- 2. Time:** The Harvard intra-service time is 188 minutes, while several more recent and more accurate methods indicate that the true intra-service time is much longer. Our median survey intra-service time was 220 minutes. The survey also requested that physicians report the actual times for their last three procedures. The median value for those procedures was 240 minutes. The survey also requested respondents to supply actual time data from their hospitals, and the volume weighted mean of these institution's median times was 205 minutes. Finally, the SVS 10 hospital OR data analysis (Table 1) revealed that the median time was 228 minutes. Considered together, these data suggest that 220 minutes is a far more accurate measure of intra-service time than the 188 minutes suggested by Harvard. Likewise, the Harvard data give a figure of 72.5 minutes for pre-service time, whereas the median survey pre-service time was 90 minutes. The Harvard post-service time was 167.5 minutes, whereas the survey post-service time was 200 minutes. The Harvard survey did not include an ICU day; however, an ICU day is common after a limb salvage operation in a patient with many comorbidities who is likely to have an arterial line and an epidural catheter in place (none of our respondents felt that our vignette was atypical).
- 3. Intensity:** The intensity of 35583 is high with a median mental effort/judgment of 4, a median technical skill value of 4, and median psychological stress value of 4. While intensity is difficult to compute back to work values, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 35583 in 1995 is 0.042 based on our SVS 10 hospital data analysis of OR log times for procedures (Table 1). It is 0.057 according to the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95). This is less than that accorded most other major procedures in all other specialties. If 35583 is recalculated using an IWPUT of 0.07 (the low end of the spectrum of major complicated and at least moderately intense procedures), a more accurate reflection of intra-service is achieved. By this technique, intra work is $220 \times .07 = 15.40$ units. Since intra-work is 49% of the total work based on the survey data, the total work is $15.40 / .49 = 31.43$ units (see attached Appendix for an expanded discussion). Thus, this third and entirely different method of calculating work strongly supports the survey request of 24 units.
- 4. Summary:** Five different analyses suggest work values ranging from 22.28 to 31.43 for this service:
 1. The median opinion of our respondents was a request of 24.

2. Comparison to the most frequently used reference service, CPT 35606, by our survey respondents suggests a value of 28.71.
3. The E/M building block method results in an estimate of 28.14.
4. The results of the American College of Surgeons survey suggested 22.28.
5. The IWPUT method, using the most conservative IWPUT figures, justified an RVW of 31.43.

After careful review of the survey results and 4 supplemental work analyses for 35583, we recommend an RVW of 24.00.

Appendix: IWPUT Method for work calculation of 35583

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.026 to 0.12 in the SVS Operative Log Data analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 was 0.082. Almost all major operations with reasonably high level of intensity will have an IWPUT of at least 0.070. Almost all major vascular procedures have an IWPUT of less than 0.070.
4. The performance of 35583 with its attendant risks of cardiac complications, failure, and possible limb loss should merit at least the low end of the usual spectrum of major complicated and at least moderately intense procedures. (The survey intensity ratings would actually support more than a low-end IWPUT level.)
5. The Survey intra-service median time for 35583 of 220 minutes is substantiated by our original OR log data analysis (228 min).
6. The intra-service work for 35583 should equal the operative time multiplied by the low end major surgical IWPUT, or $220 \times 0.070 = 15.4$.
7. The pre- and post- service work for 35583 are at least typical of the average operation of large magnitude in that patients presenting for this operation commonly suffer from symptomatic coronary disease, hypertension, diabetes, hyperlipidemia, obesity and COPD.
8. The RUC survey data indicate that intra-service work represents 0.49 of total work. In other words $\text{total work} = \text{intra-work} / 0.49$.
9. The total work of 35583, based on a low end of the spectrum (0.070) IWPUT value, should be $15.4 / 0.49 = 31.43$.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35585 Global Period: 090 1995 RVW: 19.05 Recommended RVW: 27.00

CPT Descriptor: In-situ vein bypass; femoral-anterior tibial, posterior tibial, or peroneal artery

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures by collecting and analyzing accurate intraoperative surgery time (skin-to-skin) of commonly performed vascular and non-vascular procedures. Data were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study found the intra-service work of code 35585 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. These intra-service work comparisons formed the basis for choosing procedures to be surveyed for all aspects of work in the five-year review.

1994 Frequency of Service: 8,874

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 78 year old male with a 63 pack-year history of smoking presents with a history of a non healing ulcer over his left first metatarsal. He has long standing hypertension, recent diabetes controlled with oral medication, and mild angina on occasion. He has had a previous coronary artery bypass eleven years before, and the right saphenous vein was used. He has worsening pain in his foot at rest. Arteriography, as an out-patient, revealed an occlusion of his superficial femoral artery and reconstitution of the posterior tibial artery at the level of his medial malleolus. His anterior tibial artery and his peroneal artery were not acceptable out-flow conduits. Cardiac evaluation is done as an out-patient. He is admitted to the hospital; appropriate invasive monitoring is done, an epidural catheter is inserted for anesthesia, and a femoral-posterior tibial bypass using *in situ* saphenous vein is constructed. Postoperatively he spends one day in the ICU, and is able to be discharged from the hospital on the tenth postoperative day with a palpable posterior pulse.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before the operation until the beginning of the procedure. This includes obtaining and reviewing pre-procedural work-up, with special attention to cardiopulmonary and hematologic status; reviewing previous imaging studies (especially arteriograms) and laboratory studies; consulting with the referring physician and cardiologist, if necessary, and other health care professionals; and communicating with the patient and patient's family to review the operative risks, benefits, and alternative treatments, and to obtain informed consent. Other pre-operative services include dressing, being present while appropriate invasive monitoring is done with insertion of a Swan-Ganz catheter (if necessary), arterial line, and Foley catheter. Sequential compression devices (on the contralateral leg if desired by the surgeon) are applied and placement of non-invasive ECG and oxygen saturation monitoring devices, and satisfactory anesthesia, generally consisting of insertion of an epidural catheter (or establishing general anesthesia via endotracheal inhalation), is achieved. Additional pre-operative services include ensuring that sufficient blood,

especially if the patient has previously donated blood, is available, that the surgical instruments and supplies that might be necessary are available in the operative suite, scrubbing and supervision of the positioning, prepping, and draping of the patient. Appropriate lines are connected including electrocautery and suction tubes.

Description of Intra-Service work: An incision is made in the groin and the common femoral, superficial femoral, and profunda femoris arteries as well as the greater saphenous vein are isolated and encircled. The incision is then extended down the thigh and lower leg over the greater saphenous vein until sufficient vein is exposed to allow the bypass to be constructed using one continuous segment of vein for the bypass. This usually requires an incision from the groin to near the ankle. The point for the distal anastomosis is identified, an incision is made, and the distal artery is exposed. The branches of the vein are carefully dissected and ligated with meticulous attention to making sure the saphenous vein wall itself is not damaged. The proximal end of the vein is then anastomosed to the femoral artery in an end-of-vein to side-of-artery fashion. The distal vein is divided and mobilized sufficiently to allow an anastomosis of the distal vein to the distal artery. The vein valves are then disrupted mechanically and the vein conduit is flushed with arterial flow to make sure the rate of flow is sufficient and any small bleeding points are carefully closed with fine sutures. An anastomosis, using magnification, is then made between the vein and the distal artery. Once satisfactory flow into the distal arterial circulation is determined, the incision from the groin to near the ankle is carefully closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, checking the extremity for adequate arterial perfusion, and transfer of the patient to the recovery room where postoperative orders are written. Post-service work also includes stabilization of the patient in the recovery room, monitoring blood gas values as well as obtaining electrolytes and a hematocrit. It also includes communication with the family and other health care professionals (including written and oral reports and orders), all hospital visits and services performed by the surgeon, including ICU care and ventilator management as necessary, careful monitoring of cardiopulmonary, and hemodynamic status; ordering and reviewing post-operative radiographs and laboratory studies; monitoring and care of the incision which has a high incidence of incision edge necrosis; monitoring care, most especially physical therapy for training in ambulation, and removal of all tubes and drains; and antibiotics and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital and likely post hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure including removal of sutures, out-patient wound care, evaluation of periodic imaging and laboratory reports, and antibiotic and pain medication adjustments.

Other Hospital:	107.5	9
Office:	45	3

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>1995 RVW</u>
1)	35606	Bypass Graft, with other than vein, carotid-subclavian	17.40
2)	35372	Thromboendarterectomy, with or without patch graft; deep (profunda) femoral	12.28
3)	47130	Hepatectomy, resection of liver; total right lobectomy	31.56
4)	43631	Gastrectomy, partial, distal; with gastroduodenostomy	18.10

RELATIONSHIP OF CODE UNDER SURVEY TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Construction of a reference service table (Table 3) for the 5-year reevaluation was difficult for the vascular codes since most of the vascular procedures on the MPC list were submitted for reevaluation. The SVS/ISCVS advisors asked the RUC administrative staff for assistance with construction of the reference service table; we were referred to Dr. Kwass, chair of the RUC research subcommittee to which these codes are assigned. The recommendation was to choose some vascular codes if, in our opinion they were approximately correctly valued, as well as some reference services from the general surgery codes on the MPC list since 1) all vascular surgeons have completed a full 5 year categorical general surgery residency

and are therefore familiar with general surgery cases and 2) while we are "vascular surgeons" by dint of concentrated training or fellowship programs in vascular surgery, many vascular surgeons have practices which include general surgery cases in addition to their vascular practice. Thus, while the reference services are related to the code being surveyed by pre-service work, operative time, intensity, and magnitude of the operation, in addition to post-service work and global periods, the actual operations may be dissimilar.

Comparison to 35606: The survey respondents believed that the intra-service time spent for 35585 was 1.74 times that required for 35606, the total time was 1.62 times that for 35606, and the intensity was 1.15 times that of 35606. The calculated total work ratio was 1.96 times that of 35606. Applying this ratio to the current work value of 35606 (17.40 RVWs), results in **34.10 RVWs** for 35585 (17.40 x 1.96). This comparison, therefore, suggests that a work value for 35585 of 27 RVW is quite reasonable, using 35606 as a reference code. Additional time and intensity data for 35606 from the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95) were not available for analysis.

Comparison to E/M Codes: The work of 35585 may be calculated as the sum of the following E/M services, using intensive care codes as the best comparison to the complex intra-service work involved with this service:

<u>Service</u>	<u>Time</u>	<u>E/M Code</u>	<u>RVW</u>
Pre-Service	90	99215	1.51
Intra-service	270	99291 + 99292 x 7	16.52
Post-day of proc	40	99291	3.64
POD #1 ICU	30	99291	3.64
POD #2-9	10	99231 x 8	4.08
POD #10 Disch	35	99238	1.06
Office x 3	45	99213 x 3	1.65
Total			32.10

Thus, by using the E/M reference service building-block method, the work of 35585 should be **32.10 units**.

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in RVW is based upon improvements in the accuracy of existing Harvard work, time, and intensity data for this code.

1. Work: The Harvard work value was originally estimated at 20.89 units by a panel without substantial participation by vascular surgeons as discussed in the Introduction. The RVU was decreased to 19.72 in 1992 and decreased further to 19.05 in 1994. The median RVW of the current survey is 27 units. The median survey value is easily justified by comparison to the most frequently used reference service, CPT 35606, which results in a value of 34.10. The E/M building block calculation of 32.10 units also compares favorably with the recommended RVW of 27.00. In addition, the work survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report) suggests a work value of 28.18 for this service.

2. Time: The Harvard intra-service time is 233 minutes, while several more recent and more accurate methods indicate that the true intra-service time is considerably longer. Our median survey intra-service time was 270 minutes. The survey also requested that physicians report the actual times for their last three procedures. The median value for those procedures was 278 minutes. The survey also requested respondents to supply actual time data from their hospitals, and the volume weighted mean of these institution's median times was 273 minutes. Finally, the SVS 10 hospital OR data analysis (Table 1) revealed that the median time was 261 minutes. Considered together, these data suggest that 270 minutes is a far more accurate measure of intra-service time than 233 minutes. Likewise, the Harvard data give a figure of 68.5 minutes for pre-service time, whereas the median survey pre-service time was 90 minutes. The Harvard post-service time was 172.5 minutes, whereas the survey time was 222.5 minutes. The Harvard survey did not include an ICU day; however, this is common after a limb salvage operation in a patient with many comorbidities who is likely to have an arterial line and an epidural catheter in place (only 1 of our respondents felt that our vignette was atypical).

3. Intensity: The intensity of 35585 is very high with a median mental effort/judgment of 4, a median technical skill value of 4, and median psychological stress value of 4. While intensity is difficult to compute back to work values, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 35585 in 1995 is 0.048 based on our SVS 10 hospital data analysis of OR log times for procedures (Table 1). It is 0.059 according to the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95). This is considerably less than that accorded most other procedures in all other specialties. If 35585 is recalculated using an IWPUT of 0.07 (the low end of the spectrum of major complicated and at least moderately intense procedures), a more accurate reflection of intra-service time is achieved. By this technique, intra-work is $270 \times 0.07 = 18.90$ units. Since intra-work is 51% of the total work based on the survey data, the total work is $18.90/0.51 = 37.06$ units (see attached Appendix for an expanded discussion). Thus, this third and entirely different method of calculating work strongly supports the survey request of 27 units.

4. Summary: Five different analyses suggest work values from 27.00 to 37.06:

1. Median survey value is 27.00.
2. Comparison to reference code 35606 suggests a work value of 34.10.
3. The E/M building block method results in an estimate of 32.10.
4. The American College of Surgeons survey suggested 28.18.

5. The IWPUT method, using conservative IWPUT figures, justifies a value of 37.06.

After careful review of the survey results and supplemental work analyses for 35585, we recommend an RVW of 27.00.

Appendix: IWPUT Method for work calculation of 35585

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.026 to 0.12 in the SVS Operative Log Data analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 was 0.082. Almost all major operations with reasonably high level of intensity will have an IWPUT of at least 0.070. Almost all major vascular procedures have an IWPUT of less than 0.070.
4. The performance of 35585 with its attendant risks of cardiac complications, failure, and possible limb loss should merit at least the low end of the usual spectrum of major complicated and at least moderately intense procedures. (The survey intensity ratings would actually support more than a low-end IWPUT level.)
5. The Survey intra-service median time for 35585 of 270 minutes is substantiated by our original OR log data analysis (261 min).
6. The intra-service work for 35585 should equal the operative time multiplied by the low end major surgical IWPUT, or $270 \times 0.070 = 18.9$.
7. The pre- and post- service work for 35585 are at least typical of the average operation of large magnitude in that patients presenting for this operation commonly suffer from symptomatic coronary disease, hypertension, diabetes, hyperlipidemia, obesity and COPD.
8. The RUC survey data indicate that intra-service work represents 0.51 of total work. In other words $\text{total work} = \text{intra-work} / 0.51$.
9. The total work of 35585, based on a low end of the spectrum (0.07) IWPUT value, should be $18.9/0.51 = 37.06$.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35656 **Global Period:** 090 1995 **RVW:** 13.86 **Recommended RVW:** 18.00

CPT Descriptor: Bypass graft, with other than vein; femoral-popliteal

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures by collecting and analyzing accurate intraoperative surgery time (skin-to-skin) of commonly performed vascular and non-vascular procedures. Data were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-Service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study found the intra-service work of code 35656 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. These intra-service work comparisons formed the basis for choosing procedures to be surveyed for all aspects of work in the five-year review.

1994 Frequency of Service: 21,644

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A vigorous 72 year old male with a 50 pack-year history of smoking and long standing hypertension presents with severe claudication limiting him to walking 1/4 block. He still works and finds these symptoms extremely life style limiting. Arteriography as an out-patient reveals an occlusion of the superficial femoral artery at the groin with reconstitution of the popliteal artery above the knee. Two of the three distal tibial vessels are open. Cardiac evaluation is done as an out-patient. He is admitted to the hospital a week after the arteriogram and appropriate invasive monitoring is done. On the day of admission an epidural catheter is inserted for anesthesia and a femoral-popliteal bypass above the knee is constructed with a PTFE graft. The patient does not require stay in the ICU and is able to walk and be discharged on the sixth postoperative day.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before the operation until the beginning of the procedure. This includes obtaining and reviewing pre-procedural work-up, with special attention to cardiopulmonary and hematologic status; reviewing previous imaging studies (especially arteriograms) and laboratory studies; consulting with the referring physician and cardiologist, if necessary, and other health care professionals; and communicating with the patient and patient's family to review the operative risks, benefits, and alternative treatments, and to obtain informed consent. Other pre-operative services include dressing, being present while appropriate invasive monitoring is done with insertion of a Swan-Ganz catheter and arterial line, if necessary, and a Foley catheter. Sequential compression devices (on the contralateral leg if desired by the surgeon) are applied and placement of non-invasive ECG and oxygen saturation monitoring devices, and satisfactory anesthesia, generally consisting of insertion of an epidural catheter (or establishing general anesthesia via endotracheal inhalation), is achieved. Additional pre-operative services include ensuring that sufficient blood is available, that the surgical instruments and supplies that might be necessary are available in the operative suite, scrubbing and supervision of the positioning, prepping, and draping of the patient. Appropriate lines are connected including electrocautery and suction tubes.

