10%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 43% , Overnight stay-less than 24 hours 51% , Overnight stay-more than 24 hours 6%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 36%

Description of Pre-Service Work: The admission history and physical exam is reviewed, signed, dated and updated. Labs and imaging studies are reviewed. The discontinuation of any high risk medication is verified. Appropriate antibiotic coverage is determined consistent with procedure risks, patient's weight and known allergies. Antibiotic administration is synchronized with expected incision time. The method and timing of DVT prophylaxis is considered and implementation is assured. Other appropriate SCIP measures are identified and addressed. The surgical site is identified and marked if required and the procedure is verified. HIPPA contact is confirmed with the patient and any remaining questions are answered. Physician changes into scrub clothes. The instruments and anticipated supplies are checked for completeness and functionality. The patient is transferred to the operating room and positioned on the table. Sequential compressive devices are applied and activated. After collaboration with anesthesia and observation of anesthesia induction, the patient is placed at the appropriate height on the table and adjusted safely into a dorsal lithotomy position while observing for possible neural injury sites. Appropriate padding is placed to minimize neural injury. Surgical lighting is positioned. The extent of surgical prep is delineated. Physician scrubs and gowns. Surgical fire risk is identified. The patient is draped. The surgical timeout is performed.

Description of Intra-Service Work: Examination under anesthesia is performed and the prolapse is staged and recorded. The bladder is drained, if necessary by catheter. The surgeon outlines the extent of the incision to determine the desired postoperative caliber of the vagina and introitus. An incision is made on the perineal body and the overlying skin is removed. Hydro-dissection, if performed, is completed to develop the true rectovaginal space. Incision is extended into the posterior vaginal epithelium and any pre-existing scar from prior obstetrical laceration is removed. Full thickness dissection of vaginal epithelium from underlying rectovaginal septum is accomplished to the vaginal apex and medial margins of the levator musculature. Rectal examination is performed to identify rectovaginal fascial defects laterally, superiorly, and at the perineal body. A triangular strip of full thickness vaginal wall is removed. Apical detachments, if present, are corrected by suture plication. Repair and plication of the perirectal and rectovaginal fascia is performed from the vaginal apex to the vaginal introitus. Puborectalis and levator ani are plicated distal to the rectovaginal space. Perineal

body is reconstructed by plicating the superficial and deep perineal muscles. Distal rectovaginal septum is re-attached to the perineal body. Hemostasis is obtained. Vaginal caliber is re-assessed and sutures replaced as needed. Posterior vaginal wall epithelium is closed. Perineal skin is closed. Rectal examination is performed. Vaginal packing, if used, is placed. Foley catheter, if used, is placed. Manipulators and retractors are removed. Instrument and sponge count are confirmed.

Description of Post-Service Work: A surgical debriefing is performed with the circulating nurse for specimen identification, wound classification and procedure verification. The transfer of patient to recovery area is supervised. Vital signs are checked and immediate pain assessment is made. Recovery orders and postoperative medications are completed through computer entry. Appropriate SCIP measures are identified and addressed. Patient condition, operative findings and anticipated outcome is related to HIPPA contact. The anticipated recovery process and criteria for discharge are conveyed. Procedure documentation is created. Labeled images from the procedure are transferred to the medical record. Absence of procedural complications, adequate pain management, urine clarity and output, and volume of fluids input is verified. The patient is informed of procedural findings and anticipated hospital care plan. Vaginal packing and foley catheter are removed and a voiding trial is performed.

#### VISIT 1 (7-14 days)

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary systems with focus on the vulva, urethra, vagina, vaginal cuff, perineum, rectum, and lower extremity lymphatics. Granulation tissue is addressed if indicated. Pathology and lab results are reviewed and discussed with the patient. Voiding activity is thoroughly reviewed with emphasis on completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function including frequency, hygiene, Bristol score, and hematochezia is queried and recommendations for improvement, if needed, are provided. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any defecatory dysfunction or voiding dysfunction.

#### VISIT 2 (4-6 weeks)

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary systems with focus on the vulva, urethra, vagina, vaginal cuff and perineum. Voiding activity is thoroughly reviewed with assessment of completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory hygiene and function including Bristol score and hematochezia is addressed. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Future evaluations for bladder and defecatory function are discussed as needed. Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Colporrhaphy CPT Codes 57240, 57250, 57260 and 57265 were identified in the 2015 site-of-service screen. The specialty society brought this family of colporrhaphy codes to the CPT Editorial Panel to revise the procedures to include cystourethroscopy after colporrhaphy.

**Billed Together**

CPT Codes 57240, 57260 and 57265 are used to report anterior colporrhaphy services. In the past CPT Code 52000 was used to separately report the cystourethroscopy procedure. However, NCCI now precludes the separate reporting of CPT Code 52000 with these colporrhaphy services. The Society believes that payment policy has inappropriately skewed the recent billed together data. It is important to note that it is standard practice to perform cystoscopy to detect for lower urinary tract injury.

**Positioning Time**

The society requests 5 extra minutes of positioning time to put the patient in the dorsal lithotomy position. Confirmation that no compression of nerves in the arms, hands, legs and feet is performed and hip flexion is evaluated for nerve stretch injury potential.

**Intensity**

The society is recommending work RVUs for the new bundled procedure that results in higher IWP/UTs from existing intensities. There are two main clinical explanations for this increase in intensity. First, the plane of dissection in the rectovaginal space is much closer to the viscous resulting in a greater risk of perirectal bleeding and greater risk for viscous injury from suture placement. Secondly, the extent of dissection is much greater today than when these procedures were originally described (2005).

It is also important to note that the pre service evaluation time has increased while mandated RUC pre-time packages force the pre-time recommendations to decrease from current inputs, thus artificially increasing the overall intensity of the procedure.

**Post Operative Visits**

The society is requesting two level three office visits for these procedures, supported by survey data.

**VISIT 1 (7-14 days)**

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, perineum, rectum and lower extremity lymphatics. Granulation tissue is addressed if indicated. If failed voiding trial in the hospital, the foley catheter is utilized for retrograde filling, removed and a voiding trial is then performed. Rectal exam is performed when indicated. Pathology and lab results are reviewed and discussed with the patient. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any voiding or defecatory dysfunction.

**VISIT 2 (4-6 weeks)**

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with emphasis on the vulva, urethra, vagina, perineum and rectum. Rectal exam is performed. Defecatory hygiene and function including Bristol score is addressed. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Disability forms are completed if indicated. Future evaluations for bladder and defecatory function are discussed as needed.

Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

**Recommendations**

ACOG received over 100 completed RUC physician work surveys from physicians. The ACOG RUC workgroup reviewed the survey data and believes the following physician work recommendations appropriately rank these procedures within the obstetrics/gynecology family as well as within the fee schedule. See below:

	CPT	IWPUT	wRVU	Total Time	Pre Time	Intra Time	Post Time	99231	99238	99213	99212

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐

The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 57250

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty obstetrics/gynecology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,600

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based off the current Medicare utilization in the existing RUC database

Specialty Obstetrics/gynecology	Frequency 6515	Percentage 85.72 %
---------------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Other

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 57260      Tracking Number   Y3

Original Specialty Recommended RVU: **13.25**Presented Recommended RVU: **13.25**

Global Period: 090

RUC Recommended RVU: **13.25**

CPT Descriptor: Combined anteroposterior colporrhaphy, including cystourethroscopy, when performed; (Do not report 57260 in conjunction with 52000)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 73-year-old multigravid female presents for evaluation of worsening vulvar pressure and a mass that protrudes from the vagina. Her symptoms are worse when she coughs or stands for a long period of time. She denies stress urinary incontinence. Additionally she complains of incomplete emptying of bowel and bladder. On examination she has distal defects in the anterior and posterior compartments that are to the introitus with valsalva. The uterus is well supported. An anterior and posterior colporrhaphy is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 91% , In the ASC 9%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 25% , Overnight stay-less than 24 hours 65% , Overnight stay-more than 24 hours 11%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 37%

Description of Pre-Service Work: The admission history and physical exam is reviewed, signed, dated and updated. Labs and imaging studies are reviewed. The discontinuation of any high risk medication is verified. Appropriate antibiotic coverage is determined consistent with procedure risks, patient's weight and known allergies. Antibiotic administration is synchronized with expected incision time. The method and timing of DVT prophylaxis is considered and implementation is assured. Other appropriate SCIP measures are identified and addressed. The surgical site is identified and marked if required and the procedure is verified. HIPPA contact is confirmed with the patient and any remaining questions are answered. Physician changes into scrub clothes. The instruments and anticipated supplies are checked for completeness and functionality. The patient is transferred to the operating room and positioned on the table. Sequential compressive devices are applied and activated. After collaboration with anesthesia and observation of anesthesia induction, the patient is placed at the appropriate height on the table and adjusted safely into a dorsal lithotomy position while observing for possible neural injury sites. Appropriate padding is placed to minimize neural injury. Surgical lighting is positioned. The extent of surgical prep is delineated. Physician scrubs and gowns. Surgical fire risk is identified. The patient is draped. The surgical timeout is performed.

Description of Intra-Service Work: Examination under anesthesia is performed and prolapse is appropriately staged and recorded. A foley catheter is placed, and the urethrovesical neck and vaginal apex are identified. A weighted speculum is placed into the vagina. Hydro-dissection, if performed, is completed for development of the true vesico-vaginal space. A full thickness incision through the vaginal mucosa is performed. Sharp and blunt dissection is used to mobilize the vaginal tissue laterally to the descending pubic rami on each side and superiorly to the vaginal apex superiorly. Identification of fascial defects is completed. Plicating sutures are placed at the level of the urethrovesical junction. Lateral, paravaginal defects, if identified, are individually repaired by suture plication to the fascia over the obturator internus muscle. Midline plication of the deep vaginal tissue is performed with interrupted sutures. Suture correction of vaginal defects is performed. Excessive vaginal epithelium is excised. Hemostasis is obtained. If cystoscopy is performed, the video equipment is set up,

tested, and cystoscopic instruments are assembled. Foley catheter is removed. Bladder mucosal integrity and bilateral ureteral patency are confirmed. The foley catheter is replaced. The vaginal incision is closed. The posterior compartment defect is identified and demarcated. A triangular incision is made on the perineal body and the overlying skin is removed. Incision is extended into the posterior vaginal epithelium and any pre-existing scar from prior obstetrical laceration is removed. Hydro-dissection, if performed, is completed to develop the true recto-vaginal space. Incision is extended into the posterior vaginal epithelium and any pre-existing scar from prior obstetrical laceration is removed. Full thickness dissection of vaginal epithelium from underlying rectovaginal septum is accomplished to the vaginal apex and medial margins of the levator musculature. Rectal examination is performed to identify rectovaginal fascial defects laterally, superiorly, and at the perineal body. A triangular strip of full thickness vaginal wall is removed. Apical detachments, if present, are corrected by suture plication. Repair and plication of the perirectal and recto-vaginal fascia is performed from the vaginal apex to the vaginal introitus. Puborectalis and levator ani are plicated distal to the rectovaginal space. Perineal body is reconstructed by plicating the superficial and deep perineal muscles. The distal rectovaginal septum is re-attached to the perineal body. Hemostasis is obtained. Vaginal caliber is re-assessed and sutures replaced as needed. Posterior vaginal wall epithelium is closed. Perineal skin is closed. Rectal examination is performed. Vaginal packing, if used, is placed. Foley catheter is placed. Manipulators, retractors, and probes are removed. Instrument and sponge count are confirmed.

Description of Post-Service Work: A surgical debriefing is performed with the circulating nurse for specimen identification, wound classification and procedure verification. The transfer of patient to recovery area is supervised. Vital signs are checked and immediate pain assessment is made. Recovery orders and postoperative medications are completed through computer entry. Appropriate SCIP measures are identified and addressed. Patient condition, operative findings and anticipated outcome is related to HIPPA contact. The anticipated recovery process and criteria for discharge are conveyed. Procedure documentation is created. Labeled images from the procedure are transferred to the medical record. Absence of procedural complications, adequate pain management, urine clarity and output, and volume of fluids input is verified. The patient is informed of procedural findings and anticipated hospital care plan. Vaginal packing and foley catheter are removed and a voiding trial is performed.

#### VISIT 1 (7-14 days)

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, vaginal cuff, lower extremity lymphatics, urethra, mons pubis and perineal body. Granulation tissue is addressed if indicated. Pathology and lab results are reviewed and discussed with the patient. If failed voiding trial in the hospital, retrograde filling of the bladder is performed; Foley catheter is removed and a voiding trial is performed. Voiding activity is thoroughly reviewed with emphasis on completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function including frequency, Bristol score, and hematochezia is queried and recommendations for improvement, if needed, are provided. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any defecatory or bladder dysfunction.

#### VISIT 2 (4-6 weeks)

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, vaginal cuff, perineum, and rectum. Voiding activity is thoroughly reviewed with review of completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function including frequency, Bristol score, and hematochezia is queried and recommendations for improvement, if needed, are provided. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Future evaluations for bladder and defecatory function are discussed as needed. Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Colporrhaphy CPT Codes 57240, 57250, 57260 and 57265 were identified in the 2015 site-of-service screen. The specialty society brought this family of colporrhaphy codes to the CPT Editorial Panel to revise the procedures to include cystourethroscopy after colporrhaphy.

**Billed Together**

CPT Codes 57240, 57260 and 57265 are used to report anterior colporrhaphy services. In the past CPT Code 52000 was used to separately report the cystourethroscopy procedure. However, NCCI now precludes the separate reporting of CPT Code 52000 with these colporrhaphy services. The Society believes that payment policy has inappropriately skewed the recent billed together data. It is important to note that it is standard practice to perform cystoscopy for detection of lower urinary tract injury.

**Positioning Time**

The society requests 5 extra minutes of positioning time to put the patient in the dorsal lithotomy position. Confirmation that no compression of nerves in the arms, hands, legs and feet is performed and hip flexion is evaluated for potential of nerve stretch injury.

**Intensity**

The society is recommending work RVUs for the new bundled procedure that results in higher IWP/UTs from existing intensities. There are two main clinical explanations for this increase in intensity. First, the plane of dissection in the vesico-vaginal space is much closer to the viscous resulting in a greater risk of voiding dysfunction postoperatively and greater risk for viscous injury. The plane of dissection in the rectovaginal space is much closer to the viscous resulting in greater risk of perirectal bleeding and greater risk for viscous injury from suture placement. Secondly, the extent of dissection is much greater today than when these procedures were originally described (2005).

It is also important to note that the pre service evaluation time has increased while mandatory RUC pre time packages force the pre time recommendations to decrease from current inputs, thus artificially increasing the overall intensity of the procedure.

**Post Operative Visits**

The society is requesting two level three office visits for these procedures, supported by survey data.

**VISIT 1 (7-14 days)**

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, perineum, rectum and lower extremity lymphatics. Granulation tissue is addressed if indicated. If failed voiding trial in the hospital, the foley catheter is utilized for retrograde filling, removed and a voiding trial is then performed. Rectal exam is performed when indicated. Pathology and lab results are reviewed and discussed with the patient. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any voiding or defecatory dysfunction.

**VISIT 2 (4-6 weeks)**

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with emphasis on the vulva, urethra, vagina, perineum and rectum. Rectal exam is performed. Defecatory hygiene and function including Bristol score is addressed. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Future evaluations for bladder and defecatory function are discussed as needed. Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

**Recommendations**

ACOG received over 100 completed RUC physician work surveys from physicians. The ACOG RUC workgroup reviewed the survey data and believes the following physician work recommendations appropriately rank these procedures within the obstetrics/gynecology family as well as within the fee schedule. See below:

	CPT	IWPUT	wRVU	Total Time	Pre Time	Intra Time	Post Time	99231	99238	99213	99212

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 57260 and 52000

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty obstetrics/gynecology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,600

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based off the current Medicare utilization in the existing RUC database

Specialty Obstetrics/gynecology	Frequency 6615	Percentage 87.03 %
---------------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Other

Original Specialty Recommended RVU: **15.00**Presented Recommended RVU: **15.00**

Global Period: 090

RUC Recommended RVU: **15.00**

CPT Descriptor: Combined anteroposterior colporrhaphy, including cystourethroscopy, when performed; with enterocele repair (Do not report 57265 in conjunction with 52000)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 66-year-old multigravida patient presents for evaluation of a mass that is protruding from the vagina. Her symptoms are worse when she coughs or stands for a long period of time. The patient had a hysterectomy 20 years ago. She denies stress incontinence. Additionally she complains of incomplete emptying of bowel and bladder. On examination, she is found to have an anterior compartment defect, a posterior compartment defect and apical descent with ballooning of the apex extending down the upper posterior wall. She has an enterocele on recto-vaginal exam. An anterior and posterior colporrhaphy with enterocele repair is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 96% , In the ASC 4%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 12% , Overnight stay-less than 24 hours 70% , Overnight stay-more than 24 hours 18%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 33%

Description of Pre-Service Work: The admission history and physical exam is reviewed, signed, dated and updated. Labs and imaging studies are reviewed. The discontinuation of any high risk medication is verified. Appropriate antibiotic coverage is determined consistent with procedure risks, patient's weight and known allergies. Antibiotic administration is synchronized with expected incision time. The method and timing of DVT prophylaxis is considered and implementation is assured. Other appropriate SCIP measures are identified and addressed. The surgical site is identified and marked if required and the procedure is verified. HIPPA contact is confirmed with the patient and any remaining questions are answered. Physician changes into scrub clothes. The instruments and anticipated supplies are checked for completeness and functionality. The patient is transferred to the operating room and positioned on the table. Sequential compressive devices are applied and activated. After collaboration with anesthesia and observation of anesthesia induction, the patient is placed at the appropriate height on the table and adjusted safely into a dorsal lithotomy position while observing for possible neural injury sites. Appropriate padding is placed to minimize neural injury. Surgical lighting is positioned. The extent of surgical prep is delineated. Physician scrubs and gowns. Surgical fire risk is identified. The patient is draped. The surgical timeout is performed.

Description of Intra-Service Work: Examination under anesthesia is performed and prolapse is appropriately staged and recorded. A foley catheter is placed, and the urethrovesical neck and vaginal apex are identified. A weighted speculum is placed into the vagina. Hydro-dissection, if performed, is completed with identification and development of the true vesico-vaginal space. A full thickness incision is made through the vaginal mucosa. Sharp and blunt dissection is used to mobilize the vaginal tissue laterally to the descending pubic rami bilaterally and superiorly with complete development of the vesico-vaginal space to the vaginal apex. Identification of fascial defects is completed. Plicating sutures are placed at the level of the urethrovesical junction. Lateral, paravaginal defects, if identified, are individually repaired by suture plication to the fascia over the obturator internus muscle. Midline plication of the deep vaginal tissue is performed. Excessive vaginal epithelium is excised. Hemostasis is obtained. Foley catheter is removed. Cystoscopy is performed and the video

equipment is set up, tested, and cystoscopic instruments are assembled. Bladder mucosal integrity and bilateral ureteral patency are confirmed. Vaginal incision is closed. The posterior compartment defect is identified and demarcated. A triangular incision is made on the perineal body and the overlying skin is removed. Hydro-dissection, if performed, is completed to develop the true recto-vaginal space. Incision is extended into the posterior vaginal epithelium and any pre-existing scar from prior obstetrical laceration is removed. Full thickness dissection of vaginal epithelium from underlying recto-vaginal septum is accomplished to the vaginal apex and medial margins of the levator musculature. Further dissection is performed above the vaginal apex to delineate the enterocele sac. The peritoneum is freed from the pubocervical tissue anteriorly and rectovaginal tissue posteriorly. The posterior vaginal wall is dissected from the enterocele sac, anterior rectal wall and rectovaginal septum through sharp and blunt dissection. The enterocele sac is entered sharply. Small bowel and omental adhesions, if present, are dissected to the level of the neck of the enterocele. Several purse-string sutures are used to close the enterocele sac and excessive peritoneum is excised. The cardinal-uterosacral ligaments are identified and suture incorporated into the closed enterocele sac and apical vaginal tissue. Sutures are tied in sequence. Cystoscopy is again performed to confirm bilateral ureteral patency. The anterior and posterior portions of the mucosal apex are reapproximated. Rectal examination is performed to identify rectovaginal fascial defects, laterally, superiorly, and at the perineal body. Portions of full thickness vaginal wall are removed. Repair and plication of the perirectal and rectovaginal fascia is performed from the vaginal apex to the vaginal introitus. Puborectalis and levator ani are plicated distal to the rectovaginal space. Perineal body is reconstructed by plicating the superficial and deep perineal muscles. Distal rectovaginal septum is re-attached to the perineal body. Hemostasis is obtained. Vaginal caliber is re-assessed and sutures replaced as needed. Posterior vaginal wall epithelium is closed. Perineal skin is closed. Rectal examination is performed. Vaginal packing is placed. Manipulators and retractors, are removed. Instrument and sponge count are confirmed.

Description of Post-Service Work: A surgical debriefing is performed with the circulating nurse for specimen identification, wound classification and procedure verification. The transfer of patient to recovery area is supervised. Vital signs are checked and immediate pain assessment is made. Recovery orders and postoperative medications are completed through computer entry. Appropriate SCIP measures are identified and addressed. Patient condition, operative findings and anticipated outcome is related to HIPPA contact. The anticipated recovery process and criteria for discharge are conveyed. Procedure documentation is created. Labeled images from procedure are transferred to the medical record. Physician changes out of scrub clothes. Absence of procedural complications, adequate pain management, urine clarity and output, and volume of fluids input is verified. The patient is informed of procedural findings and anticipated hospital care plan. Vaginal packing and foley catheter are removed and a voiding trial is performed.

#### VISIT 1 (7-14 days)

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, vaginal cuff, perineum, rectum, and lower extremity lymphatics. Granulation tissue is addressed if indicated. Pathology and lab results are reviewed and discussed with the patient. If failed voiding trial in the hospital, retrograde filling of the bladder is performed; Foley catheter is removed and a voiding trial is performed. Voiding activity is thoroughly reviewed with emphasis on completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function including frequency, Bristol score, and hematochezia is queried and recommendations for improvement, if needed, are provided. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any defecatory or bladder dysfunction.

#### VISIT 2 (4-6 weeks)

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, vaginal cuff, perineum, and rectum. Voiding activity is thoroughly reviewed with review of completion of micturition, frequency, urgency, hematuria, nocturia, and dysuria. Defecatory function including frequency, Bristol score, and hematochezia is queried and recommendations for improvement, if needed, are provided. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Future evaluations for bladder and defecatory function are discussed as needed. Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

Ref Code****2<sup>nd</sup> Key  
Ref Code****Time Segment (Mean)**

Overall intensity/complexity	1.30	0.92
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Colporrhaphy CPT Codes 57240, 57250, 57260 and 57265 were identified in the 2015 site-of-service screen. The specialty society brought this family of colporrhaphy codes to the CPT Editorial Panel to revise the procedures to include cystourethroscopy after colporrhaphy.

**Billed Together**

CPT Codes 57240, 57260 and 57265 are used to report anterior colporrhaphy services. In the past CPT Code 52000 was used to separately report the cystourethroscopy procedure. However, NCCI now precludes the separate reporting of CPT Code 52000 with these colporrhaphy services. The Society believes that payment policy has inappropriately skewed the recent billed together data. It is important to note that it is standard practice to perform cystoscopy for detection of lower urinary tract injury.

**Positioning Time**

The society requests 5 extra minutes of positioning time to put the patient in the dorsal lithotomy position. Confirmation that no compression of nerves in the arms, hands, legs and feet is performed and hip flexion is evaluated for potential of nerve stretch injury.

**Intensity**

The society is recommending work RVUs for the new bundled procedure that results in higher IWP/UTs from existing intensities. There are two main clinical explanations for this increase in intensity. First, the plane of dissection in the vesico-vaginal space is much closer to the viscous resulting in a greater risk of voiding dysfunction postoperatively and greater risk for viscous injury. The plane of dissection in the rectovaginal space is much closer to the viscous resulting in greater risk of perirectal bleeding and greater risk for viscous injury from suture placement. Secondly, the extent of dissection is much greater today than when these procedures were originally described (2005).

It is also important to note that the pre service evaluation time has increased, while the mandate to use RUC pre time packages forces the pretime recommendations to decrease from current inputs, thus artificially increasing the overall intensity of the procedure.

**Post Operative Visits**

The society is requesting two level three office visits for these procedures, supported by survey data.

**VISIT 1 (7-14 days)**

Pt is questioned about her postoperative course including query of fever, nausea, vomiting, pain, bleeding, bladder function, bowel function, shortness of breath, lower extremity edema, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with focus on the vulva, urethra, vagina, perineum, rectum and lower extremity lymphatics. Granulation tissue is addressed if indicated. If failed voiding trial in the hospital, the foley catheter is utilized for retrograde filling, removed and a voiding trial is then performed. Rectal exam is performed when indicated. Pathology and lab results are reviewed and discussed with the patient. Pt is counseled regarding progression of activities, expected findings of vaginal discharge, bleeding, and future sexual activity. Appropriate changes in activities and medications are discussed to correct any voiding or defecatory dysfunction.

**VISIT 2 (4-6 weeks)**

Pt is questioned about her postoperative course including query of fever, pain, bleeding, bladder function, bowel function, and neurologic dysfunction. 3 vital signs are collected and the patient undergoes an examination involving general evaluation, abdomen, and genitourinary system with emphasis on the vulva, urethra, vagina, perineum and rectum. Rectal exam is performed. Defecatory hygiene and function including Bristol score is addressed. Postoperative instructions regarding progression of daily activities, return to work, and sexual activity are discussed. Future evaluations for bladder and defecatory function are discussed as needed. Corresponding documents to referring physician, if indicated, including operative reports, pathology reports, and postoperative notes are created, collated, and signed for distribution.

**Recommendations**

ACOG received over 100 completed RUC physician work surveys from physicians. The ACOG RUC workgroup reviewed the survey data and believes the following physician work recommendations appropriately rank these procedures within the obstetrics/gynecology family as well as within the fee schedule. See below:

	CPT	IWPUT	wRVU	Total Time	Pre Time	Intra Time	Post Time	99231	99238	99213	99212

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 57265 and 52000

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty obstetrics/gynecology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,500

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based off the current Medicare utilization in the existing RUC database

Specialty obstetrics/gynecology                      Frequency 4050                      Percentage 90.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Other

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 57265

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS

**Tab Number**

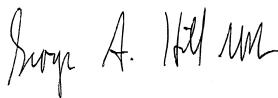

Colporrhaphy with Cystourethroscopy  
**Code Issue**

57240, 57250, 57260 & 57265  
**Code Range**

### **Attestation Statement**

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

Date

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

**Global Period:** 090

**Meeting Date:** January 2017

*57240 Anterior colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed (Do not report 57240 in conjunction with 52000)*

*57250 Posterior colporrhaphy, repair of rectocele with or without perineorrhaphy (For repair of rectocele [separate procedure] without posterior colporrhaphy, use 45560)*

*57260 Combined anteroposterior colporrhaphy, including cystourethroscopy, when performed; (Do not report 57260 in conjunction with 52000)*

*57265 Combined anteroposterior colporrhaphy, including cystourethroscopy, when performed; with enterocele repair (Do not report 57265 in conjunction with 52000)*

---

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

ACOG convened a workgroup consisting of their CPT/RUC committee members and AUGS representatives. The workgroup developed these practice expense recommendations based on the physician survey results, the clinical aspects of the procedure and standard PE committee inputs.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

The specialty society has included the existing PE inputs for CPT codes 57240, 57250, 57260 and 57265. The spreadsheet also includes the recently CMS approved PE inputs for CPT code 52000, which will go into effect January 2017.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

N/A

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

60 Minutes clinical staff time for standard 090-day procedure

- Complete pre-service diagnostic and referral forms 5
- Coordinate pre-surgery services (including test results) 20
- Schedule space and equipment in facility 8
- Provide pre-service education/obtain consent 20
- Complete pre-procedure phone calls and prescription 7

Intra-Service Clinical Labor Activities:

6 minutes clinical staff time for a half-day discharge

Post-Service Clinical Labor Activities/Post Operative Visits:

The specialty society is recommending two level 3 post-operative office visits. The first visit will occur 7-14 days post surgery. The second visit will occur 4-6 weeks post surgery.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS High Expenditure Procedures Screen*

January 2017

**Percutaneous Neurostimulator Placement**

In the Proposed Rule for 2015, a stakeholder raised questions regarding whether codes 64553 and 64555 include the appropriate direct PE inputs when furnished in the non-facility setting. It appears that these inputs have not been evaluated recently and therefore CMS are nominating these codes as potentially misvalued for the purpose of ascertaining whether or not there are non-facility direct PE inputs that are not included in the direct PE inputs that are typical supply costs for these services. The RUC reviewed the practice expense only in January 2015. In the Final Rule for 2015 CMS requested that the work and PE be reviewed. In April 2015, the RUC discussed the confusion that survey respondents experienced valuing this service. The description only states the nerve that the neurostimulator is implanted in, and most respondents completed the survey as if it is performed in the facility setting. The Medicare data conflicts with this site of service, reporting that 65% of the time this service is performed in the physician's office. Additionally the supplies and equipment may be different for the temporary and permanent implantation. The RUC recommended referring CPT code 64553 to the CPT Editorial Panel to better define this service, such as having one code to describe temporary or testing implantation and another code to describe permanent implantation. The RUC recognized that it needed to establish an interim value for 64553 until this service could be clarified by CPT. The RUC recommended maintaining the current work value of 2.36 as interim for CPT code 64553 and referral to the CPT Editorial Panel. In May 2016 CPT postponed this tab to rework for September 2016.

In September 2016, the CPT Editorial Panel deleted code 64565 to report percutaneous placement of a neuromuscular neurostimulator electrode, and added parenthetical notes to direct users to report the appropriate codes for TENS, PENS, and PNT services throughout the family of codes.

**Compelling Evidence**

The specialty societies presented compelling evidence for CPT codes 64553 and 64555. The surveying specialty societies agree that codes 64553 and 64555 are undervalued and presented the following compelling evidence as support. CPT codes 64553 and 64555 as originally described and valued by the Harvard study were very different procedures than they are today. The current generation of implants did not exist when these codes were first considered so, the specialties noted, this survey represents the first true data regarding the work of the modern procedure. The old testing procedure was similar to using a stimulating needle for nerve localization for a peripheral nerve block which takes less time, less clinical expertise and less training than the current procedure. The specialties also explained that imaging guidance was not typical and the type of nerves that could be targeted was limited by anatomic considerations (e.g., easily accessible, ability to visualize directly). The leads at that time were also very simple, often with only one or two electrical contacts. Codes 64553 and 64555, as originally performed, took much less time and were much less invasive.

The specialty societies noted and the RUC concurred that peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of a multi-contact lead with up to 16 contacts adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

Additionally, the patient population has changed as the ability to stimulate and provide better analgesia to cranial and peripheral nerves throughout the nervous system has become possible using the new multi-contact technology. The current patient population is much more complex. The current procedure is for the treatment of patients with very severe nerve injuries and intractable pain in a variety of nerves. Many of the nerves that are stimulated today were not approachable with previous techniques and equipment. Lastly, the original valuation for 64553 and 64555 was based on responses from a small group of general surgeons and not by physicians who perform these procedures today. The RUC agreed that there is compelling evidence that codes 64553 and 64555 are misvalued based on a change in technology, change in patient population and a flawed original methodology.

***64553 Percutaneous implantation of neurostimulator electrode array; cranial nerve***

The RUC reviewed the survey results from 30 physicians and agreed with the following physician time components: pre-service evaluation time of 18 minutes, pre-service positioning time of 1 minute, pre service scrub/dress/wait time of 6 minutes, intra-service time of 75 minutes, immediate post-service time of 18 minutes, a half-day discharge visit (99238) and 1 99213 office visit. The RUC noted that the existing physician time from the Harvard study was not valid and that this service had never been evaluated by the RUC in the past.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 6.13 and agreed that this value appropriately accounts for the physician work involved in performing this service. To justify a work RVU of 6.13, the RUC compared the survey code to top key reference CPT code 63650 *Percutaneous implantation of neurostimulator electrode array, epidural* (work RVU= 7.15, intra-service time of 60 minutes and total time of 170 minutes) and noted that the survey code has more intra-service time and both services have similar physician work intensities, supporting the work RVU of the survey code at 6.13 RVUs. To further justify the work RVU, the RUC compared the survey code to CPT code 62350 *Implantation, revision or repositioning of tunneled intrathecal or epidural catheter, for long-term medication administration via an external pump or implantable reservoir/infusion pump; without laminectomy* (work RVU= 6.05, intra-service time of 60 minutes, total time of 170 minutes) and noted that the survey code has more intra-service time and both services have similar physician work intensities. **The RUC recommends a work RVU of 6.13 for CPT code 64553.**

***64555 Percutaneous implantation of neurostimulator electrode array; peripheral nerve (excludes sacral nerve)***

The RUC reviewed the survey results from 31 physicians and agreed with the following physician time components: pre-service evaluation time of 18 minutes, pre-service positioning time of 1 minute, pre service scrub/dress/wait time of 6 minutes, intra-service time of 60 minutes, immediate post-service time of 18 minutes, a half-day discharge visit (99238) and 1 99213 office visit. The RUC noted that the existing physician time from the Harvard study was not valid and that this service had never been evaluated by the RUC in the past.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 5.76 and agreed that this value appropriately accounts for the physician work involved in performing this service. To justify a work RVU of 5.76, the RUC compared the survey code to top key reference CPT code 63650 Percutaneous implantation of neurostimulator electrode array, epidural (work RVU= 7.15, intra-service time of 60 minutes and total time of 170 minutes) and noted that both services had identical intra-service times and have similar physician work intensities per the survey respondents, supporting the work RVU of the survey code at 5.76 RVUs. To further justify the work RVU, the RUC compared the survey code to CPT code 62350 *Implantation, revision or repositioning of tunneled intrathecal or epidural catheter, for long-term medication administration via an external pump or implantable reservoir/infusion pump; without laminectomy* (work RVU= 6.05, intra-service time of 60 minutes, total time of 170 minutes) and noted that both services have identical intra-service times. **The RUC recommends a work RVU of 5.76 for CPT code 64555.**

***64561 Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed***

The RUC discussed CPT code 64561, noting that it was last surveyed for the January 2014 RUC meeting. The RUC agreed that the existing RVU and times for this service are appropriate. The dominant specialty for this service, Urology, noted and the RUC agreed that the amount and type of physician work and direct practice expense involved in performing this service has not changed in the past 3 years. In addition, the specialty noted that the physician work on the sacral nerve is not the same as the physician work involved in 64553 and 64555 for cranial nerves. **The RUC affirmed the work RVU of 5.44 for CPT code 64561.**

**Practice Expense**

The PE Subcommittee approved compelling evidence for the possibility of an increase in the direct practice expense inputs in the nonfacility setting. The Subcommittee only made changes to correct the equipment time formulas consistent with current standards. The RUC reviewed and approved the direct practice expense inputs as approved by the Practice Expense Subcommittee.

**Subject:** FW: Tab 15 - CPT code 64561

On Dec 14, 2016, at 10:01 AM, Stinchcomb, Stephanie <[sstinch@auanet.org](mailto:sstinch@auanet.org)> wrote:

Sherry,

CPT code 64561 Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed was included into Tab 15 that also included CPT codes 64553 and 64555. CPT code 64561 was surveyed in 2013 and reviewed at the January 2014 RUC meeting. The RUC recommended a work RVU of 5.44 for CPT code 64561 and CMS accepted this value. We also reviewed the Practice Expense. The AUA does not feel that this code should be resurveyed at this time as nothing has changed since this survey in either physician work or PE. Although CPT code 64561 was pulled into this Tab, the work on the sacral nerve is not the same as the work in 64553 and 64555 for cranial nerves.

The American Urological Association requests that the RUC reaffirm their recommendations from 2015. We do not believe this codes should be resurveyed at this time.

