RUC Referrals to CPT Editoral Panel - Incomplete Issues

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
10021	**Fine needle aspiration; without imaging guidance**	CMS Request - Final Rule for 2016	April 2016	AACE, ASBS, ASC, CAP, ES, AAOHNS, ACS	February 2017

Background: The specialty societies gave two reasons why these codes need to be referred to the CPT Editorial Panel prior to receiving a RUC survey. First, both codes need clarifying language stating that they should be reported per lesion rather than for every pass on the same lesion. Second, CPT code 10022 is reported with 76942 Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation more than 75% of the time together and a bundled code solution will be developed. The specialty societies also requested that these two codes be moved to the 2019 CPT cycle, due to the high workload currently involving the societies.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
10022	**Fine needle aspiration; with imaging guidance**	CMS Fastest Growing / CMS High Expenditure Procedural Codes2 / CMS Request - Final Rule for 2016	April 2016	AACE, ASBS, ASC, CAP, ES, ACR, SIR	February 2017

Background: The specialty societies gave two reasons why these codes need to be referred to the CPT Editorial Panel prior to receiving a RUC survey. First, both codes need clarifying language stating that they should be reported per lesion rather than for every pass on the same lesion. Second, CPT code 10022 is reported with 76942 Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation more than 75% of the time together and a bundled code solution will be developed. The specialty societies also requested that these two codes be moved to the 2019 CPT cycle, due to the high workload currently involving the societies.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
11100	**Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed; single lesion**	MPC List / CMS High Expenditure Procedural Codes2	January 2016	AAD	February 2017

Background: Prior to the January 2016 RUC meeting, the specialty society notified the RUC that their survey data displayed a bimodal distribution of responses with more outliers than usual. The specialty explained that the code descriptions do not distinguish between different types of biopsies and thus they would like to bring the biopsy of skin lesion codes back to the CPT Editorial Panel in May 2016 for refinement of the codes. The RUC recommends referring CPT codes 11100 and 11101 to the CPT Editorial Panel. At the May CPT meeting the Editorial Panel requested that the specialty society resubmit a new CCP for September 2016. In September 2016, the Editorial Panel again postponed this issue until February 2017 and requested that the specialty society specifically address the type of biopsy (punch, shave, incisional), introductory language regarding specific conditions (inflammatory and neoplastic) and differentiate bewtween partial and full-thickness biopsies.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
11101	**Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed; each separate/additional lesion (List separately in addition to code for primary procedure)**	Low Value Billed in Multiple Units / CMS High Expenditure Procedural Codes2	January 2016	AAD	February 2017

Background: Prior to the January 2016 RUC meeting, the specialty society notified the RUC that their survey data displayed a bimodal distribution of responses with more outliers than usual. The specialty explained that the code descriptions do not distinguish between different types of biopsies and thus they would like to bring the biopsy of skin lesion codes back to the CPT Editorial Panel in May 2016 for refinement of the codes. The RUC recommends referring CPT codes 11100 and 11101 to the CPT Editorial Panel. At the May CPT meeting the Editorial Panel requested that the specialty society resubmit a new CCP for September 2016. In September 2016, the Editorial Panel again postponed this issue until February 2017 and requested that the specialty society specifically address the type of biopsy (punch, shave, incisional), introductory language regarding specific conditions (inflammatory and neoplastic) and differentiate bewtween partial and full-thickness biopsies.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
22558	**Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); lumbar**	High Volume Growth2 / Codes Reported Together 75% or More-Part3	October 2013	AANS/CNS, AAOS, NASS	September 2016

Background: In January 2015 the Joint CPT/RUC Workgroup recommended a bundling solution for codes 22558 and 63090. The specialty societies have reviewed CPT coding guidelines and society educational materials for 63090 and they believe 63090 may have been inappropriately reported with 22558 because there is no definition for partial vertebral corpectomy in CPT. In September 2016, the CPT Editorial Panel added introductory language to the guidelines defining partial vertebral corpectomy. The 2014 Medicare data indicate that 22558 and 63090 are reported together 72% of the time. The Relativity Assessment Workgroup should review an action plan indicating whether a bundling solution is still necessary or if the education and coding guideline changes have/will address this issue.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
27370	**Injection of contrast for knee arthrography**	High Volume Growth1 / CMS Fastest Growing / High Volume Growth2 / Harvard Valued - Utilization Over 30,000-Part2 / High Volume Growth3 / CMS High Expenditure Procedural Codes2	October 2016	AAPMR, ACR	CPT 2019

Background: In October 2016, the RUC went through the long history of trying to address this potentially misvalued service. The specialty societies explained that the high volume growth for this procedure is likely due to its being reported incorrectly as arthrocentesis or aspiration. The correct reporting of those services is CPT code 20610 Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); without ultrasound guidance (work RVU= 0.79). The RUC extensively discussed the appropriate options to address the rising inappropriate utilization of this procedure. The RUC noted that deleting this code and then bundling it into the arthrography base procedures would not be ideal because it would involve edits to over 70 codes. The RUC also discussed that this procedure could become an add-on code. However, the RUC came to agreement that this code should be referred to CPT for deletion and replacement of a new code. The members agreed that this is the most efficient way to stem the rising inappropriate volume. The RUC recommends that CPT code 27370 be referred to the CPT Editorial Panel for deletion and be replaced with a new code.

36568	**Insertion of peripherally inserted central venous catheter (PICC), without subcutaneous port or pump; younger than 5 years of age**	Identified in RUC review of other services	October 2016	ACR, SIR	CPT 2019

Background: In October 2016, The RUC noted that CPT code 36569 is typically reported with codes 76937 Ultrasound guidance for vascular access requiring ultrasound evaluation of potential access sites, documentation of selected vessel patency, concurrent realtime ultrasound visualization of vascular needle entry, with permanent recording and reporting (work RVU= 0.30) and 77001 Fluoroscopic guidance for central venous access device placement, replacement (catheter only or complete), or removal (includes fluoroscopic guidance for vascular access and catheter manipulation, any necessary contrast injections through access site or catheter with related venography radiologic supervision and interpretation, and radiographic documentation of final catheter position) (work RVU= 0.38). These codes are commonly reported together because the current code contains a bimodal clinical scenario. The first scenario is when a clinical staff member performs the procedure without imaging. The second scenario is when a radiologist performs the procedure with imaging guidance. Therefore, CPT code 36569 should be referred to the CPT Editorial Panel to have the two common imaging codes bundled into the code. The current coding language should remain for clinical staff, but a new bundled code should be created. CMS also noted two family codes should be added to the CCA: (36568 Insertion of peripherally inserted central venous catheter (PICC), without subcutaneous port or pump; younger than 5 years of age and 36584 Replacement, complete, of a peripherally inserted central venous catheter (PICC), without subcutaneous port or pump, through same venous access). The RUC recommends CPT codes 36569, 36568 and 36584 be referred to the CPT Editorial Panel.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
36569	**Insertion of peripherally inserted central venous catheter (PICC), without subcutaneous port or pump; age 5 years or older**	CMS High Expenditure Procedural Codes2	October 2016	ACR, SIR	CPT 2019

Background: In October 2016, The RUC noted that CPT code 36569 is typically reported with codes 76937 Ultrasound guidance for vascular access requiring ultrasound evaluation of potential access sites, documentation of selected vessel patency, concurrent realtime ultrasound visualization of vascular needle entry, with permanent recording and reporting (work RVU= 0.30) and 77001 Fluoroscopic guidance for central venous access device placement, replacement (catheter only or complete), or removal (includes fluoroscopic guidance for vascular access and catheter manipulation, any necessary contrast injections through access site or catheter with related venography radiologic supervision and interpretation, and radiographic documentation of final catheter position) (work RVU= 0.38). 75894	**Transcatheter therapy, embolization, any method, radiological supervision and interpretation**	Codes Reported Together 75% or More-Part1	October 2016	ACC, ACR, SIR, SVS	RAW will assess Oct 2018

Background: The Workgroup accepts the specialties' recommendation to submit a code change proposal that would address any duplication when this service is reported with 37201 on the same date by the same physician. Previous notes indicated that ACC submitted a CCP for October 2012 CPT related to 75894, creating a new code for a particular cardiac procedure that is currently reported using that code. At the January 2013 RUC meeting the RUC recommended that 75894 be referred to CPT for revision. The Relativity Assessment Workgroup is to review the utilization for this code to determine if a coding change is necessary in October 2018.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
75984	**Change of percutaneous tube or drainage catheter with contrast monitoring (eg, genitourinary system, abscess), radiological supervision and interpretation**	Codes Reported Together 75% or More-Part2	October 2016	ACR, SIR	RAW will assess Oct 2018

Background: The Joint Workgroup recommends bundling 50392 and 74475, 50393 and 74480, 50394 and 74425, 50398 and 75984 and 50392 by the CPT 2016 cycle. To review at RAW October 2018 to determine if code bundling solution still necessary.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
76881	**Ultrasound, extremity, nonvascular, real-time with image documentation; complete**	CMS Fastest Growing / New Technology/New Services	October 2016	AAOS, ACR, ACRh, APMA	CPT 2019

Background: In February 2010, the CPT Editorial Panel created this code after deleting 76880. April 2010, the RUC recommended a CPT Assistant article be written to ensure the proper reporting of these two services. It was noted by the RUC that these services should not typically be reported more than once per day. RUC recommended 0.72. This service was flagged as New Techology/New Services and reviewed by the Relativity Assessment Workgroup in January 2015. The Workgroup recommended that the specialty societies develop a CPT Assistant article to define the proper coding of extremity ultrasound, particularly as it applies to the elements necessary to report a complete study. RAW to review in October 2016 after two years of additional Medicare utilization data. In October 2016, the specialty society noted and the Workgroup agreed that the dominant specialties providing the complete versus the limited ultrasound of extremity services are different. Thus, causing variation in what the typical practice expense inputs. The Workgroup recommends to 1) Refer CPT codes 76881 and 76882 to the Practice Expense Subcommittee for review of the direct practice expense inputs; 2) Refer to the CPT Editorial Panel to clarify the introductory language regarding the reference to one joint in the complete ultrasound; and 3) Review again in 3 years (October 2019).

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
76882	**Ultrasound, extremity, nonvascular, real-time with image documentation; limited, anatomic specific**	CMS Fastest Growing / New Technology/New Services	October 2016	AAOS, ACR, ACRh, APMA	CPT 2019

Background: In February 2010, the CPT Editorial Panel created this code after deleting 76880. April 2010, the RUC recommended a CPT Assistant article be written to ensure the proper reporting of these two services. It was noted by the RUC that these services should not typically be reported more than once per day. RUC recommended 0.72. 92275	**Electroretinography with interpretation and report**	CMS High Expenditure Procedural Codes2	January 2016	AAO, ASRS, AOA (optometry)	February 2017

Background: In January 2016, the specialty society noted that they became aware of inappropriate use of this code for a less intensive version of this test for diagnosis and indications that are not clinically proven and for which less expensive and less intensive tests already exist. The utilization of CPT code 99275 was appropriately low until 2013 when it suddenly increased by 300%. CPT changes are necessary to ensure that the service for which 92275 was intended is clearly described as well as an accurate vignette and work descriptor is developed. The RUC recommends CPT code 92275 be referred to the CPT Editorial Panel. In May 2016 this issue was postponed until September 2016. In September 2016 the CPT Editorial Panel postponed this issue was postponed until Feb 2017 to with a request for the specialty societies to submit literature for all codes and utilize the regular code change application.

93279	**Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, review and report by a physician or other qualified health care professional; single lead pacemaker system**	CMS High Expenditure Procedural Codes2	October 2016	ACC, HRS	February 2017 EC

Background: In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. In October 2016 the RUC PE Subcommittee discussed a vendor issue that with all of the implanted defibrillator and pacemaker devices where there are circumstances vendor sends a technician in to interpret the devices and in those cases the practice is not bearing the cost. Also in some cases the vendor technician even brings in the device itself and interprets and the practice is not bearing these costs as well. The Subcommittee discussed this may be addressed by a modified -26 and just report the professional interpretation or a -52 modifier and represent a reduced service. However, neither modifier addresses the issue properly. Reporting the professional service only (-26) doesn't cover the physicians expenses of exam table, office and clinical staff for vital signs and the reduced modifier (-52) does not provide a good proxy. The RUC recommends that this issue will be referred to the CPT Editorial Panel to determine how to appropriately report these cases.

93288	**Interrogation device evaluation (in person) with analysis, review and report by a physician or other qualified health care professional, includes connection, recording and disconnection per patient encounter; single, dual, or multiple lead pacemaker system**	CMS High Expenditure Procedural Codes2	October 2016	ACC, HRS	February 2017 EC

Background: In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. In October 2016 the RUC PE Subcommittee discussed a vendor issue that with all of the implanted defibrillator and pacemaker devices where there are circumstances vendor sends a technician in to interpret the devices and in those cases the practice is not bearing the cost. Also in some cases the vendor technician even brings in the device itself and interprets and the practice is not bearing these costs as well. The Subcommittee discussed this may be addressed by a modified -26 and just report the professional interpretation or a -52 modifier and represent a reduced service. However, neither modifier addresses the issue properly. Reporting the professional service only (-26) doesn't cover the physicians expenses of exam table, office and clinical staff for vital signs and the reduced modifier (-52) does not provide a good proxy. The RUC recommends that this issue will be referred to the CPT Editorial Panel to determine how to appropriately report these cases.

95251	**Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; interpretation and report**	High Volume Growth	October 2016	AACE, ES	February 2017 EC

Background: In October 2016, at the Practice Expense Subcommittee, there was extensive discussion around the issue of what codes are appropriate to report when the patient owns the equipment versus when the practice owns the equipment. The specialties clarified that CPT code 95250 Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; sensor placement, hook-up, calibration of monitor, patient training, removal of sensor, and printout of recording, since it is a PE-only code, should not be reported when the equipment is owned by the patient. In this scenario, only CPT code 95251 Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; interpretation and report would be reported.The RUC agreed with the Subcommittee that it is important that either education or a CPT parenthetical be created to clarify the appropriate reporting of these services. The RUC recommends this service be referred to the CPT Editorial Panel Executive Committee to provide a solution to ensure correct coding occurs.

RUC Recommendations to Develop CPT Assistant Articles - Incomplete Issues

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
76706	**Ultrasound, abdominal aorta, real time with image documentation, screening study for abdominal aortic aneurysm (AAA)**	Final Rule for 2015	October 2015	0.55 and refer to CPT Assistant	ACR, SIR, SVS	Article Needed

Background: When Medicare began paying for abdominal aortic aneurysm (AAA) ultrasound screening in CY 2007, CMS created HCPCS code G0389 and set the RVUs at the same level as CPT code 76775. CMS noted in the CY 2007 final rule with comment period that CPT code 76775 was used to report the service when furnished as a diagnostic test and that we believed the service reflected by G0389 used equivalent resources and work intensity to those contained in CPT code 76775. In the CY 2014 proposed rule, based on a RUC recommendation, we proposed to replace the ultrasound room included as a direct PE input for CPT code 76775 with a portable ultrasound unit. Since all the RVUs (including the PE RVUs) for G0389 were crosswalked from CPT code76775, the proposed PE RVUs for G0389 in the CY 2014 proposed rule were reduced significantly as a result of this change to the direct PE inputs for 76775. However, CMS did not discuss the applicability of this change to G0389 in the proposed rule's preamble and did not receive any comments on G0389 in response to the proposed rule. CMS finalized the change to CPT code 76775 in the CY 2014 final rule with comment period and the corresponding PE RVUs for G0389 were also reduced. Subsequent to the publication of the CY 2014 final rule, a stakeholder suggested that the reduction in the RVUs for G0389 did not accurately reflect the resources involved in furnishing the service and asked that CMS consider using an alternative crosswalk. Specifically, the stakeholder stated that the type of equipment typically used in furnishing G0389 is different than that used for CPT code 76775, the time involved in furnishing G0389 is greater than that of CPT code 76775, and the specialty that typically furnishes G0389 is different than the one that typically furnishes CPT code 76775. The stakeholder suggested an alternative crosswalk of CPT code 76705. After considering the issue, CMS are proposing G0389 as a potentially misvalued code and seeking recommendations regarding the appropriate inputs that should be used to develop RVUs for this code. CMS has not reviewed the inputs used to develop RVUs for this code since it was established in CY 2007 and the RVUs were directly crosswalked from 76705. Based on the issues raised by stakeholders, CMS believes that it should value this code through the standard methodologies, including the full PE RVU methodology. In order to do so, CMS are proposing to include this code on our list of proposed potentially misvalued codes and seek input from the public and other stakeholders, including the RUC, regarding the appropriate work RVU, time, and direct PE inputs that reflect the typical resources involved in furnishing the service. In September 2014 the RUC refered G0389 to CPT to transition this code to a Category I code for the 2016 cycle. In October 2015, the RUC raised concerns that the practice expense recommendation was prepared by specialty societies that are not the dominant provider of this service according to Medicare claims data. The presenters explained that this is likely due to increased use of G code G0389 for a handheld device, which is not the intended use of the CPT code that is currently used as a crosswalk for the G code. The presenters explained and the RUC agreed that this is likely an issue of miscoding. The RUC recommends that the specialty develop a CPT Assistant article to clarify appropriate use of the new CPT code 76706 that will replace the G code G0389.

G0445	High intensity behavioral counseling to prevent sexually transmitted infection; face-to-face, individual, includes: education, skills training and guidance on how to change sexual behavior; performed semi-annually, 30 minutes		Fecal Bacteriotherapy		CPT 2013	October 2018	The specialty societies indicated that they tried to develop a category I code to replace 44705 which is not currently covered by Medicare, but the CPT Editorial Panel did not accept the coding change proposal due to a lack in literature provided. The Workgroup recommended that these services be reviewed in 2 year after additional utilization data is available (October 2018).	☐

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2016

Intraoperative Radiation Therapy Applicator Procedures

At the May 2016 CPT meeting, the CPT Editorial Panel established one Category I code for reporting intraoperative radiation therapy applicator procedures.

19294 ***Preparation of tumor cavity, with placement of a radiation therapy applicator for intraoperative radiation therapy (IORT) concurrent with partial mastectomy (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 71 breast surgeons and agreed with the following physician time components: intra-service time of 40 minutes. The specialty noted that this add-on service is performed in conjunction with either lumpectomy or a partial mastectomy. The radiation therapy is delivered only once per breast; it is possible to perform it in each breast following a lumpectomy on both sides.

The RUC reviewed the survey median work RVU of 3.00 and agreed that it would be appropriate account for the physician work involved in performing this service. To justify a work RVU of 3.00, the RUC compared the survey code to 2nd key reference code 14302 *Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)*(work RVU of 3.73 and intra-service time of 40 minutes) and noted that both services have identical intra-service time. Similar to 14302, code 19294 includes a breast flap that is created in all directions around the defect to allow for transposition of surrounding breast tissue. In 19294 this mobilization allows secure, appropriate, approximation of breast tissue to the intraoperative radiation therapy applicator to ensure accurate radiation therapy to the targeted breast tissue. In addition to deep tissue planes, mobilization of skin flaps occurs for both 14302 and 19294. These circumferential skin flaps are mobilized around the radiation site to further assist creation of the target volume as well as enable protection of the skin from radiation injury. In comparison to 14302, the total area being mobilized in 19294 would approximate or exceed 30cm2. Code 19294 is different than 14302 in that it does not involve contouring of tissue and cosmetic closure of the defect, both of which add to the complexity/intensity of 14302. To further support a work RVU of 3.00, the RUC compared the survey code to CPT code 29826 *Arthroscopy, shoulder, surgical; decompression of subacromial space with partial acromioplasty, with coracoacromial ligament (ie, arch) release, when performed (List separately in addition to code for primary procedure)* (work RVU=3.00, intra-service time of 40 minutes) and noted that both services have identical physician time and involve a similar amount of physician work. The RUC also compared this service to all other ZZZ services with 40 minutes of intra-service time, and noted 3.00 represents an appropriate value for 19294 relative to these other services. **The RUC recommends a work RVU of 3.00 for CPT code 19294.**

Practice Expense
Since this is an intra-operative procedure, there are no direct practice expense inputs for this service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

Integumentary System
Introduction

Breast biopsies without image guidance are reported with 19100 and 19101. Image-guided breast biopsies, including the placement of localization devices when performed, are reported using 19081-19086. The image-guided placement of localization devices without image-guided biopsy are reported with 19281-19288. When more than one biopsy or localization device placement is performed using the same imaging modality, use an add-on code whether the additional service(s) is on the same or contra-lateral breast. If additional biopsies or localization device placements are performed using different imaging modalities, report another primary code for each additional biopsy or localization device placement performed using a different image guidance modality. When an open incisional biopsy is performed after image-guided placement of a localization device, 19101 is reported and the appropriate image-guided localization device placement code is reported.

When more than one breast localization device placement is performed using the same imaging modality, use an add-on code whether the additional service(s) is on the same or contra-lateral breast. If additional localization devices are placed using different imaging modalities, report another primary code for each additional modality. When an open incisional biopsy is performed after image-guided placement of a localization device, 19101 is reported and the appropriate image-guided localization device placement code is reported.

To report bilateral image-guided placement of localization devices report 19281, 19283, 19285, or 19287 for the initial lesion localized. The contra-lateral and each additional breast image-guided localization device placement is reported with code 19282, 19284, 19286 or 19288.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Code 19294 is used to report the preparation of the tumor cavity with placement of an intraoperative radiation therapy applicator concurrent with partial mastectomy (19301, 19302).

⊙ *19298* *Placement of radiotherapy afterloading brachytherapy catheters (multiple tube and button type) into the breast for interstitial radioelement application following (at the time of or subsequent to) partial mastectomy, includes imaging guidance*

✚●19294	H1	Preparation of tumor cavity, with placement of a radiation therapy applicator for intraoperative radiation therapy (IORT) concurrent with partial mastectomy (List separately in addition to code for primary procedure) (Use 19294 in conjunction with 19301 or 19302)	ZZZ	3.00

Mastectomy Procedures

19301 *Mastectomy, partial (eg, lumpectomy, tylectomy, quadrantectomy, segmentectomy);*

19302 *with axillary lymphadenectomy*

(For placement of radiotherapy afterloading balloon/brachytherapy catheters, see 19296-19298)

(For the preparation of tumor cavity with placement of an intraoperative radiation therapy applicator concurrent with partial mastectomy, use 19294)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:19294 Tracking Number H1 Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: ZZZ RUC Recommended RVU: **3.00**

CPT Descriptor: Preparation of tumor cavity, with placement of a radiation therapy applicator for intraoperative radiation therapy (IORT) concurrent with partial mastectomy (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female has been diagnosed with invasive ductal breast carcinoma. Immediately following a partial mastectomy (reported separately), the tumor cavity is prepared and an applicator to deliver intraoperative radiation therapy is placed at the treatment site. Following radiation delivery by the radiation oncologist, the tumor cavity is closed. [Note: This is an add-on code for the additional work related to preparing the tumor cavity with intraoperative placement of a radiation therapy applicator. The partial mastectomy, including closure, is reported separately as the primary procedure and not included in the work of this add-on code.]

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work:
[Note: The patient remains under anesthesia and sterility is maintained throughout IORT.]
• After removal of the tumor and pathology assessment that tumor margins are clinically clear, the tumor cavity and the remaining breast tissue are examined by the surgeon and radiation oncologist to ensure there is adequate tissue for the radiotherapy applicator to be safely and securely positioned.
• As appropriate, breast tissue is dissected off the underlying chest muscle for several inches to create a pocket into which an internal radiation barrier may be inserted and the posterior layers of the breast parenchyma are closed over this radiation barrier using sutures.
• The cavity size is measured by the surgeon. Dimensions are discussed with the radiation oncologist. An appropriately sized and shaped radiotherapy applicator is brought to the operative field.
• The surgeon places the applicator.
• [Separately reported by radiation oncologist : The position of the applicator is confirmed or manipulated as needed by the radiation oncologist.]
• Multiple sutures are placed by the surgeon as required to ensure the surgical margins are aligned with the applicator surface. To minimize local skin radiation toxicity, the skin edges adjacent to the cavity are then dissected from the underlying breast parenchyma followed by placement of retraction device(s) or multiple retraction sutures to retract the skin edges away from the radiotherapy applicator.
• [Separately reported by radiation oncologist: Necessary additional work prior to radiation delivery (eg, additional shielding, adjustments to angles and measurements) and radiation delivery. The radiation treatment is planned and delivered under the supervision of the radiation oncologist.]

• Note: The surgeon must be available during the pre-radiation and radiation period in the event that additional surgical work is needed to retract skin or other tissues.
• After the radiation treatment is complete, the surgeon removes the conforming sutures.
• [Separately reported by radiation oncologist: The applicator and radiation ensemble are removed.]
• The surgeon removes the internal radiation barrier, if placed.
• After inspection of the wound, the surgeon closes the wound (closure is included in the partial mastectomy procedure).

Description of Post-Service Work: n/a

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.40	0.75
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.50	1.17
Urgency of medical decision making	0.47	0.83
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.47	0.52
Physical effort required	0.47	0.42

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.13	0.92
Outcome depends on the skill and judgment of physician	0.67	0.88
Estimated risk of malpractice suit with poor outcome	0.33	0.92

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.70	0.92

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Recommendation

We recommend the survey median work RVU 3.00 for code 19294 and the median survey additional intraoperative time of 40 minutes.

Key Reference Service (KRS) Comparison

19297: Both code 19294 and KRS code 19297 involve placement of an applicator/catheter into the breast lumpectomy cavity for the deliverance of radiation. However, 19294 is related to a single high dose of radiation that is delivered intra-operatively via the applicator. This requires precise placement of the device along with protecting the skin and underlying chest wall from high dose radiation damage. This also requires mobilization of tissue flaps so that the breast tissue to be treated conforms to and is in contact with the applicator. Additionally the skin must be protected from radiation damage and the mammary space must be mobilized for the placement of a protective shield to prevent radiation damage to the underlying muscle and rib. This work is not included in 19297. For 19297, cat scan imaging simulation is performed in a radiology suite by radiation oncologists and the implanted device can be adjusted if needed to ensure safe administration of radiation which is typically given in multiple sessions over several days at much lower doses. This difference in work results in a more complex and intense procedure for the surgeon performing 19294.

14302: Lumpectomy results in a defect in the breast. Similar to 14302, code 19294 includes a breast flap that is created in all directions around the defect to allow for transposition of surrounding breast tissue. In 19294 this mobilization allows secure, appropriate, approximation of breast tissue to the intraoperative radiation therapy applicator to ensure accurate radiation therapy to the targeted breast tissue. In addition to deep tissue planes, mobilization of skin flaps occurs for both 14302 and 19294. These circumferential skin flaps are mobilized around the radiation site to further assist creation of the target volume as well as enable protection of the skin from radiation injury. In comparison to 14302, the total area being mobilized in 19294 would approximate or exceed 30cm2. Code 19294 is different than 14302 in that it does not involve contouring of tissue and cosmetic closure of the defect, both of which add to the complexity/intensity of 14302.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 192X1 in conjunction with 19301 or 19302)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 19499

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty surgical oncology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel consensus

Specialty general surgery Frequency 2000 Percentage 80.00 %

Specialty surgical oncology Frequency 500 Percentage 20.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 600
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel consensus

Specialty general surgery Frequency 650 Percentage 76.47 %

Specialty surgical oncology Frequency 150 Percentage 17.64 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Breast

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 49327

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued – Utilization over 30,000

October 2016

Bronchial Aspiration of Tracheobronchial Tree

In October 2015, AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on 2014 Medicare claims data and this service was identified. The RAW determined that this service would be placed on the next level of interest form to survey. Prior to surveying, the specialty societies noted that a Code Change Application (CCA) was needed. The coding change was reviewed by the CPT Editorial Panel in May 2016, in which the CPT Editorial Panel revised code 31645 by adding the "initial" and revised code 31646 to reflect "same hospital stay".

31645 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed with therapeutic aspiration of tracheobronchial tree, initial
The RUC reviewed the survey results from 116 thoracic and chest physicians and recommend the following physician time components: evaluation time of 10 minutes positioning time 5 minutes, scrub/dress/wait time 10 minutes, intra-service time of 35 minutes and immediate post-service time of 15 minutes. The RUC agreed that the pre-service evaluation time should be 10 minutes, 5 minutes less than the survey median to ensure that the work of moderate sedation, which is now reported separately, is not included. The RUC also agreed that additional 4 minutes is needed to position the patient because they often need to be readjusted based on oxygenation and other factors.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey 25th percentile work RVU of 2.88 accurately accounts for the work in code 31645. To justify a work RVU of 2.88, the RUC compared the surveyed code to the top key reference code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU= 2.78, intra time= 30 minutes) and agreed that while a majority of respondents rate both services as equally complex, the surveyed code has 5 additional minutes of intra-service time and should be valued slightly higher. The RUC also considered CPT code 57156 *Insertion of a vaginal radiation afterloading apparatus for clinical brachytherapy* (work RVU= 2.69, intra time= 30 minutes) and MPC code 11043 *Debridement, muscle and/or fascia (includes epidermis, dermis, and subcutaneous tissue, if performed); first 20 sq cm or less* (work RVU= 2.70, intra time= 30 minutes) and agreed that both codes offer appropriate relative comparators to code 31645. Finally, the RUC clarified that with the transition to the new separately reported moderate sedation codes, this value, the survey 25th percentile, does not include any physician work for this separate procedure. This is reflected in the descriptions of work, which does not mention moderate sedation. **The RUC recommends a work RVU of 2.88 for CPT code 31645.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

31646 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed with therapeutic aspiration of tracheobronchial tree, subsequent, same hospital stay

Prior to valuing this procedure, the RUC considering compelling evidence that the physician current work RVUs may be misvalued. First, the specialty noted that an anomalous relationship exists between code 31646 and the base diagnostic bronchoscopy code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU= 2.78). The current work value for code 31646 (work RVU= 2.72) is less than the current value for 31622. This is anomalous because CPT code 31646 includes all the work of a diagnostic procedure plus the additional work of the work of the pulmonary aspiration. Therefore, under no circumstances should code 31646 be valued less than the base code. Second, the specialties noted that the CPT changes to code 31646 now require that this code be performed in the inpatient hospital setting, due to the clarification of "same hospital stay" in the descriptor. This means that the typical patient will now be sicker with higher amounts of comorbidities, causing increased physician work. The RUC agreed that there is compelling evidence that the current work value for code 31646 may be misvalued.

The RUC reviewed the survey results from 113 thoracic and chest physicians and recommend the following physician time components: evaluation time of 10 minutes positioning time 5 minutes, scrub/dress/wait time 10 minutes intra-service time of 30 minutes and immediate post-service time of 15 minutes. The RUC agreed that the pre-service evaluation time should be 10 minutes, 5 minutes less than the survey median to ensure that the work of moderate sedation, which is now reported separately, is not included. The RUC also agreed that additional 4 minutes is needed to position the patient because they often need to be readjusted based on oxygenation and other factors.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the survey 25th percentile work RVU of 2.78 accurately accounts for the work in code 31646. To justify a work RVU of 2.78, the RUC compared the surveyed code to top key reference code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU= 2.78, intra time= 15 minutes) and noted that while there is some magnitude of additional work in 31646 compared to the reference code, the survey respondents indicated an intra-service time of 30 minutes for the surveyed code, identical to 31622. Therefore, the RUC agreed that a work RVU of 2.78 is appropriate for code 31646. The RUC also compared this code to the "initial" code just reviewed, CPT code 31645, and agreed that 31646 requires slightly less work and should be valued accordingly. Finally, as with 31645, the RUC clarified that with the transition to the new separately reported moderate sedation codes, this value, the survey 25th percentile, does not include any physician work for this separate procedure. This is reflected in the descriptions of work, which does not mention moderate sedation. **The RUC recommends a work RVU of 2.78 for CPT code 31646.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense:
The Practice Expense Subcommittee reviewed the CPT changes to code 31646 and noted that it now requires that this procedure be done in the facility setting. Therefore, the non-facility direct PE inputs were completely removed from code 31646. In addition, several modifications were made now that moderate sedation will be separately reported by new CPT codes. First, the oxygen supply item was added and the moderate sedation supplies and equipment were removed completely. The RUC accepted the direct practice expense inputs as modified by the PE Subcommittee.

Work Neutrality:
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

SUMMARY OF RECOMMENDATION

CPT Code:31645 Tracking Number I1 Original Specialty Recommended RVU: **3.16**
Presented Recommended RVU: **2.88**
Global Period: 000 RUC Recommended RVU: **2.88**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with therapeutic aspiration of tracheobronchial tree, initial

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old man has been hospitalized for one week for respiratory failure. He has respiratory decompensation, oxygen requirements have increased, and chest radiograph shows new lung atelectasis. Bronchoscopy is performed for the clearance of secretions obstructing bronchi.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient's preprocedural work-up and medical records are reviewed. Communication with other professionals, the patient, and the patient's family is completed. The patient is examined to verify that the patient can undergo the procedure. The identity of the patient and the procedure to be performed are verified in accordance with The Joint Commission regulations. The details of the procedure are reviewed with the patient or family, including possible complications, and informed consent is obtained. The patient is brought into the bronchoscopy suite and is positioned for bronchoscopy. Need for respiratory isolation procedures are assessed and used where appropriate. Leads for monitoring blood pressure, pulse, electrocardiogram (ECG), end-tidal carbon dioxide (ETCO2), and oxygen saturation (SpO2) are applied to the patient and monitored continuously throughout the procedure. Oxygen via nasal cannula is begun. A topical anesthetic is administered through a nebulizer. An intravenous (IV) line is placed and a saline infusion is started. A surgical "time out" is performed with the team. Staff, under the supervision of the physician monitors for pulse, respiratory rate, SPO2, end-tidal carbon dioxide (ETCO2), blood pressure, O2 and ECG.

Description of Intra-Service Work: Physician evaluates for the appropriate topical anesthesia and moderate sedation, oxygen evaluated to maintain normal oxygen saturations throughout procedure. A flexible bronchoscope is inserted through the mouth or nostril to visualize the upper airways to the vocal cords. The vocal cords are observed for function. The bronchoscope is then advanced into the trachea. All of the airways are inspected. Secretions are identified and aspirated. All segments of the lung are visualized and each segment is aspirated as needed to clear secretions. Sterile saline may be required to mobilize more viscous and distal secretions. The bronchoscope is removed and the inner channel is flushed as necessary to clear more tenacious secretions. The bronchoscope is reinserted as necessary until the secretions are clear. The physician examines the patient immendiatly post-endoscopy to ascertain that no complications such as desaturation or respiratory failure has occurred.

Description of Post-Service Work: The patient's blood pressure, respiratory rate, pulse, ECG, ETCO2 and SpO2 are monitored. Oxygen is continued to maintain normal oxygen saturations. The bronchoscopy report is generated and completed. The microbiology and pathology requisition form(s) are completed. The specimens are labeled and the physician confirms the accuracy. The results of the procedure, how the patient did during the procedure, and the patient's

current condition are explained to the patient's family. Once the patient is awake, the bronchoscopy findings are discussed with the patient. Orders for when the patient can drink or eat are given to the patient and the patient's family. Once the patient has stable vital signs and feels well enough to leave, the patient is discharged from the bronchoscopy suite. When the results from the microbiology and pathology results have been finalized, the patient is contacted, the results are delivered, and plans for therapy and future studies are discussed with the patient and finalized. Communicate the results with the referring physician and includes discussions with additional consultants as needed.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.04	-0.20
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.16	-0.09
Urgency of medical decision making	0.78	0.89

Technical Skill/Physical Effort (Mean)

Technical skill required	0.18	0.11
Physical effort required	0.37	0.63

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.43	-0.06
Outcome depends on the skill and judgment of physician	0.33	0.17
Estimated risk of malpractice suit with poor outcome	0.20	0.06

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.37	0.40

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2015, the AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on the 2014 Medicare claims data and CPT code 31645 was identified. CPT 31646 was identified as part of the family. The American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST) submitted a CPT code change application for the AMA CPT editorial Panel consideration at the May 2016 meeting. ATS and CHEST believe that CPT 31645 and 31646 require revisions that would be of benefit to any survey taker for these services.

CPT Outcome

The CPT Panel modified these codes as follows: 1) removing the example "(eg, drainage of lung abscess)" in code 31645; 2) substituting the originally requested "same day or" with "same hospital stay" for code 31646 3) revising the parenthetical following code 31646 by adding "with fiberscope"; 4) deleting the second parenthetical after code 31646; and 5) removing code 31646 from the parenthetical following code 94770. Of importance, ATS and CHEST argued and still believe, that the work of 31645 and 31646 are so similar that they did not warrant two separate CPT codes. the CPT panel did not agree. ATS and CHEST conducted the survey for the two recently revised CPT codes 31645 and 31646.

Survey Results & ATS/CHEST Recommendations:

CPT 31645

A joint multi-society expert panel from the American Thoracic Society (ATS) and American College of Chest Physicians (CHEST) herein referred to as the ATS/CHEST expert panel, convened for a call and over subsequent e-mail to review and discuss the survey results. The ATS/CHEST panel was pleased that there were a total of 116 responses to this code family survey request. The survey pool was a standard random sample from both societies de-duplicating the members so any potential participant only received one survey request. The survey performance rate median of 20 studies per year among the 116 respondents is a reasonable rate given the RUC database volume for 2015 is 31,949 for this procedure.

- 93% of respondents found the vignette to be typical.
- 89% of respondents said that this service was typically performed in the Hospital ASC setting with moderate sedation.
- 80% of the respondents said that this service was not provided in the office setting.

For both the CPT 31645 and the CPT 31646, survey the participants both chose the same two Key Reference Service codes, CPT 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure))* and CPT 31625 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites.*)

Based on these observations and the rest of the survey results, the expert panel is recommending the following with respect to physician time and work.

Compelling Evidence Discussion:
The current physician work RVU for CPT code 31622 is 2.78. This was an outcome of the January 2015 RUC recommendation to which CMS agreed. CPT 31646 has a current Harvard physician work value of 2.72. We are arguing for compelling evidence due to rank order anomaly, as the current value of CPT 31646 should not be less than the value of the basic bronchoscopy procedure code 31622. As noted earlier, our joint societies believed that CPT 31646 should be deleted and this would have eliminated the rank order issue. However, maintaining CPT 31646, has maintained a rank order anomaly. Therefore, we request the RUC recognize our compelling evidence argument.

Time:
The ATS/CHEST panel chose pre-service package 1b-FAC straightforward patient procedure with sedation/anesthesia. We reduced the pre-service evaluation time by (-4) minutes consistent with the survey median and added 9 minutes to the standard positioning time. We adjusted the pre service scrub, dress and wait time from the package 5 to the median 10. The addition of the (total of 10 minutes) minutes is supported by the survey median of 10 minutes and consistent with some increases for positioning for RUC approved colonoscopy positioning times to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring. The ATS/CHEST panel chose post service package 8A IV sedation/simple procedure adjusting by 10 minutes consistent with our survey median time of 15 minutes.

The ATS/CHEST expert panel agreed that the survey median intra-service time of 35 minutes accurately reflects the time required to perform this service today and is consistent with the current median time of CPT 31622. After review of the survey data in total and relativity between the family of codes, the expert panel is recommending our survey median intra-service time of 35 minutes with (15, 10, 10 total 35) pre and 15 post time for CPT 31645.

Work:

Survey respondents estimated CPT 31645 at a median work RVW of 3.18 consistent with the current work RVW of 3.16, based on a comparison to the top two key reference services. The survey results supports the top two reference service codes chosen by the survey respondents, CPT 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure))* (RVW 2.78) to have all higher measures including overall time intensity complexity and CPT 31625 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites.*) (RVW 3.36) to have a lower time work intensity and complexity, skill and psychological stress than 31645. The expert panel reviewed the intensity complexity measures and agreed with the survey respondents that the urgency of medical decision making, the technical skill and the physician effort for CPT 31645 is greater than CPT 31622.

The expert panel compared 31645 to two MPC codes CPT 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure))* (RVW 2.78, times 21-30-15 total time 66 minutes) and CPT 31625 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites.*), (RVW 3.36, times 23-35-15, total 73 min). We believe these procedures along with our survey result support maintaining the current relative value.

In summary, we recommend maintaining the current RVW of 3.16 for 31645 with our median times per the survey adjusted per the preservice packages as noted earlier for a pre service total time 35 minutes, intra service time 35 minutes and post time 15 minutes.

After RUC discussion, we recommend maintaining the 25 percentile survey RVW of 2.78 for 31645 with our median times per the survey adjusted per the preservice packages modifying positioning and moderate sedation removal for a pre service total time 25 minutes, intra service time 35 minutes and post time 15 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 25% of time seen with Hospital Visit E/M services.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31645

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Commonly

Specialty Critical Care How often? Commonly

Specialty Internal Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 95847
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. three times the medicare volume

Specialty Pulmonary Frequency 66134 Percentage 68.99 %

Specialty Critical Care Frequency 11502 Percentage 12.00 %

Specialty Internal Medicine Frequency 7668 Percentage 8.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 31,949 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC data base 2015 early data

Specialty Pulmonary Frequency 22045 Percentage 69.00 %

Specialty Critical Care Frequency 3834 Percentage 12.00 %

Specialty Internal Medicine Frequency 2556 Percentage 8.00 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:31646 Tracking Number I2 Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: 000 RUC Recommended RVU: **2.78**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with therapeutic aspiration of tracheobronchial tree, subsequent, same hospital stay

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old man, who previously underwent bronchoscopy for obstructing secretions during the current hospitalization, develops new or recurrent signs of respiratory compromise, retained secretions and atelectasis. Bronchoscopy is performed again for the clearance of secretions.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient's preprocedural work-up and medical records are reviewed. Communication with other professionals, the patient, and the patient's family is completed. The patient is examined to verify that the patient can undergo the procedure. The identity of the patient and the procedure to be performed are verified in accordance with The Joint Commission regulations. The procedure is reviewed with the patient or family, all whom are familiar from the initial procedure, including possible complications, and informed consent is obtained. The patient is brought into the bronchoscopy suite and is positioned for bronchoscopy. Need for respiratory isolation procedures are assessed and used where appropriate. Leads for monitoring blood pressure, pulse, electrocardiogram (ECG), end-tidal carbon dioxide (ETCO2), and oxygen saturation (SpO2) are applied to the patient and monitored continuously throughout the procedure. Oxygen via nasal cannula is begun. A topical anesthetic is administered through a nebulizer. An intravenous (IV) line is placed and a saline infusion is started. A surgical "time out" is performed with the team. Staff, under the supervision of the physician monitors for pulse, respiratory rate, SPO2, end-tidal carbon dioxide (ETCO2), blood pressure, O2 and ECG.

Description of Intra-Service Work: Physician evaluates for the appropriate topical anesthesia and moderate sedation, oxygen evaluated to maintain normal oxygen saturations throughout procedure. A flexible bronchoscope is inserted through the mouth or nostril to visualize the upper airways to the vocal cords. The vocal cords are observed for function. The bronchoscope is then advanced into the trachea. All of the airways are inspected. Secretions are identified and aspirated. All segments of the lung are visualized and each segment is aspirated as needed to clear secretions. Sterile saline may be required to mobilize more viscous and distal secretions. The bronchoscope is removed and the inner channel is flushed as necessary to clear more tenacious secretions. The bronchoscope is reinserted as necessary until the secretions are clear. The physician examines the patient immendiatly post-endoscopy to ascertain that no complications such as desaturation or respiratory failure has occurred.

Description of Post-Service Work: The patient's blood pressure, respiratory rate, pulse, ECG, ETCO2 and SpO2 are monitored. Oxygen is continued to maintain normal oxygen saturations. The bronchoscopy report is generated and completed. The microbiology and pathology requisition form(s) are completed. The specimens are labeled and the physician confirms the accuracy. The results of the procedure, how the patient did during the procedure, and the patient's

current condition are explained to the patient's family. Once the patient is awake, the bronchoscopy findings are discussed with the patient. Orders for when the patient can drink or eat are given to the patient and the patient's family. Once the patient has stable vital signs and feels well enough to leave, the patient is discharged from the bronchoscopy suite. When the results from the microbiology and pathology results have been finalized, the patient is contacted, the results are delivered, and plans for therapy and future studies are discussed with the patient and finalized. Communicate the results with the referring physician and includes discussions with additional consultants as needed.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99205	XXX	3.18	**RUC Time**	2,880,608

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 60 minutes are spent face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.33	-0.46
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.16	-0.46
Urgency of medical decision making	0.58	0.64

Technical Skill/Physical Effort (Mean)

Technical skill required	0.18	0.00
Physical effort required	0.33	0.57

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.39	-0.11
Outcome depends on the skill and judgment of physician	0.42	-0.04
Estimated risk of malpractice suit with poor outcome	0.30	-0.04

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.35	0.21

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In October 2015, the AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on the 2014 Medicare claims data and CPT code 31645 was identified. CPT 31646 was identified as part of the family. The American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST) submitted a CPT code change application for the AMA CPT editorial Panel consideration at the May 2016 meeting. ATS and CHEST believe that CPT 31645 and 31646 require revisions that would be of benefit to any survey taker for these services.

CPT Outcome

The CPT Panel modified these codes as follows: 1) removing the example "(eg, drainage of lung abscess)" in code 31645; 2) substituting the originally requested "same day or" with "same hospital stay" for code 31646 3) revising the parenthetical following code 31646 by adding "with fiberscope"; 4) deleting the second parenthetical after code 31646; and 5) removing code 31646 from the parenthetical following code 94770. Of importance, ATS and CHEST argued and still believe, that the work of 31645 and 31646 are so similar that they did not warrant two separate CPT codes. The CPT panel did not agree. ATS and CHEST conducted the survey for the two recently revised CPT codes 31645 and 31646.

Survey Results & ATS/CHEST Recommendations:

CPT 31646

A joint multi-society expert panel from the American Thoracic Society (ATS) and American College of Chest Physicians (CHEST) herein referred to as the ATS/CHEST expert panel, convened for a call and over subsequent e-mail to review and discuss the survey results. The ATS/CHEST panel was pleased that there were a total of 113 responses to this code family survey request. The survey pool was a standard random sample from both societies de-duplicating the members so any potential participant only received one survey request. The survey performance rate median of 10 studies per year among the 113 respondents is a reasonable rate given the RUC database volume for 2015 is 4,255 for this procedure.

- 97% of respondents found the vignette to be typical.
- 89% of respondents said that this service was typically performed in the Hospital ASC setting with moderate sedation.
- 80% of the respondents said that this service was not provided in the office setting.

For both the CPT 31645 and the CPT 31646, survey the participants both chose the same two Key Reference Service codes, CPT 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure))* and CPT 31625 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites.*)

Based on these observations and the rest of the survey results, the expert panel is recommending the following with respect to physician time and work.

Compelling Evidence Discussion:
The current physician work RVU for CPT code 31622 is 2.78. This was an outcome of the January 2015 RUC recommendation to which CMS agreed. CPT 31646 has a current Harvard physician work value of 2.72. We are arguing for compelling evidence due to rank order anomaly, as the current value of CPT 31646 should not be less than the value of the basic bronchoscopy procedure code 31622. As noted earlier, our joint societies believed that CPT 31646 should be deleted and this would have eliminated the rank order issue. However, maintaining CPT 31646, has maintained a rank order anomaly. Therefore, we request the RUC recognize our compelling evidence argument.

Time:
The ATS/CHEST panel chose pre-service package 1b-FAC straightforward patient procedure with sedation/anesthesia. We reduced the pre-service evaluation time by nine minutes consistent with the survey median and added nine minutes to the standard positioning time. We adjusted the pre service scrub, dress and wait time from the package 5 to the median 10. The addition of the (total of 5 minutes) minutes is supported by the survey median of 10 minutes and consistent with increases for positioning for RUC approved colonoscopy positioning times to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring. The ATS/CHEST panel chose post service package 8A IV sedation/simple procedure adjusting by 10 minutes consistent with our survey median time of 25 minutes.

The ATS/CHEST expert panel agreed that the survey median intra-service time of 35 minutes accurately reflects the time required to perform this service today and is consistent with the current median time of CPT 31622. After review of the survey data in total and relativity between the family of codes, the expert panel is recommending our survey median intra-service time of 30 minutes with (10, 10, 10 total 30) pre and 15 post time for CPT 31646.

Work:

Survey respondents estimated CPT 31646 at a median work RVW of 3.00 consistent with relativity to 31645 and more than the current work RVW of 2.72, based on a comparison to the top two key reference services. The survey results supports the top two reference service codes chosen by the survey respondents, CPT 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure))* (RVW 2.78) to have all higher measures including overall time intensity complexity and CPT 31625 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites.*) (RVW 3.36) to have a lower time work intensity and complexity, skill and psychological stress than 31645. The expert panel reviewed the intensity complexity measures and agreed with the survey respondents that the urgency of medical decision making, the technical skill and the physician effort for CPT 31646 is greater than CPT 31622.

The expert panel compared 31646 to two MPC codes CPT 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure))* (RVW 2.78, times 21-30-15 total time 66 minutes) and CPT 31625 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites.*), (RVW 3.36, times 23-35-15, total 73 min). We believe these procedures along with our survey result support the median survey value of 3.00 and maintains relativity within the bronchoscopy family.

In summary, we are recommending the median survey RVW of 3.00 for 31646 with our median times per the survey adjusted per the preservice packages as noted earlier for a pre service total time 30 minutes, intra service time 30 minutes and post time 15 minutes.

After RUC discussion, we are recommending the 25 percentile of the survey RVW of 2.78 for 31646 with our median times per the survey adjusted per the preservice packages and taking out time for moderate sedation and positioning, as noted earlier for a pre service total time 25 minutes, intra service time 30 minutes and post time 15 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain) 40% of time with Hospital Visit E/M services.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31646

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Commonly

Specialty Critical Care How often? Commonly

Specialty Internal Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 12765
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. three times the medicare volume

Specialty Pulmonary Frequency 8297 Percentage 64.99 %

Specialty Critical Care Frequency 1659 Percentage 12.99 %

Specialty Internal Medicine Frequency 1021 Percentage 7.99 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,255
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC data base 2015 early data

Specialty Pulmonary Frequency 2766 Percentage 65.00 %

Specialty Critical Care Frequency 533 Percentage 12.52 %

Specialty Internal Medicine Frequency 340 Percentage 7.99 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT, Global and Long Descriptor:

CPT	Global	Long Description
31645	000	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with therapeutic aspiration of tracheobronchial tree, initial
31646	000	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with therapeutic aspiration of tracheobronchial tree, subsequent, same hospital stay

Meeting Date: **October 2016** **revised 10-5-2016**

All inputs for 31646 were removed as the CPT code description specifies this code is for the same hospital stay so it cannot be used in the non-facility setting.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **The ATS and CHEST convened a consensus panel via telephone and email to develop the inputs for this code.**

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes.
Reference Code Rationale: The surveying societies supplied the existing codes and values as references, additionally a recently surveyed and PE reviewed CPT code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* is also used as a reference since for aspiration services, would be performing this service. To be clear, a provider cannot bill 31622 in addition, as 31622 is inherent as part of any performed bronchoscopy.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:
Lines: 12 to 16 when decision for service is made, rationale. "While many of these procedure are performed in the facility setting, if done in non-facility setting the coordination to set up appointments is similar to bronchoscopy and would be typical for that setting, therefore we cross walked to 31622 times.
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Details of the requested increases over the current:
(Line 30) Increased time, consistent with the physician work from survey time.
(Line 38) Increased time, consistent with time for 31622 to allow for requisitions for specimens.
(Line 75) As per the current guidelines noted in our compelling evidence during the January 2015 PE meeting, the national standard is 5L/M and based on the time from our survey the use of oxygen was added or increased consistent with the physician time and standard.
(Line 69) removed input as this is insufficient volume to provide service.
(Line 70) Added one unit of the correct volume of sodium chloride 0.9% inj (250-1000ml uou)

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Hospital outpatient and ASC admission and pre-procedural work-up, review of records, communication with other professionals, patient and family.
- Obtain informed consent.
- Obtain vital signs. (height, weight, temperature, respiratory rate, pulse rate/ regularity, supine BP, O2 Sat)
- Provide preservice education about the bronchoscopy.
- Dress in gown, non-sterile gloves and eye shield before the procedure. Don lead apron for fluoroscopic guidance, if used. It is not typical for CPT codes 31645 and 31646.
- Prepare room, equipment, supplies and scope.
- Prepare and position the patient and equipment, following instructions by the physician, as noted in the SoR for physician work two additional minutes are necessary for **Positioning**: Addition of 2 minutes (3 min total) to account for positioning the patient, to allow the RN/RT to place an IV, and video/scope equipment to allow access for the procedure and patient monitoring. (Note: The patient may not require moderate sedation, however, the patient will be monitored post procedure.)
- The RN/RT also verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulations.

Intra-Service Clinical Labor Activities:

- The patient is placed by the RN/RT on supplemental oxygen in the bronchoscopy suite which has resuscitative equipment in place.
- The physician supervises the nebulized administration of inhaled topical anesthesia.
- The physician next applies local topical anesthesia to the oropharynx and nasopharynx.

Post-Service Clinical Labor Activities:

- The RN/RT checks dressings, coordinates discharge, provides home care instructions, completes diagnostic forms, lab requisitions for specimens and a chest x-ray requisition.
- The RN/RT Cleans scope(s).
- The RN/RT examines the patient post-bronchoscopy and pre-discharge from the facility to ascertain that no complications, such as bleeding, mucus plugging, or shortness of breath have occurred.
- The RN/RT informs the patient and explains to the family the previous instructions about post-procedure complications.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2016

Laparoscopic Total Pelvic Lymphadenectomy

The CPT Editorial Panel created a new code to describe the laparoscopic bilateral total pelvic lymphadenectomy at their May 2016 meeting.