Description of Intra-Service work: An incision is made in the groin and the common femoral, superficial femoral, and profunda femoris arteries are isolated and encircled. A separate incision (almost always above the knee) is made and the popliteal artery is likewise identified, mobilized and encircled. A suitable prosthetic graft is selected and anastomosed to the femoral artery in the groin in an end-of-graft to side-of-artery fashion. Once there is no bleeding from the suture line, the graft is tunneled beneath the thigh muscles to the popliteal artery where a second anastomosis is performed. Once all bleeding is controlled and satisfactory flow into the distal arterial circulation is determined, the two incisions (groin and above-knee) are carefully closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, checking the extremity for adequate arterial perfusion, and transfer of the patient to the recovery room where postoperative orders are written. Post-service work also includes stabilization of the patient in the recovery room and monitoring blood values. It also includes communication with the family and other health care professionals (including written and oral reports and orders), all hospital visits and services performed by the surgeon, careful monitoring of cardiopulmonary, and hemodynamic status; ordering and reviewing post-operative radiographs and laboratory studies; monitoring care, most especially physical therapy for training in ambulation, and antibiotics and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital and likely post hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure including removal of sutures, out-patient wound care, evaluation of periodic imaging and laboratory reports, and antibiotic and pain medication adjustments.

Other Hospital:	72.5	6
Office:	40	2

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>1995 RVW</u>
1)	35606	Bypass Graft, with other than vein, carotid-subclavian	17.40
2)	35372	Thromboendarterectomy, with or without patch graft; deep (profunda) femoral	12.28
3)	43631	Gastrectomy, partial, distal; with gastroduodenostomy	18.10
4)	27880	Amputation, leg through tibia and fibula	10.69

RELATIONSHIP OF CODE UNDER SURVEY TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Construction of a reference service table (Table 3) for the 5-year reevaluation was difficult for the vascular codes since most of the vascular procedures on the MPC list were submitted for reevaluation. The SVS/ISCVS advisors asked the RUC administrative staff for assistance with construction of the reference service table; we were referred to Dr. Kwass, chair of the RUC research subcommittee to which these codes are assigned. The recommendation was to choose some vascular codes if, in our opinion they were

approximately correctly valued, as well as some reference services from the general surgery codes on the MPC list since 1) all vascular surgeons have completed a full 5 year categorical general surgery residency and are therefore familiar with general surgery cases and 2) while we are "vascular surgeons" by dint of concentrated training or fellowship programs in vascular surgery, many vascular surgeons have practices which include general surgery cases in addition to their vascular practice. Thus, while the reference services are related to the code being surveyed by pre-service work, operative time, intensity, and magnitude of the operation, in addition to post-service work and global periods, the actual operations may be dissimilar.

Comparison to 35606: The survey respondents believed that the intra-service time spent for 35656 was 1.01 times that required for 35606, the total time was 1.14 times that for 35606, and the intensity was 0.89 times that of 35606. The calculated total work was 1.01 that of 35606, indicating that the total work of 35656 is similar to that of 35606. If the ratio of 1.01 is applied to the current value of 35606 (17.40 RVWs), the result is 17.57 work units for 35656. This comparison closely approximates the recommended work value for 35656 of 18 RVW and suggests that the current value of 13.86 does not adequately reflect the work of this service. Additional time and intensity data for 35606 from the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95) were not available for analysis.

Comparison to E/M Codes: The work of 35656 may be calculated as the sum of the following E/M services, using intensive care codes as the best comparison to the complex intra-service work involved in this service:

<u>Service</u>	<u>Time</u>	<u>E/M Code</u>	<u>RVW</u>
Pre-Service	90	99215	1.51
Intra-service	150	99291 + 99292 x 3	9.16
Post-day of proc	30	99291	3.64
POD #1-5	10	99231 x 4	2.04
POD #6 Disch	22.5	99238	1.06
Office x 2	40	99213 x 2	1.10
Total			18.51

Thus, by using the E/M reference service building-block method, the work of 35656 should be 18.51 units, further justifying an RVW of 18.00.

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in RVW is based upon improvements in the accuracy of existing Harvard work, time, and intensity data for this code.

1. Work: The Harvard work value was originally estimated at 15.49 units by a panel without substantial participation by vascular surgeons as discussed in the Introduction. The RVW was decreased to 14.53 in 1992 and decreased further to 13.86 in 1994. The median RVW of the current survey is 18 units. The median RVW is reinforced by comparison to the key reference service which results in an equivalent value of 17.57 units. The E/M building block calculation of 18.51 units also compares favorably with the requested RVW of 18. In addition, the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report) suggests a work value of 19.33 for this service.

2. Time: The Harvard intra-service time is 148 minutes, consistent with the median value revealed in our survey of 150 minutes. The survey also requested that physicians report the actual times for their last three procedures. The median value for those procedures was 165 minutes. The survey also requested respondents to supply actual time data for their hospitals, and the volume weighted mean of these institution's median times was 158 minutes. Finally, the SVS 10 hospital OR data analysis (Table 1) revealed that the median time was 170 minutes. Considered together, these data suggest that 150 minutes is a conservative estimate of the median time. The Harvard data give a figure of 69.5 minutes for pre-service time, whereas the median survey pre-service time was 90 minutes. The Harvard post-service time was 157.5 minutes, whereas the survey post-service time was 142.5 minutes.

3. Intensity: The intensity of 35656 is moderate with a median mental effort/judgment of 3, a median technical skill value of 3, and median psychological stress value of 3. While intensity is difficult to compute back to work values, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 35656 in 1995 is 0.048 based on our SVS 10 hospital data analysis of OR log times for procedures (Table 1). It is 0.062 according to the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95). This is less than that accorded most other major procedures in all other specialties. If 35656 is recalculated using an IWPUT of 0.07 (the low end of the spectrum of major complicated and at least moderately intense procedures), a more accurate reflection of intra-service intensity is achieved. By this technique, intra work is $150 \times .07 = 10.50$ units. Since intra-work is 56% of the total work based on the survey data, the total work is $10.50 / .56 = 18.75$ units (see attached Appendix for an expanded discussion). Thus, this method of calculating work supports the survey request of 18 units.

4. Summary: Five different analyses suggest work values of 17.57 to 19.33 for this service:

1. Median survey value is **18.00**.
2. Comparison to the reference code 35606 suggests a work value of **17.57**.
3. The E/M building block method results in an estimate of **18.51**.
4. The American College of Surgeons survey suggested **19.33**.
5. The IWPUT method, using conservative IWPUT figures, justifies an RVW of **18.75**.

After careful review of the survey results and supplemental work analyses for 35656, we recommend an RVW of **18.00**.

Appendix: IWPUT Method for work calculation of 35656

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.026 to 0.12 in the SVS Operative Log Data analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 was 0.082. Almost all major operations with reasonably high level of intensity will have an IWPUT of at least 0.070. Almost all major vascular procedures have an IWPUT of less than 0.070.
4. The performance of 35656 with its attendant risks of cardiac complications, failure, and possible limb loss should merit at least the low end of the usual spectrum of major complicated and at least moderately intense procedures.
5. The Survey intra-service median time for 35656 of 150 minutes is substantiated by our original OR log data analysis (170 min).
6. The intra-service work for 35656 should equal the operative time multiplied by the low end major surgical IWPUT, or $150 \times 0.070 = 10.5$.
7. The pre- and post- service work for 35656 are at least typical of the average operation of large magnitude in that patients presenting for this operation commonly suffer from symptomatic coronary disease, hypertension, diabetes, hyperlipidemia, obesity and COPD.
8. The RUC survey data indicate that intra-service work represents 0.56 of total work. In other words $\text{total work} = \text{intra-work} / 0.56$.
9. The total work of 35656, based on a low end of the spectrum (0.070) IWPUT value, should be $10.5 / 0.56 = 18.75$.

1)	36215	Selective arterial catheter placement, first order abdominal branch.	5.07
2)			
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

See Rationale

RATIONALE

Two parallel groups of codes describe selective catheter placement in noncoronary arteries: 36245 through 36248 describing placement of a catheter in arteries below the diaphragm and 36215 through 36218 describing selective arterial catheter placement in thoracic or brachiocephalic arteries above the diaphragm.

Harvard data showed that the work of second and third order arterial catheterizations was equivalent whether above or below the diaphragm. Thus, in the current Medicare Fee Schedule the work of 36216 equals the work of 36246, the work of 36217 equals the work of 36247, and the work of 36218 equals the work of 36248. The Harvard study, however, did show a difference in the work of 36215 and 36245, and these codes were thus assigned different work RVUs in the 1992 Medicare Fee Schedule.

While we understand that the Harvard data showed dissimilar work for 36215 and 36245, we believe that the Harvard data is flawed. We predominantly believe this because radiologists or interventional radiologists were not surveyed despite the fact that current Medicare provider files show that radiologists and interventionalists provide 68.9 percent of the total services in 1994 and 83.6 percent of the total 36215 services. Original SCVIR survey data (conducted in 1991 during

construction of an Interventional Radiology RVS) shows that the work involved in 36215 and 36245 was virtually identical. That survey data is included in Appendix A. Despite several comments to HCFA by SCVIR that the work of 36215 should be at least as high as the work of 36245, no change in the Medicare Fee Schedule has been made. We believe that the work value of 36215 should be raised to that of 36245 for the following reasons:

- 1) **Inherent equivalence of work.** It is illogical that first order catheterization in one family (above the diaphragm) should be given a lower work value than an identical service performed below the diaphragm. In reality, many interventionalists would argue that cerebrovascular arterial catheterization is more work than abdominal arterial catheterization.
- 2.) **Confirmation of equivalence by other survey data.** The equivalence of 36215 and 36245 was confirmed by a SCVIR survey in 1991 using Harvard methodology.

We therefore request that the value of CPT 36215 be raised to that of CPT 36245 (RVW 5.07).

3)	36216	Initial second order thoracic... artery branch	5.28
4)	36217	Initial third order thoracic... artery branch	6.30

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

See Rationale

RATIONALE

The above two codes are used to describe further second, third, and fourth order catheterization after the initial most selective catheterization has been achieved. SCVIR believes that the RVWs for codes 36218 and 36248 are inappropriately low. Practicing interventionalists are uniformly of the opinion that placement of a catheter in an additional second, third, or fourth order branch is frequently the most time and labor intensive aspect of selective and superselective arterial catheterization. For example, a physician who performs catheterization of the splenic artery off the celiac (a second order catheterization) and then performs selective hepatic arterial catheterization, another second order placement will frequently spend an additional amount of time greater than the time taken to catheterize the splenic artery. Such an activity will often require a change of a catheter over the guidewire and the use of several different guidewires to achieve final catheter position. Yet, the current Medicare Fee Schedule pays less than one fifth of the fee that he would receive for 36246). This, we believe, represents a gross payment inequity.

The SCVIR surveyed codes 36218 and 36248 in a comprehensive study of interventional radiology codes conducted using Harvard methodology in 1991. The SCVIR survey found that 36218 and 36248 require approximately 65 percent of the work involved in 36216 and 36246, and 46 percent of that involved in 36217 and 36247. These data are included in Appendix A. Relative to these survey results, Medicare currently undervalues 36218 and 36248 significantly. The recommended work value of 2.74 would bring values closer to the SCVIR survey findings so that the work value of 36218 and 36248 would be 52 percent of that for 36216 and 36246, and 43 percent of that for

36217 and 36247.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	36246	Initial second order abdominal... artery branch	5.28
2)	36247	Initial third order abdominal... artery branch	6.30
3)	36216	Initial second order thoracic... artery branch	5.28
4)	36217	Initial third order thoracic... artery branch	6.30

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

See Rationale

RATIONALE

The above two codes are used to describe further second, third, and fourth order catheterization after the initial most selective catheterization has been achieved. SCVIR believes that the RVWs for codes 36218 and 36248 are inappropriately low. Practicing interventionalists are uniformly of the opinion that placement of a catheter in an additional second, third, or fourth order branch is frequently the most time and labor intensive aspect of selective and superselective arterial catheterization. For example, a physician who performs catheterization of the splenic artery off the celiac (a second order catheterization) and then performs selective hepatic arterial catheterization, another second order placement will frequently spend an additional amount of time greater than the time taken to catheterize the splenic artery. Such an activity will often require a change of a catheter over the guidewire and the use of several different guidewires to achieve final catheter position. Yet, the current Medicare Fee Schedule pays less than one fifth of the fee that he would receive for 36246). This, we believe, represents a gross payment inequity.

The SCVIR surveyed codes 36218 and 36248 in a comprehensive study of interventional radiology codes conducted using Harvard methodology in 1991. The SCVIR survey found that 36218 and 36248 require approximately 65 percent of the work involved in 36216 and 36246, and 46 percent of that involved in 36217 and 36247. These data are included in Appendix A. Relative to these survey results, Medicare currently undervalues 36218 and 36248 significantly. The recommended work value of 2.74 would bring values closer to the SCVIR survey findings so that the work value of 36218 and 36248 would be 52 percent of that for 36216 and 36246, and 43 percent of that for 36217 and 36247.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 36533 **Global Period:** 010 **1995 RVW:** 3.82 **Recommended RVW:** 5.00

CPT Descriptor: Insertion of implantable venous access port, with or without subcutaneous reservoir

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 14 general surgeons, with the assistance of Abt Associates, Inc., designed a study that included a survey instrument to effectively measure all aspects of physician work for commonly performed general surgery services. The results of this study found code 36533 to be undervalued at the present time.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

42-year-old female with systemic lupus erythematosus, diabetes mellitus, and osteomyelitis of her right lower extremity needs venous access for long-term IV antibiotic therapy. She is a perfect candidate for implantable venous access with reservoir and underwent insertion of a subclavian venous access mediport. She subsequently was discharged from the hospital for long-term antibiotic therapy.

Description of Pre-Service Work:

Pre-service work begins after the decision to operate is made, from the day before the operation until the time of the procedure. This activity includes obtaining and reviewing previous laboratory and imaging studies, with special attention to vascular, cardiopulmonary, diabetic, and hematologic status; consulting with the referring physician, if necessary, and with other health care professionals; and communicating with the patient (and/or the patient's family) to review alternate forms of therapy for venous access, the complications and risks of those alternate forms, and to obtain informed consent. Other preoperative services include dressing, scrubbing, and waiting to begin the operation; supervising the positioning, prepping, and draping of the patient; and ensuring that the necessary surgical instruments and supplies are present and available in the operative suite.

Description of Intra-Service Work:

After local infiltration of anesthesia, central venous access is obtained. A guide wire is introduced through the central vein into the superior vena cava. Wire position is confirmed fluoroscopically. After further local infiltration of anesthesia, a subcutaneous pocket is created in proper physical proximity to the venipuncture site. A sheath-dilator assembly is passed over the guide wire. The dilator is removed, and the catheter is placed through the peel-away sheath. The sheath is gradually removed as the catheter is advanced into position. The catheter is tunneled from the venipuncture site to the pocket and is then trimmed to a length that is appropriate for positioning within the vena cava and for reaching the reservoir without kinking. The catheter is attached to the reservoir, and the reservoir is sutured to the deep layer of the pocket. The pocket is closed in layers. Patency of the reservoir-catheter system is confirmed by aspiration and injection. Position of the system is confirmed by contrast injection. The system is primed with heparinized saline.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes the application of sterile dressings; monitoring the patient's stability; communicating with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including assessment of a postoperative chest radiograph; monitoring and care of the incision, as well as the patency of the venous access port; and antibiotic and pain medication management. Discharge management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 10 days after the day of the operation are considered part of the postoperative work for this procedure.

6.29	090	63685	Incision and subcutaneous placement of spinal neurostimulator pulse generator or receiver, direct or inductive coupling

¹This RVW recently was approved by the RUC and submitted to HCFA for the 1996 MFS.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

36533 is similar in total work to 36010, 36011, and 62360. 36010 and 36011 represent the placement of the catheter using fluoroscopic assistance, while 62360 (recently approved by RUC) represents work involved for the subcutaneous pocket. The combination of 36010 and 62360 (RVW 4.43=2.43 + 2.00) represents 80 percent of the work of 36533, with the remaining 20 percent attributable to the subcutaneous tunneling of the catheter. Additionally, connection of the catheter to the reservoir, testing the reservoir for function, and completion of venography to confirm proper placement are necessary and contribute to the total work of 36533. 36533 also is comparable in work to 62350 and 63685. However, the latter codes have 90-day global periods.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Many patients with malignant disease who require chemotherapy are candidates for this procedure. In addition, the patients requiring this service often are older, more debilitated patients with chronic antibiotic therapy needs. Medicare data show that 37 percent of patients requiring this service are 75 years of age or older.

The recommended increase in the RVW for code 36533 (from 3.82 to 5.00) also is based on an anomalous relationship with other catheter procedures currently in the *CPT Manual* and on the vertical relationship within a selected family of venous codes (36400 through 36535). In order to achieve a better relationship within the family of codes, a reduction in the RVW for code 36534 (Revision of implantable venous access port and/or subcutaneous reservoir) was recommended (from 3.79 to 2.73). This reduction was placed on the five-year review consent calendar.