**CLINICAL DESCRIPTION OF SERVICE:**

**Vignette Used in Survey:** A 53-year-old male has a 1-year history of intractable right forehead pain from post-herpetic neuralgia. His pain persists despite medications, biofeedback and peripheral nerve blocks. Due to his persistent, debilitating pain, a trial of supraorbital (cranial) nerve stimulation is scheduled to relieve his pain and improve his function.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 60% , In the ASC 27%, In the office 13%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 80% , Overnight stay-less than 24 hours 20% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 4%

Description of Pre-Service Work: The physician communicates with the referring physician and other health care professionals, and obtains informed consent from the patient. The physician obtains and reviews the previous operative note(s) and any pertinent radiographs, laboratory studies and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics are written and patient's medications reviewed. The surgeon meets with patient and family to review planned procedure and post-operative management. The surgeon also reviews the type of anesthesia with anesthesiologist, verifies that all required instruments and supplies are available, and assists with positioning the patient. The surgeon also monitors/assists with draping and positioning of the patient. The surgeon scrubs and gowns, and then perform the surgical "time out" with the operating and anesthesia team.

Pre-operatively the surgeon has discussion and provides education to the patient regarding intraoperative verbal testing which will occur during the operation. Intraoperative testing involves detailed communication between the physician, technician, and patient. The patient is instructed on questions that will be asked during the procedure and appropriate answers that will help direct the surgeon. This education is analogous to pre-test education required for any type of standardized testing. This education gives the patient a proper understanding of the questions being asked, and helps the patient provide appropriate responses to questions that guide modifications in anatomical lead positioning and stimulation parameters (amplitude, pulse width, frequency) during the procedure. This pre service education is especially important since patients are sedated during the procedure and pre-procedure education reinforces their ability to provide appropriate answers; ultimately this will lead to more precise localization of the targeted nerve structure and hence improved therapeutic outcomes.

In addition, stimulators require significant pre-service work on the physician's part which involves a discussion with the patient about their usual sleep position and medical co morbidities (whether or not they sleep on their right or left side, their stomach or their back). This is required for proper site selection for placement of lead hardware (connectors and generator), in order to prevent lead migration, damage of the lead from crossing joints or other mobile structures, and

problems with neurostimulator generator comfort. With cranial nerve stimulation this is even more complex because of the multiple possible sites for generator placement and the multiple anatomical concerns as one passes from the head into the neck and then the torso. This includes measuring degrees of cervical spine flexion, extension, left rotation, right rotation, right lateral bending, and left lateral bending in order to determine appropriate lead lengths, and appropriate placement of lead hardware (connectors in which the leads plug into).

Prior to sedation, the area of pain is carefully outlined, the patient receives preoperative intravenous antibiotics. The physician identifies appropriate skin and bony landmarks and locates pertinent vascular structures. After identifying and marking the intended target along the course of the nerve, the skin around the planned entry point is injected with local anesthetic.

Description of Intra-Service Work: An introducer needle is advanced along the intended course of the nerve, maintaining the proper depth of insertion as the needle is advanced. Fluoroscopy and/or ultrasound may be used to verify final needle position (separately reportable). The physician guides a percutaneous electrode array through the needle and delivers to a location in proximity to the nerve. Final location is verified with electrical stimulation and then final location may be documented with fluoroscopy or ultrasound (also separately reportable). The introducer needle is removed and the exposed end of the electrode array is attached to an external stimulator unit. A technician tests various electrode combinations and the lead location is adjusted (physically relocated) until the patient indicates paresthesia overlap in the target nerve innervation and the distribution of the patient's typical area of pain.

Once lead impedances are verified an incision is made around the needle and then soft tissue dissection performed to create an anchoring site (anchoring location will vary with specific nerve and depth). Once the lead is anchored it is tunneled to a remote exit site for a trial or to the generator for a permanent implant. The incision is closed and dressings are applied.

Description of Post-Service Work: Covers the site with a sterile occlusive dressing and reconnects the lead to the external stimulator unit. The patient is observed for stability of vital signs and comfort and then the operator communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The patient receives education about their stimulator (internal or external) which requires significant patient education to navigate through various programs, amplitudes, frequencies, pulse width, etc. Wound care postoperatively for trial is extremely important where a lead is protruding through the skin. The surgeon writes prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary, discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.

Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, and monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Codes 64553 and 64555 are Harvard valued and have not been subject to physician work review since the RBRVS fee schedule was implemented. The direct PE inputs for these two codes were last reviewed by the PERC/PEAC at the January 2003 RUC meeting. CMS identified this family of codes as being potentially misvalued in the NPRM for 2015 MPFS. A stakeholder raised the question as to whether there are missing direct practice expense (PE) inputs when provided in the non-facility setting. No mention was made in the 2015 proposed rule as to what specific inputs may be missing. In the 2015 MPFS Final Rule, CMS requested that both the work and the PE be reviewed for 64553 and 64555.

The codes were surveyed for the April 2015 meeting. At the April 2015 RUC meeting, after review of the SoRs, the RUC agreed with the CMS request. The RUC believed that the survey respondents were confused because they indicated in the survey that the typical site of service for 64555 was the facility setting but claims data show that the typical site of service is the physician office.

The RUC recommended referring CPT code 64555 to the CPT Editorial Panel to consider whether there should be two codes, one to describe temporary or trial implantation, and another to describe permanent implantation. The Panel considered a coding proposal at the February 2016 meeting and postponed the issue for several reasons, including whether or not there should be separate codes for trial and permanent lead implantation. The issue was re-presented to CPT at the Sept/Oct 2016 meeting. After a lengthy discussion, the CPT Panel did not make any changes to the descriptors of codes 64553 and 64555. However, parenthetical notes were added to direct users to report the appropriate codes for TENS, PENS, and PNT services, which may more likely be performed in an office setting. Prior to the CPT changes, the societies had also addressed incorrect coding through society education which not only resulted in a decrease in utilization for 64555, but also a decrease in the percentage of claims with office site of service. According to the 2016 RUC database, code 64553 was minimally utilized (240 in 2015) and was performed in the office setting 17.5% of the time and code 64555 was performed 8,200 times in 2015 (down from 73,881 in 2008) and was performed in the office setting 53% of the time (down from 63% in 2014, 68% in 2013 and 75% in 2012).

The typical patient vignettes have not changed since the April 2015 survey, as confirmed by recent CPT action, and the work has not changed. Therefore, these codes were not re-surveyed, and the 2015 survey data are being presented.

## Survey Methodology

A standard RUC survey was sent through an email list-service to 2000 randomly selected members of the American Academy of Physical Medicine and Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), North American Spine Society (NASS), and American Association of Neurological Surgeons (AANS) and Congress of Neurological Surgeons (CNS).

## Compelling Evidence

The surveying specialty societies agree that codes 64553 and 64555 are undervalued and present the following compelling evidence as support.

### 1. Change in Physician Work Due to Technique

CPT codes 64553 and 64555 as originally described and valued by Hsiao were very different procedures than they are today. In the 1980s and early 1990s, for example, percutaneous peripheral neurostimulation was a procedure primarily performed by surgeons to quickly locate a nerve with a stimulating needle for testing and possible later consideration for surgical implantation of a single cathode/anode stimulating cuff electrode type lead surgically implanted around the target nerve. The current generation of implants did not exist when these codes were first considered so this survey represents the first true data regarding the work of the modern procedure. The old testing procedure was similar to using a stimulating needle for nerve localization for a peripheral nerve block which takes less time, less clinical expertise and less training than the current procedure. The physician identified the nerve which needed to be treated by using an insulated stimulating needle to stimulate various nerves until the patient's pattern of symptoms were reproduced. If the symptoms were reproduced, the surgeon proceeded with the direct surgical implantation of a cuff electrode lead around the target nerve using an open surgical approach. Imaging guidance was not typical and the type of nerves that could be targeted was limited by anatomic considerations (e.g., easily accessible, ability to visualize directly). The leads at that time were also very simple, often with only one or two electrical contacts. Codes 64553 and 64555, as originally performed, took much less time and were much less invasive.

Peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of multi-contact leads with between 4 and 16 contacts, adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

Current technique involves skin nerve mapping to determine:

1. lead insertion site
2. lead trajectory
3. lead depth
4. lead endpoint

All of these steps are performed prior to implantation.

Multi-contact implanted leads are much more complex to insert and program and the surgical technique required to tunnel the leads and fix them in place is entirely different than it was twenty years ago. Multiple attempts to properly position the leads for optimal stimulation, lead depth, and good proximity of all contacts for the entire 6 cm of nerve length may be required.

The time to perform the current procedure is much longer than the historical procedure for a number of reasons. As described, lead insertion is more difficult due to the size and location of the target nerve and scar tissue can complicate placement when there has been trauma or previous surgery (e.g., trauma and surgery are common causes of nerve injury).

In summary, peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of a multi-contact lead with up to 16 contacts adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

*See Atlas of Implantable Therapies for Pain Management, 2<sup>nd</sup> Edition, 2016 (Timothy Deer, MD and Jason Pope, MD, Eds.).*

## 2. Change in Patient Population

The patient population has changed as the ability to stimulate and provide better analgesia to cranial and peripheral nerves throughout the nervous system has become possible using the new multi-contact technology. The current patient population is much more complex. The current procedure is for the treatment of patients with very severe nerve injuries and intractable pain in a variety of nerves. Many of the nerves we are stimulating today were not approachable with previous techniques and equipment (i.e. – may require image guidance for nerve localization). It is important to note that this technology is an alternative to using opioids for pain management.

## 3. Flawed Process used for Original Valuation

The original valuation by Hsiao for 64553 and 64555 was based on responses from a small group of general surgeons. - not by physicians who perform these procedures today.

Given the change in technique, patient population, site of service, and the flawed process used for the original valuation, we believe the criteria for compelling evidence have been met.

### **Work RVU Recommendation**

We are recommending the 25th percentile survey value of 6.13 RVW for 64553.

### **Pre-time and Post-time Packages**

Pre-time package 1a (Straightforward Patient/Straightforward Procedure, No anesthesia care) is recommended with no changes to the package times.

Post-time package 7a (Local Anesthesia/ Straightforward Procedure) is recommended with no change to package time.

### **Clinical Comparison with Key Reference**

The key reference service 63650 (Percutaneous implantation of neurostimulator electrode array, epidural), surveyed in 2010, has a RVW of 7.16, and was chosen by 73% of survey respondents. This key reference service is similar to 64553 in the sense that it is a percutaneous implantation of a neurostimulator electrode array used for relief of chronic intractable pain. Both procedures are placements of a lead by a physician via percutaneous approach. However, code 64553 is for lead placement at the cranial nerve.

### **Work Comparison with Key Reference**

The work of 64553 is similar to that of 63650 (Percutaneous implantation of neurostimulator electrode array, epidural). Both procedures require the advancement of a needle along the intended nerve and maintaining the proper depth of insertion as the needle is advanced. Both procedures require 60 minutes of intra-time and there is a half day discharge for both services. The difference between these codes is the total time, 63650 has a total time of 170 min. and we are recommending a total time of 155 min. for 64553; this difference can be accounted for in the development of the standardized pre- and post-service packages; 63650 was last reviewed in 2010 before the standard packages were developed.

### **Summary**

Based on comparisons to the key reference service, which has similar work, the multispecialty consensus panel recommends the survey 25th percentile value of 6.13 is appropriate for 64553.

## **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64553

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology                      How often? Rarely

Specialty Neurosurgery                      How often? Rarely

Specialty Physical Medicine and Rehabilitation                      How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 240

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. his is based on the 2015 claims data from the RUC database.

Specialty Anesthesiology	Frequency 182	Percentage 75.83 %
--------------------------	---------------	--------------------

Specialty Neurosurgery	Frequency 14	Percentage 5.83 %
------------------------	--------------	-------------------

Specialty PMR	Frequency 1	Percentage 0.41 %
---------------	-------------	-------------------

Do many physicians perform this service across the United States? No

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Musculoskeletal

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64553

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 64555	Tracking Number Z3	Original Specialty Recommended RVU: <b>5.76</b>
		Presented Recommended RVU: <b>5.76</b>
Global Period: 010		RUC Recommended RVU: <b>5.76</b>

CPT Descriptor: Percutaneous implantation of neurostimulator electrode array; peripheral nerve (excludes sacral nerve)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 44-year-old woman has a 5-year history of severe headaches, occurring at least 15 days per month. She has had poor control of her pain despite multiple medication trials, biofeedback and peripheral nerve blocks. Due to her persistent, debilitating pain, a trial of occipital (peripheral) nerve stimulation is scheduled to relieve her pain and improve her function.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 58% , In the ASC 29%, In the office 13%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 88% , Overnight stay-less than 24 hours 11% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 4%

Description of Pre-Service Work: The physician communicating with the referring physician and other health care professionals, and obtains informed consent from the patient. The physician obtains and reviews the previous operative note(s) and any pertinent radiographs, laboratory studies and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics are written and patient's medications reviewed. The surgeon meets with patient and family to review planned procedure and post-operative management. The surgeon also reviews the type of anesthesia with anesthesiologist, verifies that all required instruments and supplies are available, and assists with positioning the patient. The surgeon would monitor/assists with draping and positioning of the patient. The surgeon scrubs and gowns, and then performs the surgical "time out" with the operating and anesthesia team.

Pre-operatively the surgeon has discussion and provides education to the patient regarding intraoperative verbal testing which will occur during the operation. Intraoperative testing involves detailed communication between the physician, technician, and patient. The patient is instructed on questions that will be asked during the procedure and appropriate answers that will help direct the surgeon. This education is analogous to pre-test education required for any type of standardized testing. This education gives the patient a proper understanding of the questions being asked, and helps the patient provide appropriate responses to questions that guide modifications in anatomical lead positioning and stimulation parameters (amplitude, pulse width, frequency) during the procedure. This pre service education is especially important since patients are sedated during the procedure and pre-procedure education reinforces their ability to provide appropriate answers; ultimately this will lead to more precise localization of the targeted nerve structure and hence improved therapeutic outcomes.

In addition, stimulators require significant pre-service work on the physician's part which involves a discussion with the patient about their usual sleep position and medical co morbidities (whether or not they sleep on their right or left side, their stomach or their back). This is required for proper site selection for placement of lead hardware (connectors and

generator), in order to prevent lead migration, damage of the lead from crossing joints or other mobile structures, and problems with neurostimulator generator comfort. With cranial nerve stimulation this is even more complex because of the multiple possible sites for generator placement and the multiple anatomical concerns as one passes from the head into the neck and then the torso. This includes measuring degrees of cervical spine flexion, extension, left rotation, right rotation, right lateral bending, and left lateral bending in order to determine appropriate lead lengths, and appropriate placement of lead hardware (connectors in which the leads plug into).

Prior to sedation, the area of pain is carefully outlined, the patient receives preoperative intravenous antibiotics. Identify appropriate skin and bony landmarks and locate pertinent vascular structures. After identifying and marking the intended target along the course of the nerve, the skin around the planned entry point is injected with local anesthetic.

Description of Intra-Service Work: An introducer needle is advanced along the intended course of the nerve, maintaining the proper depth of insertion as the needle is advanced. Fluoroscopy and/or may be used to verify final needle position (separately reportable). Guide a percutaneous electrode array through the needle and deliver to a location in proximity to the nerve. Final location is verified with electrical stimulation and then final location may be documented with fluoroscopy or ultrasound (also separately reportable). The introducer needle is removed and the exposed end of the electrode array is attached to an external stimulator unit. A technician tests various electrode combinations and the lead location is adjusted (physically relocated) until the patient indicates paresthesia overlap in the target nerve innervation and the distribution of the patient's typical area of pain. The physician checks lead impedances, detaches the external unit, removes the needle and stylet, and anchors the lead.

Description of Post-Service Work: Covers the site with a sterile occlusive dressing and reconnects the lead to the external stimulator unit. The physician then obtains a final fluoroscopic image to document final placement. The patient is observed for stability of vital signs and comfort and then the operator communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The patient receives education about their stimulator (internal or external) which requires significant patient education to navigate through various programs, amplitudes, frequencies, pulse width, etc. Wound care postoperatively for trial is extremely important where a lead is protruding through the skin. The surgeon writes prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary, discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.

Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, and monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

### Background

Codes 64553 and 64555 are Harvard valued and have not been subject to physician work review since the RBRVS fee schedule was implemented. The direct PE inputs for these two codes were last reviewed by the PERC/PEAC at the January 2003 RUC meeting. CMS identified this family of codes as being potentially misvalued in the NPRM for 2015 MPFS. A stakeholder raised the question as to whether there are missing direct practice expense (PE) inputs when provided in the non-facility setting. No mention was made in the 2015 proposed rule as to what specific inputs may be missing. In the 2015 MPFS Final Rule, CMS requested that both the work and the PE be reviewed for 64553 and 64555.

The codes were surveyed for the April 2015 meeting. At the April 2015 RUC meeting, after review of the SoRs, the RUC agreed with the CMS request. The RUC believed that the survey respondents were confused because they indicated in the survey that the typical site of service for 64555 was the facility setting but claims data show that the typical site of service is the physician office.

The RUC recommended referring CPT code 64555 to the CPT Editorial Panel to consider whether there should be two codes, one to describe temporary or trial implantation, and another to describe permanent implantation. The Panel considered a coding proposal at the February 2016 meeting and postponed the issue for several reasons, including whether or not there should be separate codes for trial and permanent lead implantation. The issue was re-presented to CPT at the Sept/Oct 2016 meeting. After a lengthy discussion, the CPT Panel did not make any changes to the descriptors of codes 64553 and 64555. However, parenthetical notes were added to direct users to report the appropriate codes for TENS, PENS, and PNT services, which may more likely be performed in an office setting. Prior to the CPT changes, the societies had also addressed incorrect coding through society education which not only resulted in a decrease in utilization for 64555, but also a decrease in the percentage of claims with office site of service. According to the 2016 RUC database, code 64553 was minimally utilized (240 in 2015) and was performed in the office setting 17.5% of the time and code 64555 was performed 8,200 times in 2015 (down from 73, 881 in 2008) and was performed in the office setting 53% of the time (down from 63% in 2014, 68% in 2013 and 75% in 2012).

The typical patient vignettes have not changed since the April 2015 survey, as confirmed by recent CPT action, and the work has not changed. Therefore, these codes were not re-surveyed, and the 2015 survey data are being presented.

## Survey Methodology

A standard RUC survey was sent through an email list-service to 2000 randomly selected members of the American Academy of Physical Medicine and Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), North American Spine Society (NASS), and American Association of Neurological Surgeons (AANS) and Congress of Neurological Surgeons (CNS).

## Compelling Evidence

The surveying specialty societies agree that codes 64553 and 64555 are undervalued and present the following compelling evidence as support.

### 1. Change in Physician Work Due to Technique

CPT codes 64553 and 64555 as originally described and valued by Hsiao were very different procedures than they are today. In the 1980s and early 1990s, for example, percutaneous peripheral neurostimulation was a procedure primarily performed by surgeons to quickly locate a nerve with a stimulating needle for testing and possible later consideration for surgical implantation of a single cathode/anode stimulating cuff electrode type lead surgically implanted around the target nerve. The current generation of implants did not exist when these codes were first considered so this survey represents the first true data regarding the work of the modern procedure. The old testing procedure was similar to using a stimulating needle for nerve localization for a peripheral nerve block which takes less time, less clinical expertise and less training than the current procedure. The physician identified the nerve which needed to be treated by using an insulated stimulating needle to stimulate various nerves until the patient's pattern of symptoms were reproduced. If the symptoms were reproduced, the surgeon proceeded with the direct surgical implantation of a cuff electrode lead around the target nerve using an open surgical approach. Imaging guidance was not typical and the type of nerves that could be targeted was limited by anatomic considerations (e.g., easily accessible, ability to visualize directly). The leads at that time were also very simple, often with only one or two electrical contacts. Codes 64553 and 64555, as originally performed, took much less time and were much less invasive.

Peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of multi-contact leads with between 4 and 16 contacts, adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

Current technique involves skin nerve mapping to determine:

1. lead insertion site
2. lead trajectory
3. lead depth
4. lead endpoint

All of these steps are performed prior to implantation.

Multi-contact implanted leads are much more complex to insert and program and the surgical technique required to tunnel the leads and fix them in place is entirely different than it was twenty years ago. Multiple attempts to properly position the leads for optimal stimulation, lead depth, and good proximity of all contacts for the entire 6 cm of nerve length may be required.

The time to perform the current procedure is much longer than the historical procedure for a number of reasons. As described, lead insertion is more difficult due to the size and location of the target nerve and scar tissue can complicate placement when there has been trauma or previous surgery (e.g., trauma and surgery are common causes of nerve injury).

In summary, peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of a multi-contact lead with up to 16 contacts adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

*See Atlas of Implantable Therapies for Pain Management, 2<sup>nd</sup> Edition, 2016 (Timothy Deer, MD and Jason Pope, MD, Eds.).*

## 2. Change in Patient Population

The patient population has changed as the ability to stimulate and provide better analgesia to cranial and peripheral nerves throughout the nervous system has become possible using the new multi-contact technology. The current patient population is much more complex. The current procedure is for the treatment of patients with very severe nerve injuries and intractable pain in a variety of nerves. Many of the nerves we are stimulating today were not approachable with previous techniques and equipment (i.e. – may require image guidance for nerve localization). It is important to note that this technology is an alternative to using opioids for pain management.

## 3. Flawed Process used for Original Valuation

The original valuation by Hsiao for 64553 and 64555 was based on responses from a small group of general surgeons. – not by physicians who perform these procedures today.

Given the change in technique, patient population, site of service, and the flawed process used for the original valuation, we believe the criteria for compelling evidence have been met.

### **Work RVU Recommendation**

We are recommending the 25<sup>th</sup> percentile survey value of 5.76 RVW for 64555.

### **Pre-time and Post-time Packages**

Pre-time package 1a (Straightforward Patient/Straightforward Procedure, No anesthesia care) is recommended with no changes to the package times.

Post-time package 7a (Local Anesthesia/ Straightforward Procedure) is recommended with no change to package time.

### **Clinical Comparison with Key Reference**

The key reference service 63650 (Percutaneous implantation of neurostimulator electrode array, epidural), surveyed in 2010, has a RVW of 7.16, and was chosen by 74% of survey respondents. This key reference service is similar to 64555 in the sense that it is a percutaneous implantation of a neurostimulator electrode array used for relief of chronic intractable pain. Both procedures are placements of a lead by a physician via percutaneous approach.

### **Work Comparison with Key Reference**

The work of 64555 is similar to that of 63650 (Percutaneous implantation of neurostimulator electrode array, epidural). Both procedures require the advancement of a needle along the intended nerve and maintaining the proper depth of insertion as the needle is advanced. Both procedures require 60 minutes of intra-time and there is a half day discharge for both services. The difference between these codes is the total time, 63650 has a total time of 170 min. and we are recommending a total time of 140 min. for 64555; this difference can be accounted for in the development of the standardized pre- and post-service packages; 63650 was last reviewed in 2010 before the standard packages were developed.

### **Summary**

Based on comparisons to the key reference service, which has similar work, the multispecialty consensus panel recommends the survey 25<sup>th</sup> percentile value of 5.76 is appropriate for 64555.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64555

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Sometimes

Specialty Neurosurgery How often? Sometimes

Specialty PMR How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8,200

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. From 2015 Claims data

Specialty Anesthesiology	Frequency 1324	Percentage 16.14 %
--------------------------	----------------	--------------------

Specialty Neurosurgery	Frequency 303	Percentage 3.69 %
------------------------	---------------	-------------------

Specialty PMR	Frequency 1081	Percentage 13.18 %
---------------	----------------	--------------------

Do many physicians perform this service across the United States? No

---

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Musculoskeletal

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64555

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Long Descriptor:

64553 Percutaneous implantation of neurostimulator electrode array; cranial nerve

Global Period: 010

Meeting Date January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

RUC Advisors from each specialty society involved in this survey process reviewed the practice expense recommendations and approved them.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The existing code 64553 was used as the reference code.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are recommending the standard use of clinical staff for pre-service clinical activities, with the exception of 5 minutes of "Other Clinical Activity." This time represents that time that clinical staff spends reviewing the results of a psychological evaluation of the patient. The Medicare National Coverage Determination for Electrical Nerve Stimulators (160.7) requires that patients have undergone careful screening, evaluation and diagnosis by a multidisciplinary team prior to implantation. Such screening must include psychological, as well as physical evaluation. The nurse reviews the results of the evaluation and flags any issues for the physician.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

CPT codes 64553 and 64555 as originally described and valued by Hsiao were very different procedures than they are today. In the 1980s and early 1990s, for example, percutaneous peripheral neurostimulation was a procedure primarily performed by surgeons to quickly locate a nerve with a stimulating needle for testing and possible later consideration for surgical implantation of a single cathode/anode stimulating cuff electrode type lead surgically implanted around the target nerve. The current generation of implants did not exist when these codes were first considered so this survey represents the first true data regarding the work of the modern procedure. The old testing procedure was similar to using a stimulating needle for nerve localization for a peripheral nerve block which takes less time, less clinical expertise and less training than the current procedure. The physician identified the nerve which needed to be treated by using an insulated stimulating needle to stimulate various nerves until the patient's pattern of symptoms were reproduced. If the symptoms were reproduced, the surgeon proceeded with the direct surgical implantation of a cuff electrode lead around the target nerve using an open surgical approach. Imaging guidance was not typical and the type of nerves that could be targeted was limited by anatomic considerations (e.g., easily accessible, ability to visualize directly). The leads at that

**Specialty Society(s):** American Association of Neurological Surgeons and Congress of Neurological Surgeons,  
American Society of Anesthesiologists, North American Neuromodulation Society

time were also very simple, often with only one or two electrical contacts. Codes 64553 and 64555, as originally performed, took much less time and were much less invasive.

Peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of multi-contact leads with between 4 and 16 contacts, adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

**5 minutes-** Other clinical activity; psychological evaluation. Clinical staff reviews the results of a psychological evaluation of the patient. The Medicare National Coverage Determination for Electrical Nerve Stimulators (160.7) requires that patients have undergone careful screening, evaluation and diagnosis by a multidisciplinary team prior to implantation. Such screening must include psychological, as well as physical evaluation. The nurse reviews the results of the evaluation and flags any issues for the physician.

Intra-Service Clinical Labor Activities:

**3 minutes-** Greet patient, provide gowning, ensure appropriate medical records are available.

**5 minutes-** Obtain vital signs. Clinical staff measures the patient's blood pressure, body temperature, pulse rate, and respiration rate.

**10 minutes-** Provide pre-service education/obtain consent. Clinical staff gives the patient additional instruction on use of trial screener device, specific to their programs that were developed and designed day of surgery (these are unique for each patient). The intra-op course is reviewed (the patient will be awake and asked to provide specific feedback and reporting and they need to understand what will be asked of them during the surgery) and pain pattern reviewed. This service requires more education than other procedures.

**2 minutes-** Prepare room, equipment, supplies.

**2 minutes-** Prepare and position patient/monitor patient/set up IV.

**75 minutes-** Assist physician in performing procedure. Clinical staff assists the physician for the entire procedure by performing testing of various electrode combinations and checking lead impedances. The Clinical staff is dedicated solely to assisting the physician for the entire procedure and is not engaged in any other activity.

**7.5 minutes-** Monitor pt. following procedure/check tubes, monitors, drains, multitasking 1:4. The patient remains in the office for 30 minutes after the procedure. Clinical staff monitors the patient periodically during that period, mainly to inspect the lead insertion site for bleeding. Using the standard formula of 1:4, 7.5 minutes are included.

**3 minutes-** Clean room/equipment by physician staff.

**5 minutes-** Check dressings & wound/home care instructions/coordinate office visits/prescriptions

Post-Service Clinical Labor Activities:

**CPT Code:**64553

**Specialty Society('s):** American Association of Neurological Surgeons and Congress of Neurological Surgeons,  
American Society of Anesthesiologists, North American Neuromodulation Society

**3 minutes-** Conduct phone calls/call in prescriptions. Clinical staff conducts phone calls with the patient and calls in prescriptions.

**Specialty Society('s):** American Association of Neurological Surgeons and Congress of Neurological Surgeons,  
American Society of Anesthesiologists, North American Neuromodulation Society

**AMA/Specialty Society Update Process**

American Society of Anesthesiologists, North American Neuromodulation Society

time were also very simple, often with only one or two electrical contacts. Codes 64553 and 64555, as originally performed, took much less time and were much less invasive.

Peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of multi-contact leads with between 4 and 16 contacts, adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

**5 minutes-** Other clinical activity; psychological evaluation. Clinical staff reviews the results of a psychological evaluation of the patient. The Medicare National Coverage Determination for Electrical Nerve Stimulators (160.7) requires that patients have undergone careful screening, evaluation and diagnosis by a multidisciplinary team prior to implantation. Such screening must include psychological, as well as physical evaluation. The nurse reviews the results of the evaluation and flags any issues for the physician.

Intra-Service Clinical Labor Activities:

**3 minutes-** Greet patient, provide gowning, ensure appropriate medical records are available.

**5 minutes-** Obtain vital signs. Clinical staff measures the patient's blood pressure, body temperature, pulse rate, and respiration rate.

**10 minutes-** Provide pre-service education/obtain consent. Clinical staff gives the patient additional instruction on use of trial screener device, specific to their programs that were developed and designed day of surgery (these are unique for each patient). The intra-op course is reviewed (the patient will be awake and asked to provide specific feedback and reporting and they need to understand what will be asked of them during the surgery) and pain pattern reviewed. This service requires more education than other procedures.

**2 minutes-** Prepare room, equipment, supplies.

**2 minutes-** Prepare and position patient/monitor patient/set up IV.

**60 minutes-** Assist physician in performing procedure. Clinical staff assists the physician for the entire procedure by performing testing of various electrode combinations and checking lead impedances. The Clinical staff is dedicated solely to assisting the physician for the entire procedure and is not engaged in any other activity.

**7.5 minutes-** Monitor pt. following procedure/check tubes, monitors, drains, multitasking 1:4. The patient remains in the office for 30 minutes after the procedure. Clinical staff monitors the patient periodically during that period, mainly to inspect the lead insertion site for bleeding. Using the standard formula of 1:4, 7.5 minutes are included.

**3 minutes-** Clean room/equipment by physician staff.

**5 minutes-** Check dressings & wound/home care instructions/coordinate office visits/prescriptions.

Post-Service Clinical Labor Activities:

**CPT Code:**64555

**Specialty Society('s):** American Association of Neurological Surgeons and Congress of Neurological Surgeons,  
American Society of Anesthesiologists, North American Neuromodulation Society

**3 minutes-** Conduct phone calls/call in prescriptions. Clinical staff conducts phone calls with the patient and calls in prescriptions.

**Specialty Society(s):** American Association of Neurological Surgeons and Congress of Neurological Surgeons,  
American Society of Anesthesiologists, North American Neuromodulation Society

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Facility Direct Inputs**

CPT Long Descriptor:

64553 Percutaneous implantation of neurostimulator electrode array; cranial nerve

Global Period: 010

Meeting Date January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

RUC Advisors from each specialty society involved in this survey process reviewed the practice expense recommendations and approved them.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

The existing code 64553 was used as the reference code.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are recommending the standard use of clinical staff for pre-service clinical activities, with the exception of 5 minutes of "Other Clinical Activity." This time represents that time that clinical staff spends reviewing the results of a psychological evaluation of the patient. The Medicare National Coverage Determination for Electrical Nerve Stimulators (160.7) requires that patients have undergone careful screening, evaluation and diagnosis by a multidisciplinary team prior to implantation. Such screening must include psychological, as well as physical evaluation. The nurse reviews the results of the evaluation and flags any issues for the physician.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

CPT codes 64553 and 64555 as originally described and valued by Hsiao were very different procedures than they are today. In the 1980s and early 1990s, for example, percutaneous peripheral neurostimulation was a procedure primarily performed by surgeons to quickly locate a nerve with a stimulating needle for testing and possible later consideration for surgical implantation of a single cathode/anode stimulating cuff electrode type lead surgically implanted around the target nerve. The current generation of implants did not exist when these codes were first considered so this survey represents the first true data regarding the work of the modern procedure. The old testing procedure was similar to using a stimulating needle for nerve localization for a peripheral nerve block which takes less time, less clinical expertise and less training than the current procedure. The physician identified the nerve which needed to be treated by using an insulated stimulating needle to stimulate various nerves until the patient's pattern of symptoms were reproduced. If the symptoms were reproduced, the surgeon proceeded with the direct surgical implantation of a cuff electrode lead around the target nerve using an open surgical approach. Imaging guidance was not typical and the type of nerves that could be targeted was limited by anatomic considerations (e.g., easily accessible, ability to visualize directly). The leads at that

**Specialty Society(s):** American Association of Neurological Surgeons and Congress of Neurological Surgeons,

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS Fastest Growing / High Volume Growth screen*

January 2014

**Percutaneous Implantation of Neuroelectrodes**

At the October 2013, meeting the Relativity Assessment Workgroup reviewed High Volume Growth Services where Medicare utilization increased by at least 100% from 2006 to 2011. The RUC requested that these services be surveyed for physician work and develop practice expense inputs for the January 2014 RUC meeting.