38573 Laparoscopy, surgical; with bilateral total pelvic lymphadenectomy and peri-aortic lymph node sampling, peritoneal washings, peritoneal biopsy(s), omentectomy, and diaphragmatic washings, including biopsy(s) when performed
The RUC reviewed the survey data from 65 gynecology and oncology physician providers and recommends the survey 25th percentile work RVU of 20.00. The RUC recommends the following physician time: pre-service time of 68 minutes, intra-service time of 180 minutes, and immediate post-service time of 30 minutes with a half day discharge day (0.5 – 99328) and two post-operative office visits (1 – 99213, 1 – 99214). The RUC compared this service to similar service 60650 *Laparoscopy, surgical, with adrenalectomy, partial or complete, or exploration of adrenal gland with or without biopsy, transabdominal, lumbar or dorsal* (work RVU=20.73, intra-service time of 180 minutes) and determined that both services have identical intra-service time and comparable physician work and should therefore be valued similarly. To validate a work RVU of 20.00, the RUC compared the survey code to top key reference code 38572 *Laparoscopy, surgical; with bilateral total pelvic lymphadenectomy and peri-aortic lymph node sampling (biopsy), single or multiple* (work RVU=15.60, intra-service time of 120 minutes) and noted that the reference code has lower intra-service time, and the survey respondents indicated that the survey code is somewhat to much more intense to perform, further justifying this valuation.

The RUC discussed the limited services with 010 day global periods and thus comparison to other major procedures with 010 global periods is difficult, however, the IWPUT is consistent with other major procedures. The typical patient has had a prior recent hysterectomy and the physician is concerned about injuring bowel and blood vessels while accessing the peritoneal cavity. Techniques such as an open approach (Hasson), or insertion of the verees needle and trocar in the left upper quadrant is considered. Additional adhesions are universally encountered, including inflammation related to the recent procedure. After development of appropriate spaces, and completion of the lymphadenectomy, the physician must bring the omentum into view. An omentectomy is challenging given the course of the transverse colon from the hepatic flexure to the splenic flexure. Attachments to the colon need to be taken down carefully to ensure the physician does not cause traumatic or thermal injury to the bowel. The lesser sac is eventually entered and then attachments just below the greater curvature of the stomach are taken down and the vessels sealed and cut. The physician must ensure avoidance of the vasculature in the splenic hilum as well as tearing of the splenic capsule. Finally, extraction of the omentum requires a larger incision than typically required for lymph nodes and hence a minilaparotomy is almost always necessary. Given the comparison codes and intensity of this service, the RUC determined the 25th percentile of the survey results accurately reflects the work of this service. **The RUC recommends a work RVU of 20.00 for CPT code 38573.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense:
The Practice Expense Subcommittee reviewed the recommended equipment for this procedure and agreed that it was not typical to have EQ170 *light, fiberoptic headlight w-source*. The Subcommittee agreed to add the standard exam light (EQ168). In addition, the pelvic exam pack supply item SA051 was added. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

SUMMARY OF RECOMMENDATION

CPT Code:38573 Tracking Number J1 Original Specialty Recommended RVU: **24.00**
Presented Recommended RVU: **20.00**
Global Period: 010 RUC Recommended RVU: **20.00**

CPT Descriptor: Laparoscopy, surgical; with bilateral total pelvic lymphadenectomy and peri-aortic lymph node sampling peritoneal washings, peritoneal biopsy(s), omentectomy, and diaphragmatic washings, including biopsy(s) when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old female has undergone a laparoscopic hysterectomy and bilateral salpingo-oophorectomy for what was thought to be a benign ovarian mass. Subsequently, the final pathology showed a grade 1 ovarian cancer. The patient was counseled about her risks of recurrence and was offered a laparoscopic surgical staging of the ovarian malignancy.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 6% , Overnight stay-less than 24 hours 74% , Overnight stay-more than 24 hours 20%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 31%

Description of Pre-Service Work: The history and physical exam are reviewed and updated. Medicine reconciliation is performed. Labs, imaging studies, and biopsies are reviewed. The discontinuation of any high risk medication is verified. Appropriate antibiotic coverage is determined consistent with procedure risks and patient's known allergies. The method and timing of DVT prophylaxis is considered and implementation is assured. The procedure is verified with the patient and any remaining questions are answered. Physician changes into scrub clothes. The instruments and anticipated supplies are checked for completeness and functionality. The appropriate images are displayed in the operating room. Following induction of anesthesia a second IV is inserted. The patient is placed safely in dorsal lithotomy position. The arms are wrapped in foam and safely tucked alongside the body and all joints are inspected to prevent nerve compression. A tilt test is performed to verify the patient will tolerate maximum trendelenberg from a cardiopulmonary status and physical positioning. There is verification that the IVs, arterial-line, pulse oximetry and blood pressure monitoring are functioning with the arms tucked. The patient is placed back into a horizontal position. An oral-gastric tube is placed to decompress the stomach. The face and eyes are protected with pads or shields. The extent of surgical prep is delineated. Physician scrubs. The surgical timeout is performed. The patient is draped.

Description of Intra-Service Work: A bimanual and rectovaginal exam is performed under anesthesia to assess nodularity in the cul de sac or pelvic masses. A foley catheter is inserted into the bladder. A sponge stick in placed in the vagina . A diagnostic laparoscopy is performed, 5-6 laparoscopic ports are placed in the abdomen ranging in size from 5-12mm. The patient is assessed for intra-abdominal metastases, diaphragmatic metastases and retroperitoneal adenopathy. Biopsies of any suspicious lesions are performed. Adhesions from the prior surgery involving bowel and omentum are lysed. The bowels and bowel mesentery are systematically evaluated for the presence of metastatic disease. Peritoneal cytology is obtained. Patient is placed in steep trendelenberg and the bowel is mobilized and dissected out of the pelvis. The retroperitoneum is opened bilaterally to identify the ureters, paravesical and pararectal spaces. A pelvic lymphadenectomy is performed. The nodes from the external and internal iliac, lower common illiac and obturator spaces are placed in a bag and removed separately. The peritoneum over the aorta and vena cava are opened and ureters, inferior mesenteric artery

and renal vessels are identified. Peri-aortic lymph node sampling is performed. Lymph nodes are placed in a bag and removed from the abdomen. An omentectomy is performed by dissecting it free from the transverse colon and stomach. The omentum is placed in a bag and removed through a small mini-laparotomy incision. After completing the staging, hemostasis is confirmed and the pelvis and abdomen are inspected for any injuries. The mini-laparotomy is closed. The instruments and ports are removed and all port sites are closed

Description of Post-Service Work: The oral-gastric tube is removed. The prep is washed off the skin. The transfer of patient to recovery area is supervised. Vital signs are checked and immediate pain assessment is made. Recovery and postoperative medications are ordered and initiated. Patient condition, findings and anticipated outcome is conveyed to family members. The anticipated recovery process and criteria for discharge are conveyed. Procedure documentation is created and reviewed. Labeled images from procedure are transferred to the medical record. The patient is assessed again later in the day to evaluate for any post-procedural complications and the findings at surgery are discussed with the patient. The patient is assessed again the following day, laboratory studies are obtained and reviewed and the patient is assessed for appropriateness of discharge. Plans for discharge are made. Prescriptions for pain medications, DVT prophylaxis, resuming home medications and home therapy are processed. Restrictions of activities and precautions are outlined. Post-procedure follow-up is scheduled.

First Visit: Level 4 Office Visit (99214)
The patient is first seen 1-2 days post-discharge. A detailed history is performed to assess for pain, cardio-pulmonary status, return of bowel function, ileus, nausea and vomiting, bladder function and urinary retention, signs of infection or eroma, retroperitoneal bleeding, lymphedema of the groin, lower abdomen, perineum, or lower extremities, assessment for DVTs and nerve damage. Medications are reviewed. A detailed exam including vitals, neurologic status, skin for infections, musculoskeletal for DVTs, cardio-pulmonary exam, exam of perineum, GI exam for bowel function or hernias and lymphatic exam for lymphedema. Laboratory studies are ordered, reviewed and prescriptions are filled as needed.

Second Visit: Level 4 Office Visit (99214)
The patient is next seen at 7-10 days after the procedure. A detailed history is taken to review pain, bowel and bladder function, vaginal bleeding or discharge, any signs of infection, DVTs, lymphedema, lymphocysts or post-operative complications. Medications are reviewed. Chronic medical conditions are assessed for changes in the post op period. A detailed exam is performed including general appearance, vital signs, cardiopulmonary exam, GI exam for bowel function and hernias, skin to assess for infection, lymphatic exam to assess for edema of groins, lower abdomen and external genitalia. An assessment for hematoma formation, seroma and lymphocyst formation is performed. Pathology is reviewed and timing for therapy is addressed. Prescriptions are filled as needed.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.00	0.85
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.03	0.85
Urgency of medical decision making	0.79	0.55
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.30	0.60
Physical effort required	1.33	0.65

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.06	0.85
Outcome depends on the skill and judgment of physician	1.12	0.75
Estimated risk of malpractice suit with poor outcome	0.88	0.55

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.24	0.80

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel created a new code (38573) for reporting bilateral total pelvic lymphadenectomy, peri-aortic lymph node sampling, peritoneal biopsies, and omentectomy.

Methodology

ACOG was granted research subcommittee approval to use a mixed global period (010 and 090) reference service list.

Survey Data

ACOG received 65 completed RUC physician work surveys. The ACOG RUC workgroup reviewed the survey data and believes the median work value of 24.00 RVUs appropriately ranks this new procedure with services in OB/GYN and MPCs.

	CPT	IWPUT	wRVU	Total Time	PreTime	Intra Time	Post Time	99232	99231	99238	99214	99213	99212

Reference	58548	0.089	31.63	585	76	240	45	1	2	1	1	2	

Positioning Time

The society requests 5 extra minutes of positioning time to put the patient in the dorsal lithotomy position. The society also requests 5 additional minutes of positioning time, for a total of 13 minutes. The additional 5 minutes are needed because an additional IV is placed since anesthesia will not have access to the arms. The arms are carefully wrapped in foam and confirmed to be in a neutral position. The arms are tucked along the side of the

abdomen. Confirmation that IV lines, BP cuff and pulse oximetry are functioning with the arms tucked is required. Confirmation that no compression of nerves in the arms, hands, legs and feet is also performed. The patient is then placed into steep trendelenberg to confirm that there is no compromise to the patient's cardiopulmonary function in this position. Once it is confirmed that steep trendelenberg position is well tolerated, the patient is placed back into a horizontal position. A naso gastric tube is placed to decompress the stomach. The face and eyes are padded or shielded to prevent injury

Intensity
The society is recommending an IWPUT of 0.102 for this new procedure. The society has limited services with 010 day global periods and thus comparison to other major procedures with 010 global periods is difficult. However, they believe this IWPUT is consistent with other major procedures.

This patient has had a prior recent hysterectomy and the physician has to be concerned about injuring bowel and blood vessels while accessing the peritoneal cavity. Techniques such as an open approach (Hasson), or insertion of the verees needle and trocar in the LUQ can be considered. Additional adhesions are universally encountered, including inflammation related to the recent procedure. After development of appropriate spaces, and completion of the lymphadenectomy, one has to bring the omentum into view. Omentectomy is challenging given the course of the transverse colon from the hepatic flexure to the splenic flexure. Attachments to the colon need to be taken down carefully to ensure one does not cause traumatic or thermal injury to the bowel. The lesser sac is eventually entered and then attachments just below the greater curvature of the stomach need to be taken down, vessels sealed and cut. As you get closer to the splenic flexure, one needs to ensure avoidance of the vasculature in the splenic hilum as well as tearing of the splenic capsule. Finally, extraction of the omentum requires a larger incision than typically required for lymph nodes and hence a minilaparatomy is almost always necessary.

Post Operative Visits
The society is requesting two level four office visits for this procedures, supported by survey data.

First Visit: Level 4 Office Visit (99214)
The patient is first seen 1-2 days post-discharge. A detailed history is performed to assess for pain, cardio-pulmonary status, return of bowel function, ileus, nausea and vomiting, bladder function and urinary retention, signs of wound hematoma or seroma, retroperitoneal bleeding, lymphedema of the groin, lower abdomen, perineum, or lower extremities, and assessment for DVTs and nerve damage. Medications are reviewed. A detailed exam including vital signs, neurologic status, skin for hematoma or seroma, lower extremity exam for DVTs, cardio pulmonary exam, exam of perineum for edema and bruising, GI exam for bowel function or hernias and lymphatic exam for lymphedema. Laboratory studies are ordered, reviewed and prescriptions are filled as needed.

Second Visit: Level 4 Office Visit (99214)
The patient is next seen at 7-10 days after the procedure. A detailed history is taken to review pain, bowel and bladder function, vaginal bleeding or discharge, any signs of infection, DVTs, lymphedema, lymphocysts or post-operative complications. Medications are reviewed. Chronic medical conditions are assessed for changes in the post op period. A detailed exam is performed including general appearance, vital signs, cardiopulmonary exam, GI exam for bowel function and hernias, skin to assess for infection, lymphatic exam to assess for edema of groins, lower abdomen and external genitalia. An assessment for hematoma formation, seroma and lymphocyst formation is performed. Pathology is reviewed and timing for therapy is addressed. Prescriptions are filled as needed.

Recommendation
The specialty society is recommending 24.00 work RVUs for this new procedure with a total time of 377 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 38572 and 49329

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gynecology/Oncology How often? Commonly

Specialty Obstetrics/Gynecology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty GynecologyOncology Frequency 5950 Percentage 85.00 %

Specialty ObstetricsGynecology Frequency 1050 Percentage 15.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 40% of the ovarian cancers are in the Medicare population. However, given the utilization of the unlisted code 49329, under current reporting mechanisms only roughly 1,000 could be current reported.

Specialty GynecologyOncology Frequency 2380 Percentage 85.00 %

Specialty ObstetricsGynecology Frequency 420 Percentage 15.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 58548

Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

Laparoscopy, surgical; with bilateral total pelvic lymphadenectomy and peri-aortic lymph node sampling peritoneal washings, peritoneal biopsy(s), omentectomy, and diaphragmatic washings, including biopsy(s) when performed

(Do not report 38573 in conjunction with 38562, 38564, 38570, 38571, 38572, 38589, 38770, 38780, 49255, 49320, 49326, 58541, 58542, 58543, 58544, 58548, 58550, 58552, 58553, 58554)

Global Period: 010 **Meeting Date:** October 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ACOG convened a workgroup consisting of their CPT/RUC committee members and SGO representatives. The workgroup developed these practice expense recommendations based on the physician survey results, the clinical aspects of the procedure and standard PE committee inputs.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We included CPT Code 38572 as a PE reference code. It was chosen as the key reference service on the physician work survey and includes similar direct practice expense inputs as the newly created service.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are requesting "Extensive use of Clinical Staff" for this 010 service. This procedure is typically performed to complete surgical staging of an unexpected cancer diagnosis and the timing of the procedure in relation to the antecedent operation is very short. Services with 010 global periods do not typically include a service of this intensity. Clinical staff is intimately involved with explanation to all stakeholders regarding this procedure. Clinical staff is involved with patient education as well as a new cancer diagnosis and the need for complete staging of the malignancy. The teaching for anticoagulation needs and preoperative prophylactic therapy associated with a cancer and a second pelvic operation is more robust. Management of medical co-morbidities associated with this procedure are complex and time-intensive.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms (5)
Clinical staff is utilized for explanation of need for the second operation to stakeholders (i.e. insurance carrier nurse) during a prior global period.

Coordinate pre-surgery services/review test/exam results (10)
Obtain pathology reports from referring clinical team and any other consulting pathology services. Obtain slides, if needed, for physician review. Obtain initial operative report to determine extent of gross pathology for surgical-procedure planning.

Schedule space and equipment in facility (5)
Standard scheduling protocols with additional notification of possible need for post-operative ICU care.

Provide pre-service education/obtain consent (7)
Standard consent with additional education for a new cancer diagnosis and explanation of need for complete surgical staging. Additional education for DVT prophylaxis, bowel prep, and comorbidity management with a second operation. Review of supplements and medications is critical with use of DVT prophylaxis.

PRE phone calls & prescriptions (3)
Anticoagulation prophylaxis and preoperative antibiotics for bowel prep.

Intra-Service Clinical Labor Activities

Standard Discharge Management (12)

Post-Service Clinical Labor Time

Post-Operative day 3 office visit (99214) to evaluate postoperative progress reviewing bowel, bladder, lymphatic, neurologic sequelae as well as DVT surveillance, seroma development and routine wound evaluation of multiple incisions. History involves multiple system discussion and physical exam includes vulvar and vaginal exam for seroma development in addition to routine post-operative evaluation of multiple systems.

Post-Operative day 10 office visit (99214) to evaluate postoperative progress reviewing bowel, bladder, lymphatic, neurologic sequelae as well as DVT surveillance, seroma development and routine wound evaluation of multiple incisions. History involves multiple system discussion and physical exam includes vulvar and vaginal exam for seroma development in addition to routine post-operative evaluation of multiple systems.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2016

Esophagectomy

In October 2015, the CPT Editorial Panel created three new codes 43286, 43287, 43288 to report esophagectomy via laparoscopic and thoracoscopic approaches, and revised 43112 to clarify this service. However, following the CPT meeting, during the CPT Panel minutes review the vignettes were altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the CPT Panel and tried to correct prior to the survey; however, the Panel did not adjust the vignette. The specialty societies conducted a survey and found that a significant number of respondents did not agree that the changed vignette described the typical patient and noted that the typical patient does undergo neoadjuvant chemotherapy and radiation therapy prior to surgery. Therefore, the specialty societies believed the survey was flawed and the codes should be re-surveyed with the appropriate vignette. After review of the survey results, the specialty societies also found that significant rank order anomalies existed among the three most common open approach esophagectomy codes 43107, 43112, and 43117. Additionally, there had been significant changes in the patient population for these procedures. The open approach codes were last reviewed by the RUC in 2000 as part of the second 5-year review. The specialty societies recommended re-survey of codes 43107, 43112, and 43117. The RUC agreed with the specialty societies and recommended: 1) the CPT Editorial Panel table new codes 43286, 43287, 43288 until CPT 2018; 2) the specialty societies go to the Research Subcommittee to obtain approval for the current typical patient (vignette) for both the new thoracoscopic/laparoscopic codes and open codes (43107, 43112 and 43117); and 3) the specialty societies survey all six codes for the October 2016 RUC meeting.

At the October 2016 RUC meeting, the RUC questioned why open approach codes 43108, 43113 and 43118 were not also surveyed. The specialty societies indicated and the RUC agreed that the only similarity between 43107, 43112, and 43117 and 43108, 43113 and 43118 is the surgical approach(es) and the ultimate location of the esophageal anastomosis. The other key parts of 43108, 43113, and 43118 are substantially different. Codes 43107, 43112, and 43117 utilize stomach to reestablish continuity between the remaining esophagus and stomach following removal of the diseased portion of the esophagus and stomach. Codes 43108, 43113, and 43118 involve removal of the diseased esophagus and entire stomach but intestinal continuity is then restored utilizing either the small intestine or colon, which represents significantly different and more physician work. To re-establish esophageal to intestinal continuity with small intestine or colon requires mobilization and preparation of the mesentery for transposition. Additionally, more anastomoses are required if small bowel or colon are utilized --one additional anastomosis for small bowel and three additional anastomoses for colon. The RUC agreed that the only similarities between 43107 and 43108, 43112 and 43113, and 43117 and 43118 are the approach and location of the esophageal anastomosis, and otherwise physician work is different. Codes 43108, 43113, and 43118 were reviewed as part of the Third Five-Year Review and are rarely performed (less than 10 Medicare claims per year) and would be difficult to survey (ie, find surgeons with recent experience).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Compelling Evidence

The specialty societies identified three points that support compelling evidence: rank order anomaly, flawed survey methodology and a change in work since the last RUC review in 2000. The RUC agreed that there is an anomalous relationship between codes 43107, 43112 and 43117. The compelling evidence points discussed are detailed below.

Rank order anomaly

Due in large part to the flawed survey methodology, there now exists a rank order anomaly for codes 43107, 43112, 43117 with all other 90-day global procedures that have significant intra-time and significant post-operative work. For example, 43117, a procedure that requires both a large thoracotomy incision and a laparotomy is valued less than 43107, a procedure that requires a laparotomy and a neck incision. In addition, 43112, a procedure that requires three incisions including a thoracotomy, laparotomy, and a neck incision, is valued less than 43121, a procedure that necessitates only a thoracotomy incision. The RUC agreed that this anomalous relationship demonstrates compelling evidence for codes 43107, 43112 and 43117.

Flawed Methodology

The flawed survey methodology is best summarized as utilization of an inappropriate, circular RSL when code 43117 was reviewed in 2000, a time when the codes that were being surveyed were also included in the RSL. At the following RUC meeting in 2001, for the survey of 43107 and 43112, code 43117 was included in the RSL and was chosen as the key reference for both codes. The end result was perpetuation of the flawed value of 43117. Therefore, the elements of a circular and inappropriate RSL during the review in 2000 applied by the limitations of the Medicare fee schedule relative value scale at the time of the second Five-Year Review generated a flawed survey process.

Change in work

As a result of changes in technology, there has been a dramatic change in total physician work, especially the postoperative management. Over the last 15 years, there have been advances in technology that allow patients with early stage esophageal cancer to undergo endoscopic mucosal resection (EMR), thereby avoiding major surgical resection. This change in disease management has led to a decline in total patients undergoing esophagectomy. EMR is now the preferred treatment for patients with Barrett's esophagus with high-grade dysplasia, T1a invasive cancers, and increasingly some T1b invasive cancers. Therefore, patients with Stage 0, Stage 1A, and now even Stage 1B can avoid major resection leaving only patients with locally advanced cancers to undergo major resections. As a result, the majority of patients undergoing esophagectomy have T2 or greater disease, and this was clearly not the case during the review in 2000. Studies published utilizing the SEER database[1] and National Cancer Database[2] support the fact that patients who now undergo esophageal resection require more complex total care than patient cohorts at the time of the prior survey since they are genuinely sicker patients coming into the surgery. This new cohort of patients will require more complex postoperative management, resulting in higher levels of post-operative visits.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

In summary, during the last review of these codes, an inappropriate circular RSL created a flawed survey methodology. This flawed methodology perpetuated inappropriate valuation and has created rank order anomalies for these three codes when compared with other codes in the physician payment schedule that include significant and comparable total physician work. In addition, advancement in technology over the last 15 years has significantly changed the total physician work, most significantly the post-operative work, for codes 43107, 43112 and 43117.

RUC Review

CMS questioned whether any of the codes on the October 2016 reference service list (RSL) were valued using the STS database and mean times. The specialty societies indicated that a combination of the STS database and ACS National Surgical Quality Improvement Program (NSQIP) data with median times were used, not mean, when valuing the services on the current RSL.

CMS questioned if any high work RVU codes were added to the current RSL and/or what were the modifications. The specialty society indicated that the high work RVU and low work RVU codes were removed, along with the existing codes currently being surveyed. As suggested by the Research Subcommittee, codes were then added in the middle range of work RVUs for the 2016 survey RSL to help fill in the big gap between 51.00 and 67.00 and to fill in another gap that was created when the open approach codes were removed.

A RUC member questioned what occurred in the third Five-Year Review with this set of codes. The specialty indicated that only 3 codes were extracted and compelling evidence met to be reviewed at the second Five-Year Review with an additional 9 codes allowed to be reviewed in 2001. The remaining esophagectomy codes were not reviewed until the third Five-Year Review, thus causing various additional anomalies.

43107 Total or near total esophagectomy, without thoracotomy; with pharyngogastrostomy or cervical esophagogastrostomy, with or without pyloroplasty (transhiatal)

The RUC reviewed the survey responses from 63 general and thoracic surgeons and determined that the survey 25th percentile work RVU of 52.05 appropriately accounts for the work required to perform this service. The RUC recommends 60 minutes evaluation, 20 minutes positioning, 15 minutes scrub/dress/wait time, 270 minutes intra-service and 45 minutes immediate post-service time. This service is performed via a separate laparotomy and left neck incision, removal of the esophagus is both by sharp and blunt dissection, but also blind dissection within the mediastinum freeing it up the from the trachea, the aorta and the azygos vein. The esophagogastric anastomosis is ultimately accomplished in the neck by sewing or stapling the esophagus to the stomach. The surgeon manages the post-operative intensive care.

The RUC noted that the previous value was incorrect and cannot be used to compare the current recommendation. The RUC compared the surveyed code to the second key reference service 43121 *Partial esophagectomy, distal two-thirds, with thoracotomy only, with or without proximal gastrectomy, with thoracic esophagogastrostomy, with or without pyloroplasty* (work RVU = 51.43 and 240 minutes intra-service time) and noted that the survey respondents indicated that 43107 was more intense and complex on all measures. The RUC also referenced MPC code

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33863 *Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)* (work RVU = 58.79 and 287 minutes) noting that 33863 requires slightly more time and physician work than the surveyed service, further supporting the value for the survey code. **The RUC recommends a work RVU of 52.05 for CPT code 43107.**

43117 Partial esophagectomy, distal two-thirds, with thoracotomy and separate abdominal incision, with or without proximal gastrectomy; with thoracic esophagogastrostomy, with or without pyloroplasty (Ivor Lewis)
The RUC reviewed the survey responses from 67 general and thoracic surgeons and determined that the survey 25th percentile work RVU of 57.50 appropriately accounts for the work required to perform this service. The RUC recommends 60 minutes evaluation, 30 minutes positioning, 15 minutes scrub/dress/wait time, 330 minutes intra-service and 45 minutes immediate post-service time. This service is performed by a separate laparotomy incision and then after laparotomy incision is closed, the patient is repositioned to their side. Through a separate right thoracotomy incision the remaining esophagus is resected and the tubularized stomach is brought high into the chest and anastomosis is performed.

The 2016 survey data shows that 2 critical care visits (99291) are now inherent in postoperative care for code 43117, which is a change from the current inputs from 2000. The RUC noted that the two critical care visits (99291) are consistent with the existing visit pattern for 43107 and 43112. Patients who now undergo esophageal resection require more complex total care than the typical patient at the time of the prior survey since they are genuinely sicker patients. Patients typically spend 5 to 6 hours under general anesthesia. These patients are in critical condition after this physiologically arduous procedure that involves invasion and disruption of the organs and structures in the chest, mediastinum, and abdominal cavities including resection of the esophagus and the stomach. The surgeon must manage the functions of one or more vital organ systems during the immediate post-operative period to assess, and manipulate recovery after surgery to prevent deterioration in the patient's condition.

The operating surgeon is best positioned to understand the nuances of postoperative care for these complex patients in the ICU and will take the lead in patient management which includes but is not limited to the following: these patients have significant third spacing fluid changes in the first 48 to 72 hours, are at risk of vocal cord paresis, or paralysis, and often have significant respiratory complications. They need aggressive pulmonary care for secretion control to prevent atelectasis and in turn pneumonia. They need careful monitoring of their blood pressure and urine output. The patient is at risk for mediastinal bleeding and the anastomotic sites must be closely managed and monitored for leakage. They also have a higher than usual need for blood transfusion. Management of nasogastric tube or other issues that limits the patient's ability to cough early on is also imperative. Pain management of the thoracotomy and laparotomy is also required. These patients have two chest tubes in the right chest, an epidural catheter for pain control and Foley catheter for strict in and out monitoring, as well as an arterial line for blood pressure monitoring. The surgeon is managing this post-operative intensive care.

The RUC compared the surveyed service with the top key reference service 43121 *Partial esophagectomy, distal two-thirds, with thoracotomy only, with or without proximal gastrectomy, with thoracic esophagogastrostomy, with or without pyloroplasty* (work RVU = 51.43 and 240 minutes intra-service time) noting that 64% of survey respondents indicated that the overall intensity and complexity for these services are identical and 36% indicated that the survey code was more intense and complex. The RUC noted that the previous value was incorrect and cannot

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

be used to compare the current recommendation. The current IWPUT of 0.088 for 43117 is appropriate, especially relative to the intensity of 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* has a IWPUT of 0.096. The RUC also referenced MPC code 33863 *Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)* (work RVU = 58.79 and 287 minutes), noting these services require similar physician work and time, thus validating the recommendation. **The RUC recommends a work RVU of 57.50 for CPT code 43117.**

43112 Total or near total esophagectomy, with thoracotomy; with pharyngogastrostomy or cervical esophagogastrostomy, with or without pyloroplasty (ie, McKeown esophagectomy, or tri-incisional esophagectomy)
The RUC reviewed the survey responses from 65 general and thoracic surgeons and determined that the survey 25th percentile work RVU of 62.00 appropriately accounts for the work required to perform this service. The RUC recommends 60 minutes evaluation, 30 minutes positioning, 15 minutes scrub/dress/wait time, 360 minutes intra-service and 45 minutes immediate post-service time. This service starts with a full right thoracotomy with dissection of the intrathoracic esophagus under direct vision. After closing the thoracotomy incision, the patient is repositioned to the supine position. Through a separate laparotomy and left neck incision the remaining esophagus and stomach are resected as necessary and the anastomosis is performed high in the left neck. The physician work in code 43112 is essentially a combination of the work involved in both codes 43107 and 43117. The surgeon manages the post-operative intensive care.

The RUC noted that the previous value was incorrect and cannot be used to compare the current recommendation. The RUC compared the surveyed service with the top key reference service 43124 *Total or partial esophagectomy, without reconstruction (any approach), with cervical esophagostomy* (work RVU = 69.09 and 243 minutes of intra-service time). The RUC noted and agreed with the 59% of survey respondents who indicted that CPT code 43112 is overall more intense and complex. The RUC also referenced MPC code 33863 *Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)* (work RVU = 58.79 and 287 minutes) and similar service CPT code 33411 *Replacement, aortic valve; with aortic annulus enlargement, noncoronary sinus* (work RVU = 62.07 and 283 minutes intra-service time) noting these services require similar physician work and time, thus validating the recommendation. **The RUC recommends a work RVU of 62.00 for CPT code 43112.**

43286 Esophagectomy, total or near total, with laparoscopic mobilization of the abdominal and mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, laparoscopic transhiatal esophagectomy)
The RUC reviewed the survey responses from 56 general, gastrointestinal and thoracic surgeons and determined that the survey 25th percentile work RVU of 55.00 appropriately accounts for the work required to perform this service. The RUC recommends 60 minutes evaluation, 20 minutes positioning, 20 minutes scrub/dress/wait time, 300 minutes intra-service and 60 minutes immediate post-service time. The surgeon manages the post-operative intensive care.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared the surveyed code to the top key reference 43121 *Partial esophagectomy, distal two-thirds, with thoracotomy only, with or without proximal gastrectomy, with thoracic esophagogastrostomy, with or without pyloroplasty* (work RVU = 51.43 and 240 minutes intra-service time) and the RUC agreed with the 94% of respondents who indicated that the surveyed code is overall more intense and complex. The RUC also referenced MPC code 33863 *Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)* (work RVU = 58.79 and 287 minutes) and similar service CPT code 47785 *Anastomosis, Roux-en-Y, of intrahepatic biliary ducts and gastrointestinal tract* (work RVU = 56.19 and 360 minutes intra-service time), noting these services require similar physician work and time, thus validating the recommendation. **The RUC recommends a work RVU of 55.00 for CPT 43286.**

43287 Esophagectomy, distal two-thirds, with laparoscopic mobilization of the abdominal and lower mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with separate thoracoscopic mobilization of the middle and upper mediastinal esophagus and thoracic esophagogastrostomy (ie, laparoscopic-thoracoscopic esophagectomy, Ivor Lewis esophagectomy)
The RUC reviewed the survey responses from 59 general and thoracic surgeons and determined that the survey 25th percentile work RVU of 63.00 appropriately accounts for the work required to perform this service. The RUC recommends 60 minutes evaluation, 30 minutes positioning, 20 minutes scrub/dress/wait time, 360 minutes intra-service and 60 minutes immediate post-service time. The surgeon manages the post-operative intensive care.

A RUC member questioned the differences in 43287 and 43112 since they both require 360 minutes intra-service time. The specialty society indicated and the RUC agreed that the complexity of the patients is probably similar; however, the difference is in the approach. The McKeown service (43112) requires a separate thoracotomy, abdomen and neck incisions. Whereas code 43287 only requires a laparoscopic and thoracoscopic approaches. Overall, the laparoscopic and thoracoscopic approaches require more physician work, intensity and complexity in these cases.

The RUC compared the surveyed code to the top key reference code 43118 *Partial esophagectomy, distal two-thirds, with thoracotomy and separate abdominal incision, with or without proximal gastrectomy; with colon interposition or small intestine reconstruction, including intestine mobilization, preparation, and anastomosis(es)* (work RVU = 67.07 and 327 minutes of intra-service time) and noted that 88% of respondents indicated that the surveyed code is overall more intense and complex. The RUC also referenced MPC code 33863 *Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)* (work RVU = 58.79 and 287 minutes) and similar service CPT code 61697 *Surgery of complex intracranial aneurysm, intracranial approach; carotid circulation* (work RVU = 63.40 and 300 minutes intra-service time), noting all three services require similar physician work and time, thus validating the recommendation. **The RUC recommends a work RVU of 63.00for CPT code 43287.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

43288 Esophagectomy, total or near total, with thoracoscopic mobilization of the upper, middle, and lower mediastinal esophagus, with separate laparoscopic proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, thoracoscopic, laparoscopic and cervical incision esophagectomy, McKeown esophagectomy, tri-incisional esophagectomy)

The RUC reviewed the survey responses from 60 general and thoracic surgeons and determined that the survey 25th percentile work RVU of 66.42 appropriately accounts for the work required to perform this service. The RUC recommends 60 minutes evaluation, 30 minutes positioning, 20 minutes scrub/dress/wait time, 420 minutes intra-service and 60 minutes immediate post-service time. The surgeon manages the post-operative intensive care.

The RUC compared the surveyed code to the top key reference code 43124 *Total or partial esophagectomy, without reconstruction (any approach), with cervical esophagostomy* (work RVU = 69.09 and 243 minutes of intra-service time) and noted that 80% of respondents indicated that the surveyed code is overall more intense and complex. The RUC also referenced MPC code 33863 *Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)* (work RVU = 58.79 and 287 minutes) and similar service CPT code 61686 *Surgery of intracranial arteriovenous malformation; infratentorial, complex* (work RVU = 67.50 and 420 minutes intra-service time) noting these services require similar physician work and time, thus validating the recommendation. **The RUC recommends a work RVU of 66.42for CPT code 43288.**

Practice Expense

The Practice Expense Subcommittee deleted an exam light from the 4th post-operative visit and corrected the equipment minutes. The remaining direct practice expense inputs are the standards for 090-day global facility-only codes. The RUC recommends the direct practice expense inputs as modified by the PE Subcommittee.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●43286	G1	Esophagectomy, total or near total, with laparoscopic mobilization of the abdominal and mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, laparoscopic transhiatal esophagectomy)	090	55.00

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old man presents with a history that includes gastroesophageal reflux, progressive dysphagia, and testing that revealed a distal esophageal adenocarcinoma arising within long segment Barrett's esophagus with multifocal high-grade dysplasia. He undergoes esophageal resection and reconstruction.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 59%

Description of Pre-Service Work: Within the 24 hours prior to surgery, review preadmission work-up, with attention to endoscopic and imaging information and reports including preoperative pathology and pulmonary and cardiac co-morbidities. The patient is seen and examined to rule out concurrent illness and any contraindication to surgery. Update the H&P. Meet with patient and family to review planned procedure and post-operative management. The patient and family are counseled, questions are answered, and operative consent is obtained. Preoperative orders are written. Operative site markings are performed. The surgeon dresses. The surgeon performs the team briefing (anesthesia, OR staff, house staff). The surgeon verifies that all required instruments and supplies are available. The surgeon assists in transfer of patient from cart to operating table. The surgeon waits for the institution of appropriate monitoring, vascular access, DVT prophylaxis, and induction of anesthesia. The surgeon then places the patient in the supine position with additional special positioning of the neck and arms required. The skin of the neck, anterolateral chest, and abdomen is prepped from the lower ears to the pubis and laterally to each mid-axillary line, after which the surgeon scrubs, gowns, and drapes the patient. The pre-incision surgical pause is completed.

Description of Intra-Service Work: Under general anesthesia through an upper midline incision, the abdomen is explored for metastatic disease and the feasibility of esophagogastric junction resection. Subcostal retractors and a liver retractor are placed to allow visualization of the esophageal hiatus. A nasogastric tube may be placed if it will pass. The mobilization of the stomach begins by widely resecting the gastrohepatic omentum until it reaches the right crus. The right crus is visualized and dissected, the peritoneum overlying the esophagogastric junction is incised followed by the dissection of the left crus of the diaphragm. It is important to handle the stomach gently and with care during the procedure. Utilizing ultrasonic coagulating shears, the greater curvature of the stomach is then mobilized by dividing the gastrocolic omentum taking great care to preserve the right gastroepiploic artery. Short gastric vessels are similarly divided with care taken to protect the spleen. A Kocher maneuver is performed mobilizing the proximal duodenum and the hepatic flexure of the colon mobilized again protecting the right gastroepiploic artery. The diaphragm anterior to the espophagus is divided. A wide en bloc dissection of the esophagus including all periesophageal tissue flush with the posterior pericardium, both parietal pleura, and the adventia of the thoracic aorta is carefully performed. Encircling the esophagus with a rubber drain may help with this dissection. Additional posterior attachments of the stomach are then divided by retracting the stomach

anteriorly. Celiac axis lymph nodes are resected with the specimen. The left gastric artery is divided flush with the celiac axis. With narrow, long retractors, further dissection of the esophagus is continued under direct vision within the mediastinum to above the level of the inferior pulmonary veins. Further blunt dissection of the esophagus is then continued up into the mediastinum taking care to not injure the membranous portion of the trachea and bronchi. A pyloromyotomy or pyloroplasty is performed. The pylorus is covered with a remnant of omentum. With mobilization of the distal and middle esophagus and stomach completed, attention is turned to the left neck. An incision is made along the anterior border of the left sternocleidomastoid muscle. The sternocleidomastoid muscle and underlying carotid sheath and its contents are retracted to the left, carefully avoiding undue compression on the carotid artery. The neck strap muscles are divided. The trachea and thyroid gland are retracted to the right, carefully avoiding pressure on the tracheoesophageal groove and injury to the left recurrent laryngeal nerve. The middle thyroid vein and inferior thyroid artery are identified, ligated and divided, and the underlying cervical esophagus identified. Carefully avoiding injury to the left recurrent laryngeal nerve in the tracheoesophageal groove, the cervical esophagus is encircled with a rubber drain, and the remaining intra thoracic esophagus carefully bluntly dissected free within the thoracic inlet and middle mediastinum working simultaneously both through the cervical and abdominal incisions. Throughout the mediastinal dissection and mobilization of the intrathoracic esophagus careful attention to the intra-arterial blood pressure is mandatory so that prolonged hypotension is avoided. Coordination with anesthesiology is important. The cervical esophagus is divided with a surgical stapler. Frozen section pathology confirms that the proximal esophageal margin is free of tumor. The intrathoracic esophagus and esophagogastric junction is delivered out of the mediastinum through the diaphragmatic hiatus and placed on the anterior chest wall along with the mobilized stomach. The mediastinum is inspected for bleeding. The mediastinum is carefully packed with gauze packs to facilitate hemostasis. A gastric tube approximately 5 cm in width is then created utilizing multiple firings of a stapling device starting just proximal to the pyloroplasty. With each progressive application of the stapler toward the gastric fundus, gentle traction is placed upon the tip of the greater curvature of the stomach to insure construction of as long and straight gastric conduit as is possible. The gastroesophageal junction and juxtaposed tumor are resected with grossly free margins. The longitudinal staple line is over sewn with running suture. Frozen section pathology confirms that the gastric margin is free of tumor. The previously placed packs within the mediastinum are carefully removed and the mediastinum inspected for bleeding. Once hemostasis has been assured, the tip of the mobilized stomach is gently grasped with one hand, which is then inserted through the diaphragmatic hiatus and advanced superiorly through the middle mediastinum behind the trachea and beneath the aortic arch, until the tip of the stomach can be grasped by the second hand inserted downward into the superior and middle mediastinum through the neck incision. Throughout this positioning of the gastric conduit in the original esophageal bed, careful attention to the arterial blood pressure is mandatory so that prolonged hypotension and compromise of the gastric conduit is avoided. Once the tip of the stomach is grasped in the neck, gentle traction on the stomach through the neck incision along with simultaneous gentle pushing of the distal stomach from below results in an adequate length of stomach coming through the neck incision for an esophagogastric anastomosis. Care is taken to insure that the stomach is not twisted as it is brought through the middle mediastinum and out the neck incision. Through the abdominal incision, several sutures between the diaphragmatic hiatus and adjacent stomach are placed to minimize the risk of subsequent herniation of intestine into the chest through the diaphragmatic hiatus. Hemostasis is carefully checked for. A feeding jejunostomy tube may be inserted (separately reported). After careful inspection again for hemostasis, the abdomen is copiously irrigated. The abdominal incision is then closed in multiple layers. Sterile dressings are applied to the abdominal incision. Attention is redirected to the neck. A side-to-side esophagogastric anastomosis is created utilizing the linear stapling device for the posterior portion of the anastomosis. Prior to completing the anterior portion of the anastomosis, a nasogastric tube is placed under direct visualization. The anterior portion of the anastomosis is then completed with an inner layer of running absorbable suture and an outer layer of interrupted permanent suture. After a careful inspection for hemostasis, the neck wound is irrigated, a cervical wound drain placed, and the neck incision closed with multiple layers of absorbable suture. Sterile dressings are applied to the neck incision. The nasogastric tube is secured in place.

Description of Post-Service Work:
Hospital: Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to cart. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes, drains and other devices. Write immediate postoperative orders. Write brief operative note and place in chart. Discuss procedure and outcome with family. Dictate final operative report and copy referring physician(s). Review post-operative chest x-ray and labs. Write orders for transferring patient to appropriate surgical floor and discuss ongoing care with floor nurses. On a daily basis and at other times as necessary, examine patient, including reviewing vital signs, respiratory status, and gastrointestinal status, and confirming as necessary. Auscultate heart and lungs. Monitor status of incisions and drains looking for signs of infection. Manage wound dressings. Continue prophylaxis for DVT. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status, renal

function, and nutritional status. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, nutrition, and patient activity. Chart patient progress notes, daily. Review labs and x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. NPO, intravenous, and/or tube feedings). Carefully assess and monitor postoperative nutritional status as maintained by both intravenous and enteral feedings. Obtain and evaluate postoperative barium esophagram to document anastomotic healing and satisfactory emptying of intrathoracic stomach. Advance diet, as appropriate. Discuss in detail post-esophagogastrectomy dietary restrictions for the post-operative period (e.g. liquid, post-esophagogastrectomy, and/or mechanical soft and eventual post-esophagogastrectomy anti-dumping diets and their duration). Write orders for follow-up, post-discharge labs, x-rays, home care, tube feedings, and physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is no evidence of infection, return of bowel function, adequate nutritional intake, and pain is adequately controlled, and majority of drains removed. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, insurance forms, and correspondence with all necessary providers.

Office: Talk with and examine patient, assess ease of swallowing and pulmonary function. Remove dressings, sutures, and remaining drains when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by review of calorie counts and patient dietary logs and recording patient's weight. If utilized, adjust tube feedings as necessary. Eventually remove feeding jejunostomy tube when utilized and when appropriate. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.35	0.19
Urgency of medical decision making	0.25	0.06
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.60	0.31
Physical effort required	0.70	0.38

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.55	0.13
Outcome depends on the skill and judgment of physician	0.50	0.50
Estimated risk of malpractice suit with poor outcome	0.55	0.13

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.65	0.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background: 43107, 43112, 43117, 43286, 43287, 43288

In October 2015, the CPT Editorial Panel created three new codes 43286, 43287, 43288 to report esophagectomy via laparoscopic and thoracoscopic approaches, and made an editorial revision to code 43112. Following the CPT meeting, during Panel minutes review, the vignettes for the new codes were altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the Panel and tried to correct the vignettes prior to surveying the codes; however, the Panel maintained the altered vignettes.

The STS, AATS, SAGES and ACS conducted a survey and found that a significant number of respondents did not agree that the vignette described the typical patient. The respondents noted that their typical patient underwent neoadjuvant chemotherapy and radiation therapy prior to surgery. At the February 2016 RUC meeting, the societies submitted a letter to the RUC indicating that we believed the survey was flawed and the codes should be re-surveyed with the appropriate vignette. We additionally asked that the three open codes be added to the survey process since it became apparent that there have been substantial changes in the patient population and technology related to patients undergoing open esophagectomy.

The RUC agreed with the specialty societies and recommended:

- The CPT Editorial Panel table new codes 43286, 43287, 43288 until CPT 2018;
- The specialty societies go to the Research Subcommittee to obtain approval for typical patients for all six codes; and
- The specialty societies survey all six codes for the October 2016 RUC meeting.

At the RUC April 2016 RUC meeting, we provided vignettes for all six codes to the Research Subcommittee for review. We also provided supporting information including "*NCCN Clinical Practice Guidelines in Oncology for Esophageal and Esophagogastric Junction Cancers Version 3 (2015)*" and "*Minimally Invasive vs. Open Esophagectomy for Esophageal Cancer: A Comparison of Early Surgical Outcomes from the Society of Thoracic Surgeons National Database"* (Ann Thorac Surg. April 2016).

The Research Subcommittee accepted the proposed vignettes. The STS, AATS, SAGES and ACS conducted a survey for all six codes. For this survey, we included the newly approved language in the outgoing email and in the survey that asked the surgeons to only respond to questions for survey code(s) that they have experience performing or are familiar with.

For the three new codes that were previously surveyed with the faulty vignettes and not presented to the RUC, we have provided the summary data in the RUC summary spreadsheet identified as "SVY-10/15".

For codes 43107, 43112, and 43117 last surveyed during the second 5-year review in 2000, we believe compelling evidence supports an increase in work RVUs.

Compelling Evidence: 43107, 43112, 43117

Background for the 2nd 5-year review in 2000

The second 5-year review in 2000 was complex for many reasons including compression of the fee schedule (ie, the top end of the wRVU scale was compressed) and the large number of codes being reviewed simultaneously by both general surgery (320 codes) and cardiothoracic surgery (90 codes). Additional issues included a circular reference service list for the cardiothoracic codes compounded by compelling evidence issues and the use of mini surveys, which further complicated the review of the general thoracic surgery codes at that time. Unfortunately, due to the complexity of that survey process for so many codes at one time, code 43117 was one of three codes that were surveyed with a circular reference service list (ie, codes that were being surveyed were included on the reference service list) that was not reconciled by the RUC. When the adult and congenital cardiac codes met compelling evidence during the August 2000 Workgroup review, the flawed survey methodology was overcome by using a methodology that cross walked and developed the values related to a then recently reviewed and valued cardiac code. Since the general thoracic surgery codes did not initially meet compelling evidence, the original surveys with the circular references were not addressed. Instead, the original surveys for the three codes, including 43117 were approved after compelling evidence was presented and accepted by the RUC at the October 2000 RUC meeting. In addition, the RUC agreed that the STS could re-survey 9 additional general thoracic codes as part of the 2000 5-year review and present those codes to the RUC at the Feb. 2001 RUC meeting. Those three approved codes, which included 43117, were then used on the reference service list for the 9 code survey before CMS validation, at the newly approved wRVUs from October (40 wRVU for 43117). The 9 code survey included 43107 and 43112. The end result was potential perpetuation of the flawed value of 43117 because 43117 was chosen as the key reference for 43107 and 43112 on the additional survey. In addition, the limited range of the entire physician fee schedule (PFS) in 2000 was an additional challenge with the RSL and review. There were only 48 codes (out of 7,000) with a wRVU above 40 and most of these codes were replantation procedures or skull-base surgical procedures that were rarely performed. In fact, the highest wRVU on the STS 2000 survey RSL where code 43117 was valued was 34.79. This made review and comparison of a procedure with significant intra-time and significant post-operative work (ie, 43117) difficult because the available codes for the RSL didn't compare. Subsequently, for the 2001 STS survey RSL where codes 43107 and 43112 were valued the highest wRVU was a general surgery code with a wRVU of 48.00.

Compelling Evidence

The specialty societies have identified three points that support compelling evidence: flawed survey methodology, rank order anomaly, and a change in work since the last survey review in 2000.

Flawed Methodology

The flawed survey methodology is best summarized as utilization of an inappropriate circular RSL when code 43117 was reviewed in 2000, where the codes that were being surveyed, were also included in the RSL. For the 2000 review of 43117, the RSL utilized was also inadequate to capture the significant work of 43117 because the RSL code with the highest wRVU was much less work than required for 43117. This made it impossible for both the survey respondents and RUC to judge work using magnitude estimation (ie, how much "higher" than the top of a reference scale is appropriate for "significantly more" work than the top code on the scale). Then, the following meeting, for the survey of 43107 and 43112, code 43117 was included in the RSL and was chosen as the key reference for both codes. The end result was perpetuation of the flawed value of 43117. The limited range of the entire physician fee schedule (PFS) during the second 5-year review in 2000 was an additional challenge. The highest valued code on the STS RSL for the survey for 43117 was a Harvard valued code that had a wRVU of 34.79. As evidenced by a general understanding of the complexity of these procedures, the RUC still provided a valuation for 43117 that eclipsed the wRVU of the RSL at 40. However, the effect of this upper-end compression of the fee schedule on the valuation of 43117 was clear and it created a scenario for misvaluation of 43107 and 43112 as they were crosswalked to 43117 the following year.

Incidentally, the code with the highest value on the RSL in 2000 with the wRVU of 34.79 has since been RUC reviewed revalued and is now valued at 59.00 wRVUs. The table titled *Tab 6 - PFS Rank Order Comparison Table* demonstrates the effect of compression reflected in the current valuation of these three open esophagectomy procedures (highlighted in orange) are clear outliers in valuation of procedures with significant intra-operative time and significant post-operative work. Therefore, the elements of a circular and unvalidated RSL and significant wRVU compression in the PFS during the review in 2000 applied by the limitations of the coding hierarchy at the time of the second 5-year review generated a flawed survey process.

Rank order anomaly

Due in large part to the flawed survey methodology described above, there now exists a rank order anomaly for codes 43107, 43112, 43117 with all other 90-day global procedures that have significant intra-time and significant post-operative work. For example, 43117, a procedure that requires both a large thoracotomy incision and a laparotomy is valued less than 43107, a procedure that requires a laparotomy and a neck incision. In addition, 43112, a procedure that requires three incisions including a thoracotomy, laparotomy, and a neck incision, is valued less than 43121, a procedure that necessitates only at thoracotomy incision. Therefore, rank order anomaly, recognized by the RUC and CMS as a source for compelling evidence is demonstrated for all codes 43107, 43112, and 43117.

Change in work

As a result of changes in technology, there has been a dramatic change in total physician work, especially the postoperative management. Over the last 15 years, we have seen advances in technology that allow patients with early stage esophageal cancer to undergo Endoscopic Mucosal Resection (EMR), thereby avoiding major surgical resection. This change in disease management has led to a downward shift in patients undergoing esophagectomy. EMR is now the preferred treatment for patients with Barrett's esophagus with high-grade dysplasia, T1a invasive cancers, and increasingly some T1b invasive cancers. Therefore, patients with Stage 0, Stage 1A, and now even Stage 1B avoid major resection leaving only patients with locally advanced cancers. As a result, the majority of patients undergoing esophagectomy have T2 or greater disease, where this was not the case during the review in 2000. Studies published utilizing the SEER database[1] and National Cancer Database[2] support that patients who now undergo esophageal resection require more complex total care than patient cohorts at the time of the prior survey as they are genuinely sicker patients coming into the surgery, resulting in higher level of post-operative visits.

In summary, during the last review of these codes, an inappropriate circular RSL and an RSL that was significantly impacted by inadequate codes with wRVUs to use as comparators (ie, compression) created a flawed survey methodology. This flawed methodology perpetuated inappropriate valuation and has created rank anomalies for these three codes when compared with other codes in the fee schedule that include significant work. In addition, advancement in technology over the last 15 years has significantly changed the total physician work, most significantly the post-operative work, for codes 43107, 43112, 43117.

Recommendation for 43107

We recommend the survey 25th percentile work RVU of 52.05 for code 43107.

PRE-TIME Package 4

Evaluation (total = 60 minutes): Additional 20 minutes added to package to account for: extensive data review of recent imaging and labs including CT/PET, upper GI endoscopy report. Review chemo/radiation therapy reports from oncology. Coordinate the multi-incisional approach with assistant surgeon, anesthesia, and scrub nurse. Mark all sites. Ensure extensive equipment is available and functioning.

Positioning (total = 20 minutes): Addition 17 minutes added to package to account for padding, positioning, and securing patient to table that will adjust (eg, reverse Trendelenburg, roll, etc.) during the procedure. Also includes additional positioning for neck, chest, and abdominal incisions and accommodation of double lumen endotracheal tube, and lines near operative field.

Scrub, dress, wait (total = 15 minutes): Default to survey median of 15 minutes which is less than package time.

POST-TIME Package 9b

Total = 45 minutes: Additional 12 minutes has been added to package to account for multiple site dressings which will take more than 2 minutes; reversing excessive padding prior to transfer off table which will take more than 1 minute; post-operative notes that will take more than 5 minutes; and post-operative orders which will take more than 5 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43107

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic surgery How often? Sometimes

Specialty General surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not is unknown although it is estimated that in 2016 there will be 16,910 cases of esophageal cancer. 20% of cases present in a localized fashion such that surgical resection might be considered. This leads to approximately 3000 esophageal resections maximum in total and split between all of the esophagectomy codes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 385
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Thoracic surgery Frequency 160 Percentage 41.55 %

Specialty General surgery Frequency 130 Percentage 33.76 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43107

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Total or near total esophagectomy, with thoracotomy; with pharyngogastrostomy or cervical esophagogastrostomy, with or without pyloroplasty (ie, McKeown esophagectomy, or tri-incisional esophagectomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old man presents with progressive dysphagia. Testing revealed a mid-esophageal adenocarcinoma above the level of the carina. He received neoadjuvant chemotherapy and radiation therapy. He now undergoes surgical resection.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 57%

Description of Pre-Service Work: Within the 24 hours prior to surgery, review preadmission work-up, with attention to endoscopic and imaging information and reports including preoperative pathology and pulmonary and cardiac co-morbidities. The patient is seen and examined to rule out concurrent illness and any contraindication to surgery. Update the H&P. Meet with patient and family to review planned procedure and post-operative management. The patient and family are counseled, questions are answered, and operative consent is obtained. Preoperative orders are written. Operative site markings are performed. The surgeon dresses. The surgeon performs the team briefing (anesthesia, OR staff, house staff). The surgeon verifies that all required instruments and supplies are available. The surgeon assists in transfer of patient from cart to operating table. The surgeon waits for the institution of appropriate monitoring, vascular access, DVT prophylaxis, and induction of anesthesia with a double lumen endotracheal tube. The surgeon then places the patient in a left lateral decubitus position. Correct positioning of the double lumen endotracheal tube is assured bronchoscopically. The skin of the right lateral chest wall is prepared after which the surgeon scrubs, gowns, and drapes the patient. The pre-incision surgical pause is completed.