It should be noted that code 36533 was valued by HCFA. Therefore, no pre-, intra-, and postoperative time data are available to compare to the five-year review survey data.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 36830 Global Period: 090 1995 RVW: 7.78 **Recommended RVW: 11.25**

CPT Descriptor: Creation of arteriovenous fistula by other than direct arteriovenous anastomosis; nonautogenous graft

Source and Summary of Comment to HCFA on this service: A technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures by collecting and analyzing accurate intraoperative surgery time (skin-to-skin) of commonly performed vascular and non-vascular procedures. Data were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-Service time and intra-service work per minute (IWPUT) were calculated (Appendix I). The results of this study found the intra-service work of code 36830 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. This prompted a survey of code 36830 which was presented to the RUC Subcommittee Workgroup 4 in July. There was some concern that this procedure was one performed by general and transplant surgeons as well and that the survey might not be truly reflective of the views of those doing the procedure. A second survey was conducted including transplant and general surgeons. These data form the basis for this report.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old right handed patient with hypertension and insulin dependent diabetes has chronic renal failure. He has never had a previous hemoaccess procedure. Neither cephalic vein is an acceptable conduit for an A-V fistula access. As an out-patient he has a left arm A-V graft using PTFE inserted with local anesthesia and intravenous sedation (by an anesthesiologist). He returns for one visit for suture removal as an out-patient.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before the operation until the beginning of the procedure. This includes obtaining and reviewing pre-procedural work-up, with special attention to acid base and electrolyte values as well as cardiac and hematologic status; consulting with the referring physician and nephrologist and other health care professionals; and communicating with the patient and patient's family to review the operative risks, benefits, and alternative treatments, and to obtain informed consent. Additional pre-operative services include ensuring that the surgical instruments and supplies that might be necessary are available in the operative suite, scrubbing and supervision of the positioning, prepping, and draping of the patient. Appropriate lines are connected including electrocautery and suction tubes. Anesthesia is achieved with intravenous sedation and with local anesthesia prior to making the incision.

Description of Intra-Service work: An incision is made in the axilla and the basilic vein is isolated and encircled. A separate incision is made above the elbow and the brachial artery is likewise identified, mobilized and encircled. A suitable prosthetic graft is selected and a tunnel is created beneath the skin on the lateral portion of the arm. The graft is pulled through this tunnel and anastomosed to the basilic vein. The graft is trimmed to the appropriate length and anastomosed to the brachial artery in an end-of-graft to side-of-artery fashion. Once all bleeding is controlled and satisfactory flow into the vein is achieved, the two incisions are carefully closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, checking the extremity for adequate arterial perfusion, and transfer of the patient to the recovery room where postoperative orders are written. Post-service work also includes stabilization of the patient in the recovery room and monitoring blood values. It also includes communication with the family and other health care professionals (including written and oral reports and orders). Discharge management includes the surgeon's final examination of the patient, discussion of the hospital and likely post hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure including removal of sutures, out-patient wound care, and antibiotic and pain medication adjustments. Finally, those these patients do not frequently see their surgeon in the global period, they are the cause of numerous phone conversations that are time consuming and often highly inconvenient (i.e., while the surgeon is in an operating room with another patient) with the patient who has not understood instructions because of infirmity or uremia, with the referring physician, with the referring nephrologist, and with the staff of the dialysis center where the patient is dialyzed.

SURVEY DATA:

Specialty: Society for Vascular Surgery (SVS) & Internatl. Society for Cardiovascular Surgery (ISCVS). Included also are general and transplant surgeons from around the country who are known to do hemoaccess procedures.

Sample Size: 72 Response Rate: 34 (47.2%) Median RVW: 11.81

Median Post-Service Time: Total Time Number of Visits

Day of Procedure	<u>25</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>0</u>	<u>0</u>
Office:	<u>20</u>	<u>1</u>

This is a new survey directed to those known to perform hemoaccess operations. At the request of the subcommittee, transplant surgeons and general surgeons were included in those surveyed in addition to vascular surgeons. The 34 respondents include 9 that categorized themselves as general surgeons, 13 who categorized themselves as vascular surgeons, and 12 as transplant surgeons. *It should be noted that many that view themselves as vascular surgeons are characterized in various registries as general surgeons thus accounting for the disparity frequently noted in Medicare data that suggest that general surgeons do most of the vascular surgery performed on Medicare patients. Reflecting this classification anomaly, the American College of Surgeons, which represents general surgeons for payment issues, has consistently deferred to the vascular surgical societies for RBRVS Comments.*

The vignette used in this survey was changed at the request of a subcommittee member to lower the severity of illness of the "typical patient". Twelve of the 34 (35%) respondents replied that the vignette did not describe their typical patient and all expressed the view that the typical patient is considerably sicker with many more comorbidities. This view that the typical vascular access patient is sicker than that described in the vignette is shared by the Vascular Society RUC Advisors.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	35661	Bypass graft, with other than vein, femoral-femoral	11.81
2)	36821	Arteriovenous anastomosis, direct, any site (eg, Cimino type)	8.39
3)	35650	Bypass graft, with other than vein, axillary-axillary	13.05
4)	50370	Removal of transplanted renal allograft	11.11

RELATIONSHIP OF CODE BEING SURVEYED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Comparison to 36821 (A-V Fistula with vein, eg, Cimino type): CPT code 36821 is probably the best comparison code for 36830 because the operations are done in similar patients for the same reasons. #6830 simply represents a more complex surgical procedure. The survey respondents believed that the pre and post service time spent for 36830 was the same as that required for 36821, the intra-service time was 40 minutes more than 36821, and the intensity was slightly more than that of 36821. Using the Workgroup 4 comments that valued one hour of intraoperative work at 4.80 RVUs the value of 36830, when compared with 36821 should be 11.58 ($0.667 \times 4.80 + 8.39$). This comparison, therefore, indicates that a work value for 36830 of 11.25 RVW is reasonable, using 36821 as a reference code.

Comparison to 35661 (Femoral-femoral bypass): Almost all survey respondents believed that the intra-service time spent for 36830 was about the same as that required for 35661, the total time was 30 minutes less than 35661, and the intensity was slightly less than that of 35661. This comparison, therefore, indicates that a work value for 36830 of 11.25 RVW is reasonable, using 35661 as a reference code.

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in RVW is based upon improvements in the accuracy of existing work, time, and intensity data for this code.

1. Work: The Harvard work value was originally estimated at 8.01 units by a panel without substantial participation by vascular surgeons (see Appendix III in previous submission for compelling evidence discussion). The work RVU was decreased to 7.78 in 1992 for budget neutrality purposes where it has remained. Since 36830 is clearly more complicated than 36821 (two vascular anastomoses rather than one, insertion and tunneling of a prosthetic graft, usually two incisions rather than one) yet is valued less

than 36821 (7.78 vs. 8.39), it is clear that code 36830 is misvalued. The value of 36821 was considered by the RUC in June 1993 and determined to be accurate. The extent of this misvaluation becomes even more apparent when it (code 36830; 7.78 work RVUs) is compared with two other similar vascular procedures: femoral-femoral bypass (code 35661; 11.81 work RVUs) and axillary-axillary bypass (code 35650; 13.05 work RVUs). Both of these comparison codes require two vascular anastomoses: insertion and tunneling of a prosthetic graft, not used in 36821; and two incisions. All three take about the same amount of time to perform. The primary difference is that chronic renal failure patients are sicker.

The median RVW of the current survey is 11.81 units (compared to 12 of the earlier survey). Comparison to one of the two key reference services (code 36821) indicates a value of 11.58 work units for 36830. Comparison to the other reference service (code 35661) indicates a value of about 11.0 work units for 36830. In addition, the work survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report) suggests a work value of 12.75 for this service.

2. Time: The Harvard intra-service time is 92 minutes, lower than that revealed in our survey of 120 minutes. The survey participants were asked to provide measured times rather than estimated. This figure is consistent with the earlier measured time of 115 minutes for intra-service work.

3. Intensity: The intensity of 36830 is moderate with a median mental effort/judgment of 3, a median technical skill value of 3 and median psychological stress value of 3. While intensity is difficult to compute back to work values, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 36830 in 1995 is 0.041 based on our SVS 10 hospital data analysis of OR log times for procedures (Table 1 of previous submission) It is 0.052 according to the Summary of work and time estimates for services undergoing investigation (AMA RUC June 1, 1995). This is less than that accorded most other major procedures in all other specialties. If 36830 is recalculated using an IWPUT of 0.080 (Workgroup 4 notes) a more accurate reflection of intra-service intensity is achieved. By this technique, intra-work is 9.6. Pre- and post-service time in this survey was 100 min. Reimbursement for this time is calculated at 0.028 RVUs/min (Workgroup 4 notes). This adds an additional 2.8 work units for a total of 12.4. Even if a pre-service time of 30 minutes (25th percentile) is used, this would still give a value of 2.1 for pre- and post-service time and a total of 11.7.

Summary: Five different analyses suggest work values from 11.0 to 13.0 for this service:

1. Median Survey value is **11.81**.
2. The American College of Surgeons survey suggests a value of **12.75**.
3. Comparison to 35606 and 35661 by our survey respondents suggests a value of between 11 and **11.58**.
4. Using IWPUT figures, this analysis technique suggests a value of at least **11.7**.
5. The median survey among vascular surgeons submitted earlier to the RUC was **12.0**.

After careful review of both survey results, we recommend a value of **11.25** for 36830.

QUESTIONNAIRE

CPT Code Number: 36830

Global Period: 090

CPT Descriptor: Creation of arteriovenous fistula by other than direct arteriovenous anastomosis; autogenous graft

Typical Service/Patient: A 40 year old right handed patient with hypertension and insulin dependent diabetes has chronic renal failure. He has never had a previous hemoaccess procedure. Neither cephalic vein is an acceptable conduit for an A-V fistula access. As an out-patient he has a left arm A-V graft using PTFE inserted with local anesthesia and intravenous sedation (by an anesthesiologist). He returns for one visit for suture removal as an out-patient.

Step 1 Estimate the Relative Value of Physician Work (work RVU): _____

Step 2 List one or two important reference services (Table 1) in estimating physician work for this code (List only the CPT code numbers for the reference services):

1) _____ 2) _____

Step 3 Estimate the following service characteristics for the code that you have rated and your key reference services:

Service Characteristic	CPT code that you have rated in Step 1	Reference Service 1 (from Step 2)	Reference Service 2 (from Step 2)
CPT Code	36830		
TIME IN MINUTES (See Appendix A for detailed definitions of Time Periods)			
Pre-Service Time			
Intra-Service Time			
Post-Service Time:			
Day of Procedure			
ICU (Total Time/Number of Visits)	/	/	/
Other Hospital (Total Time/# of Visits)	/	/	/
Office (Total Time/Number of Visits)	/	/	/
Complexity/Intensity on a scale of 1 to 5 (1=least complex, 5=most complex) (See Appendix A for detailed definitions)			
Mental Effort and Judgment			
Technical Skill & Physical Effort			
Psychological Stress			

Step 4 Has the work of performing this service changed in the past 5 years? ___ Yes ___ No. If yes, complete a - c.

- a. This service represents new technology that has become more familiar (i.e., less work). ___ I agree ___ I do not agree
- b. Patients requiring this service are now: ___ more complex (more work) ___ less complex (less work) ___ no change
- c. The usual site-of-service has changed: ___ from outpatient to inpatient ___ from inpatient to outpatient ___ no change

Step 5 Do you agree that the Typical Service/Patient provided above describes your typical patient? Yes ___ No ___

Step 6 What percentage of your practice is devoted to vascular surgery (not counting hemoaccess procedures) _____%

Step 7 How would you characterize yourself: Transplant surgeon ___; General surgeon ___; Vascular surgeon ___

Step 8 Do you have the Special Certificate in Vascular from the American Board of Surgery? Yes ___; No ___

Table 1

Vascular Surgery

Society for Vascular Surgery/International Society for Cardiovascular Surgery

CPT Code	1995 Descriptor	Work RVU	Global Period
99214	Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.	0.94	XXX
99254	Initial inpatient consultation for a new or established patient, which requires at least two of these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.	2.27	XXX
34201	Embolectomy or thrombectomy, with or without catheter; femoropopliteal, aortoiliac artery, by leg incision	8.04	090
15100	Free skin graft; split graft, trunk, scalp, arms, legs, hands, and/of feet (except multiple digits); 100 sq cm or less, or each one percent of body area of infants and children (except 15050)	8.05	090
36821	Arteriovenous anastomosis, direct, any site (eg, Cimino type)	8.39	090
27880	Amputation, leg through tibia and fibula	10.69	090
50370	Removal of transplanted renal allograft	11.11	090
47605	Cholecystectomy with cholangiography	11.53	090
35661	Bypass graft, with other than vein, femoral-femoral	11.81	090
35650	Bypass graft, with other than vein, axillary-axillary	13.05	090
35558	Bypass graft, with other than vein, carotid-subclavian	17.40	090

CPT five digit codes, two digit number modifiers, and descriptions only are copyright by the American Medical Association. No payment schedules, fee schedules, relative value units, scales, conversion factors, or components thereof are included in CPT. The AMA is not recommending that any specific relative values, fees, payment schedules, or related listings be attached to CPT. Any relative value scales or relative listings assigned to CPT codes are not those of the AMA, and the AMA is not recommending use of these relative values.

RUC guidelines for compelling evidence

The limitations of the work values assigned to vascular surgery codes can be related to the RUC guidelines published in May 1994 for developing compelling evidence to change RVWs. Five of these eight guidelines seem to pertain directly to the vascular surgery experience:

1. *Proof that incorrect assumptions were made in the initial valuation of the service, as documented, for example, by a misleading vignette in the Harvard study, data from the study, and flawed crosswalk assumptions.*

- We believe that incorrect assumptions were made in the initial valuation of many vascular services. For example, the vignette in the Harvard study of abdominal aortic aneurysm recounted a healthy 65 year old male with a five centimeter aneurysm. Most patients with abdominal aortic aneurysms (CPT codes 35081 and 35102) are older than 65, and virtually all have one or more comorbid conditions such as coronary artery disease, hypertension, or some compromise of kidney function.

2. *Proof that the mechanism or methodology used in the original valuation was seriously flawed, for example, evidence that no pediatricians were consulted in assigning pediatric values.*

- We believe the mechanism or methodology used in the original valuation was seriously flawed in that no vascular surgeons were on a Phase I, II, or III RBRVS technical consulting panel. In contrast, there were a total of eight dermatologists, eleven psychiatrists, seven plastic surgeons, etc.. Indeed, there were three "thoracic/cardiovascular" members in Phase I, none of whom was a vascular surgeon as defined as having vascular surgery as a primary focus of their practice or being an active member in our highly inclusive North American Chapter of the International Society for Cardiovascular Surgery. Vascular procedures were evaluated as a small part of a larger group of cardiac and general surgical procedures by cardiac surgeons or by general surgeons, few of whom did vascular procedures on a regular basis. (The instructions given by Hsiao were for the surgeon evaluators to give estimates of the time and intensity if the surgeon was familiar with the procedure, even if he or she didn't actually routinely perform the procedure.) Moreover, in Phase I-III only eleven of 220 vascular codes were surveyed by Hsiao and, of these eleven, only three represented arterial reconstructive procedures, the principal responsibility of vascular surgeons.

3. *If Harvard surveyed one specialty to obtain a value, but it turns out that that the service is now provided by physicians from a different specialty according to BMAD.*

- It is clear that Harvard surveyed general and cardiac surgery to obtain vascular values, but it turned out that that the surgeons chosen did not perform vascular surgery and consistently and markedly underestimated the work of vascular procedures as will be clearly apparent.

4. *An anomalous relationship between the coding being valued and multiple key reference services. For example, if code A describes a service that requires significantly more work than codes B, C, and D, but is nevertheless valued lower. The specialty would need to assemble evidence on service time, technical skill, patient severity, complexity, length of stay and other factors for each of the four codes.*

- The rank order within vascular codes is appropriate because of our earlier work in 1991 and 1992 (on the basis of the Harvard study the vascular codes were originally markedly distorted). In contrast, when vascular procedures are compared to other specialty procedures requiring similar amounts of work, the vascular procedures are consistently undervalued. We have attempted herein to provide evidence on service time, technical skill, patient severity, complexity, length of stay and other factors for each of the codes for which we are requesting increases in RVUs.

5. *Analysis of other data on time and effort measures, such as operating room logs.*

- The Council has attempted to obtain accurate time data, rather than estimates, for vascular surgery procedures. Table 1 provides data on intra-service time derived from accurate operating room logs, most often computer based, for a wide range of procedures. Data were collected from 10 hospitals across the country, and, for most procedures, involved a minimum of 300 procedures of each type.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

General Surgery, Colon and Rectal Surgery, and Gastroenterology

Review of general surgery procedures primarily addressed comments submitted by the American College of Surgeons (ACS) on codes identified as misvalued through a study conducted by Abt Associates Inc. Although this study identified many procedures as potentially misvalued, the ACS comments selected only 30 codes for review, based on the magnitude of the change and their frequency and expenditures. The ACS recommended both increases and decreases. The RUC recommends adoption of most of the recommended decreases and a few of the recommended increases, based on results from a survey of 175 surgeons, comparisons to the final Harvard study results, comparisons to key reference services, and analysis of Medicare claims data.

The American Society of General Surgeons (ASGS) also submitted comments on a number of procedures, including several general surgery procedures, and their suggestions were consistent with some of those made by the ACS. The current RVUs for several of the codes identified by the ASGS, however, are based on previous RUC recommendations, and the RUC did not believe reconsideration was warranted.

The American Society of Colon and Rectal Surgeons (ASCRS) submitted comments indicating that the partial colectomy codes and hemorrhoidectomy codes should be reviewed to place them in a more correct rank order from least to most difficult. The CMDs identified rank order problems in these families as well, and also identified three overvalued procedures, and the ASGS commented that the RVUs for several colon and rectal procedures services should be increased. The RUC agreed with most of the recommended changes based on the evidence provided by the ASCRS.