**64561 Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed**

The RUC reviewed the survey results from 83 urologists and gynecologists and determined that the survey 25<sup>th</sup> percentile work RVU of 6.88 was too high because the physician intra-service time required to perform this service had decreased 20 minutes from when it was last evaluated in 2001. Although the current work RVU for CPT code 64561 is 7.15, the Committee determined that the efficiencies gained account for a higher decrease in work RVUs. The Committee compared 64561 to MPC code 52235 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; MEDIUM bladder tumor(s) (2.0 to 5.0 cm)* (work RVU = 5.44 and 29 minutes pre-service, 45 minutes intra-service time and 20 minutes immediate post-service time) and recommends a direct crosswalk. This brings the intensity required to perform this service in line with other similar services. For additional support, the Committee referenced 33213 *Insertion of pacemaker pulse generator only; with existing dual leads* (090 global, work RVU = 5.53 and 46 minutes intra-service time and 1-99213). The RUC determined that 22 minutes pre-evaluation, 5 minutes positioning, 45 minutes intra-service time and 19 minutes immediate post service time and one 99214 office visit for CPT code 64561 appropriately account for the work required to perform this service. **The RUC recommends a work RVU of 5.44 for CPT code 64561.**

**Work Neutrality**

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

**Practice Expense**

The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

<b>CPT Code (●New)</b>	<b>CPT Descriptor</b>	<b>Global Period</b>	<b>Work RVU Recommendation</b>
64561	Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed	010	5.44

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64561	Tracking Number	Original Specialty Recommended RVU: <b>6.88</b>
		Presented Recommended RVU: <b>6.88</b>
Global Period: 010		RUC Recommended RVU: <b>5.44</b>

CPT Descriptor: Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 47-year-old female with intractable and debilitating urge incontinence voids hourly. All available conservative remedies have been unsuccessful. A percutaneous test stimulation is planned to determine the effectiveness of transsacral neuromodulation for control of her urinary symptoms.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 40% , In the ASC 20%, In the office 39%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 42%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 25%

Description of Pre-Service Work: Pre-service Work- Day before surgery:

Review pre-op lab results

Review medical record

Check to be sure necessary equipment/supplies are in the office

Pre-service work- Day of surgery:

Review surgical procedure, post-op recovery with patient and family

Answer patient and family questions, be sure informed consent is in record

Position patient on power table

Verify that all necessary instruments are available

Description of Intra-Service Work:

Approximate levels of the sacral foramina using fluoroscopy

Anesthetize skin and periosteum over and near chosen foramen

Pass an electrically insulated 3 or 5 inch needle percutaneously into the foramen

Connect an external screener (power source) to the foramen needle by a separate cable and grounding source

Discern and document specific biologic responses to stimulation of S2 and no activity for S4

Desired responses are S2 and S3

A 3 - 0 temporary electrode is exchanged through the lumen of the foramen needle, leaving only the electrode in place

Re-testing is performed to confirm response

Dressing is placed to secure the electrode in place  
Hard X-ray is done to confirm lead position

Description of Post-Service Work:

Apply dressings  
Write post-op orders  
Review post procedure care and medications with staff  
Meet with patient and family to discuss the procedure, expected outcome, planned post operative care  
Call referring physician regarding outcome of procedure and any unusual aspects of post operative care (cardiac disease, diabetic management)  
Dictate detailed operative narrative  
Write prescriptions for post-op medications

Post-op Office work

Examine patient, check vital signs  
Review testing results and voiding diary  
Remove lead and electrode from patient  
Apply dressing  
Talk with patient and family  
Answer questions from patient and family  
Write necessary prescriptions  
Schedule next office visit  
Mark appropriate diagnosis and CPT code on Superbill  
Dictate patient progress notes for office medical record  
Dictate letter to referring physician

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
63650	010	7.15	RUC Time

CPT Descriptor Percutaneous implantation of neurostimulator electrode array, epidural**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
55706	010	6.28	RUC Time	1,565
<u>CPT Descriptor 1</u> Biopsies, prostate, needle, transperineal, stereotactic template guided saturation sampling, including imaging guidance				

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
22524	010	8.54	RUC Time	25,978

CPT Descriptor 2 Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device, 1 vertebral body, unilateral or bilateral cannulation (eg, kyphoplasty); lumbar

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
		0.00	

CPT Descriptor**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 49      % of respondents: 59.0 %

**TIME ESTIMATES (Median)**

<u>CPT Code:</u>	<u>Key Reference CPT Code:</u>	<u>Source of Time</u>
64561	63650	RUC Time

Median Pre-Service Time	27.00	48.00
Median Intra-Service Time	45.00	60.00
Median Immediate Post-service Time	19.00	20.00
Median Critical Care Time	0.0	0.00
Median Other Hospital Visit Time	0.0	19.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	40.0	23.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
<b>Median Total Time</b>	<b>131.00</b>	<b>170.00</b>
<b>Other time if appropriate</b>		

**INTENSITY/COMPLEXITY MEASURES (Mean)****(of those that selected Key Reference code)****Mental Effort and Judgment (Mean)**

The number of possible diagnosis and/or the number of management options that must be considered	4.10	4.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.24	4.12
Urgency of medical decision making	2.80	2.96

**Technical Skill/Physical Effort (Mean)**

Technical skill required	4.35	4.22
Physical effort required	3.57	3.49

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality	3.24	3.35
Outcome depends on the skill and judgment of physician	4.33	4.27
Estimated risk of malpractice suit with poor outcome	2.94	3.10

**INTENSITY/COMPLEXITY MEASURES****CPT Code****Reference Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	3.59	3.59
Intra-Service intensity/complexity	4.10	4.00
Post-Service intensity/complexity	3.55	3.53

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AUA sent a “do you do letter” to a random number of AUA and American Congress of Obstetricians and Gynecologists’ subspecialty: American Urogynecologic Society members. The surveys were then sent to the individual physicians who answered that they do the procedure and would complete the RUC survey. The survey was sent to 197 individuals and of those individuals, 83 responses were received for a response rate of 42.13%. In 2013, 17,771 of these procedures were performed in the Medicare population so the number of responses to this survey meets the new RUC criteria of 30 respondents as the minimum survey sample size for this code.

The AUA RUC expert panel reviewed the survey results, which confirmed that 45 minutes of intraservice time is necessary to complete this procedure. The current intraservice time is 70 minutes. The current work RVU is 7.15. The median work value from the survey is 7.15. Although the survey results state that 40% of these procedures are performed in the hospital, Medicare claims data shows that 69% of these procedures in 2013 were performed in the physicians’ office. Since this procedure is done the majority of the time in the physician’s office, a half day discharge is no longer required and it was determined that one 99214 should be assigned in the global period. The preservice time package 5 was chosen which reduced the preservice time from 45 minutes to 10 minutes and the postservice package 7A was chosen which reduced the postservice time from 30 minutes to 16 minutes. In addition, the RUC expert panel felt that two minutes of positioning time was appropriate for this procedure.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64561

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology                      How often? Sometimes

Specialty OB/GYN                      How often? Sometimes

Specialty Colorectal Surgery                      How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 22213

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare X 125%

Specialty Urology                      Frequency 17641                      Percentage 79.41 %

Specialty OB/GYN                      Frequency 4140                      Percentage 18.63 %

Specialty Colorectal Surgery                      Frequency 81                      Percentage 0.36 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

17,771 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC Database

Specialty Urology                      Frequency 14113                      Percentage 79.41 %

Specialty OB/GYN                      Frequency 3312                      Percentage 18.63 %

Specialty Colorectal Surgery                      Frequency 65                      Percentage 0.36 %

Do many physicians perform this service across the United States? Yes

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:  
Procedures

BETOS Sub-classification:  
Major procedure

BETOS Sub-classification Level II:  
Other

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64561

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

64561 Percutaneous implantation of neurostimulator electrode array; sacral nerve (transforaminal placement) including image guidance, if performed

Global Period: 010 Meeting Date: January 2014

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: RUC Advisors from each specialty society involved in this survey process reviewed the practice expense recommendations and approved them.
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: These code are being reviewed so we are using 64561 as our reference code.
3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:
5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Visit prior to procedure:

Provide pre-service education and obtain consent from patient

Day of Procedure – Pre-Service

Greet the patient

Provide gown

Obtain urine specimen

Ensure appropriate medical records are available

Obtain three vitals (BP, weight and temperature)

Prepare room, equipment and supplies

Assist physician in positioning patient

Tray set up: (using sterile technique)

1. Tray draped with sterile drape
2. Necessary instruments arranged on tray
3. Solution for numbing drawn up

Betadine prep to sacral area, sterile drape placement and grounding pad placement confirmed.

Patient cable attached to external test stimulation box done.

C-arm positioned

Intra-Service Clinical Labor Activities:

Assist physician during the procedure  
Hands necessary supplies and equipment to the physician

Post-Service Clinical Labor Activities:

Clean the room and equipment  
Provide follow up information to patient.  
Patient education/teaching as appropriate based upon the visit  
Confers with the MD verbally for any last minute instructions for patient.  
Next appointment is set up for patient while checking out.

Next day after patient leaves the office, clinical staff calls patient to verify system is working.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS Request-Final Rule for 2014 and Final Rule for 2015*

April 2015

**Implantation of Neuroelectrodes**

CMS indicated that a stakeholder raised questions regarding whether CPT codes 64553 and 64555 included the appropriate direct PE inputs when furnished in the non-facility setting. It appears that these inputs have not been evaluated recently and therefore CMS nominated these codes as potentially misvalued for the purpose of ascertaining whether or not there are non-facility direct PE inputs that are not included in the direct PE inputs that are typical supply costs for these services. In September 2014, the RUC recommended that these services be reviewed for direct practice expense only at the January 2015 meeting. However in the Final Rule for 2015, CMS requested for both physician work and direct PE inputs to be reviewed. In order for work and direct PE inputs to be reviewed together, the specialty societies indicated they will survey for April 2015. The specialty societies presented survey data at the April 2015 meeting.

During discussion it became clear that for both codes there are differences in the physician work and practice expense when these services are provided in the facility, versus non-facility setting. In the non-facility office setting the implant is temporary and if successful, the patient will return for a permanent implant in the facility inpatient setting. According to Medicare data this service is typically performed in the physician office, meaning that the services are typical for the temporary implantation of neuroelectrodes. However, the survey respondents reported that 87% of the time they perform the services in the facility setting. This created a problem for the RUC in valuing these services because they are being reported as typical in the non-facility, yet the survey data is predicated on a facility-based permanent procedure.

***64553 Percutaneous implantation of neurostimulator electrode array; cranial nerve***

The RUC discussed the confusion that survey respondents experienced valuing this service. The descriptor only states which nerve the neurostimulator is implanted in, and most respondents completed the survey as if it is performed in the facility-setting. The 2013 Medicare claims data conflicts with this site of service, reporting that 65% of the time this service is performed in the physician's office. Additionally the supplies and equipment may be different for the temporary and permanent implantation. The RUC recommends referring CPT code 64553 to the CPT Editorial Panel to better define this service, such as having one code to describe temporary or testing implantation and another code to describe permanent implantation. The RUC recognized that it needed to establish an interim value for 64553 until this service could be clarified by CPT. **The RUC recommends maintaining the current work value of 2.36, as interim for CPT code 64553 and referral to the CPT Editorial Panel.**

**Practice Expense**

The RUC reviewed and approved the direct practice expense inputs with revisions as approved by the Practice Expense Subcommittee.

<b>CPT Code (●New)</b>	<b>CPT Descriptor</b>	<b>Global Period</b>	<b>Work RVU Recommendation</b>
64553	Percutaneous implantation of neurostimulator electrode array; cranial nerve	010	Refer to CPT 2.36 (No Change)
64555	Percutaneous implantation of neurostimulator electrode array; peripheral nerve (excludes sacral nerve)	010	Refer to CPT 2.32 (No Change)

		Presented Recommended RVU:
Global Period: 010		RUC Recommended RVU:

CPT Descriptor: Percutaneous implantation of neurostimulator electrode array; cranial nerve

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 53-year-old male has a 1-year history of intractable right forehead pain from post-herpetic neuralgia. His pain persists despite medications, biofeedback and peripheral nerve blocks. Due to his persistent, debilitating pain, a trial of supraorbital (cranial) nerve stimulation is scheduled to relieve his pain and improve his function.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 60% , In the ASC 27%, In the office 13%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 80% , Overnight stay-less than 24 hours 20% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 4%

Description of Pre-Service Work: The physician communicates with the referring physician and other health care professionals, and obtains informed consent from the patient. The physician obtains and reviews the previous operative note(s) and any pertinent radiographs, laboratory studies and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics are written and patient's medications reviewed. The surgeon meets with patient and family to review planned procedure and post-operative management. The surgeon also reviews the type of anesthesia with anesthesiologist, verifies that all required instruments and supplies are available, and assists with positioning the patient. The surgeon also monitors/assists with draping and positioning of the patient. The surgeon scrubs and gowns, and then perform the surgical "time out" with the operating and anesthesia team.

Pre-operatively the surgeon has discussion and provides education to the patient regarding intraoperative verbal testing which will occur during the operation. Intraoperative testing involves detailed communication between the physician, technician, and patient. The patient is instructed on questions that will be asked during the procedure and appropriate answers that will help direct the surgeon. This education is analogous to pre-test education required for any type of standardized testing. This education gives the patient a proper understanding of the questions being asked, and helps the patient provide appropriate responses to questions that guide modifications in anatomical lead positioning and stimulation parameters (amplitude, pulse width, frequency) during the procedure. This pre service education is especially important since patients are sedated during the procedure and pre-procedure education reinforces their ability to provide appropriate answers; ultimately this will lead to more precise localization of the targeted nerve structure and hence improved therapeutic outcomes.

In addition, stimulators require significant pre-service work on the physician's part which involves a discussion with the patient about their usual sleep position and medical co morbidities (whether or not they sleep on their right or left side, their stomach or their back). This is required for proper site selection for placement of lead hardware (connectors and generator), in order to prevent lead migration, damage of the lead from crossing joints or other mobile structures, and

problems with neurostimulator generator comfort. With cranial nerve stimulation this is even more complex because of the multiple possible sites for generator placement and the multiple anatomical concerns as one passes from the head into the neck and then the torso. This includes measuring degrees of cervical spine flexion, extension, left rotation, right rotation, right lateral bending, and left lateral bending in order to determine appropriate lead lengths, and appropriate placement of lead hardware (connectors in which the leads plug into).

Prior to sedation, the area of pain is carefully outlined, the patient receives preoperative intravenous antibiotics. The physician identifies appropriate skin and bony landmarks and locates pertinent vascular structures. After identifying and marking the intended target along the course of the nerve, the skin around the planned entry point is injected with local anesthetic.

Description of Intra-Service Work: An introducer needle is advanced along the intended course of the nerve, maintaining the proper depth of insertion as the needle is advanced. Fluoroscopy and/or ultrasound may be used to verify final needle position (separately reportable). The physician guides a percutaneous electrode array through the needle and delivers to a location in proximity to the nerve. Final location is verified with electrical stimulation and then final location may be documented with fluoroscopy or ultrasound (also separately reportable). The introducer needle is removed and the exposed end of the electrode array is attached to an external stimulator unit. A technician tests various electrode combinations and the lead location is adjusted (physically relocated) until the patient indicates paresthesia overlap in the target nerve innervation and the distribution of the patient's typical area of pain.

Once lead impedances are verified an incision is made around the needle and then soft tissue dissection performed to create an anchoring site (anchoring location will vary with specific nerve and depth). Once the lead is anchored it is tunneled to a remote exit site for a trial or to the generator for a permanent implant. The incision is closed and dressings are applied.

Description of Post-Service Work: Covers the site with a sterile occlusive dressing and reconnects the lead to the external stimulator unit. The patient is observed for stability of vital signs and comfort and then the operator communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The patient receives education about their stimulator (internal or external) which requires significant patient education to navigate through various programs, amplitudes, frequencies, pulse width, etc. Wound care postoperatively for trial is extremely important where a lead is protruding through the skin. The surgeon writes prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary, discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.

Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, and monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

Codes 64553 and 64555 are Harvard valued and have not been subject to physician work review since the RBRVS fee schedule was implemented. The direct PE inputs for these two codes were last reviewed by the PERC/PEAC at the January 2003 RUC meeting. CMS identified this family of codes as being potentially misvalued in the NPRM for 2015 MPFS. A stakeholder raised the question as to whether there are missing direct practice expense (PE) inputs when provided in the non-facility setting. No mention was made in the 2015 proposed rule as to what specific inputs may be missing. In the 2015 MPFS Final Rule, CMS requested that both the work and the PE be reviewed for 64553 and 64555.

The codes were surveyed for the April 2015 meeting. At the April 2015 RUC meeting, after review of the SoRs, the RUC agreed with the CMS request. The RUC believed that the survey respondents were confused because they indicated in the survey that the typical site of service for 64555 was the facility setting but claims data show that the typical site of service is the physician office.

The RUC recommended referring CPT code 64555 to the CPT Editorial Panel to consider whether there should be two codes, one to describe temporary or trial implantation, and another to describe permanent implantation. The Panel considered a coding proposal at the February 2016 meeting and postponed the issue for several reasons, including whether or not there should be separate codes for trial and permanent lead implantation. The issue was re-presented to CPT at the Sept/Oct 2016 meeting. After a lengthy discussion, the CPT Panel did not make any changes to the descriptors of codes 64553 and 64555. However, parenthetical notes were added to direct users to report the appropriate codes for TENS, PENS, and PNT services, which may more likely be performed in an office setting. Prior to the CPT changes, the societies had also addressed incorrect coding through society education which not only resulted in a decrease in utilization for 64555, but also a decrease in the percentage of claims with office site of service. According to the 2016 RUC database, code 64553 was minimally utilized (240 in 2015) and was performed in the office setting 17.5% of the time and code 64555 was performed 8,200 times in 2015 (down from 73,881 in 2008) and was performed in the office setting 53% of the time (down from 63% in 2014, 68% in 2013 and 75% in 2012).

The typical patient vignettes have not changed since the April 2015 survey, as confirmed by recent CPT action, and the work has not changed. Therefore, these codes were not re-surveyed, and the 2015 survey data are being presented.

## Survey Methodology

A standard RUC survey was sent through an email list-service to 2000 randomly selected members of the American Academy of Physical Medicine and Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), North American Spine Society (NASS), and American Association of Neurological Surgeons (AANS) and Congress of Neurological Surgeons (CNS).

## Compelling Evidence

The surveying specialty societies agree that codes 64553 and 64555 are undervalued and present the following compelling evidence as support.

### 1. Change in Physician Work Due to Technique

CPT codes 64553 and 64555 as originally described and valued by Hsiao were very different procedures than they are today. In the 1980s and early 1990s, for example, percutaneous peripheral neurostimulation was a procedure primarily performed by surgeons to quickly locate a nerve with a stimulating needle for testing and possible later consideration for surgical implantation of a single cathode/anode stimulating cuff electrode type lead surgically implanted around the target nerve. The current generation of implants did not exist when these codes were first considered so this survey represents the first true data regarding the work of the modern procedure. The old testing procedure was similar to using a stimulating needle for nerve localization for a peripheral nerve block which takes less time, less clinical expertise and less training than the current procedure. The physician identified the nerve which needed to be treated by using an insulated stimulating needle to stimulate various nerves until the patient's pattern of symptoms were reproduced. If the symptoms were reproduced, the surgeon proceeded with the direct surgical implantation of a cuff electrode lead around the target nerve using an open surgical approach. Imaging guidance was not typical and the type of nerves that could be targeted was limited by anatomic considerations (e.g., easily accessible, ability to visualize directly). The leads at that time were also very simple, often with only one or two electrical contacts. Codes 64553 and 64555, as originally performed, took much less time and were much less invasive.

Peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of multi-contact leads with between 4 and 16 contacts, adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

Current technique involves skin nerve mapping to determine:

1. lead insertion site
2. lead trajectory
3. lead depth
4. lead endpoint

All of these steps are performed prior to implantation.

Multi-contact implanted leads are much more complex to insert and program and the surgical technique required to tunnel the leads and fix them in place is entirely different than it was twenty years ago. Multiple attempts to properly position the leads for optimal stimulation, lead depth, and good proximity of all contacts for the entire 6 cm of nerve length may be required.

The time to perform the current procedure is much longer than the historical procedure for a number of reasons. As described, lead insertion is more difficult due to the size and location of the target nerve and scar tissue can complicate placement when there has been trauma or previous surgery (e.g., trauma and surgery are common causes of nerve injury).

In summary, peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of a multi-contact lead with up to 16 contacts adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

*See Atlas of Implantable Therapies for Pain Management, 2<sup>nd</sup> Edition, 2016 (Timothy Deer, MD and Jason Pope, MD, Eds.).*

## 2. Change in Patient Population

The patient population has changed as the ability to stimulate and provide better analgesia to cranial and peripheral nerves throughout the nervous system has become possible using the new multi-contact technology. The current patient population is much more complex. The current procedure is for the treatment of patients with very severe nerve injuries and intractable pain in a variety of nerves. Many of the nerves we are stimulating today were not approachable with previous techniques and equipment (i.e. – may require image guidance for nerve localization). It is important to note that this technology is an alternative to using opioids for pain management.

## 3. Flawed Process used for Original Valuation

The original valuation by Hsiao for 64553 and 64555 was based on responses from a small group of general surgeons. - not by physicians who perform these procedures today.

Given the change in technique, patient population, site of service, and the flawed process used for the original valuation, we believe the criteria for compelling evidence have been met.

### **Work RVU Recommendation**

We are recommending the 25th percentile survey value of 6.13 RVW for 64553.

### **Pre-time and Post-time Packages**

Pre-time package 1a (Straightforward Patient/Straightforward Procedure, No anesthesia care) is recommended with no changes to the package times.

Post-time package 7a (Local Anesthesia/ Straightforward Procedure) is recommended with no change to package time.

### **Clinical Comparison with Key Reference**

The key reference service 63650 (Percutaneous implantation of neurostimulator electrode array, epidural), surveyed in 2010, has a RVW of 7.16, and was chosen by 73% of survey respondents. This key reference service is similar to 64553 in the sense that it is a percutaneous implantation of a neurostimulator electrode array used for relief of chronic intractable pain. Both procedures are placements of a lead by a physician via percutaneous approach. However, code 64553 is for lead placement at the cranial nerve.

### **Work Comparison with Key Reference**

The work of 64553 is similar to that of 63650 (Percutaneous implantation of neurostimulator electrode array, epidural). Both procedures require the advancement of a needle along the intended nerve and maintaining the proper depth of insertion as the needle is advanced. Both procedures require 60 minutes of intra-time and there is a half day discharge for both services. The difference between these codes is the total time, 63650 has a total time of 170 min. and we are recommending a total time of 155 min. for 64553; this difference can be accounted for in the development of the standardized pre- and post-service packages; 63650 was last reviewed in 2010 before the standard packages were developed.

### **Summary**

Based on comparisons to the key reference service, which has similar work, the multispecialty consensus panel recommends the survey 25th percentile value of 6.13 is appropriate for 64553.

## **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64553

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology                      How often? Rarely

Specialty Neurosurgery                      How often? Rarely

Specialty Physical Medicine and Rehabilitation                      How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 240

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. his is based on the 2015 claims data from the RUC database.

Specialty Anesthesiology	Frequency 182	Percentage 75.83 %
--------------------------	---------------	--------------------

Specialty Neurosurgery	Frequency 14	Percentage 5.83 %
------------------------	--------------	-------------------

Specialty PMR	Frequency 1	Percentage 0.41 %
---------------	-------------	-------------------

Do many physicians perform this service across the United States? No

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Musculoskeletal

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64553

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 64555

Tracking Number

Original Specialty Recommended RVU: **5.76**

Presented Recommended RVU:

Global Period: 010

RUC Recommended RVU:

CPT Descriptor: Percutaneous implantation of neurostimulator electrode array; peripheral nerve (excludes sacral nerve)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 44-year-old woman has a 5-year history of severe headaches, occurring at least 15 days per month. She has had poor control of her pain despite multiple medication trials, biofeedback and peripheral nerve blocks. Due to her persistent, debilitating pain, a trial of occipital (peripheral) nerve stimulation is scheduled to relieve her pain and improve her function.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 58% , In the ASC 29%, In the office 13%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 88% , Overnight stay-less than 24 hours 11% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 4%

Description of Pre-Service Work: The physician communicating with the referring physician and other health care professionals, and obtains informed consent from the patient. The physician obtains and reviews the previous operative note(s) and any pertinent radiographs, laboratory studies and medical information regarding implant from the implant manufacturer or available medical records. Pre-service work also includes a focused examination of the patient. The results of preadmission testing are reviewed. The medical record is reviewed to ensure that the patient is stable for the planned surgical procedure. The preoperative history and physical examination is updated. Preoperative orders for antibiotics are written and patient's medications reviewed. The surgeon meets with patient and family to review planned procedure and post-operative management. The surgeon also reviews the type of anesthesia with anesthesiologist, verifies that all required instruments and supplies are available, and assists with positioning the patient. The surgeon would monitor/assists with draping and positioning of the patient. The surgeon scrubs and gowns, and then performs the surgical "time out" with the operating and anesthesia team.

Pre-operatively the surgeon has discussion and provides education to the patient regarding intraoperative verbal testing which will occur during the operation. Intraoperative testing involves detailed communication between the physician, technician, and patient. The patient is instructed on questions that will be asked during the procedure and appropriate answers that will help direct the surgeon. This education is analogous to pre-test education required for any type of standardized testing. This education gives the patient a proper understanding of the questions being asked, and helps the patient provide appropriate responses to questions that guide modifications in anatomical lead positioning and stimulation parameters (amplitude, pulse width, frequency) during the procedure. This pre service education is especially important since patients are sedated during the procedure and pre-procedure education reinforces their ability to provide appropriate answers; ultimately this will lead to more precise localization of the targeted nerve structure and hence improved therapeutic outcomes.

In addition, stimulators require significant pre-service work on the physician's part which involves a discussion with the patient about their usual sleep position and medical co morbidities (whether or not they sleep on their right or left side, their stomach or their back). This is required for proper site selection for placement of lead hardware (connectors and

generator), in order to prevent lead migration, damage of the lead from crossing joints or other mobile structures, and problems with neurostimulator generator comfort. With cranial nerve stimulation this is even more complex because of the multiple possible sites for generator placement and the multiple anatomical concerns as one passes from the head into the neck and then the torso. This includes measuring degrees of cervical spine flexion, extension, left rotation, right rotation, right lateral bending, and left lateral bending in order to determine appropriate lead lengths, and appropriate placement of lead hardware (connectors in which the leads plug into).

Prior to sedation, the area of pain is carefully outlined, the patient receives preoperative intravenous antibiotics. Identify appropriate skin and bony landmarks and locate pertinent vascular structures. After identifying and marking the intended target along the course of the nerve, the skin around the planned entry point is injected with local anesthetic.

Description of Intra-Service Work: An introducer needle is advanced along the intended course of the nerve, maintaining the proper depth of insertion as the needle is advanced. Fluoroscopy and/or may be used to verify final needle position (separately reportable). Guide a percutaneous electrode array through the needle and deliver to a location in proximity to the nerve. Final location is verified with electrical stimulation and then final location may be documented with fluoroscopy or ultrasound (also separately reportable). The introducer needle is removed and the exposed end of the electrode array is attached to an external stimulator unit. A technician tests various electrode combinations and the lead location is adjusted (physically relocated) until the patient indicates paresthesia overlap in the target nerve innervation and the distribution of the patient's typical area of pain. The physician checks lead impedances, detaches the external unit, removes the needle and stylet, and anchors the lead.

Description of Post-Service Work: Covers the site with a sterile occlusive dressing and reconnects the lead to the external stimulator unit. The physician then obtains a final fluoroscopic image to document final placement. The patient is observed for stability of vital signs and comfort and then the operator communicates with the patient, family, and other health care professionals (including written and telephone reports and orders) and coordinates discharge day management. Additionally, all hospital visits and post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure. The patient receives education about their stimulator (internal or external) which requires significant patient education to navigate through various programs, amplitudes, frequencies, pulse width, etc. Wound care postoperatively for trial is extremely important where a lead is protruding through the skin. The surgeon writes prescriptions for medications needed after discharge and instructions, such as home restrictions (i.e., diet, activity, bathing, driving), are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge progress notes, discharge summary, discharge instructions, and insurance forms. The patient is discharged when there is return of adequate nutrition intake, adequate pain control with oral analgesics, and independent ambulation.

Office post-discharge work: Examine and talk with patient. Perform wound check. Remove sutures/staples if placed. Review activity and restrictions. Perform neurological exam and confirm normal strength, reflexes and sensation. Answer patient/family questions. Write medication prescriptions. Order physiotherapy, as necessary, and monitor rehabilitation. Discuss progress with PCP (verbal and written). Dictate progress notes for medical record. All post-discharge office visits for care throughout the global period are considered part of the post-operative work for this procedure.

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

### Background

Codes 64553 and 64555 are Harvard valued and have not been subject to physician work review since the RBRVS fee schedule was implemented. The direct PE inputs for these two codes were last reviewed by the PERC/PEAC at the January 2003 RUC meeting. CMS identified this family of codes as being potentially misvalued in the NPRM for 2015 MPFS. A stakeholder raised the question as to whether there are missing direct practice expense (PE) inputs when provided in the non-facility setting. No mention was made in the 2015 proposed rule as to what specific inputs may be missing. In the 2015 MPFS Final Rule, CMS requested that both the work and the PE be reviewed for 64553 and 64555.

The codes were surveyed for the April 2015 meeting. At the April 2015 RUC meeting, after review of the SoRs, the RUC agreed with the CMS request. The RUC believed that the survey respondents were confused because they indicated in the survey that the typical site of service for 64555 was the facility setting but claims data show that the typical site of service is the physician office.

The RUC recommended referring CPT code 64555 to the CPT Editorial Panel to consider whether there should be two codes, one to describe temporary or trial implantation, and another to describe permanent implantation. The Panel considered a coding proposal at the February 2016 meeting and postponed the issue for several reasons, including whether or not there should be separate codes for trial and permanent lead implantation. The issue was re-presented to CPT at the Sept/Oct 2016 meeting. After a lengthy discussion, the CPT Panel did not make any changes to the descriptors of codes 64553 and 64555. However, parenthetical notes were added to direct users to report the appropriate codes for TENS, PENS, and PNT services, which may more likely be performed in an office setting. Prior to the CPT changes, the societies had also addressed incorrect coding through society education which not only resulted in a decrease in utilization for 64555, but also a decrease in the percentage of claims with office site of service. According to the 2016 RUC database, code 64553 was minimally utilized (240 in 2015) and was performed in the office setting 17.5% of the time and code 64555 was performed 8,200 times in 2015 (down from 73, 881 in 2008) and was performed in the office setting 53% of the time (down from 63% in 2014, 68% in 2013 and 75% in 2012).

The typical patient vignettes have not changed since the April 2015 survey, as confirmed by recent CPT action, and the work has not changed. Therefore, these codes were not re-surveyed, and the 2015 survey data are being presented.

## **Survey Methodology**

A standard RUC survey was sent through an email list-service to 2000 randomly selected members of the American Academy of Physical Medicine and Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), North American Spine Society (NASS), and American Association of Neurological Surgeons (AANS) and Congress of Neurological Surgeons (CNS).

## **Compelling Evidence**

The surveying specialty societies agree that codes 64553 and 64555 are undervalued and present the following compelling evidence as support.

### **1. Change in Physician Work Due to Technique**

CPT codes 64553 and 64555 as originally described and valued by Hsiao were very different procedures than they are today. In the 1980s and early 1990s, for example, percutaneous peripheral neurostimulation was a procedure primarily performed by surgeons to quickly locate a nerve with a stimulating needle for testing and possible later consideration for surgical implantation of a single cathode/anode stimulating cuff electrode type lead surgically implanted around the target nerve. The current generation of implants did not exist when these codes were first considered so this survey represents the first true data regarding the work of the modern procedure. The old testing procedure was similar to using a stimulating needle for nerve localization for a peripheral nerve block which takes less time, less clinical expertise and less training than the current procedure. The physician identified the nerve which needed to be treated by using an insulated stimulating needle to stimulate various nerves until the patient's pattern of symptoms were reproduced. If the symptoms were reproduced, the surgeon proceeded with the direct surgical implantation of a cuff electrode lead around the target nerve using an open surgical approach. Imaging guidance was not typical and the type of nerves that could be targeted was limited by anatomic considerations (e.g., easily accessible, ability to visualize directly). The leads at that time were also very simple, often with only one or two electrical contacts. Codes 64553 and 64555, as originally performed, took much less time and were much less invasive.

Peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of multi-contact leads with between 4 and 16 contacts, adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

Current technique involves skin nerve mapping to determine:

1. lead insertion site
2. lead trajectory
3. lead depth
4. lead endpoint

All of these steps are performed prior to implantation.

Multi-contact implanted leads are much more complex to insert and program and the surgical technique required to tunnel the leads and fix them in place is entirely different than it was twenty years ago. Multiple attempts to properly position the leads for optimal stimulation, lead depth, and good proximity of all contacts for the entire 6 cm of nerve length may be required.

The time to perform the current procedure is much longer than the historical procedure for a number of reasons. As described, lead insertion is more difficult due to the size and location of the target nerve and scar tissue can complicate placement when there has been trauma or previous surgery (e.g., trauma and surgery are common causes of nerve injury).

In summary, peripheral neuromodulation today involves a multi-step process, knowledge of advanced technology, and placement of a multi-contact lead with up to 16 contacts adjacent to the length of a nerve (as opposed to just two contacts next to or around a nerve), as well as use of a multi-contact array for multiple anodes/cathodes in a single lead, requiring much more complex programming of these multiple contacts.

*See Atlas of Implantable Therapies for Pain Management, 2<sup>nd</sup> Edition, 2016 (Timothy Deer, MD and Jason Pope, MD, Eds.).*

## 2. Change in Patient Population

The patient population has changed as the ability to stimulate and provide better analgesia to cranial and peripheral nerves throughout the nervous system has become possible using the new multi-contact technology. The current patient population is much more complex. The current procedure is for the treatment of patients with very severe nerve injuries and intractable pain in a variety of nerves. Many of the nerves we are stimulating today were not approachable with previous techniques and equipment (i.e. – may require image guidance for nerve localization). It is important to note that this technology is an alternative to using opioids for pain management.

## 3. Flawed Process used for Original Valuation

The original valuation by Hsiao for 64553 and 64555 was based on responses from a small group of general surgeons. – not by physicians who perform these procedures today.

Given the change in technique, patient population, site of service, and the flawed process used for the original valuation, we believe the criteria for compelling evidence have been met.

### **Work RVU Recommendation**

We are recommending the 25<sup>th</sup> percentile survey value of 5.76 RVW for 64555.

### **Pre-time and Post-time Packages**

Pre-time package 1a (Straightforward Patient/Straightforward Procedure, No anesthesia care) is recommended with no changes to the package times.

Post-time package 7a (Local Anesthesia/ Straightforward Procedure) is recommended with no change to package time.

### **Clinical Comparison with Key Reference**

The key reference service 63650 (Percutaneous implantation of neurostimulator electrode array, epidural), surveyed in 2010, has a RVW of 7.16, and was chosen by 74% of survey respondents. This key reference service is similar to 64555 in the sense that it is a percutaneous implantation of a neurostimulator electrode array used for relief of chronic intractable pain. Both procedures are placements of a lead by a physician via percutaneous approach.

### **Work Comparison with Key Reference**

The work of 64555 is similar to that of 63650 (Percutaneous implantation of neurostimulator electrode array, epidural). Both procedures require the advancement of a needle along the intended nerve and maintaining the proper depth of insertion as the needle is advanced. Both procedures require 60 minutes of intra-time and there is a half day discharge for both services. The difference between these codes is the total time, 63650 has a total time of 170 min. and we are recommending a total time of 140 min. for 64555; this difference can be accounted for in the development of the standardized pre- and post-service packages; 63650 was last reviewed in 2010 before the standard packages were developed.

### **Summary**

Based on comparisons to the key reference service, which has similar work, the multispecialty consensus panel recommends the survey 25<sup>th</sup> percentile value of 5.76 is appropriate for 64555.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64555

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Sometimes

Specialty Neurosurgery How often? Sometimes

Specialty PMR How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8,200

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. From 2015 Claims data

Specialty Anesthesiology	Frequency 1324	Percentage 16.14 %
--------------------------	----------------	--------------------

Specialty Neurosurgery	Frequency 303	Percentage 3.69 %
------------------------	---------------	-------------------

Specialty PMR	Frequency 1081	Percentage 13.18 %
---------------	----------------	--------------------

Do many physicians perform this service across the United States? No

---

**Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Musculoskeletal

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64555

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

64553 Percutaneous implantation of neurostimulator electrode array; cranial nerve

Global Period: 10 Meeting Date: April 2015

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

RUC Advisors from each specialty society involved in this survey process reviewed the practice expense recommendations and approved them.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes.  
Reference Code Rationale:

These codes are being revised so we are using 64553 as our reference code.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: NA
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

**Compelling Evidence**

The surveying specialty societies will be recommending changes to both codes to correct inaccuracies in the database. We are recommending an increase in clinical labor time and supplies. Clinical labor time increase in PE is a result of the recommended increase in the intra-service time of 64553. The increase in supplies is a result of inaccurate inputs. We will therefore argue compelling evidence based on two criteria: flawed methodology and clinical labor time.

1. **Flawed methodology**

Code 64553 is Harvard valued and has never been subject to physician work reviewed since the fee schedule was implemented. The Harvard study never surveyed a specialty society for accurate inputs or clinical labor time. Based on this flawed methodology we recommend revaluing this code.

2. **Clinical Labor Time**

Code 64553 currently has 95 minutes of clinical labor time; we are recommending, based on our survey 133 minutes of clinical labor; the flawed Harvard methodology created inaccurate time inputs for this service.

**Specialty Society(s)** American Academy of Physical Medicine and Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), North American Spine Society (NASS), and American Association of Neurological Surgeons and Congress of Neurological Surgeons (AANS-CNS)

Clinical staff assists the physician throughout the entire procedure. The percutaneous implantation of the neurostimulator electrode array into the cranial nerve requires identification of the appropriate skin and bony landmarks and locating pertinent vascular structures. After identifying and marking the intended target along the course of the nerve, the skin around the planned entry point is injected with local anesthetic. Next, an epidural needle is advanced along the intended course of the nerve, maintaining the proper depth of insertion as the needle is advanced. Fluoroscopy is used to verify final needle position (separately reportable). The physician guides a percutaneous electrode array into the epidural needle and verifies final location with fluoroscopy and then removes the epidural needle and attaches the exposed end of the electrode array to an external stimulator unit. A technician that is in the room assisting the physician the entire time, tests various electrode combinations while the lead is physically relocated by the physician until the patient indicates that the dermatomal areas of his typical pain have been covered with the paresthesias generated by the stimulator. The lead impedances must be checked. And then the external unit must be detached, remove the needle and stylet, and anchor the lead to the skin. The wound must be covered with a sterile occlusive dressing and lead reconnected to the external stimulator unit. And a final fluoroscopic image must be obtained to document final placement.