Description of Intra-Service Work: Under general anesthesia, one lung ventilation is initiated. A right posterolateral thoracotomy is performed dividing extrathoracic muscles with electrocautery for hemostasis and resecting a 1 cm segment of the 6th rib posteriorly to facilitate spreading of the ribs. The chest is explored. The right lung and mediastinum are carefully palpated to assess for metastatic cancer and any unsuspected pulmonary nodules. The right lung is carefully retracted anteriorly while blood pressure is monitored. The inferior pulmonary ligament is divided. The mediastinal pleura overlying the esophagus is divided and resected up to the level of the azygos vein. The azygos vein is divided and the mediastinal pleura opened to the level of the thoracic inlet. A nasogastric tube may be placed if it will pass. A mediastinal lymphadenectomy may be performed (separately reported). Utilizing the ultrasonic coagulating sheers, electrocautery, and blunt dissection, the esophagus and periesophageal tissues are carefully circumferentially mobilized from just above the diaphragm to just below the thoracic inlet. A rubber drain placed around the esophagus may aid in esophageal traction and exposure. The vagus nerve is divided above the level of the azygos vein with care taken to protect the right recurrent laryngeal nerve. Care is taken to avoid injury to the membranous portions of the trachea, bronchi, thoracic aorta, thoracic duct, and the recurrent laryngeal nerves. The chest is carefully evaluated for hemostasis and irrigated. Two chest tubes are

placed and connected to an appropriate collection device. The right lung re-expanded. The ribs are carefully re-approximated with pericostal sutures and the chest incision closed in multiple layers of absorbable suture. Sterile dressings are applied.

The entire surgical field is taken down with care to maintain sterility of the surgical equipment and instrumentation for the abdominal and cervical portions of the procedure. The patient is placed in a supine position. The double lumen endotracheal tube is removed and a single lumen endotracheal tube placed. The surgeon then completes the positioning with additional special positioning of the neck and arms required. The skin of the neck, anterolateral chest, and abdomen is prepped from the lower ears to the pubis and laterally to each mid-axillary line, after which the surgeon scrubs, gowns, and drapes the patient. A second pre-incision surgical pause is completed. An upper midline incision, the abdomen is explored for metastatic disease and the feasibility of esophagogastric junction resection. Subcostal retractors and a liver retractor are placed to allow visualization of the esophageal hiatus. The mobilization of the stomach begins by widely resecting the gastrohepatic omentum until it reaches the right crus. The right crus is visualized and dissected, the peritoneum overlying the esophagogastric junction is incised followed by the dissection of the left crus of the diaphragm. It is important to handle the stomach gently and with care during the procedure. Utilizing ultrasonic coagulating shears, the greater curvature of the stomach is then mobilized by dividing the gastrocolic omentum taking great care to preserve the right gastroepiploic artery. Short gastric vessels are similarly divided with care taken to protect the spleen. A Kocher maneuver is performed mobilizing the proximal duodenum and the hepatic flexure mobilized again protecting the right gastroepiploic artery. The diaphragm anterior to the esophagus is divided. A wide en bloc dissection of the esophagus including all periesophageal tissue flush with the posterior pericardium, both parietal pleura, and the adventia of the thoracic aorta is carefully performed up to the level of the previously mobilized intrathoracic esophagus. Additional posterior attachments of the stomach are then divided by retracting the stomach anteriorly. Celiac axis lymph nodes are resected with the specimen. The left gastric artery is divided flush with the celiac axis. A pyloromyotomy or pyloroplasty is performed. The pylorus is covered with a remnant of omentum. With mobilization of the distal and middle esophagus and stomach completed, attention is turned to the left neck. An incision is made along the anterior border of the left sternocleidomastoid muscle. The sternocleidomastoid muscle and underlying carotid sheath and its contents are retracted to the left, carefully avoiding undue compression on the carotid artery. The neck strap muscles are divided. The trachea and thyroid gland are retracted to the right, carefully avoiding pressure on the tracheoesophageal groove and injury to the left recurrent laryngeal nerve. The middle thyroid vein and inferior thyroid artery are identified, ligated and divided, and the underlying cervical esophagus identified. Carefully avoiding injury to the left recurrent laryngeal nerve in the tracheoesophageal groove, the cervical esophagus is encircled with a rubber drain, and the remaining intra thoracic esophagus carefully bluntly dissected free within the thoracic inlet. The cervical esophagus is divided with a surgical stapler. Frozen section pathology confirms that the proximal esophageal margin is free of tumor. The intrathoracic esophagus and esophagogastric junction is delivered out of the mediastinum through the diaphragmatic hiatus and placed on the anterior chest wall along with the mobilized stomach. The mediastinum is inspected for bleeding. The mediastinum is carefully packed with gauze packs if necessary to facilitate hemostasis. A gastric tube approximately 5 cm in diameter is then created utilizing multiple firings of the stapling device starting just proximal to the pyloroplasty. With each progressive application of the stapler toward the gastric fundus, gentle traction is placed upon the tip of the greater curvature of the stomach to insure construction of as long and straight gastric conduit as is possible. The gastroesophageal junction and juxtaposed tumor are resected with grossly free margins. The longitudinal staple line is over sewn with running suture. Frozen section pathology confirms that the gastric margin is free of tumor. The previously placed packs within the mediastinum are carefully removed and the mediastinum inspected for bleeding. Once hemostasis has been assured, the tip of the mobilized stomach is gently grasped with one hand, which is then inserted through the diaphragmatic hiatus and advanced superiorly through the middle mediastinum behind the trachea and beneath the aortic arch, until the tip of the stomach can be grasped by the second hand inserted downward into the superior and middle mediastinum through the neck incision. Throughout this positioning of the gastric conduit in the original esophageal bed, careful attention to the arterial blood pressure is mandatory so that prolonged hypotension is avoided. Once the tip of the stomach is grasped in the neck, gentle traction on the stomach through the neck incision along with simultaneous gentle pushing of the distal stomach from below results in an adequate length of stomach coming through the neck incision for an esophagogastric anastomosis. Care is taken to insure that the stomach is not twisted as it is brought through the middle mediastinum and out the neck incision. Through the abdominal incision, several sutures between the diaphragmatic hiatus and adjacent stomach are placed to minimize the risk of subsequent herniation of intestine into the chest through the diaphragmatic hiatus. Hemostasis is carefully checked for. A feeding jejunostomy tube may be inserted (separately reported). After careful inspection again for hemostasis, the abdomen is copiously irrigated. The abdominal incision is then closed in multiple layers. Sterile dressings are applied to the abdominal incision. Attention is redirected to the neck. A side-to-side esophagogastric anastomosis is created utilizing the linear stapling device for the posterior portion of the anastomosis. Prior to completing the anterior portion of the anastomosis, a nasogastric tube is placed under direct visualization. The

anterior portion of the anastomosis is then completed with an inner layer of running absorbable suture and an outer layer of interrupted permanent suture. After a careful inspection for hemostasis, the neck wound is irrigated, a cervical wound drain placed, and the neck incision closed with multiple layers of absorbable suture. Sterile dressings are applied to the neck incision. The nasogastric tube is secured in place.

Description of Post-Service Work:
Hospital: The patient is returned to the supine position. Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to cart. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes, drains and other devices. Write immediate postoperative orders. Write brief operative note and place in chart. Discuss procedure and outcome with family. Dictate final operative report and copy referring physician(s). Review post-operative chest x-ray and labs. Write orders for transferring patient to appropriate surgical floor and discuss ongoing care with floor nurses. On a daily basis and at other times as necessary, examine patient, including reviewing vital signs, respiratory status, and gastrointestinal status, and confirming as necessary. Auscultate heart and lungs. Monitor status of incisions and drains looking for signs of infection. Manage wound dressings. Continue prophylaxis for DVT. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status, renal function, and nutritional status. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, nutrition, and patient activity. Chart patient progress notes, daily. Review labs and x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. NPO, intravenous, and/or tube feedings). Carefully assess and monitor postoperative nutritional status as maintained by both intravenous and enteral feedings. Obtain and evaluate postoperative barium esophagram to document anastomotic healing and satisfactory emptying of intrathoracic stomach. Advance diet, as appropriate. Discuss in detail post-esophagogastrectomy dietary restrictions for the post-operative period (e.g. liquid, post-gastrectomy, and/or mechanical soft and eventual post-esophagogastrectomy anti-dumping diets and their duration). Write orders for follow-up, post-discharge labs, x-rays, home care, tube feedings, and physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is no evidence of infection, return of bowel function, adequate nutritional intake, and pain is adequately controlled, and majority of drains removed. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, insurance forms, and correspondence with all necessary providers.

Office: Talk with and examine patient, assess ease of swallowing and pulmonary function. Remove dressings, sutures, and remaining drains when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by review of calorie counts and patient dietary logs and recording patient's weight. If utilized, adjust tube feedings as necessary. When utilized, eventually remove feeding jejunostomy when appropriate. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background: 43107, 43112, 43117, 43286, 43287, 43288

In October 2015, the CPT Editorial Panel created three new codes 43286, 43287, 43288 to report esophagectomy via laparoscopic and thoracoscopic approaches, and made an editorial revision to code 43112. Following the CPT meeting, during Panel minutes review, the vignettes for the new codes were altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the Panel and tried to correct the vignettes prior to surveying the codes; however, the Panel maintained the altered vignettes.

The STS, AATS, SAGES and ACS conducted a survey and found that a significant number of respondents did not agree that the vignette described the typical patient. The respondents noted that their typical patient underwent neoadjuvant chemotherapy and radiation therapy prior to surgery. At the February 2016 RUC meeting, the societies submitted a letter to the RUC indicating that we believed the survey was flawed and the codes should be re-surveyed with the appropriate vignette. We additionally asked that the three open codes be added to the survey process since it became apparent that there have been substantial changes in the patient population and technology related to patients undergoing open esophagectomy.

The RUC agreed with the specialty societies and recommended:

- The CPT Editorial Panel table new codes 43286, 43287, 43288 until CPT 2018;
- The specialty societies go to the Research Subcommittee to obtain approval for typical patients for all six codes; and
- The specialty societies survey all six codes for the October 2016 RUC meeting.

At the RUC April 2016 RUC meeting, we provided vignettes for all six codes to the Research Subcommittee for review. We also provided supporting information including "*NCCN Clinical Practice Guidelines in Oncology for Esophageal and Esophagogastric Junction Cancers Version 3 (2015)*" and "*Minimally Invasive vs. Open Esophagectomy for Esophageal Cancer: A Comparison of Early Surgical Outcomes from the Society of Thoracic Surgeons National Database"* (Ann Thorac Surg. April 2016).

The Research Subcommittee accepted the proposed vignettes. The STS, AATS, SAGES and ACS conducted a survey for all six codes. For this survey, we included the newly approved language in the outgoing email and in the survey that asked the surgeons to only respond to questions for survey code(s) that they have experience performing or are familiar with.

For the three new codes that were previously surveyed with the faulty vignettes and not presented to the RUC, we have provided the summary data in the RUC summary spreadsheet identified as "SVY-10/15".

For codes 43107, 43112, and 43117 last surveyed during the second 5-year review in 2000, we believe compelling evidence supports an increase in work RVUs.

Compelling Evidence: 43107, 43112, 43117

Background for the 2nd 5-year review in 2000

The second 5-year review in 2000 was complex for many reasons including compression of the fee schedule (ie, the top end of the wRVU scale was compressed) and the large number of codes being reviewed simultaneously by both general surgery (320 codes) and cardiothoracic surgery (90 codes). Additional issues included a circular reference service list for the cardiothoracic codes compounded by compelling evidence issues and the use of mini surveys, which further complicated the review of the general thoracic surgery codes at that time. Unfortunately, due to the complexity of that survey process for so many codes at one time, code 43117 was one of three codes that were surveyed with a circular reference service list (ie, codes that were being surveyed were included on the reference service list) that was not reconciled by the RUC. When the adult and congenital cardiac codes met compelling evidence during the August 2000 Workgroup review, the flawed survey methodology was overcome by using a methodology that cross walked and developed the values related to a then recently reviewed and valued cardiac code. Since the general thoracic surgery codes did not initially meet compelling evidence, the original surveys with the circular references were not addressed. Instead, the original surveys for the three codes, including 43117 were approved after compelling evidence was presented and accepted by the RUC at the October 2000 RUC meeting. In addition, the RUC agreed that the STS could re-survey 9 additional general thoracic codes as part of the 2000 5-year review and present those codes to the RUC at the Feb. 2001 RUC meeting. Those three approved codes, which included 43117, were then used on the reference service list for the 9 code survey before CMS validation, at the newly approved wRVUs from October (40 wRVU for 43117). The 9 code survey included 43107 and 43112. The end result was potential perpetuation of the flawed value of 43117 because 43117 was chosen as the key reference for 43107 and 43112 on the additional survey. In addition, the limited range of the entire physician fee schedule (PFS) in 2000 was an additional challenge with the RSL and review. There were only 48 codes (out of 7,000) with a wRVU above 40 and most of these codes were replantation procedures or skull-base surgical procedures that were rarely performed. In fact, the highest wRVU on the STS 2000 survey RSL where code 43117 was valued was 34.79. This made review and comparison of a procedure with significant intra-time and significant post-operative work (ie, 43117) difficult because the available codes for the RSL didn't compare. Subsequently, for the 2001 STS survey RSL where codes 43107 and 43112 were valued the highest wRVU was a general surgery code with a wRVU of 48.00.

Compelling Evidence

The specialty societies have identified three points that support compelling evidence: flawed survey methodology, rank order anomaly, and a change in work since the last survey review in 2000.

Flawed Methodology

The flawed survey methodology is best summarized as utilization of an inappropriate circular RSL when code 43117 was reviewed in 2000, where the codes that were being surveyed, were also included in the RSL. For the 2000 review of 43117, the RSL utilized was also inadequate to capture the significant work of 43117 because the RSL code with the highest wRVU was much less work than required for 43117. This made it impossible for both the survey respondents and RUC to judge work using magnitude estimation (ie, how much "higher" than the top of a reference scale is appropriate for "significantly more" work than the top code on the scale). Then, the following meeting, for the survey of 43107 and 43112, code 43117 was included in the RSL and was chosen as the key reference for both codes. The end result was perpetuation of the flawed value of 43117. The limited range of the entire physician fee schedule (PFS) during the second 5-year review in 2000 was an additional challenge. The highest valued code on the STS RSL for the survey for 43117 was a Harvard valued code that had a wRVU of 34.79. As evidenced by a general understanding of the complexity of these procedures, the RUC still provided a valuation for 43117 that eclipsed the wRVU of the RSL at 40. However, the effect of this upper-end compression of the fee schedule on the valuation of 43117 was clear and it created a scenario for misvaluation of 43107 and 43112 as they were crosswalked to 43117 the following year.

Incidentally, the code with the highest value on the RSL in 2000 with the wRVU of 34.79 has since been RUC reviewed revalued and is now valued at 59.00 wRVUs. The table titled *Tab 6 - PFS Rank Order Comparison Table* demonstrates the effect of compression reflected in the current valuation of these three open esophagectomy procedures (highlighted in orange) are clear outliers in valuation of procedures with significant intra-operative time and significant post-operative work. Therefore, the elements of a circular and unvalidated RSL and significant wRVU compression in the PFS during the review in 2000 applied by the limitations of the coding hierarchy at the time of the second 5-year review generated a flawed survey process.

Rank order anomaly

Due in large part to the flawed survey methodology described above, there now exists a rank order anomaly for codes 43107, 43112, 43117 with all other 90-day global procedures that have significant intra-time and significant post-operative work. For example, 43117, a procedure that requires both a large thoracotomy incision and a laparotomy is valued less than 43107, a procedure that requires a laparotomy and a neck incision. In addition, 43112, a procedure that requires three incisions including a thoracotomy, laparotomy, and a neck incision, is valued less than 43121, a procedure that necessitates only at thoracotomy incision. Therefore, rank order anomaly, recognized by the RUC and CMS as a source for compelling evidence is demonstrated for all codes 43107, 43112, and 43117.

Change in work

As a result of changes in technology, there has been a dramatic change in total physician work, especially the postoperative management. Over the last 15 years, we have seen advances in technology that allow patients with early stage esophageal cancer to undergo Endoscopic Mucosal Resection (EMR), thereby avoiding major surgical resection. This change in disease management has led to a downward shift in patients undergoing esophagectomy. EMR is now the preferred treatment for patients with Barrett's esophagus with high-grade dysplasia, T1a invasive cancers, and increasingly some T1b invasive cancers. Therefore, patients with Stage 0, Stage 1A, and now even Stage 1B avoid major resection leaving only patients with locally advanced cancers. As a result, the majority of patients undergoing esophagectomy have T2 or greater disease, where this was not the case during the review in 2000. Studies published utilizing the SEER database[1] and National Cancer Database[2] support that patients who now undergo esophageal resection require more complex total care than patient cohorts at the time of the prior survey as they are genuinely sicker patients coming into the surgery, resulting in higher level of post-operative visits.

In summary, during the last review of these codes, an inappropriate circular RSL and an RSL that was significantly impacted by inadequate codes with wRVUs to use as comparators (ie, compression) created a flawed survey methodology. This flawed methodology perpetuated inappropriate valuation and has created rank anomalies for these three codes when compared with other codes in the fee schedule that include significant work. In addition, advancement in technology over the last 15 years has significantly changed the total physician work, most significantly the post-operative work, for codes 43107, 43112, 43117.

Recommendation for 43112

We recommend the survey 25th percentile work RVU of 62.00 for code 43112.

PRE-TIME Package 4

Evaluation (total = 60 minutes): Additional 20 minutes added to package to account for: extensive data review of recent imaging and labs including CT/PET, upper GI endoscopy report. Review chemo/radiation therapy reports from oncology. Coordinate the multi-incisional approach with assistant surgeon, anesthesia, and scrub nurse. Mark all sites. Ensure extensive equipment is available and functioning.

Positioning (total = 30 minutes): Addition 27 minutes added to package to account for padding, positioning, and securing patient to table that will adjust (eg, reverse Trendelenburg, roll, etc.) during the procedure. Also includes additional positioning for neck, chest, and abdominal incisions and accommodation of double lumen endotracheal tube, and lines near operative field.

Scrub, dress, wait (total = 15 minutes): Default to survey median of 15 minutes which is less than package time.

POST-TIME Package 9b

Total = 45 minutes: Additional 12 minutes has been added to package to account for multiple site dressings which will take more than 2 minutes; reversing excessive padding prior to transfer off table which will take more than 1 minute; post-operative notes that will take more than 5 minutes; and post-operative orders which will take more than 5 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43112

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic surgery How often? Sometimes

Specialty General surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National frequency is unknown although it is estimated that in 2016 there will be 16,910 cases of esophageal cancer. 20% of cases present in a localized fashion such that surgical resection might be considered. This leads to approximately 3000 esophageal resections maximum in total and split between all of the esophagectomy codes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 188
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Thoracic surgery Frequency 100 Percentage 53.19 %

Specialty General surgery Frequency 60 Percentage 31.91 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43112

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Global Period: 090 RUC Recommended RVU: **57.50**

CPT Descriptor: Partial esophagectomy, distal two-thirds, with thoracotomy and separate abdominal incision, with or without proximal gastrectomy; with thoracic esophagogastrostomy, with or without pyloroplasty (Ivor Lewis)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old woman presents with one month history of progressive dysphagia. Testing revealed a distal esophagogastric junction adenocarcinoma. She received neo-adjuvant chemotherapy and radiation therapy. She now undergoes surgical resection.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 57%

Description of Pre-Service Work: Within the 24 hours prior to surgery, review preadmission work-up, with attention to endoscopic and imaging information and reports including preoperative pathology and pulmonary and cardiac co-morbidities. The patient is seen and examined to rule out concurrent illness and any contraindication to surgery. Update the H&P. Meet with patient and family to review planned procedure and post-operative management. The patient and family are counseled, questions are answered, and operative consent is obtained. Preoperative orders are written. Operative site markings are performed. The surgeon dresses. The surgeon performs the team briefing (anesthesia, OR staff, house staff). The surgeon verifies that all required instruments and supplies are available. The surgeon assists in transfer of patient from cart to operating table. The surgeon waits for the institution of appropriate monitoring, vascular access, DVT prophylaxis, and induction of anesthesia with a single lumen endotracheal tube. An nasogastric tube may be placed if it passes. The surgeon then places the patient in the supine position, and preps the patient. The skin of the anterolateral chest, and abdomen is prepped from the clavicles to the pubis and laterally anterior to each mid-axillary line, after which the surgeon scrubs, gowns, and drapes the patient. The pre-incision surgical pause is completed.

Description of Intra-Service Work: Under general anesthesia through an upper midline incision, the abdomen is explored for metastatic disease and the feasibility of esophagogastric junction resection. Subcostal retractors and a liver retractor are placed to allow visualization of the esophageal hiatus. A nasogastric tube may be placed if it will pass. The mobilization of the stomach begins by widely resecting the gastrohepatic omentum until it reaches the right crus. The right crus is visualized and dissected, the peritoneum overlying the esophagogastric junction is incised followed by the dissection of the left crus of the diaphragm. It is important to handle the stomach gently and with care during the procedure. Utilizing ultrasonic coagulating shears, the greater curvature of the stomach is then mobilized by dividing the gastrocolic omentum taking great care to preserve the right gastroepiploic artery. Short gastric vessels are similarly divided with care taken to protect the spleen. A Kocher maneuver is performed mobilizing the proximal duodenum and the hepatic flexure mobilized again protecting the right gastroepiploic artery. The diaphragm anterior to the esophagus is divided. A wide en bloc dissection of the esophagus including all periesophageal tissue flush with the posterior pericardium, both parietal pleura, and the adventia of the thoracic aorta is carefully performed. Encircling the esophagus with a rubber drain may help with this dissection. Additional posterior attachments of the stomach are then divided by retracting the stomach anteriorly.

Celiac axis lymph nodes are resected with the specimen. The left gastric artery is divided flush with the celiac axis. Further dissection of the esophagus is continued under direct vision within the mediastinum to above the level of the inferior pulmonary veins. A pyloromyotomy or pyloroplasty is performed. The pylorus is covered with a remnant of omentum. A feeding jejunostomy tube may be inserted (separately reported). After careful inspection for hemostasis, the abdomen is copiously irrigated. The abdominal incision is then closed in multiple layers. Sterile dressings are applied to the incision

The entire surgical field is taken down with care to maintain sterility of the surgical equipment and instrumentation for the thoracic portion of the procedure. The single lumen endotracheal tube is changed to a double lumen endotracheal tube for eventual one lung anesthesia. The patient's position is then changed to the left lateral decubitus position. Correct positioning of the double-lumen endotracheal tube assured bronchoscopically. The skin of the right chest wall is prepared. The surgeon the rescrubs, gowns and drapes the patient. A second pre-incision surgical pause is completed. Single lung ventilation is instituted. A right posterolateral thoracotomy is performed dividing extrathoracic muscles with electrocautery for hemostasis and resecting a 1 cm segment of the 5th rib posteriorly to facilitate spreading of the ribs. The chest is explored. The right lung and mediastinum are carefully palpated to assess for metastatic cancer and any unsuspected pulmonary nodules. The right lung is carefully retracted anteriorly while blood pressure is monitored. The inferior pulmonary ligament is divided. The mediastinal pleura overlying the esophagus is divided and resected up to the level of the azygos vein. The azygos vein is divided and the mediastinal pleura opened to the level of the thoracic inlet. A mediastinal lymphadenectomy may be performed (separately reported). Utilizing the ultrasonic coagulating sheers, electrocautery, and blunt dissection, the esophagus and periesophageal tissues are carefully circumferentially mobilized from the diaphragm to just below the thoracic inlet. A rubber drain placed around the esophagus may aid in esophageal traction and exposure. The vagus nerve is divided above the level of the azygos vein with care taken to protect the right recurrent laryngeal nerve. Care is taken to avoid injury to the membranous portions of the trachea, bronchi, thoracic aorta, thoracic duct, and the recurrent laryngeal nerves. The esophagus is divided above the level of the azygos vein. The proximal esophageal margin is sent to frozen section pathology to confirm it is free of tumor. The distal esophagus and stomach are then carefully brought into the chest maintaining proper orientation in order to avoid twisting of the stomach. The esophagogastric junction is widely resected and a gastric tube approximately 5 cm in diameter is created utilizing multiple firings of a linear ending proximal to the pylorus. The gastroesophageal junction and juxtaposed tumor are resected with grossly free margins. The longitudinal staple line is over sewn with running suture. The resected gastric margin is evaluated by frozen section pathology to confirm it is free of tumor. A side-to-side esophagogastric anastomosis is created utilizing the endoscopic linear stapling device for the posterior portion of the anastomosis. Prior to completing the anterior portion of the anastomosis, a nasogastric tube is placed under direct visualization. The anterior portion of the anastomosis is then completed with an inner layer of absorbable suture and an outer layer of interrupted permanent suture. The esophagogastric conduit is carefully placed in the mediastinum and secured in place with interrupted suture. The chest is carefully evaluated for hemostasis and irrigated. Two chest tubes are placed and connected to an appropriate drainage device. The right lung re-expanded. The ribs are carefully re-approximated with pericostal sutures and the chest incision closed in multiple layers of absorbable suture. Sterile dressings are applied.

Description of Post-Service Work:
Hospital: The patient is returned to the supine position. Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to cart. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes, drains and other devices. Write immediate postoperative orders. Write brief operative note and place in chart. Discuss procedure and outcome with family. Dictate final operative report and copy referring physician(s). Review post-operative chest x-ray and labs. Write orders for transferring patient to appropriate surgical floor and discuss ongoing care with floor nurses. On a daily basis and at other times as necessary, examine patient, including reviewing vital signs, respiratory status, and gastrointestinal status, and confirming as necessary. Auscultate heart and lungs. Monitor status of incisions and drains looking for signs of infection. Manage wound dressings. Continue prophylaxis for DVT. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status, renal function, and nutritional status. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, nutrition, and patient activity. Chart patient progress notes, daily. Review labs and x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. NPO, intravenous, and/or tube feedings). Carefully assess and monitor postoperative nutritional status as maintained by both intravenous and enteral feedings. Obtain and evaluate postoperative barium esophagram to document anastomotic healing and satisfactory emptying of intrathoracic stomach. Advance diet, as appropriate. Discuss in detail post-esophagogastrectomy dietary restrictions for the post-operative period (e.g. liquid, post-gastrectomy, and/or mechanical soft and eventual post-esophagogastrectomy anti-dumping diets and their duration). Write orders for follow-up, post-discharge labs, x-rays, home care, tube feedings, and

physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is no evidence of infection, return of bowel function, adequate nutritional intake, and pain is adequately controlled, and majority of drains removed. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, insurance forms, and correspondence with all necessary providers.

Office:Talk with and examine patient, assess ease of swallowing and pulmonary function. Remove dressings, sutures, and remaining drains when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by review of calorie counts and patient dietary logs and recording patient's weight. If utilized, adjust tube feedings as necessary. When utilized, eventually remove feeding jejunostomy tube when appropriate. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

Time Segment (Mean)

Overall intensity/complexity	0.44	0.20

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background: 43107, 43112, 43117, 43286, 43287, 43288

In October 2015, the CPT Editorial Panel created three new codes 43286, 43287, 43288 to report esophagectomy via laparoscopic and thoracoscopic approaches, and made an editorial revision to code 43112. Following the CPT meeting, during Panel minutes review, the vignettes for the new codes were altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the Panel and tried to correct the vignettes prior to surveying the codes; however, the Panel maintained the altered vignettes.

The STS, AATS, SAGES and ACS conducted a survey and found that a significant number of respondents did not agree that the vignette described the typical patient. The respondents noted that their typical patient underwent neoadjuvant chemotherapy and radiation therapy prior to surgery. At the February 2016 RUC meeting, the societies submitted a letter to the RUC indicating that we believed the survey was flawed and the codes should be re-surveyed with the appropriate vignette. We additionally asked that the three open codes be added to the survey process since it became apparent that there have been substantial changes in the patient population and technology related to patients undergoing open esophagectomy.

The RUC agreed with the specialty societies and recommended:

- The CPT Editorial Panel table new codes 43286, 43287, 43288 until CPT 2018;
- The specialty societies go to the Research Subcommittee to obtain approval for typical patients for all six codes; and
- The specialty societies survey all six codes for the October 2016 RUC meeting.

At the RUC April 2016 RUC meeting, we provided vignettes for all six codes to the Research Subcommittee for review. We also provided supporting information including "*NCCN Clinical Practice Guidelines in Oncology for Esophageal and Esophagogastric Junction Cancers Version 3 (2015)*" and "*Minimally Invasive vs. Open Esophagectomy for Esophageal Cancer: A Comparison of Early Surgical Outcomes from the Society of Thoracic Surgeons National Database"* (Ann Thorac Surg. April 2016).

The Research Subcommittee accepted the proposed vignettes. The STS, AATS, SAGES and ACS conducted a survey for all six codes. For this survey, we included the newly approved language in the outgoing email and in the survey that asked the surgeons to only respond to questions for survey code(s) that they have experience performing or are familiar with.

For the three new codes that were previously surveyed with the faulty vignettes and not presented to the RUC, we have provided the summary data in the RUC summary spreadsheet identified as "SVY-10/15".

For codes 43107, 43112, and 43117 last surveyed during the second 5-year review in 2000, we believe compelling evidence supports an increase in work RVUs.

Compelling Evidence: 43107, 43112, 43117

Background for the 2nd 5-year review in 2000

The second 5-year review in 2000 was complex for many reasons including compression of the fee schedule (ie, the top end of the wRVU scale was compressed) and the large number of codes being reviewed simultaneously by both general surgery (320 codes) and cardiothoracic surgery (90 codes). Additional issues included a circular reference service list for the cardiothoracic codes compounded by compelling evidence issues and the use of mini surveys, which further complicated the review of the general thoracic surgery codes at that time. Unfortunately, due to the complexity of that survey process for so many codes at one time, code 43117 was one of three codes that were surveyed with a circular reference service list (ie, codes that were being surveyed were included on the reference service list) that was not reconciled by the RUC. When the adult and congenital cardiac codes met compelling evidence during the August 2000 Workgroup review, the flawed survey methodology was overcome by using a methodology that cross walked and developed the values related to a then recently reviewed and valued cardiac code. Since the general thoracic surgery codes did not initially meet compelling evidence, the original surveys with the circular references were not addressed. Instead, the original surveys for the three codes, including 43117 were approved after compelling evidence was presented and accepted by the RUC at the October 2000 RUC meeting. In addition, the RUC agreed that the STS could re-survey 9 additional general thoracic codes as part of the 2000 5-year review and present those codes to the RUC at the Feb. 2001 RUC meeting. Those three approved codes, which included 43117, were then used on the reference service list for the 9 code survey before CMS validation, at the newly approved wRVUs from October (40 wRVU for 43117). The 9 code survey included 43107 and 43112. The end result was potential perpetuation of the flawed value of 43117 because 43117 was chosen as the key reference for 43107 and 43112 on the additional survey. In addition, the limited range of the entire physician fee schedule (PFS) in 2000 was an additional challenge with the RSL and review. There were only 48 codes (out of 7,000) with a wRVU above 40 and most of these codes were replantation procedures or skull-base surgical procedures that were rarely performed. In fact, the highest wRVU on the STS 2000 survey RSL where code 43117 was valued was 34.79. This made review and comparison of a procedure with significant intra-time and significant post-operative work (ie, 43117) difficult because the available codes for the RSL didn't compare. Subsequently, for the 2001 STS survey RSL where codes 43107 and 43112 were valued the highest wRVU was a general surgery code with a wRVU of 48.00.

Compelling Evidence

The specialty societies have identified three points that support compelling evidence: flawed survey methodology, rank order anomaly, and a change in work since the last survey review in 2000.

Flawed Methodology

The flawed survey methodology is best summarized as utilization of an inappropriate circular RSL when code 43117 was reviewed in 2000, where the codes that were being surveyed, were also included in the RSL. For the 2000 review of 43117, the RSL utilized was also inadequate to capture the significant work of 43117 because the RSL code with the highest wRVU was much less work than required for 43117. This made it impossible for both the survey respondents and RUC to judge work using magnitude estimation (ie, how much "higher" than the top of a reference scale is appropriate for "significantly more" work than the top code on the scale). Then, the following meeting, for the survey of 43107 and 43112, code 43117 was included in the RSL and was chosen as the key reference for both codes. The end result was perpetuation of the flawed value of 43117. The limited range of the entire physician fee schedule (PFS) during the second 5-year review in 2000 was an additional challenge. The highest valued code on the STS RSL for the survey for 43117 was a Harvard valued code that had a wRVU of 34.79. As evidenced by a general understanding of the complexity of these procedures, the RUC still provided a valuation for 43117 that eclipsed the wRVU of the RSL at 40. However, the effect of this upper-end compression of the fee schedule on the valuation of 43117 was clear and it created a scenario for misvaluation of 43107 and 43112 as they were crosswalked to 43117 the following year.

Incidentally, the code with the highest value on the RSL in 2000 with the wRVU of 34.79 has since been RUC reviewed revalued and is now valued at 59.00 wRVUs. The table titled *Tab 6 - PFS Rank Order Comparison Table* demonstrates the effect of compression reflected in the current valuation of these three open esophagectomy procedures (highlighted in orange) are clear outliers in valuation of procedures with significant intra-operative time and significant post-operative work. Therefore, the elements of a circular and unvalidated RSL and significant wRVU compression in the PFS during the review in 2000 applied by the limitations of the coding hierarchy at the time of the second 5-year review generated a flawed survey process.

Rank order anomaly

Due in large part to the flawed survey methodology described above, there now exists a rank order anomaly for codes 43107, 43112, 43117 with all other 90-day global procedures that have significant intra-time and significant post-operative work. For example, 43117, a procedure that requires both a large thoracotomy incision and a laparotomy is valued less than 43107, a procedure that requires a laparotomy and a neck incision. In addition, 43112, a procedure that requires three incisions including a thoracotomy, laparotomy, and a neck incision, is valued less than 43121, a procedure that necessitates only at thoracotomy incision. Therefore, rank order anomaly, recognized by the RUC and CMS as a source for compelling evidence is demonstrated for all codes 43107, 43112, and 43117.

Change in work

As a result of changes in technology, there has been a dramatic change in total physician work, especially the postoperative management. Over the last 15 years, we have seen advances in technology that allow patients with early stage esophageal cancer to undergo Endoscopic Mucosal Resection (EMR), thereby avoiding major surgical resection. This change in disease management has led to a downward shift in patients undergoing esophagectomy. EMR is now the preferred treatment for patients with Barrett's esophagus with high-grade dysplasia, T1a invasive cancers, and increasingly some T1b invasive cancers. Therefore, patients with Stage 0, Stage 1A, and now even Stage 1B avoid major resection leaving only patients with locally advanced cancers. As a result, the majority of patients undergoing esophagectomy have T2 or greater disease, where this was not the case during the review in 2000. Studies published utilizing the SEER database[1] and National Cancer Database[2] support that patients who now undergo esophageal resection require more complex total care than patient cohorts at the time of the prior survey as they are genuinely sicker patients coming into the surgery, resulting in higher level of post-operative visits.

In summary, during the last review of these codes, an inappropriate circular RSL and an RSL that was significantly impacted by inadequate codes with wRVUs to use as comparators (ie, compression) created a flawed survey methodology. This flawed methodology perpetuated inappropriate valuation and has created rank anomalies for these three codes when compared with other codes in the fee schedule that include significant work. In addition, advancement in technology over the last 15 years has significantly changed the total physician work, most significantly the post-operative work, for codes 43107, 43112, 43117.

Recommendation for 43117

We recommend the survey 25th percentile work RVU of 57.50 for code 43117.

PRE-TIME Package 4

Evaluation (total = 60 minutes): Additional 20 minutes added to package to account for: extensive data review of recent imaging and labs including CT/PET, upper GI endoscopy report. Review chemo/radiation therapy reports from oncology. Coordinate the multi-incisional approach with assistant surgeon, anesthesia, and scrub nurse. Mark all sites. Ensure extensive equipment is available and functioning.

Positioning (total = 30 minutes): Addition 27 minutes added to package to account for padding, positioning, and securing patient to table that will adjust (eg, reverse Trendelenburg) during the procedure. Also includes additional positioning for neck, chest, and abdominal incisions and accommodation of double lumen endotracheal tube, and lines near operative field.

Scrub, dress, wait (total = 15 minutes): Default to survey median of 15 minutes which is less than package time.

POST-TIME Package 9b

Total = 45 minutes: Additional 12 minutes has been added to package to account for multiple site dressings which will take more than 2 minutes; reversing excessive padding prior to transfer off table which will take more than 1 minute; post-operative notes that will take more than 5 minutes; and post-operative orders which will take more than 5 minutes.

Critical Care

The 2016 survey data shows that 2 critical care visits (99291) are now inherent in postoperative care for code 43117, which is a change from the current inputs from 2000. As indicated, data from the SEER database[1] and National Cancer Database[2] support that patients who now undergo esophageal resection require more complex total care than patient cohorts at the time of the prior survey as they are genuinely sicker patients. This is reflected in the change in critical care visit from 1 to 2 for 43117 and the shift to higher level postoperative visits for the other open codes.

Patient's who have an Ivor Lewis esophageal resection typically spend 5 – 6 hours under general anesthesia. These patients are in critical condition after this physiologically hostile procedure that involves invasion and disruption of the organs and structures in the chest and abdominal cavities including resection of the esophagus and the stomach. The surgeon must manage the functions of one or more vital organ systems during the immediate post operative period to assess, and manipulate recovery after surgery to prevent deterioration in the patient's condition.

The operating surgeon is best positioned to understand the nuances of postoperative care for these complex patients in the ICU and will take the lead in patient management which includes but is not limited to the following: These patients have significant 3rd spacing fluid changes in the first 48 to 72 hours and are at risk of vocal cord paresis, or paralysis. The patient's are at risk for mediastinal bleeding and the anastomotic sites must be closely managed and monitored for leakage. They also have a higher than usual need for blood transfusion. They need aggressive pulmonary care for secretion control to prevent atelectasis and in turn pneumonia. They need careful monitoring of their blood pressure and urine output. Management of NG tube or other issues that limits the patient's ability to cough early on is also imperative. Pain management of the thoracotomy and laparotomy is also required. These patient's have two chest tubes in the right chest, an epidural catheter for pain control and Foley catheter for strict in and out monitoring, an arterial line for blood pressure monitoring.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43117

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic surgery How often? Sometimes

Specialty General surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is unknown although it is estimated that in 2016 there will be 16,910 cases of esophageal cancer. 20% of cases present in a localized fashion such that surgical resection might be considered. This leads to approximately 3000 esophageal resections maximum in total and split between all of the esophagectomy codes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 705
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Thoracic surgery Frequency 400 Percentage 56.73 %

Specialty General surgery Frequency 200 Percentage 28.36 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43117

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION

CPT Code:43286 Tracking Number G1 Original Specialty Recommended RVU: **55.00**
Presented Recommended RVU: **55.00**
Global Period: 090 RUC Recommended RVU: **55.00**

CPT Descriptor: Esophagectomy, total or near total, with laparoscopic mobilization of the abdominal and mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, laparoscopic transhiatal esophagectomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old man presents with a history that includes gastroesophageal reflux, progressive dysphagia and testing that revealed a distal esophageal adenocarcinoma arising within long segment Barrett's esophagus with multifocal high-grade dysplasia. He undergoes esophageal resection and reconstruction.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 50%

Description of Pre-Service Work: Within the 24 hours prior to surgery, review preadmission work-up, with attention to endoscopic and imaging information and reports including preoperative pathology and pulmonary and cardiac co-morbidities. The patient is seen and examined to rule out concurrent illness and any contraindication to surgery. Update the H&P. Meet with patient and family to review planned procedure and post-operative management. The patient and family are counseled, questions are answered, and operative consent is obtained. Preoperative orders are written. Operative site markings are performed. The surgeon dresses. The surgeon performs the team briefing (anesthesia, OR staff, house staff). The surgeon verifies that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. The surgeon assists in transfer of patient from cart to operating table. The surgeon waits for the institution of appropriate monitoring, vascular access, DVT prophylaxis, and induction of anesthesia. The surgeon then places the patient in a modified lithotomy position with additional special positioning of the neck and arms is required. The skin of the neck, anterolateral chest, and abdomen is prepped from the lower ears to the pubis and laterally to each mid-axillary line, after which the surgeon scrubs, gowns, and drapes the patient. The surgeon then assures that: 1) all equipment necessary for laparoscopy (laparoscopes, fiberoptic light cord, video camera, cautery cord, etc.) is placed in the field, assembled, and fixed to the drapes; 2) the ends of the camera, light, and cautery cords are passed off in sterile fashion to the circulating nurse for attachment of light, video and cautery equipment; 3) the equipment is activated and the settings adjusted appropriately (focus, light settings, cautery settings). The pre-incision surgical pause is completed.

Description of Intra-Service Work: Under general anesthesia, an orogastric tube may be placed to decompress the stomach if it will pass. Surgical laparoscopy is performed. Utilizing local infiltrative anesthetic, pneumoperitoneum is established to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are carefully monitored so as not to impair ventilation or decrease venous return. Utilizing local infiltrative anesthetic, in total, four to six 5-mm to 12-mm trocars are inserted through the anterior abdominal wall. The abdominal cavity and viscera are inspected to rule out metastatic disease. A liver retractor is inserted and the liver retracted to allow visualization of the esophageal hiatus. The mobilization of the stomach begins by widely resecting the gastrohepatic omentum until it reaches the right crus. The right crus is visualized, the phrenoesophageal membrane is incised and dissected followed by the dissection of the left crus of

the diaphragm. It is important to handle the stomach gently and with extreme care during the procedure. The greater curvature of the stomach is then mobilized by dividing the short gastric vessels with the ultrasonic coagulating shears. Care is taken to protect the spleen. The gastrocolic omentum is then divided with care taken to preserve the right gastroepiploic artery. A Kocher maneuver is performed mobilizing the proximal duodenum. The posterior attachments of the stomach are then divided by retracting the stomach anteriorly. Celiac axis lymph nodes are resected with the specimen. The left gastric artery is divided with an endovascular stapling device. An endoscopic pyloroplasty is performed in a Heineke-Mikulicz fashion. The pylorus is incised longitudinally and then closed transversely with interrupted sutures. The pyloroplasty is covered with a remnant of omentum . Transhiatal dissection of the esophagus is then performed. The diaphragm anterior to the esophagus is divided, and a circumferential dissection of the esophagus to above the level of the carina performed. Care is taken to avoid opening the pleura. A gastric tube approximately 5 cm in diameter is then created utilizing multiple firings of the linear endoscopic stapler starting just proximal to the pyloroplasty. The gastroesophageal junction and juxtaposed tumor are resected with grossly free margins. The longitudinal staple line is over sewn with running suture. The tubularized gastric conduit is then secured to the proximal stomach remnant with interrupted suture. A laparoscopic feeding jejunostomy tube may be inserted (separately reported). The abdomen is inspected to be sure hemostasis is adequate. The pneumoperitoneum is deflated. Attention is turned to the left neck, where an incision is made along the anterior border of the sternocleidomastoid muscle. The sternocleidomastoid muscle and underlying carotid sheath and its contents are retracted to the left, carefully avoiding undue compression on the carotid artery. The neck strap muscles are divided. The trachea and thyroid gland are retracted to the right, carefully avoiding pressure on the tracheoesophageal groove and injury to the left recurrent laryngeal nerve. The middle thyroid vein and inferior thyroid artery are identified, ligated and divided, and the underlying cervical esophagus identified. Carefully avoiding injury to the left recurrent laryngeal nerve in the tracheoesophageal groove, the cervical esophagus is encircled with a rubber drain, and the remaining high thoracic esophagus carefully bluntly dissected free within the thoracic inlet and chest and now the completely mobilized esophagus brought into the neck wound. The cervical esophagus is divided with a surgical stapler. Pneumoperitoneum is restored and under direct visualization so as not to twist the gastric conduit, the distal esophagus, proximal stomach and attached gastric conduit then gently pulled up through the mediastinum and out through the cervical incision. The resected tumor is removed through the neck incision and removed from the surgical field. Frozen section pathology confirms that the proximal esophageal and distal gastric margins are free of tumor. Hemostasis within the mediastinum is checked for. Throughout this portion of the procedure careful attention to the arterial blood pressure is mandatory. In order to perform the esophagogastric anastomosis, the tip of the stomach is grasped via the neck incision and gentle traction on the stomach is used to deliver an adequate length of the gastric conduit out the neck incision. A side-to-side esophagogastric anastomosis is created utilizing the linear stapling device for the posterior portion of the anastomosis. Prior to completing the anterior portion of the anastomosis, a nasogastric tube is placed under direct visualization. The anterior portion of the anastomosis is then completed with an inner layer of running absorbable suture and an outer layer of interrupted permanent suture. After a careful inspection for hemostasis, the neck wound is irrigated, a cervical wound drain placed, and the neck incision closed with multiple layers of absorbable suture. Attention is redirected to the abdomen where hemostasis is carefully checked for. The liver retractor and then trocars are removed under direct vision. All abdominal trocar sites are inspected for hemostasis, irrigated, and then closed with multiple layers of absorbable suture. Sterile dressings are applied to all incisions. The nasogastric tube is secured in place.

Description of Post-Service Work:
Hospital: The patient is returned to a supine position. Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to cart. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes, drains and other devices. Write immediate postoperative orders. Write brief operative note and place in chart. Discuss procedure and outcome with family. Dictate final operative report and copy referring physician(s). Review post-operative chest x-ray and labs. Write orders for transferring patient to appropriate surgical floor and discuss ongoing care with floor nurses. On a daily basis and at other times as necessary, examine patient, including reviewing vital signs, respiratory status, gastrointestinal status, and confirming as necessary. Auscultate heart and lungs. Monitor status of incisions and drains looking for signs of infection. Manage wound dressings. Continue prophylaxis for DVT. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status, renal function, and nutritional status. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, nutrition, and patient activity. Chart patient progress notes, daily. Review labs and x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. NPO, intravenous, and/or tube feedings). Carefully assess and monitor postoperative nutritional status as maintained by both intravenous and enteral feedings. Obtain and evaluate postoperative esophagram to document anastomotic healing and satisfactory emptying of intrathoracic stomach. Advance diet, as appropriate. Discuss in detail post-esophagogastrectomy dietary restrictions for the post-operative period (e.g. liquid, post-

gastrectomy, and/or mechanical soft and eventual post-esophagogastrectomy anti-dumping diets and their duration). Write orders for follow-up, post-discharge labs, x-rays, home care, tube feedings, and physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is no evidence of infection return of bowel function, adequate nutritional intake, pain is adequately controlled, and majority of drains removed. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, insurance forms, and correspondence with all necessary providers.

Office: Talk with and examine patient, assess ease of swallowing and pulmonary function. Remove dressings, sutures, and remaining drains when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by review of calorie counts and patient dietary logs and recording patient's weight. If utilized, adjust tube feedings as necessary. When utilized, eventually remove feeding jejunostomy tube when appropriate. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.50	0.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.50	0.42
Urgency of medical decision making	0.44	-0.25
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.63	1.17

Physical effort required	1.19	0.75

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.63	0.58
Outcome depends on the skill and judgment of physician	0.94	1.08
Estimated risk of malpractice suit with poor outcome	0.63	0.67

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.25	1.08

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background: 43107, 43112, 43117, 43286, 43287, 43288

In October 2015, the CPT Editorial Panel created three new codes 43286, 43287, 43288 to report esophagectomy via laparoscopic and thoracoscopic approaches, and made an editorial revision to code 43112. Following the CPT meeting, during Panel minutes review, the vignettes for the new codes were altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the Panel and tried to correct the vignettes prior to surveying the codes; however, the Panel maintained the altered vignettes.

The STS, AATS, SAGES and ACS conducted a survey and found that a significant number of respondents did not agree that the vignette described the typical patient. The respondents noted that their typical patient underwent neoadjuvant chemotherapy and radiation therapy prior to surgery. At the February 2016 RUC meeting, the societies submitted a letter to the RUC indicating that we believed the survey was flawed and the codes should be re-surveyed with the appropriate vignette. We additionally asked that the three open codes be added to the survey process since it became apparent that there have been substantial changes in the patient population and technology related to patients undergoing open esophagectomy.

The RUC agreed with the specialty societies and recommended:

- The CPT Editorial Panel table new codes 43286, 43287, 43288 until CPT 2018;
- The specialty societies go to the Research Subcommittee to obtain approval for typical patients for all six codes; and
- The specialty societies survey all six codes for the October 2016 RUC meeting.

At the RUC April 2016 RUC meeting, we provided vignettes for all six codes to the Research Subcommittee for review. We also provided supporting information including "*NCCN Clinical Practice Guidelines in Oncology for Esophageal and Esophagogastric Junction Cancers Version 3* (2015)" and "*Minimally Invasive vs. Open Esophagectomy for Esophageal Cancer: A Comparison of Early Surgical Outcomes from the Society of Thoracic Surgeons National Database*" (Ann Thorac Surg. April 2016).

The Research Subcommittee accepted the proposed vignettes. The STS, AATS, SAGES and ACS conducted a survey for all six codes. For this survey, we included the newly approved language in the outgoing email and in the survey that asked the surgeons to only respond to questions for survey code(s) that they have experience performing or are familiar with.

For the three new codes that were previously surveyed with the faulty vignettes and not presented to the RUC, we have provided the summary data in the RUC summary spreadsheet identified as "SVY-10/15".

Summary of the differences between the 10/2015 survey and 10/2016 survey of the laparoscopic/ thoracoscopic esophagectomy codes (43286, 43287, 43288):

- ***Vignettes:*** The RUC Research Subcommittee approved changes to the vignettes for codes 43287 and 43288 by adding the sentence "She received neo-adjuvant chemotherapy and radiation therapy." to both vignettes.
- ***RSL:*** Codes 43107 and 43112 were included in the 10/15 RSL, but removed from the 10/16 RSL since they were being surveyed. This resulted in a large wRVU gap (39.53 – 51.43) in the middle of the RSL where the two open codes had been removed. Two general surgery codes (43622 and 43415) were added to fill in that gap. In addition, the Research Subcommittee requested that wRVU range was inappropriate (too low and too high), so codes were removed from the lower end and the higher end.
- ***Response rate:*** There were more survey respondents for the 2016 surveys and those respondents had more experience. For example, for code 43286, the median experience in 10/2015 was zero. For the 10/2016, the median experience was 1.
- ***Survey process:*** The same survey process was used for the 2015 and 2016 surveys. The ACS sent surveys to a random sample of the membership self identified as general surgeons, the STS sent surveys to members self identified as general thoracic surgeons and SAGES sent surveys to a random sample of their membership. The surveys were not sent to the exact same lists for the 2015 and 2016 surveys; new random samples from each specialty were selected, although some of the respondents may have been the same. In addition, only the laparoscopic/thoracoscopic codes were surveyed for 10/15, however, for 10/16, the open and laparoscopic/thoracoscopic codes were surveyed together.

Recommendation for 43286

We recommend the survey 25th percentile work RVU of 55.00 for code 43286.

PRE-TIME Package 4

Evaluation (total = 60 minutes): Additional 20 minutes added to package to account for: extensive data review of recent imaging and labs including CT/PET, upper GI endoscopy report. Review chemo/radiation therapy reports from oncology. Coordinate the multi-incisional approach with assistant surgeon, anesthesia, and scrub nurse. Mark all sites. Ensure extensive equipment is available and functioning.

Positioning (total = 20 minutes): Addition 17 minutes added to package to account for padding, positioning, and securing patient to table that will adjust (eg, reverse Trendelenburg, roll, etc.) during the procedure. Also includes additional positioning for neck, chest, and abdominal incisions, and lines near operative field. Additional positioning is also necessary for endoscopy work to get monitors for all scopes into view of the surgeons.

Scrub, dress, wait (total = 20 minutes): Package time.

POST-TIME Package 9b

Total time = 60 minutes:

- Additional 12 minutes has been added to package account for multiple site dressings which will take more than 2 minutes; reversing excessive padding prior to transfer off table which will take more than 1 minute; post-operative notes that will take more than 5 minutes; and post-operative orders which will take more than 5 minutes.
- Additional 15 minutes has been added to package to account for additional immediate post-op work. For the open codes, the patient's anesthesia level is reduced after the fascia is closed and while the skin is closed and dressings applied. However, for the laparoscopic scope codes, anesthesia needs to be maintained at full level

until the last scope is pulled, intraperitoneal gas is allowed to escape and the skin is closed. This results in a longer time to monitor the patient prior to extubation and moving the patient to recovery.