Comments were submitted by the American College of Gastroenterology (ACG) and a CMD on several gastroenterology codes. The RUC did not believe compelling evidence had been provided to either increase or decrease the RVUs for these services, since most gastroenterology procedures have previously been reviewed by the RUC.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
General Surgery						
21930	Remove lesion, back or flank	6.55	4.82	This code was identified as overvalued in the ACS Abt study and a reduction to 4.82 RVUs was recommended. The procedure was considered overvalued in comparison to codes 54520 [<i>simple orchiectomy</i>] and 63688 [<i>Revision or removal of implanted spinal neurostimulator pulse generator or receiver</i>].	The RUC accepted the recommended reduction.	3
22900	Remove abdominal wall lesion	6.56	5.13	This code was identified as overvalued in the ACS Abt study. It is considered comparable to codes 39400 [<i>Mediastinoscopy, with or without biopsy</i>] and 54520 [<i>simple orchiectomy</i>].	The RUC accepted the recommended reduction.	3
43420	Repair esophagus opening	10.19	10.19	The ASGS recommended an increase to 11.89 RVUs.	Since there are fewer than 1,000 claims annually, the RUC did not believe a survey of practicing physicians would yield sufficient evidence to support the change. No one provided other evidence, and the RUC recommends the current RVUs be maintained.	2
43610	Excision of stomach lesion	10.11	10.11	The ASGS recommended an increase to 15.57 RVUs.	The current RVUs are based on a previous RUC recommendation, and no evidence was provided by the ASGS to warrant reconsideration. The RUC recommends maintaining the current RVUs.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
43750	Place gastrostomy tube	5.71	4.27	Although an increase had been recommended for 43750 in the original comment, the ASGS indicated that it had misunderstood that 43750 is for percutaneous endoscopic gastrostomy (PEG) and 43830 is for the more complex tube placement. The ASGS and ACS agreed, therefore, that an anomaly exists in the current RVUs with 43750 valued higher than 43830.	Harvard data indicate that the intrawork per unit time (IWPUT) for 43750 is 0.082, while it is 0.059 for 43830. Since 43830 is much more complex than 43750, the IWPUT is the reverse of the appropriate relationship. Code 43830 is often done for pediatric patients and for brain-injured patients. It was valued by Harvard at 6.52 RVUs, which is 35% higher than the current Medicare RVUs. Even at the higher Harvard RVUs, however, the IWPUT is too low. The RUC recommends adopting the ACS recommended increase for 43830 from 4.84 to 7.50 RVUs, but also decreasing 43750 from 5.71 to the Harvard RVUs of 4.27. It considered calculating frequency-weighted RVUs for the two services, but because it is often done for pediatric patients, it did not seem appropriate to base the RVUs on Medicare frequencies.	5
43830	Place gastrostomy tube	4.84	7.50			1
44950	Appendectomy	6.06	6.06	The ACS recommended increasing both these services to 8.25 RVUs.	The ACS argued that the RVUs for appendectomy should be increased because the services involve more time than is assumed in the current value and that the services are more complex because patients seek care later. The current RVUs are based on the Harvard study, however, and the RUC did not believe sufficient evidence was presented either that the Harvard study of this service was fatally flawed or that the service has changed since that time to justify increasing the RVUs.	2
56315	Laparoscopic appendectomy	6.06	6.06			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
47130	Partial removal of liver	31.56	31.56	The ASGS recommended an increase to 32.16.	Since there are fewer than 1,000 claims annually, the RUC did not believe a survey of practicing physicians would yield sufficient evidence to support the change. No other evidence was provided, and the RUC recommends the current RVUs be maintained.	2
47600	Removal of gallbladder	10.68	10.68	The ACS originally recommended increases in all five of these cholecystectomy services based on its Abt study, but withdrew the recommended increases for 47600 and 47605, and the corresponding laparoscopic codes 56340 and 56341 when RUC survey data did not support the increases.	In the absence of any data to suggest an increase, the RUC recommends that the current RVUs for 47600, 47605, 56315, and 56340 be maintained.	2
47605	Removal of gallbladder	11.53	11.53		The RUC recommends increasing 47610 [<i>Cholecystectomy with exploration of common duct;</i>] from 13.86 to 15.00 RVUs because the use of ERCP has removed the simpler patients from this service and made the typical patient more complex, and to achieve a better relationship between 47610 and 47605, which has 11.53 RVUs and does not involve exploration of the common duct. In addition, the RUC evaluated the comparative work of code 50080 for ureteroenterostomy, direct anastomosis of ureter to intestine (13.10 RVUs), and, particularly, code 44140 for partial colectomy (16.97 RVUs). Patients undergoing 47610 are likely to be sicker than patients undergoing 44140, they are jaundiced, the procedure is more urgent, and the obstructed liver presents problems and adds to the procedure's complexity. In addition, many of these procedures are reoperations.	2
47610	Removal of gallbladder	13.86	15.00		1	
56340	Laparoscopic cholecystectomy	10.68	10.68		2	
56341	Laparoscopic cholecystectomy	11.53	11.53		2	

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
48150	Partial removal of pancreas	40.25	40.25	The ASGS submitted a comment that the RVUs for the Whipple procedure should be decreased by 0.06 RVUs to 40.19.	The current RVUs for this service are based on a previous RUC recommendation and review by a HCFA refinement panel. The RUC did not believe reconsideration was warranted, particularly given the extremely slight magnitude of the suggested change.	2
49000	Exploration of abdomen	8.99	11.00	The ACS commented that the code is comparable to codes 51860 [<i>simple cystorrhaphy</i>] and 52601 [<i>TURP</i>]. Although the service may be provided to either trauma or non-trauma patients, the non-trauma patients tend to be more complex, and the trauma patients require "exclusionary" laparotomy.	The RUC accepted the specialty's recommendation that the RVUs for exploratory laparotomy be increased. The service has become more complex over time due to changes in the patient population that are in turn due to the use of diagnostic laparoscopy and CT scans. The RUC compared the service to codes 51860 [Repair of bladder wound, 11.17 RVUs] and 52601 [Prostatectomy (TURP), 11.51 RVUs] from the MPC, as well as code 38115 [Splenorhaphy, 12.59 RVUs] and agreed the recommended increase was justified.	1
49180	Biopsy, abdominal mass	1.49	1.73	The SCVIR recommended that code 49180 for percutaneous needle biopsy of abdominal mass be increased to the median value of other biopsy services such as percutaneous needle biopsies of the liver (code 47000, 1.90 RVUs), lung (code 32405, 1.93 RVUs), and kidney (code 50200, 2.63 RVUs).	The RUC agreed in principal that the RVUs should be more equivalent for these services. The SCVIR did not provide survey data supporting its recommended value of 1.93, however, so the RUC based its recommendation of 1.73 on the Harvard RBRVS study.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
49255	Removal of omentum	4.04	10.25	The ACS commented that the work for this code is equivalent to 23412 [<i>repair of ruptured musculotendinous cuff</i>]. In addition, it is similar in intensity and length of stay to code 62223 [<i>creation of ventriculo-peritoneal or pleural shunt</i>]. More postoperative work is involved in the omentectomy, however, since a malignancy is involved and follow-up care such as chemotherapy needs to be determined.	At 4.04, the current RVUs for code 49255 for omentectomy are 60% lower than the Harvard RVUs of 10.25 for this service. The ACS recommended 11.50 RVUs based on the time involved in the procedure and comparison to codes such as 58950 for oophorectomy, with 6.54 RVUs, and 49002 for reopening of recent laparotomy, which, at 9.40 RVUs, involves less work than 49255. Code 49255 involves the same procedure as 49002, but also involves the additional work of an omentectomy and lysis of adhesions. Because the ACS surveyed times were so close to the Harvard times, however, the RUC recommends adoption of the Harvard RVUs of 10.25.	4
49505	Repair inguinal hernia	6.17	6.17	The ASGS commented that the RVUs for 49505 should be increased to 8.66.	This family of codes has already undergone substantial review by the RUC and HCFA refinement panels. No evidence was presented that the work of the service has changed since the most recent review and the RUC recommends the current RVUs be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
49900	Repair of abdominal wall	4.54	9.40	The ACS commented that 49900 is at least as much work as code 23412 [<i>Repair of ruptured musculotendinous cuff (eg, rotator cuff); chronic</i>] and 62223 [<i>creation of ventriculo-peritoneal shunt</i>]. Code 44900 compares favorably with the intensity of the intraoperative work, along with a longer hospital stay and more difficult postoperative management due to prolonged naso-gastric suction and ileus associated with it.	The RUC compared code 49900 for suture of abdominal wall for evisceration or dehiscence to code 49002 for reopening of a recent laparotomy (9.40 RVUs). Both codes involve reoperations, but 49002 is planned whereas 49900 is an urgent procedure done for patients who are immunocompromised, malnourished, and critically ill. In addition, they are sicker at the time of the reoperation than the first operation. The ACS survey showed that the service involved considerably more time, particularly postservice time, than the Harvard study, and that it involved three ICU visits compared to none in the Harvard study. This service was not directly surveyed by Harvard, and the RUC concluded that the Harvard data were flawed. Claims data such as the percent of beneficiaries who are disabled and older lends further support to the RUC's recommendation that 49900 be increased from 4.54 to 9.00 RVUs.	1
56312	Laparoscopic lymphadenectomy	12.06	12.06	A clinic identified this service as undervalued.	The current RVUs are based on a RUC recommendation. The RUC did not believe reconsideration was warranted and recommends the current RVUs be maintained.	2
56360	Peritoneoscopy	4.04	3.87	The ACS recommended a reduction based on its Abt study.	The RUC agrees with the recommended reduction.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
Colon and Rectal Surgery						
44010	Incision of small bowel	9.24	9.24	A CMD recommended an increase to 10.05 RVUs for 44010 and a decrease to 9.95 RVUs for 44020, stating that intensity of 44010 is higher because if the duodenotomy leaks post-op, it is usually more catastrophic than if an enterotomy leaks. Also, operative access to duodenum takes more time than access to jejunum and ileum.	Since there are fewer than 1,000 claims annually, the RUC did not believe a survey of practicing physicians would yield sufficient evidence to support the changes, and recommends the current RVUs be maintained.	2
44020	Exploration of small bowel	10.69	10.69			2

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
44140	Partial removal of colon	16.97	16.97	<p>The ASCRS submitted a comment indicating that the partial colectomy codes, 44140 through 44145 should be reviewed to place them in a more correct rank order from least to most difficult. The CMDs also identified rank order problems in these codes.</p>	<p>The ASCRS conducted a survey of the work involved in these codes. It recommended and the RUC agreed that the current RVUs for this family of codes are not in the correct rank order, and that the current RVUs for code 44140 and 44145, the elective procedures, should be retained.</p>	2
44141	Partial removal of colon	17.36	17.36			2
44143	Partial removal of colon	15.00	17.36			4
44144	Partial removal of colon	15.00	16.97			4
44145	Partial removal of colon	21.29	21.29			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
44152	Removal of colon/ileostomy	22.98	22.98	The ASGS commented that the RVUs for code 44152 should be increased from 22.98 to 25.21 RVUs.	The current RVUs for code 44152 were established by a HCFA refinement panel and the RUC did not consider the evidence presented by ASGS sufficiently compelling to warrant changing the current RVUs.	2
44160	Removal of colon	14.09	14.09	Comments suggested the RVUs for code 44160 should be increased from 14.09 to 14.52.	No further evidence was presented to support the comments on code 44160, so the RUC recommends retaining the current RVUs.	2
44322	Colostomy with biopsies	10.31	10.31	A CMD commented that 44322 should be increased to 11.70, which would be higher than 44320, a colostomy without biopsies valued at 11.39. This recommendation would correct a rank order anomaly by adding 0.31 RVUs to 44320. A colonoscopy without biopsy (code 45378) has 3.70 RVUs. A colonoscopy with biopsies (code 45380) has 4.01 RVUs. The addition of biopsies to the basic procedure is therefore 0.31 RVUs (4.01 - 3.70).	Since there are fewer than 1,000 claims annually, the RUC did not believe a survey of practicing physicians would yield sufficient evidence to support the changes, and recommends the current RVUs be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
44388	Colon endoscopy	2.82	2.82	An individual commented that the RVUs for all of these codes should be increased by more than 20%.	The RUC has previously reviewed the RVUs for these services and recommends the current RVUs be maintained.	2
44389	Colonoscopy with biopsy	3.13	3.13			2
44390	Colonoscopy for foreign body	3.83	3.83			2
44391	Colonoscopy for bleeding	4.32	4.32			2
44392	Colonoscopy & polypectomy	3.82	3.82			2
44393	Colonoscopy, lesion removal	4.84	4.84			2
44394	Colonoscopy w/ snare	4.43	4.43			2
45110	Removal of rectum	21.68	21.68	The ASGS commented that the RVUs for code 45110 should be increased from 21.68 to 28.78.	No further evidence was presented to support the comments on code 45110, so the RUC recommends retaining the current RVUs.	2
45303	Proctosigmoidoscopy	0.50	0.80	A CMD commented that code 45303 [<i>Proctosigmoidoscopy, rigid; with dilation, any method</i>] should be increased from 0.50 to 0.80 RVUs to value it more appropriately relative to 45300 [<i>Proctosigmoidoscopy, rigid; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)</i>].	An ASCRS survey of the work involved in code 45303, as well as an explanation of what is involved in rigid proctosigmoidoscopy supported the recommended increase.	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
45378	Diagnostic colonoscopy	3.70	3.70	The ACG submitted a comment that the RVUs for these services should be increased by about a third.	The RUC has previously reviewed these services. In addition, none of the specialties on the RUC Advisory Committee elected to conduct a survey or present any evidence supporting this suggested increase.	2
45380	Colonoscopy and biopsy	4.01	4.01			2
45550	Repair rectum; remove sigmoid	13.38	16.97	A CMD commented that this service involves 10% more work than 44140 [<i>Colectomy, partial; with anastomosis, 16.97 RVUs</i>].	An ASCRS survey of the work involved in code 45550 indicated it is currently undervalued, but found that the work is equal to 44140, not 10% more than 44140 as stated in the CMD comment.	1
46040	Incision of rectal abscess	4.90	4.41	A CMD commented that the value should be closer to 46045 [<i>Incision and drainage of intramural, intramuscular or submucosal abscess, transanal, under anesthesia</i>] and farther from 46060 [<i>Incision and drainage of ischiorectal or intramural abscess, with fistulectomy or fistulotomy, submuscular, with or without placement of seton</i>].	The RUC agreed with the recommended reduction.	3
46255	Hemorrhoidectomy	4.95	4.95	The ASCRS commented that four hemorrhoidectomy codes, 46255, 46260, 46261, and 46262, should be reviewed to place them in a more correct rank order from least to most difficult. The ASGS also commented that the RVUs for several of these services should be increased. The CMDs identified rank order problems also, with 46261 and 46262 having more intraservice time than 46260.	Although a survey was conducted of the hemorrhoidectomy codes, the ASCRS recommended and the RUC agreed that the existing incremental RVU changes for codes 46255 [<i>Hemorrhoidectomy, internal and external, simple, 4.95 RVUs</i>], 46257 [<i>with fissurectomy, 5.87 RVUs</i>], and 46258 [<i>with fistulectomy, with or without fissurectomy, 6.26 RVUs</i>] provide a better basis for valuing codes 46260 through 46262 ["simple" is replaced by "complex or extensive" in these codes] than use of the survey medians. The RUC recommends, therefore, that the current RVUs be maintained for 46255 and 46260 and that 46261 and 46262 be increased.	2
46260	Hemorrhoidectomy	6.70	6.70			2
46261	Remove hemorrhoids & fissure	6.54	7.62			1
46262	Remove hemorrhoids & fistula	6.77	8.01			1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
46945	Ligation of hemorrhoids	3.06	1.90	A CMD commented that codes 46945 and 46946 for ligation of internal hemorrhoids are valued too high relative to hemorrhoidectomy by simple ligature (code 46221, 1.38 RVUs), which the Harvard study valued as equivalent to 46945.	The specialty society and the RUC agree with the recommended reductions.	3
46946	Ligation of hemorrhoids	4.04	2.76			3
47425	Incision of bile duct	14.79	NA	A CMD noted that, in 1994, RUC recommended and HCFA agreed to a value of 15.31 for code 47420, choledochostomy without sphincterotomy. This created a rank order anomaly with code 47425, choledochostomy <u>with</u> sphincterotomy. To determine an appropriate increment for sphincterotomy, the CMDs looked to the relationship of ERCP without sphincterotomy (code 93262, RVU 5.96) and ERCP with sphincterotomy (code 43262, RVU 7.39). The difference in RVUs (7.39-5.96) equals 1.43. This value was added to the value of 47420 to obtain the recommended RVU of 16.74 for 47425.	Based on inaccurate information, the RUC adopted as part of a "consent calendar" the recommended decrease to 13.50 RVUs that was noted in the "Summary of CMD Comments" table provided by HCFA, since no specialty society objected or asked to provide more evidence. Closer review of the actual CMD rationale, however, suggests the CMD was actually recommending an <u>increase</u> , not the decrease presented in the table. The error was not noted in time for the RUC to take any definitive action, so the RUC is not making any recommendation on this code.	NA
Gastroenterology						
43235	Upper GI endoscopy, diagnosis	2.39	2.39	The ACG and the ASGS submitted comments recommending that code 43235 be increased to 3.85 or 4.23 RVUs.	The RVUs for code 43235 are based on a previous RUC recommendation. Since no additional evidence was submitted by the commenting specialty societies, the RUC recommends that the current RVUs be maintained.	2