#### **Clinical Staff Recommendation**

We are recommending a clinical labor time of 133 min.

#### **Supplies Recommendation**

We are recommending the addition of SA022, kit, percutaneous neuro test stimulation and SC029 needle, 18-27g.

5. Please describe in detail the clinical activities of your staff:

#### Pre-Service Clinical Labor Activities:

N/A

#### Intra-Service Clinical Labor Activities:

Assist physician throughout the procedure and performs testing of various electrode combinations. Check lead impedances.

#### Post-Service Clinical Labor Activities:

Three minutes to clean the room and equipment

Five minutes to check dressings and wound, provide follow-up information and patient education/teaching as appropriate based upon the visit

Confers with the MD verbally for any last minute instructions for patient.

Next day, follow-up phone call to patient.

**Specialty Society(s)** American Academy of Physical Medicine and Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), North American Spine Society (NASS), and American Association of Neurological Surgeons and Congress of Neurological Surgeons (AANS-CNS)

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

64555 Percutaneous implantation of neurostimulator electrode array; peripheral nerve (excludes sacral nerve)

Global Period: 10 Meeting Date: April 2015

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: RUC Advisors from each specialty society involved in this survey process reviewed the practice expense recommendations and approved them.
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: These codes are being revised so we are using 64555 as our reference code.
3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

**Compelling Evidence**

The surveying specialty societies will be recommending changes to both codes to correct inaccuracies in the database. We are recommending an increase in clinical labor time and supplies. Clinical labor time increase in PE is a result of the recommended increase in the intra-service time of 64555. The increase in supplies is a result of inaccurate inputs. We will therefore argue compelling evidence based on two criteria: flawed methodology and physician time.

**1. Flawed methodology**

Code 64555 is Harvard valued and has never been subject to physician work reviewed since the fee schedule was implemented. The Harvard study never surveyed a specialty society for accurate inputs or clinical labor time. Based on this flawed methodology we recommend changes to the inaccuracies in the PE inputs.

**2. Clinical Labor Time**

Code 64555 currently has 95 minutes of clinical labor time; we are recommending, based on our survey 118 minutes of clinical labor; the flawed Harvard methodology created inaccurate time inputs for this service.

Clinical staff assists the physician throughout the entire procedure. The percutaneous implantation of the neurostimulator electrode array into the cranial nerve requires identification of the appropriate skin and bony landmarks and locating pertinent vascular structures. After identifying

**Specialty Society(s)** American Academy of Physical Medicine and Rehabilitation (AAPM&R), American Society of Anesthesiologists (ASA), North American Spine Society (NASS), and American Association of Neurological Surgeons and Congress of Neurological Surgeons (AANS-CNS).

and marking the intended target along the course of the nerve, the skin around the planned entry point is injected with local anesthetic. Next, an epidural needle is advanced along the intended course of the nerve, maintaining the proper depth of insertion as the needle is advanced. Fluoroscopy is used to verify final needle position (separately reportable). The physician guides a percutaneous electrode array into the epidural needle and verifies final location with fluoroscopy and then removes the epidural needle and attaches the exposed end of the electrode array to an external stimulator unit. A technician that is in the room assisting the physician the entire time, tests various electrode combinations while the lead is physically relocated by the physician until the patient indicates that the dermatomal areas of his typical pain have been covered with the paresthesias generated by the stimulator. The lead impedances must be checked. And then the external unit must be detached, remove the needle and stylet, and anchor the lead to the skin. The wound must be covered with a sterile occlusive dressing and lead reconnected to the external stimulator unit. And a final fluoroscopic image must be obtained to document final placement.

**Clinical Staff Recommendation**

We are recommending a clinical labor time of 118 min.

**Supplies Recommendation**

We are recommending the addition of SA022, kit, percutaneous neuro test stimulation.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

Assist physician throughout the procedure and performs testing of various electrode combinations. Check lead impedances.

Post-Service Clinical Labor Activities:

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2017

### Nerve Repair with Nerve Allograft

The CPT Editorial Panel created two new Category I codes to report the repair of a nerve using a nerve allograft. Codes 64910 and 64911 were added as family codes for review.

#### **64910 Nerve repair; with synthetic conduit or vein allograft (eg, nerve tube), each nerve**

The RUC reviewed the survey results from 63 hand surgeons and plastic surgeons and agreed on the following physician time components: 33 minutes of pre-service evaluation time, 10 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, intra-service time of 75 minutes, immediate post-time of 20 minutes, one-half discharge day management (0.5 x 99238), 3 x 99213 post-op office visits and 1 x 99212 post-op office visit. The specialty societies explained that the 4 post-op office visits include the following physician work: Patient and family questions about surgery outcome and progress are answered. The dressings are removed and the wound is assessed for any signs of infection or edema. The neurovascular status is assessed. The range of motion of the wrist, fingers and thumb are evaluated. The presence of a progressing Tinel's sign is evaluated. Dressings and a splint are reapplied to the wound. At the first visit, a therapy prescription is generated for the fabrication of a custom splint that will protect the nerve repair while allowing gentle protected range of motion of the wrist, fingers and thumb. If necessary an outside therapist will be contacted to discuss the postoperative regimen. At subsequent visits, the interval therapy report is reviewed and signed. Additional therapy recommendations will be prescribed, as appropriate. Sutures will be removed at the second or third visit, as appropriate. Scar control techniques are demonstrated. Pain is assessed at each visit and medication is ordered as necessary. The chart note and letter to the PCP/referring physician are completed at each visit. Disability documentation, if needed, is completed at each visit.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 10.52 which is less than the current work RVU and agreed that this value correctly accounts for the physician work involved in performing this service. To justify a work RVU of 10.52, the RUC compared the survey code to top key reference code 64831 *Suture of digital nerve, hand or foot; 1 nerve* (work RVU of 9.16, intra-service time of 60 minutes, total time of 237 minutes) and noted that the survey code includes more intra-service and total time. Both services have a near identical IWP/UT which is consistent since both services involve a similar intensity of physician work. To further support a work RVU of 10.52, the RUC referenced code 36821 *Arteriovenous anastomosis, open; direct, any site (eg, Cimino type) (separate procedure)* (work RVU = 11.90, intra-time 75 minutes, total time = 233 minutes). **The RUC recommends a work RVU of 10.52 for CPT code 64910.**

**64911 Nerve repair; with autogenous vein graft (includes harvest of vein graft), each nerve**

The RUC reviewed the survey results from 35 hand surgeons and plastic surgeons for this rarely performed procedure and agreed on the following physician time components: 33 minutes of pre-service evaluation time, 10 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, intra-service time of 110 minutes, immediate post-time of 20 minutes, one-half discharge day management (0.5 x 99238), 3 x 99213 post-op office visits and 1 x 99212 post-op office visit. The specialty societies explained that the 4 post-op office visits include the following physician work: Patient and family questions about surgery outcome and progress are answered. The dressings are removed and both wounds are assessed for any signs of infection or edema. The neurovascular status is assessed. The range of motion of the wrist, fingers and thumb are evaluated. The presence of a progressing Tinel's sign is evaluated. Dressings are reapplied to both wounds and splint is applied. At the first visit, a therapy prescription is generated for the fabrication of a custom splint that will protect the nerve repair while allowing gentle protected range of motion of the wrist, fingers and thumb. If necessary an outside therapist will be contacted to discuss the postoperative regimen. At subsequent visits, the interval therapy report is reviewed and signed. Additional therapy recommendations will be prescribed, as appropriate. Sutures will be removed at the second or third visit, as appropriate. Scar control techniques are demonstrated. Pain is assessed at each visit and medication is ordered as necessary. The chart note and letter to the PCP/referring physician are completed at each visit. Disability documentation, if needed, is completed at each visit.

The RUC reviewed the survey median work RVU of 14.00 which is less than the current work RVU and agreed that this value correctly accounts for the physician work involved in performing this service. To justify a work RVU of 14.00, the RUC compared the survey code to MPC code 52649 *Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)* (work RVU of 14.56, intra-service time of 120 minutes, total time of 279 minutes) and noted that although the reference code has more intra-service time, the survey code includes more total time. To further support a work RVU of 14.00, the RUC compared the survey code to CPT code 58543 *Laparoscopy, surgical, supracervical hysterectomy, for uterus greater than 250 g;* (work RVU of 14.39, intra-service time of 110 minutes, total time of 261 minutes) and noted that both services have identical intra-service time whereas the survey code includes more total time. **The RUC recommends a work RVU of 14.00 for CPT code 64911.**

**64912 Nerve repair; with nerve allograft, each nerve, first strand (cable)**

The RUC reviewed the survey results from 65 hand surgeons and plastic surgeons and agreed on the following physician time components: 33 minutes of pre-service evaluation time, 10 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, intra-service time of 90 minutes, immediate post-time of 20 minutes, one-half discharge day management (0.5 x 99238), 3 x 99213 post-op office visits and 1 x 99212 post-op office visit. The specialty societies explained that the 4 post-op office visits include the following physician work: Patient and family questions about surgery outcome and progress are answered. The dressings are removed and the wound is assessed for any signs of infection or edema. The neurovascular status is assessed. The range of motion of the wrist, fingers and thumb are evaluated. The presence of a progressing Tinel's sign is evaluated. Dressings and a splint are reapplied. At the first visit, a therapy prescription is generated for the fabrication of a custom splint that will protect the nerve repair while allowing gentle protected range of motion of the wrist, fingers and thumb. If necessary an outside therapist will be contacted to discuss the postoperative regimen. At subsequent visits, the interval therapy report is reviewed and signed. Additional therapy

recommendations will be prescribed, as appropriate. Sutures will be removed at the second or third visit, as appropriate. Scar control techniques are demonstrated. Pain is assessed at each visit and medication is ordered as necessary. The chart note and letter to the PCP/referring physician are completed at each visit. Disability documentation, if needed, is completed at each visit.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 12.00 and agreed that this value correctly accounts for the physician work involved in performing this service. To justify a work RVU of 12.00, the RUC compared the survey code to MPC code 53445 *Insertion of inflatable urethral/bladder neck sphincter, including placement of pump, reservoir, and cuff* (work RVU of 13.00, intra-service time of 90 minutes, total time of 314 minutes) and noted that both services have identical intra-service time whereas the reference code involves somewhat more total time. To further support a work RVU of 12.00, the RUC compare the survey code to MPC code 47563 *Laparoscopy, surgical; cholecystectomy with cholangiography* (work RVU of 11.47, intra-service time of 90 minutes, total time of 238 minutes, and noted that both services have identical intra-service times whereas the survey code includes more total time, and a somewhat higher valuation for the survey code is warranted. **The RUC recommends a work RVU of 12.00 for CPT code 64912.**

#### **64913 Nerve repair; with nerve allograft, each additional strand (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 36 hand surgeons and plastic surgeons and agreed on the following physician time components: intra-service time of 30 minutes.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 3.00 and agreed this value correctly accounts for the physician work involved in performing this service. To justify a work RVU of 3.00, the RUC compared the survey code to CPT code 15157 *Tissue cultured skin autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU of 3.00, intra-service time of 30 minutes) and noted that both services have identical times and involve a similar amount of physician work. To further support a value of 3.00, the RUC compared the survey code to top key reference code 14302 *Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU of 3.73, intra-service time of 40 minutes) and noted that the reference code includes more intra-service time and has a higher work RVU, though 93 percent of survey respondents indicated that the survey code is a more intense service to perform, supporting the somewhat higher IWPUT for the survey code and the recommended work RVU. **The RUC recommends a work RVU of 3.00 for CPT code 64913.**

#### **Practice Expense**

The Practice Expense Subcommittee reduced the amount of equipment time for the power table, as the 4<sup>th</sup> office visit would typically use a chair instead of a table. The Subcommittee also reduced the amount of equipment time for the exam light as it is typically only used for the first two office visits. The RUC reviewed and approved the direct practice expense inputs as modified by the Practice Expense Subcommittee.

**New Technology**

CPT codes 64912 and 64913 will be placed on the New Technology list to be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Nervous System Extracranial Nerves, Peripheral Nerves, and Autonomic Nervous System Neurorrhaphy With Nerve Graft, Vein Graft, and Conduit</b>				
(f) 64910	AA1	Nerve repair; with synthetic conduit or vein allograft (eg, nerve tube), each nerve	090	10.52
(f) 64911	AA2	with autogenous vein graft (includes harvest of vein graft), each nerve  (Do not report 69990 in addition to 64910, 64911)	090	14.00
●64912	AA3	with nerve allograft, each nerve, first strand (cable)	090	12.00
●+64913	AA4	with nerve allograft, each additional strand (List separately in addition to code for primary procedure)  (Use 64913 in conjunction with 64912)  (Do not report 69990 in conjunction with 64912, 64913)	ZZZ	3.00

### **Operating Microscope**

The surgical microscope is employed when the surgical services are performed using the techniques of microsurgery. Code 69990 should be reported (without modifier 51 appended) in addition to the code for the primary procedure performed. Do not use 69990 for visualization with magnifying loupes or corrected vision. Do not report 69990 in addition to procedures where use of the operating microscope is an inclusive component (15756-15758, 15842, 19364, 19368, 20955-20962, 20969-20973, 22551, 22552, 22856-22861, 26551-26554, 26556, 31526, 31531, 31536, 31541, 31545, 31546, 31561, 31571, 43116, 43180, 43496, 46601, 46607, 49906, 61548, 63075-63078, 64727, 64820-64823, 64912, 64913, 65091-68850, 0184T, 0308T, 0402T).

**+ 69990**      *Microsurgical techniques, requiring use of operating microscope (List separately in addition to code for primary procedure)*

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64910      Tracking Number   AA1

Original Specialty Recommended RVU: **10.52**Presented Recommended RVU: **10.52**

Global Period: 090

RUC Recommended RVU: **10.52**

CPT Descriptor: Nerve repair; with synthetic conduit or vein allograft (eg, nerve tube), each nerve

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 2 cm gap in the median nerve in the forearm in a 26-year-old man is repaired with a synthetic nerve conduit using microsurgical technique.

Percentage of Survey Respondents who found Vignette to be Typical: 59%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 47% , In the ASC 59%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 85% , Overnight stay-less than 24 hours 15% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Orders for preoperative medications are written, and results of preadmission testing, including lab results and imaging studies, are reviewed. The planned procedure and postoperative management are reviewed with the patient and the patient's family. The patient is reexamined to make sure physical findings have not changed. The patient's history and physical is updated. The operative site is marked, and the proposed skin incision(s) is confirmed with the patient. Informed consent is obtained. The length and type of anesthesia is reviewed with the anesthesiologist. The availability of all required supplies, instruments and synthetic conduit is verified. The patient is transferred from the gurney and positioned on the operating room table. Bony prominences are padded and thermal regulation drapes are applied. The position of the extremities and head is assessed and adjusted as needed. The patient's arm is placed on the hand surgery table. A tourniquet is applied to the proximal arm, and areas of the skin to be prepped are indicated. The surgeon scrubs and gowns. The arm and hand are prepped and draped. The arm is elevated and exsanguinated. The pneumatic tourniquet is inflated. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: An incision is made over site of the nerve injury and dissection is carried out to expose the median nerve ends. The operating microscope is brought into position and the ends of the median nerve are freshened. The diameter of the nerve is measured as well as the size of the gap between nerve ends. An appropriately sized synthetic conduit is selected. The conduit is placed in the nerve gap and each end of the nerve is sutured inside the conduit using microsurgical technique. The wound is irrigated and closed in layers.

Description of Post-Service Work: A sterile dressing and a dorsal forearm-wrist-hand splint are applied. The outcome of the surgery is discussed with the patient's family, and a brief operative note is written. Patient stabilization and the neurovascular status of the operated extremity are monitored in the recovery room. After the patient is awake, the outcome of the surgery is discussed with the patient. An operative report is dictated and medical record documentation is completed. Aftercare treatment, including home restrictions (ie, activity, bathing) and use of a sling, is discussed with the patient, the patient's family, and other healthcare professionals. Medications are reconciled and orders for discharge medications are written. A discharge summary and instructions are completed.

The patient is examined in the office within a few days of surgery and for several more visits within and possibly beyond the 90-day global period. Patient and family questions about surgery outcome and progress are answered. The dressings are removed and the wound is assessed for any signs of infection or edema until healed. The neurovascular status is assessed. The range of motion of the wrist, fingers and thumb are evaluated. The presence of a progressing Tinel's sign is evaluated.

Dressings are reapplied. At the first visit, a therapy prescription is generated for the fabrication of a splint that will protect the nerve repair while allowing gentle protected range of motion of the wrist, fingers and thumb. If necessary an outside therapist will be contacted to discuss the postoperative regimen. At subsequent visits, the interval therapy report is reviewed and signed. Additional therapy recommendations will be prescribed, as appropriate. Sutures will be removed at the second or third visit, as appropriate. Scar control techniques are demonstrated. Pain is assessed at each visit and medication is ordered as necessary. The chart note and letter to the PCP/referring physician are completed at each visit. Disability documentation, if needed, is completed at each visit.

**INTENSITY/COMPLEXITY MEASURES**

*(of those that selected Key Reference codes)*

*Survey respondents are rating the survey code relative to the key reference code.*

**Intensity & Complexity Rating Scale:** (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	<b><u>Top Key Ref Code</u></b>	<b><u>2<sup>nd</sup> Key Ref Code</u></b>
<b><u>Mental Effort and Judgment (Mean)</u></b>		
The number of possible diagnosis and/or the number of management options that must be considered	0.50	0.56
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.44	0.56
Urgency of medical decision making	0.50	0.33

**Technical Skill/Physical Effort (Mean)**

Technical skill required	0.81	0.67
Physical effort required	0.56	0.44

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality	0.44	0.11
---	------	------

Outcome depends on the skill and judgment of physician	0.63	0.33
--	------	------

Estimated risk of malpractice suit with poor outcome	0.31	0.33
--	------	------

**INTENSITY/COMPLEXITY MEASURES****Top Key  
Ref Code****2<sup>nd</sup> Key  
Ref Code****Time Segment (Mean)**

Overall intensity/complexity	0.63	0.44
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

The CPT Editorial Panel approved two new Category I codes to report the repair of a nerve using a nerve allograft. Codes 64910 and 64911 were added by the RUC as family codes for RUC review.

**Survey Process**

The ASSH and ASPS conducted a RUC survey of members that were randomly selected from their membership databases.

**Recommendation**

We recommend the survey 25<sup>th</sup> percentile work RVU of 10.52 which is less than the current work RVU. This value takes into account a slight decrease in intraoperative time and compares well with the key reference codes and MPC codes.

**Pre-time Package**

We recommend Pre-Time Package 3 (Straightforward Patient/Difficult Procedure) with an additional 7 minutes for positioning time that includes padding of bony prominences; application of thermal regulation drapes; assessing position of the extremities and head and adjusting as needed; rotating patient onto hand surgery table; marking, prepping and draping hand; application of tourniquet to the proximal arm; elevating and exsanguinating arm; and inflating pneumatic tourniquet. A total of 10 minutes for upper extremity positioning is supported by RUC reviewed upper extremity codes 23656-26358 (2015), 25607-25609 (2014) and 36831 (2013).

**Immediate Post-Time Package**

We recommend Post-Service Time Package 9b (General Anesthesia or Complex Regional Block/Complex Procedure). Package time is reduced by 13 minutes to be consistent with survey median.

**Reference Code Comparison**

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64910

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty hand surgery                      How often? Sometimes

Specialty orthopaedic surgery                      How often? Rarely

Specialty plastic surgery                      How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency is not known

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 896  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty hand surgery	Frequency 350	Percentage 39.06 %
Specialty orthopaedic surgery	Frequency 225	Percentage 25.11 %
Specialty plastic surgery	Frequency 175	Percentage 19.53 %

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64910

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64911      Tracking Number   AA2

Original Specialty Recommended RVU: **14.00**Presented Recommended RVU: **14.00**

Global Period: 090

RUC Recommended RVU: **14.00**

CPT Descriptor: Nerve repair; with autogenous vein graft (includes harvest of vein graft), each nerve

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 2 cm gap in the median nerve in the forearm in a 26-year-old man is repaired with an interposition vein graft using microsurgical technique.

Percentage of Survey Respondents who found Vignette to be Typical: 57%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 54% , In the ASC 46%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 84% , Overnight stay-less than 24 hours 16% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Orders for preoperative medications are written, and results of preadmission testing, including lab results and imaging studies, are reviewed. The planned procedure and postoperative management are reviewed with the patient and the patient's family. The patient is reexamined to make sure physical findings have not changed. The patient's history and physical is updated. The operative sites are marked, and the proposed skin incisions are confirmed with the patient. Informed consent is obtained. The length and type of anesthesia is reviewed with the anesthesiologist. The availability of all required supplies and instruments is verified. The patient is transferred from the gurney and positioned on the operating room table. Bony prominences are padded and thermal regulation drapes are applied. The position of the extremities and head is assessed and adjusted as needed. The patient's arm is placed on the hand surgery table. A tourniquet is applied to the proximal arm, and areas of the skin to be prepped are indicated. The surgeon scrubs and gowns. The arm and hand are prepped and draped. The arm is elevated and exsanguinated. The pneumatic tourniquet is inflated. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: An incision is made over the area of the nerve injury and the median nerve ends are exposed. The operating microscope is brought into position and the ends of the median nerve are freshened. The diameter of the nerve is measured as well as the size of the gap between nerve ends. A second incision is made, either on the dorsal or palmar aspect of the forearm and the vein graft is harvested. The vein graft donor site is then closed in layers. The vein graft is then placed between the nerve ends which are sutured inside the graft using microsurgical technique. The wound is irrigated and closed in layers.

Description of Post-Service Work: A sterile dressing is applied to both wounds and a dorsal forearm-wrist-hand splint are applied. The outcome of the surgery is discussed with the patient's family, and a brief operative note is written. Patient stabilization and the neurovascular status of the operated extremity are monitored in the recovery room. After the patient is awake, the outcome of the surgery is discussed with the patient. An operative report is dictated and medical record documentation is completed. Aftercare treatment, including home restrictions (ie, activity, bathing) and use of a sling, is discussed with the patient, the patient's family, and other healthcare professionals. Medications are reconciled and orders for discharge medications are written. A discharge summary and instructions are completed.

The patient is examined in the office within a few days of surgery and for several more visits within and possibly beyond the 90-day global period. Patient and family questions about surgery outcome and progress are answered. The dressings are removed and both wounds are assessed for any signs of infection or edema until healed. The neurovascular status is

assessed. The range of motion of the wrist, fingers and thumb are evaluated. The presence of a progressing Tinel's sign is evaluated. Dressings are reapplied to both wounds. At the first visit, a therapy prescription is generated for the fabrication of a splint that will protect the nerve repair while allowing gentle protected range of motion of the wrist, fingers and thumb. If necessary an outside therapist will be contacted to discuss the postoperative regimen. At subsequent visits, the interval therapy report is reviewed and signed. Additional therapy recommendations will be prescribed, as appropriate. Sutures will be removed at the second or third visit, as appropriate. Scar control techniques are demonstrated. Pain is assessed at each visit and medication is ordered as necessary. The chart note and letter to the PCP/referring physician are completed at each visit. Disability documentation, if needed, is completed at each visit.

Ref Code****2<sup>nd</sup> Key  
Ref Code****Time Segment (Mean)**

Overall intensity/complexity	0.92	1.20
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

The CPT Editorial Panel approved two new Category I codes to report the repair of a nerve using a nerve allograft. Codes 64910 and 64911 were added by the RUC as family codes for RUC review.

**Survey Process**

The ASSH and ASPS conducted a RUC survey of members that were randomly selected from their membership databases.

**Recommendation**

We recommend the survey median work RVU of 14.00 which is less than the current work RVU. This value takes into account a decrease in intraoperative time and compares well with the key reference codes and MPC codes.

**Pre-time Package**

We recommend Pre-Time Package 3 (Straightforward Patient/Difficult Procedure) with an additional 7 minutes for positioning time that includes padding of bony prominences; application of thermal regulation drapes; assessing position of the extremities and head and adjusting as needed; rotating patient onto hand surgery table; marking, prepping and draping hand; application of tourniquet to the proximal arm; elevating and exsanguinating arm; and inflating pneumatic tourniquet. A total of 10 minutes for upper extremity positioning is supported by RUC reviewed upper extremity codes 23656-26358 (2015), 25607-25609 (2014) and 36831 (2013).

**Immediate Post-Time Package**

We recommend Post-Service Time Package 9b (General Anesthesia or Complex Regional Block/Complex Procedure). Package time is reduced by 13 minutes to be consistent with survey median.

**Reference Code Comparison**

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64912      Tracking Number   AA3

Original Specialty Recommended RVU: **12.00**

Global Period: 090

Presented Recommended RVU: **12.00**RUC Recommended RVU: **12.00**

CPT Descriptor: Nerve repair; with nerve allograft, each nerve, first strand (cable)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient with a 2 cm gap in the median nerve in the forearm undergoes repair with a nerve allograft using microsurgical technique.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 52% , In the ASC 48%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 71% , Overnight stay-less than 24 hours 29% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Orders for preoperative medications are written, and results of preadmission testing, including lab results and imaging studies, are reviewed. The planned procedure and postoperative management are reviewed with the patient and the patient's family. The patient is reexamined to make sure physical findings have not changed. The patient's history and physical is updated. The operative site is marked, and the proposed skin incision(s) is confirmed with the patient. Informed consent is obtained. The length and type of anesthesia is reviewed with the anesthesiologist. The availability of all required supplies, instruments and nerve allograft is verified. Patient positioning, padding of bony prominences, and the application of thermal regulation drapes are monitored. The position of the extremities and head is assessed and adjusted as needed. The patient's arm is placed on the hand surgery table. A tourniquet is applied to the proximal arm, and areas of the skin to be prepped are indicated. The surgeon scrubs and gowns. The arm and hand are prepped and draped. The arm is elevated and exsanguinated. The pneumatic tourniquet is inflated. A surgical "time out" is performed with the operating surgical team.

Description of Intra-Service Work: An incision is made over the site of the nerve injury and dissection is carried out to expose the median nerve ends. The operating microscope is brought into position and the ends of the median nerve are freshened. The diameter of the nerve is measured as well as the size of the gap between nerve ends. An appropriately sized nerve allograft is selected. The allograft is placed in the nerve gap. The fascicular alignment of the proximal nerve stump is evaluated and matched to that of the nerve allograft. Microsurgical technique is used to anastomose the proximal nerve stump to the proximal nerve allograft. The fascicular alignment of the distal nerve stump is evaluated and matched to that of the nerve allograft. Microsurgical technique is used to anastomose the distal proximal nerve stump to the distal nerve allograft. The wound is irrigated and closed in layers.

Description of Post-Service Work: A sterile dressing and a dorsal forearm-wrist-hand splint are applied. The outcome of the surgery is discussed with the patient's family, and a brief operative note is written. Patient stabilization and the neurovascular status of the operated extremity are monitored in the recovery room. After the patient is awake, the outcome of the surgery is discussed with the patient. An operative report is dictated and medical record documentation is completed. Aftercare treatment, including home restrictions (ie, activity, bathing) and use of a sling, is discussed with the patient, the patient's family, and other healthcare professionals. Medications are reconciled and orders for discharge medications are written. A discharge summary and instructions are completed.

The patient is examined in the office within a few days of surgery and for several more visits within and possibly beyond the 90-day global period. Patient and family questions about surgery outcome and progress are answered. The dressings are removed and the wound is assessed for any signs of infection or edema until healed. The neurovascular status is assessed. The range of motion of the wrist, fingers and thumb are evaluated. The presence of a progressing Tinel's sign is evaluated. Dressings are reapplied. At the first visit, a therapy prescription is generated for the fabrication of a splint that will protect the nerve repair while allowing gentle protected range of motion of the wrist, fingers and thumb. If necessary an outside therapist will be contacted to discuss the postoperative regimen. At subsequent visits, the interval therapy report is reviewed and signed. Additional therapy recommendations will be prescribed, as appropriate. Sutures will be removed at the second or third visit, as appropriate. Scar control techniques are demonstrated. Pain is assessed at each visit and medication is ordered as necessary. The chart note and letter to the PCP/referring physician are completed at each visit. Disability documentation, if needed, is completed at each visit.

**SURVEY DATA**

RUC Meeting Date (mm/yyyy)		01/2017			
Presenter(s):	Anne Miller, MD; Mark Villa, MD

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? Yes

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
25609	090	14.38	RUC Time

CPT Descriptor Open treatment of distal radial intra-articular fracture or epiphyseal separation; with internal fixation of 3 or more fragments

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
64831	090	9.16	RUC Time

CPT Descriptor Suture of digital nerve, hand or foot; 1 nerve

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
47563	090	11.47	RUC Time	46,546

**INTENSITY/COMPLEXITY MEASURES**

*(of those that selected Key Reference codes)*

Survey respondents are rating the survey code relative to the key reference code.

**Intensity & Complexity Rating Scale:** (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	<u>Top Key Ref Code</u>	<u>2<sup>nd</sup> Key Ref Code</u>
<b><u>Mental Effort and Judgment (Mean)</u></b>		
The number of possible diagnosis and/or the number of management options that must be considered	0.96	0.91
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.57	0.55
Urgency of medical decision making	0.61	0.09

**Technical Skill/Physical Effort (Mean)**

Technical skill required	1.13	0.55
Physical effort required	0.78	0.64

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality	0.57	0.36
---	------	------

Outcome depends on the skill and judgment of physician	1.04	0.73
--	------	------

Estimated risk of malpractice suit with poor outcome	0.65	0.55
--	------	------

**INTENSITY/COMPLEXITY MEASURES****Top Key  
Ref Code****2<sup>nd</sup> Key  
Ref Code****Time Segment (Mean)**

Overall intensity/complexity	1.00	1.00
------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

The CPT Editorial Panel approved two new Category I codes to report the repair of a nerve using a nerve allograft. Codes 64910 and 64911 were added by the RUC as family codes for RUC review.

**Survey Process**

The ASSH and ASPS conducted a RUC survey of members that were randomly selected from their membership databases.

**Recommendation**

We recommend the survey 25<sup>th</sup> percentile work RVU of 12.00. This value compares well with the key reference codes and MPC codes.

**Pre-time Package**

We recommend Pre-Time Package 3 (Straightforward Patient/Difficult Procedure) with an additional 7 minutes for positioning time that includes padding of bony prominences; application of thermal regulation drapes; assessing position of the extremities and head and adjusting as needed; rotating patient onto hand surgery table; marking, prepping and draping hand; application of tourniquet to the proximal arm; elevating and exsanguinating arm; and inflating pneumatic tourniquet. A total of 10 minutes for upper extremity positioning is supported by RUC reviewed upper extremity codes 23656-26358 (2015), 25607-25609 (2014) and 36831 (2013).

**Immediate Post-Time Package**

We recommend Post-Service Time Package 9b (General Anesthesia or Complex Regional Block/Complex Procedure). Package time is reduced by 13 minutes to be consistent with survey median.

**Reference Code Comparison**

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64999 Unlisted procedure, nervous system

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty hand surgery                      How often? Sometimes

Specialty orthopaedic surgery                      How often? Sometimes

Specialty plastic surgery                      How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 4000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate based on manufacturer sales data

Specialty hand surgery	Frequency 1200	Percentage 30.00 %
Specialty orthopaedic surgery	Frequency 1200	Percentage 30.00 %
Specialty plastic surgery	Frequency 1200	Percentage 30.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 750  
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate.

Specialty hand surgery	Frequency 225	Percentage 30.00 %
Specialty orthopaedic surgery	Frequency 225	Percentage 30.00 %
Specialty plastic surgery	Frequency 225	Percentage 30.00 %

Do many physicians perform this service across the United States? Yes

---

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Other

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64910

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64913      Tracking Number   AA4

Original Specialty Recommended RVU: **3.00**Presented Recommended RVU: **3.00**

Global Period: ZZZ

RUC Recommended RVU: **3.00**

CPT Descriptor: Nerve repair; with nerve allograft, each additional strand (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient presents with a 2 cm gap in a large diameter median nerve in the forearm. Repair with two nerve allografts is necessary due to a size mismatch between the native and allograft nerves or to separately match the sensory and motor fascicles of the native nerve. After insertion of the first nerve allograft (reported separately), a second nerve allograft is inserted using microsurgical technique. [Note: This is an add-on code for the additional work related to insertion of an additional nerve allograft for the same nerve. The work related to the first nerve allograft is reported separately as the primary procedure and not included in the work of this add-on code.]

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: After insertion of the first nerve allograft (reported separately), an appropriately sized additional nerve allograft is selected. The allograft is placed in the nerve gap. The fascicular alignment of the proximal nerve stump is evaluated and matched to that of the nerve allograft. Microsurgical technique is used to anastomose the proximal nerve stump to the proximal nerve allograft. The fascicular alignment of the distal nerve stump is evaluated and matched to that of the nerve allograft. Microsurgical technique is used to anastomose the distal proximal nerve stump to the distal nerve allograft.

Description of Post-Service Work: N/A

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? Yes

**TOP KEY REFERENCE SERVICE:**

Key CPT Code	Global	Work RVU	Time Source
14302	<u>ZZZ</u>	3.73	<u>RUC Time</u>

CPT Descriptor Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)

**SECOND HIGHEST KEY REFERENCE SERVICE:**

Key CPT Code	Global	Work RVU	Time Source
11008	<u>ZZZ</u>	5.00	<u>RUC Time</u>

CPT Descriptor Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection) (List separately in addition to code for primary procedure)

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
36227	<u>ZZZ</u>	2.09	<u>RUC Time</u>	9,909

CPT Descriptor 1 Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
63048	<u>ZZZ</u>	3.47	<u>RUC Time</u>	134,208

CPT Descriptor 2 Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
15157	<u>ZZZ</u>	3.00	<u>RUC Time</u>

CPT Descriptor Tissue cultured skin autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)

**RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Top Key Reference Code: 14      % of respondents: 38.8 %**

**Number of respondents who choose 2<sup>nd</sup> Key Reference Code: 8      % of respondents: 22.2 %**

**TIME ESTIMATES (Median)**

	<b>CPT Code: <u>64913</u></b>	<b>Top Key Reference CPT Code: <u>14302</u></b>	<b>2nd Key Reference CPT Code: <u>11008</u></b>
Median Pre-Service Time	0.00	0.00	0.00
Median Intra-Service Time	30.00	40.00	60.00
Median Immediate Post-service Time	0.00	0.00	0.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
<b>Median Total Time</b>	<b>30.00</b>	<b>40.00</b>	<b>60.00</b>
<b>Other time if appropriate</b>			

**INTENSITY/COMPLEXITY MEASURES**

*(of those that selected Key Reference codes)*

*Survey respondents are rating the survey code relative to the key reference code.*

**Intensity & Complexity Rating Scale:** (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	<b><u>Top Key Ref Code</u></b>	<b><u>2<sup>nd</sup> Key Ref Code</u></b>
--	------------------------------------	---

**Mental Effort and Judgment (Mean)**

The number of possible diagnosis and/or the number of management options that must be considered	0.86	1.13
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.71	1.00
Urgency of medical decision making	0.93	0.25

**Technical Skill/Physical Effort (Mean)**

Technical skill required	1.50	1.88
--------------------------	------	------

Physical effort required	1.00	1.00
<b><u>Psychological Stress (Mean)</u></b>		
The risk of significant complications, morbidity and/or mortality	0.71	1.00
Outcome depends on the skill and judgment of physician	1.14	1.75
Estimated risk of malpractice suit with poor outcome	0.86	0.88

---

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

The CPT Editorial Panel approved two new Category I codes to report the repair of a nerve using a nerve allograft. Codes 64910 and 64911 were added by the RUC as family codes for RUC review.