Key Reference Service Comparison

CPT	Long Descriptor	RVW	IWPUT	minutes				visits

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43289, 43499, 43659

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic surgery How often? Sometimes

Specialty General surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is unknown although it is estimated that in 2016 there will be 16,910 cases of esophageal cancer. 20% of cases present in a localized fashion such that surgical resection might be considered. This leads to approximately 3000 esophageal resections maximum in total and split between all of the esophagectomy codes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

Specialty Thoracic surgery Frequency 55 Percentage 55.00 %

Specialty General surgery Frequency 35 Percentage 35.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43107

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:43287 Tracking Number G2 Original Specialty Recommended RVU: **63.00**
Presented Recommended RVU: **63.00**
Global Period: 090 RUC Recommended RVU: **63.00**

CPT Descriptor: Esophagectomy, distal two-thirds, with laparoscopic mobilization of the abdominal and lower mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with separate thoracoscopic mobilization of the middle and upper mediastinal esophagus and thoracic esophagogastrostomy (ie, laparoscopic thoracoscopic esophagectomy, Ivor Lewis esophagectomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old woman presents with one month history of progressive dysphagia. Testing revealed a distal esophagogastric junction adenocarcinoma. She received neo-adjuvant chemotherapy and radiation therapy. She now undergoes surgical resection.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 51%

Description of Pre-Service Work: Within the 24 hours prior to surgery, review preadmission work-up, with attention to endoscopic and imaging information and reports including preoperative pathology and pulmonary and cardiac co-morbidities. The patient is seen and examined to rule out concurrent illness and any contraindication to surgery. Update the H&P. Meet with patient and family to review planned procedure and post-operative management. The patient and family are counseled, questions are answered, and operative consent is obtained. Preoperative orders are written. Operative site markings are performed. The surgeon dresses. The surgeon performs the team briefing (anesthesia, OR staff, house staff). The surgeon verifies that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. The surgeon assists in transfer of patient from cart to operating table. The surgeon waits for the institution of appropriate monitoring, vascular access, DVT prophylaxis, and induction of anesthesia. The surgeon then places the patient in a modified lithotomy position, and preps the patient. The skin of the anterolateral chest, and abdomen is prepped from the clavicles to the pubis and laterally anterior to each mid-axillary line, after which the surgeon scrubs, gowns, and drapes the patient. The surgeon then assures that: 1) all equipment necessary for laparoscopy and thoracoscopy (laparoscopes, thoracoscopes, fiberoptic light cord, video camera, cautery cord, etc.) is placed in the field or available, assembled, and fixed to the drapes; 2) the ends of the camera, light, and cautery cords are passed off in sterile fashion to the circulating nurse for attachment of light and video and cautery equipment; 3) the equipment is activated and the settings adjusted appropriately (focus, light settings, cautery settings). The pre-incision surgical pause is completed.

Description of Intra-Service Work: General anesthesia utilizing a single lumen endotracheal tube is initiated. An orogastric tube may be placed to decompress the stomach if it will pass. Surgical laparoscopy is performed. Utilizing local infiltrative anesthetic, pneumoperitoneum is established to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are carefully monitored so as not to impair ventilation or decrease venous return. Utilizing local infiltrative anesthetic, in total, four to six 5-mm to 12-mm trocars are inserted through the anterior abdominal wall. The abdominal cavity and viscera are inspected to rule out metastatic disease. A liver retractor is inserted and the liver retracted to allow visualization of the esophageal hiatus. The mobilization of the stomach begins by widely resecting the

gastrohepatic omentum until it reaches the right crus. The right crus is visualized and dissected, the phrenoesophageal membrane is incised followed by the dissection of the left crus of the diaphragm. It is important to handle the stomach gently and with extreme care during the procedure. The greater curvature of the stomach is then mobilized by dividing the short gastric vessels with the ultrasonic coagulating shears. Care is taken to protect the spleen. The gastrocolic omentum is then divided with care taken to preserve the right gastroepiploic artery. A Kocher maneuver is performed mobilizing the proximal duodenum. The posterior attachments of the stomach are then divided by retracting the stomach anteriorly. Celiac axis lymph nodes are resected with the specimen. The left gastric artery is divided with an endovascular stapling device. An endoscopic pyloroplasty is performed in a Heineke-Mikulicz fashion. The pylorus is incised longitudinally and then closed transversely with interrupted sutures. The pyloroplasty is covered with a remnant of omentum. Transhiatal dissection of the lower esophagus is then performed. The diaphragm anterior to the esophagus is divided, and a circumferential dissection of the esophagus to about the level of the inferior pulmonary vein is performed. Care is taken to avoid opening the pleura. A gastric tube approximately 5 cm in diameter is then created utilizing multiple firings of the linear endoscopic stapler starting just proximal to the pyloroplasty. The gastroesophageal junction and juxtaposed tumor are resected with grossly free margins. The longitudinal staple line is over sewn with running suture. The tubularized gastric conduit is then secured to the proximal stomach remnant with interrupted suture. A laparoscopic feeding jejunostomy tube may be inserted (separately reported). The abdomen is inspected to be sure hemostasis is adequate. Hemostasis is again checked for. The liver retractor is removed under direct vision. All abdominal trocars are removed under direct vision. All abdominal trocar sites are inspected for hemostasis, irrigated, and then closed with multiple layers of absorbable suture. Sterile dressings are applied to the abdominal incision.

The entire surgical field is taken down with care to maintain sterility of the surgical equipment and instrumentation for the thoracic portion of the procedure. The single lumen endotracheal tube is changed to a double lumen endotracheal tube for eventual one lung anesthesia. The patient's position is then changed to the left lateral decubitus position. Correct positioning of the double-lumen endotracheal tube assured bronchoscopically. The skin of the right chest wall is prepared. The surgeon the rescrubs, gowns and drapes the patient. The surgeon then assures that: 1) all equipment necessary for thoracoscopy (thoracoscopes, fiberoptic light cord, video camera, cautery cord, etc.) is placed in the field, assembled, and fixed to the drapes; 2) the ends of the camera, light, and cautery cords are passed off in sterile fashion to the circulating nurse for attachment of light and video and cautery equipment; 3) the equipment is activated and the settings adjusted appropriately (focus, light settings, cautery settings). The second pre-incision surgical pause is completed. Single-lung ventilation is instituted. Utilizing local infiltrative anesthetic, a total of four or five 5-mm to 10-mm trocars are utilized. A retracting suture is placed through the central tendon of the diaphragm and brought out through the lower chest wall through a 1-mm skin incision. This helps with downward traction on the diaphragm and exposure of the distal esophagus. The inferior pulmonary ligament of the lung is divided. The mediastinal pleura overlying the esophagus is divided and opened up to the level of the azygos vein. The azygos vein is mobilized and divided with an endovascular stapling device. A mediastinal lymphadenectomy may be performed (separately reported). Utilizing the ultrasonic coagulating sheers, electrocautery, and blunt dissection, the esophagus, periesophageal tissue and periesophageal lymph nodes are carefully circumferentially mobilized from the diaphragm to above the level of the azygos vein. The vagus nerve is divided above the level of the azygos vein with care taken to protect the recurrent laryngeal nerve. A rubber drain placed around the esophagus may aid in esophageal traction and exposure. Care is taken to avoid injury to the membranous portions of the trachea, bronchi, thoracic aorta, thoracic duct, and the recurrent laryngeal nerves. The esophagus is divided above the level of the azygos vein. The proximal esophageal margin is sent to frozen section pathology to confirm it is free of tumor. The distal esophagus and gastric conduit are then carefully brought into the chest maintaining proper orientation in order to avoid twisting of the gastric conduit. The eighth interspace thoracoscopic port is enlarged, a wound protector placed, and the specimen removed. The gastric margin is evaluated by frozen section pathology to confirm it is free of tumor. A side-to-side esophagogastric anastomosis is created utilizing the endoscopic linear stapling device for the posterior portion of the anastomosis. Prior to completing the anterior portion of the anastomosis, a nasogastric tube is placed under direct visualization. The anterior portion of the anastomosis is then completed with an inner layer of absorbable suture and an outer layer of interrupted permanent suture. The chest is carefully evaluated for hemostasis and irrigated. Two chest tubes are placed and connected to an appropriate drainage device. A large soft drain is placed posterior to the anastomosis and brought out the lower chest wall. All trocars are removed and hemostasis assured. The lung is expanded under direct vision. All trocar site wounds are irrigated and closed with multiple layers of absorbable suture. Sterile dressings are applied to the chest incision and chest tube sites. The nasogastric tube is secured in place.

Description of Post-Service Work:
Hospital: The patient is returned to the supine position. Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to cart. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff

including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes, drains and other devices. Write immediate postoperative orders. Write brief operative note and place in chart. Discuss procedure and outcome with family. Dictate final operative report and copy referring physician(s). Review post-operative chest x-ray and labs. Write orders for transferring patient to appropriate surgical floor and discuss ongoing care with floor nurses. On a daily basis and at other times as necessary, examine patient, including reviewing vital signs, respiratory status, and gastrointestinal status, and confirming as necessary. Auscultate heart and lungs. Monitor status of incisions and drains looking for signs of infection. Manage wound dressings. Continue prophylaxis for DVT. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status, renal function, and nutritional status. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, nutrition, and patient activity. Chart patient progress notes, daily. Review labs and x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. NPO, intravenous, and/or tube feedings). Carefully assess and monitor postoperative nutritional status as maintained by both intravenous and enteral feedings. Obtain and evaluate postoperative barium esophagram to document anastomotic healing and satisfactory emptying of intrathoracic stomach. Advance diet, as appropriate. Discuss in detail post-esophagogastrectomy dietary restrictions for the post-operative period (e.g. liquid, post-gastrectomy, and/or mechanical soft and eventual post-esophagogastrectomy anti-dumping diets and their duration). Write orders for follow-up, post-discharge labs, x-rays, home care, tube feedings, and physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is no evidence of infection return of bowel function, adequate nutritional intake, and pain is adequately controlled, and majority of drains removed. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, insurance forms, and correspondence with all necessary providers.

Office: Talk with and examine patient, assess ease of swallowing and pulmonary function. Remove dressings, sutures, and remaining drains when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by review of calorie counts and patient dietary logs and recording patient's weight. If utilized, adjust tube feedings as necessary. Eventually remove feeding jejunostomy tube when utilized and when appropriate. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.12	0.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.29	0.57
Urgency of medical decision making	0.29	0.36
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.18	1.43

Physical effort required	0.71	1.14

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.00	0.71
Outcome depends on the skill and judgment of physician	0.82	0.79
Estimated risk of malpractice suit with poor outcome	0.06	0.71

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.65	1.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background: 43107, 43112, 43117, 43286, 43287, 43288

In October 2015, the CPT Editorial Panel created three new codes 43286, 43287, 43288 to report esophagectomy via laparoscopic and thoracoscopic approaches, and made an editorial revision to code 43112. Following the CPT meeting, during Panel minutes review, the vignettes for the new codes were altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the Panel and tried to correct the vignettes prior to surveying the codes; however, the Panel maintained the altered vignettes.

The STS, AATS, SAGES and ACS conducted a survey and found that a significant number of respondents did not agree that the vignette described the typical patient. The respondents noted that their typical patient underwent neoadjuvant chemotherapy and radiation therapy prior to surgery. At the February 2016 RUC meeting, the societies submitted a letter to the RUC indicating that we believed the survey was flawed and the codes should be re-surveyed with the appropriate vignette. We additionally asked that the three open codes be added to the survey process since it became apparent that there have been substantial changes in the patient population and technology related to patients undergoing open esophagectomy.

The RUC agreed with the specialty societies and recommended:

- The CPT Editorial Panel table new codes 43286, 43287, 43288 until CPT 2018;
- The specialty societies go to the Research Subcommittee to obtain approval for typical patients for all six codes; and
- The specialty societies survey all six codes for the October 2016 RUC meeting.

At the RUC April 2016 RUC meeting, we provided vignettes for all six codes to the Research Subcommittee for review. We also provided supporting information including "*NCCN Clinical Practice Guidelines in Oncology for Esophageal and Esophagogastric Junction Cancers Version 3(2015)*" and "*Minimally Invasive vs. Open Esophagectomy for Esophageal Cancer: A Comparison of Early Surgical Outcomes from the Society of Thoracic Surgeons National Database"* (Ann Thorac Surg. April 2016).

The Research Subcommittee accepted the proposed vignettes. The STS, AATS, SAGES and ACS conducted a survey for all six codes. For this survey, we included the newly approved language in the outgoing email and in the survey that asked the surgeons to only respond to questions for survey code(s) that they have experience performing or are familiar with.

For the three new codes that were previously surveyed with the faulty vignettes and not presented to the RUC, we have provided the summary data in the RUC summary spreadsheet identified as "SVY-10/15".

Summary of the differences between the 10/2015 survey and 10/2016 survey of the laparoscopic/ thoracoscopic esophagectomy codes (43286, 43287, 43288):

- ***Vignettes:*** The RUC Research Subcommittee approved changes to the vignettes for codes 43287 and 43288 by adding the sentence "She received neo-adjuvant chemotherapy and radiation therapy." to both vignettes.
- ***RSL:*** Codes 43107 and 43112 were included in the 10/15 RSL, but removed from the 10/16 RSL since they were being surveyed. This resulted in a large wRVU gap (39.53 – 51.43) in the middle of the RSL where the two open codes had been removed. Two general surgery codes (43622 and 43415) were added to fill in that gap. In addition, the Research Subcommittee requested that wRVU range was inappropriate (too low and too high), so codes were removed from the lower end and the higher end.
- ***Response rate:*** There were more survey respondents for the 2016 surveys and those respondents had more experience. For example, for code 43286, the median experience in 10/2015 was zero. For the 10/2016, the median experience was 1.
- ***Survey process:*** The same survey process was used for the 2015 and 2016 surveys. The ACS sent surveys to a random sample of the membership self identified as general surgeons, the STS sent surveys to members self identified as general thoracic surgeons and SAGES sent surveys to a random sample of their membership. The surveys were not sent to the exact same lists for the 2015 and 2016 surveys; new random samples from each specialty were selected, although some of the respondents may have been the same. In addition, only the laparoscopic/thoracoscopic codes were surveyed for 10/15, however, for 10/16, the open and laparoscopic/thoracoscopic codes were surveyed together.

Recommendation for 43287

We recommend the survey 25th percentile work RVU of 63.00 for code 43287.

PRE-TIME Package 4

Evaluation (total = 60 minutes): Additional 20 minutes added to package to account for: extensive data review of recent imaging and labs including CT/PET, upper GI endoscopy report. Review chemo/radiation therapy reports from oncology. Coordinate the multi-incisional approach with assistant surgeon, anesthesia, and scrub nurse. Mark all sites. Ensure extensive equipment is available and functioning.

Positioning (total = 30 minutes): Addition 27 minutes added to package to account for padding, positioning, and securing patient to table that will adjust (eg, reverse Trendelenburg, roll, etc.) during the procedure. Also includes additional positioning for neck, chest, and abdominal incisions and accommodation of double lumen endotracheal tube, and lines near operative field. Additional positioning is also necessary for endoscopy work to get monitors for all scopes into view of the surgeons.

Scrub, dress, wait (total = 20 minutes): Package time.

POST-TIME Package 9b

Total time = 60 minutes:

- Additional 12 minutes has been added to package account for multiple site dressings which will take more than 2 minutes; reversing excessive padding prior to transfer off table which will take more than 1 minute; post-operative notes that will take more than 5 minutes; and post-operative orders which will take more than 5 minutes.
- Additional 15 minutes has been added to package to account for additional immediate post-op work. For the open codes, the patient's anesthesia level is reduced after the fascia is closed and while the skin is closed and

dressings applied. However, for the scope codes, anesthesia needs to be maintained at full level until the last laparoscope/thoracoscope is pulled, intraperitoneal gas is allowed to escape and the skin is closed. This results in a longer time to monitor the patient prior to extubation and moving the patient to recovery.

Comparison to Other Complex/Intense Procedures

The table below places the recommendations for the survey codes and key reference codes in work RVU order relative to other similarly intense and complex procedures that include significant intraoperative time and significant postoperative work. This table clearly shows that the recommendations are aligned correctly and are appropriately bracketed by the key reference codes.

CPT	Long Descriptor	RVW	IWPUT	minutes				visits			
				Total	PRE	INTRA	POST	ICU	INPT	DCHG	OV

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43289, 43499, 43659

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic surgery How often? Sometimes

Specialty General surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. National frequency is unknown although it is estimated that in 2016 there will be 16,910 cases of esophageal cancer. 20% of cases present in a localized fashion such that surgical resection might be considered. This leads to approximately 3000 esophageal resections maximum in total and split between all of the esophagectomy codes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 300
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

Specialty Thoracic surgery Frequency 175 Percentage 58.33 %

Specialty General surgery Frequency 100 Percentage 33.33 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43117

SUMMARY OF RECOMMENDATION

CPT Code:43288 Tracking Number G3 Original Specialty Recommended RVU: **66.42**
Presented Recommended RVU: **66.42**
Global Period: 090 RUC Recommended RVU: **66.42**

CPT Descriptor: Esophagectomy, total or near total, with thoracoscopic mobilization of the upper, middle, and lower mediastinal esophagus, with separate laparoscopic proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, thoracoscopic, laparoscopic and cervical incision esophagectomy, McKeown esophagectomy, tri-incisional esophagectomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old man presents with progressive dysphagia. Testing revealed a mid-esophageal adenocarcinoma above the level of the carina. He received neoadjuvant chemotherapy and radiation therapy. He now undergoes surgical resection.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 53%

Description of Pre-Service Work: Within the 24 hours prior to surgery, review preadmission work-up, with attention to endoscopic and imaging information and reports including preoperative pathology and pulmonary and cardiac co-morbidities. The patient is seen and examined to rule out concurrent illness and any contraindication to surgery. Update the H&P. Meet with patient and family to review planned procedure and post-operative management. The patient and family are counseled, questions are answered, and operative consent is obtained. Preoperative orders are written. Operative site markings are performed. The surgeon dresses. The surgeon performs the team briefing (anesthesia, OR staff, house staff). The surgeon verifies that all required instruments and supplies are available, including reusable and disposable laparoscopic equipment. The surgeon assists in transfer of patient from cart to operating table. The surgeon waits for the institution of appropriate monitoring, vascular access, DVT prophylaxis, and induction of anesthesia with a double lumen endotracheal tube. The surgeon then places the patient in a left lateral decubitus position. Correct positioning of the double lumen endotracheal tube is assured bronchoscopically. The skin of the right lateral chest wall is prepared after which the surgeon scrubs, gowns, and drapes the patient. The surgeon then assures that: 1) all equipment necessary for thoracoscopy and laparoscopy (thoracoscopes, laparoscopes, fiberoptic light cord, video camera, cautery cord, etc.) is available or appropriately placed in the field, assembled, and fixed to the drapes; 2) the ends of the camera, light, and cautery cords are passed off in sterile fashion to the circulating nurse for attachment of light and video and cautery equipment; 3) the equipment is activated and the settings adjusted appropriately (focus, light settings, cautery settings). The pre-incision surgical pause is completed.

Description of Intra-Service Work: Under general anesthesia, single-lung ventilation is instituted. An orogastric tube may be placed to decompress the stomach if it will pass. Utilizing local infiltrative anesthetic, a total of four or five 5-mm to 10-mm trocars are utilized across the right chest wall. A retracting suture is placed through the central tendon of the diaphragm and brought out through the lower chest wall through a 1-mm skin incision. This helps with downward traction on the diaphragm and exposure of the distal esophagus. The inferior pulmonary ligament of the lung is divided. The mediastinal pleura overlying the esophagus is divided and opened up to the level of the azygos vein. The azygos vein is

mobilized and divided with an endovascular stapling device. A mediastinal lymphadenectomy may be performed (separately reported). Utilizing the ultrasonic coagulating sheers, electrocautery, and blunt dissection, the esophagus, periesophageal tissue and periesophageal lymph nodes are carefully circumferentially mobilized from the diaphragm to well above the level of the azygos vein. The vagus nerve is divided above the level of the azygos vein with care taken to protect the right recurrent laryngeal nerve. A rubber drain placed around the esophagus may aid in esophageal traction and exposure. Care is taken to avoid injury to the membranous portions of the trachea, bronchi, thoracic aorta, thoracic duct, and the recurrent laryngeal nerves. The chest is carefully evaluated for hemostasis. Two chest tubes are placed and connected to an appropriate drainage device. All trocars are removed and hemostasis assured. The lung is expanded under direct vision. All chest trocar site wounds are irrigated and closed with multiple layers of absorbable suture. Sterile dressings are applied to the chest incision and chest tube sites.

The entire surgical field is taken down with care to maintain sterility of the surgical equipment and instrumentation for the abdominal and cervical portions of the procedure. The patient is placed in a supine position. The double lumen endotracheal tube is removed and a single lumen endotracheal tube placed. The surgeon then places the patient in a modified lithotomy position with additional special positioning of the neck and arms is required. The skin of the neck, anterolateral chest, and abdomen is prepped and draped from the lower ears to the pubis and laterally to each mid-axillary line, after which the surgeon re-scrubs, gowns, and drapes the patient. The surgeon then assures that: 1) all equipment necessary for laparoscopy (laparoscopes, fiberoptic light cord, video camera, cautery cord, etc.) is placed in the field, assembled, and fixed to the drapes; 2) the ends of the camera, light, and cautery cords are passed off in sterile fashion to the circulating nurse for attachment of light and video and cautery equipment; 3) the equipment is activated and the settings adjusted appropriately (focus, light settings, cautery settings). A second pre-incision surgical pause is completed. Surgical laparoscopy is performed. Utilizing local infiltrative anesthetic, pneumoperitoneum is established to distend the abdomen, and the laparoscope is introduced. Gas flow and intra-abdominal pressure are carefully monitored so as not to impair ventilation or decrease venous return. Utilizing local infiltrative anesthetic, in total, four to six 5-mm to 12-mm trocars are inserted through the anterior abdominal wall. The abdominal cavity and viscera are inspected to rule out metastatic disease. A liver retractor is inserted and the liver retracted to allow visualization of the esophageal hiatus. The mobilization of the stomach begins by widely resecting the gastrohepatic omentum until it reaches the right crus. The right crus is visualized and dissected, the phrenoesophageal membrane is incised followed by the dissection of the left crus of the diaphragm. It is important to handle the stomach gently and with extreme care during the procedure. The greater curvature of the stomach is then mobilized by dividing the short gastric vessels with the ultrasonic coagulating shears. Care is taken to protect the spleen. The gastrocolic omentum is then divided with care taken to preserve the right gastroepiploic artery. A Kocher maneuver is performed mobilizing the proximal duodenum. The posterior attachments of the stomach are then divided by retracting the stomach anteriorly. Celiac axis lymph nodes are resected with the specimen. The left gastric artery is divided with an endovascular stapling device. An endoscopic pyloroplasty is performed in a Heineke-Mikulicz fashion. The pylorus is incised longitudinally and then closed transversely with interrupted sutures. The pyloroplasty is covered with a remnant of omentum. Transhiatal dissection of the esophagus is then performed. The diaphragm anterior to the esophagus is divided, and a circumferential dissection of the esophagus to the level of the previously thoracoscopically mobilized esophagus is performed. A gastric tube approximately 5 cm in diameter is then created utilizing multiple firings of the linear endoscopic stapler starting just proximal to the pyloroplasty. The gastroesophageal junction and juxtaposed tumor are resected with grossly free margins. The longitudinal staple line is over sewn with running suture. The tubularized gastric conduit is then secured to the proximal stomach remnant with interrupted suture. A laparoscopic feeding jejunostomy tube may be inserted (separately reported). The abdomen is inspected to be sure hemostasis is adequate. The pneumoperitoneum is deflated. Attention is turned to the left neck, where an incision is made along the anterior border of the sternocleidomastoid muscle. The sternocleidomastoid muscle and underlying carotid sheath and its contents are retracted to the left, carefully avoiding undue compression on the carotid artery. The neck strap muscles are divided. The trachea and thyroid gland are retracted to the right, carefully avoiding pressure on the tracheoesophageal groove and injury to the left recurrent laryngeal nerve. The middle thyroid vein and inferior thyroid artery are identified, ligated and divided, and the underlying cervical esophagus identified. Carefully avoiding injury to the left recurrent laryngeal nerve in the tracheoesophageal groove, the cervical esophagus is encircled with a rubber drain, and the remaining high thoracic esophagus carefully bluntly dissected free within the thoracic inlet and chest and the now completely mobilized esophagus brought into the neck wound. The cervical esophagus is divided with a surgical stapler. Pneumoperitoneum is restored and under direct visualization so as not to twist the gastric conduit, the distal esophagus, proximal stomach and attached gastric conduit then gently pulled up through the mediastinum and out through the cervical incision. The resected tumor is removed through the neck incision and removed from the surgical field. Frozen section pathology confirms that the proximal esophageal and distal gastric margins are free of tumor. Hemostasis within the mediastinum is checked for. Throughout this portion of the procedure careful attention to the arterial blood pressure is mandatory. In order to perform the esophagogastric anastomosis, the tip of the stomach is grasped in the neck incision and gentle traction on the stomach is

used to deliver an adequate length of the gastric conduit out the neck incision. A side-to-side esophagogastric anastomosis is created utilizing the linear stapling device for the posterior portion of the anastomosis. Prior to completing the anterior portion of the anastomosis, a nasogastric tube is placed under direct visualization. The anterior portion of the anastomosis is then completed with an inner layer of running absorbable suture and an outer layer of interrupted permanent suture. After a careful inspection for hemostasis, the neck wound is irrigated, a cervical wound drain placed, and the neck incision closed with multiple layers of absorbable suture. Attention is redirected to the abdomen where hemostasis is carefully checked for. The liver retractor and then abdominal trocars are removed under direct vision. All abdominal trocar sites are inspected for hemostasis, irrigated, and then closed with multiple layers of absorbable suture. Sterile dressings are applied to all of the incisions. The nasogastric tube is secured in place.

Description of Post-Service Work:
Hospital: The patient is returned to the supine position. Monitor patient during reversal of anesthesia. Avoidance of sudden straining during extubation is stressed. Assist in transfer of patient from operating table to cart. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia and anti-emetics. Instruct nursing staff in care of tubes, drains and other devices. Write immediate postoperative orders. Write brief operative note and place in chart. Discuss procedure and outcome with family. Dictate final operative report and copy referring physician(s). Review post-operative chest x-ray and labs. Write orders for transferring patient to appropriate surgical floor and discuss ongoing care with floor nurses. On a daily basis and at other times as necessary, examine patient, including reviewing vital signs, respiratory status, gastrointestinal status, and confirming as necessary. Auscultate heart and lungs. Monitor status of incisions and drains looking for signs of infection. Manage wound dressings. Continue prophylaxis for DVT. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status, renal function, and nutritional status. Review nursing/other staff patient chart notes. Write orders for labs, x-rays, medications, nutrition, and patient activity. Chart patient progress notes, daily. Review labs and x-rays (if ordered). Answer patient and family questions. Answer nursing/other staff questions. Discuss in detail dietary restrictions for the immediate post-operative period (e.g. NPO, intravenous, and/or tube feedings). Carefully assess and monitor postoperative nutritional status as maintained by both intravenous and enteral feedings. Obtain and evaluate postoperative esophagram to document anastomotic healing and satisfactory emptying of intrathoracic stomach. Advance diet, as appropriate. Discuss in detail post-esophagogastrectomy dietary restrictions for the post-operative period (e.g. liquid, post-gastrectomy, and/or mechanical soft and eventual post-esophagogastrectomy anti-dumping diets and their duration). Write orders for follow-up, post-discharge labs, x-rays, home care, tube feedings, and physical therapy. Write prescriptions for medications needed post-discharge. Home instructions and restrictions (i.e., diet as above, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when there is no evidence of infection, return of bowel function, adequate nutritional intake, and pain is adequately controlled, and majority of drains removed. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, insurance forms, and correspondence with all appropriate providers.

Office: Talk with and examine patient, assess ease of swallowing and pulmonary function. Remove dressings, sutures, and remaining drains when appropriate. Review activity and restrictions. Monitor healing of incisions with appropriate physical examination. Discuss advancement of diet with slow introduction of solid foods. Monitor dietary caloric intake by review of calorie counts and patient dietary logs and recording patient's weight. If utilized, adjust tube feedings as necessary. Eventually remove feeding jejunostomy tube when utilized and when appropriate. Answer patient/family questions. Write prescriptions for medication and therapy, as necessary. Discuss progress with referring physician(s) (verbal and written). Dictate/type progress notes for medical chart.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.20	0.55
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.40	0.55
Urgency of medical decision making	0.07	0.36
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.47	1.55

Physical effort required	1.07	1.27

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.60	0.73
Outcome depends on the skill and judgment of physician	1.07	1.09
Estimated risk of malpractice suit with poor outcome	0.47	0.73

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.24	1.27

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background: 43107, 43112, 43117, 43286, 43287, 43288

In October 2015, the CPT Editorial Panel created three new codes 43286, 43287, 43288 to report esophagectomy via laparoscopic and thoracoscopic approaches, and made an editorial revision to code 43112. Following the CPT meeting, during Panel minutes review, the vignettes for the new codes were altered, removing the statement that the typical patient undergoes chemotherapy and radiation therapy prior to surgery. The specialties contacted the Panel and tried to correct the vignettes prior to surveying the codes; however, the Panel maintained the altered vignettes.

The STS, AATS, SAGES and ACS conducted a survey and found that a significant number of respondents did not agree that the vignette described the typical patient. The respondents noted that their typical patient underwent neoadjuvant chemotherapy and radiation therapy prior to surgery. At the February 2016 RUC meeting, the societies submitted a letter to the RUC indicating that we believed the survey was flawed and the codes should be re-surveyed with the appropriate vignette. We additionally asked that the three open codes be added to the survey process since it became apparent that there have been substantial changes in the patient population and technology related to patients undergoing open esophagectomy.

The RUC agreed with the specialty societies and recommended:

- The CPT Editorial Panel table new codes 43286, 43287, 43288 until CPT 2018;
- The specialty societies go to the Research Subcommittee to obtain approval for typical patients for all six codes; and
- The specialty societies survey all six codes for the October 2016 RUC meeting.

At the RUC April 2016 RUC meeting, we provided vignettes for all six codes to the Research Subcommittee for review. We also provided supporting information including "*NCCN Clinical Practice Guidelines in Oncology for Esophageal and Esophagogastric Junction Cancers Version 3 (2015)*" and "*Minimally Invasive vs. Open Esophagectomy for Esophageal Cancer: A Comparison of Early Surgical Outcomes from the Society of Thoracic Surgeons National Database"* (Ann Thorac Surg. April 2016).

The Research Subcommittee accepted the proposed vignettes. The STS, AATS, SAGES and ACS conducted a survey for all six codes. For this survey, we included the newly approved language in the outgoing email and in the survey that asked the surgeons to only respond to questions for survey code(s) that they have experience performing or are familiar with.

For the three new codes that were previously surveyed with the faulty vignettes and not presented to the RUC, we have provided the summary data in the RUC summary spreadsheet identified as "SVY-10/15".

Summary of the differences between the 10/2015 survey and 10/2016 survey of the laparoscopic/ thoracoscopic esophagectomy codes (43286, 43287, 43288):

- ***Vignettes:*** The RUC Research Subcommittee approved changes to the vignettes for codes 43287 and 43288 by adding the sentence "She received neo-adjuvant chemotherapy and radiation therapy." to both vignettes.
- ***RSL:*** Codes 43107 and 43112 were included in the 10/15 RSL, but removed from the 10/16 RSL since they were being surveyed. This resulted in a large wRVU gap (39.53 – 51.43) in the middle of the RSL where the two open codes had been removed. Two general surgery codes (43622 and 43415) were added to fill in that gap. In addition, the Research Subcommittee requested that wRVU range was inappropriate (too low and too high), so codes were removed from the lower end and the higher end.
- ***Response rate:*** There were more survey respondents for the 2016 surveys and those respondents had more experience. For example, for code 43286, the median experience in 10/2015 was zero. For the 10/2016, the median experience was 1.
- ***Survey process:*** The same survey process was used for the 2015 and 2016 surveys. The ACS sent surveys to a random sample of the membership self identified as general surgeons, the STS sent surveys to members self identified as general thoracic surgeons and SAGES sent surveys to a random sample of their membership. The surveys were not sent to the exact same lists for the 2015 and 2016 surveys; new random samples from each specialty were selected, although some of the respondents may have been the same. In addition, only the laparoscopic/thoracoscopic codes were surveyed for 10/15, however, for 10/16, the open and laparoscopic/thoracoscopic codes were surveyed together.

Recommendation for 43288

We recommend the survey 25th percentile work RVU of 66.42 for code 43288.

PRE-TIME Package 4

Evaluation (total = 60 minutes): Additional 20 minutes added to package to account for: extensive data review of recent imaging and labs including CT/PET, upper GI endoscopy report. Review chemo/radiation therapy reports from oncology. Coordinate the multi-incisional approach with assistant surgeon, anesthesia, and scrub nurse. Mark all sites. Ensure extensive equipment is available and functioning.

Positioning (total = 30 minutes): Addition 27 minutes added to package to account for padding, positioning, and securing patient to table that will adjust (eg, reverse Trendelenburg, roll, etc.) during the procedure. Also includes additional positioning for neck, chest, and abdominal incisions and accommodation of double lumen endotracheal tube, and lines near operative field. Additional positioning is also necessary for endoscopy work to get monitors for all scopes into view of the surgeons.

Scrub, dress, wait (total = 20 minutes): Package time.

POST-TIME Package 9b

Total time = 60 minutes:

- Additional 12 minutes has been added to package account for multiple site dressings which will take more than 2 minutes; reversing excessive padding prior to transfer off table which will take more than 1 minute; post-operative notes that will take more than 5 minutes; and post-operative orders which will take more than 5 minutes.
- Additional 15 minutes has been added to package to account for additional immediate post-op work. For the open codes, the patient's anesthesia level is reduced after the fascia is closed and while the skin is being closed

and dressings applied. However, for the laparocopic/thoracoscopic codes, anesthesia needs to be maintained at full level until the last scope is pulled, intraperitoneal gas is allowed to escape and the skin is closed. This results in a longer time to monitor the patient prior to extubation and moving the patient to recovery.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43289, 43499, 43659

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Thoracic surgery How often? Sometimes

Specialty General surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is unknown although it is estimated that in 2016 there will be 16,910 cases of esophageal cancer. 20% of cases present in a localized fashion such that surgical resection might be considered. This leads to approximately 3000 esophageal resections maximum in total and split between all of the esophagectomy codes.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 75 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty estimate

Specialty Thoracic surgery Frequency 50 Percentage 66.66 %

Specialty General surgery Frequency 20 Percentage 26.66 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43112

Utilization of Surgical Treatment for Local and Locoregional Esophageal Cancer: Analysis of the National Cancer Data Base

Lauren J. Taylor, MD; Caprice C. Greenberg, MD, MPH; Anne O. Lidor, MD, MPH; Glen E. Leverson, PhD; James D. Maloney, MD; and Ryan A. Macke, MD

BACKGROUND: Previous studies have suggested that esophagectomy is severely underused for patients with resectable esophageal cancer. The recent expansion of endoscopic local therapies, advances in surgical techniques, and improved postoperative outcomes have changed the therapeutic landscape. The impact of these developments and evolving treatment guidelines on national practice patterns is unknown. **METHODS:** Patients diagnosed with clinical stage 0 to III esophageal cancer were identified from the National Cancer Database (2004-2013). The receipt of potentially curative surgical treatment over time was analyzed, and multivariate logistic regression was used to identify factors associated with surgical treatment. **RESULTS:** The analysis included 52,122 patients. From 2004 to 2013, the overall rate of potentially curative surgical treatment increased from 36.4% to 47.4% ($P<.001$). For stage 0 disease, the receipt of esophagectomy decreased from 23.8% to 17.9% ($P<.001$), whereas the use of local therapies increased from 34.3% to 58.8% ($P<.001$). The use of surgical treatment increased from 43.4% to 61.8% ($P<.001$), from 36.1% to 45.0% ($P<.001$), and from 30.8% to 38.6% ($P<.001$) for patients with stage I, II, and III disease, respectively. In the multivariate analysis, divergent practice patterns and adherence to national guidelines were noted between academic and community facilities. **CONCLUSIONS:** The use of potentially curative surgical treatment has increased for patients with stage 0 to III esophageal cancer. The expansion of local therapies has driven increased rates of surgical treatment for early-stage disease. Although the increased use of esophagectomy for more advanced disease is encouraging, significant variation persists at the patient and facility levels. ***Cancer*** **2016;000:000-000.** © *2016 American Cancer Society.*

KEYWORDS: epidemiology, esophageal cancer, esophagectomy, socioeconomic factors, treatment..

INTRODUCTION

The national incidence of esophageal cancer has risen steadily and has increased 7-fold since the 1970s.[1,2] In 2016, there will be an estimated 16,900 newly diagnosed cases; roughly 50% to 60% of these patients will present with potentially resectable disease.[2,3] Although esophagectomy has traditionally been the mainstay of curative treatment, prior studies have suggested that it is severely underused.[4-6] Possible explanations include a nihilistic attitude toward surgery because of historically high postoperative morbidity and mortality, variations in access to treatment, and a paucity of definitive evidence to guide therapy.[5,6] However, recent paradigm shifts in the management of potentially curable disease call for a reevaluation of surgical utilization.

The development of new treatment modalities and advances in operative technique have changed the therapeutic landscape. National Comprehensive Cancer Network guidelines first recommended endoscopic local therapy as a primary option for early-stage disease in 2008 and as a preferred treatment in 2012. However, esophagectomy persists as an accepted alternative for stage 0 and I disease and continues to be integral to the management of stage II and III disease.[7] Furthermore, improved outcomes with minimally invasive approaches may allow patients who were previously considered too high-risk for resection to benefit from surgical treatment.[8-10]

The optimal management of locoregional disease continues to evolve. National guidelines promote preoperative chemoradiation followed by esophagectomy but allow for multiple therapeutic pathways.[7] Although the necessity of surgical treatment for squamous cell tumors has been challenged,[6,11] National Comprehensive Cancer Network recommendations support definitive chemoradiation only for patients who refuse surgery, are medically unfit for resection, or present

with cervical esophageal tumors.[7] In contrast, European Society for Medical Oncology guidelines endorse definitive chemoradiation for select stage II/III squamous cell carcinomas.[12]

The impact of conflicting treatment strategies, expanded therapeutic options, and improved surgical outcomes on practice patterns remains unknown. We sought to evaluate national utilization of esophagectomy and local therapies over time and to identify factors associated with surgical treatment for patients with local or locoregional esophageal cancer.

MATERIALS AND METHODS

We conducted a retrospective cohort study with the National Cancer Data Base (NCDB), a joint project of the Commission on Cancer of the American College of Surgeons and the American Cancer Society. The NCDB collects data from more than 1500 Commission on Cancer–accredited facilities nationwide. The database captures more than 70% of newly diagnosed cancer cases in the United States and Puerto Rico each year. Because the NCDB is a deidentified, readily available data set, this study was not subject to institutional review board approval.

Study Population

We selected patients who were 18 years old or older and had been diagnosed with adenocarcinoma or squamous cell carcinoma of the esophagus or gastroesophageal junction from 2004 to 2013. The NCDB records data from a single reporting facility; we excluded patients who were diagnosed at the reporting facility but received all treatment elsewhere. The clinical stage was reported according to the American Joint Committee on Cancer staging edition at the time of diagnosis, and we collapsed this variable (eg, stages IA and IB were categorized as stage I). We excluded patients with documented clinical evidence of metastatic disease or tumors of the cervical esophagus, which were identified according to the 3rd edition of *International Classification of Diseases for Oncology* (C15.0; Fig. 1).[13] The median household income was based on the patient's home zip code at the time of diagnosis. We considered community and comprehensive community treatment centers together; we called them community hospitals.

Treatment Definitions

The NCDB reports therapies administered as part of the planned initial course of treatment, and given the disease stages selected for analysis, we presumed that patients underwent surgery with a curative intent. Potentially curative surgical treatment includes esophagectomy (codes 30-80) and endoscopic local therapy (codes 10-27 and 90) according to Facility Oncology Registry Standards.[14] A detailed distribution of local therapies is provided in Table 1. The NCDB defines these interventions as "surgery" and reports the reason for no surgical treatment according to the categories depicted in Figure 1. "Surgery not part of the first course of treatment" includes situations in which patients were given multiple options and chose medical therapy or did not receive any treatment.

Analysis

The primary outcome was the rate of potentially curative surgical treatment from 2004 to 2013. We used logistic regression with the year of diagnosis as a continuous predictor to evaluate treatment rates over time. The comparison of patient and facility characteristics was performed with Pearson chi-square tests for categorical variables. To evaluate predictors of surgical treatment, we performed a multivariate analysis using a binary logistic regression model with the year of diagnosis as the main predictor, and we included age, sex, race, Charlson-Deyo comorbidity score, insurance status, median household income, American Joint Committee on Cancer clinical stage, histology, facility type, and geographic region as a priori defined covariates. We performed a sensitivity analysis excluding patients who died before surgery or for whom surgery was not recommended because of patient risk factors.

We performed 2 subgroup analyses. First, because local therapy is preferred over esophagectomy for superficial lesions, we used multivariate models to identify factors associated with the receipt of esophagectomy for the subset of patients with clinical stage 0 (carcinoma in situ) or I disease who underwent potentially curative surgical treatment. Second, because the guidance on the use of definitive chemoradiation as a potentially curative alternative to esophagectomy for locoregional disease has evolved, we compared stage II/III patients who underwent esophagectomy with those who were offered multiple treatment options but opted for chemoradiation without surgery. Patients for whom surgery was contraindicated because of risk factors or who died before surgery were excluded. The significance level (α) was set at .05 for all analyses, and P values were calculated as 2-tailed. Analyses were performed with SPSS 23 (SPSS, Chicago, Ill).

RESULTS

The analytic cohort included 52,122 patients. Patients had a median age of 67 years (range, 19-90 years) and

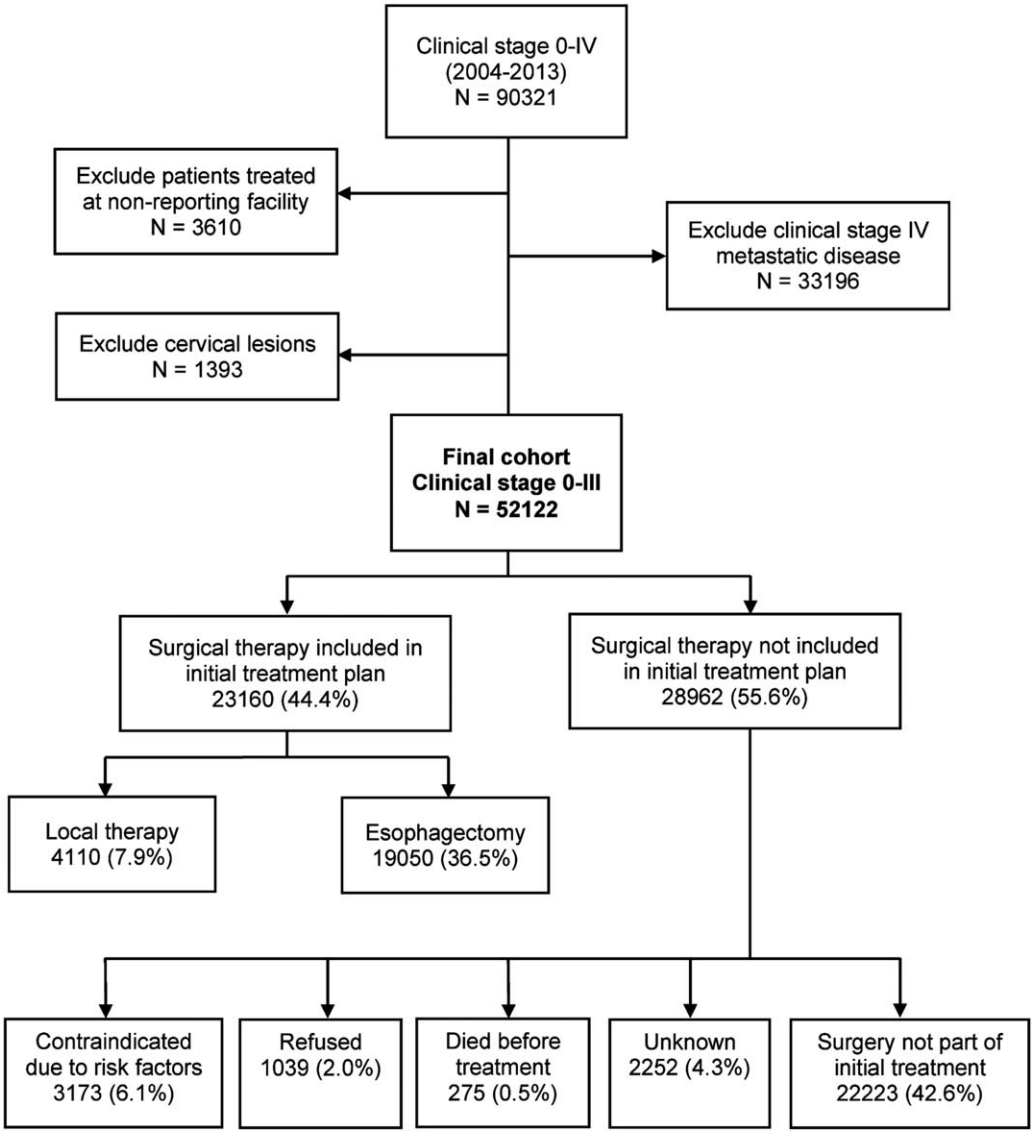

Figure 1. Cohort selection and management of patients with stage 0 to III esophageal cancer from 2004 to 2013.

were predominantly white males. More than 70% presented with clinical stage II or III disease, and 64.5% had adenocarcinoma. Although approximately 13% of the hospitals in the database were academic facilities, nearly half of the study population (46.8%) was managed at these institutions (Table 2).

Overall, 19,050 patients (36.5%) underwent esophagectomy, and 4110 (7.9%) received endoscopic local therapy. The rate of esophagectomy steadily increased from 30.7% to 37.9% ($P < .001$), and the use of local therapies rose from 5.6% to 9.5% ($P < .001$), so the overall rate of potentially curative surgical treatment increased from 36.4% in 2004 to 47.4% in 2013 ($P < .001$). Reasons why the remaining 28,962 patients (55.6%) did not undergo surgical treatment included death before planned surgery (n = 275), a contraindication due to patient risk factors (n = 3173), patient refusal (n = 1039), and unknown reasons (n = 2252; Fig. 1). Among the 22,223 patients for whom surgery was not part of the planned first course of treatment, 3761 received single-modality medical therapy with either chemotherapy or radiation, 14,408 received combined chemoradiation, and 3566 opted for no treatment.

Utilization of Surgical Treatment by Clinical Stage

For stage 0, esophagectomy use decreased from 23.8% to 17.9% ($P < .001$) with a concomitant rise in rates of

endoscopic local therapy from 34.3% to 58.8% ($P < .001$). The impact of local therapies drove growth in the overall use of surgical treatment from 58.0% in 2004 to 76.7% by 2013 (Fig. 2A). The receipt of esophagectomy for stage I increased modestly from 29.8% to 34.5% ($P = .16$). The use of local therapies doubled from 13.6% to 27.4% ($P < .001$), and this contributed to an expansion of surgical treatment from 43.4% to 61.8% by 2013 for stage I (Fig. 2B). For locoregional disease, rates of surgical treatment increased from 36.1% to 45.0% ($P < .001$) and from 30.8% to 38.6% ($P < .001$) for clinical stages II and III, respectively. The use of local therapy remained less than 2.6% (Fig. 2C,D).

Predictors of Potentially Curative Surgical Treatment

Patients receiving surgical treatment tended to be younger, white, privately insured males with a higher median household income ($P < .001$). Those managed at academic centers were significantly more likely to undergo potentially curative surgical treatment than those managed at community hospitals (odds ratio [OR], 2.72; 95% confidence interval [CI], 2.61-2.84). A more advanced clinical stage was associated with decreased odds of surgical treatment in comparison with stage 0 (OR for stage I, 0.51; 95% CI, 0.46-0.57; OR for stage II, 0.26; 95% CI, 0.23-0.29; OR for stage III, 0.16; 95% CI, 0.15-0.18), and patients with adenocarcinoma were more than 2-fold more likely to undergo surgical treatment than patients with squamous cell carcinoma (OR, 2.68; 95% CI, 2.56-2.81). In the adjusted analysis, the year of diagnosis remained a small but significant predictor (OR per year, 1.04; 95% CI, 1.03-1.04; $P < .001$; Table 3). A sensitivity analysis excluding patients who died before surgery or for whom surgery was contraindicated yielded similar findings.

Use of Esophagectomy: Clinical Stage 0 or I

For the subset of stage 0/I patients who underwent surgical treatment (n = 7965), the adjusted analysis revealed that the receipt of esophagectomy rather than endoscopic local therapy was more likely for patients with clinical stage I disease (OR, 3.52; 95% CI, 3.08-4.02) and for those with adenocarcinoma versus squamous cell carcinoma (OR, 1.28; 95% CI, 1.06-1.37). Notably, patients managed at community facilities had significantly greater odds of being treated with esophagectomy (OR, 1.78;

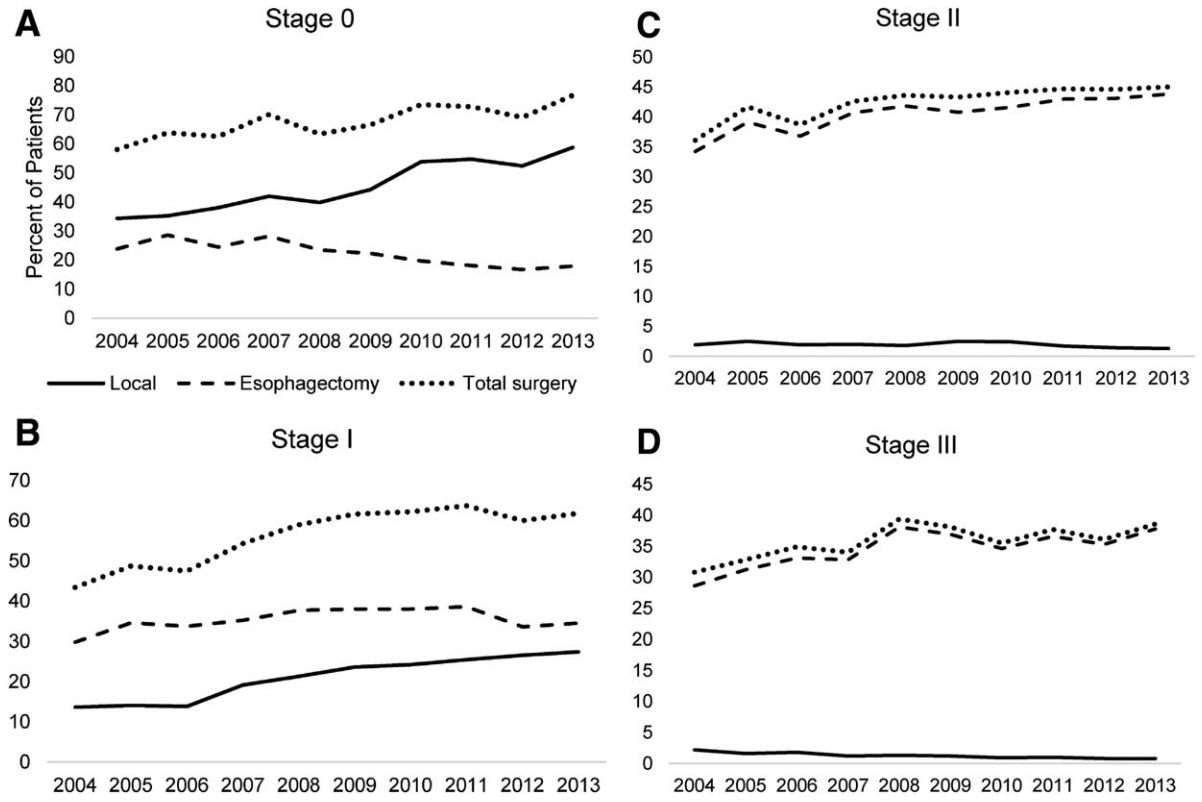

Figure 2. Utilization rates of esophagectomy, local therapy, and overall potentially curative surgical treatment from 2004 to 2013 for patients with (A) clinical stage 0, (B) clinical stage I, (C) clinical stage II, and (D) clinical stage III esophageal cancer.

95% CI, 1.59-2.00). Year of diagnosis was a negative predictor of esophagectomy (OR per year, 0.91; 95% CI, 0.89-0.92; $P < .001$; Table 4).

Use of Esophagectomy: Clinical Stage II or III

As for stage II/III patients treated with esophagectomy or chemoradiation without surgery (n = 29,480), those managed surgically tended to be younger, white, privately insured and to live in regions with a higher median household income ($P < .001$ for all). Compared with stage II patients, stage III patients were less likely to undergo esophagectomy (OR, 0.66; 95% CI, 0.63-0.70). Treatment at an academic facility (OR, 2.42; 95% CI, 2.29-2.56) and adenocarcinoma (OR, 2.83; 95% CI, 2.67-3.01) were the strongest predictors of surgical treatment. In the adjusted analysis, the year of diagnosis remained a significant predictor of esophagectomy (OR per year, 1.02; 95% CI, 1.01-1.03; $P < .001$; Table 5).

DISCUSSION

Based on a large national data set, our results demonstrate a significant increase in the utilization of surgical treatments for stage 0 to III esophageal cancer from 36.4% in 2004 to 47.4% in 2013. This rise was fueled by the adoption of endoscopic local therapies for the management of local disease (stage 0/I) and the increased use of esophagectomy for locoregional cancers (stage II/III). To our knowledge, this is the first study to report national practice patterns for the surgical management of potentially resectable esophageal cancer in recent years. These findings are encouraging because of the rising burden of disease and suggest growing awareness of and adherence to national guidelines.

Although evidence supports improved survival after complete surgical resection for patients without distant disease,[4,15] previous national studies have reported severe underuse of esophagectomy.[4,5] Investigations using the Surveillance, Epidemiology, and End Results cancer registry report a rate of 34.1% for stages I to III between 1997 and 2002,[4] and a subsequent analysis including in situ, local, and regional disease from 1988 to 2004 found that 44% of patients received an esophagectomy. Notably, esophagectomy rates failed to increase during the 17-year period.[5] Although exposing critical underuse, these studies were limited by small sample sizes and were conducted before the formal incorporation of local therapies into national guidelines.