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
43239	Upper GI endoscopy, biopsy	2.69	2.69	The ACG submitted a comment that the RVUs for these services should be increased from 34-54%.	The RUC has previously reviewed these services. In addition, none of the specialties on the RUC Advisory Committee elected to conduct a survey or present any evidence supporting this suggested increase.	2
43260	Endoscopy, bile duct/pancreas	5.96	5.96			2
43262	Endoscopy, bile duct/pancreas	7.39	7.39			2
43456	Dilate esophagus	3.52	2.57	A CMD recommended this decrease because the current value represents more than 50% greater intensity than 43458 [Dilation of esophagus with balloon (30 mm diameter or larger) for achalasia], which is a slighter longer and equally difficult procedure. Revised value gives 43456 the same intensity as 43458.	The RUC agrees with the recommended decrease.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key
91122	Anorectal manometry	1.77	1.77	The CMDs submitted a comment that code 91122 should be decreased from 1.77 to 0.66 RVUs because anorectal manometry is less work than 99204 [Office/outpatient visit, new, 1.71 RVUs] and is similar to the combination of 46600 [Diagnostic anoscopy, 0.50 RVUs] and 93770 [Measure venous pressure, 0.16 RVUs].	The American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of the work involved in anorectal manometry which produced a 1.81 median value. The specialty explained that diagnostic anoscopy is a simple, straightforward procedure which takes only a few minutes. With 30 minutes of intraservice time and 65 minutes for the complete procedure, however, anorectal manometry is a much more complex service. The physician must perform a digital rectal exam, insert a multichannel catheter into the rectum 15-20 cm., and perform station pull-through at half-cm increments to identify the location of the internal anal sphincter and basal pressure. This process must be repeated four times, with the patient squeezing as hard and long as possible to determine maximal squeeze pressure and duration. Then, the physician must test sensation with pinprick in 4 anal quadrants, measure baseline pressure for 5 minutes, then gradually inflate and deflate a balloon to and from various cc's to determine sensing threshold. Finally, the physician must analyze the tracing, calculate pressures, and explain initial impressions to the patient. The service cannot be provided by a technician and it involves a repeated process of testing and evaluation, not a single pressure measurement. In time and complexity, it is comparable to 99204. The RUC recommends that the current RVUs be maintained.	2

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 43830 **Global Period:** 090 **1995 RVW:** 4.84 **Recommended RVW:** 7.50

CPT Descriptor: Gastrostomy, temporary (tube, rubber or plastic) (separate procedure);

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 14 general surgeons, with the assistance of Abt Associates, Inc., designed a study that included a survey instrument to effectively measure all aspects of physician work for commonly performed general surgery services. The results of this study found code 43830 to be undervalued at the present time.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

19-year-old male, who attempted suicide by ingesting lye, developed a severe esophageal stricture and now requires long-term alimentation through a gastrostomy tube. He was taken to the operating room and underwent insertion of the tube. Postoperatively, he did well and was discharged on the fourth postoperative day, to be followed in the office.

Description of Pre-Service Work:

Pre-service work begins after the decision to operate is made until the time of the procedure. This activity includes obtaining and reviewing previous laboratory and imaging studies, with special attention to cardiopulmonary and hematologic status; consulting with the referring physician, if necessary, and with other health care professionals; and communicating with the patient (and/or the patient's family) to explain the operative risks and benefits and to obtain informed consent. Other preoperative services include dressing, scrubbing, and waiting to begin the operation; supervising the positioning, prepping, and draping of the patient; and ensuring that the necessary surgical instruments and supplies are present and available in the operative suite.

Description of Intra-Service Work:

The abdomen is opened, and the epigastrium is assessed for the presence of any contraindications to gastrostomy tube placement. An appropriate site for tube placement is selected on the anterior gastric wall, and a double purse-string suture is placed at that site. A separate skin incision site for tube exit through the anterior abdominal wall is selected, and a tunnel is created through the anterior abdominal wall to connect the exit site to the site of the purse-string suture. A tube of the appropriate size is selected and introduced through the tunnel to the gastrostomy site. A gastrotomy is made within the purse-string suture, and the tube is advanced through the gastrotomy to the appropriate location within the stomach. The purse-string suture is tied down, creating a serosal-lined tunnel around the tube. The tube-bearing area of the stomach is then secured to the peritoneum of the anterior abdominal wall at the site of the anterior abdominal wall tunnel. The abdomen is closed in layers. The tube is secured to the skin of the anterior abdominal wall and is flushed to confirm patency. Sterile dressings are applied at the laparotomy and skin exit sites.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes the application of sterile dressings at the laparotomy and skin exit sites. Post-service work also includes monitoring the patient's stability in the recovery room; writing orders; communicating with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including careful monitoring of cardiopulmonary status; ordering and reviewing postoperative chest radiographs and laboratory studies; monitoring and care of the incisions and the functioning of the gastrostomy tube; instituting nutritional support; and antibiotic and pain medication management. Discharge management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure, including removal of sutures; ordering and evaluating periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

SURVEY DATA:

Specialty: American College of Surgeons

Sample Size: 175

Response Rate (%): 56 (32%)

	Median	Low	25th pctl	75th pctl	High
RVW:	7.50	4.00	6.20	9.00	11.43
PRE-Service	30				
INTRA-Service	60	15	45	60	90
POST-Service:					
Day of procedure - total time	20				
ICU - total time / # of visits	0	0			
Other hosp. - total time / # of visits	45	4			
Office - total time / # of visits	25	2			

KEY REFERENCE SERVICE(S):

1995

RVW	Global	CPT	Descriptor
7.77	090	44300	Enterostomy or cecostomy, tube (eg, for decompression or feeding) (separate procedure)
5.71	010	43750	Percutaneous placement of gastrostomy tube
5.59	000	50392	Introduction of intracatheter or catheter into renal pelvis for drainage and/or injection, percutaneous

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Slightly less work is required for 43830 than for 44300 due to the fact that it takes a bit longer to ascertain the exact position for placement of the tube in the jejunum. However, 43830 is considerably more work than 43750 or 50392, in that 43830 requires general anesthesia and limited laparotomy with subsequent closure, in addition to placement of the gastrostomy tube (43750) and its suture fixation to the intra-abdominal wall. Additionally, these patients require a hospital stay of 3-4 days. 43830 has a global period of 90 days, compared with 43750 and 50392, which are outpatient procedures and have global periods of 10 and 0 days, respectively.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Some of the patients who require this procedure have sustained neurological injuries, esophageal obstructions, gastroesophageal obstructions, or chronic debilitation and require long-term nutritional support. Many of these patients are not candidates for percutaneous endoscopic gastrostomy (PEG) or long-term nasogastric tube feeding. According to Medicare data, 92.2 percent of patients requiring this service are age 75 or older. Pediatric patients with repeated aspiration pneumonias secondary to gastroesophageal reflux also may require this service. The response to survey question 4b indicated that patients requiring this service are medically "more complex (more work)," which may relate, among other things, to the fact that patients often are either quite elderly or extremely young.

Code 43830 involves suturing the tube into position and then suturing the stomach to the abdominal wall. This action assures that, if the tube is dislodged, there is no spillage of the gastric contents into the peritoneal cavity, which could result in peritonitis. The PEG does not involve fixation of the stomach to the abdominal wall. Therefore, the tube may become dislodged and spillage of the gastric contents into the peritoneal cavity can occur.

Code 43830 was surveyed as part of the Harvard project. The work value that was recommended for this service was 6.52, which is considerably higher than the current work value of 4.84. Moreover, the value of 6.52 was based on an intra-service time of 51 minutes, which is less than the time of 60 minutes that was reported in the five-year review survey.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 47610 **Global Period:** 090 **1995 RVW:** 13.86 **Recommended RVW:** 15.00

CPT Descriptor: Cholecystectomy with exploration of common duct;

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 14 general surgeons, with the assistance of Abt Associates, Inc., designed a study that included a survey instrument to effectively measure all aspects of physician work for commonly performed general surgery services. The results of this study found code 47610 to be undervalued at the present time.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

55-year-old male presents with jaundice, a history of fatty food intolerance, and a past history of ultrasound-proven cholelithiasis. He underwent HIDA scan, which showed no filling of the gallbladder and no flow of the isotope into the intestines. Preoperatively, the ERCP revealed multiple filling defects in the common bile duct and multiple stones in the gallbladder. He was taken to the operating room and underwent cholecystectomy of the common duct, exploration with removal of four common duct stones consistent with the preoperative ERCP, and drainage of his common bile duct. Postoperatively, he did well and was discharged on the sixth postoperative day.

Description of Pre-Service Work:

Pre-service work begins after the decision to operate is made, from the day before the operation until the time of the procedure. This activity includes obtaining and reviewing previous laboratory and imaging studies, with special attention to cardiopulmonary, gastrointestinal, and hematologic status; reviewing findings at ERCP; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or the patient's family) to explain the operative risks and benefits and to obtain informed consent. Other preoperative services include dressing, scrubbing, and waiting to begin the operation; supervising the positioning, prepping, and draping of the patient; and ensuring that the necessary surgical instruments and supplies are present and available in the operative suite.

Description of Intra-Service Work:

The abdomen is incised, with dissection carried through the abdominal wall and into the peritoneal cavity. The peritoneum is explored for other abnormalities, and adhesions are taken down, as needed. The gallbladder is mobilized and a cholecystectomy is performed. The common bile duct is explored by mobilizing the duodenum (Kocher maneuver), opening the common bile duct, and removing any free stones and debris with irrigation, bile duct forceps, and biliary duct balloon catheters. The size and patency of the ampulla is assessed by passage of a biliary duct balloon catheter or a Bakes dilator. When all stones and debris are removed, a T-tube is selected, cut to fit the common bile duct, and placed in the duct to allow adequate drainage. The common bile duct is then repaired. The T-tube is sewn in place, brought out through a separate incision, and attached to a drainage device. A completion T-tube cholangiogram is then obtained to evaluate the patency of the ampulla, placement of the tube, and to exclude any retained common bile duct stones. The cholangiogram is interpreted in the operating room by the surgeon, and communication with the radiologist is undertaken, as indicated. Drains are inserted, as necessary. The abdominal wall is closed in layers, and dressings are applied.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes the application of sterile dressings. Post-service work also includes monitoring the patient's stability in the recovery room; writing orders; communicating with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon; careful monitoring of cardiopulmonary

status; ordering and reviewing postoperative radiographs and laboratory studies; monitoring and care of the incision; monitoring, maintenance, and removal of all drains; ordering and reviewing a T-tube cholangiogram, when indicated; and antibiotic and pain medication management. Discharge management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the operation are considered part of the postoperative work for this procedure, including removal of sutures; ordering and evaluating periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

KEY REFERENCE SERVICE(S):

1995

RVW	Global	CPT	Descriptor
8.90	000	43264	Endoscopic retrograde cholangiopancreatography (ERCP); with endoscopic retrograde removal of stone(s) from biliary and/or pancreatic ducts

11.53	090	47605	Cholecystectomy; with cholangiography
-------	-----	-------	---------------------------------------

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The recommendation for the increased RVW for this service is based on the building block methodology. Code 47610 involves a cholecystectomy with cholangiography (code 47605, valued at 11.53) and an ERCP (code 43264, valued at 8.90). For purposes of recommending a value for code 47610, the portion involving the ERCP is valued at 50 percent or 4.45 (intra-operative time only). Based on the building block method ($11.53 + 4.45 = 15.98$), the value that is recommended for code 47610 is 15.00. This method, previously used and accepted by the RUC, demonstrates that this service is undervalued.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 49000 **Global Period:** 090 **1995 RVW:** 8.99 **Recommended RVW:** 11.00

CPT Descriptor: Exploratory laparotomy, exploratory celiotomy with or without biopsy(s) (separate procedure)

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 14 general surgeons, with the assistance of Abt Associates, Inc., designed a study that included a survey instrument to effectively measure all aspects of physician work for commonly performed general surgery services. The results of this study found code 49000 to be undervalued at the present time.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

19-year-old male presents to the emergency department with a stab wound of the left flank. Abdominal X-rays reveal no free air. He is hemodynamically stable. He subsequently develops abdominal tenderness over six hours of observation. The attack weapon was allegedly a butcher knife that is 12 inches long. CT scan reveals fluid in the cul-de-sac. He is taken to the operating room, where a thorough exploration reveals a stab wound of the left retroperitoneum with minimal bleeding. All other structures are normal. The incision is closed. The patient has an uneventful postoperative course and is discharged on the third postoperative day.

Description of Pre-Service Work:

Pre-service work begins after the decision to operate is made. This activity includes assessing the patient in the emergency department; taking a history regarding the incident; obtaining and reviewing emergency department admission imaging and laboratory studies, with special attention to cardiopulmonary, gastrointestinal, and hematologic status; communicating with other health care professionals; ordering preoperative antibiotics and tetanus prophylaxis; and arranging for an adequate supply of intra-operative blood products. Pre-service work, which is frequently performed under adverse circumstances due to uncooperative patients (secondary to drug or alcohol ingestion), also includes trying to obtain consent from the patient or responsible family member. Other preoperative services include dressing, scrubbing, and waiting to begin the operation; supervising the positioning, prepping, and draping of the patient; and ensuring that the necessary surgical instruments and supplies are present and available in the operative suite.

Description of Intra-Service Work:

An abdominal incision is made that is large enough to allow evaluation of the entire abdominal cavity. The peritoneal surfaces are inspected for site of violation. Hematomas, crepitus, and bile staining are sought and excluded, including all appropriate maneuvers to inspect the retroperitoneum, such as mobilization of the duodenum, ascending colon, and descending colon, and mobilization of the gastrocolic ligament to inspect the pancreas. The solid viscera are evaluated by inspection and palpation. The gastrointestinal tract from the esophagogastric junction to the peritoneal reflection of the rectum in the pelvis is evaluated and injury excluded. The great vessels of the abdomen and the urinary tract are examined and injury excluded. All other intra-abdominal organs are systematically inspected and the absence of injury is confirmed. The abdomen is closed in layers.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes the application of sterile dressings. Post-service work also includes monitoring the patient's stability in the recovery room; writing orders; communicating with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring of cardiopulmonary status; monitoring and care of the incisions; and antibiotic and pain medication management. Discharge management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure, including removal of sutures; ordering and evaluating periodic laboratory reports, if needed; and antibiotic and pain medication adjustments.

KEY REFERENCE SERVICE(S):

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
11.19	090	49010	Exploration, retroperitoneal area with or without biopsy(s) (separate procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Due to technological advances in diagnostic CAT scans, ultrasonography, MRI, and diagnostic laparoscopy, exploratory laparotomy currently is performed most frequently in trauma patients. As a result, the population of patients requiring this service has changed. In addition, the intensity of the procedure has increased because it is now imperative for the surgeon to exclude all intra-abdominal and retroperitoneal injuries at the time of exploration. The work that is required for this code is equivalent to the work of 49010, which has an RVW of 11.19.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Code 49000 was included in the Harvard project and a work value of 9.05 was recommended. This value is slightly greater than the current work value for this code. Moreover, the work value of 9.05 is based on pre-, intra-, and post-service times that are less than those reported in the five-year review survey.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	47000	Biopsy of liver, needle, percutaneous	1.9
2)	32405	Biopsy, lung or mediastinum, percutaneous needle	1.93
3)	50200	Renal biopsy, percutaneous, by trocar or needle	2.63
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

See Rationale

RATIONALE

The current value for this service of 1.49 is inconsistent with other services such as percutaneous liver biopsy (CPT 47000; RVW 1.9), percutaneous lung biopsy (CPT 32405; RVW 1.93), renal biopsy (CPT 50200; RVW 2.63). The median values of these other biopsy codes is 2.05 RVWs. In our opinion, percutaneous biopsy of an abdominal mass clearly requires an equivalent amount of physician time and effort when compared with these other biopsies. For example, biopsy of a 3 cm lesion of the liver requires initial evaluation of previous examinations, laboratory results, and consultation with the family and physician followed by localization of the mass under the imaging guidance of choice. After the skin has been anesthetized and the mass relocalized, a needle is passed through the mass, the position of the needle confirmed, and tissues aspirated or withdrawn. After appropriate specimens are taken, the patient is monitored, orders are written, and the patient and the referring physician are spoken with. The procedure also involves the use of conscious sedation. Biopsy of the kidney, lung, and liver is virtually identical to a biopsy of an abdominal mass; the service is different only in location of the mass and typically does not involve less stress or less difficulty because of the potential hazards from inadvertent puncture of adjacent vital organs or vascular structures. Regarding risks, the risks of bleeding from an abdominal mass are essentially equivalent to the risks of pneumothorax from inadvertent needle passage across the pleural space for example.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 49255 **Global Period:** 090 **1995 RVW:** 4.04 **Recommended RVW:** 11.50

CPT Descriptor: Omentectomy, epiploectomy, resection of omentum (separate procedure)

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 14 general surgeons, with the assistance of Abt Associates, Inc., designed a study that included a survey instrument to effectively measure all aspects of physician work for commonly performed general surgery services. The results of this study found code 49255 to be undervalued at the present time.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

45-year-old female patient underwent a pelvic exploration one week ago. The findings of the previous operation were uncertain as to pathology inasmuch as the frozen section diagnosis was unclear. The permanent pathology report indicated a poorly differentiated ovarian carcinoma. The plan is to resect the patient's omentum as completely as possible and to further stage the extent of her disease. The pathologist's report of this specimen showed several small foci of tumor. The patient's postoperative course was satisfactory, and she was discharged on the fifth postoperative day.