**Survey Process**

The ASSH and ASPS conducted a RUC survey of members that were randomly selected from their membership databases.

**Recommendation**

We recommend the survey 25<sup>th</sup> percentile work RVU of 3.00. This value compares well with the key reference codes, MPC codes, and other ZZZ global codes with similar time.

**Reference Code Comparison**

CPT	Description	IWPUT	RVW	TOT	PRE	INTRA	POST
<b>64913</b>	Nerve repair; with nerve allograft, each additional strand (List separately in addition to code for primary procedure)	0.100	3.00	30	0	30	0
<b>14302</b>	Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)	0.093	3.73	40	0	40	0
<b>11008</b>	Removal of prosthetic material or mesh, abdominal wall for infection (eg, for chronic or recurrent mesh infection or necrotizing soft tissue infection) (List separately in addition to code for primary procedure)	0.083	5.00	60	0	60	0

**MPC Code Comparison**

CPT	Description	IWPUT	RVW	TOT	PRE	INTRA	POST
<b>36227</b>	Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)	0.139	2.09	15	0	15	0
<b>64913</b>	Nerve repair; with nerve allograft, each additional strand (List separately in addition to code for primary procedure)	0.100	3.00	30	0	30	0
<b>63048</b>	Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)	0.077	3.47	45	0	45	0

<b>35686</b>	Creation of distal arteriovenous fistula during lower extremity bypass surgery (non-hemodialysis) (List separately in addition to code for primary procedure)	3.34	0.095	35
<b>61797</b>	Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); each additional cranial lesion, simple (List separately in addition to code for primary procedure)	3.48	0.116	30
<b>22512</b>	Percutaneous vertebroplasty (bone biopsy included when performed), 1 vertebral body, unilateral or bilateral injection, inclusive of all imaging guidance; each additional cervicothoracic or lumbosacral vertebral body (List separately in addition to code for primary procedure)	4.00	0.132	32
<b>22515</b>	Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure)	4.00	0.132	32
<b>32674</b>	Thoracoscopy, surgical; with mediastinal and regional lymphadenectomy (List separately in addition to code for primary procedure)	4.12	0.137	30
<b>38746</b>	Thoracic lymphadenectomy by thoracotomy, mediastinal and regional lymphadenectomy (List separately in addition to code for primary procedure)	4.12	0.137	30

CPT	Descriptor	RVW	IWPUT	TOTAL TIME
36228	Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure)	4.25	0.142	30
61641	Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)	4.33	0.144	30
33572	Coronary endarterectomy, open, any method, of left anterior descending, circumflex, or right coronary artery performed in conjunction with coronary artery bypass graft procedure, each vessel (List separately in addition to primary procedure)	4.44	0.148	30
32501	Resection and repair of portion of bronchus (bronchoplasty) when performed at time of lobectomy or segmentectomy (List separately in addition to code for primary procedure)	4.68	0.187	25
33924	Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure)	5.49	0.183	30

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 64X92 in conjunction with 64X91)

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty hand surgery                      How often? Rarely

Specialty orthopaedic surgery                      How often? Rarely

Specialty plastic surgery                      How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency is not known

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 150  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Specialty estimate.

Specialty hand surgery	Frequency 50	Percentage 33.33 %
------------------------	--------------	--------------------

Specialty orthopaedic surgery	Frequency 50	Percentage 33.33 %
-------------------------------	--------------	--------------------

Specialty plastic surgery	Frequency 50	Percentage 33.33 %
---------------------------	--------------	--------------------

Do many physicians perform this service across the United States? Yes

---

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Other

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64832

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT	Descriptor	global
64910	Nerve repair; with synthetic conduit or vein allograft (eg, nerve tube), each nerve	090
64911	Nerve repair; with autogenous vein graft (includes harvest of vein graft), each nerve	090
64912	Nerve repair; with nerve allograft, each nerve, first strand (cable)	090
64913	Nerve repair; with nerve allograft, each additional strand (List separately in addition to code for primary procedure)	ZZZ

Global Period: 090, ZZZ

Meeting Date: January 2017

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The Advisors reviewed the current inputs for 64910 and 64911 and determined that the standard 90-day inputs are appropriate.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

Current PE inputs used as reference.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A**

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

Supply items have been added that are necessary for splint removal, dressing change, and new splint at first postop visit. In addition, a cast cutter and cart have been added as necessary to remove the postop splint and fabricate a new splint at the first postop visit. These supply and equipment items correspond to recently (RUC and CMS) approve PE inputs for flexor tendon surgery (April 2015, 26356-26358).

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

The clinical staff completes the required battery of pre-service diagnostic and referral forms. They call the hospital to schedule the procedure in the operating room, identify the needed supplies and equipment, including splinting supplies, and to schedule anesthesia. The clinical staff educates both the patient and family on what they need to do to prepare for and recover from surgery.

Intra-Service Clinical Labor Activities:

Patients are typically discharged on the same day. Standard 6 minutes is indicated.

Post-Service Clinical Labor Activities:

Standard time for each postoperative EM visit is indicated.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*\*CMS High Expenditure Procedural Codes\**

January 2017

**Photodynamic Therapy**

CPT code 96567 *Photodynamic therapy by external application of light to destroy premalignant and/or malignant lesions of the skin and adjacent mucosa (eg, lip) by activation of photosensitive drug(s), each phototherapy exposure session* was identified by Centers for Medicare and Medicaid Services (CMS) in the high expenditure services screen. The RUC recommended that this service be removed from the screen because the work RVU=0.00. However, in the Final Rule for 2016, CMS indicated that the work and practice expense for this service should be reviewed.

In April 2001 CPT code 96567 was reviewed as new technology. The procedure involves application of a photo-sensitizing agent followed by exposure to special ultra-violet light. A survey of 39 dermatologists using this new technology indicated that there was some physician work for this XXX global period procedure. However, upon review of the survey responses, the specialty society concluded that the respondents did not accurately assess the time required by the physician for this procedure using the new technology and included a written recommendation that for the typical patient receiving this procedure, there is no physician work. The RUC agreed that the procedure, using this new technology, does not involve physician work but does involve practice expense direct inputs. Years later the service was nominated to be considered in 2005 Five-Year Review. The final Five-Year Workgroup report indicated that after extensive discussion with the RUC regarding the potential need for further CPT revisions the RUC advised the specialty society that if physician work is part of the code the specialty would need to submit a coding proposal to CPT to clarify the language to include physician work. At that time the specialty decided to instead withdraw the code from the Five-Year Review.

At the April 2016 RUC meeting the specialty society recommended that the service be deferred to the October 2016 RUC meeting in order for a survey of work to be conducted. The specialty explained that in reviewing the service closely, they realized that there is now physician work involved in providing this service. In order to confirm this observation the specialty conducted an informal survey that was sent to a few dermatologists. The specialty contends that the results confirm that physicians are involved in the actual delivery of care to patients by performing tasks such as: curettage of thick lesions, real time tailoring of the PDT regimen, explaining side effects, and providing post care instructions. A RUC member questioned if any of the aforementioned services were separately reportable and the specialty clarified that they are not. The specialty added that there has been no change to the service and that it is not necessary to refer to the code to the CPT Editorial Panel. A RUC member questioned why the specialty would be claiming that there is physician work now, when it was stated by the specialty that the service has not changed and in 2001 the specialty concluded that for the typical patient there is no physician work as noted above. A RUC member suggested that there may be the need for two separate codes, one for a simple procedure that clinical staff can provide and one that is more complex and needs physician involvement. Another RUC member stated that we do not have enough information to determine if the service should or should

not be submitted to CPT and ultimately that decision is up to the specialty society. The RUC member continued that this is an unusual service in that it usually is a two encounter service yet it is a single XXX global code. If they are going to survey for work, it is advisable to go to CPT in order to separate this into two codes or at a minimum seek advice from the Research Subcommittee about how to survey for this type of service. The specialty indicated that it would submit a code change application to split code 96567 into two codes—one to describe physician work and one to describe the technical component. The RUC referred CPT code 96567 to the CPT Editorial Panel.

In September 2016, the CPT Editorial Panel deleted code 96567 and created two new codes to describe physician identification of debridement and hyperkeratotic lesions and physician application of a photosensitizing agent.

### **Compelling Evidence**

The specialty societies presented compelling evidence for codes 96573 and 96574. The specialty explained that the concept of the old code where the clinical staff blindly applies photosensitizer one day and then shines the photosensitizer light on it the next day is obsolete. Photodynamic therapy has evolved with more aggressive skin preparation, customized multilayer application of photosensitizer by the physician and occlusion during incubation has changed the procedure from being a two day procedure to a one day procedure with increased efficacy and decreased side effects. As it is done now, the application is a multilayer application which depends on how much disease is present. The physician would need to be the one to evaluate how much disease is present. The RUC accepted that there is compelling evidence that the technique involved in performing 96573 and 96574 has changed where the service can now necessitate physician work the same day as the procedure. It was also noted that previously, when the service was performed over two days, there would be some physician work that happened on the first day via a separately reported E/M service. The RUC noted that if physician work is included in 96573 and 96574, that same-day E/M services should be prohibited unless the service is for an unrelated diagnosis to the photodynamic therapy.

**96567 Photodynamic therapy by external application of light to destroy premalignant and/or malignant lesions of the skin and adjacent mucosa with application and (eg, lip) by illumination/activation of photosensitive drug(s), per day each phototherapy exposure session**

The RUC agreed that the coding structure for this family of services should cover situations both where the photodynamic therapy application was solely performed by the clinical labor staff and also if it was solely performed by a Physician. **To accomplish this, the RUC recommends that PE-only CPT code 96567 should be undeleted and remain zero physician work.** Also, the RUC agreed that the descriptor for 96567 should have an editorial change to “*Photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s), per day.*”

**96573 Photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s) provided by a physician or other qualified health care professional, per day**

The RUC reviewed the survey results from 88 dermatologists and agreed with the specialty on the following physician time components: 5 minutes of pre-service evaluation time, 10 minutes of intra-service time, and 5 minutes of immediate post-service time.

The RUC reviewed the survey 25th percentile work RVU of 0.92 and agreed that the survey respondents overvalued the work involved in performing this service. To find an appropriate work RVU crosswalk for CPT code 96573, the RUC compared the survey code to CPT code 99212 *Office or other outpatient visit for the evaluation and management of an established patient*, (work RVU=0.48, 10 minutes intra-service ) and noted that both services involve an identical amount of intra-service time and a similar amount of physician work. Therefore, the RUC recommends a direct work RVU crosswalk from code 99212 to code 96573. For additional support, the RUC also referenced CPT code 99201 (work RVU=0.48, 10 minutes intra-service time), which also has identical intra-service time and involves a similar amount of physician work relative to 96573.

The RUC also agreed that the global for this code should be 000-day to avoid the potential for billing of same day E/M related to performing the photodynamic therapy service. Further, the RUC recommends that an NCCI edit of “1” should be applied to this code. In addition, the RUC agreed that a CPT parenthetical should be created to prohibit the performance of same-day E/M that is related to the photodynamic therapy and that it cannot be reported with 96567 or 96574. **The RUC recommends a work RVU of 0.48 for 96573, as well as a 000-day global period and a descriptor change so the service can only be provided by a physician or other qualified health care professional.** The RUC noted that their work RVU recommendation is contingent on CMS using the 000-day global and that CPT Editorial Panel implementing the recommended code changes.

***96574 Debridement of premalignant hyperkeratotic lesion(s) (ie, targeted curettage, abrasion) followed with photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s) provided by a physician or other qualified health care professional, per day***

The RUC reviewed the survey results from 69 dermatologists and agreed with the specialty on the following physician time components: 10 minutes of pre-service evaluation time, 16 minutes of intra-service time, and 10 minutes of immediate post-service time. The RUC noted that 96574 should include more post-service time relative to 96573, since in addition to the same post-service work as 96573, patients typically have additional bleeding following the curettage which often requires cautery.

The RUC reviewed the survey 25th percentile work RVU of 1.25 and agreed that the survey respondents overvalued the work involved in performing this service. To find an appropriate work RVU crosswalk for CPT code 96574, the RUC compared the survey code to CPT code 11042 *Debridement, subcutaneous tissue (includes epidermis and dermis, if performed); first 20 sq cm or less* (work RVU of 1.01, intra-service time of 15 minutes, total time of 36 minutes) and noted that both services have similar intra-service time, identical total time and involve a similar amount of physician work. Therefore, the RUC recommends a direct work RVU crosswalk from code 11042 to code 96574. For additional support, the RUC compared the survey code to CPT code 40490 *Biopsy of lip* (work RVU of 1.22, intra-service time of 15 minutes, total time of 34 minutes) and noted that the survey code has slightly more intra-service and total time, while also involving a comparable amount of physician work. The RUC also noted that the intra-service work intensity of 96574 should be somewhat higher than 96573 to account for the more intense physician work involved in performing the curettage.

The RUC also agreed that the global for this code should be 000-day to avoid the potential for billing of same day E/M related to performing the photodynamic therapy service. Further, the RUC recommends that an NCCI edit of “1” should be applied to this code. In addition, the RUC agreed that a CPT parenthetical should be created to prohibit the performance of same-day E/M that is related to the photodynamic therapy and that it cannot be reported with 96567 or 96573. **The RUC recommends a work RVU of 1.01 for 96574, as well as a 000-day global period and a descriptor change so the service can only be provided by a physician or other qualified health care professional.** The RUC noted that their work RVU recommendation is contingent on CMS using the 000-day global and that CPT Editorial Panel implementing the recommended code changes.

### **Practice Expense**

The RUC reviewed the direct practice expense inputs as approved by the Practice Expense Subcommittee. As the Practice expense subcommittee convened prior to the RUC’s decision to make several coding changes, the RUC made several modifications to the Practice Expense Subcommittee’s original recommendations. The RUC determined that the current practice expense inputs for undeleted code 96567 would be the same with the reduction of assist physician performing procedure to 0 minutes and including 10 minutes for the clinical staff to perform the procedure. Also the RUC determined that 2 minutes to check dressings & wound/home care instructions/coordinate office visits/prescriptions should be added to CPT 96567. In addition, the intraservice component of the service period to assist physician in performing procedure will be removed from CPT code 96573 and 96574. The RUC approved the direct practice expense inputs approved by the Practice Expense Subcommittee, though with the above modifications.

### **Global Period**

The RUC also agreed that 96573 and 96574 should have the 000-day global period to avoid the potential for billing of related same day E/M related to performing the photodynamic therapy service.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Special Dermatological Procedures</b> <b>Photodynamic Therapy</b>  <u>Codes 96573, 96574 should be used to report nonsurgical treatment of cutaneous lesions using photodynamic therapy by external application of light to destroy premalignant lesion(s) of the skin and adjacent mucosa (eg, face, scalp) by activation of photosensitizing drug(s).</u>  <u>A treatment session is defined as an application of photosensitizer to all lesions within an anatomic area (eg, face, scalp), with or without debridement of all premalignant hyperkeratotic lesions in that area, followed by illumination/activation with an appropriate light source to the same area.</u>  <u>Do not report codes for debridement (11000 – 11005), lesion shaving (11300 – 11313), biopsy (11100, 11101), or lesion excision (11400-11471) within the treatment area(s) on the same day as photodynamic therapy (96573, 96574).</u>

RE: Summary of Recommendations for Tab 17

Dear Sherry,

The American Academy of Dermatology Association (AADA) appreciates the opportunity to submit the attached summary of recommendations of physician work and practice expense for Tab 17, Photodynamic Codes 96X73 and 96X74.

Below is a list of the attached items:

- RUC Summary spreadsheet – Tab 17
- Work SOR 96X73 - Tab 17
- Work SOR 96X74 - Tab 17
- Practice Expense Recommendation Worksheet - Tab 17
- PE SOR for 96X73 – Tab 17
- PE SOR for 96X74 – Tab 17
- Paid Invoices for new supply items
- Attestation and Financial disclosures

If you have any questions regarding the survey and the recommendations, please feel free to contact Helen Olkaba at [holkaba@aad.org](mailto:holkaba@aad.org) or (202) 712-2612.

Respectfully submitted,

Howard Rogers, M.D.  
Acting RUC Advisor

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 96573      Tracking Number   EE1

Original Specialty Recommended RVU: **0.68**Presented Recommended RVU: **0.68**

Global Period: 000

RUC Recommended RVU: **0.48**

CPT Descriptor: Photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s), per day

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65-year-old female patient with numerous, ill-defined actinic keratosis.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review pertinent data in medical records and relevant pathology. Obtain pertinent history from patient to include previous skin cancers, prior treatment history, sun protection history, photosensitizing conditions or medications, etc. Discuss choice of treatment options. Describe the photodynamic therapy procedure method and expected reaction and results. Review medical risks, such as bleeding, pain and/or paresthesias, edema, infection, delayed healing, scarring, pigmentary alteration, and actinic keratosis recurrence. Obtain informed consent and advise staff on necessary supplies and instrument tray preparation.

Patient is gowned and positioned. The patient is examined under surgical lighting and magnification. Each lesion within the treatment field is identified and graded based on size, degree of thickness/hyperkeratosis and potential functional risk. Lesions are marked for photography, and the total number of lesions is counted and recorded. Pre-procedural topical skin preparation for removal of oils, sebum, and loose stratum corneum. Preparation of photosensitizer.

Description of Intra-Service Work: Variable application of prepared photo-sensitizing agent in topical solution form directly to individual lesions and entire treatment field dependent on clinical characteristics. Allow drying. Apply occlusive dressing and photoprotective shielding.

Description of Post-Service Work: The patient is allowed to incubate in dark room for the period of time determined by the physician. Patient is positioned for illumination and proper monochromatic eye protection applied. The patient receives illumination of the treatment area with appropriate light source to completely activate photosensitizer. Patient must be observed and this process is monitored by a qualified healthcare professional to provide intervention to any adverse reaction. Apply photoprotective topical product, and apply dressing, when appropriate. Instruct patient and/or family on postoperative wound care, dressing changes, as well as instructions for problems such as bleeding or pain and restrictions on activities, continued duration of photosensitivity, functional risks, and follow-up period. Provide prescriptions for pain and antibiotics/antivirals, as necessary. Complete medical record and communicate results to referring physician as appropriate.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

The American Academy of Dermatology Association (AADA) surveyed the two new Photodynamic therapy codes 96573 and 96574. These two codes replace the current CPT code 96567, which entered the fee schedule in 2002. When the code was presented in 2001 as a new technology, the society felt that physician work, on the day of the procedure, was not typical. The survey data did suggest that physician work was inherent to the procedure, but the society decided to not include this work in valuation since the procedure was new, and it was not clear how the procedure would be performed in practice as it became more widely available.

In preparation to survey CPT code 96567 in 2016, the society's expert panel conducted an informal survey of various internal committees to determine if there was any physician work in providing the service. This survey simply asked if physicians see the patient on the day of the service and, if so, to describe the work they do. The work described by those respondents included application of the photosensitizing drug (always) and curettage of hyperkeratotic lesions (sometimes). It was clear to the expert panel that the procedure had evolved over time such that impermeable hyperkeratotic epidermis is removed and application of the photosensitizing drug is titrated based on the degree of disease present to achieve the dual goals of both individual lesion treatment and broad general field therapy. Therefore, the society asked to take code 96567 back to CPT. The result of that effort was two new codes for photodynamic therapy, one without (96573) and one with the curettage of hyperkeratotic lesions (96574).

The RUC requested the society to survey the new codes for the January 2017 RUC meeting. The society conducted a targeted survey using a list provided by DUSA Pharmaceuticals, Inc., the vendor that manufactures the equipment, with the approval of the Research Subcommittee.

**Recommendation**

The expert panel reviewed the survey result recommended the following RVUs and Times for the RUC's review for code 96573.

*Pre-service time:*

The expert panel recommends the median survey pre service time of 5 minutes for evaluation and the selected pre-time package is XXX global code.

*Intra-service time:*

The expert panel recommends the median intra-service time of 10 minutes.

*Post-Service time*

The expert panel believes the survey median post-service time of 5 minutes would accurately account for the work performed during the post service time.

*Relative Value Units:*

The expert panel believes that the 25<sup>th</sup> percentile value does not compare appropriately with the selected key reference services, especially when the intensity and complexity measures are taken into account. Therefore, the expert panel recommends 0.68 work RVUs for this procedure, which is lower than the 25% percentile of the survey data. We believe this relative value is supported by recently reviewed XXX-global codes with the same times. We compared the time and RVU of the survey data with other comparator codes that have the same Pre/Intra/Post times as shown in the table below. Placing the survey code in the middle of this group, we recommend a direct crosswalk to code 76642 (*Ultrasound, breast, unilateral*).

**Recently Reviewed XXX-global Comparator Codes**

CPT Code	Long Desc	Global	Work RVU	Pre Eval Time	Intra Time	Post Time	Total Time	IWPUT	Most Recent RUC Review
78013	Thyroid imaging (including vascular flow, when	XXX	0.37	5	10	5	20	0.0146	Apr12

78226	Hepatobiliary system imaging, including gallbl	XXX	0.74	5	10	5	20	0.0516	Feb11
78264	Gastric emptying imaging study (eg, solid, liq	XXX	0.74	5	10	5	20	0.0516	Apr15
78580	Pulmonary perfusion imaging (eg, particulate)	XXX	0.74	5	10	5	20	0.0516	Feb11
78597	Quantitative differential pulmonary perfusion, in	XXX	0.75	5	10	5	20	0.0526	Feb11
78070	Parathyroid planar imaging (including subtract	XXX	0.80	5	10	5	20	0.0576	Apr12
99462	Subsequent hospital care, per day, for evaluat	XXX	0.84	5	10	5	20	0.0616	Oct10
78472	Cardiac blood pool imaging, gated equilibrium;	XXX	0.98	5	10	5	20	0.0756	Sept11

In summary, the expert panel recommends 0.68 RVUs, 5 minutes of pre-service time, 10 minutes for intra-service time and 5 minutes of post-time for code 96573.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 96567

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology                      How often? Sometimes

Specialty                                      How often?

Specialty                                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 201675

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Since the existing code is split into three codes, this represents the 50% of the Medicare database volume of 134450 (67,225) and multiplied by 3.

Specialty Dermatology	Frequency 167350	Percentage 82.98 %
Specialty Physician Assistants	Frequency 20309	Percentage 10.07 %
Specialty Nurse Practitioners	Frequency 8128	Percentage 4.03 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 67,225 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The estimation is based on the 2015 Medicare utilization rate accounting for the fact that the original code 96567 is split into three codes.

Specialty Dermatology	Frequency 55783	Percentage 82.97 %
Specialty Physician Assistants	Frequency 6743	Percentage 10.03 %
Specialty Nurse Practitioners	Frequency 2709	Percentage 4.02 %

Do many physicians perform this service across the United States? No

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Skin

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 96567

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 96574      Tracking Number   EE2

Original Specialty Recommended RVU: **1.00**Presented Recommended RVU: **1.00**

Global Period: 000

RUC Recommended RVU: **1.01**

CPT Descriptor: Debridement of premalignant hyperkeratotic lesion(s) (ie, targeted curettage, abrasion) followed with photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s), per day

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65-year female patient with numerous, hyperkeratotic actinic keratoses on separate body areas

Percentage of Survey Respondents who found Vignette to be Typical: 87%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review pertinent data in medical records and relevant pathology. Obtain pertinent history from patient to include previous skin cancers, prior treatment history, sun protection history, photosensitizing conditions or medications, etc. Discuss choice of treatment options. Describe the curettage and photodynamic therapy procedure method and expected reaction and results. Review medical risks, such as bleeding, pain and/or paresthesias, edema, infection, delayed healing, scarring, pigmentary alteration, and actinic keratosis recurrence. Obtain informed consent and advise staff on necessary supplies and instrument tray preparation.

Patient is gowned and positioned. Each lesion within the treatment field is identified and graded based on size, degree of thickness/hyperkeratosis and potential functional risk. Lesions are marked for photography, and the total number of lesions is counted and recorded. Pre-procedural topical skin preparation for removal of oils, sebum, and loose stratum corneum. Sterilely prep patient's skin. Injection of appropriate local anesthetic into all hyperkeratotic lesions prior to curettage and wait for effect. Apply sterile drapes. Preparation of photosensitizer.

Description of Intra-Service Work: Using curette, remove hyperkeratotic epidermis from each lesion. Achieve hemostasis with pressure, or electrocautery, or application of topical hemostatic agents. Variable application of prepared photosensitizing agent in topical solution form directly to individual curetted lesions, non-hyperkeratotic (non-curetted) lesions and entire treatment field dependent on clinical characteristics. Allow drying. Apply occlusive dressing and photoprotective shielding.

Description of Post-Service Work: The patient is allowed to incubate in dark room for the period of time determined by the physician. Patient is positioned for illumination and proper monochromatic eye protection applied. The patient receives illumination of the treatment area with appropriate light source to completely activate photosensitizer. Patient must be observed and this process is monitored by a qualified healthcare professional to provide intervention to any adverse reaction. Apply antibiotic ointment and photoprotective topical product, and apply dressing, when appropriate. Instruct patient and/or family on postoperative wound care, dressing changes, as well as instructions for problems such as bleeding or pain and restrictions on activities, continued duration of photosensitivity, functional risks, and follow-up period. Provide prescriptions for pain and antibiotics/antivirals, as necessary. Complete medical record and communicate results to referring physician as appropriate.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
11308	000	1.46	RUC Time

CPT Descriptor Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter over 2.0 cm

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99214	XXX	1.50	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 25 minutes are spent face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Medicare Utilization</u>

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

**Background**

The American Academy of Dermatology Association (AADA) surveyed the two new Photodynamic therapy codes 96573 and 96574. These two codes replace the current CPT code 96567, which entered the fee schedule in 2002. When the code was presented in 2001 as a new technology, the society felt that physician work, on the day of the procedure, was not typical. The survey data did suggest that physician work was inherent to the procedure, but the society decided to not include this work in valuation since the procedure was new, and it was not clear how the procedure would be performed in practice as it became more widely available.

In preparation to survey CPT code 96567 in 2016, the society's expert panel conducted an informal survey of various internal committees to determine if there was any physician work in providing the service. This survey simply asked if physicians see the patient on the day of the service and, if so, to describe the work they do. The work described by those respondents included application of the photosensitizing drug (always) and curettage of hyperkeratotic lesions (sometimes). It was clear to the expert panel that the procedure had evolved over time such that impermeable hyperkeratotic epidermis is removed and application of the photosensitizing drug is titrated based on the degree of disease present to achieve the dual goals of both individual lesion treatment and broad general field therapy. Therefore, the society asked to take code 96567 back to CPT. The result of that effort was two new codes for photodynamic therapy, one without (96573) and one with the curettage of hyperkeratotic lesions (96574).

The RUC requested the society to survey the new codes for the January 2017 RUC meeting. The society conducted a targeted survey using a list provided by DUSA Pharmaceuticals, Inc., the vendor that manufactures the equipment, with the approval of the Research Subcommittee.

**Recommendation**

The expert panel reviewed the survey result recommended the following RVUs and Times for the RUC's review for code 96574.

*Pre-service time:*

The expert panel recommends the median survey pre service time of 10 minutes for evaluation and the selected pre-time package is XXX global code.

#### *Intra-service time:*

The expert panel recommends the median intra-service time of 16 minutes.

#### *Post-Service time*

The expert panel believes the survey median post-service time of 10 minutes would accurately account for the work performed during the post service time.

#### *Relative Value Units:*

Similarly to the base code (96573), the expert panel believes that the 25<sup>th</sup> percentile value does not compare appropriately with the selected key reference services, especially when the intensity and complexity measures are taken into account. The expert panel recommends 1.00 work RVUs for this procedure, which is lower than the 25% percentile of the survey data. We believe this relative value is supported by recently reviewed XXX-global codes with similar times. We compared the time and RVU of the survey data with other comparator codes that have the similar Pre/Intra/Post times as shown in the table below. Placing the survey code within this group, we recommend a direct crosswalk to code 95907 (*Nerve conduction studies*), with the understanding that the crosswalk code has one minute less intra-service time than the survey code.

#### **Recently Reviewed XXX-global Comparator Codes**

CPT Code	Long Desc	Global	Work RVU	Pre Eval Time	Intra Time	Post Time	Total Time	IWPUT	Most Recent RUC Review
95869	Needle electromyography; thor	XXX	0.37	10	15	10	35	-0.0052	Apr12
95870	Needle electromyography; limi	XXX	0.37	10	15	10	35	-0.0052	Apr12
76872	Ultrasound, transrectal;	XXX	0.69	10	15	10	35	0.0161	Apr12
93261	Interrogation device evaluation	XXX	0.74	10	15	10	35	0.0195	Apr14
95867	Needle electromyography; crai	XXX	0.79	10	15	10	35	0.0228	Apr12
93260	Programming device evaluation	XXX	0.85	10	15	10	35	0.0268	Apr14
95801	Sleep study, unattended, simu	XXX	1.00	10	15	15	40	0.0293	Apr10
95907	Nerve conduction studies; 1-2	XXX	1.00	10	15	10	35	0.0368	Apr12
96X74	Debridement of premalignant h	XXX	1.00	10	16	10	36	0.0345	
95866	Needle electromyography; her	XXX	1.25	10	15	10	35	0.0535	Apr12
95865	Needle electromyography; lary	XXX	1.57	10	15	7	32	0.0800	Apr12

Furthermore, the additional 0.32 RVUs in addition to the base code (96573) value of 0.68 RVU takes into account the increased intensity, the time factor, and maintains rank order across the family, and is consistent with the RVU differential seen in the survey. The 96574 code involves debridement of the lesions in addition to the photodynamic treatment, which necessitates the increased time.

In summary, the expert panel recommends 1.00 RVUs, 10 minutes of pre-service time, 16 minutes for intra-service time and 10 minutes of post-time for code 96574.

#### **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.

- ☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 96567

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology                      How often? Sometimes

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 176340

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Since this code is split into three codes, this represents the 40% the Medicare database volume of 134450 (53,780) and multiplied by 3.

Specialty Dermatology	Frequency 145710	Percentage 82.63 %
Specialty Nurse Practitioner	Frequency 17687	Percentage 10.03 %
Specialty Physician Assistant	Frequency 7124	Percentage 4.03 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 53,780 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The estimation is based on the 2015 Medicare utilization rate accounting for the fact that the original code 96567 being split into three codes.

Specialty Dermatology	Frequency 44438	Percentage 82.62 %
Specialty Nurse Practitioner	Frequency 5394	Percentage 10.02 %
Specialty Physician Assistant	Frequency 2167	Percentage 4.02 %

Do many physicians perform this service across the United States? No

## Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:  
 Procedures

BETOS Sub-classification:  
Minor procedure

BETOS Sub-classification Level II:  
Skin

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 96567

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

### Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair, AMA Representative and Alternate AMA Representative.)

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

Photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s), per day

Global Period: XXX Meeting Date: January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

AADA convened a RUC expert panel to review the current Practice Expense data and practice patterns to make a recommendation.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

Since this is a revised code, we used the PE direct inputs of existing code (CPT 96567) as a reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

**The equipment time is calculated accounting for patient incubation time.**

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Greet patient, ensure appropriate medical records are available. Review of pertinent test results. Obtain vital signs (Three BP- Pulse, Respiration). Provide pre-service education on treatment requirements, risks and scheduling /obtain consent. Prepare room, equipment, supplies. Patient is gowned and positioned. Assist physician during assessment and documentation of lesions for size, location, functional risks, and thickness. Photograph lesions and treatment area for documentation. **Staff assist in** pre-procedural topical skin preparation for removal of oils, sebum, and loose stratum corneum.

**Intra-Service Clinical Labor Activities:**

Assist physician in application of prepared photo-sensitizing agent including stabilizing patient's head and holding gauze to prevent photosensitizer from running into facial orifices and non-treatment areas. Assist physician in application of topical anesthetic product Assist physician in application of occlusive dressing and photo-protective shielding.

**Post-Service Clinical Labor Activities:**

Prepare room for patient to incubate in dark room for the period of time determined by the physician. Monitor patient intermittently during incubation. Review treatment requirements, any reactions or complaints regarding photosensitizing agent. Pre-illumination topical skin scrub for removal of topical products. Patient is positioned for illumination and proper monochromatic eye protection applied. The patient receives activation of the affected area with the BLU-U Photodynamic Therapy Illuminator for approximately 17 minutes. Patient must be observed and this process must be continuously monitored to provide intervention to any adverse reaction. Apply interventions for discomfort and monitor treatment breaks. Once illumination is complete, apply photoprotective topical product, and apply dressing, when appropriate.

## AMA/Specialty Society Update Process Practice Expense Summary of Recommendation Non Facility Direct Inputs

### CPT Long Descriptor:

Debridement of premalignant hyperkeratotic lesion(s) (ie, targeted curettage, abrasion) followed with photodynamic therapy by external application of light to destroy premalignant lesions of the skin and adjacent mucosa with application and illumination/activation of photosensitizing drug(s), per day

Global Period: XXX Meeting Date: January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

AADA convened a RUC expert panel to review the current Practice Expense data and practice patterns to make a recommendation.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

Since this is a revised code, we used the PE direct inputs of existing code (CPT 96567) as a reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

Greet patient, ensure appropriate medical records are available. Review of pertinent test results. Obtain vital signs. Provide pre-service education on treatment requirements, risks and scheduling /obtain consent. Prepare room, equipment, supplies. Patient is gowned and positioned. Assist physician during assessment and documentation of lesions for size, location, functional risks, and thickness. Photograph lesions and treatment area for documentation. **Assist physician in** pre-procedural topical skin preparation for removal of oils, sebum, and loose stratum corneum. **Assist in** pre-procedural surgical scrub to lesions selected for curettage. Assist physician with injection of local anesthetic to selected lesions.

Intra-Service Clinical Labor Activities:

Assist physician with curettage of hyperkeratotic epidermis from each lesion, including stabilizing patient's head, passing instruments, and holding pressure and obtaining hemostasis. Assist physician in application of prepared photo-sensitizing agent including stabilizing patient's head and holding gauze to prevent photosensitizer from running into facial orifices and non-treatment areas. Assist physician in application of topical anesthetic product. Apply occlusive dressing and photo-protective shielding.

Post-Service Clinical Labor Activities:

Prepare room for patient to incubate in dark room for the period of time determined by the physician. Monitor patient intermittently during incubation. Review treatment requirements, any reactions or complaints regarding photosensitizing agent. Pre-illumination topical skin scrub for removal of topical products. Ensure proper hemostasis. Patient is positioned for illumination and proper monochromatic eye protection applied. The patient receives irradiation of the affected area with the BLU-U Photodynamic Therapy Illuminator for approximately 17 minutes. Patient must be observed and this process must be continuously monitored by a healthcare professional to provide intervention to any adverse reaction. Apply interventions for discomfort and monitor treatment breaks. Once illumination is complete, apply photo-protective topical product, and apply dressing, when appropriate

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
\*CMS High Expenditure Procedural Codes\*

January 2017

**Psychological and Neuropsychological Testing**

In the July 2015 Proposed Rule and November 2015 Final Rule, CMS identified high expenditure services for review, include codes related to psychological and neuropsychological testing. In January 2016, the specialty societies requested that the entire family of psychological and neuropsychological testing codes be referred to the CPT Editorial Panel to be revised. The testing practice has been significantly altered by the growth and availability of technology, including computerized testing. The current codes do not reflect the multiple standards of practice and therefore result in confusion about how to report the codes. The RUC recommended that the entire psychological and neuropsychological testing codes be referred to the CPT Editorial Panel for revision. CMS also requested that CPT code 96125 and 96127 be added to this family of services for revision/review. In September 2016, the CPT Editorial Panel created seven codes to differentiate technician administration of psychological testing and neuropsychological testing from physician/ psychologist administration and assessment of testing; and deleted codes 96101-96103, 96111, 96118, 96119, 96120.