We noted a significant overall increase in the rates of esophagectomy driven by the clear majority of patients who presented with stage II/III disease. Although esophagectomy has been historically viewed as an invasive, high-risk procedure with questionable benefit because of low overall disease survival,[4] these findings suggest increasing

acceptance of radical resection. Potential explanations for this shift include the adoption of minimally invasive esophagectomy,[8,10] lower postoperative mortality at specialized high-volume centers,[16-18] and growing evidence from prospective studies such as the CROSS trial[19] demonstrating improved long-term survival with preoperative chemoradiation.[20,21]

In concordance with preferred treatment algorithms, endoscopic modalities were the primary contributor to increasing rates of surgical treatment for superficial cancers, and a subgroup analysis of stage 0/I disease indicates a shift away from esophagectomy. Our findings build on work by Berry et al,[22] who reported increasing use of endoscopic local therapies for T1N0 disease from 8.1% in 1998 to 24.1% in 2008. Although retrospective analyses suggest that local treatments provide effective therapy,[22,23] because of the apparent widespread adoption of these modalities, prospective trials may be increasingly valuable for evaluating long-term outcomes.

We found that 61.9% of newly diagnosed cases presented with tumors considered resectable according to the clinical stage (0-III); this is consistent with previous population-based reports.[2] Although our data suggest an increase in overall surgical use, more than half of these patients received exclusively nonsurgical therapies or did not undergo treatment, and this indicated significant ongoing underutilization of potentially curative surgical options. Previous investigations have cited racial and socioeconomic disparities as drivers of surgical underuse,[4,5] and unfortunately, we have found that this trend persists. Interestingly, although patient-level disparities were less pronounced in predictors of esophagectomy versus local therapies for stages 0 and I, we noted significant racial and socioeconomic influence in the use of esophagectomy versus definitive chemoradiation in the stage II/III subgroup. The precise etiology of this patient-level variation is uncertain but may include the following: access to care, cost of therapy, knowledge deficits related to available and preferred treatment options, and patient preference to avoid

potentially onerous radical surgical resection. Further clarification of patient-related barriers to surgical treatment is needed, particularly for those with more advanced disease.

Our analysis uncovered significant variations in adherence to national guidelines because academic and community hospitals demonstrated distinctly different practice patterns. We found that patients treated at community hospitals were less likely to receive surgical treatment than their counterparts at academic centers. Diverging practices persisted in both subgroup analyses: those managed at community centers were more likely to undergo esophagectomy for stage 0/I disease and were less likely to undergo esophagectomy for stage II/III tumors. Heightened deviation from preferred algorithms at nonacademic centers may stem from limited access to skilled providers who can perform local therapies or advanced minimally invasive techniques and from insufficient resources to facilitate higher level multidisciplinary postesophagectomy management of these complex patients. Because academic centers are not located in many communities, longer travel times and a hesitancy to refer patients to out-of-network providers may pose critical barriers to preferred surgical treatment, particularly in light of identified socioeconomic disparities. This facility variability highlights an opportunity to improve the awareness of current guidelines and the dissemination of local therapy options at the community level.

Ongoing controversy exists regarding the optimal management of patients with squamous cell carcinomas. Although a recent Cochrane review found no difference in long-term mortality or recurrence for patients treated with definitive chemoradiation versus surgery, the quality of evidence was low or very low.[24] Our results demonstrate that patients with squamous cell carcinoma were almost 3 times less likely to have surgical therapy than those with adenocarcinoma. This histology-based deviation provides evidence to support the impact of European guidelines[12] endorsing definitive chemoradiation on practice patterns in the United States.

It is worth noting that for the majority of patients who did not undergo surgical therapy, the reason was documented as "surgery not part of the first course of treatment." This includes a heterogeneous group of patients; it is unknown how many were offered surgery and chose alternative therapy versus how many were not offered surgery. However, this category is distinct from those for whom surgery is contraindicated, and thus we presume that it represents patients who are potentially surgical candidates. Further characterization of patients who do not undergo curative treatment offers tremendous potential to increase utilization, address potential surgeon bias, and improve patients' understanding of therapeutic options.

Our use of the NCDB offers an analysis of a significantly larger nationally representative sample in comparison with previous reports. However, this study has several limitations. We included all patients with potentially resectable disease according to the clinical stage to facilitate comparisons with earlier studies. Although our cohort contained patients for whom surgery was contraindicated or who died before treatment, these patients represented a small proportion, and a sensitivity analysis produced similar results. Because of changes in American Joint Committee on Cancer staging guidelines during the study period, our cohort included 725 patients (1.4% of the total cohort) with T4b lesions for whom definitive chemoradiation is currently recommended. We believe that the inclusion of these patients was justified to facilitate comparisons with earlier studies because before 2010 the distinction between T4a and T4b lesions did not exist. The NCDB does not provide information on how patients were staged, so we were unable to assess the quality and accuracy of staging information, and although it offers some data on patient characteristics, this database lacks the granularity necessary to better define differences between those for whom surgical therapies were and were not recommended. Unfortunately, the database records information only for a single reporting facility, and thus we acknowledge that our analyses do not account for patients who were diagnosed at the reporting hospital but received all treatment elsewhere. However, this scenario occurred for less than 4% of the patients in the database with clinical stage 0 to IV disease, and because of the otherwise large sample size, the exclusion of these patients was unlikely to have had a substantial impact on the overall trends. Finally, these data represent the planned initial treatment strategy; the NCDB does not report subsequent therapies after failed first-course treatments. Therefore, it is likely that overall utilization of surgical treatment is greater than these results indicate because there are certainly patients who underwent esophagectomy after failed local therapy, salvage resection after definitive chemoradiation, or subsequent local therapy such as cryotherapy with palliative intent.

In conclusion, using a large national sample, we have demonstrated increased use of surgical treatment from 2004 to 2013 for stage 0 to III esophageal cancer. The impact of local therapies has significantly expanded the receipt of surgical treatment for superficial tumors.

However, facility- and patient-level variation in the use of esophagectomy for locoregional disease persists. Further investigation into the characteristics of medically fit patients managed nonoperatively is warranted to identify barriers to receiving recommended surgical therapies.

Outcomes after endoscopic versus surgical therapy for early esophageal cancers in an older population CME

Linda C. Cummings, MD, MS,[1,2] Tzuyung Doug Kou, PhD,[2] Mark D. Schluchter, PhD,[2] Amitabh Chak, MD,[1,2] Gregory S. Cooper, MD[1,2]

Cleveland, Ohio, USA

Background and Aims: Endoscopic treatment of early esophageal cancer provides an alternative to esophagectomy, which older patients may not tolerate. Population-based data regarding short-term outcomes and recurrence after endoscopic treatment for esophageal cancer are limited. We compared short-term outcomes, treated recurrence, and survival after endoscopic versus surgical therapy for early esophageal cancers in an older population.

Methods: We conducted a retrospective cohort study identifying patients aged ≥66 years with Tis or T1a tumors without nodal involvement diagnosed from 1994 to 2011 from the linked Surveillance, Epidemiology, and End Results (SEER)-Medicare database.

Results: Of 2193 patients, 41% (n = 893) underwent esophagectomy, and 12% (n = 255) underwent endoscopic treatment within 6 months of diagnosis. Those treated endoscopically were older and more likely to have a Charlson comorbidity score ≥2. A composite endpoint, hospitalization and/or adverse events at 60 days, was higher in surgical patients than in the endoscopic treatment group (30% vs 12%; $P < .001$). In a Cox model stratified by histology, adjusting for other factors, endoscopic treatment was associated with improved 2-year survival (hazard ratio 0.51; 95% CI, 0.36-0.73).

Conclusions: In this older population, a composite short-term endpoint was worse in the surgical group. Endoscopic treatment was associated with improved survival through 2 years. These results suggest that endoscopic treatment is a reasonable approach for early esophageal cancers in the elderly. (Gastrointest Endosc 2016;84:232-40.)

(footnotes appear on last page of article)

Esophageal cancer carries a poor prognosis, with a 40% 5-year survival rate for localized disease.[1] In the United States, this cancer predominantly affects older individuals, with a median age at diagnosis of 67.[2] Although esophagectomy provides the best chance of cure for early stage I esophageal cancer (T1N0M0)[3] and high-grade dysplasia (TisN0M0), it is a technically demanding, invasive operation with potentially high rates of short-term mortality (7%-13%)[4] and morbidity. In elderly patients who often have comorbid conditions, short-term risks may outweigh the benefit of long-term cure offered by esophagectomy.

Endoscopic treatment with resection, often performed with ablation, is gaining acceptance and may be better tolerated in elderly patients. Endoscopic treatment can be used particularly for high-grade dysplasia and superficial cancers confined to the lamina propria or muscularis mucosae (T1a) because of low likelihood of lymph-node metastasis.[5] Endoscopic methods may, however, raise concerns about inadequate resection because they yield markedly limited tissue specimens compared with esophagectomy. Assessment of tumor depth of invasion and nodal involvement by EUS may guide the treatment approach.[6]

Previous research assessing esophagectomy in older patients has not compared its effectiveness with endoscopic treatment. We therefore aimed to compare short-term and long-term outcomes among older patients undergoing endoscopic treatment versus esophagectomy. We hypothesized that endoscopic treatment of early esophageal cancer provides comparable long-term outcomes and

favorable short-term outcomes compared with esophagectomy in elderly patients. Our primary outcome was 2-year survival. Other outcomes of interest included hospitalizations, adverse events, death at 60 days, need for dilation, and use of EUS.

METHODS

We performed a retrospective cohort study by using the Surveillance, Epidemiology, and End Results (SEER) tumor registry data linked to Medicare claims (SEER-Medicare) to identify patients with early esophageal cancer or high-grade dysplasia. The study protocol was approved by the University Hospitals Case Medical Center Institutional Review Board and the National Cancer Institute (NCI).

Data sources

NCI's SEER program provides reliable data regarding cancer incidence from cancer registries which, after its latest expansion in 2010, now covers approximately 28% of the U.S. population.[7] SEER collects data regarding patients with a confirmed cancer diagnosis including demographic information, presenting stage, lymph node involvement, histology, surgery and radiation treatment within 4 months of diagnosis, and survival. Linkage of SEER to Medicare claims data allows identification of comorbidities and treatment beyond the first 4 months after cancer diagnosis. Procedures can be identified in SEER and from Medicare hospital inpatient claims, physician-supplier claims (national claims history), or standard analytical file outpatient claims. Procedures in Medicare hospital inpatient claims are identified through International Classification of Diseases, 9th Revision-Clinical Modification (ICD-9-CM) procedure codes. Procedures from national claims history and standard analytical file are identified through Current Procedural Terminology (CPT) codes (© American Medical Association copyright 2009. All rights reserved. Courtesy of the American Medical Association).

Study population

Patients with incident cases of high-grade dysplasia or early esophageal cancer diagnosed between 1994 and 2011 who underwent esophagectomy or endoscopic treatment within 6 months of diagnosis were identified. In order to capture comorbid conditions and outpatient procedures, patients had to participate in Medicare Part A and B from 6 months before diagnosis until 9 months after diagnosis or death. Patients aged $\geq$66 at diagnosis were included to assess comorbid conditions and to evaluate use of EUS before cancer diagnosis. We excluded patients enrolled in a health maintenance organization from 6 months before to 3 months after cancer diagnosis, because of incomplete claims data; patients not enrolled in Medicare Part B, because of lack of outpatient claims data; and patients with prior cancer.

MEASURES

Patient, hospital, and tumor characteristics

Patient demographic characteristics including age, race, marital status, SEER registry, and sex were obtained from SEER. Cases with anatomic site recorded as esophagus were included. Histology as reported by ICD-O-3 coding was classified as adenocarcinoma or squamous cell carcinoma according to the Collaborative Stage Data Collection System Version 02.04.[8] Cases with tumor depth classified as in situ (Tis) or extending into the mucosa (T1a) were included based on SEER variables for tumor extension (e10ex1 for cases diagnosed 1994-2003, coded as 00 or 10-12 and csex1 for cases diagnosed 2004-2011, coded as 000, 100, 110, or 120). Cases with T1b and greater tumor depth, lymph node involvement, or metastatic disease at presentation were excluded.

Geographic characteristics

County-level Area Health Resources Files (AHRF) data regarding education (% residents with a college education) and median income were used as proxy for socioeconomic status. County-level gastroenterologist and primary care provider density per 1000 population were characterized by using AHRF data. Cases missing AHRF data were excluded. AHRF data were categorized into quartiles because of their skewed distribution. SEER registries were grouped into 4 geographic regions (Northeast, Midwest, South, and West).

Comorbidities

A modified version of the Deyo adaptation of the Charlson comorbidity index was used to identify comorbid conditions by using ICD-9-CM diagnosis codes from inpatient, outpatient, and physician-supplier claims.[9] Malignancy was excluded from the Charlson calculation.

Treatment approach

Patients with early esophageal cancer undergoing esophagectomy or endoscopic treatment (ablation, local tumor destruction, or EMR) from 1 month before to 6 months after diagnosis were included. Because use of both SEER (which records the most invasive cancer-directed treatment) and Medicare claims may enhance identification of cancer surgery,[10] patients receiving endoscopic treatment according to SEER with no Medicare claims for esophagectomy 1 month before to 6 months after cancer diagnosis were classified in the endoscopic treatment group. Treatment approach was identified from Medicare inpatient, outpatient, and physician-supplier claims. Patients undergoing both endoscopic treatment and esophagectomy within 6 months of diagnosis were included in the esophagectomy group. Procedure codes

used to identify treatment approach (Supplemental Table 1, available online at www.giejournal.org) include those suggested by the American Society for Gastrointestinal Endoscopy Technology Committee to be the most applicable for endoscopic treatment.[11] Radiation therapy as first course of treatment was assessed through SEER (variable rad1) and demonstrated high concordance (κ statistic = 0.802) with receipt of radiation in Medicare claims as identified through a previously published algorithm.[12]

EUS

Receipt of EUS was assessed within 30 days before diagnosis to 3 months after diagnosis as in a previous study from our group.[13] EUS was identified from outpatient and physician-supplier files with the following CPT codes: 43231, 43232, 43242, 43259, 76975.

Short-term outcomes

Hospital admission was defined as admission to an acute-care hospital within 60 days of discharge after hospitalization (for esophagectomy) or procedure (for endoscopic treatment). Admissions to skilled nursing care, rehabilitation facilities, and long-term care hospitals were excluded. Adverse events within 60 days, identified from inpatient, outpatient, and physician-supplier claims, included postprocedural interventions; as previously suggested,[14] they are closely associated with severe adverse events. Adverse events were identified by using the following ICD-9-CM diagnosis codes and procedure codes (ICD-9-CM and CPT): hemorrhage complicating a procedure (998.1), accidental puncture or laceration during a procedure (998.2), retrieval of retained foreign body (CPT 49085; ICD-9 54.92), management of postoperative shock/hemorrhage (ICD-9 39.98), management of abdominal infection (CPT 49020, 49021, 49040, 49041, 49060, 49061, 49080, 49081, 75989; ICD-9 54.0, 54.91, 54.19), repair of an organ injury/laceration (CPT 38100, 44602, 44603; ICD-9 31.71, 33.41, 41.5, 42.82, 44.61, 46.71, 46.73, 50.61, 51.91), reoperative laparotomy (CPT 49002, 49000, 49010; ICD-9 54.12, 54.11, 54.21), management of wound adverse event (CPT 10060, 10061, 10120, 10121, 10140, 10180, 12020, 13160, 97601, 97602; ICD-9 54.61, 86.22), and management of bowel obstruction (CPT 44050). An a priori composite short-term outcome measure, defined as hospitalization and/or adverse event within 60 days, was evaluated to comply with NCI policy, which bars reporting of events with frequency <11. Perioperative mortality was defined as death occurring within 60 days of esophagectomy or endoscopic treatment.

Dilation

Endoscopic dilation within 6 months of esophagectomy or endoscopic treatment was evaluated from inpatient, outpatient, and physician-supplier files. The following codes were used to identify dilation: CPT 43220, 43249, 43226, 43248, 43450, 43453, 43456; ICD-9 42.92.

Treated recurrence

Similar to a previously published algorithm for identifying cancer relapse,[15] treatment for recurrent disease was assessed by receipt of chemotherapy and/or radiation >6 months after endoscopic or surgical treatment. Receipt of chemotherapy was identified from Medicare hospital inpatient claims, physician-supplier, and standard analytical files with the following codes: chemotherapy administration (99.25), antineoplastic chemotherapy encounter (V58.11), cancer chemotherapy follow-up (V67.2), convalescence and palliative care after chemotherapy (V66.2), outpatient or physician administration of chemotherapy (Q0083–Q0085), chemotherapeutic agents (Healthcare Common Procedure Coding System codes J9000-J9999), and revenue center codes (0331, 0332, 0335). Radiation therapy was identified with ICD-9 codes 92.2, V58.0, V66.1, and V67.1, CPT codes 77xxx, and revenue center codes 0330 and 0333. The proportion of patients receiving endoscopic treatment within the first 6 months of diagnosis who subsequently underwent esophagectomy was assessed.

Statistical analysis

The Pearson chi-square test or the Fisher exact test was used to compare categoric variables among treatment groups. Continuous variables were compared by using parametric or nonparametric tests as appropriate. Survival was measured from cancer diagnosis to death or last follow-up through December 31, 2013. Kaplan-Meier curves were generated to compare survival between treatment groups; the log-rank test was used to compare survival curves. Cox proportional hazards models were used to evaluate treatment approach and other covariates and their association with survival time. Because of the known association between histology and long-term survival, our primary analysis was a Cox model stratified by histology. We included all tracked covariates in multivariable models because they were believed to be clinically meaningful. Potential proportional hazards assumption violations were assessed by testing for the interaction of covariates with time and through visual inspection of Kaplan-Meier curves and log (-log[survival]) versus survival time plots. For 2-year survival analysis, patient survival times were censored at 2 years. To assess effects of perioperative mortality or timing of diagnosis on long-term survival, multivariable Cox models stratified by histology censoring patients dying within 60 days of the procedure or limiting the cohort to patients diagnosed from 2002 to 2009 were developed. Data were analyzed by using SAS software version 9.3 (Cary, NC).

As a secondary analysis, a propensity score model was used to adjust for potential selection bias because of nonrandom treatment allocation. Propensity scores, the

predicted probability of receiving endoscopic treatment,[16] were generated through nonparsimonious logistic regression models incorporating all observed covariates evaluated in the multivariable Cox proportional hazards models. Endoscopic treatment and esophagectomy patients were matched 1:1 by propensity scores by using a previously described matching algorithm.[17]

RESULTS

From SEER-Medicare data, we identified 38,519 patients with esophageal cancer, including 2193 patients with early-stage esophageal cancer (Tis, T1a) who met our inclusion and exclusion criteria. Figure 1 displays stepwise cohort identification. Among 2193 patients, 41% (n = 893) primarily underwent esophagectomy, and 12% (n = 255) underwent endoscopic treatment within 6 months of diagnosis. Of the remaining 1045 patients who did not receive either treatment, 58% (n = 610) received radiation therapy as a first course of treatment. The mean follow-up time was 3.5 years (standard deviation [SD] 3.6 years) and was longer among patients undergoing esophagectomy (5.0 years, SD 4.1 years) or endoscopic treatment (4.3 years, SD 2.4 years).

Baseline demographic characteristics by treatment approach are presented in Table 1. Patients who did not receive esophagectomy or endoscopic treatment were more likely to be non-white ethnicity and more likely to receive radiation than patients who were treated with esophagectomy or endoscopic treatment. Among patients receiving endoscopic or surgical treatment, there were no significant differences with respect to sex, ethnic makeup, histology, SEER registry, county-level physician density, or county-level education and income. However, endoscopically treated patients were older than those undergoing esophagectomy and were more likely to have Tis tumors and Charlson scores ≥2. Within the esophagectomy and endoscopic treatment groups, among those receiving radiation (19% and 14%, respectively), the vast majority (>94%) had T1a tumors. Over the study period, the rate of endoscopic treatment increased over time, with 91% of endoscopic cases occurring in 2002 or later. Use of EUS varied among treatment groups; only 17% (n = 182) of patients not receiving esophagectomy or endoscopic treatment underwent EUS, compared with 41% (n = 367) of esophagectomy patients and 59% (n = 151) of endoscopically treated patients.

Short-term outcomes and treated recurrence

A composite endpoint of hospitalization and/or adverse events at 60 days after the procedure was significantly higher in the esophagectomy group (30%, n = 265) than in the endoscopic treatment group (12%, n = 30; $P < .001$). The rate of dilation was higher in the esophagectomy group (25%, n = 220) than in the endoscopic treatment group (15%, n = 39; $P < .01$). The rate of death at 60 days was significantly higher in the esophagectomy group (4%) than in the endoscopic treatment group (numbers suppressed because of counts <11). There was no difference in the rate of treated recurrence between the esophagectomy group (16%, n = 139) and the endoscopic treatment group (13%, n = 32; $P = .23$). Among patients treated endoscopically, 15 subsequently underwent esophagectomy >6 months after cancer diagnosis.

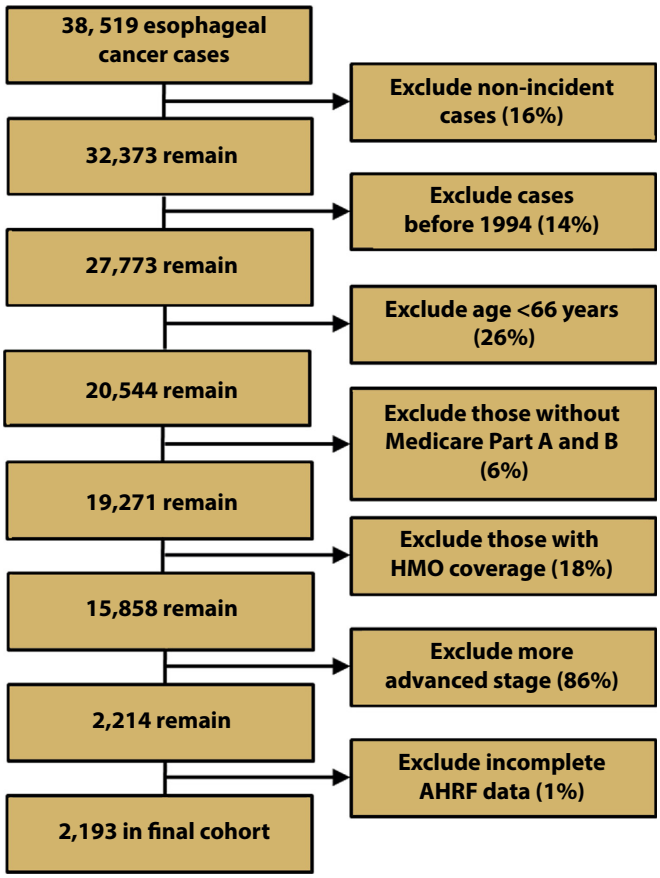

Figure 1. Stepwise patient selection flowsheet. Percentage in parentheses indicates the proportion of patients excluded at each step. *HMO,* Health Maintenance Organization; *AHRF,* Area Health Resources Files.

Overall long-term survival

Kaplan-Meier curves showing overall survival by treatment approach up to 2 years after diagnosis are shown in Figure 2. There were significant differences in unadjusted 2-year survival by treatment approach ($P < .001$ by log-rank test). Two-year unadjusted survival was 71% in the esophagectomy group and 84% in the endoscopic treatment group among adenocarcinoma patients, compared with 60% and 76%, respectively, among squamous cell carcinoma patients. The results of the Cox model stratifying by histology adjusted for other factors are presented in Table 2. Endoscopic treatment was associated with decreased mortality (HR 0.51; 95% CI, 0.36-0.73). Increasing age and receipt of radiation were independent

predictors of mortality. Cases diagnosed from 2002 to 2009 and Tis lesions were associated with a decreased risk of death.

We conducted several sensitivity analyses to assess the robustness of our results. A Cox model censoring patients dying within 60 days of the procedure developed to evaluate the impact of perioperative mortality on long-term survival demonstrated that endoscopic treatment was associated with decreased mortality through 2 years after adjusting for other factors (HR 0.61; 95% CI, 0.45-0.85). Among patients matched 1:1 by treatment approach based on propensity scores, endoscopic treatment remained associated with decreased mortality (HR 0.59; 95% CI, 0.41-0.86). Among patients diagnosed between 2002 and 2009 (a time period accounting for most endoscopically treated cases), endoscopic treatment was associated with decreased mortality (HR 0.51; 95% CI, 0.36-0.74) after adjusting for other factors.

DISCUSSION

The current study compared short-term and long-term outcomes in elderly patients undergoing treatment for early esophageal cancer. We demonstrated favorable short-term and long-term outcomes in patients undergoing endoscopic treatment compared with surgical resection. Previous studies evaluating the morbidity and mortality associated with esophageal cancer resection among elderly patients used varying age cutpoints between 65 and 75.[18-21] Some data have demonstrated increased risk of cardiopulmonary adverse events in older patients after esophagectomy, but no difference in operative or long-term mortality compared with younger patients.[18,19] In contrast, 1 study reported an 11% 30-day mortality rate after esophagectomy in a Medicare population compared with 4% to 7% in younger cohorts.[21] A study of patients aged ≥70 undergoing esophagectomy for esophageal cancer (predominantly adenocarcinoma) reported a 5-year survival rate of 24%.[18] A recent, single-center study found no increase in adverse events in patients aged ≥75 undergoing endoscopic mucosal resection for Barrett's esophagus lesions compared with younger patients.[22]

In our study, only 52% of 2193 patients with early disease underwent esophagectomy or endoscopic treatment within the first 6 months. The proportion of non-white patients was higher among patients not receiving esophagectomy or endoscopic treatment (Table 1). This finding may reflect the lower proportion of adenocarcinomas (which typically affect white patients) among this group, although previous studies have demonstrated underuse of surgery among potentially resectable patients with esophageal cancer, particularly in non-white patients.[23,24]

In the current study, among patients not receiving esophagectomy or endoscopic treatment, 58% (n = 610) received radiation therapy as a first course of treatment. However, radiation therapy is not part of the treatment algorithm in the National Comprehensive Cancer Network guidelines for node-negative cancers with Tis or T1a disease.[25] Presumably these patients were not deemed surgical candidates, were not offered endoscopic treatment, or declined surgery. Patients in this group were more likely to have Charlson scores ≥2 (10%, n = 109) than those in the endoscopic treatment and surgery groups. Among patients receiving endoscopic or surgical treatment, radiation therapy was independently associated with increased mortality. This finding is consistent with previous analyses not focused on the elderly comparing endoscopic and surgical treatment for early esophageal cancers.[26-28]

The unadjusted 2-year survival among adenocarcinoma patients in the current study was 71% in the esophagectomy group and 84% in the endoscopic treatment group. Direct comparison with other studies is challenging because of differences in setting, patient selection, and outcome measurement. Our results compare favorably with previous SEER-Medicare analyses reporting 53% to 57% 1-year survival after esophagectomy for locoregional cancer; however, one of those studies measured survival from the date of surgery rather than date of cancer diagnosis.[4,29] On the other hand, 5-year survival after esophagectomy for stage I esophageal adenocarcinoma has been reported to be as high as 81% to 95% in tertiary-care center case series.[30-32]

As in other studies,[26-28,33] we found that increasing age was an independent predictor of mortality. Although Steyerberg et al[33] found that increasing comorbidity was associated with increased risk of death, Charlson scores ≥2 were not an independent predictor of mortality in our stratified Cox model through 2 years. In our study, endoscopic treatment was associated with better survival

TABLE 2. Cox model stratified by histology identifying predictors of overall mortality (2-year survival)

through 2 years. This finding could reflect better tolerability of this less-invasive procedure or the lower proportion of T1a lesions. Perioperative mortality does not explain improved long-term survival in the endoscopic treatment group because survival analysis censoring patients who died perioperatively still demonstrated decreased mortality with endoscopic treatment. Beyond the first 2 years after cancer diagnosis, endoscopically treated patients may have been more likely to die from non-cancer–related causes, especially considering they

were more likely to have Charlson scores ≥2. Our selection of 2-year survival as an outcome encompassed a time period after diagnosis during which many recurrences would probably have been captured.[34]

The overall rate of EUS was 32%, or 700 of 2193 patients in our cohort. EUS was performed more frequently in patients receiving esophagectomy (41%) and endoscopic treatment (59%). In previous SEER-Medicare studies, which also included patients with more advanced stages, only 16% to 21% of patients undergoing esophagectomy and 12% to 22% of patients with in situ or localized disease underwent EUS.[13,35] However, the rate of EUS among patients with early disease undergoing esophagectomy was not reported. Although accuracy of EUS in early esophageal cancers has been debated, with some proposing that endoscopic resection should be used as a primary staging modality,[36] a more recent meta-analysis demonstrated that EUS had 85% sensitivity and 87% specificity for staging T1a tumors compared with final staging by endoscopic mucosal resection or surgical resection.[6]

We found that short-term outcomes including dilation, a composite endpoint of hospitalizations and/or adverse events at 60 days, and the number of perioperative deaths, were significantly higher in the esophagectomy group. We examined short-term mortality at 60 days because 30-day mortality may not provide a complete assessment after esophagectomy.[37] We assessed dilation within 6 months of treatment because these procedures would likely reflect treatment of dysphagia secondary to anastomotic or post-endoscopic resection strictures rather than palliation of recurrent malignant disease. Hospitalizations, adverse events, and dilation potentially impact health-related quality of life; indeed, major postoperative adverse events have been shown to have a long-term impact on health-related quality of life after esophagectomy.[38] Our results suggest that, over the short term, esophagectomy for early esophageal cancer in elderly patients is associated with greater morbidity and potentially greater mortality.

Our study is unique in several respects. Although other studies have compared long-term outcomes after endoscopic treatment versus surgery, they have not focused on elderly patients, in whom surgical risks are potentially greater. Our study is unusual in its evaluation of short-term outcomes at a population level. We also assessed use of EUS and dilation in this population. Because SEER captures approximately one fourth of the U.S. population, our results may be generalized to the elderly.

Despite its strengths, the study had several limitations. Claims data lack detailed clinical information and do not capture patient preferences or patient characteristics such as frailty, which may impact decision-making regarding treatment approach. Most likely, not all endoscopically treated cases were identified because EMR lacks unique ICD-9-CM procedure codes or CPT codes. Due in part to NCI's data confidentiality policy, we were unable to adjust for esophagectomy volume, which may have impacted mortality. Adverse events could well have been undercoded—we focused on temporally correlated adverse events requiring intervention, because these may be more likely to occur in administrative data.[14] Nonetheless, because codes used to identify adverse events were not specific to endoscopy or esophagectomy, without access to medical records we cannot definitively ascribe these codes to treatment approach. Finally, our ability to detect differences in outcomes between treatment groups was limited by the relatively small number of patients receiving endoscopic treatment within each histology type.

In summary, in this elderly population, esophagectomy for early esophageal cancer was associated with worse short-term and long-term outcomes. Based on our results, endoscopic treatment may be a preferred approach for early esophageal cancers in the elderly. Future studies could compare health-related quality of life in older patients undergoing endoscopic versus surgical treatment for early esophageal cancers or evaluate costs associated with these treatment strategies.

43107	Total or near total esophagectomy, without thoracotomy; with pharyngogastrostomy or cervical esophagogastrostomy, with or without pyloroplasty (transhiatal)
43112	Total or near total esophagectomy, with thoracotomy; with pharyngogastrostomy or cervical esophagogastrostomy, with or without pyloroplasty (ie, McKeown esophagectomy, or tri-incisional esophagectomy)
43117	Partial esophagectomy, distal two-thirds, with thoracotomy and separate abdominal incision, with or without proximal gastrectomy; with thoracic esophagogastrostomy, with or without pyloroplasty (Ivor Lewis)
43286	Esophagectomy, total or near total, with laparoscopic mobilization of the abdominal and mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, laparoscopic transhiatal esophagectomy)
43287	Esophagectomy, distal two-thirds, with laparoscopic mobilization of the abdominal and lower mediastinal esophagus and proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with separate thoracoscopic mobilization of the middle and upper mediastinal esophagus and thoracic esophagogastrostomy (ie, laparoscopic thoracoscopic esophagectomy, Ivor Lewis esophagectomy)
43288	Esophagectomy, total or near total, with thoracoscopic mobilization of the upper, middle, and lower mediastinal esophagus, with separate laparoscopic proximal gastrectomy, with laparoscopic pyloric drainage procedure if performed, with open cervical pharyngogastrostomy or esophagogastrostomy (ie, thoracoscopic, laparoscopic and cervical incision esophagectomy, McKeown esophagectomy, tri-incisional esophagectomy)

Global Period 090 Meeting Date 10/2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: Expert Panel

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale: The current codes 43107, 43112, 43117 are used as reference for the same current codes and for the new multi-approach codes.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: These complex esophageal resection and reconstruction procedures require additional clinical staff time to assist the surgeon with multidisciplinary coordination. This was discussed during the initial practice expense review for not only the open procedures (43107, 43112, 43117), but other multidisciplinary complex procedures, and the PE Subcommittee agreed that 15 minutes accounted for the additional clinical staff time for this activity. The clinical staff time for the new multi-approach codes will require that same additional multidisciplinary coordination, and therefore we recommend that the additional 15 minutes be applied to the three new codes.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Discharge management coding has changed from 99238 to 99239. The standard minutes for 99239 have been applied to the current codes and the new codes.

Additional incision care pack for suture removal has been added. Patients will go home with drains sutured in place, requiring removal at an office visit. This will typically be performed on a different date/ different office visit than staple removal.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

A majority of the clinical staff time is related to phone calls that are made to coordinate with the facility, the patient, the family, other physician and surgeon offices (GI, rad-onc, assistant surgeon, PCP), as necessary to prepare for the procedure. For example, coordinating changes in polypharmacy with the PCP and other consultants such as GI prior to the procedure. Clinical staff will make several calls to complete pre-service diagnostic and referral forms and schedule space and equipment for the procedure. Neoadjuvant radiation may impose certain time restrictions/windows for when a procedure can be performed and scheduling changes may need to be reconciled. Additional tests, including labs and imaging, may be required as the patient recovers from chemo-rad therapy to verify status for surgery. Clinical staff will provide and review educational materials and information including instructions on diet and changes to medications prior to the procedure and what to expect after discharge from the hospital. Follow-up calls to the patient are needed prior to the procedure to confirm pre-procedure instructions are being carried out.

Intra-Service Clinical Labor Activities:

These patients will typically go home with feeding tubes and drains requiring the clinical staff to coordinate with home health and nutritional professionals as well as the family/caregiver to ensure that the patient has the correct feeding and nutritional support prior to discharge.

Post-Service Clinical Labor Activities:

Assist physician at postoperative E/M visits.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2016

Laparoscopic Total Hysterectomy

The CPT Editorial Panel created a new code to describe the laparoscopic total hysterectomy for resection of malignancy at their May 2016 meeting.

58575 Laparoscopy, surgical, total hysterectomy for resection of malignancy (tumor debulking), with omentectomy including salpingo-oophorectomy, unilateral or bilateral when performed
The RUC reviewed the survey data from 44 gynecology and oncology physician providers and determined that the survey 25th percentile work RVU of 32.60 appropriately accounts for the work required to perform this service. The RUC recommends the following physician time: pre-service time of 73 minutes, intra-service time of 240 minutes, and immediate post-service time of 33 minutes with three post-operative visits (2 – 99213 and 1- 99214). To validate a work RVU of 32.60, the RUC compared the survey code to top key reference code 58548 *Laparoscopy, surgical, with radical hysterectomy, with bilateral total pelvic lymphadenectomy and para-aortic lymph node sampling (biopsy), with removal of tube(s) and ovary(s), if performed* (work RVU =31.63, intra-service time of 240 minutes) and noted that the reference code has the same intra-service time, and the survey respondents indicated that the survey code is somewhat to much more intense to perform, further justifying this valuation.

The RUC noted that this is an intense procedure with a complex patient. This patient has had advanced stage ovarian cancer and abdominal carcinomatosis now treated with neoadjuvant chemotherapy. Patients with advanced cancer, especially those who have received chemotherapy preoperatively, are more likely to be malnourished, anemic, immunocompromised and susceptible to infection, and at higher risk of venous thromboembolism. In addition, the procedure is challenging given the course of the transverse colon from the hepatic flexure to the splenic flexure. Attachments to the colon need to be taken down carefully to ensure there is no traumatic or thermal injury to the bowel. The RUC agreed with the specialty that this procedure is intense and has an appropriate IWPUT of 0.102. **The RUC recommends a work RVU of 32.60 for CPT code 58575.**

Practice Expense:
The Practice Expense Subcommittee reviewed the recommended equipment for this procedure and agreed that it was not typical to have EQ170 *light, fiberoptic headlight w-source*. The Subcommittee agreed to add the standard exam light (EQ168). In addition, two pelvic exam pack supply items SA051 were added. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:58575 Tracking Number K1 Original Specialty Recommended RVU: **34.00**
Presented Recommended RVU: **32.60**
Global Period: 090 RUC Recommended RVU: **32.60**

CPT Descriptor: Laparoscopy, surgical, total hysterectomy for resection of malignancy (tumor debulking), with omentectomy including salpingo-oophorectomy, unilateral or bilateral when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 63-year-old female presented with advanced stage ovarian cancer with a large malignant pleural effusion. She was given neoadjuvant chemotherapy. Reassessment after chemotherapy demonstrates a good partial response with imaging tests that show an enlarged right ovarian mass, peritoneal thickening with an omental tumor, and a 3 cm mesenteric nodule. The patient is a good surgical candidate and has been offered a minimally invasive option for interval tumor debulking with a total laparoscopic hysterectomy and bilateral salpingo-oophorectomy and laparoscopic omentectomy, with resection of peritoneal, mesenteric and diaphragmatic implants, if present.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 98% , In the ASC 0%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 37% , Overnight stay-more than 24 hours 63%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 49%

Description of Pre-Service Work: The history and physical exam are reviewed and updated. Medicine reconciliation is performed. Labs, imaging studies, and biopsies are reviewed. The discontinuation of any high risk medication is verified. Appropriate antibiotic coverage is determined consistent with procedure risks and patient's known allergies. The method and timing of DVT prophylaxis is considered and implementation is assured. The procedure is verified with the patient and any remaining questions are answered. Physician changes into scrub clothes. The instruments and anticipated supplies are checked for completeness and functionality. The appropriate images are displayed in the operating room. Following induction of anesthesia a second IV is inserted. The patient is placed safely in dorsal lithotomy position. The arms are wrapped in foam and safely tucked alongside the body and all joints are inspected to prevent nerve compression. A tilt test is performed to verify the patient will tolerate maximum trendelenberg from a cardiopulmonary status and physical positioning. There is verification that the IVs, arterial-line, pulse oximetry and blood pressure monitoring are functioning with the arms tucked. The patient is placed back into a horizontal position. An oral-gastric tube is placed to decompress the stomach. The face and eyes are protected with pads or shields. The extent of surgical prep is delineated. Physician scrubs. The surgical timeout is performed. The patient is draped.

Description of Intra-Service Work: A bimanual and rectovaginal exam is performed under anesthesia to assess uterine size, mobility and nodularity in the cul de sac. A foley catheter is inserted into the bladder. A speculum in placed in the vagina and a tenaculum placed on the cervix. The uterus is sounded and the cervix dilated. An appropriate sized uterine manipulator is chosen, placed into the uterus and sutured in place. A diagnostic laparoscopy is performed, 5-6 laparoscopic ports are placed in the abdomen ranging in size from 5-12mm. Adhesions from the ovarian cancer are systematically lysed to provide visualization of abdominal and pelvic structures. The patient is assessed for intra-abdominal metastases, diaphragmatic metastases and retroperitoneal adenopathy. Biopsies of suspicious lesions are obtained. The bowels and bowel mesentery are systematically evaluated for the presence of metastatic disease. Peritoneal cytology is obtained. The Patient is placed into steep trendelenberg and the bowel is mobilized and dissected out of the pelvis. The retroperitoneum is

opened to identify the ureters, paravesical and pararectal spaces. The ureters are freed from pelvic and peritoneal metastasis. A total laparoscopic hysterectomy with bilateral salpingo-oophorectomy is performed. The uterus and ovaries are removed through the vagina. Extra-ovarian tumor masses are resected in the pelvis, the abdomen, from the bowel mesentery and diaphragm. Patient positioning is changed to resect disease in the upper abdomen. An omentectomy is performed by dissecting it free from the transverse colon and stomach. Specimens are removed through the vagina and the then vaginal closure is performed. After completing the resection of disease hemostasis is confirmed and the pelvis and abdomen are inspected for any injuries. All instruments and ports are removed and the port sites are closed

Description of Post-Service Work: The oral-gastric tube is removed. The prep is washed off the skin. The transfer of patient to recovery area is supervised. Vital signs are checked and immediate pain assessment is made. Recovery and postoperative medications are ordered and initiated. Patient condition, findings and anticipated outcome are related to family members. The anticipated recovery process and criteria for discharge are conveyed. Procedure documentation is created and reviewed. Labeled images from procedure are transferred to the medical record. The patient is assessed again later in the day to evaluate for any post-procedural complications and the findings at surgery are discussed with the patient. The patient is assessed again the following day, laboratory studies are obtained and reviewed. The patient is evaluated for pain, bowel function, urinary retention, fever, infection and hemodynamic stability. Findings at surgery are discussed with the patient. The patient is seen post op day 2 and assessed for appropriateness of discharge. Plans for discharge are made. Prescriptions for pain medications, DVT prophylaxis, resuming home medications and home therapy are processed. Restrictions of activities and precautions are outlined. Post-procedure follow-up is scheduled.

First Visit: Level 4 Office Visit (99214)
The patient is first seen 2-3 days post-discharge. A detailed history is performed to assess for pain, cardio-pulmonary status, return of bowel function, ileus, nausea and vomiting, lymphedema lower extremities, vaginal bleeding or discharge, bladder function and urinary retention, signs of infection or seroma, retroperitoneal bleeding, assessment for DVTs and nerve damage. Medications are reviewed. A detailed exam including general assessment, vitals, neurologic status, skin for infections, MSK for DVTs, cardio pulmonary exam, exam of perineum, GI exam for bowel function or hernias, lymphatic exam for lymphedema, vaginal bleeding. Laboratory studies are ordered, reviewed and prescriptions are filled as needed

Second Visit: Level 4 Office Visit (99214)
The patient is seen again at 10-14 days post op. A detailed history is taken to review pain, bowel and bladder function, vaginal bleeding or discharge, any signs of infection (incision, pelvic abscess or cuff cellulitis), DVTs, lymphedema, or post-operative complications. Medications are reviewed. Chronic medical conditions are assessed post operatively. A detailed exam is performed including general appearance, vital signs, cardiopulmonary exam, GI exam for bowel function and hernias, skin to assess for infection, lymphatic exam to assess for edema of groins, lower abdomen and external genitalia. An assessment for hematoma formation, seroma and formation is performed. A speculum exam is performed to assess for vaginal cuff healing or cellulitis. Prescriptions are filled as needed. Pathology is reviewed and timing for resuming therapy is addressed.

Third Visit: Level 4 Office Visit (99214)
The patient is next seen 3-6 weeks from the surgery. A detailed history is taken to evaluate for any residual bowel, bladder, gynecologic, pain or incisional issues. Chronic medical conditions are assessed post operatively. Review of medications and fitness for chemotherapy are assessed. A detailed exam to evaluate for any complications from surgery including vitals, a neurologic exam, assessment for incisional infections, hernias or tumor nodules in the port sites. GI and GU exam is performed and a speculum exam for assessment of vaginal cuff healing. Extremities are assessed for swelling. Laboratory studies are ordered and prescriptions are filled as needed.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	1.11	0.86
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.93	0.57
Urgency of medical decision making	0.89	0.86
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.37	1.14

Physical effort required	1.26	1.14

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.93	0.71
Outcome depends on the skill and judgment of physician	1.19	1.00
Estimated risk of malpractice suit with poor outcome	0.59	0.86

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	1.15	1.14

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel recently created a new code (58575) for reporting total hysterectomy, with resection of malignancy, performed laparoscopically.

Survey Data

ACOG received 44 completed RUC physician work surveys. The ACOG RUC workgroup reviewed the survey data and believes 34.00 work RVUs appropriately ranks this new procedure with services in OB/GYN and MPCs.

	CPT	IWPUT	wRVU	Total Time	Pre Time	Intra Time	Post Time	99232	99231	99238	99239	99214	99213	99212

Positioning Time

The society requests 5 extra minutes of positioning time to put the patient in the dorsal lithotomy position. The society also requests 5 additional minutes of positioning time, for a total of 13 minutes. The additional 5 minutes are needed because an additional IV is placed since anesthesia will not have access to the arms. The arms are carefully wrapped in foam and confirmed to be in a neutral position. The arms are tucked along the side of the

abdomen. Confirmation that IV lines, BP cuff and pulse oximetry are functioning with the arms tucked is required. Confirmation that no compression of nerves in the arms, hands, legs and feet is also performed. The patient is then placed into steep trendelenberg to confirm that there is no compromise to the patient's cardiopulmonary function in this position. Once it is confirmed that the steep trendelenberg position is well tolerated, the patient is placed back into a horizontal position. An oral gastric tube is placed to decompress the stomach. The face and eyes are padded or shielded to prevent injury.

Intensity
The society is recommending an IWPUT of 0.103 for this new procedure. This patient has had advanced stage ovarian cancer and abdominal carcinomatosis now treated with neoadjuvant chemotherapy. The physician has to be concerned about injuring bowel and blood vessels while accessing the peritoneal cavity. Techniques such as an open approach (Hasson), insertion of the verees needle and trocar in the LUQ can be considered, additional adhesions are universally encountered. There is often obliteration of normal anatomical planes and abnormal adhesions due to inflammation or fibrosis between loops of bowel and treated neoplasm. Ovaries and their blood supply are typically retracted into the retroperitoneum and obscured by colon and neoplasm. After development of appropriate spaces, and completion of the hysterectomy with or without oophorectomy, one has to bring the omentum into view. The omentum has tumor involvement and these areas are adherent to adjacent loops of small bowel and large bowl and their mesentery. Omentectomy is challenging given the course of the transverse colon from the hepatic flexure to the splenic flexure. Attachments to the colon need to be taken down carefully to ensure there is no traumatic or thermal injury to the bowel. Lesser Sac is eventually entered and then attachments just below the greater curvature of the stomach need to be taken down, vessels sealed and cut. As one gets closer to the splenic flexure, one needs to ensure avoidance of vasculature in the splenic hilum as well as tearing off the splenic capsule. Additional tumor implants will be resected. These are often embedded in the peritoneal surfaces with invasion of underlying musculature along gutters and the abdominal wall, and additionally may be adherent to the mesentery of small and large bowel requiring careful excision so as not to injure the blood supply of the bowel. Some of these implants may be in the anterior or posterior cul de sac increasing the likelihood of injury to the bladder and rectal wall. The surgery almost always involves all four quadrants of the abdomen requiring repositioning of the patient and instruments. Patients with advanced cancer, especially those who have received chemotherapy preoperatively, are more likely to be malnourished, anemic, immunocompromised and susceptible to infection, and at higher risk of venous thromboembolism.

Post Operative Visits
The society is requesting three level four office visits for this procedure, supported by survey data.

First Visit: Level 4 Office Visit (99214)
The patient is first seen 2-3 days post-discharge. A detailed history is performed to assess for pain, cardio-pulmonary status, return of bowel function, ileus, nausea and vomiting, lymphedema of the lower extremities, vaginal bleeding or discharge, bladder function and urinary retention, signs of infection or seroma, retroperitoneal bleeding, assessment for DVTs and nerve damage. Medications are reviewed. A detailed exam including general assessment, vital signs, neurologic status, skin for infections, lower extremity exam for DVTs, cardio pulmonary exam, exam of perineum, GI exam for bowel function or hernias, lymphatic exam for lymphedema, vaginal bleeding. Laboratory studies are ordered, reviewed and prescriptions are filled as needed

Second Visit: Level 4 Office Visit (99214)
The patient is seen again at 10-14 days post op. A detailed history is taken to review pain, bowel and bladder function, vaginal bleeding or discharge, any signs of infection (incision, pelvic abscess or cuff cellulitis), DVTs, lymphedema, or post-operative complications. Medications are reviewed. Chronic medical conditions are assessed post operatively. A detailed exam is performed including general appearance, vital signs, cardiopulmonary exam, GI exam for bowel function and hernias, skin to assess for infection, lymphatic exam to assess for edema of groins, lower abdomen and external genitalia. An assessment for hematoma formation, seroma and lymphocyst formation is performed. A speculum exam is performed to assess for vaginal cuff

healing or cellulitis. Prescriptions are filled as needed. Pathology is reviewed and timing for resuming therapy is addressed.

Third Visit: Level 4 Office Visit (99214)
The patient is next seen 3-6 weeks from the surgery. A detailed history is taken to evaluate for any residual bowel, bladder, gynecologic, pain or incisional issues. Chronic medical conditions are assessed post operatively. Review of medications and fitness for chemotherapy are assessed. A detailed exam to evaluate for any complications from surgery including vital signs, a neurologic exam, assessment for incisional infections, hernias or tumor nodules in the port sites. GI and GU exam are performed and a speculum exam for assessment of vaginal cuff healing. Extremities are assessed for swelling. Laboratory studies are ordered and prescriptions are filled as needed.

Recommendation
The specialty society is recommending 34.00 work RVUs for this new procedure with a total time of 544 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 58570/58571 and 49329

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gynecology/Oncology How often? Commonly

Specialty Obstetrics/Gynecology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Using the National Cancer Data Base (American College of Surgeons – Commission on Cancer), neoadjuvant chemotherapy (NACT - chemotherapy given prior to surgery) was provided in 16% of patients with Stages III and IV ovarian cancer in 2011, but the proportion is increasing annually. The American Cancer Society estimates that there will be 21,290 cases of ovarian cancer in 2015. Approximately 64% will present in Stages III and IV, or about 13,600 per year. If 16% receive NACT, then this would be 2180/year. If 50% are eligible for minimally invasive surgery due to a marked response (either complete or excellent partial), then a conservative estimate of about 1090 would be eligible for this procedure annually.

Specialty GynecologyOncology Frequency 1275 Percentage 85.00 %

Specialty ObstetricsGynecology Frequency 225 Percentage 15.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 600
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 40% of the ovarian cancers are in the Medicare population.

Specialty GynecologyOncology Frequency 510 Percentage 85.00 %

Specialty ObstetricsGynecology Frequency 90 Percentage 15.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Hysterectomy

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 58571

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

CPT Long Descriptor:

Laparoscopy, surgical, total hysterectomy for resection of malignancy (tumor debulking), with omentectomy including salpingo-oophorectomy, unilateral or bilateral when performed

(Do not report 58575 in conjunction with 49255, 49320, 49321, 58570, 58571, 58572, 58573, 58661)

Global Period: 090 **Meeting Date:** October 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ACOG convened a workgroup consisting of their CPT/RUC committee members and SGO representatives. The workgroup developed these practice expense recommendations based on the physician survey results, the clinical aspects of the procedure and standard PE committee inputs.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We included CPT Code 58548 as a PE reference code. It was chosen as the key reference service on the physician work survey and includes similar direct practice expense inputs as the newly created service.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Time

Complete Pre-service diagnostic and referral forms (5)
Clinical staff is utilized for explanation of procedure to stakeholders (i.e. insurance company nurse) and secure appropriate approval.

Coordinate pre-surgery services/review tests/exam results (20)
Obtain pathology reports and slides if necessary from referring physician. Coordinate and evaluate necessary testing for medical clearance of surgery including cardio-pulmonary status and metabolic status.

Schedule space and equipment in facility (8)
Clinical staff is utilized to schedule space in the facility.

Provide pre-service education/obtain consent (20)
Standard consent with additional education for a new cancer diagnosis and loss of future fertility. Additional education for DVT prophylaxis, bowel prep, and comorbidity management is completed. Review of supplements and medications is critical with use of DVT prophylaxis.

PRE phone calls & prescriptions (3)
Anticoagulation prophylaxis and preoperative antibiotics for bowel prep.

Intra-Service Clinical Labor Activities

Standard Discharge Management (12)

Post-Service Clinical Labor Time

Post-Operative day 3 office visit (99214) to evaluate postoperative progress reviewing bowel, bladder, lymphatic, neurologic sequelae as well as DVT surveillance, seroma development and routine wound evaluation of multiple incisions. History involves multiple system discussion and physical exam includes vulvar exam for seroma development in addition to routine post-operative evaluation of multiple systems.

Post-Operative day 7-10 office visit (99214) to evaluate postoperative progress reviewing bowel, bladder, lymphatic, neurologic sequelae as well as DVT surveillance, seroma development and routine wound evaluation of multiple incisions. History involves multiple system discussion and physical exam includes vulvar and vaginal cuff exam for seroma development in addition to routine post-operative evaluation of multiple systems.

Post-Operative day 35-42 (99214) to evaluate postoperative progress reviewing bowel, bladder, lymphatic, neurologic sequelae and routine wound evaluation of multiple incisions. History involves multiple system discussion and physical exam includes vulvar and vaginal cuff exam for possible carcinomatous implant development in addition to routine post-operative evaluation of multiple systems.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures Screen

October 2016

Pulmonary Diagnostic Tests

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 94620 was identified via this screen.

In January 2016, the specialty societies explained that they submitted a Code Change Application (CCA) for the February 2016 CPT Editorial Panel meeting as CPT codes 94620 and 94621 required revisions that would allow the survey respondents to better value these services. Code 94620 described two different tests commonly performed for evaluation of dyspnea, the six minute walk test as well as pre-exercise and post-exercise spirometry. These tests are entirely different and should be described with two separate codes. In addition, code 94620 described a "simple" pulmonary exercise test and code 94621 a "complex" pulmonary exercise test. The testing described in 94621 is commonly called a cardiopulmonary exercise test (CPET) and not a complex pulmonary exercise test as it is currently labeled in CPT 2016. Code 94621 includes the measurement of minute ventilation and exhaled gases in addition to heart rate, oximetry and ECG monitoring. As such, it should not be included as part of the family of less complex exercise tests. The RUC referred CPT code 94620 to the CPT Editorial Panel. In February 2016, the CPT Editorial Panel deleted code 94620, added two new codes 94617 & 94618 to report an exercise test for bronchospasm, and revised code 94621 to describe a cardiopulmonary exercise test.