Description of Pre-Service Work:

Pre-service work begins after the decision to operate is made, from the day before the operation until the time of the procedure. This includes obtaining and reviewing previous work-up, with special attention to cardiopulmonary, gastrointestinal, and hematologic status; reviewing findings of the prior operation; reviewing imaging and laboratory studies; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or the patient's family) to explain operative risks and benefits and to obtain informed consent. Other preoperative services include dressing, scrubbing, and waiting to begin the operation; supervising the positioning, prepping, and draping of the patient; and ensuring that the necessary surgical instruments and supplies are present and available in the operative suite.

Description of Intra-Service Work:

The abdomen is incised, with dissection carried through the abdominal wall and into the peritoneal cavity. The peritoneum is explored for other abnormalities, and adhesions are taken down, as needed. The omentum is mobilized and an omentectomy is performed. The abdominal wall is closed in layers.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes application of sterile dressings. Post-service work also includes monitoring the patient's stability in the recovery room; writing orders; communicating with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including careful monitoring of cardiopulmonary status; ordering and reviewing postoperative radiographs and laboratory studies; monitoring and care of the incision; and antibiotic and pain medication management. Discharge management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure including removal of sutures; ordering and evaluating periodic imaging and laboratory reports, if needed; arranging and initiating chemotherapy; and antibiotic and pain medication adjustments.

SURVEY DATA:

Specialty: American College of Surgeons

Sample Size: 175 Response Rate (%): 51 (29%)

KEY REFERENCE SERVICE(S):

1995

<u>RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
9.40	090	49002	Reopening of recent laparotomy
14.10	090	58950	Resection of ovarian malignancy with bilateral salpingo-oophorectomy and omentectomy;
6.54	090	58940	Oophorectomy, partial or total, unilateral or bilateral;

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 49002 has an RVW of 9.4. Code 49255 requires the same work as 49002, but it also involves the additional work of an omentectomy and lysis of adhesions. Code 49255 also involves the same amount of work as 58950, but without the oophorectomy. Therefore, in comparison with codes 49002 and 58950, an RVW of 11.50 is recommended for 49255.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Code 49255 was included in the Harvard project, and a work value of 10.25 was recommended. This value is approximately 60 percent greater than the current work value of 4.04 for this code. The Harvard value was based on an intra-service RVW of 5.15, which is greater than the current total work value for this code. Moreover, the value of 10.25 is based on pre-service, intra-service, and post-service hospital times that are slightly less than those reported in the five-year review survey. Code 49255 is listed in the *CPT Manual* as a separate procedure, but it is valued as though it were an add-on.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 49900 **Global Period:** 090 **1995 RVW:** 4.54 **Recommended RVW:** 9.40

CPT Descriptor: Suture, secondary, of abdominal wall for evisceration or dehiscence

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 14 general surgeons, with the assistance of Abt Associates, Inc., designed a study that included a survey instrument to effectively measure all aspects of physician work for commonly performed general surgery services. The results of this study found code 49900 to be undervalued at the present time.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

71-year-old male underwent a repair of a ruptured abdominal aortic aneurysm six days ago. The patient had known advanced COPD prior to the emergency procedure. His postoperative course was difficult, primarily due to his lung problems. He was maintained on the ventilator for two days and then successfully weaned from it. The patient had severe paroxysms of coughing following extubation. On morning rounds, he was noted to have serosanguineous drainage issuing from his midline wound. Shortly thereafter, an area of the wound opened and small bowel was noted. The patient was returned immediately to the operating room for a secondary closure with wire retention sutures. His postoperative course continued to be a problem due to his persistent bronchitic cough. His wound eventually healed, and his cough subsided. He was discharged three weeks after his initial emergency operation.

Description of Pre-Service Work:

Pre-service work begins after the decision to operate is made, from the day before the operation until the time of the procedure. This activity includes obtaining and reviewing the previous work-up, with special attention to cardiopulmonary, gastrointestinal, and hematologic status; reviewing imaging and laboratory studies; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or the patient's family) to explain the operative risks and benefits and to obtain informed consent. Other preoperative services include dressing, scrubbing, and waiting to begin the operation; supervision of the positioning, prepping, and draping of the patient; and ensuring that the necessary surgical instruments and supplies are present and available in the operative suite.

Description of Intra-Service Work:

The abdomen is incised, with removal of all sutures and the dissection is carried through the abdominal wall and into the peritoneal cavity. The peritoneum is explored for other abnormalities, and adhesions are taken down, as needed. The abdomen is lavaged with saline, cultures are taken, and debridement of the abdominal wall, as needed, is done. The abdominal wall is closed in layers, with retention sutures also being placed along with skin.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes application of sterile dressings. Post-service work also includes monitoring the patient's stability in the recovery room; communicating with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including ICU care and ventilator management, as necessary; careful monitoring of cardiopulmonary status; ordering and reviewing postoperative radiographs and laboratory studies; monitoring and care of the incision; and antibiotic and pain medication management. Discharge management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure, including removal of sutures; ordering and evaluating periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

SURVEY DATA:

KEY REFERENCE SERVICE(S):

1995

<u>RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
9.40	090	49002	Reopening of recent laparotomy

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The work of 49002 and 49900 is virtually the same. They both require reopening and re-closing a recent incision. They both involve exploration of the peritoneal cavity.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in the RVW for this code (from 4.54 to 9.40) is based on the similarity of the overall work of 49002 and 49900. They both require reopening and reclosing a recent incision. They both involve exploration of the peritoneal cavity.

Code 49900 was reviewed in the Harvard project, and a work value of 6.43 was recommended. This value is 29 percent greater than the current value of 4.54. Moreover, the Harvard value is based on pre-service, intra-service, post-service hospital, and post-service office times that are less than those derived from the five-year review survey. In addition, the Harvard data included no ICU time, as compared to the five-year review survey data, which indicated three ICU visits as part of the work of the surgeon for this procedure.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
 FIVE-YEAR REVIEW PROCESS
 SUMMARY OF RECOMMENDATION

CPT Code: 44140 Global Period: 90 Current RVW: 16.97 Recommended RVW: 16.97

CPT Descriptor: Colectomy, Partial; with anastomosis

Source and Summary of Comment to HCFA on this service: ACS- undervalued
 Rec'd RVW = 18.79

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old male with a history of rectal bleeding and anemia undergoes a colonoscopy. He is found to have a single sigmoid carcinoma of 35 cm from the anal verge. This is a 3cm annular lesion. The patient has an outpatient bowel preparation. ON the day of admission, he undergoes a partial colectomy with

Description of Pre-Service Work: Counsel patient for surgery, evaluate preoperative labs, X-rays and EKG. Position patient on operating table. Supervise Foley catheter placement and preparation of operative area.

Description of Intra-Service Work: Proceed with a abdominal exploration and mobilization of colonic segment. Divide colon and isolate and divide mesenteric vessels. Perform intestinal anastomosis and close mesenteric defect.

Description of Post-Service Work: Daily visits to assess wound and intestinal function. Evaluate labs and X-rays. Follow up to assess for anastomotic "leaks".

SURVEY DATA:

Specialty: American Society of Colon and Rectal Surgery

Sample Size: 80 Response Rate (%): 40 Median RVW: 18

has an uneventful post-operative course and is discharged on the seventh post operative
day.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	44150	Colectomy, total, abdominal, without proctectomy, with ileostomy, or ileoproctostomy	19.04
2)	44130	Excision of Rectal procidentia, with anastomosis; perineal approach	13.03
3)	45153	Colectomy, total, abdominal, without proctectomy, with rectal mucosectomy, ileoanal anastomosis, creation of ileal reservoir (S or J), with or without loopileostomy.	
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Codes 44150 and 44153 involve more pre service counseling and positioning. The operative procedures are more extensive, requiring greater technical skill and physical effort. The post service recovery is more involved in dealing with a stoma or change in bowel function. Code 44130 is less involved with no abdominal incision.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Several colectomy codes were introduced into the five year review process to realign the codes properly within the family of colectomy codes. These codes are best discussed in aggregate so that the entire family is appropriately represented within the RBRBS. The codes involved are 44140, 44141, 44143, 44144, 44145. CPT grouped these codes together because they represent a progression of surgical procedures that generally demonstrate increasing levels of physician work. This increased work involves pre, intra, and post service elements of care. These work elements are not only comprised of increases in time but also in mental effort, judgement, technical skill, and psychological stress. An additional code included in this discussion, 45550, was also offered for review by the CVs for being undervalued it involves a partial colectomy with proctopexy, it is included in this discussion to preserve the proper relationships within the family of codes. The 1995 RVW,s for the primary family of colectomy codes presently range from 16.97 to 21.29. The ASCRS survey instrument provided a slightly higher range, 18 to 22. Code 45550 was grossly undervalued in relation to the colectomy group with a '95 RVw of 13.38

In general, the pre service times were similar throughout the survey. Although the times are similar, the mental effort and judgement are different. Codes 44140 and 44145 are used for elective colon resections. Codes 44141, 44143, and 44144 develop urgent or emergent colon resections and they've increased intensity, mental effort, judgement and psychological stress involving the pre, intra, and post service time.

The intra service times show a progressive increase from code 44140 through code 44145 which properly reflects the increase in difficulty in physically performing each procedure, especially the low rectal dissections within the pelvis detailed in code 44145. The post service times reflect the increased ICU and hospital times for the urgent and emergent procedures, codes 44141, 44143, and 44144, as illustrated in these surveys. The elective cases, 44140 and 44145, do not have the ICU time and increased hospital times frequently seen in the non-elective setting. The surveys demonstrated the highest levels of complexity and intensity throughout the colectomy group with progression from the base code 44140 to code 44145.

Therefore, the ASCRS recommends a realignment in these survey codes maintaining the original range from 16.97 (code 44140) to 21.29 (44145). The ASCRS recommends the intermediate codes (44141, 44143, 44144) increased proportionately according to the ratio established in the survey instrument. In the survey, the median RVw's for codes 44141 and 44143 were 111% of code 44140; thus 44140 =16.97, 44141 =18.83, 44143=18.83. Code 44144 represented 107% of code 44140; 44144=18.15. The recommended values for the intermediate codes align themselves with the CMC proposed value for code 45550 (CMD RVw = 18.68) and a survey RVw (=18). Finally the survey suggested that 44145 was 112% of the base code 44140, thus 44145=20.7. The ASCRS feels that the survey vignette for 44145 did not represent the typical patient requiring a low anterior resection and thus recommended maintaining the current value of 21.29 (which is 125% of the base code 44140).

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 44144 Global Period: 90 Current RVW: 15 Recommended RVW 18.15

CPT Descriptor: Colectomy, Partial; with resection, with colostomy or ileostomy and creation of a mucous fistula

Source and Summary of Comment to HCFA on this service: ACS undervalued Rec'd RVW= 18.79

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 65 year old male presents with an intestinal obstruction. He is found to have an unresectable rectosigmoid carcinoma with complete colonic obstruction. He is taken to the operating room and undergoes sigmoid mobilization and transection of the sigmoid with the proximal end brought out as a

Description of Pre-Service Work: Emergent/urgent surgery. Counsel patient for surgery. Mark patient for stoma site. Volume resuscitate patient. Evaluate preop labs and x-rays. Position the patient on the operating table. Supervise Foley catheter placement and preparation of operative area.

Description of Intra-Service Work: Proceed with abdominal exploration. Debride all infected or necrotic tissue. Mobilize the colonic segment. Divide the colon and isolate and divide mesenteric vessels. Perform an intestinal anastomosis and establish a proximal diverting colostomy.

Description of Post-Service Work: Daily visits to assess wound and stoma. Evaluate intestinal function. Evaluate labs and x-rays. Follow up to assess for persistent sepsis.

SURVEY DATA:

Specialty: American Society of Colon and Rectal Surgery

Sample Size: 80 Response Rate (%): 40 Median RVW: 20.55

25th Percentile RVW: 18 75th Percentile RVW: 20.55 Low: 11.92 High: 33

Median Pre-Service Time: 90 Median Intra-Service Time: 180

25th Percentile Intra-Svc Time: 117.5 75th Percentile Intra-Svc Time: 185 Low: 70 High: 270

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 47.5

ICU: 0 0

Other Hospital: 200 10

Office: 60 3

Vignette continued--colostomy and the distal end brought to the midline wound as a mucus fistula. Postoperatively, he does well and he is prepared for chemoradiation therapy. He is discharged from the hospital on the 10th postoperative day.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	44150	Colectomy, total, abdominal, without proctectomy, with ileostomy, or ileoproctostomy	19.04
2)	44130	Excision of rectal procidentia, with anastomosis; perineal approach	13.03
3)	45153	Colectomy, total, abdominal, without proctectomy with rectal mucosectomy, ileoanal anastomosis, creation of ileal reservoir (S or J), with or without loopileostomy.	
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 44150 involves more colon in the resection but code 44141 is similar because of the various elements associated with urgent/emergent surgery. Code 445153 is more intense involving more counseling and more physical work in preserving sphincter function. Code 44130 is much less involved, with no stoma and no abdominal incision.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 44145 Global Period: 90 Current RVW: 21.29 Recommended RVW 21.29

CPT Descriptor: Colectomy, Partial; with coloproctostomy (low pelvic anastomosis)

Source and Summary of Comment to HCFA on this service: ACS undervalued Rec'd RVW= 23.62

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 55 year old male is evaluated for rectal bleeding and a decrease in the caliber of his stool. Colonoscopy reveals no other lesions. On rigid sigmoidoscopy, the lower limit of a 3 cm lesion is at 10 cm from the anal verge. Biopsy proves this to be an adenocarcinoma. He is otherwise well. His CEA level is Description of Pre-Service Work: Counsel patient for surgery, evaluate preoperative labs, x-rays and EKG. Position patient on operating table. Supervise Foley catheter placement and preparation of operative area. Description of Intra-Service Work: Proceed with abdominal exploration. Mobilize sigmoid, descending colon and splenic flexure. Take omentum off transverse and descending colon. Mobilize rectum. Divide colon and rectum. Isolate and divide mesenteric vessels. Isolate and protect uterus. Perform anastomosis with Description of Post-Service Work: Daily visits to assess wound and intestinal function. Evaluate labs and x-rays. Follow up to assess for anastomotic "leaks".

SURVEY DATA:

Specialty: American Society of Colon and Rectal Surgery

Sample Size: 80 Response Rate (%): 40 Median RVW: 22

25th Percentile RVW: 21.25 75th Percentile RVW: 24 Low: 17 High: 33

Median Pre-Service Time: 120 Median Intra-Service Time: 210

25th Percentile Intra-Svc Time: 180 75th Percentile Intra-Svc Time: 240 Low: 120 High: 270

Median Post-Service Time:	Total Time	Number of Visits
Day of Procedure:	<u>45</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>180</u>	<u>10</u>
Office:	<u>60</u>	<u>4</u>

CPT Code: 44145

Vignette continued--3.6. He is bowel prepped as an outpatient with antibiotics and GoLytely. On the day of admission, he is taken to the operating room and undergoes a sigmoid colectomy with a low pelvic anastomosis approximately 5 cm from the anal verge. Postoperatively he has an uneventful recovery and is discharged on the 9th postoperative day.

Intra service work continued--pelvis (possibly trans anal instrumentation).

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	44150	Colectomy, total, abdominal, without proctectomy, with eleostomy, or ileoproctostomy	19.04
2)	44130	Excision of rectal procidentia, with anastomosis; perineal approach	13.03
3)	45153	Colectomy, total, abdominal, without proctectomy with rectal mucosectomy, ileoanal anastomosis, creation of ileal reservoir (S or J), with or without loopileostomy.	
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

This code compares similarly to code 45153. Code 45153 is more involved with sphincter dysfunction but the rectal dissection and anastomosis are similar. The pre, intra and post service times are all less, but the physical effect and stress are significant.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 45303 Global Period: 10 Current RVW: 0.50 Recommended RVW 0.80

CPT Descriptor: Proctosigmoidoscopy, rigid; with dilation any method

Source and Summary of Comment to HCFA on this service: CMD undervalued Rec'd RVW= 0.80

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 68 year old patient who had previously undergone a low anterior resection with a low pelvic anastomosis complains of increasing bouts of constipation, diarrhea, and rectal fullness. Digital examination reveals a stenotic anastomosis that barely admits the index finger. The rigid proctoscopy is

Description of Pre-Service Work: After identifying a stricture or stenosis the patient is counseled. The patient is repositioned in the prone jack-knife or left lateral Sims position.

Description of Intra-Service Work: Rigid proctoscopy identifies the stricture. The area is cleaned of debris and feces. The stricture is dilated with insertion of the proctoscopic obturator. The obturator is removed

Description of Post-Service Work:

SURVEY DATA:

Specialty: American Society of Colon and Rectal Surgery

Sample Size: 80 Response Rate (%): 46 Median RVW: 1.75

25th Percentile RVW: 1.3 75th Percentile RVW: 2.3 Low: 1.01 High: 5

Median Pre-Service Time: 15 Median Intra-Service Time: 20

25th Percentile Intra-Svc Time: 10 75th Percentile Intra-Svc Time: 30 Low: 5 High: 60

Median Post-Service Time:	Total Time	Number of Visits
Day of Procedure:	<u>10</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>0</u>	<u>0</u>
Office:	<u>0</u>	<u>0</u>

Vignette continued--performed and impacted feces are removed from and around the area of the anastomosis. With reinsertion of the rigid proctoscopy, an attempt to dilate the anastomosis is met with resistance. The anastomotic area is then biopsied to open the stenotic anastomosis and allow for passage of the rigid proctoscope and dilation of the anastomosis. The patient is subsequently cautioned about recurrent anastomotic strictures and the possibility of perianal or perirectal bleeding.