Organizations representing psychiatry, psychology, neurology, pediatrics and speech pathologists conducted a survey for the January 2017 RUC and HCPAC Review Board meetings. During this effort, it became apparent that further CPT revisions are required. Survey respondents were unable to articulate the work at the 60 or 30 minute coding increments and there is significant concern regarding the duplication of pre and post work as several units of service would be reported. Therefore, the organizations submitted a letter to the CPT Editorial Panel and the RUC to rescind the coding changes summarized below for *CPT 2018*. The organizations will submit a new coding proposal for consideration at the June 2017 CPT Editorial Panel meeting for *CPT 2019*. **The RUC supports referral to CPT.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Psychiatry</b>				
<b>Functional Brain Mapping</b>				
96020		<i>Neurofunctional testing selection and administration during noninvasive imaging functional brain mapping, with test</i>		

*administered entirely by a physician or other qualified health care professional (ie, psychologist), with review of test results and report*

*(For functional magnetic resonance imaging [fMRI], brain, use 70555)*

*(Do not report 96020 in conjunction with ~~96101-96103~~, 96116-96120, 963X0-963X5)*

*(Do not report 96020 in conjunction with 70554)*

*(Evaluation and Management services codes should not be reported on the same day as 96020)*

**Central Nervous System Assessments/Tests (eg, Neuro-Cognitive, Mental Status, Speech Testing)**

The following codes are used to report the services provided during testing of ~~the cognitive~~ psychological, neuropsychological and cognitive function of the central nervous system. The testing of cognitive processes, including but not limited to visual motor responses, memory, and abstractive reasoning/problem-solving abilities is accomplished by the combination of several types of testing procedures. It is expected that the administration of these tests will generate material that will be formulated into a report. A minimum of 31 minutes must be provided to report any per hour code. ~~Services 96101, 96116, 96118, and 96125 report time as face to face time with the patient and the time spent evaluating, interpreting and preparing the report.~~

*(For development of cognitive skills, see 97532, 97533)*

*(For cognitive performance assessment performed by a physician, see **Evaluation and Management** services codes)*

*(Do not report ~~96101-96125, 96125, 96105, 96110, 96116, 96125, 963X0-963X5~~ in conjunction with 0364T, 0365T, 0366T, 0367T, 0373T, 0374T)*

Psychological evaluation services in the testing context may include record review, integration of test results with other sources of clinical data, interpretation, clinical decision making, treatment planning and report. Evaluation domains may include emotional and interpersonal functioning, intellectual abilities, thought processes, personality and psychopathology.

Psychological test battery administration is performed via multiple, individually administered paper/pencil test instruments, technical apparatus, and/or interactive electronic platforms.

Neuropsychological evaluation services may include record review, integration of test battery results with other sources of clinical data, interpretation, diagnostic decision making, treatment planning and report. The relevant domains for neuropsychological evaluation include intellectual function, attention, executive function, language and communication, memory, visual-spatial function, sensorimotor function,

emotional and personality features, and adaptive behavior.

Neuropsychological test battery administration is performed via multiple, individually administered paper/pencil test instruments, technical apparatus, and/or interactive electronic platforms.

Cognitive performance testing (96125) assesses the patient's ability to complete specific functional tasks applicable to the patient's environment in order to identify or quantify specific cognitive deficits. The results are used to determine impairments and develop therapeutic goals and objectives.

Do not report psychological or neuropsychological testing in conjunction with 96125 for the same service.

~~Neuropsychological test battery administration is performed via multiple, individually administered paper/pencil test instruments, technical apparatus, and/or interactive electronic platforms.~~

Interactive feedback is used to convey the implications of psychological or neuropsychological test findings and diagnostic formulation. Based on patient-specific cognitive and emotional strengths and weaknesses, interactive feedback may include promoting adherence to medical and/or psychological treatment plans, educating and engaging the patient about his/her condition to maximize patient collaboration in their care, addressing safety issues, facilitating psychological coping, coordinating care, and engaging the patient in planning given the expected course of illness or condition when preformed.

<b>D 96101</b>	-	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg,MMPI, Rorschach, WAIS), per hour of the psychologist's or physician's time, both face to face time administering tests to the patient and time interpreting these test results and preparing the report  (96101 is also used in those circumstances when additional time is necessary to integrate other sources of clinical data, including previously completed and reported technician and computer administered tests)  (Do not report 96101 for the interpretation and report of 96102, 96103)	-	1.86
<b>D 96102</b>	-	Psychological testing (includes psychodiagnostic assessment of emotionality, intellectual abilities, personality and psychopathology, eg, MMPI and WAIS), with qualified health care professional interpretation	-	0.50

**RE: Tab 18/29, Psychological and Neuropsychological Evaluation and Testing**

Dear Dr. Smith:

The American Academy of Neurology (AAN), the American Academy of Pediatrics (AAP), the American Psychological Association (APA), the American Psychiatric Association (APA), and the American Speech-Language-Hearing Association (ASHA) are writing you today regarding Tab 18/29, Psychological Evaluation and Testing which is on the agenda for the January 2017 RUC meeting. This tab is made up of the following codes (96105, 96110, 96116, 96125, 96127, and 963X0-X6). We would like to inform the RUC that we have made a request to the CPT Editorial Panel that this code family be referred back to the Panel and as such we would like to request that the RUC remove this issue from the agenda of the January 2017 RUC meeting. The societies will be submitting a Code Change Proposal by the March 1, 2017 deadline for the May/June 2017 CPT Editorial Panel meeting.

Tab 18 is made up of codes that describe psychological and neuropsychological evaluation and testing; developmental testing; aphasia testing; and cognitive testing. They were identified on the CMS High Expenditure Procedural Codes screen and were reviewed at the October 2016 CPT Editorial Panel meeting. The current psychological testing and neuropsychological testing codes were last revised in 2006. Since that time, there have been significant changes in testing practice – particularly concerning the growth of computerized testing. The developmental testing code was surveyed for work relative value units in 2003. Testing had been performed before that year, but 2004 was the first year the service could be tracked.

The societies attempted to survey the codes for the January 2017 RUC meeting. While an adequate number of responses were received, the expert panel of reviewers found the survey results to be quite flawed for a majority of the codes in the tab, which is believed to be a result of survey respondents' confusion about the coding structure of the new family of codes. The family of codes is made up of individual 60-minute and 30-minute codes that will typically be reported multiple times for a battery of tests. These tests and associated pre- and post-work may be provided over multiple days. The high recommended work RVUs and time (pre, intra and post) of the survey results indicated to the expert panel that some survey respondents were not valuing the individual codes but the entire episode of care.

We would note that we did not experience this problem with the two aphasia and cognitive testing codes (96105 and 96125) that are also a part of this tab. While their data were not problematic and we do not believe they need to go back to CPT Editorial Panel, we do believe

December 13, 2016

Peter Smith, MD

Page 2

that to avoid rank order within the family and other issues, it is important that the family of codes is valued together. Therefore we have included them as part of this larger request to the RUC and CPT Editorial Panel.

The table below summarizes the RUC survey data for CPT code 963X3 (*Psychological or neuropsychological test administration and scoring by physician, or other qualified health care professional two or more tests any method, per 30 minutes*) and exemplifies the type of problematic data that we encountered with this survey.

			Work RVU			Pre-Service			Intra-Service			Post-Service			Key Ref. Code		Second Ref.	
		No.	25th	Med.	75th	25th	Med.	75th	25th	Med.	75th	25th	Med.	75th	Code	Work RVU	Code	Work RVU
963X3	Test admin & scoring, per 30 min (professional)	149	2.1	3	3.5	15	30	30	45	180	300	15	45	90	99205	3.17	90791	3

As you can see the survey times did not correspond to the code which is defined per 30 minutes. As a result it was unclear to us if respondents were recommending work RVU values for the entire episode of care or for the 30 minutes. We experienced similar intra, pre and post service survey problems with the other per hour and per half hour codes.

In addition to concerns regarding intra-service time, a primary RUC-related concern emerged during the review of the survey data: while these services do contain pre and post time, these codes are reported multiple times, the current survey responses reflect redundant pre- and post-time, because these codes are reported in multiple units. The typical scenario of reporting multiple units of the codes will result in what is often described as “double-dipping” at the RUC. We believe this problem cannot be addressed by just resurveying the codes. The coding structure of the family must be revised to better reflect the actual process of care. The participating societies have already discussed potential alternatives to the coding structure.

We are keenly aware that there is great interest by the Centers for Medicare and Medicaid Services (CMS) and the RUC for these codes to be reviewed and revalued. We agree that these codes are outdated (excepting codes 96105 and 96125) and must be revised; this request is not an attempt to delay their revision. This code family represents significant and critical services provided by not just psychologists but also neurologists, pediatricians and speech-language-hearing specialists and could have a significant impact on the access to these important services. We believe that this compels us to ensure that these codes are appropriately designed and valued.

We appreciate your consideration of our request. Please contact us if you have any questions.

Sincerely,

Marianna Spanaki, MD, PhD

**RE: Tab 82, Psychological and Neuropsychological Evaluation and Testing (October 2016 CPT Editorial Panel meeting)**

Dear Dr. Brin:

The American Academy of Neurology (AAN), the American Academy of Pediatrics (AAP), the American Psychological Association (APA), the American Psychiatric Association (APA), and the American Speech-Language-Hearing Association (ASHA) are writing you today regarding Tab 82, Psychological Evaluation and Testing which was reviewed and approved at the October 2016 CPT Editorial Panel meeting. A set of new and revised codes are scheduled to be published in the 2018 CPT book. We would like to request the CPT Editorial Panel that these approved codes be rescinded and that this code family is referred back to the Panel. This code family is also on the agenda for the January 2017 RUC meeting (Tab 18) and we have also submitted a letter to the RUC asking to remove this tab from the agenda of the January 2017 RUC meeting. The codes on the agenda at the RUC meeting are: 96105, 96110, 96116, 96125, 96127, and 963X0-X6. The societies will be submitting a Code Change Proposal by the March 1, 2017 deadline for the May/June 2017 CPT Editorial Panel meeting. We would note that this issue (Tab 40) is on the agenda for the February 2017 CPT meeting for some editorial clean-up. Approval of this request would also result in removing this agenda item from the February 2017 meeting.

We would note that the CPT codes 96105 and 96125 which while part of this family and are on the agenda for the upcoming RUC meeting did not go through the recent CPT Editorial Panel review and are not part of the request to go back to the Panel.

Tab 82 from the October 2016 CPT Editorial Panel meeting is made up of codes that describe psychological and neuropsychological evaluation and testing; developmental testing; and cognitive testing. They were identified on the CMS High Expenditure Procedural Codes screen and were reviewed at the October 2016 CPT Editorial Panel meeting (CPT codes 96105 and 96125 are low volume codes that were not captured by this screen). The current psychological testing and neuropsychological testing codes were last revised in 2006. Since that time, there have been significant changes in testing practice – particularly concerning the growth of computerized testing. The developmental testing code was surveyed for work relative value units in 2003. Testing had been performed before that year, but 2004 was the first year the service could be tracked.

The societies attempted to survey the codes for the January 2017 RUC meeting. While an adequate number of responses were received, the expert panel of reviewers found the survey results to be quite flawed for the majority of codes in the tab, which is believed to be a result of survey respondents' confusion about the coding structure of the new family of codes.. The family of codes is made up of individual 60 minute and 30 minute codes that will typically be reported multiple times for a battery of tests. These tests and associated pre- and post-work may be provided over multiple days. The high recommended work RVUs and time (pre, intra and post) of the survey results indicated to the expert panel that some survey respondents were not valuing the individual codes but the entire episode of care.

We would note that we did not experience this problem with the two aphasia and cognitive testing codes (96105 and 96125) that are also a part of this tab. While their data were not problematic and we do not believe they need to go back to CPT Editorial Panel, we do believe that to avoid rank order within the family and other issues, it is important that the family of codes is valued together. Therefore we have included them as part of this larger request to the RUC and CPT Editorial Panel.

The table below summarizes the RUC survey data for CPT code 963X3 (*Psychological or neuropsychological test administration and scoring by physician, or other qualified health care professional two or more tests any method, per 30 minutes*) and exemplifies the type of problematic data that we encountered with this survey.

		No.	Work RVU			Pre-Service			Intra-Service			Post-Service			Key Ref. Code		Second Ref.	
			25th	Med.	75th	25th	Med.	75th	25th	Med.	75th	25th	Med.	75th	Code	Work RVU	Code	Work RVU
963X3	Test admin & scoring, per 30 min (professional)	149	2.1	3	3.5	15	30	30	45	180	300	15	45	90	99205	3.17	90791	3

As you can see the survey times did not correspond to the code which is defined per 30 minutes. As a result it was unclear to us if respondents were recommending work RVU values for the entire episode of care or for the 30 minutes. We experienced similar intra, pre and post service survey problems with the other per hour and per half hour codes.

In addition to concerns regarding intra-service time, a primary RUC-related concern emerged during the review of the survey data is that while these services do contain pre- and post- time, since these codes are reported multiple times, the current survey responses reflect redundant pre- and post-time and the typical scenario of reporting multiple instances of the codes will result in what is often described as “double-dipping” at the RUC. We believe this problem cannot be addressed by just resurveying the codes. The coding structure of the family must be revised to better reflect the actual process of care. The participating societies have already discussed potential alternatives to the coding structure.

We are keenly aware that there is great interest by the Centers for Medicare and Medicaid Services (CMS), the CPT Editorial Panel and the RUC for these codes to be reviewed and revalued. We agree that these codes are outdated and must be revised and this request is not an attempt to delay their revision. AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*\*High Volume Growth\**

January 2017

**INR Monitoring**

In October 2015, AMA Staff assembled a list of all services with total Medicare utilization of 10,000 or more that have increased by at least 100% from 2008 through 2013 and these services were identified. In January 2016, the RAW recommended to survey G0250 along with G0248 and G0249 for April 2016. In April 2016, the specialty society indicated that they intend to develop Category I codes to describe home INR monitoring services for the September 2016 CPT meeting with review at the January 2017 RUC meeting. The RUC recommends that codes G0248, G0249 and G0250 be referred to CPT to create Category I codes to describe these services. In September 2016, the Editorial Panel deleted 99363 and 99364 and created two new codes.

**93792 Patient/caregiver training for initiation of home INR monitoring under the direction of a physician or other qualified health care professional, including face-to-face, use and care of the INR monitor, obtaining blood sample, instructions for reporting home INR test results, and documentation of patient's/caregiver's ability to perform testing and report results**

CPT code 93792 is a practice expense only service performed by an RN, independent of a physician. The Practice Expense (PE) Subcommittee discussed that the intra-service portion of the service period recommended by the specialty society of 50 minutes and found that there was no clinical explanation for the established time, rather it was crosswalked from code G0248. Code G0248 was never reviewed by the PE Subcommittee and it is unclear how the time of 50 minutes in the G code was determined. The PE Subcommittee agreed with the specialty that an RN performs the service, but reduced the time of 50 minutes to 40 minutes. The Practice Expense (PE) Subcommittee made this reduction based on their own clinical expertise and recommends that survey data be obtained to better understand the time required. The Subcommittee also discussed that although an RN may perform the pre- and post-service tasks related to this service the training of an RN is not required. The PE Subcommittee determined that it is appropriate to change all clinical staff time apart from the intra-service portion of the service period to clinical staff type RN/LPN/MTA (L037D). **The PE Subcommittee recommends that this service be surveyed for practice expense the next time it is under review because it is performed by clinical staff independently.**

**93793 Anticoagulant management for a patient taking warfarin, must include review and interpretation of a new home, office, or lab International Normalized Ratio (INR) test result, patient instructions, dosage adjustment (as needed), and scheduling of additional test(s) when performed**

The RUC reviewed the survey results from 57 cardiologists and agreed with the societies on the following physician time components: a pre-service time of 3 minutes, an intra-service time of 4 minutes and a post-service time of 2 minutes.

The specialty society explained that the vignette they selected for their survey pertained to a patient with a mechanical valve instead of a patient with arrhythmia as is what was the most common ICD-9 code grouping per the CY 2014 Medicare claims data available in the RUC database. In 2010, the first of the warfarin replacement anticoagulation medications were released; there are now four of these new novel direct-acting anticoagulants. In 2015, for the first time, the majority of patients placed on anticoagulant therapy were placed on one of these new agents. The expert panel projects that the usage of warfarin will decline. However, none of the new agents are recommended or indicated for mechanical valves, so those patients will remain on warfarin indefinitely for as long as they live. Mechanical valves are put in less frequently these days because of the durability of bovine pericardial valves. Hence, looking forward, as the mechanical valve patients eventually die, it is anticipated that warfarin will be used less and less. Currently, the CPT codes for management of INR (99363-99364) are designated as bundled services under Medicare, so the utilization of 93793 will go up in Medicare utilization for the first year once the work is reported using this new code.

The RUC reviewed the survey 25<sup>th</sup> percentile work RVU of 0.18 and agreed that this value appropriately accounts for the physician work involved. To justify a work RVU of 0.18, the RUC compared the survey code to MPC code 71010 *Radiologic examination, chest; single view, frontal* (work RVU of 0.18, intra-service time of 3 minutes, total time of 5 minutes) and noted that the survey code involves more intra-service and total time, supporting the proposed value for the survey code. To further support an RVU of 0.18, the RUC also compared the survey code to CPT code 77080 *Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine)* (work RVU of 0.20, intra-service time of 5 minutes, total time of 9 minutes) and noted that both services have similar intra-service time and identical total time. **The RUC recommends a work RVU of 0.18 for CPT code 93793.**

**Practice Expense**

CPT code 93792 is a practice expense only service performed by an RN, independent of a physician. The Practice Expense (PE) Subcommittee discussed that the intra-service portion of the service period recommended by the specialty society of 50 minutes and found that there was no clinical explanation for the time, rather it was crosswalked from the G code G0248. G code G0248 was never reviewed by the PE Subcommittee and it is unclear how the time of 50 minutes in the G code was determined. The PE Subcommittee agreed with the specialty that an RN performs the service, but reduced the time of 50 minutes to 40 minutes. The Practice Expense (PE) Subcommittee made this reduction based on their own clinical expertise and recommends that survey data be obtained to better understand the time required. The Subcommittee also discussed that although an RN may perform the pre- and post-service tasks related to this service the training of an RN is not required. The PE Subcommittee determined that it is appropriate to change all clinical staff time apart from the intra-service portion of

the service period to clinical staff type RN/LPN/MTA (L037D). **The PE Subcommittee recommends that this service be surveyed for practice expense the next time it is under review because it is performed by clinical staff independently.**

### **Recommendation to Delete G codes G0248, G0249 and G0250**

With the creation of new CPT codes 93792 and 93793, the RUC recommends for CMS to delete G codes 90248, 90249 and 90250.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<p><b>Evaluation and Management Services</b>  <b>Prolonged Services</b>  <b>Prolonged service Without Direct Patient Contact</b></p> <p><i>Code 99358 and 99359 . . .</i>  . . .</p> <p>Do not report 99358, 99359 for time spent in care plan oversight services (99339, 99340, 99374-99380), <del>anticoagulant management (99363, 99364)</del> home INR monitoring (93792, 93793), medical team conferences (99366-99368), on-line medical evaluations (99444), or other non-face-to-face services that have more specific codes and no upper time limit in the CPT code set. Codes 99358, 99359 may be reported when related to other non-face-to-face services codes that have a published maximum time (eg, telephone services).</p> <p><b>Case Management Services</b>  <i>Case management is a process in which a physician or another qualified health care professional is responsible for direct care of a patient and, additionally, for coordinating, managing access to, initiating, and/or supervising other health care services needed by the patient.</i></p> <p><b>Anticoagulant Management</b>  <del>Anticoagulant services are intended to describe the outpatient management of warfarin therapy, including ordering, review, and interpretation of International Normalized Ratio (INR) testing, communication with patient, and dosage adjustments as appropriate.</del></p> <p><del>When reporting these services, the work of anticoagulant management may not be used as a basis for reporting an evaluation and</del></p>				

management (E/M) service or care plan oversight time during the reporting period. Do not report these services with 98966-98969, 99441-99444 when telephone or on-line services address anticoagulation with warfarin management. If a significant, separately identifiable E/M service is performed, report the appropriate E/M service code using modifier 25.

These services are outpatient services only. When anticoagulation therapy is initiated or continued in the inpatient or observation setting, a new period begins after discharge and is reported with 99364. Do not report 99363-99364 with 99217-99239, 99291-99292, 99304-99318, 99471-99480 or other code(s) for physician review, interpretation, and patient management of home INR testing for a patient with mechanical heart valve(s).

Any period less than 60 continuous outpatient days is not reported. If less than the specified minimum number of services per period are performed, do not report the anticoagulant management services (99363-99364).

<b>D 99363</b>	-	Anticoagulant management for an outpatient taking warfarin, physician review and interpretation of International Normalized Ratio (INR) testing, patient instructions, dosage adjustment (as needed), and ordering of additional tests; initial 90 days of therapy (must include a minimum of 8 INR measurements)	-	1.65
<b>D 99364</b>	-	Anticoagulant management for an outpatient taking warfarin, physician review and interpretation of International Normalized Ratio (INR) testing, patient instructions, dosage adjustment (as needed), and ordering of additional tests; each subsequent 90 days of therapy (must include a minimum of 3 INR measurements)  (Do not report 99363, 99364 during the same month with 99487-99489)  (Do not report 99363, 99364 when performed during the service time of codes 99495 or 99496)	-	0.63

(99363, 99364 have been deleted. To report, see 93792, 93793)

**Medicine**

**Cardiovascular**

**International Normalization Ratio (INR)**

**Home INR Monitoring**

Home International Normalized Ratio (INR) monitoring services describe the management of warfarin therapy, including ordering, review, and interpretation of new INR test result(s), patient instructions, and dosage adjustments as needed.

If a significantly, separately identifiable E/M service is performed on the same day as 93792, the appropriate E/M service may be reported using modifier 25.

Do not report 93793 on the same day as an evaluation and management (E/M) service.

Do not report 93792, 93793 in conjunction with 98966, 98967, 98968, 98969, 99441, 99442, 99443, 99444 when telephone or on-line services address home INR monitoring.

Do not report 93792, 93793 when performed during the service time of 99487, 99489, 99490, 99495, 99496.

●93792	M1	Patient/caregiver training for initiation of home INR monitoring under the direction of a physician or other qualified health care professional, including face-to-face, use and care of the INR monitor, obtaining blood sample, instructions for reporting home INR test results, and documentation of patient's/caregiver's ability to perform testing and report results  <u>(For provision of test materials and equipment for home INR monitoring see code 99070 or the appropriate supply code)</u>	XXX	0.00  (PE Only)

*evaluation and management services provided to an established patient or guardian, not originating from a related E/M service provided within the previous 7 days, using the Internet or similar electronic communications network*

*(Do not report 99444 when using 99339, 99340, 99374- 99380 for the same communication[s])*

*(Do not report 99444 for ~~anticoagulation management~~ home INR monitoring when reporting ~~99363, 99364~~ 93792, 93793)*

*(Do not report 99444 during the same month with 99487- 99489)*

.....

### **Care Management Services**

*Care management services . . .*

*A plan of care . . .*

E/M services may be reported separately by the same physician or other qualified health care professional during the same calendar month. Care management services include care plan oversight services (99339, 99340, 99374-99380), prolonged services without direct patient contact (99358, 99359), ~~anticoagulant management (99363, 99364), home INR monitoring (93792, 93793)~~, medical team conferences (99366, 99367, 99368), education and training (98960, 98961, 98962, 99071, 99078), telephone services (99366, 99367, 99368, 99441, 99442, 99443), on-line medical evaluation (98969, 99444), preparation of special reports (99080), analysis of data (99090, 99091), transitional care management services (99495, 99496), medication therapy management services (99605, 99606, 99607) and, if performed, these services may not be reported separately during the month for which 99487, 99489, 99490 are reported. All other services may be reported. Do not report 99487, 99489, 99490 if reporting ESRD services (90951-90970) during the same month. If the care management services are performed within the postoperative period of a reported surgery, the same individual may not report 99487, 99489, 99490.

. . .

### **Complex Chronic Care Management Services**

#### **✚99489**

*Complex chronic care management services, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, establishment or substantial revision of a comprehensive care plan, moderate or high complexity medical decision making; each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month*

*(List separately in addition to code for primary procedure)*

~~(Do not report 99487, 99489, 99490 in conjunction with 93792, 93793)~~

*(Report 99489 in conjunction with 99487)*

*(Do not report 99489 for care management services of . . .*

*(Do not report 99487, 99489, 99490 during the same month with 90951-90970, 98960-98962, 98966-98969, 99071, 99078, 99080, 99090, 99091, 99339, 99340, 99358, 99359, ~~99363, 99364~~ 93792, 93793, 99366-99368, 99374-99380, 99441-99444, 99495, 99496, 99605-99607)*

### **Transitional Care Management**

...

A physician or other qualified health care professional who reports codes 99495, 99496 may not report care plan oversight services (99339, 99340, 99374-99380), prolonged services without direct patient contact (99358, 99359), ~~anticoagulant management (99363, 99364), home INR monitoring (93792, 93793)~~ medical team conferences (99366-99368), education and training (98960-98962, 99071, 99078), telephone services (98966-98968, 99441-99443), end stage renal disease services (90951-90970), online medical evaluation services (98969, 99444), preparation of special reports (99080), analysis of data (99090, 99091), complex chronic care coordination services (99487-99489), medication therapy management services (99605-99607), during the time period covered by the transitional care management services codes.

**★99496**      *Transitional Care Management Services with the following required elements: Communication (direct contact, telephone, electronic) with the patient and/or caregiver within 2 business days of discharge Medical decision making of high complexity during the service period Face-to-face visit, within 7 calendar days of discharge*

(Do not report 99495, 99496 in conjunction with 93792, 93793)

*(Do not report 90951-90970, 98960-98962, 98966-98969, 99071, 99078, 99080, 99090, 99091, 99339, 99340, 99358, 99359, ~~99363, 99364~~, 99366-99368, 99374-99380, 99441-99444, 99487-99489, 99605-99607 when performed during the service time of codes 99495 or 99496)*

### **Medicine Cardiovascular**

98968      *Telephone assessment and management service provided by a qualified nonphysician health care professional to*

*an established patient, parent, or guardian not originating from a related assessment and management service provided within the previous 7 days nor leading to an assessment and management service or procedure within the next 24 hours or soonest available appointment; 21-30 minutes of medical discussion*

*(Do not report 98966-98968 during the same month with 99487-99489)*

*(Do not report 98966-98968 when performed during the service time of codes 99495, 99496)*

*(Do not report 98966, 98967, 98968 in conjunction with 93792, 93793)*

**98969**      *Online assessment and management service provided by a qualified nonphysician health care professional to an established patient or guardian, not originating from a related assessment and management service provided within the previous 7 days, using the Internet or similar electronic communications network*

*(Do not report 98969 when using 99339-99340, 99374- 99380 for the same communication[s])*

*(Do not report 98969 for anticoagulation management when reporting 99363, 99364, 93792, 993X<sup>2</sup>)*

<b>D G0248</b>	-	<del>Demonstration, prior to initiation of home INR monitoring, for patient with either mechanical heart valve(s), chronic atrial fibrillation, or venous thromboembolism who meets Medicare coverage criteria, under the direction of a physician; includes: face to face demonstration of use and care of the INR monitor, obtaining at least one blood sample, provision of instructions for reporting home INR test results, and documentation of patient's ability to perform testing and report results</del>	-	Recommend CMS delete

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 93793      Tracking Number M2

Original Specialty Recommended RVU: **0.18**Presented Recommended RVU: **0.18**

Global Period: XXX

RUC Recommended RVU: **0.18**

CPT Descriptor: Anticoagulant management for a patient taking warfarin, must include review and interpretation of a new home, office, or lab International Normalized Ratio (INR) test result, patient instructions, dosage adjustment (as needed), and scheduling of additional test(s) when performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old female with a mechanical heart valve is managed for anticoagulation with warfarin.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: For each prothrombin time test, a physician accesses and reviews the patient's medical record, determines where test result was obtained and whether patient has any new complaints.

Description of Intra-Service Work: Review the results, and determine if any dosage adjustment and/or change in care plan is necessary. The physician may make dosage adjustments and/or care plan changes to account for: acute illness, possible drug interactions, diet changes affecting vitamin K intake; and/or procedures that require withholding or alternative anticoagulation.

Description of Post-Service Work: The physician then must make a notation in the medical record and arrange repeat testing at the appropriate interval.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

G0250 was flagged by the RAW as a service with Medicare utilization of more than 10,000 or more that increased by at least 100% from 2008 to 2013. This code was created in 2002 in coordination with a [2002 CMS NCD](#) that covered use of "home PT INR monitoring for OAC management for patients with mechanical heart valves on Warfarin." Additional indications for "chronic AF or venous thromboembolism" were added in a [2008 NCD reconsideration](#). Believing the G0250 code to be unnecessarily limited to patients that fall within the NCD regarding home INR monitoring because it does not account for other uses of INRs, ACC, ACP, and AAFP submitted a CCP to create the code you have before you. 93793 can be used to report each INR reading, no matter where it is obtained.

93793 is a new code that describes the work of anticoagulation management when reading a single INR test result, provision of patient instructions, dosage adjustment (as needed), and scheduling of additional test(s) when performed. A random survey of 1400 cardiologists was executed with 57 completed surveys.

The key reference was selected by 25 respondents. Respondents who selected Level 1 office visit (99211) found anticoagulation management to be somewhat more intense/complex than 99211. The second key reference service was selected by 12 respondents. Respondents who selected interpretation and report of an EKG indicated anticoagulation management to be more intense in some aspects, less in others, and fairly similar overall. Both the primary and secondary key references are MPC services.

Reflecting a robust survey, **we recommend the survey 25<sup>th</sup>-percentile work RVU of 0.18 with survey median times of 3 minutes preservice, 4 minutes intraservice, and 2 minutes postservice.** As shown in the summary spreadsheet, we identified MPC codes and one additional comparator code with similar intraservice times, total times, and RVUs to support the recommendation.

---

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. uncertain

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

554,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Twice the utilization of G0250 from 2015 RUC database

Specialty cardiology	Frequency 390000	Percentage 70.39 %
----------------------	------------------	--------------------

Specialty primary care/other	Frequency 164000	Percentage 29.60 %
------------------------------	------------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States?

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Tests

BETOS Sub-classification:

Lab tests

BETOS Sub-classification Level II:

Other (MPFS)

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. G0250

### Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Non Facility Direct Inputs**

CPT Long Descriptor: 93792: Patient/caregiver training for initiation of home INR monitoring under the direction of a physician or other qualified health care professional, including face-to-face, use and care of the INR monitor, obtaining blood sample, instructions for reporting home INR test results, and documentation of patient's/caregiver's ability to perform testing and report results

Global Period: XXX Meeting Date: January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The ACC reviewer panel utilized a consensus panel process to develop recommended inputs.
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

93792 is fundamentally an updated version of G0248. The clinical limitations transferred from CMS coverage language into G0248 are not present in 93792. Clinical staff spend significant time training the patient and providing ongoing support for their home monitoring needs. 93792 is similar to G0248 in that it will typically be provided by an RN who travels to the patient's home to initiate home INR monitoring. Significant effort was made to quantify G0248 inputs when CMS assigned these values in 2001. Little has changed about the time it takes for clinical staff to complete these tasks or which supplies and equipment are required. We recommend crosswalking the inputs from G0248 to 93792.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:
5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Nurse coordinates with patient to schedule time to come to patient's home for initial INR demonstration and provisioning.

Intra-Service Clinical Labor Activities:

Nurse trains the patient/caregiver on use of home INR monitor, demonstrating how to obtain blood sample, instructing how to report home INR test results.

Post-Service Clinical Labor Activities:

Documentation of proficiency of patient, addressing follow-up questions patient has.

CPT Long Descriptor: 93793: Anticoagulant management for a patient taking warfarin, must include review and interpretation of a new home, office, or lab International Normalized Ratio (INR) test result, patient instructions, dosage adjustment (as needed), and scheduling of additional test(s) when performed

Global Period: XXX Meeting Date: January 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The ACC reviewer panel utilized a consensus panel process to develop recommended inputs.
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

93793 has similarities to to-be-deleted codes 99363 and 99364. Both services require clinical staff to review charts and communicate with the patient and physician. The difference is that the existing codes were designed to be billed when clinical staff and a clinician in a physician office setting manage outpatients over a period of time, while 93793 is meant to be billed each time an INR test is obtained, regardless of where the patient is located. Since 93793 cannot be billed on the same day as an E/M, we predict the typical use to still be management of outpatients and recommend crosswalking the six minutes per INR clinical staff time from 99363 and 99364. For patients who go to a lab for INR testing, the lab would bill routine venipuncture code 36415.

Finally, the CPT Panel avoided creating a third code that mirrors existing home INR resupply code G0249. The Panel did not feel it was appropriate for CPT to create a customized supply code, and instead includes parenthetical instructions "For provision of test materials and equipment for home INR monitoring see code 99070 or the appropriate supply code." While we respect the Panel's process and decision, some sort of resupply code does need to exist. Similar to the use of G0248 inputs for 93792, we recommend the RUC affirm the clinical staff, supply, and equipment minutes from G0249 so they can continue to be used in G0249 or whatever resupply G code CMS may deem appropriate. The 4315 minutes for the INR monitor was calculated as a way to approximate the costs of the monitor by dividing the \$2000.00 over an equipment lifespan of four years and dividing it into the number of minutes needed per for tests.  $\$2000/4=\$500$ ;  $\$500/12=\$41.67$ . At a price of \$0.093 per minute, that closely approximates \$40.11 in the fee schedule.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: The current G code for interpreting INR testing does not have any direct PE inputs. It is not the case that when this test result is obtained and read it is done without assistance by clinical staff.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: n/a

Intra-Service Clinical Labor Activities: Clinical staff reviews charts and communicates results, dosage changes, etc. to patient

**CPT Code: 93792-93793**  
**Specialty Society(s) ACC**

Post-Service Clinical Labor Activities: n/a

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2017

### Psychiatric Collaborative Care Management Services

In February 2016, the CPT Editorial Panel created three new codes to describe a model for providing psychiatric care in the primary care setting. This code set is one of several in response to a request from CMS to facilitate appropriate valuation of the services furnished under the Collaborative Care Model (CoCM). This CoCM is used to treat patients with common psychiatric conditions in the primary care setting through the provision of a defined set of services which operationalize the following core concepts: 1) Patient-Centered Team Care/Collaborative Care; 2) Population-Based Care; 3) Measurement-Based Treatment to Target; and 4) Evidence-Based Care.

In April 2016, the RUC reviewed the new code set for Psychiatric Collaborative Care Management, which captures a primary care physician working with a behavioral health manager and consulting psychiatrist to manage a patient's psychiatric care. The specialty societies requested that this issue be deferred until the January 2017 RUC meeting. The RUC noted that an Ad Hoc Workgroup has been created to provide feedback and guidance to the specialties involved to appropriately survey this code set. The Workgroup and the Research Subcommittee reviewed the unique survey plan and survey tool before it was launched. The RUC also recommended inclusion of a proposed G code, 99484, to be included in the survey for this issue as CMS finalized it in the Final Rule for 2017.

Specialty societies representing family medicine, internal medicine, geriatric medicine and psychiatry all participated in a survey in November/December 2016. Although the organizations received 80+ combined surveys, the number of primary care physicians responding is considered too low to be representative. The specialty societies concluded that respondents estimated the total time spent by all physicians/behavioral health care managers during the course of the month, rather than their own individual time for which the specialties intended to sum. The RUC agreed that the time in this survey was not reliable. The RUC concurred with the specialties that the estimated work values followed the same pattern as the time estimates and were also not reliable. The RUC recommends that the following CMS times and work values be retained until sufficient experience is obtained to resurvey. When the services are reviewed again in two years, the RUC's Research Subcommittee will work with the specialties to design a survey instrument to better obtain physician time and work estimates.