The RUC discussed the survey results for CPT codes 94617, 94621and 94618 and determined that the survey respondents indicated immediate post-procedure physician time was not representative of the time required to perform this service. The RUC noted that the description of immediate post-procedure physician work described the same intensity for each of the three services but was not represented the same across all three services by the survey respondents.

The standard survey instrument did indicate that the survey respondents should capture the interpretation and report work in the intra-service time period as is typical for XXX global services, but the specialty society contends that the survey respondents did not appear to capture the physician time correctly. The RUC recommended that the specialty societies resurvey codes 94617, 94621and 94618 with the same exact survey instrument (the current standard RUC survey for imaging and tests) for the October 2016 RUC meeting.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

94618 Pulmonary stress testing (eg, 6-minute walk test), including measurement of heart rate, oximetry and oxygen titration, when performed
The RUC reviewed the survey data from 73 physician providers and recommends the survey 25th percentile work RVU of 0.48. The RUC recommends the following physician time: pre-service time of 3 minutes, intra-service time of 10 minutes, and immediate post-service time of 4 minutes. The pre and post time were discussed in detail because an Evaluation and Management (E/M) service is performed on the same day. Therefore, 2 minutes of pre-service evaluation and 6 minutes of immediate post-service time were removed to ensure no duplication of work is performed. It was noted that this code should represent 95% of services previously reported with CPT code 94620. Newly described code 94618 requires less physician time than previously reported 94620 and thus the RUC is recommending a decrease in the work RVU for this service.

The RUC compared this service to CPT code 99212 *Office or other outpatient visit for the evaluation and management of an established patient…Typically, 10 minutes are spent face-to-face with the patient and/or family.* (work RVU=0.48, intra-service time of 10 minutes) and code 74230 *Swallowing function, with cineradiography/videoradiography* (work RVU=0.53 and an intra-service time of 10 minutes) and noted that both reference services have identical intra-service time and should be valued similarly. To further validate a work RVU of 0.48, the RUC compared the survey code to top key reference code 93015 *Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report* (work RVU=0.75, intra-service time of 20 minutes) and noted that the survey code has lower intra-service time, and the survey respondents indicated that the survey code is identical to less intense to perform, further justifying this valuation. **The RUC recommends a work RVU of 0.48 for CPT code 94618**

94617 Exercise test for bronchospasm, including pre- and post-spirometry and pulse oximetry
The RUC reviewed the survey data from 71 physician providers and recommends the survey median of 0.70 work RVUs for CPT code 964X2. The RUC recommends the following physician time: pre-service time of 6 minutes, intra-service time of 10 minutes, and immediate post-service time of 10 minutes. It was noted that this code should represent 5% of services previously reported with CPT code 94620 and that this service is not billed with an E/M typically, leading to acceptance of the survey median pre and post-service times. This post-service time work reflects the following: Discuss the findings with the patient. Discussion includes the patient's response to exercise, severity of bronchospasm along with appropriate change in their medication regimen. Further discussion of mandatory exercise preparation including warm up and modifications as needed based on environmental conditions, (i.e. warming devices). Additionally, instructions need to be given on pre-exercise medication use and timing, dietary modification and nutritional supplementation. Develop plans for therapy and/or additional testing. Communicate the results with the referring physician and complete any necessary return forms.

For additional support the RUC referenced similar services 76642 *Ultrasound, breast, unilateral, real time with image documentation, including axilla when performed; limited* (work RVU=0.68, intra-service time of 10 minutes) and 78226 *Hepatobiliary system imaging, including gallbladder when present;* (work RVU=0.74, intra-service time of 10 minutes). To validate a work RVU of 0.70, the RUC compared the survey code to top key reference code 93015 *Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report* (work RVU=0.75, intra-service time

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

of 20 minutes) and noted that the survey code has slightly lower intra-service time, and the survey respondents indicated that the survey code is identical to somewhat less intense to perform, further justifying this valuation. **The RUC recommends a work RVU of 0.70 for CPT code 94617**

94621 Cardiopulmonary exercise testing, (including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings

The RUC reviewed the survey data from 70 physician providers and recommends maintaining the current work RVU of 1.42 for CPT code 94621. The RUC recommends the following physician time: pre-service time of 10 minutes, intra-service time of 30 minutes, and immediate post-service time of 10 minutes. The RUC compared this service to 95806 *Sleep study, unattended, simultaneous recording of, heart rate, oxygen saturation, respiratory airflow, and respiratory effort (eg, thoracoabdominal movement)* (work RVU=1.25, intra-service time of 25 minutes) and 99214 *Office or other outpatient visit for the evaluation and management of an established patient…Typically, 25 minutes are spent face-to-face with the patient and/or family.* (work RVU=1.50, intra-service time of 25 minutes) and noted that both reference services have comparable physician work and time with code 94621 and provide appropriate brackets around the recommended value.

For additional support, the RUC referenced similar services 99203 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU=1.42, intra-service time of 20 minutes) and 99497 *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; first 30 minutes, face-to-face with the patient, family member(s), and/or surrogate* (work RVU=1.50, intra-service time of 30 minutes). To validate a work RVU of 1.42, the RUC compared the survey code to top key reference code 93015 *Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report* (work RVU=0.75, intra-service time of 20 minutes) and noted that the survey code has higher intra-service time, and the survey respondents indicated that the survey code is somewhat more to much more intense to perform, further justifying this valuation. **The RUC recommends a work RVU of 1.42 for CPT code 94621.**

Practice Expense:

The RUC reviewed and accepted the direct PE inputs as modified by the Practice Expense Subcommittee.

Work Neutrality:

The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:94618 Tracking Number F3 Original Specialty Recommended RVU: **0.48**
Presented Recommended RVU: **0.48**
Global Period: XXX RUC Recommended RVU: **0.48**

CPT Descriptor: Pulmonary stress testing (eg, 6-minute walk test), including measurement of heart rate, oximetry and oxygen titration, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female with documented COPD is evaluated for symptoms of dyspnea while walking.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: This service is typically billed with an E/M. Therefore in addition to review patient personal data and review medical information to determine the rationale to perform the exercise test, this service includes assessing the patient for any acute illnesses or other change in clinical status that would determine fitness for the test on same day.

Description of Intra-Service Work: Review data on SpO2, heart rate and distance measured at 1, 2, 3, 4, 5 and 6 minutes as well as blood pressure measured before and after exercise. Calculate percent of distance compared to predicted. Review the dyspnea index. Analyze the data and check for irregularities. Compare to previous testing, if available. Prepare a written report including an interpretation of the test results.

Description of Post-Service Work: Discuss the findings with the patient. Discussion includes reason and timing for Oxygen supplementation, environmental conditions, appropriate flow rates and medication changes if necessary. Develop plans for physical therapy or pulmonary rehabilitation and/or additional testing. Communicate the results with the referring physician, including the development or revision of oxygen prescriptions.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.20	0.23
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.13	0.38
Urgency of medical decision making	0.00	0.38

Technical Skill/Physical Effort (Mean)

Technical skill required	-0.47	-0.15
Physical effort required	-0.53	0.15

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.07	0.54
Outcome depends on the skill and judgment of physician	-0.20	0.23
Estimated risk of malpractice suit with poor outcome	-0.33	0.38

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	-0.40	0.31

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

As part of the proposed CY 2016 rule, CMS identified CPT 94620 as potentially misvalued based on volume and the year it had last been surveyed. In preparing for a potential RUC survey of the code and any code in the family the American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST) reviewed the CPT codes, descriptions and vignettes. To provide clarity in the code descriptions and bring the services to current practice, the joint societies prepared revisions for the CPT Panels to consider prior to moving to survey. At the February 2016 CPT meeting the panel approved revisions to CPT 94621 and created two new codes to replace 94620. Specifically, the changes that involve code 94620 describes two different tests commonly performed for evaluation of dyspnea, the six-minute walk test, as well as, pre-exercise and post-exercise spirometry for the assessment of exercise-induced bronchoconstriction. These tests are entirely different and for future CPT versions will be described with two separate codes 94617 and 94618. In addition, code 94620 described a "simple" pulmonary exercise test and code 94621 a "complex" pulmonary exercise test. The testing described in 94621 is commonly called a cardiopulmonary exercise test (CPET) and not a complex pulmonary exercise test as it is currently labeled in CPT 2016. Code 94621 includes the measurement of minute ventilation and exhaled gases for many calculations including oxygen consumption or VO2Max, in addition to heart rate, oximetry and ECG monitoring. Regarding the volume for CPT 94620, we project that 95 % will go to 94618 and 5% to 94617.

In April 2016, we conducted a survey of CPT 94618, 94617 and revised 94621 and presented that data to the RUC. We have provided the April 2016 survey data along with this summer's survey results in one RUC

summary table for ease of review. The April 2016 Tab 9, went to facilitation, where a robust discussion about the times were reviewed. The pulmonary community has participated in several surveys recently, some of which were global 000. We hypothesized, our societies members might not have placed time for the report in the intra service location. The facilitation committee agree that a resurvey with highlighted aspects of the survey tool (approved by the research committee) would be beneficial. The societies obtained approval from the AMA research committee for a revised cover letter to members and revised survey tool to ensure that members did not misunderstand or miss the instructions to place their estimate of time for the "report time" in the intra service time estimate. Additionally, the societies widened the pool of survey participants in an attempt to obtain a higher response rate.

94618 July 2016 Survey Compared to April 2016 Survey Results & Recommendations:

A joint ATS and CHEST RVS consensus committee (herein referred to as "joint societies") reviewed and discussed both sets of survey results. Both surveys contained all three codes and was conducted with random members from both societies, removing any duplicates as necessary. The ATS and CHEST distribution lists were randomly selected by the membership departments. The April survey was sent to 3557 participants while the July survey was sent to 11500 participants, with changes to the survey tool noted above in the background.

The joint societies reviewed the summary data of 73 (61, April 2016) responses to the survey request. There were 9 respondents that took both surveys. Of note, in the July survey an increased percentage of 85 percent compared to 78 percent of the survey respondents stated the vignette was typical. The survey performance rate median 50 studies (from both surveys) per year among the respondents is an anticipated rate given this service will be the higher volume procedure compared to the 94617, which adds support to the survey responses. The joint societies reviewed the July 2016 survey times and agreed that the physician median times of 6 minutes pre-service, 10 minutes' intra-service, accurately reflect the time required to perform this service we are recommending 5 minutes of post service time.

The team reviewed the RVWs survey data, of note the current code 94620 is 0.64 RVW and is similar CPT 94618 survey median 0.66. As this code will be ninety-five percent of the volume as mentioned earlier and is less work than 94617 we believe that the survey 25th percentile is the appropriate RVW. We also believe the survey participants correctly rank ordered the new 94617 to 94618 at the median level.

The key reference code 1 chosen was 93015 *Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report* by 29 respondents and the key reference code 2, 94013 *Measurement of lung volumes (ie, functional residual capacity [FRC], forced vital capacity [FVC], and expiratory reserve volume [ERV]) in an infant or child through 2 years of age.* We believe this supports rank order for our recommendation. The intensity complexity comparisons for key reference code 1 and 2 support our recommendation.

We then reviewed other similar RUC surveyed codes noted in the table below and believe that these services support accepting CPT 94618 at the April 2016 median survey RVW 0.48 with the median times 5-10-5.

CPT	***Short Description***	RVW	Pre	Intra	Post	Total
99212	E/M, typical 10 min	0.48	2	10	4	16
78014	Thyroid imaging with single or multiple uptake(s) quantitative measurement(s)	0.50	5	10	5	20
94618	Pulmonary stress testing (eg, 6-minute	0.48	5	10	5	20

	walk test), including measurement of heart rate, oximetry and oxygen titration, when performed	REC	REC	REC	REC	REC
74230	CINE/Xray throat/esoph	0.53	3	10	4	17
93015	Cardiovascular stress test; with supervision, interpretation and report	0.75	2	20	4	26

In summary, CPT 94618 tracking code F3, the joint societies recommend the RVW 0.48 with pre time 5 minutes, intra time 10 minutes and 5 minutes of post time.

After RUC descussion, CPT 94618 tracking code F3, the joint societies recommend the RVW 0.48 with pre time 3 minutes, intra time 10 minutes and 4 minutes of post time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Per the billed with E/M codes files supplied by the RUC this service is typically provided along with one of the E/Ms

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See RUC billed with files.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 94620

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary Disease How often? Commonly

Specialty Internal Medicine How often? Sometimes

Specialty Critical Care How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 709716

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 3 times preliminary 2015 Medicare Data

Specialty Pulmonary Disease	Frequency 532287	Percentage 75.00 %
Specialty Internal Medicine	Frequency 85166	Percentage 12.00 %
Specialty Critical Care	Frequency 92263	Percentage 12.99 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 236,572 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Preliminary 2015 Medicare Data

Specialty Pulmonary Disease	Frequency 177429	Percentage 75.00 %
Specialty Internal Medicine	Frequency 28389	Percentage 12.00 %
Specialty Critical Care	Frequency 30754	Percentage 12.99 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:94617 Tracking Number F1 Original Specialty Recommended RVU: **0.64**
Presented Recommended RVU: **0.70**
Global Period: XXX RUC Recommended RVU: **0.70**

CPT Descriptor: Exercise test for bronchospasm, including pre- and post-spirometry and pulse oximetry

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female is seen because of dyspnea and cough after walking several city blocks. She has a normal physical examination.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review patient personal data. Review medical information to determine the rationale to perform the exercise test.

Description of Intra-Service Work: Physician is typically present for the exercise portion of the procedure. Review patient data from exercise on treadmill or stationary bicycle–miles per hour, percent incline, exercise stage, heart rate, blood pressure and SpO2. Review ECG strips taken during exercise and recovery. Review base line spirometry results before the exercise test and multiple spirometric results following exercise. Analyze the data and check for irregularities. Prepare a written report including an interpretation of the test results.

Description of Post-Service Work: Discuss the findings with the patient. Discussion includes the patient's response to exercise, severity of bronchospasm along with appropriate change in their medication regimen. Further discussion of mandatory exercise preparation including warm up and modifications as needed based on environmental conditions, (i.e. warming devices). Additionally, instructions need to be given on pre-exercise medication use and timing, dietary modification and nutritional supplementation. Develop plans for therapy and/or additional testing. Communicate the results with the referring physician and complete any necessary return forms.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	**2nd Key Ref Code**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.32	0.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.16	0.13
Urgency of medical decision making	-0.53	0.07
Technical Skill/Physical Effort (Mean)		
Technical skill required	-0.05	0.20

Physical effort required	-0.21	0.20
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	-0.37	0.20
Outcome depends on the skill and judgment of physician	-0.11	0.27
Estimated risk of malpractice suit with poor outcome	-0.32	0.20

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**
Time Segment (Mean)		
Overall intensity/complexity	-0.05	0.13

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

As part of the proposed CY 2016 rule, CMS identified CPT 94620 as potentially misvalued based on volume and the year it had last been surveyed. In preparing for a potential RUC survey of the code and any code in the family the American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST) reviewed the CPT codes, descriptions and vignettes. To provide clarity in the code descriptions and bring the services to current practice, the joint societies prepared revisions for the CPT Panels to consider prior to moving to survey. At the February 2016 CPT meeting the panel approved revisions to CPT 94621 and created two new codes to replace 94620. Specifically, the changes that involve code 94620 describes two different tests commonly performed for evaluation of dyspnea, the six-minute walk test, as well as, pre-exercise and post-exercise spirometry for the assessment of exercise-induced bronchoconstriction. These tests are entirely different and for future CPT versions will be described with two separate codes 94617 and 94618. In addition, code 94620 described a "simple" pulmonary exercise test and code 94621 a "complex" pulmonary exercise test. The testing described in 94621 is commonly called a cardiopulmonary exercise test (CPET) and not a complex pulmonary exercise test as it is currently labeled in CPT 2016. Code 94621 includes the measurement of minute ventilation and exhaled gases for many calculations including oxygen consumption or VO2Max, in addition to heart rate, oximetry and ECG monitoring. Regarding the volume for CPT 94620, we project that 95 % will go to 94618 and 5% to 94617.

In April 2016, we conducted a survey of CPT 94618, 94617 and revised 94621 and presented that data to the RUC. We have provided the April 2016 survey data along with this summer's survey results in one RUC summary table for ease of review. The April 2016 Tab 9, went to facilitation, where a robust discussion about the times were reviewed. The pulmonary community has participated in several surveys recently, some of which were global 000. We hypothesized, our societies members might not have placed time for the report in the intra service location. The facilitation committee agree that a resurvey with highlighted

aspects of the survey tool (approved by the research committee) would be beneficial. The societies obtained approval from the AMA research committee for a revised cover letter to members and revised survey tool to ensure that members did not misunderstand or miss the instructions to place their estimate of time for the "report time" in the intra service time estimate. Additionally, the societies widened the pool of survey participants in an attempt to obtain a higher response rate.

94617 July 2016 Survey Compared to April 2016 Survey Results & Recommendations:

A joint ATS and CHEST RVS consensus committee (herein referred to as "joint societies") reviewed and discussed both sets of survey results. Both surveys contained all three codes and was conducted with random members from both societies, removing any duplicates as necessary. The ATS and CHEST distribution lists were randomly selected by the membership departments. The April survey was sent to 3557 participants while the July survey was sent to 11500 participants, with changes to the survey tool noted above in the background.

The joint societies reviewed the summary data of 71 (54, April 2016) responses to the survey request. There were 9 respondents that took both surveys. Of note, in the July survey an increased percentage of 84 percent compared to 64 percent of the survey respondents stated the vignette was typical. The survey performance rate median 10 studies (in both surveys) per year among the respondents is an anticipated rate given this service will be the lower volume procedure (5%) compared to the current CPT code 94620, which adds support to the survey responses. The joint societies reviewed the survey times and agreed that the physician median times of 6 minutes pre-service, 10 minutes' intra-service and 10 minutes' post time, accurately reflect the time required to perform this service.

The team reviewed the RVWs survey data, of note the median for the current code 94620 is 0.64 RVW. The survey median is close but less than the median for the current code CPT 94620. As this code will be five percent of the volume as mentioned earlier and is more work than 94618. We believe that the survey median accurately reflects the increased work and complexity of CPT 94617 compared to 94618. The team also reviewed the 25th percentile, 0.49 (both surveys) as compared to other RUC approved codes (see table below) and agree that the 25th percentile would be too low to recommend and would not preserve rank order among other services. The key reference code 1 chosen was 93015 *Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report* by 24 respondents and the key reference code 2, 94060 *Bronchodilation responsiveness, spirometry as in 94010, pre- and post-bronchodilator administration.* We believe this supports rank order with this recommendation. The intensity complexity comparisons for key reference code 1 and 2 support our recommendation.

We then reviewed other similar RUC surveyed codes noted in the table below and believe that these services support accepting the median value for CPT 94617 at RVW 0.70 with the median times 6-10-10 appropriately placing the RVW is correct rank relativity.

CPT	*Short Description*	RVW	Pre	Intra	Post	Total
99212	E/M, typical 10 min	0.48	2	10	4	16
78014	Thyroid imaging with single or multiple uptake(s) quantitative measurement(s)	0.50	5	10	5	20
74230	CINE/Xray throat/esoph	0.53	3	10	4	17
94617	Exercise test for bronchospasm, including pre- and post-spirometry and pulse oximetry	0.70 REC	6 REC	10 REC	10 REC	26 REC
76642	Ultrasound breast limited	0.68	5	10	5	20

78226	Hepato Imag without drug and quant	0.74	5	10	5	20
93015	Cardiovascular stress test; with supervision, interpretation and report	0.75	2	20	4	26

In summary, for CPT 946X2 tracking code F1 we recommend the median RVW 0.70 and the median survey times, pre time 6 minutes, intra time 10 minutes and 10 minutes of post time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 94620

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:94621 Tracking Number F3 Original Specialty Recommended RVU: **1.42**
Presented Recommended RVU: **1.42**
Global Period: XXX RUC Recommended RVU: **1.42**

CPT Descriptor: Cardiopulmonary exercise testing, including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings

(Do not report 94621 in conjunction with 94250, 94680, 94681 and 94690)
(Do not report 946X2, 946X3, 94621 in conjunction with 94760, 94761)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male has unexplained dyspnea, which interferes with his ability to work and exercise. A cardiopulmonary exercise test is ordered after other studies fail to identify the cause of dyspnea.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review patient personal data. Review medical information to determine the rationale to perform the complex exercise test.

Description of Intra-Service Work: Physician is typically present for the exercise portion of the procedure. Review data on oxygen uptake, CO2 output, work, anaerobic threshold (AT), heart rate, O2 pulse, blood pressure, heart rate reserve, maximum ventilation, tidal volume, respiratory rate, breathing reserve, end-tidal CO2, end-tidal O2, VE/CO2 at AT, VE/O2 at AT, VD/VT at rest and exercise, RQ, SpO2 at peak exercise, VO2/work and HR/VO2. Review the 9 graphs from the exercise data. Review ECG strips taken prior to, during and after exercise. Check all data for irregularities. Analyze the data and prepare a written report including an interpretation of the test results..

Description of Post-Service Work: Discuss the findings with the patient. The extensive and varied data achieved from this test will reveal the presence of primary pulmonary, pulmonary vascular, cardiac, or other cardiopulmonary pathology as well as obesity, deconditioning or fitness for lung resection or other major surgeries. Communicate the results with the referring physician and includes discussions with additional consultants as needed.

SURVEY DATA

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
93015	XXX	0.75	**RUC Time**

CPT Descriptor Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 25 minutes are spent face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
94003	XXX	1.37	**RUC Time**	73,384

CPT Descriptor 1 Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, each subsequent day

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99214	XXX	1.50	**RUC Time**	95,385,867

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 25 minutes are spent face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99203	XXX	142.00	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Typically, 30 minutes are spent face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 21 **% of respondents:** 30.0 **%**

Number of respondents who choose 2nd Key Reference Code: 14 **% of respondents:** 20.0 **%**

TIME ESTIMATES (Median)	**CPT Code:** 94621	**Top Key Reference CPT Code:** 93015	**2nd Key Reference CPT Code:** **99214**
Median Pre-Service Time	10.00	2.00	5.00
Median Intra-Service Time	30.00	20.00	25.00
Median Immediate Post-service Time	10.00	4.00	10.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.95	0.57
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	1.00	0.64
Urgency of medical decision making	0.57	0.14
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.81	-0.07
Physical effort required	-0.11	0.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	0.48	1.36
Outcome depends on the skill and judgment of physician	0.95	1.21
Estimated risk of malpractice suit with poor outcome	0.57	1.29

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.86	1.43

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

As part of the proposed CY 2016 rule, CMS identified CPT 94620 as potentially misvalued based on volume and the year it had last been surveyed. In preparing for a potential RUC survey of the code and any code in the family the American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST) reviewed the CPT codes, descriptions and vignettes. To provide clarity in the code descriptions and bring the services to current practice, the joint societies prepared revisions for the CPT Panels to consider prior to moving to survey. At the February 2016 CPT meeting the panel approved revisions to CPT 94621 and created two new codes to replace 94620. Specifically, the changes that involve code 94620 describes two different tests commonly performed for evaluation of dyspnea, the six-minute walk test, as well as, pre-exercise and post-exercise spirometry for the assessment of exercise-induced bronchoconstriction. These tests are entirely different and for future CPT versions will be described with two separate codes 94617 and 94618. In addition, code 94620 described a "simple" pulmonary exercise test and code 94621 a "complex" pulmonary exercise test. The testing described in 94621 is commonly called a cardiopulmonary exercise test (CPET) and not a complex pulmonary exercise test as it is currently labeled in CPT 2016. Code 94621 includes the measurement of minute ventilation and exhaled gases for many calculations including oxygen consumption or VO2Max, in addition to heart rate, oximetry and ECG monitoring. Regarding the volume for CPT 94620, we project that 95 % will go to 94618 and 5% to 94617.

In April 2016, we conducted a survey of CPT 94618, 94617 and revised 94621 and presented that data to the RUC. We have provided the April 2016 survey data along with this summer's survey results in one RUC summary table for ease of review. The April 2016 Tab 9, went to facilitation, where a robust discussion about the times were reviewed. The pulmonary community has participated in several surveys recently, some of which were global 000. We hypothesized, our societies members might not have placed time for the report in the intra service location. The facilitation committee agree that a resurvey with highlighted aspects of the survey tool (approved by the research committee) would be beneficial. The societies obtained approval from the AMA research committee for a revised cover letter to members and revised survey tool to ensure that members did not misunderstand or miss the instructions to place their estimate of time for the "report time" in the intra service time estimate. Additionally, the societies widened the pool of survey participants in an attempt to obtain a higher response rate.

94621 July 2016 Survey Compared to April 2016 Survey Results & Recommendations:

A joint ATS and CHEST RVS consensus committee (herein referred to as "joint societies") reviewed and discussed both sets of survey results. Both surveys contained all three codes and was conducted with random members from both societies, removing any duplicates as necessary. The ATS and CHEST distribution lists were randomly selected by the membership departments. The April survey was sent to 3557 participants while the July survey was sent to 11500 participants, with changes to the survey tool noted above in the background.

The joint societies reviewed the summary data of 70 (47, April 2016) responses to the survey request. There were 9 respondents that took both surveys. Of note, in the July survey an increased percentage of 95 percent compared to 92 percent of the survey respondents stated the vignette was typical. The survey performance rate median 20 studies per year among the respondents is an anticipated rate given this service volume compared to the current CPT code 94620, which adds support to the survey responses. The joint societies reviewed the survey times and agreed that the physician median times of 10 minutes pre-service, 30 minutes' intra-service and 15 minutes' post time, reflects the time required to perform this service. Since both surveys came in at the same times, we believe that lends strength to accepting them as the appropriate times for this service.

The team reviewed the RVWs survey data, of note, the median 1.78 RVW from the July 2016 survey is higher in value than the median April 2016 RVW of 1.45 and higher than the current value 1.42. The team then discussed if there was compelling evidence to justify asking for the median and the experts stated that there was a new guideline implemented in 2003. This codified a wider range of measurements to be tracked and would be evidence to suggest a higher work value. The team also reviewed the 25th percentile, 1.05 as compared to other RUC approved codes (see table below) and agree that the 25th percentile would be too low to recommend and would not preserve rank order among other services. However, comparing the increase in RVW with a decrease in time is not consistent with other RUC recommendations, therefore, the team will not present compelling evidence for an increase in RVW, rather will recommend maintaining the current value with the survey times. We reviewed the new intensity complexity measures and these also support the higher RVW survey value as compare to the reference codes.

The key reference code 1 chosen was 93015 *Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with supervision, interpretation and report* by 21 respondent and the key reference code 2, 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 25 minutes are spent face-to-face with the patient and/or family;* by 14 survey participants, neither have higher RVWs and times than the survey median or current values.

We then reviewed other similar RUC surveyed codes noted in the table below and believe that these services support maintaining with magnitude estimation to 99213 CPT 94621 at the current RVW 1.42 with the median times 10-30-15.

CPT	*Short Description*	RVW	Pre	Intra	Post	Total
93015	Cardiovascular stress test; with supervision, interpretation and report	0.75	2	20	4	26
97001	Physical therapy evaluation	1.20	4	30	6	42
88187	Flow cytometry, interpretation; 2 to 8 markers	1.36	5	30	3	38
94621	Cardiopulmonary exercise testing, including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings	1.42 REC	10 REC	30 REC	15 REC	55 REC
99203 Mag Est.	Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Typically, 30 minutes are spent face-to-face with the patient and/or family.	1.42	4	20	5	29
99497	Advance Care Planning	1.50	5	30	10	45
90832	Psychotherapy, 30 minutes	1.50	5	30	10	45

95076	Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance); initial 120 minutes of testing	1.50	7	30	5	42

In summary, for CPT 94621, tracking code F3, the joint societies believe the survey median supports maintaining the RVW current work value as well as magnitude estimating with 99203. We recommend maintaining the RVW 1.42 with survey pre time 10 minutes, intra time 30 minutes and 15 minutes of post time.
After RUC discussion for CPT 94621, tracking code F3, the joint societies believe the survey median supports maintaining the RVW current work value as well as magnitude estimating with 99203. We recommend maintaining the RVW 1.42 with survey pre time 10 minutes, intra time 30 minutes and 10 minutes of post time

---

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 94621

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary Disease How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 49242
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. 3 times Preliminary Medicare 2015 data

Specialty Pulmonary Disease Frequency 24621 Percentage 50.00 %

Specialty Cardiology Frequency 17235 Percentage 35.00 %

Specialty Internal Medicine Frequency 7386 Percentage 14.99 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 16,414 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Preliminary Medicare 2015 data

Specialty Pulmonary Disease Frequency 8207 Percentage 50.00 %

Specialty Cardiology Frequency 5745 Percentage 35.00 %

Specialty Internal Medicine Frequency 2462 Percentage 14.99 %

Do many physicians perform this service across the United States? Yes

---

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

94617	*Exercise test for bronchospasm, including pre- and post-spirometry and pulse oximetry*
94618	*Pulmonary stress testing (eg, 6-minute walk test), including measurement of heart rate, oximetry and oxygen titration, when performed*
94621	*Cardiopulmonary exercise testing, including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings*

Global Period: **XXX** Meeting Date: **April 2015**

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: *A joint society consensus with members from two societies participating including; American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST).*

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: *Existing code 94620 was brought forward from a CMS request for review. 94620 and 94621 were brought to CPT from the joint societies for revisions prior to survey.*
For 94618 we used CPT 94620 as the reference, of note, we removed inputs that would be duplicative with an E/M that was billed at 52% of the time during this review. For the revised code 94621 we used 94621 inputs for a reference. For 94617 we used a combination of 94620 which is listed plus looking to 94060 and 93015 as all these codes have PE elements for the new code 94617.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

LINE 23 (5 minutes more than standard for 94621 only total 10 minutes)
CPT 94621 Preservice education of the patient begins with history of activity limitations, current smoking history, recent respiratory infection history and level of exertion that the patient is able to perform as well as a review of current medications. This is needed in order to determine which exercise protocol (level of work) is to be used for the study. The patient is also educated on how to rate breathlessness during the testing as well as leg fatigue, as both will be rated multiple times during the test. An explanation of the equipment used including the bicycle ergometer and pedal speed/s during the warm up and exercise is needed. An explanation of the monitoring equipment including the mask, pulse oximeter, blood pressure cuff and multiple ECG leads will be given. The patient will need to understand and follow directions while wearing a tight fitting facemask. More time than the standard is required to ensure compliance during the test and to answer the patient's questions prior to beginning the procedure.

LINE 24 (94621 8 minutes more than standard 2 minutes but less than current 20 minutes)
CPT 94621 requires a total of 10 minutes for preparing the room. Typically the room and equipment is used for the standard pulmonary function testing (spirometry, plethysmography and DLCO). On days during which the cardiopulmonary exercise testing (94621) is performed, the equipment needs to be

converted to cardiopulmonary exercise test capability. The metabolic cart and spirometer require calibration prior to use. The bicycle ergometer or treadmill needs to be connected into the system. The system has to be tested for proper functionality. It is important to have O2, an emergency cart and a bronchodilator present in case of an emergency.

LINE 26 (5 minutes for 94621)
Similar to CPT 93015, preparation of the patient requires placing electrodes on the patient and positioning the patient for exercise. This is different and separate from line 23 during which the procedure is explained and the patient's role in the procedure is defined. During this time the patient is positioned correctly on the bicycle, the face mask is placed on the patient ensuring a tight seal, the pulse oximeter and blood pressure cuff are placed, and the 10 electrodes are placed on the patient.

LINE 37 (15 minutes for 94621)
As this code previously had 15 minutes, we are reaffirming the need for 15 minutes as clean-up of the room requires cleaning/highly disinfecting many different pieces of equipment such as the bicycle ergometer or treadmill, the ECG cables, the BP cuff, the pulse oximeter and cable. The equipment has to be transitioned back to enable standard pulmonary function testing to be performed.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Compelling Evidence for PE

Changes have occurred in protocols and technology for performing these studies since the codes have been reviewed.
Guidelines for exercise challenge testing (94617) have been recently been developed and describe a different test with new requirements as compared to the prior service, such as defining the timing of serial spirometries after exercise.
Cardiopulmonary exercise testing (94621) Guidelines have also been revised and include further details on testing that was not previously available. They are the standard now for testing.

LINE 30 (current 12 minutes requires 27 minutes)
CPT 94621, we are unclear why there were only 12 minutes allocated to line 30. This time is for conducting a pre exercise spirometry and MVV, plus calculating workload. A 12 lead ECG is also obtained.

LINE 31 Assist Physician in performing
CPT 94620 crosswalks to the new CPT 94618 and currently has 6 minutes. 8 minutes is the correct time as the test requires 1 minute for baseline, 6 minutes for exercise and 1 minute for recovery.

CPT 94617 is a different service from 96420. Baseline spirometry is required in addition to spirometry measure at 5, 10, 15 and 30 minutes. Each spirometry takes 9 minutes. 5 spirometries take 45 minutes plus the 10 minutes of exercise for a total for 55 minutes.

LINE 35 Monitoring patient following procedure
CPT 94621 There were no minutes in this code for recovery. The recovery of the patient requires a 1:4 monitor of the patient for 30 minutes' post procedure, therefore 7.5 minutes were added.
CPT 94617 There were five minutes of a 1:1 monitor those were moved to a 1:4 monitor for 2 minutes to represent 8 minute recovery monitor.

LINE 40 (94617, 94618 and 94621)
There were no minutes allocated to any of these codes. Similar to 93015 which have 4 minutes to complete the forms from the exercise testing, we are adding 4 minutes to 94617 and 2 minutes 94618. For 94621 we are adding 1 more minute than the 93015 to make a total of 5 minutesm, as this is a longer procedure with more documentation such as adding the comments from the PF technician and physician, review and edit the anaerobic threshold (AT), delete artifacts, print results and ECG strips and prepare charge sheet.

5. Please describe in detail the clinical activities of your staff:

94617 Exercise test for bronchospasm, including pre- and post-spirometry and pulse oximetry

Intra-Service Clinical Labor Activities:

- Greet patient, ensure appropriate medical records are available
- Obtain vital signs (Pulse/HR rate, BP, SpO2, height and weight)
- Provide pre-service education/obtain consent
- Prepare room, maintain supplies, prepare the exercise equipment (bicycle ergometer or treadmill) and they calibrate the spirometer.
- Measure spirometry and maximum voluntary ventilation (MVV). Calculate work load.
- Prepare and position patient with tight fitting mask onto the exercise equipment.
- The patient is also educated on how to rate breathlessness during the testing as well as leg fatigue, as both will be rated multiple times during the test.
- Performing the procedure

Post-Service Clinical Labor Activities:

- Monitor pt. following procedure with multitasking of 1:4
- Complete exercise testing report
- Clean/highly disinfect bicycle ergometer or treadmill and work area.
- Provide patient home care instructions, coordinate physician visits

94618 Pulmonary stress testing (eg, 6-minute walk test), including measurement of heart rate, oximetry and oxygen titration, when performed

Intra-Service Clinical Labor Activities:

- Obtain vital signs (Pulse/HR rate, BP, SpO2 , height and weight) (duplication with 52% E/M, reduced to 1 minute)
- Provide pre-service education/obtain consent
- Prepare room, equipment, and supplies
- Prepare and position patient, attach the pulse oximeter securely
- Perform the procedure
    - 1 minute for baseline, 6 minutes for exercise and 1 minute for recovery

Post-Service Clinical Labor Activities:

- Monitor pt. following procedure with multitasking of 1:4
- Complete diagnostic forms
- Clean room/equipment (duplication with 52% E/M, reduced to 1 minute)
- Provide patient home care instructions, coordinate physician visit

94621 Cardiopulmonary exercise testing, including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings

Intra-Service Clinical Labor Activities:

- Greet patient, ensure appropriate medical records are available
- Obtain vital signs (Pulse/HR rate, BP, SpO2 sat, height, weight)
- Provide pre-service education/obtain consent

The patent performs pre-test spirometry, MVV and undergoes a 12 lead ECG.

- Preservice education of the patient begins with history of activity limitations and level of exertion that the patient is able to perform as well as a review of current medications and recent smoking history. This is needed in order to determine which exercise protocol (level of work) is to be used for the study. The patient is also educated on how to rate breathlessness during the testing as well as leg fatigue, as both will be rated multiple times during the test. The patient will be given an explanation of the equipment used, including the bike and pedal speed/s or treadmill, during the warm up and exercise. An explanation will be given about the monitoring equipment including the mask, pulse oximeter, blood pressure cuff and multiple ECG leads. The patient will need to understand and follow directions while wearing a tight fitting facemask.

- Prepare room, equipment, supplies
    - Typically, the room and equipment are used for standard pulmonary function testing (spirometry, plethysmography, DLCO). The equipment needs to be adapted to perform the CPET. Additionally, the metabolic cart and spirometer requires calibration after the adaptation is made. Ensure that the bicycle ergometer or treadmill is functioning properly and is connected into the system. Ensure that O2, emergency cart and bronchodilator are present in case of an emergency
- Prepare and position patient
    - Preparation of the patient includes prepping the skin and placing electrodes. The patient will positioned for exercise wearing a tight fitting mask and an oximeter.
- Performing the procedure

Post-Service Clinical Labor Activities:

- Monitor pt. following procedure with multitasking of 1:4
- Complete diagnostic forms
- Prepare the report by adding the comments from the PF technician and physician, review and edit the anaerobic threshold (AT), delete artifacts, print results and ECG strips and prepare charge sheet.
- Convert the equipment so that standard pulmonary function testing (spirometry, plethysmography, DLCO) can be performed.
- Calibrate newly adapted equipment.
- Clean room/highly disinfect spirometer and exercise equipment.
- Move exercise equipment away from the PF equipment.
- Provide patient home care instructions, coordinate physician visits

AMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Growth

October 2016

Visual Evoked Potential Testing

In October 2015, AMA Staff assembled a list of all services with total Medicare utilization of 10,000 or more that have increased by at least 100% from 2008 through 2013. The RUC review this list and recommended that the specialty societies submit an action plan for January 2016 explaining the high volume growth. In January 2016, the RUC recommended to refer to CPT for May 2016 meeting to define a more specific delineation of test strategy relative to the clinical indication for the study. The specialty societies indicated they may recommend the elevation of Category III code 0333T to Category I. In May 2016, the CPT Editorial Panel revised codes 95930 and 0333T to differentiate visual evoked potential testing and added Category III code 0X66T.

95930 Visual evoked potential (VEP) checkerboard or flash testing, central nervous system except glaucoma, ~~checkerboard or flash,~~ with interpretation and report

The RUC reviewed the survey data from 36 ophthalmology physicians and optometric providers and determined that the current work RVU of 0.35 appropriately accounts for the work required to perform this service. The RUC discussed that the volume growth was likely related to miscoding of other tests using this code.. The survey for revised CPT code 95930 resulted in the same physician time as currently.. However, the specialty society recommended and the RUC agreed, that the pre-service and immediate post-service time should be reduced to reflect that this service is performed on the same day as an Evaluation and Management (E/M) visit. The RUC recommends the following physician time: pre-service time of 2 minutes, intra-service time of 10 minutes, and immediate post-service time of 2 minutes.

The RUC compared the surveyed code to top key reference code 92083 *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 deg;, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* (work RVU=0.50, intra-service time of 10 minutes) and noted that the reference code has the same intra-service time, and the survey respondents indicated that the reference code is somewhat more intense to perform, further justifying this slightly lower valuation. The RUC also compared this service to MPC code 92082 *Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)* (work RVU=0.40, intra-service time of 8 minutes)and determined that these services both require similar physician work and time, thus validating the recommended work RVU. . Of note, the specialty did not provide

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

compelling evidence to increase the work RVU of this code so the recommendation is for maintenance of the current value, although it is less than the 25th percentile of the survey data. **The RUC recommends a work RVU of 0.35 for CPT code 95930.**

Practice Expense:
The Practice Expense Subcommittee reviewed the recommended direct PE inputs and made several modifications. First, it was determined that the clinical staff type was not typically an EEG tech (L047B) but rather a blend (COMT/COT/RN/CST, L038A). In addition, the Subcommittee added the proper exam chair in the equipment (chair with headrest, exam, reclining, EF008). Finally, it was noted that this code is commonly billed with an ophthalmology Evaluation and Management (E/M) service and any potential duplication was addressed. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Presented Recommended RVU: **0.35**
Global Period: XXX RUC Recommended RVU: **0.35**

CPT Descriptor: . Visual evoked potential (VEP) checkerboard or flash testing, central nervous system except glaucoma, with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old female complaining of intermittent bilateral extremity weakness and past history of transient loss of vision in one eye. Physical examination is suspicious for central nervous system (CNS) impairment, but the eye and vision exams were normal. Visual evoked potentials (VEP) are requested to evaluate the history of two weeks of diminished vision in the left eye one year ago, as possible optic neuritis.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 5%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Discuss with attending physician patient's need for rest as well as any other requirements. Instruct technician regarding performance of the test and/or any special techniques that may be required.

Description of Intra-Service Work: Review pages containing printed results of brain electrical activity measurements and interpret this information.

Description of Post-Service Work: Generate report based on findings and discuss with attending physician as appropriate.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	10/2016		
Presenter(s):	David Glasser, M.D AAO		
Specialty(s):	Ophthalmology (AAO/NANOS), Optometry (AOA), and Neurophysiology (ACNS)		
CPT Code:	95930		
Sample Size:	2123	**Resp N:** 36	**Response:** 1.6 %
Description of Sample:	A random sample of members were pulled from the AAO, NANOS, AOA and ACNS databases.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.75	0.20
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.67	0.20
Urgency of medical decision making	0.42	0.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.08	1.20

Physical effort required	0.83	-0.40

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.33	0.00
Outcome depends on the skill and judgment of physician	0.42	1.20
Estimated risk of malpractice suit with poor outcome	0.33	0.00

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	0.83	-0.20

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 95930 *Visual evoked potential (VEP) testing central nervous system except glaucoma, checkerboard or flash* is an XXX procedure that was identified as potentially misvalued due to rapid growth in volume. It was last reviewed by the RUC in 1995.

Historically, the procedure has been performed almost exclusively in academic medical centers for the evaluation of optic nerve disease of CNS origin (e.g. multiple sclerosis). Recent growth in utilization paralleled expanded clinical indications such as pre-perimetric identification of glaucoma and other visual disorders of the afferent visual pathway in both children and adults. In anticipation of a bimodal pattern of utilization for each population, the AAO developed a Category III code (*0333T, Visual evoked potential, screening for visual acuity, automated*), which was placed in CPT in 2014 for detection of amblyopia. As expected, use of VEP increased during development of the new category 3 code. Unexpectedly, a significant component of the increased utilization in the Medicare population was for diagnoses such as glaucoma. VEP use for glaucoma diagnosis likely also was accelerated by the availability of more compact and more automated instruments adapted for testing in the office setting. We also suspect that much of the new use coded as "optic nerve disease" also represents glaucoma, a form of optic neuropathy. At the May 2016 CPT meeting a new code for the more automated VEP testing used for glaucoma was accepted and will be moving forward for next year.

Our survey of 95930 was targeted for its original intended utilization for MS and other central nervous disorders. In this non-automated test, a technologist applies electrodes to the patient's scalp, patches one eye at a time, and records brain electrical activity while the patient watches a checkerboard on a projector or television screen. The pattern reverses black for white repeatedly and brain electrical activity is measured after each pattern reversal. Approximately 300 to 400 pattern reversals are performed for each eye, tested separately. A physician then interprets the averaged measurements.

A random survey of AAO, AOA, NANOS and ACNS members had 36 respondents, 92% of whom found the vignette typical. The median WRVU was 0.70 and the 25th percentile was 0.50. Median IST was 10 minutes. The current value of the code is 0.35 WRVU. The primary reference service, chosen by 33%, was 92083, *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination …* (RUC April 2012) with a WRVU of 0.50 and 10 minutes IST. The second reference service, chosen by 14%, was 92014, *Ophthalmological services:*

medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; comprehensive, established patient, 1 or more visits (RUC February 2007) with a WRVU of 1.42 and 24 minutes IST. The low percentages likely reflect the diverse number of XXX reference codes with similar WRVU values, none of which are particularly similar to the type of work performed with 95930. The intensity and complexity metrics for the surveyed code were slightly higher than those of the reference codes in all cases except physical effort and overall intensity/complexity, where the metrics were slightly higher for 92014.

The expert panel of the AAO and AOA, which is familiar with the procedure and the RUC process, reviewed the survey findings. The median survey IST of 10 minutes is unchanged from the current value. We reduced the pre-time to describe the test and review its purpose, risks and benefits with the patient from the survey value of 5 minutes to 2 minutes because the procedure is typically done in conjunction with an office visit. Similarly, we reduced the survey post-service time from 10 to 2 minutes. There is no compelling evidence for an increase in value. **We therefore recommend 0.35 WRVU, the current value of the code and below the survey's 25th percentile.**

This value is supported by MPC code 92082 *Visual field… intermediate examination* (RUC April 2010) with 0.40 WRVU, an IST of 8 minutes and total time of 11 minutes. The value is also supported by CPT codes 92286, *Anterior segment imaging with interpretation and report; with specular microscopy and endothelial cell analysis* (RUC April 2012) with 0.40 WRVU, an IST of 10 minutes and total time of 15 minutes, CPT 92550, *Tympanometry and reflex threshold measurements* (RUC April 2009) with 0.35 WRVU, an IST of 10 minutes and total time of 16 minutes, and CPT 92541, *Spontaneous nystagmus test, including gaze and fixation nystagmus, with recording* (RUC April 2014) with 0.40 WRVU, and IST of 10 minutes and total time of 16 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Billed with an office visit

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. E/M or the ophthalmalogic exam codes

3.	4.	CPT Code	Pre-	Intra-	Post-	Total Time	Work RVU	Global Period
4.	4.	92002	5	15	5	25	.88	XXX
5.	5.	92004	5	25	10	40	1.82	XXX
6.	6.	92012	5	15	5	25	.92	XXX
7.	7.	92014	5	24	8	37	1.42	XXX
8.	8.	99212	2	10	4	16	.48	XXX
9.	9.	99213	3	15	5	23	.97	XXX

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95930

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalomology How often? Commonly

Specialty Optometry How often? Commonly

Specialty Neurology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 131812
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation Only

Specialty Ophthalmology Frequency 69886 Percentage 53.01 %

Specialty Optometry Frequency 48190 Percentage 36.55 %

Specialty Neurology Frequency 8541 Percentage 6.47 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 87,875 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Ophthalmology Frequency 46591 Percentage 53.01 %

Specialty Optometry Frequency 32127 Percentage 36.55 %

Specialty Neurology Frequency 5694 Percentage 6.47 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
NA

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95930

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Visual evoked potential (VEP) testing central nervous system, checkerboard or flash

Global Period: _XXX_ Meeting Date: _October, 2016_

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally, we queried other physicians who have the appropriate expertise for this code. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Current code (95930).

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: Please see below.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Prepare room, equipment, supplies: **2 min**
  - This time is spent preparing the new room where the evoked potential machine is housed, entering patient demographic information into the machine, and preparing the electrodes and equipment. It is in excess of the E&M visit.
- Greet patient, provide gowning, ensure appropriate medical records are available: **1 min**
  - This time is spent with the technician transporting the patient from the room where the E&M service was performed to the room where the evoked potential machine is housed.
- Provide pre-service education/obtain consent: **1 min**
  - The patient is informed of this procedure and educated regarding the proper positioning and performance in order to obtain accurate readings. This education occurs in the room that houses the evoked potential machine, is more technical and instructional in nature, and is in excess of the time spent educating during the E&M.
- Other Clinical Activity: Set up machine with testing parameters: **2 min**
  - Based on the VEP strategy decision made by the physician, the technician will now have to enter the visual stimuli and testing parameters to execute the appropriate test for the patient.
- Prepare and position patient/ monitor patient: **2 min**

  - This time is spent positioning the patient for the evoked potential. The patient is placed in a relaxed, seated position, and the video monitor, which is on an extendable arm is brought into alignment with the right eye. The left eye is covered with a patch. The patient's pupil is aligned with the center of the monitor, and the signal is tested for accurate alignment.
- Other Clinical Activity: measure and mark head. Apply electrodes: **4 min**
  - This time is spent carefully measuring the patient's head and marking the location where electrodes should be placed, parting the hair, prepping the scalp, then placing the electrodes on the scalp using conductive gel. The electrodes are then draped so they are out of the way for testing, and are plugged into the port, which is typically draped around the patient's neck in a necklace fashion.
- Other Clinical Activity: Check impedance and signal strength, reapply as needed: **1 min**
  - This time is spent ensuring that the signal is adequate and reliable.

Intra-Service Clinical Labor Activities:

- Perform Test: **21 minutes**
  - This time is spent executing the visual evoked potential. Patient data is acquired utilizing appropriate test patterns. The technician records brain electrical activity while the patient watches different patterns such as an alternating checkerboard on a projector or television screen. The pattern reverses black for white repeatedly and brain electrical activity is measured after each pattern reversal. Approximately 300 to 400 pattern reversals are needed for each eye, tested separately. The brain electrical activity measurements are averaged and saved for interpretation by a physician.
  - Data is replicated. Troubleshooting occurs. Blinking can invalidate the results. Very subtle movements can also invalidate the findings of this test, so after the initial positioning, subtle re-positioning movements are performed with the monitor to keep it aligned with the visual axis continually during the entire testing period. Any tremor or difficulty holding still adds significant time to the testing period. The patch is then placed over the right eye, the monitor is re-positioned in front of the left eye, and the signal is re-checked, ensuring accurate alignment, and the left eye is tested. Waveforms are recorded. Additional data is collected as needed. Data worksheets are completed and technical interpretation is performed and recorded.

Post-Service Clinical Labor Activities:

- Remove electrodes from patient's scalp and clean gel from patient's hair: **3 min**
  - Electrodes are removed and coupling gel is carefully cleaned and removed from the patient's hair.
- Clean room/equipment by staff: **3 min**
  - The room and instruments are cleaned. Any coupling gel is carefully cleaned up from instrumentation.
- Complete diagnostic forms, lab & X-ray requisitions: **2 min**
  - This time is used to complete data worksheets, billing forms, and test reports, as well as inserting the technical interpretation, including reliability of data and patient's performance during the test. The data are prepared for physician interpretation.
- Review examination with interpreting MD: **2 min**
  - This time is spent reviewing the results with the ordering physician to ensure no further testing is necessary and to communicate any variations that may have occurred during test acquisition.

Of note, we have calculated equipment times with the recommendation that this is *not* highly technical equipment. The equipment is typically not easily portable, is housed in one room, and is not in the price range of other "highly expensive equipment."

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2016

Psychiatric Collaborative Care Management Services

In February 2016, the CPT Editorial Panel created three new codes to describe a model for providing psychiatric care in the primary care setting. This code set is one of several in response to a request from CMS to facilitate appropriate valuation of the services furnished under the Collaborative Care Model (CoCM). This CoCM is used to treat patients with common psychiatric conditions in the primary care setting through the provision of a defined set of services which operationalize the following core concepts: 1) Patient-Centered Team Care/Collaborative Care; 2) Population-Based Care; 3) Measurement-Based Treatment to Target; and 4) Evidence-Based Care.

The RUC reviewed the new code set for Psychiatric Collaborative Care Management, which captures a primary care physician working with a behavioral health manager and consulting psychiatrist to manage patient psychiatric care. The specialty societies requested that this issue be deferred until the January 2017 RUC meeting. The RUC noted that an Ad Hoc Workgroup has been created to provide feedback and guidance to the specialties involved to appropriately survey this code set. The Workgroup and the Research Subcommittee will review the unique survey plan and survey tool before it is launched. The RUC also recommended inclusion of a proposed G code, GPXXX, which was noted in the 2016 Notice of Proposed Rule Making, to be included in the survey for this issue if it remains in the Final Rule that is published on or around November 1, 2016.

The RUC recommends deferral of the valuation of CPT codes 99492, 99493, 99494, and 99484 to the January 2017 RUC meeting.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management				
Care Management Services				
Care management services are management, and support services provided by clinical staff under the direction of a physician or other qualified health care professional, to a patient residing at home or in a domiciliary, rest home, or assisted living facility. Services may include establishing, implementing, revising, or monitoring the care plan, coordinating the care of other professionals

and agencies, and educating the patient or caregiver about the patient's condition, care plan, and prognosis. The physician or other qualified health care professional provides or oversees the management and/or coordination of services, as needed, for all medical conditions, psychosocial needs, and activities of daily living.

----------Coding Tip----------

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Time of care management with the emergency department is reportable using 99487, 99489, 99490 but time while the patient is inpatient or admitted as observation is not.
If the physician personally performs the clinical staff activities, his or her time may be counted toward the required clinical staff time to meet the elements of the code.

Psychiatric Collaborative Care Management Services

Psychiatric collaborative care services are provided under the direction of a treating physician or other qualified health care professional (see definitions below) during a calendar month. These services are provided when a patient has a diagnosed psychiatric disorder that requires a behavioral health care assessment; establishing, implementing, revising, or monitoring a care plan; and provision of brief interventions. These services are reported by the treating physician or other qualified health care professional and include the services of the treating physician or other qualified health care professional, the behavioral health care manager (see definition below), and the psychiatric consultant (see definition below) who has contracted directly with the treating physician or other qualified health care professional, to provide consultation.

Patients directed to the behavioral health care manager typically have newly diagnosed conditions, may need help in engaging in treatment, have not responded to standard care delivered in a non-psychiatric setting, or require further assessment and engagement, prior to consideration of referral to a psychiatric care setting.

The following definitions apply to this section:

Episode of Care

Patients are treated for an episode of care, defined as beginning when the patient is directed by the treating physician or other qualified health care profession to the behavioral health care manager and ending with:

- the attainment of targeted treatment goals, which typically results in the discontinuation of care management services and continuation of usual follow-up with the treating physician or other qualified healthcare professional; or
- failure to attain targeted treatment goals culminating in referral to a psychiatric care provider for ongoing treatment; or
- lack of continued engagement with no psychiatric collaborative care management services provided over a consecutive six month calendar period (break in episode).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

A new episode of care starts after a break in episode of six calendar months or more.