Intra service work continued--and hemostasis is achieved.

Office:	<u>45</u>	<u>3</u>

Vignette continued--patient is seen in the hospital one day postoperatively and is discharged home. She is followed up in the clinic in one week and seen again on two more occasions postoperatively to assess complete healing of the hemorrhoidal wound and closure of the posterior fissure preventing a posterior keyhole deformity.

Pre Service Work continued--consulting with referring physician, if necessary; and obtaining consent from the patient/or responsible family member.

Intra Service Work continued--epinephrine solution, careful dissection of hemorrhoidal tissue with excision, and suture closure of wound site with close attention to hemostasis, a posterior fissurectomy, mucosal advancement to cover site, all performed with adequate hemostatic control.

Post Service Work continued--monitoring of wound and possibly for pain and management. Additionally, all hospital visits and post discharge office visits for this problem for 90 days after the day of operation are considered part of this post operative work for this procedure; including evaluating laboratory reports and adjusting medication.

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 46280	Surgical Treatment of Anal Fistula (Fistulectomy	5.63
2) 15100	Split graft, trunk, scalp, arms, legs, hands	8.05
3)		
4)		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre service work is greater than for 46280 because of the hospital admission requirement. It is also greater than for 15100. The intra-service work is greater than for 46280, but slightly less than for 15100. The post service work is greater than 46280 and equivalent for greater than 15100.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research

See 46250

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 46262 Global Period: 90 Current RVW: 6.77 Recommended RVW: 8.01

CPT Descriptor: Hemorrhoidectomy internal and external, complex or extensive with fistulectomy; with/without fissurectomy

Source and Summary of Comment to HCFA on this service:
JCMD undervalued Rec'd RVW = 7.99

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48 year old male with third degree hemorrhoids had failed medical management in the left lateral and right posterior quadrants. He has also had a previous perianal abscess that has led to a chronic fistula-in-ano, extensive two quadrant hemorrhoidectomies with internal and external hemorrhoidal excisions performed in closure

Description of Pre-Service Work: Hospital admission work up, with special attention to ruling out AODM; ordering and reviewing roentgenograms and laboratory studies; communicating with the patient, the patient's family, and other health care professionals; consulting with referring physicians: if necessary; and obtaining consent from the patient and/or

Description of Intra-Service Work: Positioning the patient, with careful attention to padding the lower extremities prevent peripheral nerve damage; careful insertion of the anoscope, injection of an anesthetic solution with or without epinephrine, careful dissection of the hemorrhoid columns, suturing of the site to obtain adequate hemostasis, careful insertion

Description of Post-Service Work: Patient stabilization recovery room; communicating with the patient, family, and other health care professionals (including written and telephone reports and orders); appropriate evaluation of wound and verbal communication of postoperative orders with family and/or patient including pain management. Additionally, all post-discharge

SURVEY DATA:

Specialty: American Society of Colon and Rectal Surgery

Sample Size: 80 Response Rate (%): 45 Median RVW: 7

25th Percentile RVW: 6 75th Percentile RVW: 9 Low: 5 High: 12.34

Median Pre-Service Time: 60 Median Intra-Service Time: 60

25th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 90 Low: 45 High: 150

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>0</u>	<u>0</u>
Office:	<u>45</u>	<u>3</u>

Vignette continued--of hemorrhoidal wounds, along with a fistulotomy to excise and resolve the fistula-in-ano. The patient was discharged from the hospital on the day of surgery and is seen postoperatively in a one week period. He is followed on to other subsequent postoperative visits until complete closure of the fistula's wounds and hemorrhoidectomy sites over the 3 month period.

Pre Service Work continued--responsible family members.

Intra Service Work continued--of the anorectal probe to identify fistula tract with appropriate dissection to excise and debride this tissue.

Post Service Work continued--office visits for this problem for 90 days after the day of the operation are considered to be part of the postoperative work for this procedure; including evaluating the wound and adjusting medications.

KEY REFERENCE SERVICE(S):

1)	46280	Surgical Treatment of Anal Fistula (Fistulectomy/Fistulotomy); subcutaneous	5.63
2)	15100	Split graft, trunk, scalp, arms, legs, hands and/or feet; 100sq in. cm less, for each	8.05
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above. The pre service work for code 46262 is comparable with the work service codes for 46280 and 15100. The intraoperative work component is greater than for 46280 and is compatible with 15100. Post service component is slightly higher than 46280 and is equivalent to 15100.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

	46260 HEMORRHOIDECTOMY	6.70	090

CMD Comment:

This procedure involves pre and post-service work similar to 46260 which is used to report hemorrhoidectomies without fissurectomies (RVU - 6.70) but involves 20 to 30 minutes more intraservice time. This recommendation establishes a more accurate relationship in the family codes 46260, 46261, 46262.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 91122 Global Period: 0 Current RVW: 1.77 Recommended RVW: 1.77

CPT Descriptor: Anorectal manometry

Source and Summary of Comment to HCFA on this service: The value should not be changed. The current survey supports this. The value of 0.66 recommended by the carrier medical directors is only trivially greater than that of a simple anoscopy and grossly undervalues the procedure.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year old woman is becoming reluctant to leave her home because of fecal soiling. She is continent of solid stool but has had slowly worsening incontinence of liquid stool for 3 years. She frequently has rectal urgency. She has had four vaginal deliveries. Recent flexible sigmoidoscopy was normal. You perform and interpret an anorectal manometry study.

Description of Pre-Service Work: Explanation of procedure; review of indications.

Description of Intra-Service Work: Digital rectal exam; insert lubricated multi-channel catheter into rectum 15-20 cm.; perform station pull-through at half-cm. increments, pausing 10-15 secs. between manipulations, to identify the location of the internal anal sphincter and basal pressure. Repeat. Repeat again, with patient squeezing anal sphincter to determine augmented squeeze pressure. Repeat. Pt. then squeezes as hard and as long as possible to determine maximal squeeze pressure and duration. Test sensation with pinprick in 4 quadrants of anus. Measure baseline pressure for 5 mins., then gradually inflate/deflate balloon to/from 5 cc's, 10, 15, 20, 25, 30, 40, 50, 75, 100, 125, and 150 cc's to determine sensing threshold. Look for relaxation response to balloon distention.

Description of Post-Service Work: Analyze tracing, calculate pressures; explain initial impression to patient.

SURVEY DATA:

Specialty: Gastroenterology

Sample Size: 13 Response Rate (%): 27 Median RVW: 1.81

25th Percentile RVW: 1.75 75th Percentile RVW: 2.15 Low: 0.96 High: 3.39

Median Pre-Service Time: 20 mins. Median Intra-Service Time: 30 mins.

25th Percentile Intra-Svc Time: 30 75th Percentile Intra-Svc Time: 45 Low: 15 High: 150

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 15

ICU: _____

Other Hospital: _____

Office: _____

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	46600	Anoscopy, diagnostic	0.50
2)	45330	Sigmoidoscopy, flexible; diagnostic	0.96
3)	91010	Esophageal motility study	1.65
4)	91011	Esophageal motility study with mecholy! or other stimulant	1.98

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Diagnostic anoscopy is straightforward, simple, easy to interpret and takes only a few minutes. Minimal manipulations are required and there is no physiographic record to interpret. Diagnostic sigmoidoscopy typically takes about ten minutes to perform, with no physiographic record. These procedures are simpler and quicker to perform than anorectal manometry. Esophageal motility studies are comparable in duration and complexity to anorectal manometry; time and intensity are also comparable.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The median value of 1.81 derived from the current survey is almost identical to the existing value of 1.77. The rationale of the Medicare Carrier Medical Directors, in recommending a value of only 0.66, was that the value of anoscopy, 0.5, should be added to the value of code 93770 [determination of venous pressure], 0.16. This would suggest that the work of 91122, anorectal manometry, is the same as combining a simple anoscopy with a single pressure measurement, ignoring the many steps involved in anorectal manometry, detailed above. We strongly recommend that the current value of 1.77 be maintained.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Urology

The Carrier Medical Directors commented on and advocated reductions in 39 of the following 43 codes. In most cases the rationale of the CMDs was based on comparison to cross specialty procedures. RVUs were reduced to the level of the RVUs of the cross specialty procedure. The CMDs also attempted to link the reduction of one code in a family to other codes in an effort to maintain the reduction of RVUs throughout the family. Typically the response of the American Urological Association was to survey the code and to refute the cross specialty link established by the CMDs. The rationale established by the AUA was generally compelling in that it was based on anatomical, technical and patient population differences that proved the cross specialty comparisons to be faulty. Usually AUA arguments were supported by survey data that validated their claims when compared to Harvard data. In many instances surveyed intra-work time was greater than Harvard data showed and RVUs turned out to be greater than established 1995 values.