●99492 *Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (work RVU = 1.70, intra-time only = 40 minutes)*

●99493 *Subsequent psychiatric collaborative care management, first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (work RVU = 1.53, intra-time only = 36 minutes)*

●+99494 *Initial or subsequent psychiatric collaborative care management, each additional 30 minutes in a calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (List separately in addition to code for primary procedure) (work RVU = 0.82, intra-time only = 18 minutes)*

●99484 *Care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional, per calendar month (work RVU= 0.61, intra-time only = 15 minutes)*

#### Practice Expense

The PE Subcommittee reviewed the practice expense inputs which are similar to the CMS HCPCS codes outlined in the final rule for 2017. The Subcommittee agreed with the specialty societies that additional minimal supplies and equipment should be added into the direct practice expense inputs for 2018. The Subcommittee reduced the supply item, *tissue (Kleenex)* (SK114) from 1 to 0.05 to maintain consistency with other services utilizing this supply item. The Subcommittee notes that equipment time for the *One Couch and Two Chairs* (EF042) reflects usage during 45% of the time needed for care management activities. The RUC reviewed and approved the practice expense inputs as approved with modifications by the PE Subcommittee.

#### New Technology

These codes will be added to the new technology list so that they will be flagged for review in two years.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Evaluation and Management</b> <b>Care Management Services</b>  <i>Care management services are management, and support services provided by clinical staff under the direction of a physician or other qualified health care professional, to a patient residing at home or in a domiciliary, rest home, or assisted living facility. Services may include establishing, implementing, revising, or monitoring the care plan, coordinating the care of other professionals</i>				

*and agencies, and educating the patient or caregiver about the patient's condition, care plan, and prognosis. *If the physician personally performs the clinical staff activities, his or her time may be counted toward the required clinical staff time to meet the elements of the code.*

---

### **Psychiatric Collaborative Care Management Services**

Psychiatric collaborative care services are provided under the direction of a treating physician or other qualified health care professional (see definitions below) during a calendar month. These services are provided when a patient has a diagnosed psychiatric disorder that requires a behavioral health care assessment; establishing, implementing, revising, or monitoring a care plan; and provision of brief interventions. These services are reported by the treating physician or other qualified health care professional and include the services of the treating physician or other qualified health care professional, the behavioral health care manager (see definition below), and the psychiatric consultant (see definition below) who has contracted directly with the treating physician or other qualified health care professional, to provide consultation.

Patients directed to the behavioral health care manager typically have newly diagnosed conditions, may need help in engaging in treatment, have not responded to standard care delivered in a non-psychiatric setting, or require further assessment and engagement, prior to consideration of referral to a psychiatric care setting.

The following definitions apply to this section:

#### **Episode of Care**

Patients are treated for an episode of care, defined as beginning when the patient is directed by the treating physician or other qualified health care professional to the behavioral health care manager and ending with:

- the attainment of targeted treatment goals, which typically results in the discontinuation of care management services and continuation of usual follow-up with the treating physician or other qualified healthcare professional; or
- failure to attain targeted treatment goals culminating in referral to a psychiatric care provider for ongoing treatment; or
- lack of continued engagement with no psychiatric collaborative care management services provided over a consecutive six month calendar period (break in episode).

A new episode of care starts after a break in episode of six calendar months or more.

### **Health Care Professionals**

#### **Treating Physician or Other Qualified Health Care Professional**

The treating physician or other qualified health care professional directs the behavioral health care manager and continues to oversee the patient's care, including prescribing medications, providing treatments for medical conditions, and making referrals to specialty care when needed. Evaluation and management (E/M) and other services may be reported separately by the same physician or other qualified health care professional during the same calendar month.

#### **Behavioral Health Care Manager**

The behavioral health care manager refers to clinical staff with a masters/doctoral-level education or specialized training in behavioral health who provides care management services as well as an assessment of needs, including the administration of validated rating scales, the development of a care plan, provision of brief interventions, ongoing collaboration with the treating physician or other qualified health care profession, maintenance of a registry, all in consultation with a psychiatric consultant. Services are provided both face-to-face and non-face-to-face and psychiatric consultation is provided minimally on a weekly basis, typically non face-to-face.

The behavioral health care manager providing other services in the same calendar month, such as psychiatric evaluation (90791, 90792), psychotherapy (90832, 90833, 90834, 90836, 90837, 90838), psychotherapy for crisis (90839, 90840), family psychotherapy (90846, 90847), multiple family group psychotherapy (90849), group psychotherapy (90853), smoking and tobacco use cessation counseling (99406, 90407), and alcohol and/or substance abuse structured screening and brief intervention services (99408, 99409), may report these services separately. Activities for services reported separately are not included in the time applied to 99492, 99493, 99494.

#### **Psychiatric Consultant**

The psychiatric consultant refers to a medical professional trained in psychiatry or behavioral health and qualified to prescribe the full range of medications. The psychiatric consultant advises and makes recommendations, as needed, for psychiatric and other medical care, including psychiatric and other medical differential diagnosis, treatment strategies regarding appropriate therapies, medication management, medical management of complications associated with treatment of psychiatric disorders, and referral for specialty services; which are communicated to the treating physician or other qualified health care professional typically through the behavioral

health care manager. The psychiatric consultant does not typically see the patient nor prescribe medications, except in rare circumstances.

The psychiatric consultant may provide services in the calendar month described by other codes, such as evaluation and management (E/M) services and psychiatric evaluation (90791, 90792). These services may be reported separately by the psychiatric consultant. Activities for services reported separately are not included in the services reported using 99492, 99493, 99494.

### Code Selection

Do not report 99492 and 99493 in the same calendar month.

Table X

Type of Service	Total Duration of Collaborative Care Management Over Calendar Month	Code(s)
Initial – 70 minutes	Less than 36 minutes	Not reported separately
	36-85 minutes (36 minutes – 1 hr. 25 minutes)	99492
Initial plus each additional increment up to 30 minutes	86-116 minutes (1 hr. 26 minutes – 1 hr. 54 minutes)	99492 X 1 AND 99494 X 1
Subsequent – 60 minutes	Less than 31 minutes	Not reported separately
	31-75 minutes (31 minutes – 1 hr. 15 minutes)	99493
Subsequent plus each additional	76-105 minutes (1 hr. 16 minutes – 1 hr.	99493 X 1 AND 99494 X 1

	increment up to 30 minutes	45 minutes)		
●99492	A1	<p>Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements:</p> <ul style="list-style-type: none"> <li>• outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional;</li> <li>• initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan;</li> <li>• review by the psychiatric consultant with modifications of the plan if recommended;</li> <li>• entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant; and</li> <li>• provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.</li> </ul>	XXX	<p>1.70 CMS 2017 RVU Re-review after two years of experience</p>

Re: Psychiatric Collaborative Care Management Services (994X1-994X3) and Care Mgt for Behavioral Health (G0507)

Dear Dr. Smith and members of the RUC -

On behalf of the AAFP, ACP, AGS, and AACAP, we are providing the following information in an effort to clarify our RUC submission for Tab 20 (994X1-994X3 and G0507). As you recall, we conducted surveys of two different provider groups (PCPs and Psychiatrists), and (994X1-994X3 surveys were all to a targeted pool, while G0507 included results that were both from targeted and random pools of participants.

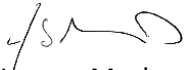

1. Regarding the RUC Summary form (applies to all codes unless otherwise noted)
  - a. The top two Key Reference Service codes are listed for each provider (PCP and Psychiatrist) and are shaded in light green
  - b. The current CMS values (from the November 2016 final rule) are below that in orange.
  - c. The combined survey data (includes both the PCP and the Psychiatric Consultant together) is in yellow.
  - d. Then individual survey data from the PCP (bright green) and the Psychiatrist (blue) are next followed by basic information (time and experience) we collected from the Behavioral Health Care Manager (tan) to use for our PE submission.
  - e. The same holds true for the G0507 EXCEPT
    - i. The top two Key Reference Service codes are calculated on the total of the targeted (PCP T or Psych T) and random (PCP R or Psych R) responses by provider type.
    - ii. The brighter yellow is the combined data for all survey respondents, both PCP and Psych and targeted and random together.
    - iii. There are two rows in light yellow that reflect the combined data for the targeted and random groups, again by provider type.
2. Regarding the Work Summary of Recommendation Forms
  - a. There is both an adult vignette and adolescent vignette (for all codes).
  - b. The description of work for the 994X1-994X3 codes includes a brief description of the duties of both the primary care provider as well as the psychiatric consultant – a separate header identifies each.
  - c. The “Survey Data” in the SOR form lists the data of the combined surveys - both the PCPs and the Psychiatrists and in the case of the G0507 it includes both the targeted and random responses. These are the figures displayed on the RUC Summary in bright yellow.
  - d. In all cases, the “Top Key Reference Service” is the top key reference service selected by the PCPs and the “Second Highest Key Reference Service” is the top key reference service selected by the Psychiatrists. This holds true for the discussion of time, and intensity complexity. In the case of the G0507 it is the key reference service identified when the data from both the random and targeted surveys were combined (The targeted and random group of PCPs is the “Key” reference service and the targeted and random group of Psychiatrists is the “Second Highest Key” reference service.
3. Regarding the Intensity and Complexity Forms

- a. Forms have been completed for both the PCP and the Psychiatrist with data on their respective "Top Key Reference Service." The number of responses correspond to the number of survey participants with that specific group. Each are labeled at the top as to the type of provider.

We've included some background information below the rationale which is the same in each Work Summary of Recommendation form with the exception of the specific RVW and time recommendations for the individual code.

We hope this information is helpful and are happy to respond to any questions.

Thank you,

Jeremy Musher, MD

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 99484      Tracking Number    A4

Original Specialty Recommended RVU: **0.61**Presented Recommended RVU: **0.61**

Global Period: XXX

RUC Recommended RVU: **0.61**

CPT Descriptor: Care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional, per calendar month, with the following required elements:

- Initial assessment or follow-up monitoring, including the use of applicable validated rating scales;
- Behavioral health care planning in relation to behavioral/psychiatric health problems, including revision for patients who are not progressing or whose status changes;
- Facilitating and coordinating treatment such as psychotherapy, pharmacotherapy, counseling and/or psychiatric consultation; and
- Continuity of care with a designated member of the care team.

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year old female established patient presents with complaints of fatigue and sleep disturbance following the recent loss of her spouse. The primary care physician diagnoses the patient with a behavioral health disorder and recommends that the patient receive behavioral health care management as part of the treatment.

A 15-year-old child presents to the primary care physician with vague complaints of stomach aches, fatigue, excessive sleep and atypically poor grades. The primary care physician diagnoses the patient with a behavioral health disorder and recommends that the patient receive behavioral health care management as part of the treatment plan.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;  
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: (Not applicable)

Description of Intra-Service Work: Provides direction and general supervision of care management services for behavioral health conditions which are generally provided by clinical staff. Provides or oversees the management and/or coordination of services, as needed, for all medical conditions, psychosocial needs, and activities of daily living.

Description of Post-Service Work: (Not applicable)

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? Yes

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99213	XXX	0.97	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99214	XXX	1.50	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Usually, the presenting problem(s) are of moderate to high severity. Typically, 25 minutes are spent face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

The American Geriatrics Society (AGS), American College of Physicians (ACP), American Academy of Family Physicians (AAFP), American Academy of Child and Adolescent Psychiatry (AACAP), and American Psychiatric Association (APA), conducted joint targeted surveys of their memberships in November 2016 for CPT codes 99492, 99493, and 99494 as well as a targeted and random survey for CMS created code 99484. A joint AGS, ACP, AAFP, AACAP, and APA RVS expert panel ("joint panel") consisting of physician advisors and specialty experts reviewed the survey work and time data and developed recommendations through participation in conference calls and e-mail discussions. Please note that the societies also conducted a survey of Behavioral Health Care Managers (BHCMS) that was only used to develop recommendations for practice expenses.

For code 99492, there were 84 responses (25 primary care physicians (PCP), 59 Psychiatric Consultants [Psych]) to the survey request with a median performance rate of 20 (PCP 10, Psych 40); 96% of the survey respondents found the vignette to be typical. For 99493, there were 80 response (23 PCP, 57 Psych) responses with a median performance rate of 20 (PCP 10, Psych 30); 94% of the respondents found the vignette to be typical. For code 99494, there were 79 responses (22 PCP, 57 Psych) with a median performance rate of 10 (PCP 4, Psych 15); 92% of the respondents found the vignette to be typical. For 99484, there were 161 responses (23 PCP targeted, 53 PCP random, 51 Psych targeted, 34 Psych random) with a median performance rate of 12 (PCP T 5, PCP R 15, Psych T 10, Psych R 15); 87% of the respondents found the vignette to be typical. The RUC summary contains a breakout of PCP participants, Psychiatric Consultant participants, and BHCMS.

The joint panel kept in mind that 99492, 99493, and 99494 are unlike any other services in CPT, because they include the work of two different physicians or other qualified health care professionals, but only one of those individuals reports the

service. The joint panel agreed that, in order for the survey data to be credible, there had to be a sufficient number of responses from both PCPs and Psychiatric Consultants and that those respondents value only the time and work effort of their individual portion of the service (e.g., PCPs should value only the time and work for the PCP portion of the service). The joint panel agreed that, because the PCP is the billing provider, it was particularly crucial for PCP responses to meet the RUC minimum threshold for number of survey responses.

With respect to the number of respondents, unfortunately, even after extending the survey and after repeated reminders and adding new participants identified by other participants, the end result of the targeted survey was that there were fewer than 30 PCP responses for each code. This does not reach the RUC minimum requirement. While the total number of respondents was more than 75 for each code, the joint panel agreed that the number of responses from each physician type (PCP, Psych) needed to meet the minimum threshold (30), because each type was performing separate, distinct work. Therefore, the joint panel was very concerned about the validity of the PCP data given the small numbers and in light of the fact that this is a new service and that the work of the PCP is essential to the service.

After noting these concerns, the expert panel reviewed the targeted survey data for 99492, 99493, and 99494 as well as the targeted and random survey data for 99484.

### **Physician Time Discussion**

The joint panel noted that these services do not include any pre and post service time, because they describe care furnished over a calendar month. Therefore, the reliability of the intra-service time data is critical to appropriately valuing the service. The joint panel also reviewed the survey instrument, which clearly stated that the respondent was to value “their” portion of the work - not the work of the entire service. This meant that the intent of the survey was to “sum” the times reported by PCPs and by the Psychiatric Consultants to arrive at a total physician time.

The joint panel then reviewed the time data for 99492. It noted that the PCPs reported a median intra-service time of 40 minutes while Psychiatric Consultant respondents reported a median intra-service time of 30 minutes. When the expert panel summed these times, the resulting value of 70 minutes was judged by the joint panel to not be credible. Specifically, the panel noted the following: (1) the vast majority of PCP and Psychiatric Consultant time is spent interacting with the BHCM, (2) if the total physician time was 70 minutes that would mean that virtually all the BHCM time (70 minutes minimum for 99492) was spent with the PCP and Psychiatric Consultant. This is not the case, as much BHCM time is spent interacting directly with the patient. The joint panel then looked at the individual times and concluded that given the requirements of the code, the Psychiatric Consultant time of 30 minutes was much more credible than the PCP time of 40 minutes and that both were high, given that the BHCM is a Masters or PhD level clinical staff person, or a clinical staff person with specialized training, experience, and expertise in managing behavioral health problems. Based on its review, the joint panel agreed that it was very possible that respondents valued the time required for the entire service, not just “their portion” of the service. If such was the case, this would mean that the median intra-service (and total) time when all survey responses were combined (combined group), (30 minutes) could represent the time of the entire service. However, for a number of reasons, the panel concluded it would be completely inappropriate to develop recommendations using this approach. For example, the panel had no idea if this reading of the data was actually the case, and second, if this reading of the data was correct, the panel had serious concerns that PCPs could accurately estimate the time spent by Psychiatric Consultant, and vice versa. Therefore, the panel did not pursue this approach further.

Next, the joint panel reviewed the time data for 99493. This review revealed the same problem as that identified for 99492. PCPs reported a median intra-service time of 40 minutes and Psychiatric Consultant respondents reported a median of 20 minutes. Based on its review, the joint panel concluded that a total time of 60 minutes was not credible. Further, the panel was concerned that PCPs were reporting the same time for 99493 as for 99492 whereas 99493 should take less time given that the patient was already receiving, as opposed to being new to, collaborative care. As with 99492, the summed time of 60 minutes would mean that all the BHCM time (60 minutes minimum) was spent with the PCP and Psychiatric Consultant, which, as with 99492, is not true. As with 99492, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (20 minutes) bore any relation to the actual combined median intra-service time for both physicians. The panel’s review of 99494 led to similar conclusions. PCPs and Psychiatric Consultants both reported median times of 15 minutes, which meant that the entire 30 minutes of required BHCM time would be spent with the physicians. As

with 99492 and 99493, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (15 minutes) bore any relation to the actual combined median intra-service time for both physicians.

Lastly, the panel reviewed the physician time for 99484. This is a code that was created by CMS and reported based on clinical staff time, and the panel was not sure whether respondents would be familiar with it. The societies surveyed both the targeted group who were surveyed for 99492, 99493, and 99494 as well as a random group. The targeted PCPs and Psychiatric Consultants reported median intra-service times of 20 and 15 minutes, respectively, while the random PCPs and Psychiatric Consultants reported median times of 30 and 60 minutes, respectively. Given these wildly disparate times and that the service requires only 20 minutes of clinical staff time, the panel concluded these times were not reliable or usable. As with 99492, 99493, and 99494, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (30 minutes), of all 4 groups of respondents, bore any relation to the actual median intra-service time for both physicians.

In summary, the joint panel concluded that the physician time data for 99492, 99493, 99494, and 99484 could not be used to develop a recommendation for the RUC. Aside from the issue of the small numbers of PCP respondents, the panel concluded that it appeared that the respondents had not understood the survey questions, had difficulty determining the time of “their portion” of the service (e.g., because it is spread out over a calendar month in very small increments), and/or tried to estimate the time of the entire service. Whatever the reason, the joint panel concluded the data was not reliable.

### Physician Work Discussion

Next, the joint panel reviewed the work RVW data. As with time, the joint panel noted that the intent of the survey was for PCPs and Psychiatric Consultants to value “their own” work, not the work of the entire service. This meant the total RVW should be the sum of the PCP and Psychiatric Consultant RVWs.

First, the panel reviewed the RVW data for 99492. The median work RVW for PCPs and Psychiatric Consultant was 2.00 and 2.75, respectively, with a summed RVW of 4.75. Assuming the median times were also summed, for a total of 70 minutes, the joint panel agreed this was not credible or presentable to the RUC. For example, 99291, *Critical care, first hour*, which is a face-to-face service and is considered the most intense E/M service, has a work RVW of 4.50 with times of (15/40/15, total 70.) Further, 4.75, for a non-face-to-face physician service, even with 70 minutes of time, would create rank order anomalies with the reference services and with all the other non-face-to-face services recently valued by the RUC. Based on its review, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just “their portion” of the service. If such was the case, this would mean that the median RVW for the combined group (2.50) could represent the work of the entire service. However, for a number of reasons, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW’s from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

When the joint panel did review the PCP and Psychiatric Consultant work data, individually, the panel noted that the PCP and Psychiatric Consultant medians were very different. The Psychiatric Consultant work values were much higher than those of the PCPs with a much lower intra-service time. This disparity was notable and resulted in very different work intensities, which led the panel to believe that, whether the respondents were valuing the entire service or just “their portion” of the work, PCPs and Psychiatric Consultants may have very different concepts of what this service is - in spite of the fact that the vignette was considered typical by both groups. The panel concluded that, for 99492, this disparity cast even more doubt on the validity of the survey data.

The analyses for 99493, 99494, and 99484 were very similar.

For 99493, the sum of the PCP survey median RVW (1.50) and the Psychiatric Consultant survey median (1.50) was 3.00, which, even with a summed time of 60 minutes, yielded rank order anomalies with face-to-face and non-face-to-face E/M services. As with 99492, the joint panel agreed that it was very possible that respondents valued the work required for the entire service, not just “their portion” of the service. If this was the case, it would mean that the median RVW for the combined group (1.50) could represent the work of the entire service. However, for a number of

reasons, as with 99492, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

For 99494, sum of the median work RVW for PCPs (1.50) and the median work RVW for Psychiatric Consultants (1.00) was 2.50, which, even with an assumed summed time of 30 minutes, was not credible. For example, 99292, *Critical care, additional 30 minutes*, has a work RVW of 2.25 with a total time of 30 minutes (all intra-service). As with 99492 and 99493, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just "their portion" of the service. If this was the case, it would mean that the median RVW for the combined group (1.00) could represent the work of the entire service. However, for a number of reasons, as with 99492 and 99493, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

Lastly, the panel reviewed the work values for 99484, and the same problems were identified. Irrespective of which PCP and Psychiatric Consultant work RVWs were used, the sum of the PCP and Psychiatric Consultant RVWs was not credible. Further, the disparity between the targeted and random groups was so great that the panel concluded the various groups of respondents appeared to have very different ideas as to what the service involves. As with 99492, 99493, and 99494, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just "their portion" of the service. If this was the case, it would mean that the median RVW for the combined group could represent the work of the entire service. However, for the reasons described above, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

In order to develop a recommendation to bring to the RUC, the joint panel did an extensive search of the RUC database for recently RUC reviewed codes with XXX globals (and ZZZ globals for 99494). In order to do the search, the joint panel had to decide what intra-service time parameters to use. For 99492 and 99493, the panel searched a range of codes between 20 and 40 minutes of intra-service time in order to account for the disparity of time in the survey data. For 99494, the search included codes with intra-service times in the 15-20 minute range (also to take into account the range of survey data).

The expert panel found that there were a number of potential crosswalk codes that supported the CMS values for work. Specifically, there were many codes in the 70000 series with similar intra-service and total times that supported the CMS valuation. For example, 70554 (*Functional MRI by tech*) has 15/35/10 (total 60) minutes with a work RVW of 2.11 which supports the CMS value for 99492. 74170 (*CT abdomen*) has 5/18/5 (total 28) minutes with a work RVW of 1.40 that supports the CMS value for 99493. There are numerous ZZZ globals with intra-times of 15 to 20 minutes with work RVWs of 0.80 to 1.00.

Furthermore, the values for 99487 (*Cmplx chron care*) are 26 minutes of intra-time and a work RVW of 1.00. This fits nicely between the CMS times and values for 99493 and 99494. The panel also noted that the MPC codes 99239 (*Hospital discharge day*) with times of 10/30/15 (total 55) minutes and a work RVW of 1.90 and 99309 (*Nursing fac care subseq*) with times of 10/25/10 (total 45) minutes and a work RVW of 1.55 also supports the CMS values for 99492 and 99493.

Therefore, even though it has reservations about the CMS methodology for establishing work RVWs for 99492, 99493, and 99494, the joint panel recommends that the CMS values be maintained as interim for three years until such time as members from the surveying specialties gain experience using these codes, at which time the specialties will

conduct another survey. As we have learned from this survey, it will be important to ensure that survey participants only report time and value work for “their portion” rather than estimating time and work the entire service.

For 99484, the specialties also recommend that the CMS values be maintained as interim until another survey can be performed in three years. CMS modeled this code after 99490 (*Chron care mgmt srvc 20 min*) (times of 0/15/0 minutes, work RVW of 0.61), and cross-walked the work RVW from 99490. Given that there does not appear to be a clear, and consistent understanding of what this service entails, the joint panel believes maintaining the CMS value on an interim basis is appropriate.

### Summary

In summary, the joint panel believes that the survey data for physician work and time is simply not credible. That said, the joint panel and the societies agree that a lot has been learned by going through the survey process. This series of codes is the first of its kind that involves the work of two different physicians that is reported by only one of the two. The joint panel and the societies think that the societies can work together to create a new survey that is modified to take into account the lessons from the current survey (e.g., to better ensure that respondents only value the work and time of “their portion” of the service and to “ignore the portion of the service performed by the...”). Further, at that point, more physicians in the field will have experience using the codes, which increases the likelihood of gaining sufficient survey respondents, especially PCPs.

Therefore, the joint panel recommends that the CMS physician work and time values for all 4 codes be maintained as interim for three years after which, the APA, AACAP, AAFP, ACP, AGS, and any other interested society will conduct another survey of all 4 codes.

### Recommendations

In summary, **we recommend the CMS RVW and times of 0.61 with 0 minutes pre, 15 minutes intra, and 0 minutes post, with a total time of 15 minutes for 99484.**

---

### HISTORY/BACKGROUND

The Psychiatric Collaborative Care Services codes were developed following a request by CMS in the proposed rule for the CY 2016 Medicare Physician Fee Schedule to create a payment structure to describe a specific model of collaborative care services for patients with common behavioral health conditions. CMS referred to the Collaborative Care Model described by the University of Washington’s AIMS Center (<http://aims.uw.edu>) in which a Primary Care Practitioner (PCP)/treating physician and Behavioral Health Care Manager (BHCM) collaborate with a Psychiatric Consultant to provide behavioral healthcare to a population of patients to help ensure the patients are improving, and to make treatment adjustments as necessary in an effort to ensure the patients reach established treatment goals. Most of the collaboration between the Psychiatric Consultant and the BCHM is non-face-to-face over the phone, through regular caseload reviews with additional contact as needed. There are instances where the PCP and Psychiatric Consultant communicate directly about specific patients, either by phone or in person, but that is not typical. Importantly, although much of the contact between the Psychiatric Consultant and the BCHM is non-face-to-face, there is also face-to-face and non-face-to-face contact between the BCHM and the patient. The face-to-face contact between the BCHM and the patient typically consists of office visits where the BCHM evaluates the patient, provides brief therapeutic interventions, and/or communicates /educates the patient regarding changes to the care plan.

As stated in the CPT coding guidelines:

- The PCP/treating physician directs the Behavioral Health Care Manager and continues to oversee the patient’s care, including prescribing medications, providing treatments for medical conditions and making referrals to specialty care.
- The Behavioral Health Care Manager is a clinical staff person with a masters/doctoral-level education or specialized training in behavioral health who provides care management services as well as an assessment of behavioral health needs including the administration of validated rating scales, the development of a care plan, provision of brief interventions, ongoing collaboration with the treating physician (which includes communicating treatment recommendations/adjustments from the Psychiatric Consultant), and maintenance of a registry, all in

consultation with a Psychiatric Consultant. The services provided to the patient are both face-to-face and non-face-to-face.

- The Psychiatric Consultant (e.g., MD, DO, PA, APRN) refers to a medical professional trained in psychiatry and qualified to prescribe the full range of medications. The consultant advises and makes recommendations as needed for psychiatric and other medical care, including psychiatric and other medical diagnoses, treatment strategies including appropriate therapies, medication management and medical management of complications associated with treatment of psychiatric disorders, and referral for specialty care services, that are communicated to the treating physician, typically through the Behavioral Health Care Manager. The Psychiatric Consultant does not typically see the patient face-to-face.

Three new CPT codes were proposed and approved by the CPT Editorial Panel at its February 2016 meeting. There is one code (99492) for the initial calendar month of services within the collaborative care program, one code for each subsequent calendar month of services, and an add-on code for additional time that can be reported in addition to the other two codes.

The new code set describes the work of two medical professionals, only one of whom submits the bill, and a clinical staff person working together collaboratively to manage a population of patients. The codes are similar to other care management codes (99487 and 99490) in that they are billed per calendar month based on the Behavioral Health Care Manager's time and they include the work of the PCP. HOWEVER, the new codes also include the work of the Psychiatric Consultant. In the model described by these codes, the Psychiatric Consultant is paid directly by the primary care practice and does not bill for his/her time using a separate CPT code.

### **RUC Process**

The AMA RUC Research Subcommittee set up a workgroup, (Ad Hoc Psychiatric Collaborative Care Management Workgroup), to assist in the modification of the standard survey tool to accommodate these new codes, as well as review the vignettes, reference service lists and survey pool. The Research Subcommittee reviewed and approved our request to do a targeted survey for CPT codes 99492- 99494. The targeted pool of participants included those PCPs and Psychiatric Consultants who have practiced in the Collaborative Care Model or who have been educated/trained in the model. In order to expand the targeted pool, each participant was asked to identify others who have worked in the model (past and present) as well as anyone who has had training in the model. The Research Subcommittee also approved two separate reference services lists (one for the PCP and one for the Psychiatric Consultant) as well as the vignettes. They also approved a modified survey tool which asked respondents to value their work with their typical patient within the "total service period" which encompassed the monthly timeframe.

### **CMS Final Rule on the CY 2017 Medicare Physician Fee Schedule**

After all the above work was completed, CMS finalized coding, coverage, and payment (effective January 1, 2017) for these services in the Final Rule for the CY 2017 Medicare Physician Fee Schedule.

#### **G0502-G0503 (99492-99494)**

CMS created three G codes, adopting the language of the CPT codes, and finalized relative value units for physician work (RVUs) (1.70, 1.53, and 0.82 RVUs respectively), physician times (40, 36, and 18 minutes respectively), and clinical labor times (70, 60, and 30 minutes respectively) as well as a clinical labor type for the Behavioral Health Care Manager. CMS assigned temporary G Codes (G0502, G0503, G0504) for use until the CPT codes go into effect on January 1, 2018.

According to CMS: "To value HCPCS codes G0502, G0503, and G0504, we proposed to base the portion of the work RVU that accounts for the work of the treating physician or other qualified health care professional on a direct crosswalk to the proposed work values for the complex CCM codes, CPT codes 99487 and 99489...Therefore, in allocating a differential portion of the work RVU to each practitioner, we believe the work RVU associated with the billing practitioner should be greater than the work RVU associated with the Psychiatric Consultant. After considering these comments, we are finalizing total work RVUs of 1.70 for G0502, 1.53 for G0503, and 0.82 for G0504. These RVUs include 0.52 for the Psychiatric Consultant based on a crosswalk to the work per minute of a level three established patient office visit [and an CMS estimate of 10 minutes of Psychiatric Consultant time per patient per month]...Since the Behavioral Health Care Manager in the services described by HCPCS codes G0502, G0503, and G0504 should have

specialized training in behavioral health, we proposed a new clinical labor type for the Behavioral Health Care Manager, L057B, at \$0.57 per minute, based on the rates for genetic counselors in the direct PE input database.”

#### 99484

CMS also finalized payment for an additional care management code, 99484, Care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional, per calendar month, (99484) which describes care management for beneficiaries with behavioral health conditions under models of care other than the collaborative care model describe above. This service may be furnished when the beneficiary has a psychiatric or behavioral health condition(s) that in the PCP/treating physician clinical judgment, requires a behavioral health care assessment, behavioral health care planning, and provision of interventions. And per CMS includes “an initial assessment or follow-up monitoring, including the use of applicable validated rating scales; Behavioral health care planning in relation to behavioral/psychiatric health problems, including revision for patients who are not progressing or whose status changes; Facilitating and coordinating treatment such as psychotherapy, pharmacotherapy, counseling and/or psychiatric consultation; and Continuity of care with a designated member of the care team.”

CMS finalized relative value units for physician RVUs (0.61 RVUs), physician time (15 minutes), and clinical labor times (20 minutes) as well as a clinical labor type for the care manager that is the same (L057B, at \$0.57 per minute) as that for the collaborative care codes discussed above.

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
- 

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) (not previously reported)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Primary Care                      How often? Commonly

Specialty Psychiatry                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 147343

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. General U.S. population is approximately seven times the Medicare population

Specialty Primary Care	Frequency 104996	Percentage 71.25 %
------------------------	------------------	--------------------

Specialty Psychiatry	Frequency 42347	Percentage 28.74 %
----------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

21,049 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Taken from utilization estimates in final rule on 2017 Medicare physician fee schedule

Specialty Primary Care	Frequency 15000	Percentage 71.26 %
------------------------	-----------------	--------------------

Specialty Psychiatry	Frequency 6049	Percentage 28.73 %
----------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Evaluation Management

BETOS Sub-classification:

BETOS Sub-classification Level II:

NA

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 99490

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 99492      Tracking Number A1

Original Specialty Recommended RVU: **1.70**Presented Recommended RVU: **1.70**

Global Period: XXX

RUC Recommended RVU: **1.70**

CPT Descriptor: Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements:

- outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional;
- initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan;
- review by the psychiatric consultant with modifications of the plan if recommended;
- entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant; and
- provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Adult: A 55-year-old woman who is separated from her husband and has no children at home has been feeling more fatigued, not sleeping well, and missing doses of the medicine she takes for her hypertension and diabetes. She worries a lot about her future. The patient is diagnosed as having a behavioral health disorder and the primary care physician recommends that the patient be enrolled in the psychiatric collaborative care management services program.

Child/Adolescent: A 15-year-old child brought in by a parent because of concerns about social withdrawal, anxiety, diminished school performance and substance abuse. The patient is diagnosed as having a behavioral health disorder and the primary care physician recommends that the patient be enrolled in the psychiatric collaborative care management services program.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: NA

Description of Intra-Service Work: Primary Care Physician/Treating Physician: Directs and provides general supervision of the behavioral health care manager (BHCM) and continues to provide or oversee the management and/or coordination of services, as needed, for all medical conditions, psychosocial needs, and activities of daily living. Reviews treatment recommendations from the psychiatric consultant with the BHCM and implements as appropriate. Ensures services are documented appropriately.

Psychiatric Consultant: Receives and reviews information from the BHCM, including HPI, past psychiatric/chemical dependency history, family history, social history, and treatments, as well as a medical history, review of systems, and focused questions related to safety, lethality, aggression, and/or competence, as indicated. Reviews the recommended

treatment plan from the PCP and formulates any additional treatment recommendations as indicated. Communicates the recommendations and associated rationale to the BHCM who, in turn, communicates those to the PCP/Treating physician to consider implementing.

Description of Post-Service Work: NA

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? Yes

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99205	XXX	3.17	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Usually, the presenting problem(s) are of moderate to high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family.

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
90792	XXX	3.25	RUC Time

CPT Descriptor Psychiatric diagnostic evaluation with medical services

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
99304	XXX	1.64	RUC Time	365,409

CPT Descriptor 1 Initial nursing facility care, per day, for the evaluation and management of a patient, which requires these 3 key components: A detailed or comprehensive history; A detailed or comprehensive examination; and Medical decision making that is straightforward or of low complexity. Usually, the problem(s) requiring admission are of low severity. Typically, 25 minutes are spent at the bedside and on the patient's facility floor or unit.

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
99318	XXX	1.71	RUC Time	117,250

CPT Descriptor 2 Evaluation and management of a patient involving an annual nursing facility assessment, which requires these 3 key components: A detailed interval history; A comprehensive examination; and Medical decision making that is of low to moderate complexity. Usually, the patient is stable, recovering, or improving. Typically, 30 minutes are spent at the bedside and on the patient's facility floor or unit.

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
70554	XXX	2.11	RUC Time

CPT Descriptor Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration

### **RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Top Key Reference Code:** 8      **% of respondents:** 9.5 %

**Number of respondents who choose 2<sup>nd</sup> Key Reference Code:** 26      **% of respondents:** 30.9 %

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

The American Geriatrics Society (AGS), American College of Physicians (ACP), American Academy of Family Physicians (AAFP), American Academy of Child and Adolescent Psychiatry (AACAP), and American Psychiatric Association (APA), conducted joint targeted surveys of their memberships in November 2016 for CPT codes 99492, 99493, and 99494 as well as a targeted and random survey for CMS created code 99484. A joint AGS, ACP, AAFP, AACAP, and APA RVS expert panel ("joint panel") consisting of physician advisors and specialty experts reviewed the survey work and time data and developed recommendations through participation in conference calls and e-mail discussions. Please note that the societies also conducted a survey of Behavioral Health Care Managers (BHCMS) that was only used to develop recommendations for practice expenses.