Health Care Professionals

Treating Physician or Other Qualified Health Care Professional

The treating physician or other qualified health care professional directs the behavioral health care manager and continues to oversee the patient's care, including prescribing medications, providing treatments for medical conditions, and making referrals to specialty care when needed. Evaluation and management (E/M) and other services may be reported separately by the same physician or other qualified health care professional during the same calendar month.

Behavioral Health Care Manager

The behavioral health care manager refers to clinical staff with a masters/doctoral-level education or specialized training in behavioral health who provides care management services as well as an assessment of needs, including the administration of validated rating scales, the development of a care plan, provision of brief interventions, ongoing collaboration with the treating physician or other qualified health care profession, maintenance of a registry, all in consultation with a psychiatric consultant. Services are provided both face-to-face and non-face-to-face and psychiatric consultation is provided minimally on a weekly basis, typically non face-to-face.

The behavioral health care manager providing other services in the same calendar month, such as psychiatric evaluation (90791, 90792), psychotherapy (90832, 90833, 90834, 90836, 90837, 90838), psychotherapy for crisis (90839, 90840), family psychotherapy (90846, 90847), multiple family group psychotherapy (90849), group psychotherapy (90853), smoking and tobacco use cessation counseling (99406, 90407), and alcohol and/or substance abuse structured screening and brief intervention services (99408, 99409), may report these services separately. Activities for services reported separately are not included in the time applied to 99492, 99493, 99494.

Psychiatric Consultant
The psychiatric consultant refers to a medical professional trained in psychiatry or behavioral health and qualified to prescribe the full range of medications. The psychiatric consultant advises and makes recommendations, as needed, for psychiatric and other medical care, including psychiatric and other medical differential diagnosis, treatment strategies regarding appropriate therapies, medication management, medical management of complications associated with treatment of psychiatric disorders, and referral for specialty services; which are communicated to the treating physician or other qualified health care professional typically through the behavioral health care manager. The psychiatric consultant does not typically see the patient nor prescribe medications, except in rare

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

circumstances.

The psychiatric consultant may provide services in the calendar month described by other codes, such as evaluation and management (E/M) services and psychiatric evaluation (90791, 90792). These services may be reported separately by the psychiatric consultant. Activities for services reported separately are not included in the services reported using 99492, 99493, 99494.

Code Selection
Do not report 99492 and 99493 in the same calendar month.

Table X

Type of Service	**Total Duration of Collaborative Care Management Over Calendar Month**	**Code(s)**
Initial – 70 minutes	Less than 36 minutes	Not reported separately
	36-85 minutes (36 minutes – 1 hr. 25 minutes)	99492
Initial plus each additional increment up to 30 minutes	86-116 minutes (1 hr. 26 minutes – 1 hr. 54 minutes)	99492 X 1 AND 99494 X 1
Subsequent – 60 minutes	Less than 31 minutes	Not reported separately
	31-75 minutes (31 minutes – 1 hr. 15 minutes)	99493
Subsequent	76-105 minutes	99493 X 1 AND

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

	plus each additional increment up to 30 minutes	(1 hr. 16 minutes – 1 hr. 45 minutes)	99494 X 1	
●99492	A1	**Initial psychiatric collaborative care management,** first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: • outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional; • initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan; • review by the psychiatric consultant with modifications of the plan if recommended; • entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant; and • provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.	XXX	Deferral to Jan 2017 RUC meeting

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●99493	A2	**Subsequent psychiatric collaborative care management,** first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: • tracking patient follow-up and progress using the registry, with appropriate documentation; • participation in weekly caseload consultation with the psychiatric consultant; • ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers; • additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant; • provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies; • monitoring of patient outcomes using validated rating scales; and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are prepared for discharge from active treatment.	XXX	Deferral to Jan 2017 RUC meeting

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●✚99494	A3	**Initial or subsequent psychiatric collaborative care management**, each additional 30 minutes in a calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (List separately in addition to code for primary procedure) (Use 99494 in conjunction with 99492, 99493)	ZZZ	Deferral to Jan 2017 RUC meeting
Coding Tips If the treating physician or other qualified health care professional personally performs behavioral health care manager activities and those activities are not used to meet criteria for a separately reported code, his or her time may be counted toward the required behavioral health care manager time to meet the elements of codes 99492, 99493, 99494. Behavioral health care manager time spent coordinating care with the emergency department may be reported using 99492, 99493, 99494, but time while the patient is inpatient or admitted to observation status may not be reported using 99492, 99493, 99494.				
●GPPPX	A4	Care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional time, per calendar month.	XXX	Deferral to Jan 2017 RUC meeting

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

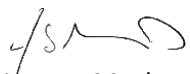
Re: Psychiatric Collaborative Care Management Services (994X1-994X3)

In light of the proposals in the recent NPRM on Revisions to Payment Policies under the Physician Fee Schedule for CY 2017, the societies surveying the Psychiatric Collaborative Care Management Services codes (the American Psychiatric Association, the American Academy of Child and Adolescent Psychiatry, the American Academy of Family Physicians, the American College of Physicians, and the American Geriatrics Society) would like to delay survey and presentation of our RUC recommendations until the January 2017 RUC meeting. This would allow us to review and alter (as noted below) our survey pending the release of the Final Rule due out later this year.

The reasons for the delay are to consider and incorporate the following:



A. CMS has proposed coverage and payment of several existing CPT codes; we would like to reconsider our reference service lists once CMS has finalized the values.

B. We believe that the GPPPX code should be part of the survey if CMS finalizes it, in order to ensure rank order with the survey participants, and

C. We have not been able to identify the minimum number of PCPs and Behavioral Health Care Managers with knowledge or experience in providing these services. Our numbers for PCPs and Care Managers are still under 20. This will give us more time to try to increase the number of people in the survey pool.

The most important reason is that CMS has introduced a new code, GPPPX, for "Care management services for behavioral health conditions, at least 20 minutes of clinical staff time, directed by a physician or other qualified health care professional time, per calendar month." We believe this falls within the same family of services described by the Psychiatric Collaborative Care Management Services. We think these codes should be surveyed together as a family in order to avoid a possible rank order anomaly. Should CMS finalize the GPPPX code in the Final Rule we would want to include it as part of our survey process. We also wonder if the Emerging CPT and RUC Issues Workgroup will review and comment on the GPPPX code. Our societies plan to send detailed comments to CMS regarding the code description including one or more vignettes, parenthetical information designed to clarify the appropriate patient population and other suggestions for appropriate use of the new code.

Thank you,

Jeremy Musher, MD

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedural Codes*
****Harvard Valued – Utilization Over 30,000****
****High Volume Growth****
CMS Fastest Growing screen

October 2016

Injection for Knee Arthrography

The RUC reviewed the extensive history of this procedure. It was first identified in April 2008 under the High Volume Growth screen. Since then, it has been identified by five additional screens and the volume has continued to grow. In the last ten years the utilization has gone from roughly 7,000 to over 130,000. At the February 2014 CPT Editorial Panel meeting the specialty societies submitted a Code Change Application (CCA) to try and address the issue. The Panel approved editorial revisions replacing the term "procedure" for "of contrast." This revision to the descriptor clarified that the correct use of 27370 is to describe the injection of contrast into the knee joint space for arthrography only. This change however has not stemmed the rise in utilization for this procedure.

The specialty societies explained that the high volume growth for this procedure is likely due to its being reported incorrectly as arthrocentesis or aspiration. The correct reporting of those services is CPT code 20610 *Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); without ultrasound guidance* (work RVU= 0.79). The RUC extensively discussed the appropriate options to address the rising inappropriate utilization of this procedure. The RUC noted that deleting this code and then bundling it into the arthrography base procedures would not be ideal because it would involve edits to over 70 codes. The RUC also discussed that this procedure could become an add-on code. However, the RUC came to agreement that this code should be referred to CPT for deletion and replacement with a new code. The members agreed that this is the most efficient way to stem the rising inappropriate volume. **The RUC recommends that CPT code 27370 be referred to the CPT Editorial Panel for deletion and be replaced with a new code.**

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
27370	Injection of contrast for knee arthrography	000	Refer to CPT Editorial Panel

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Staff Note:

Summary

CPT code 27370 has a long history of being identified in various RAW/CMS screens. Due to the CPT Editorial Panel edits for 2015, the specialty societies were waiting for 2015 Medicare claims data to be available to determine if the changes affected the growing number of miscoded claims. While these data were not listed in the specialty societies' letter, the data below shows the shifting specialty utilization for CPT code 27370.

It is clear that the CPT language changes in 2015 were ineffective in stemming the flow of inappropriate utilization and in fact utilization exploded in 2015. Given that this code has been identified by so many screens over the years, the RUC needs to determine the appropriate next steps to ensure the misuse of code 27370 is addressed and the value is appropriate.

History

1. **April 2008 – High Volume Growth screen**
    - In 2004, Medicare issued a national coverage decision that clarified correct coding and reimbursement for knee examinations and concurrently issued a non-coverage determination for arthroscopic lavage and arthroscopy debridement of the knee. As a result, physicians began to use injection procedures for knee arthrography. The Workgroup agreed with the specialty society that the increase in utilization reflects a shift away from arthroscopic lavage and arthroscopic debridement after the 2004 Medicare NCD decision. The Workgroup also agreed that this is the appropriate way to report such procedures and does not reflect any misvaluation of the service.
    - The RUC accepted the action plan of the specialty society and recommended that 27370 and 73580 be removed from this screen with no further action at this time.

2. **February 2009 – CMS Fastest Growing screen**
    - The specialty commented that these codes were reviewed through the RUC's high volume growth screen and removed from the screen. The increase in utilization is due to a non-coverage decision for arthroscopic lavage. Physicians use these codes to report different procedures.
    - The RUC recommended that these be referred to CPT for possible deletion of 73580 and 27370 and creation of a new code accurately describing the procedure that is being performed, including the radiologic guidance in the procedure codes.

3. **October 2009 – RAW Review of Outstanding Referrals to CPT**
    - The Workgroup reviewed the list of codes which were previously referred to the CPT Editorial Panel, but were still outstanding. The AAOS indicated they began work on a CPT code change proposal for codes 27370 and 73580 and it became apparent that CPT coding changes may not be appropriate. In reviewing the descriptors and the RVU information for 27370 and 73580 in relation to other arthrography injection and arthrography radiological supervision codes, it is apparent that 27370 and 73580 have descriptors and values that are very similar to other codes in the family. Any change in the nomenclature would result in potential inconsistencies when compared to the codes for other body parts and a change in RVUs might result in rank order anomalies between 27370 and 73580 and other similar codes. Therefore, the specialty society indicated they were not comfortable proposing changes to these two codes. The wording of 27370 and 73580 matches the descriptors for the other arthrography injection and radiological supervision codes. This makes it inadvisable to make any coding changes to these two codes in a stand-alone fashion.
    - AAOS also indicated Orthopaedic surgery is the dominant provider for 27370 (50.7%) and 73580 (57.6%). Orthopaedic surgery is not, however the dominant provider for many of the other codes in the family. AAOS was reluctant to proceed with CPT coding recommendations that might affect codes for which orthopaedic surgery is not the major provider. For any CPT coding changes, we would recommend review of the entire family, which would involve several specialties. The same would be true of a review of the entire family for work values by the RUC.

- The specialty society believed the volume growth has been driven by other factors-of which, the shift in practice patterns from lavage and debridement to viscosupplementation is the most likely explanation and requested that the RAW consider removing 27370 and 73580 from their screen.
- The Workgroup agreed and recommended that the specialty society create a CPT Assistant article to address misuse reporting of arthrography codes. *Clinical Examples of Radiology Bulletin #1 2010*

4. **October 2013 - High Volume Growth screen (second iteration)**
    - The RUC recommended that the specialty societies survey 27370 for January 2014, and the RAW re-review claims data in 3 years (Sept 2017) to make sure primary care is no longer reporting this service.

5. **January 2014 RUC Meeting**
    - ACR and AAOS indicated that they did not survey CPT code 27370 because a Code Change Proposal (CCP) was submitted and will be discussed at the February 2014 CPT meeting.

6. **February 2014 CPT Meeting:**
    - At the February 2014 CPT Editorial Panel meeting, the specialty societies submitted a Code Change Proposal (CCP) to address the high growth of this code. The Panel approved *editorial* revisions replacing the term "procedure" for "of contrast." This revision to the descriptor clarifies that the correct use of 27370 is to describe the injection of contrast into the knee joint space for arthrography only. The specialty societies noted that the high volume growth for this procedure is likely due to its being reported incorrectly as arthrocentesis or aspiration. The correct reporting of those services is CPT code 20610 *Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); without ultrasound guidance* (work RVU= 0.79).

7. **July and November 2015 - CMS High Expenditure Codes (second iteration)**
    - In July 2015, CMS identified CPT code 27370 and finalized their request for review in the Final Rule for 2016.

8. **October 2015 - Harvard valued codes with utilization over 30,000 and High Volume Growth (third iteration)**
    - AMA Staff re-ran the Harvard valued codes with utilization over 30,000, based on 2014 Medicare claims data, and identified CPT code 27370. The Workgroup noted that CPT code 27370 will be placed on the next Level of Interest form for survey (April 2016).

9. **April 2016 RUC Meeting**
    - When CPT code 27370 was identified by CMS as potentially misvalued in the 2016 MPFS NPRM, in October of 2015, the ACR shared with AMA staff their expected calendar for review of the codes in the NPRM. The ACR indicated it was their intention to survey this code in October of 2016. However, the code appeared on the LOI for the April 2016 RUC meeting. The ACR reiterated that they intended to survey CPT code 27370 for the October 2016 meeting and is not presenting recommendations at the April 2016 RUC meeting.

Re: Tab 12, Injection for Knee Arthrography (27370)

Dear Dr. Smith:

CPT Code 27370 *(Injection procedure for knee arthrography)* has been identified on multiple screens, including:

- the April 2013 Relativity Assessment Workgroup (RAW) screen for all services with a total Medicare utilization of 10,000 or more that have increased by at least 100% from 2006 through 2011;
- a 2015 RUC screen for Harvard Valued codes with utilization over 30,000; and,
- CMS High Expenditure and potentially mis-valued codes list for 2016.

We believe mis-coding explains the growth of this code.

Initially, we thought this issue could be addressed with an editorial change at CPT. At the October 2013 CPT meeting, the descriptor of code 27370 was revised from *"injection procedure for knee arthrography"* to *"injection <u>of contrast</u> for knee arthrography."* This edit was reflected in the 2015 CPT manual. We believed that this change had the potential to significantly decrease the utilization of this code. We were wrong. Utilization for 2015 continued to increase (greater than 30%).

Our position is that this code is not mis-valued. It is being mis-used.

An analysis of the subspecialties reporting this code supports this position. For an arthrography injection code, the expected specialties of radiology and orthopedic surgery amount to only 23% of the reported volume. Family practice, physical medicine and rehabilitation, internal medicine, obstetrics/gynecology, anesthesiology, general practice, and pain management account for 65% of utilization. These seven specialties would be expected to be treating patients with pain injections for treatment of osteoarthritis, which is the most commonly billed diagnosis at 92%. This should be coded using 20610 *(Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); without ultrasound guidance),* which has a utilization of 6,375,516 for 2015 compared with 131,272 for 27370. It only requires a small fraction of providers to unintentionally use 27370 to achieve the utilization numbers we see in the Medicare database for 27370.

The ACR and AAPM&R initially indicated our intention to survey this code for the October 2016 meeting. However, it is our position that surveying this code for the purposes of validating physician work is not going to address its inclusion on both the RUC and CMS screens. The utilization of this code may be addressed in multiple other ways, including either local or national coverage decisions through the Medicare Contractors or CMS using physician specialty as a screen. Because we believe this is fundamentally a payment policy issue, we are recommending deferral of survey and request guidance from the RUC on the next best steps to address the problem.

Sincerely,

Kurt A. Schoppe, MD
ACR RUC Advisor

Matthew Grierson, MD
AAPM&R RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

October 2016

Strapping Multi-Layer Compression

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. CPT code 29580 *Strapping; Unna boot* was identified via this screen and 29581 *Application of multi-layer compression system; leg (below knee), including ankle and foot* was added as part of this family of services.

At the April 2016 RUC meeting, the specialty societies indicated that the vignettes were flawed. The specialty societies submitted revised vignettes to the Research Subcommittee for approval. Additionally, the Research Subcommittee reviewed the instructional note about precision in time by the specialty societies. CMS also indicated that the family should include three codes for the upper arm, CPT codes 29582, 29583, and 29584. However, the RUC found that these codes are performed by different specialties than those involved in this code group. The RUC decided CPT codes 29582, 29583, and 29584 should be placed on the LOI for the October RUC meeting, in addition to CPT codes 29580 and 29581, so that appropriate specialties could opt in to survey them. The specialty societies did not consider these low volume services (29582-29584) as part of the same family and there was no interest by other specialty societies to survey these codes. CMS continued to question the review of 29584 as part of the family. The specialty societies reiterated that this is a separate body area/separate code family and did not express an interest in surveying these services.

29580 Strapping; Unna boot
The RUC reviewed the survey data from 93 podiatrists and surgeons and determined that the current work RVU of 0.55 appropriately accounts for the work required to perform this service. The RUC recommends the following physician time: pre-service time of 7 minutes, intra-service time of 11 minutes, and immediate post-service time of 5 minutes. To validate a work RVU of 0.55, the RUC compared the survey code to top key reference code 29515 *Application of short leg splint (calf to foot)* (work RVU=0.73, intra-service time of 15 minutes) and noted that the survey code has slightly lower intra-service time, thus requiring slightly less physician work. In addition, the RUC compared the surveyed code to MPC codes 46600 *Anoscopy; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)* (work RVU=0.55, intra-service time of 5 minutes) and 69210 *Removal impacted cerumen requiring instrumentation, unilateral* (work RVU=0.61, intra-service time of 10 minutes) and determined that both reference codes have similar physician time and work and provide appropriate magnitude estimation to the recommended value. **The RUC recommends a work RVU of 0.55 for CPT code 29580.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

29581 Application of multi-layer compression system; leg (below knee), including ankle and foot

Compelling Evidence:
The RUC discussed compelling evidence for CPT code 29581. Code 29581 *Application of multi-layer venous wound compression system, below knee* was approved for CPT 2010. The service was surveyed in April 2009 by SVS, ACS, APMA, and APTA and following review of a robust survey, the RUC recommended the survey 25th percentile work RVU of 0.60 (compared to Unna boot work RVU of 0.55). In the Final Rule for 2010, CMS agreed with the RUC recommendation.

In February 2010, a device manufacturer requested modification of code 29581 to remove reference to venous wound. They indicated that multilayer compression systems are used for other purposes including edema. In June 2010, the CPT Editorial Panel accepted the device manufacturer revised proposal, including creation of new codes 29582, 29583, and 29584. Since the revision to 29581 was editorial and the code was just surveyed in 2009, only the new codes (29582, 29583, 29584) were surveyed and only by the American Physical Therapy Association. The survey results were reviewed by the HCPAC. Very few responses were obtained (14-19) and for 2 codes, the median experience was zero. The rationale in the RUC database indicates that the HCPAC considered the society recommended times and crosswalks to physical therapy codes that are time based (i.e., each 15 minutes).

Flawed methodology in previous valuation:
In the Final Rule for 2012, CMS accepted the HCPAC recommendations for 29582, 29583, and 29584, which were based on expert panel crosswalk recommendations. Further, CMS determined that code 29581 should be relative to these three codes and CMS reduced the work RVU for 29581 from 0.60 to 0.25, which resulted in a negative IWPUT (-0.0013).

Given the history of Unna boot and the previous robust survey of 29581, the specialty societies indicated that the CMS work RVU reduction for 29581 was based on a flawed methodology. The RUC approved that this code met the requirements for compelling evidence based on the previous valuation method being flawed.

The RUC reviewed the survey data from 89 podiatrists and surgeons for CPT code 29581 and determined that the current work RVU of 0.60, which is lower than the survey 25th percentile, appropriately accounts for the work required to perform this service. The RUC recommends the following physician time: pre-service time of 7 minutes, intra-service time of 13 minutes, and immediate post-service time of 5 minutes. To validate a work RVU of 0.60, the RUC compared the survey code to top key reference code 29405 *Application of short leg cast (below knee to toes);* (work RVU =0.80, intra-service time of 15 minutes) and noted that the survey code has slightly lower intra-service time, and the survey respondents indicated that the survey code is identical to somewhat more intense to perform, further justifying this valuation.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC also compared the surveyed code to the second key reference service 29515 *Application of short leg splint (calf to foot)* (work RVU=0.73, intra-service time of 15 minutes) and determined that since the reference code has slightly more intra-service time, it should be valued higher. The RUC also compared the surveyed service to MPC code 69210 *Removal impacted cerumen requiring instrumentation, unilateral* (work RVU=0.61, intra-service time of 10 minutes), and noted that while code 29581 has slightly more intra-service time, this MPC code is a more intense procedure and it accurately valued nearly identical to the survey code. **The RUC recommends a work RVU of 0.60 for CPT code 29581.**

Practice Expense:
The Practice Expense Subcommittee reviewed the recommended direct PE inputs and noted that the current clinical staff time to assist the physician in performing the procedure is less than the physician intra-service time for both codes. However, now both codes will match the intra-service time. The specialties explained that the current time is in error. The staff is assisting the physician throughout the entire procedure including removal of the strapping and during the patient evaluation and strapping procedure. The PE Subcommittee agreed that this was appropriate.

In addition, there were several modifications made to the specialty recommendations. First, 7 minutes for the staff to remove the multilayer compression system was moved from the post-service period to the service period for both codes. Second, all the minutes for conducting phone calls were removed for both codes so as not to be duplicative. Finally, various minor edits were made to the supplies and equipment to match the typical encounter. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
29580	Strapping; Unna boot	000	0.55 (No Change)
29581 (f)	Application of multi-layer compression system; leg (below knee), including ankle and foot	000	0.60 (No Change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:29580 Tracking Number

Original Specialty Recommended RVU: **0.55**
Presented Recommended RVU: **0.55**
RUC Recommended RVU: **0.55**

Global Period: 000

CPT Descriptor: Strapping; Unna boot

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A diabetic patient returns to the office for ongoing treatment of a venous ulcer. The wound is examined and cleansed, and an Unna boot is applied.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review chart with general medical and surgical history update, including current medications and allergies. Perform evaluation of neurological and vascular status of lower extremity, along with a dermatologic and musculoskeletal examination of the foot, ankle, and lower leg. Examine and measure the size and depth of the ulcer. Conduct proper patient screening to exclude those with deep infection, excessive edema, or excessively fragile skin. Communicate with the patient and/or family to explain the procedure, including a discussion of possible risks and complications. Verify all required instruments and supplies are available. Perform time out.

Description of Intra-Service Work: This previously placed elastic bandage is cut away, the Unna boot is unwrapped, the primary wound dressing is removed if present, and the leg is cleaned. Cleanse the ulcer and apply a primary wound dressing as indicated. With an assistant holding the foot with the ankle in neutral position, apply compression zinc-impregnated bandage (Unna boot) beginning proximal to the toes and extending proximally to the mid-calf region. Take care to smooth out any wrinkles in the compression bandage with each compressive wrap. Make a figure-of-eight wrap around the ankle. Make frequent checks to ensure that the neutral position of the foot to the ankle is maintained. Once the entire bandage has been applied, provide additional smoothing. Apply an elastic bandage over the Unna boot.

Description of Post-Service Work: Assess circulation, sensation, and motor function of the extremity. Fit a surgical shoe on the patient, as indicated. Discuss home restrictions (ie, activity, bathing) with the patient and family. Provide instructions for removal of the dressing in the event of an emergency (eg, leg swelling with decreased circulation or pain). Dictate procedure for medical record, copy PCP and insurance.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.24	0.08
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.31	0.23
Urgency of medical decision making	0.07	-0.38
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.28	-0.15
Physical effort required	0.10	0.00

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.38	0.12
Outcome depends on the skill and judgment of physician	0.52	0.31
Estimated risk of malpractice suit with poor outcome	0.31	-0.15

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.38	0.04

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Why is 29580 being surveyed?

In the Final Rule for 2016, CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. Unna boot (29580) was identified for survey through this screen.

29580 Valuation History

Unna boot has been used for over 100 years. The product and physician work has not changed since the implementation of the Medicare fee schedule. In 1992, the work RVU for 29580 was 0.61. This value decreased the first four years of the fee schedule as CMS adjusted work RVUs for all codes to maintain budget neutrality (ie, instead of adjusting the conversion factor). In 2005, podiatry surveyed 29580 as part of the third 5YR and presented compelling evidence to the HCPAC that podiatrists were not included in the Harvard review. The HCPAC accepted compelling evidence and approved increasing the work RVU from 0.57 to the survey median work RVU of 0.60 based on comparison to other codes. CMS disagreed with the HCPAC and instead proposed and finalized a work RVU of 0.55 which was the survey 25th percentile.

Survey Process

For the April 2016 RUC meeting, the ACS, SVS, and APMA conducted a RUC survey using the vignette in the RUC database and found that almost 50 percent of the respondents indicated they disagreed with the vignette because it indicated Unna boot was placed for edema instead of stasis ulcer. In addition, it was noted that over 90 percent of the respondents indicated intra-time in increments of 5 minutes.

The societies presented the summary data as informational to the RUC and requested that we be allowed to request Research Subcommittee approval for a revised vignette and revised text for survey Question 2 to ask for more precise time estimates. The RUC agreed with our request and the Research Subcommittee approved the revised vignette and revised survey Question 2.

A survey request was sent to a random selection of each society's membership.

Recommendation - 29580

We recommend maintaining the current work RVU of 0.55 for code 29580.

Pre-time Package 5

We recommend pre-time package 5 (*Procedure with minimal anesthesia care*) with one minute subtracted for no anesthesia care.

Key Reference Services

Codes 29515 and 29405 are excellent comparison codes. These codes require slightly more time than 29580 for molding the cast/splint while the plaster sets. These codes also have a slightly higher intensity to account for maintaining bone alignment while applying the cast/splint.

MPC Comparison

CPT	Long Descriptor	RVW	IWPUT	Total	PRE	INTRA	POST
46600	Anoscopy; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	**0.55**	0.034	22	7	5	10
29580	Unna boot	**0.55**	0.026	23	7	11	5
69210	Removal impacted cerumen requiring instrumentation, unilateral	**0.61**	0.045	17	5	10	2

Summary

The physician work for 29580 has not changed. The survey supports maintaining the current work RVU of 0.55.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 29580

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

SUMMARY OF RECOMMENDATION

CPT Code:29581 Tracking Number Original Specialty Recommended RVU: **0.60**
Presented Recommended RVU: **0.60**
Global Period: 000 RUC Recommended RVU: **0.60**

CPT Descriptor: Application of multi-layer compression system; leg (below knee), including ankle and foot

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A diabetic patient returns to the office for ongoing treatment of a recalcitrant medial calf venous ulcer. The wound is examined and cleansed, and a multilayer venous ulcer compression dressing is applied.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review chart with general medical and surgical history update, including current medications and allergies. Perform evaluation of neurological and vascular status of lower extremity, along with a dermatologic and musculoskeletal examination of the foot, ankle, and lower leg. Examine and measure the size and depth of the ulcer. Conduct proper patient screening to exclude those with deep infection, excessive edema, or excessively fragile skin. Communicate with the patient and/or family to explain the procedure, including a discussion of possible risks and complications. Verify all required instruments and supplies are available. Perform time out.

Description of Intra-Service Work: Remove the previous strapping. Cleanse the ulcer and apply a primary wound dressing as indicated. With an assistant holding the foot with the ankle in neutral position, apply a compression bandage with a circular winding at the base of the toes. Apply a second circular winding that covers the top of the foot and articulating aspect of the ankle joint. Apply the next winding that covers the back of the heel and calf. Make frequent checks to ensure the foot is in a neutral position relative to the ankle. Apply each subsequent application at the specific stretch needed for the desired compression. The final layer of the multilayer system (an elastic bandage) will be applied.

Description of Post-Service Work: Assess circulation, sensation, and motor function of the extremity. Fit a surgical shoe on the patient, as indicated. Discuss home restrictions (ie, activity, bathing) with the patient and family. Provide instructions for removal of the dressing in the event of an emergency (eg, leg swelling with decreased circulation or pain). Dictate procedure for medical record, copy PCP and insurance.

Time Segment (Mean)		
Overall intensity/complexity	0.39	0.31

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Why is 29581 being Surveyed?

In the Final Rule for 2016, CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. Unna boot (29580) was identified for survey through this screen. Code 29581was added as a family code. Unna boot is a single layer strapping system containing zinc-oxide ointment with proven efficacy in a majority of patients. Scientific data indicate that a multi-layer compression system (29581) is at least equal to single layer therapy in efficacy of healing ulcers, and some studies indicate clinical superiority of the multi-layer systems. Additionally, some patients are allergic to the components within the Unna boot paste and the multi-layer compression system is an effective option.

29581 Valuation History and Compelling Evidence

Code 29581 (*Application of multi-layer venous wound compression system, below knee*) was approved for CPT 2010. The service was surveyed in April 2009 by SVS, ACS, APMA, and APTA. The RUC compared 29581 to 29580 and agreed that the multilayer compression system would take more time and work than Unna boot. The RUC recommended the survey 25th percentile work RVU of 0.60 (compared to Unna boot work RVU of 0.55). In the Final Rule for 2010, CMS agreed with the RUC recommendation.

In February 2010, a device manufacturer requested modification of code 29581 to remove reference to venous wound. They indicated that multilayer compression systems are used for other purposes including edema. The Panel postponed until time certain to revise code 29581 to expand the coding language with the involvement of appropriate specialty societies. In June 2010, the Panel accepted the device manufacturer revised proposal, including creation of new codes 29582, 29583, and 29584.

Since the revision to 29581 was editorial and the code was just surveyed in 2009, only the new codes (29582, 29583, 29584) were surveyed and only by the American Physical Therapy Association. The survey results were reviewed by the HCPAC. Very few responses were obtained (14-19) and for 2 codes, the median experience was zero. These surveys would not be accepted by the RUC (or HCPAC) today. The rationale in the RUC database indicates that the HCPAC considered the society recommended times and crosswalks to physical therapy codes that are time based (ie, each 15 minutes).

Flawed methodology in previous valuation:

In the Final Rule for 2012, CMS accepted the HCPAC recommendations for 29582, 29583, and 29584 even though they were not based on a survey data. Further, CMS determined that code 29581 should be paired with these three codes and CMS reduced the work RVU for 29581 from 0.60 to 0.25, which resulted in a negative work intensity (-0.0013).

Given the long lived history of Unna boot and the robust survey of 29581, we believe that the CMS work RVU reduction for 29581 that was based on comparison to a flawed HCPAC survey and flawed HCPAC recommendation for other codes meets compelling evidence of flawed methodology.

Survey Process

For the April 2016 RUC meeting, the ACS, SVS, and APMA conducted a RUC survey for 29580 and 29581 using the vignettes in the RUC database and found that for code 29580 almost 50 percent of the respondents indicated they disagreed with the vignette because it indicated Unna boot was placed for edema instead of stasis ulcer. In addition, we also noted that over 90 percent of the respondents for both codes indicated intra-time in increments of 5 minutes.

We presented the summary data as informational to the RUC and requested that we be allowed to request Research Subcommittee approval for revised vignettes and revised text for survey Question 2 to ask for more precise time estimates. The RUC agreed with our request and the Research Subcommittee approved the revised vignettes and revised survey Question 2.

A survey request was sent to a random selection of each society's membership.

Recommendation - 29581

We recommend that the RUC re-affirm the previous recommended work RVU of 0.60 for code 29581. This value is supported by the previous robust survey and the current robust survey. We believe the slight difference in intra-service time is due to the revision to survey Question 2 to ask for more precise time and NOT due to any change in physician work.

Pre-time Package 5

We recommend pre-time package 5 (*Procedure with minimal anesthesia care*) with one minute subtracted for no anesthesia.

Key Reference Services (KRS)

Codes 29515 and 29405 are excellent comparison codes. These codes require more time than 29581 for molding the cast/splint while the plaster sets. These codes also have a slightly higher intensity to account for maintaining bone alignment while placing the cast/splint.

MPC Comparison

CPT	Long Descriptor	RVW	IWPUT	Total	PRE	INTRA	POST
46600	Anoscopy; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	**0.55**	0.034	22	7	5	10
29581	Application of multi-layer compression system; leg (below knee), including ankle and foot	**0.60**	0.025	25	7	13	5
69210	Removal impacted cerumen requiring instrumentation, unilateral	**0.61**	0.045	17	5	10	2

Other Code

Code 64566, *Posterior tibial neurostimulation, percutaneous needle electrode, single treatment, includes programming* was reviewed by the RUC last year and CMS has accepted the RUC recommendation in the 2017 NPRM. This code provides an excellent comparison of work.

CPT	Long Descriptor	RVW	IWPUT	Total	PRE	INTRA	POST
64566	Posterior tibial neurostimulation, percutaneous needle electrode, single treatment, includes programming	**0.60**	0.033	22	7	10	5
29581	Application of multi-layer compression system; leg (below knee), including ankle and foot	**0.60**	0.025	25	7	13	5

Summary

The RUC and CMS accepted the previous survey results and the recommended work RVU of 0.60 for 29581. The physician work for 29581 includes more than application of a multi-layer compression system (ie, it is more work than required for 29582, 29583, 29584). The typical work includes cleansing, evaluation, and documentation of a venous stasis ulcer, as inherent components to the service, similar to 29580 Unna boot. The current survey supports the previous survey and the work RVU of 0.60.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

29580	Strapping; Unna boot
29581	Application of multi-layer compression system; leg (below knee), including ankle and foot

Global Period 000 Meeting Date October 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from APMA, SVS, and ACS reviewed the current inputs for these codes and agreed that there would be no significant clinical staff work when this service is performed in a facility setting..

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: N/A

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Intra-Service Clinical Labor Activities:

Non Facility Direct Inputs

REVISED 10-6-2016

CPT Long Descriptor:

29580	Strapping; Unna boot
29581	Application of multi-layer compression system; leg (below knee), including ankle and foot

Global Period 000 Meeting Date: October 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from APMA, SVS, and ACS reviewed the current inputs for these codes.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: N/A

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: Codes 29580 and 29581 are 0-day global codes for strapping application. CPT guidelines and CMS policy indicate that casting and strapping procedures include removal of cast or strapping. Because these strapping codes are repeated often (until the wound heals), the removal is often done prior to and on the same day as a new strapping is placed. Both codes require this time and therefore, seven minutes have been included as an additional activity during the service period.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

		current 29580		rec 29580		current 29581		rec 29581		
MEDICAL SUPPLIES	**CODE**	NF	FAC	NF	FAC	NF	FAC	NF	FAC	**Compelling Rationale / Discussion**
pack, minimum multi-specialty visit	SA048			**1**		**1**		**1**		On the day of the procedure, the patient will typically remove their pants and require a gown. Both codes should have this supply item.
gown (for physician)	SB026			**1**				**1**		Cleaning the leg and applying the strapping can be messy and the physician would put on a gown. There is no paper gown for a physician. Item SB026 is used as a paper gown proxy that the physician would use.
underpad 2ft x 3ft (Chux)	SB044			**1**		**1**		**1**		Cleansing leg/wound prior to strapping is a wet service. Both codes should have this supply item.
basin, irrigation	SJ009			**1**		**1**		**1**		Supply item used for cleansing leg/wound prior to strapping. Both codes should have this supply item.

		current 29580		rec 29580		current 29581		rec 29581		
MEDICAL SUPPLIES	**CODE**	NF	FAC	NF	FAC	NF	FAC	NF	FAC	**Compelling Rationale / Discussion**
water, sterile for irrigation (250-1000ml uou)	SH074			**1**		**1**		**1**		Supply item used for cleansing leg/wound prior to strapping. Both codes should have this supply item.
bulb syringe 9Asepto)	SJ011			**1**				**1**		An irrigation syringe is necessary for irrigating/cleansing the wound(s) and leg.
towel, non-sterile	SB042			**2**		**2**		**2**		Supply item used for cleansing leg/wound prior to strapping. Both codes should have this supply item.
gauze, sterile 4in x 4in (10 pack uou)	SG056			**1**		**1**		**1**		Supply item used to pad and protect bony prominences prior to application of strapping. Both codes should have this supply item.
bandage, elastic wrap 4in (Ace)	SG012			**1**						Supply item is typically applied over Unna boot strapping as a surface barrier to prevent contact of the zinc oxide with clothes, bedding, etc. This is not necessary for 29581 since the system includes this item.
tape, surgical paper 1in (Micropore)	SG079	**6**						**6**		Supply item needed for holding end of each compression layer in place. The compression layers are not self adherent. This is different than Unna boot, which is self adherent.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued – Utilization Over 30,000

October 2016

Resection Inferior Turbinate

In October 2015, AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on 2014 Medicare claims data and this service was identified. The RAW determined that this service will be placed on the next level of interest form to survey. In April 2016, the RUC recommended an interim work RVU of 3.57 for CPT code 30140. The RUC noted that because this service has a negative IWPUT and the post-operative visits were highly variable, it should be considered as a 000-day global period. The specialty society agreed with this conversion to a 000 global as they felt it would have more relativity across the fee schedule with the modified global, and the code was resurveyed for October 2016.

30140 Submucous resection inferior turbinate, partial or complete, any method
The RUC reviewed the survey responses from 117 otolaryngologists and determined that the survey median work RVU of 3.00 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes evaluation, 3 minutes positioning and 10 minutes scrub/dress/wait pre-service time, 20 minutes intra-service time and 15 immediate post-service time. The RUC compared the surveyed service to the top key reference service 31238 *Nasal/sinus endoscopy, surgical; with control of nasal hemorrhage* (work RVU = 2.74 and 25 minutes intra-service time) and similar service 31240 *Nasal/sinus endoscopy, surgical; with concha bullosa resection* (work RVU = 2.61 and 20 minutes intra-service time) and agreed that the survey code is more intense and requires more physician work. The reference code 31238 involves addressing one bleeding site and the challenge is to identify the site but once identified the physician applies cautery to the area. The other reference code 31240, involves a concha bullosa which is the middle turbinate with a big air pocket. However, there is little chance that the physician will over or under resect as it is very clear on what needs to be removed. Whereas, CPT code 30140 requires an incision at the anterior part of the inferior turbinate and to raise a tunnel in between the bone and the mucosa; it is difficult not to tear the mucosa and if torn leads to more bleeding and longer healing time. The physician removes the bone and the turbinate, if too little bone is removed than the procedure is not successful and the patient continues to have obstruction. If the physician removes too much bone, then the patient will have excessive loss of nasal structure and a feeling of constant nasal congestion which is irreversible. The RUC agreed that these differences account for the added intensity to perform 30140 compared to these similar services.

RUC also reviewed the secondary key reference service 43213 *Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)* (work RVU = 4.73 and 45 minutes intra-service time) and noted that the respondents appropriately valued 30140 lower than to 43213 as the survey code requires less physician work and time to complete. The RUC also

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

questioned the difference in physician work and intensity of similar service 31295 *Nasal/sinus endoscopy, surgical; with dilation of maxillary sinus ostium (eg, balloon dilation), transnasal or via canine fossa* (work RVU = 2.70 and 20 minutes intra-service time) compared to 30140 as they both require the same intra-service time. The specialty society noted, and the RUC agreed, that CPT code 30140 includes the actual removal of tissue and is more intense whereas for CPT code 31295 a balloon is placed in the maxillary sinus ostium and is dilated, it does not include any removal of tissue and therefore less intense. **The RUC recommends a work RVU of 3.00 for CPT code 30140.**

Practice Expense

The Practice Expense Subcommittee noted that this service is reported with CPT code 30520 64% of the time and is subject to the Multiple Procedure Payment Reduction (MPPR) and therefore justified the pre-service time now that it is a 000-day global. The PE Subcommittee removed 3 minutes in the non-facility setting for the coordination of pre-surgery services, deleted additional time to clean the hand-piece and blade as that is considered regular cleaning equipment time, revised the error in the number of supplies for tubing and canister, deleted time for cleaning sterilizer and autoclave system and corrected equipment minutes in correlation to clinical staff time. The RUC recommends the modifications as recommended by the Practice Expense Subcommittee.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
30140	Submucous resection inferior turbinate, partial or complete, any method	000 ~~090~~	3.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:30140 Tracking Number Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: 000 RUC Recommended RVU: **3.00**

CPT Descriptor: Submucous resection inferior turbinate, partial or complete, any method

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42 year old female presents with right nasal obstruction due to a hypertrophied inferior turbinate that is refractory to medical therapy. A submucous resection of the right inferior turbinate is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Review medical history and results of preoperative testing (labs, EKG, CXR). Review reports of consultants providing preoperative assessment and clearance as indicated. Meet with patient and family to review planned procedure and postoperative management. Reexamine patient to ensure that physical findings have not changed and document history and physical. Mark side for procedure. Obtain informed consent. Review airway and medical management with anesthesiologist. Review planned procedure with OR staff. Verify that all required instruments and supplies are available. Monitor/assist with prepping and draping. Scrub and gown. Administer intranasal topical anesthetic/vasoconstrictive medication. Perform surgical "time out" with operating surgical team. Inject local anesthesia into planned incision site and subcutaneous tissue.

Description of Intra-Service Work: Make an incision at the anterior edge of the inferior turbinate. Raise a submucosal tunnel along the length of the turbinate between the bone and the mucosa, taking care not to tear the mucosa. Remove the bone from the turbinate using direct removal or powered instrumentation while carefully ensuring not to remove the overall structure of the turbinate. Examine the nasal cavity to ensure improved patency. Obtain hemostasis utilizing topical vasoconstrictors and/or absorbable packing material.

Description of Post-Service Work: Monitor patient during reversal of anesthesia. Discuss postoperative recovery care with anesthesia and nursing staff. Discuss procedure and outcome with family in waiting area. Write postoperative note. Dictate operative note and copy to referring physician. Prior to discharge, examine patient and write prescriptions for medications and supplies needed post-discharge. Review post-discharge wound care and activity limitations with patient and family.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31238	000	2.74	**RUC Time**

CPT Descriptor Nasal/sinus endoscopy, surgical; with control of nasal hemorrhage

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
43213	000	4.73	**RUC Time**

CPT Descriptor Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
51102	000	2.70	**RUC Time**	13,592

CPT Descriptor 1 Aspiration of bladder; with insertion of suprapubic catheter

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
15002	000	3.65	**RUC Time**	18,831

CPT Descriptor 2 Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, trunk, arms, legs; first 100 sq cm or 1% of body area of infants and children

Other Reference CPT Code	Global	Work RVU	Time Source
31295	000	2.70	**RUC Time**

CPT Descriptor Nasal/sinus endoscopy, surgical; with dilation of maxillary sinus ostium (eg, balloon dilation), transnasal or via canine fossa

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 53 **% of respondents:** 45.2 **%**

Number of respondents who choose 2nd Key Reference Code: 15 **% of respondents:** 12.8 **%**

TIME ESTIMATES (Median)

	CPT Code: 30140	Top Key Reference CPT Code: 31238	2nd Key Reference CPT Code: **43213**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.40	0.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.47	0.40
Urgency of medical decision making	-1.15	-0.20
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.36	0.93
Physical effort required	0.32	0.73

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	-0.34	0.00
Outcome depends on the skill and judgment of physician	0.32	0.73
Estimated risk of malpractice suit with poor outcome	0.06	-0.20

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.42	0.67

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Reason for Survey: In October 2015, AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on 2014 Medicare claims data and this service was identified. The RUC determined that this service will be placed on the next level of interest form to survey for April 2016. The American Academy of Otolaryngology Head and Neck Surgery responded and indicated an interest to survey. During the April review the RUC indicated concern based on the fact that the service had a negative IWPUT, the panel suggested modifying the global to a 000 and requested that the Academy re-present the code as a 000 global at the October 2016 RUC meeting. We agreed with the change to a 000 global given that there are virtually no 090 global codes with similar time and work RVUs whereas there are many strong 000 global comparator codes for the RUC approved value of 30140. We feel this shows that as a 000 global 30140 will have stronger relativity across the fee schedule and would be more appropriately labelled as a 000 global.

Background on prior valuations: This code is Harvard valued and was RUC surveyed as a 090 global in the spring of 2016. It is being resurveyed as a 000 global for the fall of 2016.

Survey Sample:
The survey data and recommendations are based upon a random sample of AAO-HNS members. The total sample size was 2590 otolaryngologists.

Physician Time:
Pre-Service Time
Our expert panel selected pre-service package 3 (Straightforward Patient/Difficult Procedure) for this code based on the fact that the procedure is typically performed in the facility setting using general anesthesia. We are recommending taking the lesser of the survey or the pre-time package. **Therefore, we recommend a total pretime of 43 minutes.**

Intra-Service Time
We are recommending our median survey time of 20 minutes for intra service work.

Post-Service Time

The expert panel selected post-package 9A (General Anesthesia or Complex Regional Block/ Straightforward Procedure) for this code. We are recommending taking the lesser of the survey or the pre-time package. **The expert panel recommends a post-service time of 15 minutes.**

Physician Work RVU

Upon review of the survey results, the expert panel **recommends our survey's median value for 30140 of 3.00 RVUs with a total time of 78 minutes**

The following table provides other RUC reviewed codes that are similar in time and work to provide additional support for the recommended value for CPT code 30140, as they demonstrate relativity across the fee schedule.

Key Reference codes

Time Source	Most Recent RUC Review	CPT Code	Long Desc	Global	Work RVU	Intra	Total Time	IWPUT
RUC	Apr13	31238	Nasal/sinus endoscopy, surgical; with control of nasal hemorrhage	000	2.74	25	53	0.087
RUC	Oct12	43213	Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)	000	4.73	45	101	0.079

Additional Reference Codes

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Time Source	Most Recent RUC Review
43191	Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed (separate procedure)	000	0.0577	**2.49**	20	86	RUC	Oct12
31240	Nasal/sinus endoscopy, surgical; with concha bullosa resection	000	0.0783	**2.61**	20	73	RUC	Apr13
31295	Nasal/sinus endoscopy, surgical; with dilation of maxillary sinus ostium (eg, balloon dilation), transnasal or via canine fossa	000	0.0772	**2.7**	20	78	RUC	Feb10

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Information is based on current value of the code combination:
3. CPT Code 1: 30140 090 (now converted to 000) 3.57 43 / 20 / 15 Total time: 124 2 - 99213 visits
4. CPT Code 2: 30520 090 7.01 38.5 / 60 / 15 Total time: 210.5 .5 - 99238 / 2- 99213 / 2-99212
5. After accounting for the MPPR work RVUs paid for these services when billed together is: 8.795

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 30140

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 110388
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This represents the Medicare database volume of 36796 multiplied by 3.

Specialty Otolaryngology Frequency 108180 Percentage 97.99 %

Specialty Plastics and Reconstructive surgery Frequency 2208 Percentage 2.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 36,796 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the 2015 Medicare volume per the RUC database.

Specialty Otolaryngology Frequency 36060 Percentage 97.99 %

Specialty Plastics and Reconstructive Surgery Frequency 736 Percentage 2.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 30140

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Tab Number: 14 & 15

Issue: Turbinate, Tracheostomy

Code(s): 30140, 31610

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non - Facility Direct Inputs

CPT Long Descriptor: Submucous resection inferior turbinate, partial or complete, any method

Global Period: 000 Meeting Date: October 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: ***We convened an expert panel to develop our PE recommendations for this service.***

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:
We used the existing PE inputs for 30140 as our reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are requesting extensive clinical staff pre-time (15 minutes) for this procedure because despite it being converted to a 000 global service, it still must be pre-scheduled in advance by the clinical staff, referral and diagnostic forms must be completed, and education and consent is obtained from the patient.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We are requesting the addition of one supply, the 6 ft tubing suction non-latex, as it was erroneously omitted from our PE presentation in April 2016. You require one segment from canister to suction tip and another from the pump to canister. We are also requesting one new piece of equipment, the sterilizer system which is used to clean and sterilize the hand piece and blade used for debridement. The time indicated is the pre-set time that the sterilizer requires to cycle through one time. Last, we are adding in a post operative phone call to check on the patient and call in any necessary prescriptions.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
Staff complete diagnostic and referral forms, coordinate pre-surgery services, schedule space and equipment in the facility.

Intra-Service Clinical Labor Activities:
The staff greet and gown the patient, obtain 1-3 vitals, prepare room and set up supplies, prepare and position the patient, and assist the physician in applying local/topical anesthesia. While we recognize line 27 "Sedate/apply anesthesia" is typically used for procedures done under moderate sedation the PE subcommittee has historically approved this same line item for Otolaryngology procedures that utilize local anesthesia as the staff must assist the physician in the application and/or injection of local/topical anesthesia prior to the procedure. They assist for the entire procedure, handing instruments to the physician, and monitor the patient at a 1:4 ratio for 15 minutes following the procedure. They clean the room and equipment, clean the surgical instruments and the debrider hand piece and blade, and provide home care instructions and set up post op visits and prescriptions/antibiotics.

Post-Service Clinical Labor Activities: staff conduct post procedure phone calls to check on the patient and request any necessary prescriptions. Staff also take time to clean the hand piece and blade used for debridement which are reusable.

CPT Code: 30140

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Submucous resection inferior turbinate, partial or complete, any method

Global Period: 000 Meeting Date: October 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: ***We convened an expert panel to develop our PE recommendations for this service.***

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:
We used the existing PE inputs for 30140 as our reference.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are requesting extensive clinical staff pre-time (27 minutes) for this procedure because despite it being converted to a 000 global service, it still must be pre-scheduled in advance by the clinical staff, pre-surgery services must be coordinated, referral and diagnostic forms must be completed, and education and consent is obtained from the patient.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We are not requesting an increases over existing inputs or staff time.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
Staff complete diagnostic and referral forms, coordinate pre-surgery services, schedule space and equipment in the facility, and obtain consent from the patient..

Intra-Service Clinical Labor Activities:
There are no intra-service activities performed by the clinical staff.

Post-Service Clinical Labor Activities:
Staff conduct post procedure phone calls to check on the patient and request any necessary prescriptions.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedures

April 2016 and October 2016

Tracheostomy

In the Final Rule for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. Code 31600 was identified through this screen and codes 31601, 31603, 31605, and 31610 were added as family codes for survey.

31600 ***Tracheostomy, planned (separate procedure);***
The RUC reviewed the survey results from 66 general surgeons and otolaryngologists and determined that the survey 25th percentile work RVU of 5.56, lower than the current value, appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation, 10 minutes of pre-service positioning, 10 minutes of pre-service scrub/dress/wait, 30 minutes of intra-service time and 30 minutes of immediate post-operative time.

The RUC compared the surveyed code to the top two key reference services 32608 *Thoracoscopy; with diagnostic biopsy(ies) of lung nodule(s) or mass(es) (eg, wedge, incisional), unilateral* (work RVU = 6.84 and intra-service time of 60 minutes) and 43210 *Esophagogastroduodenoscopy, flexible, transoral; with esophagogastric fundoplasty, partial or complete, includes duodenoscopy when performed* (work RVU = 7.75 and intra-service time of 60 minutes) and agreed that the survey respondents valued this service lower as it requires less physician work and time to perform, but is more intense and complex. Performing a tracheotomy carries the risk of serious complications including bleeding, damage to the trachea, subcutaneous emphysema, pneumothorax, and hematoma, any of which can compromise continued breathing and patient survival.

The RUC compared 31600 to MPC code 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included)* (work RVU 6.75 and 45 minutes intra-service time) and agreed that a work RVU of 5.56 for 31600 correctly accounts for less intra-operative time, but greater intensity and complexity, as the RUC noted that 52352 was an endoscopic outpatient procedure on an otherwise healthy individual. Finally, the RUC reviewed the relative intra-operative intensity to other recently reviewed codes with similar intensity and agreed that 31600 was relatively as intense and complex. For additional support the RUC referenced comparable services 34834 *Open brachial artery exposure to assist in the deployment of aortic or iliac endovascular prosthesis by arm incision, unilateral* (work RVU = 5.34 and 30 minutes intra-service time) and 35476 *Transluminal balloon angioplasty, percutaneous; venous* (work RVU = 5.10 and 35 minutes intra-service time. **The RUC recommends a work RVU of 5.56 for CPT code 31600.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

31601 ***Tracheostomy, planned (separate procedure); younger than 2 years***

Compelling Evidence

The specialty societies presented compelling evidence that the value for code 31601 was based on a flawed methodology. The specialty societies informed the RUC that Harvard reviewed code 31601 as a 090-day global code. In that study, the intra-operative work estimates were provided by only ten general otolaryngologists and the pre-and post-operative work were computed by algorithm. The specialty societies also noted that the 1992 Medicare Physician Payment Schedule indicated a 090-day global period for 31601 with a footnote that the work RVU was "gap-filled" by CMS. In the 1993 Medicare Physician Payment Schedule, the global period was changed to 000-day and the work RVU reduced without resurvey and without any discussion in the Federal Register text. The specialty societies further noted that, during the first five-year-review in 1995, a comment was made to CMS that the intra-operative work of 31601 was under valued and the code was surveyed. However, in 1995, the society did not have the history of the CMS global period changes and "gap fill" changes in valuation for this low volume procedure. Therefore, the RUC concluded that the patient population and procedure had not changed since the Harvard review and the Harvard work RVU was maintained. The rejected survey data were entered into the RUC database several years later and were marked "do not use to validate for physician work" because the surveyed physician time did not correspond to the Harvard work RVU that the RUC maintained. The RUC accepted the compelling evidence of flawed methodology as presented.

The RUC reviewed the survey results from 33 otolaryngologists and determined that the median work RVU of 8.00 appropriately accounts for the work required to perform this service. The RUC recommends 40 minutes of pre-service evaluation, 10 minutes of pre-service positioning, 10 minutes of pre-service scrub/dress/wait, 45 minutes of intra-service time and 30 minutes of immediate post-operative time.