For code 99492, there were 84 responses (25 primary care physicians (PCP), 59 Psychiatric Consultants [Psych]) to the survey request with a median performance rate of 20 (PCP 10, Psych 40); 96% of the survey respondents found the vignette to be typical. For 99493, there were 80 response (23 PCP, 57 Psych) responses with a median performance rate of 20 (PCP 10, Psych 30); 94% of the respondents found the vignette to be typical. For code 99494, there were 79 responses (22 PCP, 57 Psych) with a median performance rate of 10 (PCP 4, Psych 15); 92% of the respondents found the vignette to be typical. For 99484, there were 161 responses (23 PCP targeted, 53 PCP random, 51 Psych targeted, 34 Psych random) with a median performance rate of 12 (PCP T 5, PCP R 15, Psych T 10, Psych R 15); 87% of the respondents found the vignette to be typical. The RUC summary contains a breakout of PCP participants, Psychiatric Consultant participants, and BHCMS.

The joint panel kept in mind that 99492, 99493, and 99494 are unlike any other services in CPT, because they include the work of two different physicians or other qualified health care professionals, but only one of those individuals reports the service. The joint panel agreed that, in order for the survey data to be credible, there had to be a sufficient number of responses from both PCPs and Psychiatric Consultants and that those respondents value only the time and work effort of

their individual portion of the service (e.g., PCPs should value only the time and work for the PCP portion of the service). The joint panel agreed that, because the PCP is the billing provider, it was particularly crucial for PCP responses to meet the RUC minimum threshold for number of survey responses.

With respect to the number of respondents, unfortunately, even after extending the survey and after repeated reminders and adding new participants identified by other participants, the end result of the targeted survey was that there were fewer than 30 PCP responses for each code. This does not reach the RUC minimum requirement. While the total number of respondents was more than 75 for each code, the joint panel agreed that the number of responses from each physician type (PCP, Psych) needed to meet the minimum threshold (30), because each type was performing separate, distinct work. Therefore, the joint panel was very concerned about the validity of the PCP data given the small numbers and in light of the fact that this is a new service and that the work of the PCP is essential to the service.

After noting these concerns, the expert panel reviewed the targeted survey data for 99492, 99493, and 99494 as well as the targeted and random survey data for 99484.

### **Physician Time Discussion**

The joint panel noted that these services do not include any pre and post service time, because they describe care furnished over a calendar month. Therefore, the reliability of the intra-service time data is critical to appropriately valuing the service. The joint panel also reviewed the survey instrument, which clearly stated that the respondent was to value “their” portion of the work - not the work of the entire service. This meant that the intent of the survey was to “sum” the times reported by PCPs and by the Psychiatric Consultants to arrive at a total physician time.

The joint panel then reviewed the time data for 99492. It noted that the PCPs reported a median intra-service time of 40 minutes while Psychiatric Consultant respondents reported a median intra-service time of 30 minutes. When the expert panel summed these times, the resulting value of 70 minutes was judged by the joint panel to not be credible. Specifically, the panel noted the following: (1) the vast majority of PCP and Psychiatric Consultant time is spent interacting with the BHCM, (2) if the total physician time was 70 minutes that would mean that virtually all the BHCM time (70 minutes minimum for 99492) was spent with the PCP and Psychiatric Consultant. This is not the case, as much BHCM time is spent interacting directly with the patient. The joint panel then looked at the individual times and concluded that given the requirements of the code, the Psychiatric Consultant time of 30 minutes was much more credible than the PCP time of 40 minutes and that both were high, given that the BHCM is a Masters or PhD level clinical staff person, or a clinical staff person with specialized training, experience, and expertise in managing behavioral health problems. Based on its review, the joint panel agreed that it was very possible that respondents valued the time required for the entire service, not just “their portion” of the service. If such was the case, this would mean that the median intra-service (and total) time when all survey responses were combined (combined group), (30 minutes) could represent the time of the entire service. However, for a number of reasons, the panel concluded it would be completely inappropriate to develop recommendations using this approach. For example, the panel had no idea if this reading of the data was actually the case, and second, if this reading of the data was correct, the panel had serious concerns that PCPs could accurately estimate the time spent by Psychiatric Consultant, and vice versa. Therefore, the panel did not pursue this approach further.

Next, the joint panel reviewed the time data for 99493. This review revealed the same problem as that identified for 99492. PCPs reported a median intra-service time of 40 minutes and Psychiatric Consultant respondents reported a median of 20 minutes. Based on its review, the joint panel concluded that a total time of 60 minutes was not credible. Further, the panel was concerned that PCPs were reporting the same time for 99493 as for 99492 whereas 99493 should take less time given that the patient was already receiving, as opposed to being new to, collaborative care. As with 99492, the summed time of 60 minutes would mean that all the BHCM time (60 minutes minimum) was spent with the PCP and Psychiatric Consultant, which, as with 99492, is not true. As with 99492, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (20 minutes) bore any relation to the actual combined median intra-service time for both physicians. The panel’s review of 99494 led to similar conclusions. PCPs and Psychiatric Consultants both reported median times of 15 minutes, which meant that the entire 30 minutes of required BHCM time would be spent with the physicians. As with 99492 and 99493, and using the same reasoning (described above), the panel concluded that it had serious

concerns that the combined intra-service median time (15 minutes) bore any relation to the actual combined median intra-service time for both physicians.

Lastly, the panel reviewed the physician time for 99484. This is a code that was created by CMS and reported based on clinical staff time, and the panel was not sure whether respondents would be familiar with it. The societies surveyed both the targeted group who were surveyed for 99492, 99493, and 99494 as well as a random group. The targeted PCPs and Psychiatric Consultants reported median intra-service times of 20 and 15 minutes, respectively, while the random PCPs and Psychiatric Consultants reported median times of 30 and 60 minutes, respectively. Given these wildly disparate times and that the service requires only 20 minutes of clinical staff time, the panel concluded these times were not reliable or usable. As with 99492, 99493, and 99494, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (30 minutes), of all 4 groups of respondents, bore any relation to the actual median intra-service time for both physicians.

In summary, the joint panel concluded that the physician time data for 99492, 99493, 99494, and 99484 could not be used to develop a recommendation for the RUC. Aside from the issue of the small numbers of PCP respondents, the panel concluded that it appeared that the respondents had not understood the survey questions, had difficulty determining the time of “their portion” of the service (e.g., because it is spread out over a calendar month in very small increments), and/or tried to estimate the time of the entire service. Whatever the reason, the joint panel concluded the data was not reliable.

### Physician Work Discussion

Next, the joint panel reviewed the work RVW data. As with time, the joint panel noted that the intent of the survey was for PCPs and Psychiatric Consultants to value “their own” work, not the work of the entire service. This meant the total RVW should be the sum of the PCP and Psychiatric Consultant RVWs.

First, the panel reviewed the RVW data for 99492. The median work RVW for PCPs and Psychiatric Consultant was 2.00 and 2.75, respectively, with a summed RVW of 4.75. Assuming the median times were also summed, for a total of 70 minutes, the joint panel agreed this was not credible or presentable to the RUC. For example, 99291, *Critical care, first hour*, which is a face-to-face service and is considered the most intense E/M service, has a work RVW of 4.50 with times of (15/40/15, total 70.) Further, 4.75, for a non-face-to-face physician service, even with 70 minutes of time, would create rank order anomalies with the reference services and with all the other non-face-to-face services recently valued by the RUC. Based on its review, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just “their portion” of the service. If such was the case, this would mean that the median RVW for the combined group (2.50) could represent the work of the entire service. However, for a number of reasons, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW’s from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

When the joint panel did review the PCP and Psychiatric Consultant work data, individually, the panel noted that the PCP and Psychiatric Consultant medians were very different. The Psychiatric Consultant work values were much higher than those of the PCPs with a much lower intra-service time. This disparity was notable and resulted in very different work intensities, which led the panel to believe that, whether the respondents were valuing the entire service or just “their portion” of the work, PCPs and Psychiatric Consultants may have very different concepts of what this service is - in spite of the fact that the vignette was considered typical by both groups. The panel concluded that, for 99492, this disparity cast even more doubt on the validity of the survey data.

The analyses for 99493, 99494, and 99484 were very similar.

For 99493, the sum of the PCP survey median RVW (1.50) and the Psychiatric Consultant survey median (1.50) was 3.00, which, even with a summed time of 60 minutes, yielded rank order anomalies with face-to-face and non-face-to-face E/M services. As with 99492, the joint panel agreed that it was very possible that respondents valued the work required for the entire service, not just “their portion” of the service. If this was the case, it would mean that the median RVW for the combined group (1.50) could represent the work of the entire service. However, for a number of reasons, as with 99492, the panel concluded it would be completely inappropriate to develop recommendations using

this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

For 99494, sum of the median work RVW for PCPs (1.50) and the median work RVW for Psychiatric Consultants (1.00) was 2.50, which, even with an assumed summed time of 30 minutes, was not credible. For example, 99292, *Critical care, additional 30 minutes*, has a work RVW of 2.25 with a total time of 30 minutes (all intra-service). As with 99492 and 99493, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just "their portion" of the service. If this was the case, it would mean that the median RVW for the combined group (1.00) could represent the work of the entire service. However, for a number of reasons, as with 99492 and 99493, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

Lastly, the panel reviewed the work values for 99484, and the same problems were identified. Irrespective of which PCP and Psychiatric Consultant work RVWs were used, the sum of the PCP and Psychiatric Consultant RVWs was not credible. Further, the disparity between the targeted and random groups was so great that the panel concluded the various groups of respondents appeared to have very different ideas as to what the service involves. As with 99492, 99493, and 99494, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just "their portion" of the service. If this was the case, it would mean that the median RVW for the combined group could represent the work of the entire service. However, for the reasons described above, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

In order to develop a recommendation to bring to the RUC, the joint panel did an extensive search of the RUC database for recently RUC reviewed codes with XXX globals (and ZZZ globals for 99494). In order to do the search, the joint panel had to decide what intra-service time parameters to use. For 99492 and 99493, the panel searched a range of codes between 20 and 40 minutes of intra-service time in order to account for the disparity of time in the survey data. For 99494, the search included codes with intra-service times in the 15-20 minute range (also to take into account the range of survey data).

The expert panel found that there were a number of potential crosswalk codes that supported the CMS values for work. Specifically, there were many codes in the 70000 series with similar intra-service and total times that supported the CMS valuation. For example, 70554 (*Functional MRI by tech*) has 15/35/10 (total 60) minutes with a work RVW of 2.11 which supports the CMS value for 99492. 74170 (*CT abdomen*) has 5/18/5 (total 28) minutes with a work RVW of 1.40 that supports the CMS value for 99493. There are numerous ZZZ globals with intra-times of 15 to 20 minutes with work RVWs of 0.80 to 1.00.

Furthermore, the values for 99487 (*Cmplx chron care*) are 26 minutes of intra-time and a work RVW of 1.00. This fits nicely between the CMS times and values for 99493 and 99494. The panel also noted that the MPC codes 99239 (*Hospital discharge day*) with times of 10/30/15 (total 55) minutes and a work RVW of 1.90 and 99309 (*Nursing fac care subseq*) with times of 10/25/10 (total 45) minutes and a work RVW of 1.55 also supports the CMS values for 99492 and 99493.

Therefore, even though it has reservations about the CMS methodology for establishing work RVWs for 99492, 99493, and 99494, the joint panel recommends that the CMS values be maintained as interim for three years until such time as members from the surveying specialties gain experience using these codes, at which time the specialties will conduct another survey. As we have learned from this survey, it will be important to ensure that survey participants only report time and value work for "their portion" rather than estimating time and work the entire service.

For 99484, the specialties also recommend that the CMS values be maintained as interim until another survey can be performed in three years. CMS modeled this code after 99490 (*Chron care mgmt svc 20 min*) (times of 0/15/0 minutes, work RVW of 0.61), and cross-walked the work RVW from 99490. Given that there does not appear to be a clear, and consistent understanding of what this service entails, the joint panel believes maintaining the CMS value on an interim basis is appropriate.

### Summary

In summary, the joint panel believes that the survey data for physician work and time is simply not credible. That said, the joint panel and the societies agree that a lot has been learned by going through the survey process. This series of codes is the first of its kind that involves the work of two different physicians that is reported by only one of the two. The joint panel and the societies think that the societies can work together to create a new survey that is modified to take into account the lessons from the current survey (e.g., to better ensure that respondents only value the work and time of “their portion” of the service and to “ignore the portion of the service performed by the....”). Further, at that point, more physicians in the field will have experience using the codes, which increases the likelihood of gaining sufficient survey respondents, especially PCPs.

Therefore, the joint panel recommends that the CMS physician work and time values for all 4 codes be maintained as interim for three years after which, the APA, AACAP, AAFP, ACP, AGS, and any other interested society will conduct another survey of all 4 codes.

### Recommendations

In summary, **we recommend the CMS RVW and times of 1.70 with 0 minutes pre, 40 minutes intra, and 0 minutes post, with a total time of 40 minutes for 99492.**

---

### HISTORY/BACKGROUND

The Psychiatric Collaborative Care Services codes were developed following a request by CMS in the proposed rule for the CY 2016 Medicare Physician Fee Schedule to create a payment structure to describe a specific model of collaborative care services for patients with common behavioral health conditions. CMS referred to the Collaborative Care Model described by the University of Washington’s AIMS Center (<http://aims.uw.edu>) in which a Primary Care Practitioner (PCP)/treating physician and Behavioral Health Care Manager (BHCM) collaborate with a Psychiatric Consultant to provide behavioral healthcare to a population of patients to help ensure the patients are improving, and to make treatment adjustments as necessary in an effort to ensure the patients reach established treatment goals. Most of the collaboration between the Psychiatric Consultant and the BCHM is non-face-to-face over the phone, through regular caseload reviews with additional contact as needed. There are instances where the PCP and Psychiatric Consultant communicate directly about specific patients, either by phone or in person, but that is not typical. Importantly, although much of the contact between the Psychiatric Consultant and the BCHM is non-face-to-face, there is also face-to-face and non-face-to-face contact between the BCHM and the patient. The face-to-face contact between the BCHM and the patient typically consists of office visits where the BCHM evaluates the patient, provides brief therapeutic interventions, and/or communicates /educates the patient regarding changes to the care plan.

As stated in the CPT coding guidelines:

- The PCP/treating physician directs the Behavioral Health Care Manager and continues to oversee the patient’s care, including prescribing medications, providing treatments for medical conditions and making referrals to specialty care.
- The Behavioral Health Care Manager is a clinical staff person with a masters/doctoral-level education or specialized training in behavioral health who provides care management services as well as an assessment of behavioral health needs including the administration of validated rating scales, the development of a care plan, provision of brief interventions, ongoing collaboration with the treating physician (which includes communicating treatment recommendations/adjustments from the Psychiatric Consultant), and maintenance of a registry, all in consultation with a Psychiatric Consultant. The services provided to the patient are both face-to-face and non-face-to-face.

- The Psychiatric Consultant (e.g., MD, DO, PA, APRN) refers to a medical professional trained in psychiatry and qualified to prescribe the full range of medications. The consultant advises and makes recommendations as needed for psychiatric and other medical care, including psychiatric and other medical diagnoses, treatment strategies including appropriate therapies, medication management and medical management of complications associated with treatment of psychiatric disorders, and referral for specialty care services, that are communicated to the treating physician, typically through the Behavioral Health Care Manager. The Psychiatric Consultant does not typically see the patient face-to-face.

Three new CPT codes were proposed and approved by the CPT Editorial Panel at its February 2016 meeting. There is one code (99492) for the initial calendar month of services within the collaborative care program, one code for each subsequent calendar month of services, and an add-on code for additional time that can be reported in addition to the other two codes.

The new code set describes the work of two medical professionals, only one of whom submits the bill, and a clinical staff person working together collaboratively to manage a population of patients. The codes are similar to other care management codes (99487 and 99490) in that they are billed per calendar month based on the Behavioral Health Care Manager's time and they include the work of the PCP. HOWEVER, the new codes also include the work of the Psychiatric Consultant. In the model described by these codes, the Psychiatric Consultant is paid directly by the primary care practice and does not bill for his/her time using a separate CPT code.

### **RUC Process**

The AMA RUC Research Subcommittee set up a workgroup, (Ad Hoc Psychiatric Collaborative Care Management Workgroup), to assist in the modification of the standard survey tool to accommodate these new codes, as well as review the vignettes, reference service lists and survey pool. The Research Subcommittee reviewed and approved our request to do a targeted survey for CPT codes 99492- 99494. The targeted pool of participants included those PCPs and Psychiatric Consultants who have practiced in the Collaborative Care Model or who have been educated/trained in the model. In order to expand the targeted pool, each participant was asked to identify others who have worked in the model (past and present) as well as anyone who has had training in the model. The Research Subcommittee also approved two separate reference services lists (one for the PCP and one for the Psychiatric Consultant) as well as the vignettes. They also approved a modified survey tool which asked respondents to value their work with their typical patient within the "total service period" which encompassed the monthly timeframe.

### **CMS Final Rule on the CY 2017 Medicare Physician Fee Schedule**

After all the above work was completed, CMS finalized coding, coverage, and payment (effective January 1, 2017) for these services in the Final Rule for the CY 2017 Medicare Physician Fee Schedule.

#### **G0502-G0503 (99492-99494)**

CMS created three G codes, adopting the language of the CPT codes, and finalized relative value units for physician work (RVUs) (1.70, 1.53, and 0.82 RVUs respectively), physician times (40, 36, and 18 minutes respectively), and clinical labor times (70, 60, and 30 minutes respectively) as well as a clinical labor type for the Behavioral Health Care Manager. CMS assigned temporary G Codes (G0502, G0503, G0504) for use until the CPT codes go into effect on January 1, 2018.

According to CMS: "To value HCPCS codes G0502, G0503, and G0504, we proposed to base the portion of the work RVU that accounts for the work of the treating physician or other qualified health care professional on a direct crosswalk to the proposed work values for the complex CCM codes, CPT codes 99487 and 99489...Therefore, in allocating a differential portion of the work RVU to each practitioner, we believe the work RVU associated with the billing practitioner should be greater than the work RVU associated with the Psychiatric Consultant. After considering these comments, we are finalizing total work RVUs of 1.70 for G0502, 1.53 for G0503, and 0.82 for G0504. These RVUs include 0.52 for the Psychiatric Consultant based on a crosswalk to the work per minute of a level three established patient office visit [and an CMS estimate of 10 minutes of Psychiatric Consultant time per patient per month]...Since the Behavioral Health Care Manager in the services described by HCPCS codes G0502, G0503, and G0504 should have specialized training in behavioral health, we proposed a new clinical labor type for the Behavioral Health Care Manager, L057B, at \$0.57 per minute, based on the rates for genetic counselors in the direct PE input database."

99484

CMS also finalized payment for an additional care management code, 99484, Care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional, per calendar month, (99484) which describes care management for beneficiaries with behavioral health conditions under models of care other than the collaborative care model describe above. This service may be furnished when the beneficiary has a psychiatric or behavioral health condition(s) that in the PCP/treating physician clinical judgment, requires a behavioral health care assessment, behavioral health care planning, and provision of interventions. And per CMS includes “an initial assessment or follow-up monitoring, including the use of applicable validated rating scales; Behavioral health care planning in relation to behavioral/psychiatric health problems, including revision for patients who are not progressing or whose status changes; Facilitating and coordinating treatment such as psychotherapy, pharmacotherapy, counseling and/or psychiatric consultation; and Continuity of care with a designated member of the care team.”

CMS finalized relative value units for physician RVUs (0.61 RVUs), physician time (15 minutes), and clinical labor times (20 minutes) as well as a clinical labor type for the care manager that is the same (L057B, at \$0.57 per minute) as that for the collaborative care codes discussed above.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) NA

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Primary Care                      How often? Sometimes

Specialty                                      How often?

Specialty                                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 70000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. General U.S. population is approximately seven times the Medicare population

Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is approximately 1% of the total Medicare claims billed for CCM services in 2015

Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? No

### **Berenson-Eggers Type of Service (BETOS) Assignment**

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:  
Evaluation Management

BETOS Sub-classification:

BETOS Sub-classification Level II:

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 99487

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 99493      Tracking Number    A2

Original Specialty Recommended RVU: **1.53**Presented Recommended RVU: **1.53**

Global Period: XXX

RUC Recommended RVU: **1.53**

CPT Descriptor: Subsequent psychiatric collaborative care management, first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements:

- tracking patient follow-up and progress using the registry, with appropriate documentation;
- participation in weekly caseload consultation with the psychiatric consultant;
- ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers;
- additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant;
- provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies;
- monitoring of patient outcomes using validated rating scales; and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are prepared for discharge from active treatment.

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Adult: A 55-year-old woman who is separated from her husband and has no children at home has been feeling more fatigued, not sleeping well, and missing doses of the medicine she takes for her hypertension and diabetes. She worries a lot about her future. The patient is diagnosed as having a behavioral health disorder and was enrolled in the psychiatric collaborative care management services program and continues to have symptoms.

Child/Adolescent: A 15-year-old child brought in by a parent because of concerns about social withdrawal, anxiety, diminished school performance and substance abuse. The patient is diagnosed as having a behavioral health disorder and was enrolled in the psychiatric collaborative care management services program and continues to have symptoms.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: NA

Description of Intra-Service Work: Primary Care Physician/Treating Physician: Directs and provides general supervision of the behavioral health care manager (BHCM) and continues to provide or oversee the management and/or coordination of services, as needed, for all medical conditions, psychosocial needs, and activities of daily living. Reviews treatment recommendations from the psychiatric consultant with the BHCM and implements as appropriate. Ensures services are documented appropriately.

Psychiatric Consultant: Psychiatric Consultant: Reviews patient progress with the BHCM, soliciting and analyzing clinical information provided by the BHCM and/or in the patient record. Provides ongoing advice and treatment recommendations, as needed (based on the data) for psychiatric and other medical care, including treatment strategies such

as appropriate therapies, medication management, medical management of complications associated with treatment of psychiatric disorders and referral for specialty care services, which are communicated to the PCP/treating physician through the BHCM.

Description of Post-Service Work: NA

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? Yes

**TOP KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99487	XXX	1.00	RUC Time

CPT Descriptor Complex chronic care management services, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, establishment or substantial revision of a comprehensive care plan, moderate or high complexity medical decision making; 60 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.

**SECOND HIGHEST KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99213	XXX	0.97	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
99309	XXX	1.55	RUC Time	8,667,991

CPT Descriptor 1 Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient has developed a significant complication or a significant new problem. Typically, 25 minutes are spent at the bedside and on the patient's facility floor or unit.

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

*The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.*

The American Geriatrics Society (AGS), American College of Physicians (ACP), American Academy of Family Physicians (AAFP), American Academy of Child and Adolescent Psychiatry (AACAP), and American Psychiatric Association (APA), conducted joint targeted surveys of their memberships in November 2016 for CPT codes 99492, 99493, and 99494 as well as a targeted and random survey for CMS created code 99484. A joint AGS, ACP, AAFP, AACAP, and APA RVS expert panel (“joint panel”) consisting of physician advisors and specialty experts reviewed the survey work and time data and developed recommendations through participation in conference calls and e-mail discussions. Please note that the societies also conducted a survey of Behavioral Health Care Managers (BHCMS) that was only used to develop recommendations for practice expenses.

For code 99492, there were 84 responses (25 primary care physicians (PCP), 59 Psychiatric Consultants [Psych]) to the survey request with a median performance rate of 20 (PCP 10, Psych 40); 96% of the survey respondents found the vignette to be typical. For 99493, there were 80 response (23 PCP, 57 Psych) responses with a median performance rate of 20 (PCP 10, Psych 30); 94% of the respondents found the vignette to be typical. For code 99494, there were 79 responses (22 PCP, 57 Psych) with a median performance rate of 10 (PCP 4, Psych 15); 92% of the respondents found the vignette to be typical. For 99484, there were 161 responses (23 PCP targeted, 53 PCP random, 51 Psych targeted, 34 Psych random) with a median performance rate of 12 (PCP T 5, PCP R 15, Psych T 10, Psych R 15); 87% of the respondents found the vignette to be typical. The RUC summary contains a breakout of PCP participants, Psychiatric Consultant participants, and BHCMS.

The joint panel kept in mind that 99492, 99493, and 99494 are unlike any other services in CPT, because they include the work of two different physicians or other qualified health care professionals, but only one of those individuals reports the service. The joint panel agreed that, in order for the survey data to be credible, there had to be a sufficient number of responses from both PCPs and Psychiatric Consultants and that those respondents value only the time and work effort of their individual portion of the service (e.g., PCPs should value only the time and work for the PCP portion of the service). The joint panel agreed that, because the PCP is the billing provider, it was particularly crucial for PCP responses to meet the RUC minimum threshold for number of survey responses.

With respect to the number of respondents, unfortunately, even after extending the survey and after repeated reminders and adding new participants identified by other participants, the end result of the targeted survey was that there were fewer than 30 PCP responses for each code. This does not reach the RUC minimum requirement. While the total number of respondents was more than 75 for each code, the joint panel agreed that the number of responses from each physician type (PCP, Psych) needed to meet the minimum threshold (30), because each type was performing separate, distinct work. Therefore, the joint panel was very concerned about the validity of the PCP data given the small numbers and in light of the fact that this is a new service and that the work of the PCP is essential to the service.

After noting these concerns, the expert panel reviewed the targeted survey data for 99492, 99493, and 99494 as well as the targeted and random survey data for 99484.

### **Physician Time Discussion**

The joint panel noted that these services do not include any pre and post service time, because they describe care furnished over a calendar month. Therefore, the reliability of the intra-service time data is critical to appropriately valuing the service. The joint panel also reviewed the survey instrument, which clearly stated that the respondent was to value “their” portion of the work - not the work of the entire service. This meant that the intent of the survey was to “sum” the times reported by PCPs and by the Psychiatric Consultants to arrive at a total physician time.

The joint panel then reviewed the time data for 99492. It noted that the PCPs reported a median intra-service time of 40 minutes while Psychiatric Consultant respondents reported a median intra-service time of 30 minutes. When the expert panel summed these times, the resulting value of 70 minutes was judged by the joint panel to not be credible. Specifically, the panel noted the following: (1) the vast majority of PCP and Psychiatric Consultant time is spent interacting with the BHCM, (2) if the total physician time was 70 minutes that would mean that virtually all the BHCM time (70 minutes minimum for 99492) was spent with the PCP and Psychiatric Consultant. This is not the case, as much BHCM time is spent interacting directly with the patient. The joint panel then looked at the individual times and concluded that given the requirements of the code, the Psychiatric Consultant time of 30 minutes was much more credible than the PCP time of 40 minutes and that both were high, given that the BHCM is a Masters or PhD level clinical staff person, or a clinical staff person with specialized training, experience, and expertise in managing

behavioral health problems. Based on its review, the joint panel agreed that it was very possible that respondents valued the time required for the entire service, not just “their portion” of the service. If such was the case, this would mean that the median intra-service (and total) time when all survey responses were combined (combined group), (30 minutes) could represent the time of the entire service. However, for a number of reasons, the panel concluded it would be completely inappropriate to develop recommendations using this approach. For example, the panel had no idea if this reading of the data was actually the case, and second, if this reading of the data was correct, the panel had serious concerns that PCPs could accurately estimate the time spent by Psychiatric Consultant, and vice versa. Therefore, the panel did not pursue this approach further.

Next, the joint panel reviewed the time data for 99493. This review revealed the same problem as that identified for 99492. PCPs reported a median intra-service time of 40 minutes and Psychiatric Consultant respondents reported a median of 20 minutes. Based on its review, the joint panel concluded that a total time of 60 minutes was not credible. Further, the panel was concerned that PCPs were reporting the same time for 99493 as for 99492 whereas 99493 should take less time given that the patient was already receiving, as opposed to being new to, collaborative care. As with 99492, the summed time of 60 minutes would mean that all the BHCM time (60 minutes minimum) was spent with the PCP and Psychiatric Consultant, which, as with 99492, is not true. As with 99492, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (20 minutes) bore any relation to the actual combined median intra-service time for both physicians. The panel’s review of 99494 led to similar conclusions. PCPs and Psychiatric Consultants both reported median times of 15 minutes, which meant that the entire 30 minutes of required BHCM time would be spent with the physicians. As with 99492 and 99493, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (15 minutes) bore any relation to the actual combined median intra-service time for both physicians.

Lastly, the panel reviewed the physician time for 99484. This is a code that was created by CMS and reported based on clinical staff time, and the panel was not sure whether respondents would be familiar with it. The societies surveyed both the targeted group who were surveyed for 99492, 99493, and 99494 as well as a random group. The targeted PCPs and Psychiatric Consultants reported median intra-service times of 20 and 15 minutes, respectively, while the random PCPs and Psychiatric Consultants reported median times of 30 and 60 minutes, respectively. Given these wildly disparate times and that the service requires only 20 minutes of clinical staff time, the panel concluded these times were not reliable or usable. As with 99492, 99493, and 99494, and using the same reasoning (described above), the panel concluded that it had serious concerns that the combined intra-service median time (30 minutes), of all 4 groups of respondents, bore any relation to the actual median intra-service time for both physicians.

In summary, the joint panel concluded that the physician time data for 99492, 99493, 99494, and 99484 could not be used to develop a recommendation for the RUC. Aside from the issue of the small numbers of PCP respondents, the panel concluded that it appeared that the respondents had not understood the survey questions, had difficulty determining the time of “their portion” of the service (e.g., because it is spread out over a calendar month in very small increments), and/or tried to estimate the time of the entire service. Whatever the reason, the joint panel concluded the data was not reliable.

### **Physician Work Discussion**

Next, the joint panel reviewed the work RVW data. As with time, the joint panel noted that the intent of the survey was for PCPs and Psychiatric Consultants to value “their own” work, not the work of the entire service. This meant the total RVW should be the sum of the PCP and Psychiatric Consultant RVWs.

First, the panel reviewed the RVW data for 99492. The median work RVW for PCPs and Psychiatric Consultant was 2.00 and 2.75, respectively, with a summed RVW of 4.75. Assuming the median times were also summed, for a total of 70 minutes, the joint panel agreed this was not credible or presentable to the RUC. For example, 99291, *Critical care, first hour*, which is a face-to-face service and is considered the most intense E/M service, has a work RVW of 4.50 with times of (15/40/15, total 70.) Further, 4.75, for a non-face-to-face physician service, even with 70 minutes of time, would create rank order anomalies with the reference services and with all the other non-face-to-face services recently valued by the RUC. Based on its review, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just “their portion” of the service. If such was the case, this would mean that the median RVW for the combined group (2.50) could represent the work of the entire service. However,

for a number of reasons, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

When the joint panel did review the PCP and Psychiatric Consultant work data, individually, the panel noted that the PCP and Psychiatric Consultant medians were very different. The Psychiatric Consultant work values were much higher than those of the PCPs with a much lower intra-service time. This disparity was notable and resulted in very different work intensities, which led the panel to believe that, whether the respondents were valuing the entire service or just "their portion" of the work, PCPs and Psychiatric Consultants may have very different concepts of what this service is - in spite of the fact that the vignette was considered typical by both groups. The panel concluded that, for 99492, this disparity cast even more doubt on the validity of the survey data.

The analyses for 99493, 99494, and 99484 were very similar.

For 99493, the sum of the PCP survey median RVW (1.50) and the Psychiatric Consultant survey median (1.50) was 3.00, which, even with a summed time of 60 minutes, yielded rank order anomalies with face-to-face and non-face-to-face E/M services. As with 99492, the joint panel agreed that it was very possible that respondents valued the work required for the entire service, not just "their portion" of the service. If this was the case, it would mean that the median RVW for the combined group (1.50) could represent the work of the entire service. However, for a number of reasons, as with 99492, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

For 99494, sum of the median work RVW for PCPs (1.50) and the median work RVW for Psychiatric Consultants (1.00) was 2.50, which, even with an assumed summed time of 30 minutes, was not credible. For example, 99292, *Critical care, additional 30 minutes*, has a work RVW of 2.25 with a total time of 30 minutes (all intra-service). As with 99492 and 99493, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just "their portion" of the service. If this was the case, it would mean that the median RVW for the combined group (1.00) could represent the work of the entire service. However, for a number of reasons, as with 99492 and 99493, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

Lastly, the panel reviewed the work values for 99484, and the same problems were identified. Irrespective of which PCP and Psychiatric Consultant work RVWs were used, the sum of the PCP and Psychiatric Consultant RVWs was not credible. Further, the disparity between the targeted and random groups was so great that the panel concluded the various groups of respondents appeared to have very different ideas as to what the service involves. As with 99492, 99493, and 99494, the joint panel agreed that it was very possible that the respondents valued the work required for the entire service, not just "their portion" of the service. If this was the case, it would mean that the median RVW for the combined group could represent the work of the entire service. However, for the reasons described above, the panel concluded it would be completely inappropriate to develop recommendations using this approach. Aside from the fact that this would dramatically depart from the intent of the survey (i.e., to sum the RVW's from each group), the panel had no idea whether this supposition was true, and second, if it was true, the panel had serious concerns that PCPs could accurately estimate the work of Psychiatric Consultants, and vice versa. Therefore, the panel did not pursue this approach further.

In order to develop a recommendation to bring to the RUC, the joint panel did an extensive search of the RUC database for recently RUC reviewed codes with XXX globals (and ZZZ globals for 99494). In order to do the search, the joint panel had to decide what intra-service time parameters to use. For 99492 and 99493, the panel searched a range of codes between 20 and 40 minutes of intra-service time in order to account for the disparity of time in the

survey data. For 99494, the search included codes with intra-service times in the 15-20 minute range (also to take into account the range of survey data).

The expert panel found that there were a number of potential crosswalk codes that supported the CMS values for work. Specifically, there were many codes in the 70000 series with similar intra-service and total times that supported the CMS valuation. For example, 70554 (*Functional MRI by tech*) has 15/35/10 (total 60) minutes with a work RVW of 2.11 which supports the CMS value for 99492. 74170 (*CT abdomen*) has 5/18/5 (total 28) minutes with a work RVW of 1.40 that supports the CMS value for 99493. There are numerous ZZZ globals with intra-times of 15 to 20 minutes with work RVWs of 0.80 to 1.00.

Furthermore, the values for 99487 (*Cmplx chron care*) are 26 minutes of intra-time and a work RVW of 1.00. This fits nicely between the CMS times and values for 99493 and 99494. The panel also noted that the MPC codes 99239 (*Hospital discharge day*) with times of 10/30/15 (total 55) minutes and a work RVW of 1.90 and 99309 (*Nursing fac care subseq*) with times of 10/25/10 (total 45) minutes and a work RVW of 1.55 also supports the CMS values for 99492 and 99493.

Therefore, even though it has reservations about the CMS methodology for establishing work RVWs for 99492, 99493, and 99494, the joint panel recommends that the CMS values be maintained as interim for three years until such time as members from the surveying specialties gain experience using these codes, at which time the specialties will conduct another survey. As we have learned from this survey, it will be important to ensure that survey participants only report time and value work for “their portion” rather than estimating time and work the entire service.

For 99484, the specialties also recommend that the CMS values be maintained as interim until another survey can be performed in three years. CMS modeled this code after 99490 (*Chron care mgmt srvc 20 min*) (times of 0/15/0 minutes, work RVW of 0.61), and cross-walked the work RVW from 99490. Given that there does not appear to be a clear, and consistent understanding of what this service entails, the joint panel believes maintaining the CMS value on an interim basis is appropriate.

### Summary

In summary, the joint panel believes that the survey data for physician work and time is simply not credible. That said, the joint panel and the societies agree that a lot has been learned by going through the survey process. This series of codes is the first of its kind that involves the work of two different physicians that is reported by only one of the two. The joint panel and the societies think that the societies can work together to create a new survey that is modified to take into account the lessons from the current survey (e.g., to better ensure that respondents only value the work and time of “their portion” of the service and to “ignore the portion of the service performed by the...”). Further, at that point, more physicians in the field will have experience using the codes, which increases the likelihood of gaining sufficient survey respondents, especially PCPs.