The RUC compared the surveyed code to the top two key reference services 43274 *Endoscopic retrograde cholangiopancreatography (ERCP); with placement of endoscopic stent into biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent* (work RVU = 8.58 and intra-service time of 68 minutes) and 43210 *Esophagogastroduodenoscopy, flexible, transoral; with esophagogastric fundoplasty, partial or complete, includes duodenoscopy when performed* (work RVU = 7.75 and intra-service time of 60 minutes) and agreed that this service is appropriately valued as it requires less time to perform but is more intense and complex. Performing a tracheotomy carries the risk of serious complications including bleeding, damage to the trachea, subcutaneous emphysema, pneumothorax, and hematoma, any of which can compromise continued breathing and survival. In addition, performing a tracheostomy in pediatric patients has added difficulty because a child's neck is anatomically different from an adult's neck in the following ways: The dome of the pleura extends into the neck and is thus vulnerable to injury. The trachea is pliable and can be difficult to palpate. The neck is short, and there is significantly less working space. The cricoid can be injured if it is not correctly identified. The RUC also determined that a work RVU of 8.00 for 31601 appropriately ranked relative to 31600, as 31601 is performed on a pediatric patient and is significantly more intense and complex and requires more physician time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC also agreed that code 31601 was more intense and complex than MPC code 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* (work RVU = 7.50 and 60 minutes intra-service time) which includes a low intensity diagnostic endoscopy prior to a therapeutic procedure and which is an outpatient procedure on otherwise healthy patients. Finally, the RUC reviewed the relative intra-operative intensity to other recently reviewed codes with similar intensity and agreed that 31601 was relatively as intense/complex. **The RUC recommends a work RVU of 8.00 for CPT code 31601.**

31603 *Tracheostomy, emergency procedure; transtracheal*

Compelling Evidence

The specialty societies presented compelling evidence that the value for code 31603 was based on a flawed methodology. The specialty societies informed the RUC that Harvard obtained estimates from both otolaryngologists and thoracic surgeons as a 090-day global code, however thoracic surgeons are not a primary provider of this service (less than 2%) and general surgeons (29%) were not included in the review. In addition, prior to implementation of the 1992 Medicare Physician Payment Schedule, the global period was changed from 090-day to 000-day and the work RVU reduced without any discussion in the Federal Register text. The specialty societies further noted that, during the first five-year-review in 1995, a comment was made to CMS that the intra-operative work of 31603 was under valued and the code was surveyed. However, in 1995, the society did not have the history of the CMS global period changes and "gap fill" changes in valuation for this low volume procedure. Therefore, the RUC concluded that the patient population and procedure had not changed since the Harvard review and the Harvard work RVU was maintained. The rejected survey data were entered into the RUC database several years later and were marked "do not use to validate for physician work" because the surveyed physician time did not correspond to the Harvard work RVU that the RUC maintained. The RUC accepted the compelling evidence of flawed methodology as presented.

The RUC reviewed the survey results from 61 general surgeons and otolaryngologists and determined that the survey 25th percentile work RVU of 6.00 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes of pre-service evaluation, 5 minutes of pre-service positioning, 10 minutes of pre-service scrub/dress/wait, 30 minutes of intra-service time and 30 minutes of immediate post-operative time.

Although both 31603 and 31600 are both intense procedures, the RUC noted code 31603 is relatively more intense than a planned tracheostomy, code 31600. The RUC compared code 31603 to the top two key reference services 43274 *Endoscopic retrograde cholangiopancreatography (ERCP); with placement of endoscopic stent into biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent* (work RVU = 8.58 and intra-service time of 68 minutes) and 32608 *Thoracoscopy; with diagnostic biopsy(ies) of lung nodule(s) or mass(es) (eg, wedge, incisional), unilateral* (work RVU = 6.84 and intra-service time of 60 minutes) and agreed that 31603 requires less physician time to perform, but is more intense and complex. Performing a tracheostomy carries the risk of serious complications including bleeding, damage to the trachea, subcutaneous emphysema, pneumothorax, and hematoma, any of which can compromise continued breathing and survival. Furthermore, in this case, the airway is not secured during the performance of the procedure, increasing the intensity and complexity.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support the RUC referenced comparable services 34834 *Open brachial artery exposure to assist in the deployment of aortic or iliac endovascular prosthesis by arm incision, unilateral* (work RVU = 5.34 and 30 minutes intra-service time); 36222 *elective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral extracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed* (work RVU = 5.53 and 40 minutes intra-service time) and MPC code 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included)* (work RVU 6.75 and 45 minutes intra-service time) and agreed that a work RVU of 6.00 for 31603 correctly accounted for less intra-operative time, but greater intensity and complexity, as the RUC noted that 52352 was an endoscopic outpatient procedure on an otherwise healthy individual and 36222, a percutaneous procedure, was also performed most often as outpatient and 11% in the office and did not carry the risks and intensity of 31603. Finally, the RUC reviewed the relative intra-operative intensity to other recently reviewed codes with similar intensity and agreed that 31603 was relatively as intense and complex. **The RUC recommends a work RVU of 6.00 for CPT code 31603.**

31605 ***Tracheostomy, emergency procedure; cricothyroid membrane***
Compelling Evidence
The specialty societies presented compelling evidence that the value for code 31605 was based on a flawed methodology. The specialty societies informed the RUC that Harvard obtained estimates from 10 otolaryngologists only for intraoperative time. General surgeons and other providers of the service were not included in the review. The specialties also indicated that Harvard work estimates and the proposed rule for the 1992 Medicare Physician Payment Schedule indicated code 31605 was a 000-day global code with a proposed work RVU of 5.57 (FR 06/05/91). Prior to implementation of the Final Rule for the first payment schedule, it appears that code 31605 was treated as if it were reviewed as a 090-day global code similar to codes 31601 and 31603 and then reduced to 3.77 as a 000-day global code (FR 11/25/91) without any discussion in the Federal Register text. The RUC accepted the compelling evidence of flawed methodology as presented.

The survey was sent to a random selection of 1,802 surgeons from the AAO-HNS and ACS membership database. Responses were obtained from 56 surgeons; however the median experience was zero. This was not unexpected as this procedure is rarely performed. The survey data was significantly different between respondents who had experience and respondents without experience. After significant discussion, the RUC agreed that the recommendation should be based on the summary data from the experienced providers. The RUC reviewed the survey results from the 20 respondents with experience preforming this very low volume service in the past 12 months and agreed that the survey 25th percentile work RVU of 6.45 accurately accounts for the work required to perform this procedure.

The RUC recommends 15 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait, 20 minutes of intra-service time and 21 minutes of immediate post-operative time. The RUC compared the surveyed code to the top two key reference services 43274 *Endoscopic retrograde cholangiopancreatography (ERCP); with placement of endoscopic stent into biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent* (work RVU = 8.58 and intra-service time of 68 minutes) and 32608 *Thoracoscopy; with diagnostic biopsy(ies) of lung nodule(s) or mass(es) (eg, wedge,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

incisional), unilateral (work RVU = 6.84 and intra-service time of 60 minutes) and agreed that the intra-service work intensity of 31605 (IWPUT=0.277) is significantly more intense and complex than both of these services. The RUC noted that the intensity of 31605 is more comparable to the intensity for 31500 *Intubation, endotracheal, emergency procedure* (Feb 2016 for CY 2017 RUC recommended work RVU=3.00, intra-service time of 10 minutes and IWPUT=0.252). **The RUC recommends a work RVU of 6.45 for CPT code 31605.**

31610 ***Tracheostomy, fenestration procedure with skin flaps***
Valuation History - CPT cycle 2018
In April 2016, the RUC noted that the recommendation for 31610 had a negative IWPUT, should be reclassified as a 000-day global and resurveyed for October 2016. The RUC also considered that the CPT Editorial Panel may need to create a new code to describe changing the tracheostomy tube in the office. The RUC noted that the specialty did not need to resurvey the entire family of codes. In June 2016, AAO-HNS and ACS appealed the interim recommendation and change to the global period because: 1) a negative IWPUT should not be the primary criteria to change a global period. CPT code 31610 is a major surgery and is appropriately classified as a 090-day global period. Additionally, the post-operative work is stable and the level and physician work was specifically outlined in the rationale for the April 2016 meeting; and 2) there is compelling evidence that the original valuation was flawed. First, the Harvard methodology algorithm used to assign postoperative hospital and office visits underestimated the level of postoperative work required and therefore underestimated the relative work RVU. Second, the previous Harvard physician intra-service time of 61 minutes was computed by an algorithm. The initial Harvard review indicated the intra-operative time was 52 minutes, but then finalized the time at 61 minutes, without any rationale for this change.

AAO-HNS and ACS requested that the RUC maintain the current 090-day global period and reconsider compelling evidence. The Committee noted that, while the RUC will submit the specialties' recommendations for the global period to CMS, the Agency makes the ultimate global period assignment. The Committee indicated concern that if this service was changed to a 000-day global period that direct practice expense activities associated with the care of the tracheostomy in the post-operative care would be lost.

A RUC Ad Hoc Appeals Committee unanimously recommended that the RUC reconsider its recommendation for CPT code 31610. The Committee unanimously agreed that there is compelling evidence that the previous valuation was flawed. The Committee supports the specialty society recommendation for a 090-day global period assignment though that recommendation was not unanimous. The Committee determined that the work RVU should be discussed by the entire RUC and anticipated more information from the specialty societies to foster discussion regarding the compelling evidence that the original valuation was flawed.

RUC Review – October 2016
In October 2016, the specialty societies presented compelling evidence that that the previous valuation of 31610 was flawed. The RUC noted that the previous Harvard physician intra-service time of 61 minutes was computed by an algorithm. The Phase III Harvard Study report indicated the intra-operative surveyed time was 52 minutes, but the Final Harvard report indicated 61 minutes, without any additional surveys, discussion or rationale for this change. The specialty societies also noted that the Harvard postoperative visit times were transformed into low level hospital and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

office visits and were not surveyed, but developed by an algorithm as well. These low level visits resulted in undervaluation of the work RVU. The RUC agreed that due to the multiple unexplained issues in the original valuation, there is compelling evidence that the Harvard methodology was flawed for CPT code 31610.

The RUC reviewed the survey results from 94 general surgeons and otolaryngologists and recommends the survey 75th percentile work RVU of 12.00 and 40 minutes of pre-service evaluation, 10 minutes of pre-service positioning, 10 minutes of pre-service scrub/dress/wait, 45 minutes of intra-service time, 20 minutes of immediate post-operative time, 2-99231 subsequent hospital care visits, 1-99232 subsequent hospital care visit, 1-99233 subsequent hospital care visit, 1-99238 discharge day management and 3-99213 office visits. The RUC agreed that the 99232 visit is typically the first inpatient post-operative visit and is more intense and complex than the two 99231 visits because the physician is checking for significant complications such as pneumothorax subcutaneous crepitus and subcutaneous emphysema. The 99231 visits are to evaluate the skin flaps for viability and make sure there is no infection. The 99233 service is typically 4-5 days after the procedure and is the most intense visit because it includes changing the tracheostomy, taking out sutures, removing the tracheostomy, inspecting the area and inserting a new tracheostomy into the stoma. Further, the RUC agreed that 3-99213 office visits are appropriate in order to examine the patient, inspect the larynx, remove the tracheostomy ,examine stoma and skin flaps, replace the tracheostomy, cauterize any granulation tissue at the stoma, answer patient/family questions, assess for adequacy of pain control and discuss proper maintenance of the tracheostomy including stomal care.

The RUC noted that the negative IWPUT at the current value is an indication that this service is not valued correctly. Although, the survey respondents analyzed the intra-service work appropriately they may have underestimated the post-service work. Therefore, the RUC recommends the survey 75% percentile work RVU of 12.00 appropriately accounts for the total physician work required for this service. The RUC compared the surveyed code to similar services 66183 *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach* (work RVU = 13.20 and intra-service time of 45 minutes) and noted that the physician work and time is appropriately relative to this similar service. The RUC referenced CPT code 27027 *Decompression fasciotomy(ies), pelvic (buttock) compartment(s) (eg, gluteus medius-minimus, gluteus maximus, iliopsoas, and/or tensor fascia lata muscle), unilateral (s)* (work RVU = 13.04 and intra-service time of 60 minutes) noting that the physician work and post-operative work is similar for 31610 and supports the recommendation. **The RUC recommends a work RVU of 12.00 for CPT code 31610.**

Practice Expense:
CPT codes 31603 and 31605 were identified by the PE Subcommittee as emergent procedures and no practice expense direct inputs were requested for these two services. For CPT code 31610, the RUC recommends the 090-global direct practice expense inputs with minor modifications for additional supplies and equipment that are not standard to Evaluation and Management services.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RUC Database Flag
The RUC recommends to flag CPT codes 31605 and 31610 as "do not use" for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
31600	Tracheostomy, planned (separate procedure);	000	5.56 (April 2016 Recommendation)
31601 (f)	Tracheostomy, planned (separate procedure); younger than 2 years	000	8.00 (April 2016 Recommendation)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31600 Tracking Number

Original Specialty Recommended RVU: **6.93**
Presented Recommended RVU: **6.93**
RUC Recommended RVU: **5.56**

Global Period: 000

CPT Descriptor: Tracheostomy, planned (separate procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male with pneumonia and chronic obstructive pulmonary disease is unable to be extubated after prolonged intubation. A planned tracheostomy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 25%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review labs and imaging. Select and order the appropriate antibiotic(s) and confirm timing and administration. Re-examine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and postoperative management. Mark site of proposed skin incision. Review and obtain informed consent with patient and/or family. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Assist in transfer of patient from gurney to operating table. Patient is positioned with the neck extended and the shoulders elevated on a small roll. Assist with adjusting the OR table and anesthesia lines so operative site is accessible.. Perform surgical time out with operating surgical team and anesthesia team. Verify areas surrounding skin incisions to be prepared and draped and sterilely prep area. Scrub and gown. Re-assess position of the extremities and head. Drape out surgical area. Inject local anesthesia into planned incision site and subcutaneous tissue.

Description of Intra-Service Work: Under general anesthesia, a transverse incision is performed. Subcutaneous fat may be removed with electrocautery. Dissection proceeds until the midline raphe between the strap muscles is identified. The inferior limit of the field is palpated to assess the proximity of the innominate artery. The aberrant anterior jugular veins and smaller vessels are either cauterized or ligated. Midline dissection is essential for hemostasis and avoidance of paratracheal structures. The strap muscles are then separated and retracted laterally, exposing the pretracheal fascia and the thyroid isthmus. The thyroid isthmus division is performed sharply with suture ligature or with electrocautery. The isthmus is elevated off the trachea with a hemostat. Anesthesia is notified that the surgical team is about to enter the airway with a cricoid hook and the endotracheal tube balloon is deflated. A cricoid hook is placed to gain control of the airway and the endotracheal tube balloon is reinflated. Next, attention is turned to drying the field and cleaning the remaining fascia off of the anterior face of the trachea. The tracheostomy tube is tested to ensure there is no leak in the balloon. The presence and ease of access of all instruments needed to secure the airway is reconfirmed. Anesthesia is notified that the surgical team

will be entering the airway and the endotracheal tube balloon is deflated. After the trachea is entered, secretions and blood are suctioned out of the airway lumen. The lateral retractors are placed in the trachea and the tracheotomy is dilated. Anesthesia withdraws the endotracheal tube slowly to a point just proximal to the opening. The previously tested tracheostomy tube is inserted. The obturator is removed, the inner cannula is placed and the balloon is inflated. After an intact airway is confirmed with carbon dioxide return and bilateral breath sounds, the tracheostomy tube is secured to the skin with non-absorbable sutures. A tracheostomy collar is attached with the head flexed to avoid unnecessary slack in the collar. The skin is not closed to avoid the risk of subcutaneous emphysema and subsequent pneumomediastinum. A sponge is placed between the skin and the flange.

Description of Post-Service Work: Assist in transfer of patient from operating table to gurney. Supervise transfer of patient, who is respirator dependent, back to the ICU. Discuss postoperative recovery care with ICU staff. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate operative report and copy referring physician(s). Review post-operative x-ray for pneumothorax.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	-0.64	-0.10
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.14	0.20
Urgency of medical decision making	0.14	0.30
Technical Skill/Physical Effort (Mean)		
Technical skill required	0.21	0.60
Physical effort required	0.07	0.60

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	0.43	1.00
Outcome depends on the skill and judgment of physician	0.43	0.60
Estimated risk of malpractice suit with poor outcome	0.50	1.00

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	0.14	0.70

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the Final Rule for 2016, code 36100 was identified by CMS through a screen of high expenditure services across specialties with Medicare allowed charges of $10 million or more.

Survey Sample

A survey request was sent to a random selection of 1,802 surgeons from the AAO-HNS and ACS membership database.

Recommendation - 31600

Pre-time Package 4

We recommend pre-time package 4 (*Difficult Patient/Difficult Procedure)*. **Recommended times for the preservice categories are 40/10/10**. An additional 7 minutes has been added for positioning *(Patient is positioned with the neck extended and the shoulders elevated on a small roll. Assist with adjusting the OR table and anesthesia lines so operative site is accessible. Re-assess position of the extremities and head, adjust as needed. Inject local anesthesia into planned incision site and subcutaneous tissue*.). The scrub, dress, wait time has been reduced by 10 minutes to be consistent with the survey median.

Post-time Package 9b

We recommend post-time package 9b (*General Anesthesia or Complex Regional Block/Complex Procedure)*, with a reduction of 3 minutes to be consistent with the survey median.

Key Reference Services (KRS)

The intra-operative work of code 31600 is more intense/complex than both 32608 and 43210. Performing a tracheotomy carries the risk of serious complications including bleeding, damage to the trachea, subcutaneous emphysema, pneumothorax, and hematoma, any of which can compromise continued breathing and patient survival.

MPC Comparison

The intra-operative work of code 31600 is more intense than MPC codes 52352 and 52353, both of which include diagnostic endoscopy prior to a therapeutic procedure and both of which are outpatient procedures on otherwise healthy patients.

Other Comparison Codes

The intra-operative work for code 31600 is intense and complex and carries the risk of serious complications that could compromise a patient's survival. Code 31600 is not easily compared with other 000 global codes, many of which are performed as outpatient and/or office procedures on ambulatory patients. As support of our recommendation, we provide a list of codes below that have been recently reviewed by the RUC and approved by CMS that have intra-operative intensities comparable to the IWPUT of 0.123 for 31600 with a work RVU of 5.56.

RUC	CPT	DESCRIPTOR	IWPUT	INTRA TIME
2015	**65855**	Trabeculoplasty by laser surgery	0.142	10
2010	**35840**	Exploration for postoperative hemorrhage, thrombosis or infection; abdomen	0.142	60
2012	**92937**	Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed; single vessel	0.145	67
2013	**33366**	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)	0.147	195
2012	**92941**	Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single vessel	0.155	70
2013	**67041**	Vitrectomy, mechanical, pars plana approach; with removal of preretinal cellular membrane (eg, macular pucker)	0.160	60
2013	**67042**	Vitrectomy, mechanical, pars plana approach; with removal of internal limiting membrane of retina (eg, for repair of macular hole, diabetic macular edema), includes, if performed, intraocular tamponade (ie, air, gas or silicone oil)	0.160	60
2010	**67220**	Destruction of localized lesion of choroid (eg, choroidal neovascularization); photocoagulation (eg, laser), 1 or more sessions	0.183	15
2010	**67210**	Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation	0.199	15
2012	**66982**	Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage	0.207	33
2012	**66984**	Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification)	0.210	21
2012	**65800**	Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous	0.217	5

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31600

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

CPT Descriptor: Tracheostomy, planned (separate procedure); younger than 2 years

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18-month-old male with subglottic stenosis is unable to be extubated after prolonged intubation. A planned tracheostomy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 15%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review labs and imaging. Select and order the appropriate antibiotic(s) and confirm timing and administration. Re-examine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and postoperative management. Mark site of proposed skin incision. Review and obtain informed consent with patient and/or family. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Assist in transfer of patient from gurney to operating table. Patient is positioned with the neck extended and the shoulders elevated on a small roll. Assist with adjusting the OR table and anesthesia lines so operative site is accessible.. Perform surgical time out with operating surgical team and anesthesia team. Verify areas surrounding skin incisions to be prepared and draped and sterilely prep area. Scrub and gown. Re-assess position of the extremities and head. Drape out surgical area. Inject local anesthesia into planned incision site and subcutaneous tissue.

Description of Intra-Service Work: Under general anesthesia, a transverse incision is performed. Subcutaneous fat may be removed with electrocautery. Dissection proceeds until the midline raphe between the strap muscles is identified. The inferior limit of the field is palpated to assess the proximity of the innominate artery. The aberrant anterior jugular veins and smaller vessels are either cauterized or ligated. Midline dissection is essential for hemostasis and avoidance of paratracheal structures. The strap muscles are then separated and retracted laterally, exposing the pretracheal fascia and the thyroid isthmus. The thyroid isthmus division is performed sharply with suture ligature or with electrocautery. The isthmus is elevated off the trachea with a hemostat. Anesthesia is notified that the surgical team is about to enter the airway with a cricoid hook and the endotracheal tube balloon is deflated. A cricoid hook is placed to gain control of the airway and the endotracheal tube balloon is reinflated. Next, attention is turned to drying the field and cleaning the remaining fascia off of the anterior face of the trachea. The tracheostomy tube is tested to ensure there is no leak in the balloon. The presence and ease of access of all instruments needed to secure the airway is reconfirmed. Anesthesia is notified that the surgical team will be entering the airway and the endotracheal tube balloon is deflated. After the trachea is entered, secretions and blood

are suctioned out of the airway lumen. The lateral retractors are placed in the trachea and the tracheotomy is dilated. Anesthesia withdraws the endotracheal tube slowly to a point just proximal to the opening. The previously tested tracheostomy tube is inserted. The obturator is removed, the inner cannula is placed and the balloon is inflated. After an intact airway is confirmed with carbon dioxide return and bilateral breath sounds, the tracheostomy tube is secured to the skin with non-absorbable sutures. A tracheostomy collar is attached with the head flexed to avoid unnecessary slack in the collar. The skin is not closed to avoid the risk of subcutaneous emphysema and subsequent pneumomediastinum. A sponge is placed between the skin and the flange.

Description of Post-Service Work: Assist in transfer of patient from operating table to gurney. Supervise transfer of patient, who is respirator dependent, back to the ICU. Discuss postoperative recovery care with ICU staff. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate operative report and copy referring physician(s). Review post-operative x-ray for pneumothorax.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.36	0.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.91	1.00
Urgency of medical decision making	0.36	1.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.09	1.20
Physical effort required	0.73	1.20

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.36	1.60
Outcome depends on the skill and judgment of physician	0.91	1.40
Estimated risk of malpractice suit with poor outcome	1.45	2.00

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.09	1.60

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the Final Rule for 2016, code 36100 was identified by CMS through a screen of high expenditure services across specialties with Medicare allowed charges of $10 million or more. Code 36101 was added as family code.

Compelling Evidence

Flawed methodology in previous valuation:
Code 31601 is a rarely performed pediatric procedure. Harvard reviewed code 31601 as a 90-day global code. Intra-operative work estimates were provided by only ten general otolaryngologists and pre-and post-operative work was computed by algorithm. In fact, the 1992 PFS indicated a 90-day global period for 31601 with a footnote that the work RVU was "gap-filled" by CMS. In the 1993 PFS, the global period was changed to 0-day and the work RVU reduced without any discussion in the Federal Register text. **Therefore, we believe the original Harvard value was derived using a flawed methodology.**

During the first five-year-review in 1995, AAO-HNS commented that the intra-operative work of 31601 was under valued. The RUC workgroup reviewing the otolaryngology codes developed criteria for considering a change in a value, specifically, the presenting society was required to have convincing evidence of a change in patient or convincing evidence that Harvard times were incorrect. Absent that evidence, the workgroup maintained the current Harvard work RVU. In 1995, the society did not have the history of the global period changes and "gap fill" changes in valuation for this low volume procedure. Therefore, the workgroup concluded that the patient population and procedure had not changed since the Harvard review. They recommended to maintain the Harvard work RVU and rejected the society recommendation of 7.75. Several years after the 1995 review, when the RUC database was created, the Harvard work RVU and the 1994 survey data were included as RUC time. Several years after that, the code was tagged as "do not use to validate for physician work" because the surveyed physician time did not correspond to the Harvard work RVU. **We believe the process of review during the Harvard study and the 1995 5YR was flawed and that consideration should have been given to the value of the intra-operative work relative to other highly intense/complex procedures.**

Survey Sample

A survey request was sent to a random selection of 1,379 surgeons from the AAO-HNS membership database.

Recommendation - 31601

We recommend the survey median work RVU of 8.00 for code 31601.

Pre-time Package 4

We recommend pre-time package 4 (*Difficult Patient/Difficult Procedure)*. **Recommended times for the preservice categories are 40/10/10.** An additional 7 minutes has been added for positioning *(Infant is positioned with the neck extended and the shoulders elevated on a small roll. Assist with adjusting the OR table and anesthesia lines so operative site is accessible. Re-assess position of the extremities and head, adjust as needed. Inject local anesthesia into planned incision site and subcutaneous tissue*.). The scrub, dress, wait time has been reduced by 10 minutes to be consistent with the survey median.

Post-time Package 9b

We recommend post-time package 9b (*General Anesthesia or Complex Regional Block/Complex Procedure),* with a reduction of 3 minutes to be consistent with the survey median.

Key Reference Services (KRS)

The intra-operative work of code 31601 is more intense/complex than both 43274 and 43210. Performing a tracheotomy carries the risk of serious complications including bleeding, damage to the trachea, subcutaneous emphysema, pneumothorax, and hematoma, any of which can compromise continued breathing and survival. In addition, performing a tracheostomy in pediatric patients has added difficulty because a child's neck is anatomically different from an adult's neck in the following ways: The dome of the pleura extends into the neck and is thus vulnerable to injury. The trachea is pliable and can be difficult to palpate. The neck is short, and there is significantly less working space. The cricoid can be injured if it is not correctly identified.

MPC Comparison

The intra-operative work of code 31601 is more intense/complex than MPC code 52353, which includes diagnostic endoscopy prior to a therapeutic procedure and which is an outpatient procedure on an otherwise healthy patient.

Other Comparison Codes

The intra-operative work for code 31601 is intense and complex and carries the risk of serious complications that could compromise a patient's survival. Code 31601 is not easily compared with other 000 global codes, many of which are performed as outpatient and/or office procedures on ambulatory patients. As support of our recommendation, we provide a list of codes below that have been recently reviewed by the RUC and approved by CMS that have intra-operative intensities comparable to the IWPUT of 0.134 for 31601 with a work RVU of 8.00.

RUC	CPT	DESCRIPTOR	IWPUT	INTRA TIME
2015	**65855**	Trabeculoplasty by laser surgery	0.142	10

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work: The pre-service work in a patient requiring an emergency tracheostomy is by nature limited due to the time constraints placed upon the physician. Typical pre-service work is not always possible, including reviewing labs, imaging, patient history and ordering pre-operative medications. Landmarks (eg, thyroid notch, sternal notch, cricoid cartilage) will be marked followed by marking the planned incision. Patient is positioned with the neck extended and the shoulders elevated on a small roll. Areas surrounding the skin incision are prepped and draped. The physician scrubs and gowns. Local anesthesia is infiltrated.

Description of Intra-Service Work: Under local anesthesia, a transverse incision is performed. Subcutaneous fat may be removed with electrocautery. Dissection proceeds until the midline raphe between the strap muscles is identified. The inferior limit of the field is palpated to assess the proximity of the innominate artery. The aberrant anterior jugular veins and smaller vessels are either cauterized or ligated. Midline dissection is essential for hemostasis and avoidance of paratracheal structures. The strap muscles are then separated and retracted laterally, exposing the pretracheal fascia and the thyroid isthmus. The thyroid isthmus division is performed sharply with suture ligature or with electrocautery. The isthmus is elevated off the trachea with a hemostat. There is communication with the patient to determine the need for further local anesthesia. A cricoid hook is placed to gain control of the airway. Next, attention is turned to drying the field and cleaning the remaining fascia off of the anterior face of the trachea. The tracheostomy tube is tested to ensure there is no leak in the balloon. The presence and ease of access of all instruments needed to secure the airway is reconfirmed. Anesthesia is notified that the surgical team will be entering the airway. After the trachea is entered, secretions and blood are suctioned out of the airway lumen. The lateral retractors are placed in the trachea and the tracheotomy is dilated. The previously tested tracheostomy tube is inserted. The obturator is removed, the inner cannula is placed and the balloon is inflated. After an intact airway is confirmed with carbon dioxide return and bilateral breath sounds, general anesthesia is induced. The tracheostomy tube is secured to the skin with non-absorbable sutures. Attach a tracheostomy collar with the head flexed to

avoid unnecessary slack in the collar. The skin is not closed to avoid the risk of subcutaneous emphysema and subsequent pneumomediastinum. A sponge is placed between the skin and the flange.

Description of Post-Service Work: Apply sterile dressings. Assist in transfer of patient from operating table to gurney. Supervise transfer of patient to the ICU. Discuss postoperative recovery care with ICU staff. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate operative report and copy referring physician(s). Review post-operative x-ray for pneumothorax.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.26	0.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	0.04	-0.63
Urgency of medical decision making	1.78	1.63
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.22	0.88

Physical effort required	1.13	0.63

Psychological Stress (Mean)

The risk of significant complications, morbidity and/or mortality	1.65	1.25
Outcome depends on the skill and judgment of physician	1.26	1.63
Estimated risk of malpractice suit with poor outcome	1.57	1.38

INTENSITY/COMPLEXITY MEASURES	**Top Key Ref Code**	**2nd Key Ref Code**

Time Segment (Mean)

Overall intensity/complexity	1.09	1.25

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the Final Rule for 2016, code 36100 was identified by CMS through a screen of high expenditure services across specialties with Medicare allowed charges of $10 million or more. Code 36103 was added as family code.

Compelling Evidence

Flawed methodology in previous valuation:
Code 31603 is a low volume procedure. Harvard obtained estimates from both otolaryngologists and thoracic surgeons as a 90-day global code. Thoracic surgeons are not a primary provider of this service and general surgeons were not included in the review. Prior to implementation of the 1992 PFS, the global period was changed to 0-day and the work RVU reduced without any discussion in the Federal Register text. **Therefore, we believe the original Harvard value was derived using a flawed methodology.**

During the first five-year-review in 1995, AAO-HNS commented that the intra-operative work of 31603 was under valued. The RUC workgroup reviewing the otolaryngology codes developed criteria for considering a change in a value, specifically, the society was required to have convincing evidence of a change in patient or convincing evidence that Harvard times were incorrect. Absent that evidence, the workgroup maintained the current work RVU. In 1995, the society did not have the history of the Harvard study process and global period changes to provide as evidence. Therefore, the workgroup concluded that the patient population and procedure had not changed since the Harvard review. They recommended to maintain the Harvard work RVU and rejected the society recommendation of 8.35. Several years after the 1995 review, when the RUC database was created, the Harvard work RVU and the 1994 survey data were included as RUC time. Several years after that, the code was tagged as "do not use to validate for physician work" because the survey physician time did not correspond to the Harvard work RVU. **We believe the process of review during the Harvard study and the first 5YR was flawed and that consideration should have been given to the value of the intra-operative work relative to other highly intense/complex procedures.**

Survey Sample

A survey request was sent to a random selection of 1,802 surgeons from the AAO-HNS and ACS membership database.

Recommendation - 31603

We recommend the survey median work RVU of 8.00 for code 31603.

Pre-time Package 4

We recommend pre-time package 4 (*Difficult Patient/Difficult Procedure)*. **Recommended times for the preservice categories are 30/5/10**. Although the code descriptor states "emergency," the typical patient will have "impending" airway obstruction and not an obstructed airway. These patients will typically be taken to the OR to perform the procedure under local, with anesthesia staff available to assist, if needed. An additional 2 minutes has been added for positioning *(Patient is positioned with the neck extended and the shoulders elevated on a small roll.*). The scrub, dress, wait time has been reduced by 10 minutes to be consistent with the survey median.

Post-time Package 7b

We recommend post-time package 7b (*Local Anesthesia/ Complex Procedure)*, with the addition of 7 minutes. Time for post-operative work to monitor/stabilize the patient and for post-operative orders for this patient who will be transferred to ICU is consistent with the times for a complex patient/procedure that will undergo general anesthesia.

Key Reference Services (KRS)

The intra-operative work of code 31603 is more intense/complex than both 43274 and 32608. Performing a tracheostomy carries the risk of serious complications including bleeding, damage to the trachea, subcutaneous emphysema, pneumothorax, and hematoma, any of which can compromise continued breathing and survival. Furthermore, in this case, the airway is not secured during the performance of the procedure, increasing the intensity and complexity.

MPC Comparison

The intra-operative work of code 31603 is more intense/complex than MPC code 52353, which includes diagnostic endoscopy prior to a therapeutic procedure and which is an outpatient procedure on an otherwise healthy patient.

Other Comparison Codes

The intra-operative work for code 31603 is intense and complex and carries the risk of serious complications that could compromise a patient's survival. Almost all of the pre-service work necessary for 31600 is necessary for 31603, but has to be performed in a much shorter time frame because of the nature of the procedure. This increases the intensity of the service. Code 31603 is not easily compared with other 000 global codes, many of which are performed as outpatient and/or office procedures on ambulatory patients. As support of our recommendation, we provide a list of codes below that have been recently reviewed by the RUC and approved by CMS that have intra-operative intensities comparable to the IWPUT of 0.215 for 31603 with a work RVU of 8.00.

RUC	CPT	DESCRIPTOR	IWPUT	INTRA TIME
2010	**67220**	Destruction of localized lesion of choroid (eg, choroidal neovascularization); photocoagulation (eg, laser), 1 or more sessions	0.183	15
2010	**67210**	Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation	0.199	15
2012	**66982**	Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage	0.207	33
2012	**66984**	Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification)	0.210	21
2012	**65800**	Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous	0.217	5
2009	**67028**	Intravitreal injection of a pharmacologic agent (separate procedure)	0.226	5

2007	**31500**	Intubation, endotracheal, emergency procedure	0.406	5

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31603

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty otolaryngology How often? Rarely

Specialty general surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,238
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty otolaryngology Frequency 600 Percentage 48.46 %

Specialty general surgery Frequency 350 Percentage 28.27 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 31603

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31605 Tracking Number Original Specialty Recommended RVU: **6.45**
Presented Recommended RVU: **6.45**
Global Period: 000 RUC Recommended RVU: **6.45**

CPT Descriptor: Tracheostomy, emergency procedure; cricothyroid membrane

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year old female develops angioedema with swelling of the larynx and airway obstruction. Intubation is unsuccessful. An emergency tracheostomy through the cricothyroid membrane is performed

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 10%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician is typically present during the intubation attempts, which ultimately, fail. The physician obtains a focused history from family and/or other physicians. Supplies needed for the tracheostomy, including scalpel, endotracheal tube, clamps, and a headlight are obtained. The physician confers with other physicians regarding airway management. Landmarks (eg, thyroid notch, sternal notch, cricoid cartilage) are identified and marked. Areas surrounding the incision site are prepped and draped while the physician scrubs and gowns. Patient is positioned with the neck extended and the shoulders elevated on a small roll. Local anesthesia is infiltrated.

Description of Intra-Service Work: An incision is made between the cricoid and thyroid cartilages. A clamp is used to spread through the subcutaneous tissues and through the cricothyroid membrane. Once access through the cricothyroid membrane is achieved, an endotracheal tube is passed through the cricothyroid membrane. An intact airway is confirmed by the return of carbon dioxide and bilateral breath sounds. Control of bleeding is obtained after the airway is secured. The endotracheal tube is secured to the patient utilizing tape and non-absorbable sutures.

Description of Post-Service Work: Once the airway is secure and the endotracheal tube secured, the physician remains with the patient for monitoring, awaiting availability of an operating room. The physician supervises transfer of patient to the OR for conversion to a tracheostomy. Discuss procedure and outcome with family. Write brief operative note and dictate full operative report.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Intensity & Complexity Rating Scale: (much less= -2.00, somewhat less= -1.00, identical= 0.00, somewhat more= 1.00, much more= 2.00)

	Top Key Ref Code	2nd Key Ref Code
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	0.50	1.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	-0.17	1.00
Urgency of medical decision making	1.83	2.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	1.33	1.50
Physical effort required	1.17	1.50
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.00	2.00

Outcome depends on the skill and judgment of physician	1.67	2.00
Estimated risk of malpractice suit with poor outcome	1.83	2.00

INTENSITY/COMPLEXITY MEASURES	Top Key Ref Code	2nd Key Ref Code
Time Segment (Mean)		
Overall intensity/complexity	1.67	1.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In the Final Rule for 2016, code 36100 was identified by CMS through a screen of high expenditure services across specialties with Medicare allowed charges of $10 million or more. Code 36105 was added as family code.

Compelling Evidence

Flawed methodology in previous valuation:
Code 31605 is a very low volume procedure. Harvard obtained estimates from 10 otolaryngologists only for intraoperative time. General surgeons and other providers of the service were not included in the review.
Harvard work estimates and the proposed rule for the 1992 PFS indicated code 31605 was a 0-day global code with a proposed work RVU of 5.57 (FR 06/05/91). Prior to implementation of the Final Rule for the first fee schedule, it appears that code 31605 was treated as if it were reviewed as a 90-day global code and then reduced to 3.77 as a 0-day global code (FR 11/25/91) without any discussion in the Federal Register text. **Therefore, we believe the original Harvard value was manipulated using flawed assumptions and a flawed methodology.**

Survey Sample

A survey request was sent to a random selection of 1,802 surgeons from the AAO-HNS and ACS membership database. Responses were obtained from 56 surgeons, however the median experience was zero. This is not unexpected as this procedure is rarely performed. The summary Excel file presents the survey data for all 56 respondents and separately for those respondents with and without experience in the past 12 months.

Recommendation - 31605

The survey data was significantly different between respondents who had experience and respondents without experience. Our recommendation is based on the summary data from experienced providers.

We recommend the survey 25th percentile work RVU of 6.45 based on data from providers with experience in the past 12 months.

Pre-time Package 4

We recommend pre-time package 4 (*Difficult Patient/Difficult Procedure)* with reductions as described below.
We recommend a total of 23 minutes (15 min for eval, 3 minutes of positioning, and 5 min for sdw). Typically, depending on the facility and site within the facility, intubation is first attempted by either anesthesiology or the emergency medicine physician. The surgeon is in attendance during this time performing a rushed pre-procedure update

of the patient presentation and history, preparing to perform 31605 including ordering supplies and equipment, and scrubbing and gowning. In this case intubation typically fails, making 31605 necessary. Once the surgeon steps in to perform 31605, the patient will need to be repositioned with the neck extended and the shoulders elevated on a small roll. The patient will also be marked, draped and prepped. For this work, we are recommending 3 minutes for positioning. Our expert panel agrees that 23 minutes total (15 min for eval, 3 minutes for positioning, and 5 min for sdw) accounts for the surgeon's time preparing for 31605 and also takes into account the fact that this service is typically billed with a critical care visit.

Post-time Package 7b

We recommend the standard 21 minutes for post-time package 7b (*Local Anesthesia/ Complex Procedure).* This time includes post-operative work to monitor the patient prior to transport to the operating room. The physician documents and writes orders, discusses the procedure and outcome with the family and other clinicians. We believe the reduction in time from the 30 minutes recommended by survey respondents accounts for the fact that this service is typically billed with a critical care visit.

Code Comparison

The intra-operative work of code 31605 is significantly more intense/complex than both 43274 and 32608 and similar in intensity to 31500 (emergency intubation, IWPUT=0.4061).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31605

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty otolaryngology How often? Rarely

Specialty general surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

CPT Descriptor: Tracheostomy, fenestration procedure with skin flaps

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old male with progressive ALS is intubated and unable to be extubated. A long term tracheostomy is needed. A tracheostomy fenestration procedure with skin flaps is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 10% , Overnight stay-more than 24 hours 99%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 30%

Description of Pre-Service Work: Review labs and imaging. Select and order the appropriate antibiotic(s) and confirm timing and administration. Re-examine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and postoperative management. Mark site of proposed skin incision. Review and obtain informed consent with patient and/or family. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available. Assist in transfer of patient from gurney to operating table. Patient is positioned with the neck extended and the shoulders elevated on a small roll. Assist with adjusting the OR table and anesthesia lines so operative site is accessible.. Perform surgical time out with operating surgical team and anesthesia team. Verify areas surrounding skin incisions to be prepared and draped and sterilely prep area. Scrub and gown. Re-assess position of the extremities and head. Drape out surgical area. Inject local anesthesia into planned incision site and subcutaneous tissue.

Description of Intra-Service Work: Under general anesthesia, a transverse incision is performed. Subcutaneous fat may be removed with electrocautery. Dissection proceeds until the midline raphe between the strap muscles is identified. The inferior limit of the field is palpated to assess the proximity of the innominate artery. The aberrant anterior jugular veins and smaller vessels are either cauterized or ligated. Midline dissection is essential for hemostasis and avoidance of paratracheal structures. The strap muscles are then separated and retracted laterally, exposing the pretracheal fascia and the thyroid isthmus. The thyroid isthmus division is performed sharply or with electrocautery and suture ligature. The isthmus is elevated off the trachea with a hemostat. Anesthesia is notified that the surgical team is about to enter the airway with a cricoid hook and the endotracheal tube balloon is deflated. A cricoid hook is placed to gain control of the airway and the endotracheal tube balloon is reinflated. Next, attention is turned to drying the field and cleaning the remaining fascia off of the anterior face of the trachea. The tracheostomy tube and endotracheal tube are tested to ensure there is no leak in the balloon. The presence and ease of access of all instruments needed to secure the airway is reconfirmed. Anesthesia is notified that the surgical team will be entering the airway and the endotracheal tube balloon is deflated. After the trachea is entered, secretions and blood are suctioned out of the airway lumen. The lateral retractors are placed in the trachea and the tracheotomy is dilated. Anesthesia withdraws the endotracheal tube slowly to a point just proximal to the opening. The previously tested endotracheal tube is inserted. The balloon is inflated. An intact airway is confirmed with carbon dioxide return and bilateral breath sounds. Skin flaps are developed and an anterior portion of the trachea is resected. The skin flaps are then sutured to the anterior tracheal opening, creating a permanent stoma. Once the stoma is secured, anesthesia is

notified the surgeon will be removing the endotracheal tube. The balloon is deflated and the endotracheal tube is removed. The previously tested tracheostomy tube is inserted. The obturator is removed, the inner cannula is placed and the balloon is inflated. After an intact airway is confirmed with carbon dioxide return and bilateral breath sounds, the tracheostomy tube is secured to the skin with non-absorbable sutures. Attach a tracheostomy collar with the head flexed to avoid unnecessary slack in the collar. The skin is not closed to avoid the risk of subcutaneous emphysema and subsequent pneumomediastinum. A sponge is placed between the skin and the flange.

Description of Post-Service Work:
Through discharge from recovery: Assist in transfer of patient from operating table to gurney. Supervise transfer of patient, who is respirator dependent, back to the ICU. Discuss postoperative recovery care with ICU staff. Write postoperative orders for medications, imaging, and labs. Discuss procedure and outcome with family. Write brief operative note. Dictate operative report and copy referring physician(s). Review post-operative x-ray for pneumothorax.

Inpatient visits: The surgeon will closely monitor and evaluate the flaps for viability; monitor the patient for pneumothorax, pneumomediastinum, or subcutaneous emphysema; and monitor the wound for infection. The surgeon will assess the patient to determine the need for continued inflation of the tracheostomy cuff and remove and replace the tracheostomy after several days. The patient's vocalization and swallowing will be closely monitored for signs of esophageal damage or laryngeal nerve damage. This is in addition to charting patient progress, answering patient and family questions, writing orders for suctioning, humidified air, breathing therapy, pain management, and labs, as required, and answering nursing and/or other staff questions.

Discharge management: Review interval chart notes. Talk with patient and family. Evaluate flaps for viability and wound for infection. Redress wound. Assess pain score and order medications, as required. Discuss home restrictions (ie, diet, activity, bathing) and care of drain with patient and family members. Medications are reconciled and orders for home care, discharge medications and supplies are written. Complete all appropriate medical records, including day of discharge progress notes and discharge instructions.

Office visits: At each office visit, the surgeon will examine the patient, inspect the larynx, remove the tracheostomy and examine the stoma and skin flaps, replace the tracheostomy, answer patient/family questions, assess for adequacy of pain control, assess adequacy of oral intake, discuss advancing diet and daily activities, assess ability to produce speech and appropriateness of speaking valve candidacy, when appropriate, discuss proper maintenance of tracheostomy including stoma care, cauterize any granulation tissue at stoma site, and chart progress notes. At each visit, the surgeon will also monitor for long term tracheostomy complications such as narrowing of the trachea, formation of a fistula between the trachea and esophagus or between the trachea and the innominate artery, infection, or bacterial colonization which can lead to pneumonia.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background and Discussion of Global Period

In the Final Rule for 2016 CMS identified code 31600 via the High Expenditure Procedures screen and codes 31601, 31603, 31605, and 31610 were added as family codes for survey. These services were surveyed and reviewed at the April 2016 RUC meeting and recommendations were sent to CMS.

In the RUC's Summary of Recommendation to CMS for 31610, the first recommendation states: *"The RUC determined that since this service has a negative IWPUT it should be converted to a 000-day global period and be re-surveyed."* After carefully considering this statement, and its far-reaching implications, we requested through appeal (June 13, 2016) that the RUC remove this statement as a rationale for action on this code. There are several reasons why we think this particular rationale should be rejected, including the precedent it would set for other services with a global period moving forward. We do not believe that a negative IWPUT, per se, should be the primary criteria to change a global period. Global surgery and global period assignment is clearly defined in the Medicare Claims Processing Manual (Chapter 12, Sections 40 and 40.1): Codes with "000" global assignment are endoscopies or some minor surgical procedures; codes with "010" global assignment are other minor procedures; and codes with "090" global assignment are major surgeries. In this instance, code 31610 is clearly a major surgery that involves the permanent placement of a tracheostomy tube and creation of flaps that require specific postoperative care. The post-operative facility and office work were outlined in our summary of recommendation (SoR) and was discussed at length during our presentation at the April 2016 meeting.

In addition, during the meeting, a comment was made by a RUC member that the postoperative work for 31610 was widely variable and that a 000 global assignment would correct valuation for the variability in postoperative work. We think the postoperative hospital and office work for 31610 is no more variable than any other major procedure with a 090 global assignment. In support of this statement, our survey data 25th, median, and 75th percentile length of stay data (3, 5, and 7, respectively) is very tight and matches the 25th, median, and 75th percentile length of stay data for the corresponding DRG (013).[1]

In our appeal letter, we also presented compelling evidence of a flawed methodology in the original valuation of this low volume code that resulted in underestimation of physician work. This information was not presented at the April 2016 RUC meeting.

[1] Table 7B Medicare Prospective Payment System Selected Percentile Lengths of Stay; FY2014 MedPAR Update - March 2015 Grouper V33 MS-DRGs

The Ad Hoc Appeals Committee unanimously recommended that the RUC reconsider its recommendation for 31610. The Committee unanimously agreed that there is compelling evidence that the previous valuation was flawed. The Committee supports the specialty society recommendation for a 090-day global period assignment but that recommendation was not unanimous. The Committee determined that the work RVU should be discussed by the entire RUC. ***The Committee anticipates more information from the specialty societies to foster discussion regarding the compelling evidence that the original valuation was flawed.***

Compelling Evidence

During the first five-year-review in 1995, AAO-HNS commented that the intra-operative work of 31610 was undervalued. The society did not receive enough responses to present to the RUC and the code was withdrawn from review. The April 2016 RUC survey is the first survey data available to compare to the Harvard study. Upon review of these data, it is clear that a flawed methodology to collect data and assign visits for this low volume code resulted in undervaluation of 31610 in the initial Medicare fee schedule.

Flawed methodology in previous valuation- Evidence that incorrect assumptions were made in the previous valuation.

1) **Unexplained discrepancy in the intra-service time:** During Phase III of the Harvard study, intra-operative work estimates were provided by multiple small panels of general otolaryngologists in order to obtain enough responses, and pre- and post-operative work were computed by algorithm. The intraoperative time from this Harvard survey was 52 minutes (see attached page from the Harvard Phase III preliminary report[2]). However, in the final data spreadsheet submitted to HCFA (now CMS), dated March 1992, the intraoperative time was shown as 61 minutes for 31610 even though 31610 was not part of the national follow-up survey to validate selected high volume (anchor) codes. There is no documentation in any Harvard Report about why the time for this low volume code was changed from a surveyed 52 minutes to 61. **We believe the unexplained discrepancy in the intraoperative time is evidence that an incorrect assumption was made in the valuation of 31610. This meets compelling evidence that the original valuation was flawed.**

2) Underestimation of post-operative visits and physician work: As noted above, postoperative visits were computed by algorithm using the intraoperative time from multiple small panels of general otolaryngologists in order to obtain enough responses; postoperative visits were not surveyed for code 31610. The Harvard study imputed visits were four 99231, one 99238, and three 99212. This information, as documented in the Harvard study report, is the basis for calculating the postoperative work. In comparison, the current RUC survey indicates that while there were still four hospital visits following the procedure, two of them were higher levels (one 99233 and one 99232). Additionally, survey respondents indicated that there were still three office visits, but that all three visits were at a higher level (99213) than the Harvard estimates. The work required at each visit was discussed at the previous presentation to the RUC in April 2016, and the RUC agreed with the recommended level of visits.

It is important to note that the typical patient will be discharged to ICU after the operation and the surgeon will closely monitor and evaluate the flaps for viability; monitor the patient for pneumothorax, pneumomediastinum, or subcutaneous emphysema; and monitor the wound for infection. The surgeon will assess the patient to determine the need for continued inflation of the tracheostomy cuff and remove and replace the tracheostomy after several days. The patient's vocalization and swallowing will be closely monitored for signs of esophageal damage or laryngeal nerve damage. This is in addition to charting patient progress, answering patient and family questions, writing orders for suctioning, humidified air, breathing therapy, pain management, and labs, as required, and answering nursing and/or other staff questions. In addition, at each office visit, the surgeon will examine the patient, inspect the larynx, remove the tracheostomy and examine the stoma and skin flaps, replace the tracheostomy, answer patient/family questions, assess for adequacy of pain control, assess adequacy of oral intake, discuss advancing diet and daily activities, assess ability to produce speech, discuss proper maintenance of tracheostomy including stoma care, cauterize any granulation tissue at the stoma site, and chart progress notes. At each visit, the surgeon will also monitor for long term tracheostomy complications such as narrowing of the trachea, formation of a fistula between the trachea and esophagus or between the trachea and the innominate artery, an assess for signs of infection or bacterial colonization which can lead to pneumonia. **We believe that the algorithm used to assign postoperative hospital and office visits for low volume**

[2] Hsiao, W.C., Braun, P., Becker, E.R., et al.: A National Study of Resource-Based Relative Value Scales for Physician Services: Phase III Study Report to the Health Care Financing Administration. HCFA Contract No. 17-C-98795/1-03. Boston, MA: Harvard School of Public Health, August 30, 1992. Vol. II, Appendices B through C: 113.

code 31610 underestimated the level of postoperative work required, and therefore, underestimated the relative work RVU. This meets compelling evidence that the original valuation was flawed.

Recommendation for 31610

We recommend the survey 75th percentile work RVU of 12.00 for code 31610. This increased value accounts for a higher level of postoperative work compared with the work estimated during the flawed Harvard review.

Pre-time Package 4

We recommend pre-time package 4 (*Difficult Patient/Difficult Procedure)*. **Recommended times for the preservice categories are 40/10/10**. An additional 7 minutes has been added for positioning *(Patient is positioned with the neck extended and the shoulders elevated on a small roll. Assist with adjusting the OR table and anesthesia lines so operative site is accessible. Re-assess position of the extremities and head, adjust as needed. Inject local anesthesia into planned incision site and subcutaneous tissue*.). The scrub, dress, wait time has been reduced by 10 minutes to be consistent with the survey median.

Post-time Package 9b

We recommend post-time package 9b (*General Anesthesia or Complex Regional Block/Complex Procedure)*, with a reduction of 13 minutes to be consistent with the survey median.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these

data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31610

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty otolaryngology How often? Sometimes

Specialty general surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,722
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty otolaryngology Frequency 1450 Percentage 84.20 %

Specialty general surgery Frequency 150 Percentage 8.71 %

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

31600	Tracheostomy, planned (separate procedure);
31601	Tracheostomy, planned (separate procedure); younger than 2 years
31603	Tracheostomy, emergency procedure; transtracheal

Global Period: 000 Meeting Date: April 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The AAO-HNS and ACS RUC Advisors reviewed the current PE details for 31600, 31601, and 31603.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale: N/A

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

31600 is a planned major operation performed in an OR under general anesthesia. We recommend the 0-day standard package for extensive use of clinical staff minus the times for providing pre-service education and follow-up phone calls to the patient since the typical patient is already in the hospital. This is the same time (20 minutes) that was previously approved by the PEAC.

31601 is a planned major operation performed in an OR under general anesthesia. We recommend the 0-day standard package for extensive use of clinical staff without any adjustments. Although the infant is in the hospital, there will typically be several phone calls from the parents regarding the procedure, after care, necessary home supplies, etc. This is the same time (30 minutes) that was previously approved by the PEAC.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

31600. For this planned procedure, clinical staff coordinate pre-service diagnostic and referral forms, coordinate pre-surgery services between the surgeon and anesthesia, and schedule space and equipment for the procedure.

31601. For this planned procedure, clinical staff coordinate pre-service diagnostic and referral forms, coordinate pre-surgery services between the surgeon and anesthesia, and schedule space and equipment for the procedure. In addition, clinical staff will field several phone calls from the parents regarding the procedure, after care, needed home supplies, etc.

31603. N/A

Intra-Service Clinical Labor Activities: N/A

Post-Service Clinical Labor Activities N/A