The RUC questioned the AUA arguments against the cross specialty links and subsequent RVU reductions. They evaluated the technical aspects of the arguments and typically came to the conclusion that the reference procedures chosen for comparison by the CMDs were inappropriate. Survey data was also analyzed to determine if time and complexity measures were sufficient to support AUA arguments. The RUC also looked at time and complexity gains to ascertain if increased RVUs were necessary. The basis for many of the CMD comments was comparison between urology codes and codes in other specialties. As part of its review the RUC compared several urology codes to other procedures on the Multispecialty Points of Comparison (MPC) based on the intrawork per unit time (IWPUT). The urology codes proved to be well within expected levels. For example, 50010, *Exploration of Kidney*, has an IWPUT of 0.094, which compares to: 93510, *left heart catheterization*, with an IWPUT of 0.099; 26531, *Revise knuckle with implant*, with an IWPUT of 0.090; 66984, *Remove cataract, insert lens*, with an IWPUT of 0.121; or 61700, *Inner skull vessel surgery*, with an IWPUT of 0.088. Code 54200, *Treatment of penis lesion*, has an IWPUT of 0.038, which compares to: 11642, *Removal of skin lesion*, with an IWPUT of 0.047; 45110, *Removal of rectum*, with an IWPUT of 0.061; or 46260, *Hemorrhoidectomy*, with an IWPUT of 0.049. Generally the RUC found that the CMD recommended reductions were not appropriate, but that rationale and data were also not sufficiently compelling to support specialty recommended increased RVUs. As a result, the RUC recommends that 32 of the 43 codes, be maintained at 1995 levels.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
50010	Exploration of kidney	10.07	10.07	CMD: Reduce RVU to 8.99; 50010 has less intra-service work than 32100, <i>thoracotomy, major; with exploration and biopsy</i> , 35371, <i>thromboendarterectomy, with or without patch graft; common femoral</i> , and 60220, <i>total thyroid lobectomy, unilateral; with or without isthmusectomy</i> . It has less intensity than 32100, and should not be more than 49000, <i>exploratory laparotomy, exploratory celiotomy with or without biopsy(s)</i> .	This procedure is most similar to 50220, <i>nephrectomy; including partial ureterectomy, any approach including rib resection</i> , which has a work RVU of 15.98. The only difference is that the kidney is not removed in 50010 as it is in 50220. 50010 is clearly different from the procedures cited by the CMDs. 32100 and 49000 do not require the removal of a rib or the mobilization of the kidney or its vascular supply.	2
50020	Drainage of kidney abscess	12.41	12.41	CMD: Reduce RVU to 9.06; The work of CPT code 50020 is slightly greater than code 50010, <i>exploration of kidney</i> ; the relationship is similar to 49020, <i>drain abdominal abscess</i> , and 49000, <i>Exploratory laparotomy, exploratory celiotomy with or without biopsy(s)</i> . It is questionable whether the drainage of an abscess requires more work than an exploration. For example, the <i>drainage of a liver abscess</i> (code 47010, RVU 8.75) is less work than an <i>exploratory laparotomy</i> (code 49000, RVU 8.99).	Drainage of an abscess is not done through exploration but through a percutaneous tube. When an exploratory procedure is required the patients are a more complex and difficult group. Supported by survey data showing median intra-service time of 90 min. and a median RVU of 17.57. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
50040	Drainage of kidney	13.8	13.80	CMD: Reduce RVU to 10.55; 50040 does not entail the total work intensity or manual labor that 63047, <i>Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root(s), (eg, spinal or lateral recess stenosis)), single vertebral segment; lumbar</i> , does. It does not include the time, intensive, intra-service work or any aspect of 32100, <i>Thoracotomy, major; with exploration and biopsy</i> , nor the intensiveness of 35371, <i>thromboendarterectomy</i> . The increment in work is similar to 49060, <i>Drainage of retroperitoneal abscess</i> , over 49000, <i>Exploratory laparotomy, exploratory celiotomy with or without biopsy(s)</i> .	The open drainage procedure is rarely done, usually drainage is accomplished by a radiologist with a tube. When procedure is required the patients are a more complex and difficult group; supported by survey data showing median intra-service time of 90 min. and a median RVU of 16.50. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
50081	Removal of kidney stone	20.58	20.58	CMD: Reduce RVU to 19.98; An increase of 6.5 RVUs for a stone above 2 cm is not consistent with the work. Adding 3.0 RVUs to code 50080, <i>removal of Kidney stone</i> , is more realistic.	Terminology confusion between 50081, <i>nephrostolithotomy</i> , and 50060, <i>nephrolithotomy</i> ; the prior is a percutaneous procedure and the latter is an open procedure; in 50081 size is very important because of procedural difficulties associated with a larger stone. Additionally, the staghorn configuration is typical for stones over 2 cm. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
50200	Biopsy of kidney	2.63	2.63	CMD: Reduce RVU to 1.90; Similar in all aspects to 4700, <i>Biopsy of liver, needle; percutaneous</i> .	Anatomical factors make the kidney more difficult to biopsy. Supported by survey data showing median intra-service time of 52.2 min. and a median RVU of 2.88. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
50205	Biopsy of kidney	12.69	12.69	CMD: Reduce RVU to 6.75; 50205, <i>open biopsy of kidney</i> , requires no more work, time, or effort than a <i>wedge biopsy of the liver</i> (47100). This procedure is incorrectly valued under the current fee schedule relative to a kidney exploration. Biopsy should be lower than an exploration to be consistent with the relationship of 47010-49000, <i>Exploratory laparotomy, exploratory celiotomy with or without biopsy(s)</i> .	Most renal biopsies are done percutaneously not open; wedge biopsy is done in as an add on to 50205. Supported by survey data showing median intra-service time of 75 min. and a median RVU of 18.50. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
50220	Removal of kidney	15.98	15.98	CMD: Reduce RVU to 12.97; Value is 50230, <i>Nephrectomy, including partial ureterectomy, any approach including rib resection; radical, with regional lymphadenectomy and/or vena caval thrombectomy</i> , minus one half of 38780, <i>Remove abdomen lymph nodes</i> . The nephrectomy itself is probably less demanding than the radical procedure, simple (50220) not as difficult as radical (50230).	The only difference between a simple procedure and a radical procedure is that the radical is for cancer; this does not necessarily make the simple procedure less difficult; supported by survey data showing median intra-service time of 120 min. and a median RVU of 18.50 (50220) and median intra-service time of 180 min. and a median RVU of 21.00 (50225). The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
50225	Removal of kidney	18.93	18.93	Same percentage decrease as code 50220 in order to maintain relativity within the nephrectomy family of codes.		
50230	Removal of kidney	20.56	20.56	Society felt that referenced general surgical codes are not realistic benchmarks. The Whipple procedure, 48150, at 40.25 RVUs was used as a benchmark instead and selected services were evaluated based on pre, intra and post-service work value measurements.	Recommended change was less than a 10% increase from the current RVU. The RUC did not believe its survey instrument to be sufficiently precise to detect such small changes, and the specialty provided no compelling evidence to support their comment.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
50234	Removal of kidney & ureter	21.11	21.11	CMD: Reduce RVUs to 17.79 & 19.93; Should be slightly less than a <i>radical nephrectomy</i> (code 50230, RVU 20.56). Percentage decrease from 50234 should be maintained for 50236.	50234 and 50236 are unrelated to 50230. 50236 is a two part procedure the building block of which yields the original RVU. Supported by survey data showing median intra-service time of 180 min. and a median RVU of 23.00 (50234) and median intra-service time of 190 min. and a median RVU of 25.00 (50236). The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
50236	Removal of kidney & ureter	23.33	23.33			
50240	Partial removal of kidney	20.24	20.24	CMD: Reduce RVU to 17.05; Maintain relationship to 50234 and 50236.	This is an inappropriate comparison. Logic for 50234 and 50236 is flawed as is this. Supported by survey data showing median intra-service time of 180 min. and a median RVU of 25.00. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
50320	Removal of donor kidney	21.22	21.22	The society believes that this procedure is not properly valued.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends that the current RVUs be maintained.	2
50390	Drainage of kidney lesion	3.24	1.96	CMD: Reduce RVU to 1.96; The intra-service and post-operative work for 32000, <i>drainage of chest</i> , is comparable to 50390. 31622, <i>Bronchoscopy; diagnostic, (flexible or rigid), with or without cell washing or brushing</i> , with RVUs of 2.83 is much more complicated than the aspiration of a renal cyst. It requires more skill, judgement, time and is a much greater risk. The procedure is most comparable to 47500, <i>injection for liver x-ray</i> .	The RUC recommends that the RVU be reduced. The CMD comparison is valid.	3
50392	Insert kidney drain	5.59	3.38	CMD: Reduce RVUs to 2.50, 3.50 and 2.50; The work of 44950, <i>Appendectomy</i> , is much greater than 50392 which compares almost identical in work with introduction of a Swan-Ganz catheter (93503) at 2.46. 50393 and 50395 both follow from reduction of 50392.	Comparison of 50392 to 44950 is not valid. The RUC recommends a reduction, but believes that it is more appropriate to maintain ratio between the codes as established by 50390.	3
50393	Insert ureteral tube	6.88	4.16			
50395	Create passage to kidney	5.15	3.38			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
50590	Fragmenting of kidney stone	9.62	9.62	CMD: Reduce RVU to 6.54; Not a surgical procedure. Intra-service work is comparable to one hour of critical care. Added to this are two hospital visits (99221 and 99231) and 2.5 level 3 office visits. This procedure also needs to be revalued to take into account the change in technology over the past 5-6 years and the apparent increase in technician time vis-a-vis physician time.	In every way this procedure is similar to a surgical procedure; anesthesia is used and urologist is always present. Technology improvements have lessened the need for anesthesia but have lengthened the time. Supported by survey data showing median intra-service time of 80 min. and a median RVU of 11.00. The RUC recommends that the RVU remain the same.	2
50684	Injection for ureter x-ray	0.76	0.76	CMD: Reduce RVU to .50; This is a procedure of such low intensity and effort that it will rarely be done by physicians. It does not compare with effort and skill of <i>indirect laryngoscopy</i> (31505).	A urologist is always present. Procedure is low intensity but takes time. Supported by survey data showing median intra-service time of 20 min. and a median RVU of 0.75. The RUC recommends that the RVU remain the same.	2
50715	Release of ureter	17.6	17.6	CMD: Reduce RVU to 14.00; This code is incorrect valued higher than 50700, <i>ureteroplasty, plastic operation on ureter (eg, stricture)</i> . It is comparable to 50080, <i>removal of stone</i> , at 14.14. It is not as difficult as 50780, <i>ureteroneocystostomy</i> , with a value of 17.31.	50715, an open procedure, is much more difficult than 50700. Reference services chosen by urologists do not compare to those chosen by the CMDs. Supported by survey data showing median intra-service time of 135 min. and a median RVU of 17.50. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
51010	Drainage of bladder	2.54	2.54	CMD: Reduce RVU to 1.75; This procedure is not as difficult in technical skills and training as is 31622, <i>bronchoscopy</i> , with 2.83. It is much closer to 47000, <i>biopsy of liver percutaneous</i> , with a value of 1.92.	Patient is not typical. 51010 is an emergency procedure not scheduled as 31622 or 47000 are. Supported by survey data showing median intra-service time of 30 min. and a median RVU of 3.24. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
51597	Removal of pelvic structures	35.27	35.27	CMD: Reduce RVU to 32.25; The large difference between this code and <i>pelvic exenteration, female</i> (58240) is due to a difference of over two hours in estimated intra-service time in the Harvard study. There is probably very little real difference in work, so the most practical step would be to average the codes and assign the same RVU to both.	Arbitrary method of averaging similar procedures is not appropriate. On a male or a female the removal of pelvic structures is an extremely demanding and stressful operation. Supported by survey data showing median intra-service time of 300 min. and a median RVU of 35.00. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
51600	Injection for bladder x-ray	0.88	0.88	CMD: Reduce RVU to 0.50; It is more comparable to <i>anoscopy</i> (code 46600, RVU 0.5). This procedure is overvalued compared to other diagnostic procedures. The work involved is less than the <i>endometrial biopsy</i> (code 58100, RVU 0.71) and <i>proctosigmoidoscopy</i> (code 45300, RVU 0.7).	Procedure is not performed in the urologist's office and must be scheduled in a radiology, fluoroscopic suite. Supported by survey data showing median intra-service time of 20 min. and a median RVU of 0.90. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU.	2
51605	Preparation for bladder x-ray	1.13	0.64	CMD: Reduce RVU to 0.64; Reduction brings this into correct alignment with this family of codes. Proportionate reduction to 51600, <i>Injection for bladder x-ray</i> .	The RUC recommends that the CMD reduction be accepted.	3
51610	Injection for bladder x-ray	1.59	1.05	CMD: Reduce RVU to 0.90; Reduction brings this into correct alignment with this family of codes. Proportionate reduction to 51600, <i>Injection for bladder x-ray</i> .	This procedure is not performed in the urologist's office and must be scheduled in a radiology, fluoroscopic suite. Supported by survey data showing median intra-service time of 20 min. and a median RVU of 1.05. The RUC recommends reducing the RVU to the level of the survey median.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
51700	Irrigation of bladder	0.88	0.88	CMD: Reduce RVU to .50; Reduction brings this into correct alignment with this family of codes. Proportionate reduction to 51600, <i>Injection for bladder x-ray</i> .	Comparison to 51600 is incorrect. 51600 is diagnostic and 51700 is therapeutic. Supported by survey data showing median intra-service time of 20 min. and a median RVU of 1.00. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
51720	Treatment of bladder lesion	1.96	1.96	CMD: Reduce RVU to 1.01; This procedure involves the same amount of time but less skill and intensity than <i>thoracentesis</i> . Increment over 51700 should be no more than that of 62289 over 62270 (0.51 RVUs).	The placement of 51720 in the family of chemotherapy codes is appropriate. BDG is a dangerous drug that requires OSHA mandated handling regulations. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
51725	Simple cystometrogram	1.51	1.51	CMD: Reduce RVU to 1.10; This procedure is overvalued compared to other diagnostic procedures. The work is no more than a <i>bone marrow aspiration</i> (code 85095, RVU 1.05) or <i>laryngoscopy</i> (code 31575, RVU 1.1).	Procedure is not comparable to 85090 or 31575; global periods are different for compared codes. Supported by survey data showing median intra-service time of 25 min. and a median RVU of 1.80. The society recommended increasing the RVU up to the survey median. However, there was no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
51726	Complex cystometrogram	1.71	1.71	CMD: Reduce RVUs to 1.25, 0.61, 1.14 and 1.17; Bring these codes into correct alignment with family of codes. Proportionate to reduction of 51725.	Since basis of reduction of 51725 was refuted, these reductions are also recommended for no change in the current RVU. This is supported by survey data showing median intra-service time of 30 (51726) and 20 (51772) min. and a median RVU of 1.71 (51726) and 1.75 (51772). In the case of 51736, the RUC recommends acceptance of the CMD suggested reduction.	2
51736	Urine flow measurement	0.84	0.61			3
51741	Electro-uroflowmetry, first	1.57	1.57			2
51772	Urethra pressure profile	1.61	1.61			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
51785	Anal/urinary muscle study	1.53	1.53	CMD: Reduce RVU to 0.42; Interpretation only; comparable to <i>EMG of extraocular muscles</i> (code 92265, RVU 0.81).	This Service was through the RUC process in 1994 and received approval. Comparison code has a different global period. This is supported by survey data showing median intra-service time of 20 min. and a median RVU of 1.55. The RUC recommends that the RVU remain the same.	2
51792	Urinary reflex study	1.10	1.10	CMD: Reduce RVU to 0.59; Interpretation only; comparable to 95935, <i>H or F reflex study</i> . The procedure is less extensive than 95925, <i>EMG of extraocular muscles</i> , as 95925 typically involves testing more nerves.	Procedure is not only interpretation. A urologist performs the procedure. 92265 is done by a lab tech and has a different global period. Supported by survey data showing median intra-service time of 20 min. and a median RVU of 1.55. The RUC recommends that the RVU remain the same.	2
51795	Urine voiding pressure study	1.53	1.53	CMD: Reduce RVUs to 1.11 and 1.17; brings these codes into correct alignment with family of codes. Proportionate to reduction of 51725.	The RUC recommends against CMD reduction of 51725 and suggests that the RVU remain the same. This is supported by survey data showing median intra-service time of 25 (51795) and 30 (51797) min. and a median RVU of 2.00 (51795) and 2.00 (51797).	2
51797	Intraabdominal pressure test	1.60	1.60			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
52007	Cystoscopy and biopsy	3.02	3.02	CMD: Reduce RVUs to 2.37; Brush biopsy involves negligible work beyond ureteral catheterization. 31622, <i>Bronchoscopy</i> , and 52005, <i>GI endoscopy</i> , values do not increase in value if brushings are done.	Comparison to 31622 is not appropriate. 52007 involves general or spinal anesthesia in the operating room. Supported by survey data showing median intra-service time of 45 min. and a median RVU of 4.50. The society recommended increasing the RVU up to the survey median. However, there was no compelling evidence to increase the RVU. The RUC recommends that the RVU remain the same.	2
52270	Cystoscopy & revise urethra	3.84	3.37	CMD: The performance of urethrotomy adds 1.0 RVUs to the base cystourethroscopy code.	The RUC recommends that the CMD reduction be accepted.	3
52275	Cystoscopy & revise urethra	4.70	4.70	CMD: Reduce RVU to 4.01; The present RVU is nearly double the base <i>cystourethroscopy</i> code (52005). Performance in a male may be more difficult but difference should not be as great.	This procedure does not compare to 52005 which is totally visual. Supported by survey data showing median intra-service time of 30 min. and a median RVU of 4.50. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
52276	Cystoscopy and treatment	3.93	5.00	CMD: Reduce to 3.43; Proportionate reduction to 52275.	This procedure is more difficult than 52275. It is a more localized more precise version of 52275. Supported by survey data showing median intra-service time of 35 min. and a median RVU of 5.00. Possible rank order anomaly between 52275 and 52276 is shown in the survey data. The RUC recommends that the societies suggested RVU be accepted.	1
52277	Cystoscopy and treatment	6.17	6.17	CMD: Reduce RVU to 3.44; Increment of work over 52000 is the same as for sphincterotomy or ablation over ERCP.	The CMDs chose an inappropriate reference procedure to make this comparison. 52000 is a diagnostic code. Typical patient for 52277 is quadriplegic, spinal anesthesia is required. Supported by survey data showing median intra-service time of 45 min. and a median RVU of 7.50. The society recommended increasing the RVU up to the survey median. However, there is no compelling evidence to increase RVU. The RUC recommends that the RVU remain the same.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
52500	Revision of bladder neck	7.82	7.82	CMD: Reduce RVU to 6.82; This is comparable to an <i>appendectomy</i> (44950) with a value of 6.13 or the <i>insertion of an epidural pump buried with catheter</i> (63780) with a value of 6.29. It is less than the value of 29881, <i>knee arthroscopy</i> , with a value of 7.52.	52340 is for pediatric patients who are more complex and difficult. Miss-billing occurs with 52500 because identical language is used in CPT descriptors and 52340 does not specify congenital cases. As a result, 52340 should be referred to CPT for clarification of congenital cases and 52500 should remain unchanged.	2
52510	Dilation prostatic urethra	6.04	6.04	An individual commented that this procedure should be equated to 52601, <i>Transurethral electrosurgical resection of prostate</i> , with 11.51 RVUs.	The RUC recommends that the current value be maintained. There is no compelling evidence to increase the RVU.	2
54200	Treatment of penis lesion	1.01	1.01	Procedure is done under anesthesia. Survey results indicate a median intra-service time of 20 min. and a median RVU of 1.78.	The society recommended increasing the RVU up to the survey median. However, there was no compelling evidence to increase the RVU. The RUC recommends that the current value be maintained.	2
54231	Dynamic cavernosometry	2.04	2.04	The society supported their original recommendation to the RUC of 3.67. Felt that the procedure was worth twice the value of 51726, <i>complex cystometrogram</i> , because it took 15 to 30 min. longer.	The RUC previously made a recommendation of 3.67 RVUs. In addition, the code was before a HCFA refinement panel.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC Rationale	Key *
54640	Suspension of testis	6.55	6.55	The society felt that referenced general surgical codes are not realistic benchmarks. The Whipple procedure, 48150, at 40.25 RVUs was used as a benchmark instead and selected services were evaluated based on pre, intra and post-service work value measurements.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends that the current RVUs be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

50010

CPT Code: 50010 Global Period: 090 Source: Harvard
Current RVW: 10.07 CMD Recommended RVW: 8.99 AUA Recommended RVW: 10.07
Medicare Frequency: 336 Proposed reduction: 11% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Renal exploration, not necessitating other specific procedures

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment: *50010 has less intra-service work than 32100, 35371, and 60220; less intensity and less post-operative work than 32100; and should not be more than 49000.*

Reference procedures used by CMD

32100 - Thoracotomy, major, with exploration and biopsy (10.07 RVW)

35371 - Thromboendarterectomy, with or without patch graft; common femoral (10.49 RVW)

49000 - Exploratory laparotomy, exploratory celiotomy with or without biopsy(s) (separate procedure) (8.99 RVW)

60220 - Total thyroid lobectomy, unilateral; with or without isthmusectomy (9.86 RVW)

CLINICAL DESCRIPTION OF SERVICE:

Vignette

NO TYPICAL PATIENT

Description of Pre-Service Work:

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work:

SEE RATIONALE

Description of Post-Service Work:

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of

the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	50220	Nephrectomy, including partial ureterectomy, any approach including rib resection	15.98

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Pre, intra and post service work is similar to as CPT 50220 - Nephrectomy

- 1) Time - key reference procedure is similar in time
- 2) Intensity - key reference procedure is similar in intensity

AUA chose not to survey 50010 - renal exploration, because it was not possible to write a typical vignette for this rarely performed procedure. This CPT code is billed when no other code is appropriate; this explains the extremely low Medicare frequency of 336 per year.

The CMDs compared this to 32100 - thoracotomy with biopsy and 49000 - exploratory laparotomy with biopsy.

A "renal exploration" involves removal of a rib, incising three separate muscle layers, mobilizing the entire kidney, mobilizing the vascular supply to the kidney and careful identification of the ureter. These are essentially all of the steps involved in a nephrectomy for benign disease without actually removing the kidney; the only additional action on the part of the surgeon would be to clamp and tie the renal artery and vein to do a nephrectomy.

It should be apparent after this brief description that this is significantly different from an exploratory laparotomy (looking at the abdominal contents). In addition, all of these patients will have a post-operative ileus for three to four days and typically a hospitalization of six to eight days.

Conclusion: "Renal exploration" is realistically "undervalued" at the current RVW of 10.07. The present value should be retained because this procedure is clearly different from the reference procedures cited by the CMDs.

CMD Comments

30-Jun-95

Code: 50010

1995 RVUs: 10.07

Recommended RVUs: 8.99

Ratio: -0.11

Long Descriptor: Renal exploration, not necessitating other specific procedures

Reference Set (y/n): N Global Period: 090 Frequency: 336 Impact: -362.88

Source: 2 Year: 92 Public Comment Letter:

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

50020

CPT Code: 50020 Global Period: 090 Source: Harvard
Current RVW: 12.41 CMD Recommended RVW: 9.06 AUA Survey RVW: 17.57
Medicare Frequency: 780 Proposed reduction: 27% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Drainage of perirenal or renal abscess (separate procedure)

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment. *The work of CPT code 50020 is slightly greater than code 50010-exploration of kidney; the relationship is similar to 49020 -Drainage of peritoneal abscess and 49000-Exploratory laparotomy. It is questionable whether the drainage of an abscess requires more work than an exploration. For example, the drainage of a liver abscess (code 47010, RVU 8.75) is less work than an exploratory laparotomy (code 49000, RVU 8.99)*

Reference codes used by CMD

49000 - Exploratory laparotomy, exploratory celiotomy with or without biopsy(s) (separate procedure) (RVW 8.99)

49020 - Drainage of peritoneal abscess or localized peritonitis, exclusive of appendiceal abscess, transabdominal (RVW 9.06)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old woman has poorly-controlled insulin-dependant diabetes, a temperature of 104 degrees, and positive blood cultures. A CT scan of the abdomen and pelvis demonstrates a perirenal abscess extending from the upper pole of the left kidney down to the pelvic brim and dissecting into the ilio psoas muscle.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work

A left flank incision is made, the retroperitoneum is opened, 800 cc of pus is drained. The kidney is carefully mobilized and explored, loculations of pus are broken up, the iliopsoas muscle is explored down to the iliac vessels. Multiple drains are placed. The wound is closed in layers.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of

Patient is transferred to the ICU. Drains are slowly advanced, prolonged hospitalization.

2) Intensity - key reference procedures are similar in intensity
 Mental effort and judgement Median response 4 of 5
 Technical skill and physical effort Median response 4 of 5
 Psychological stress Median response 4 of 5

The Carrier Medical Directors' (CMD) comment is flawed. This becomes clear from the following statement: "It is questionable whether the drainage of an abscess requires more work than an exploration." Most renal abscesses are drained in the present day by percutaneous tube placement, either by a radiologist or a urologist. The only patients that require open exploration are much more complex patients in whom there is a contraindication or technical reason for not placing a percutaneous tube for drainage.

Therefore, as noted in the vignette and description of intra service work, this is a much more difficult problem and a subset of patients has now been defined that require open drainage. These patients are much more difficult to manage. The AUA survey RVW reflects the increased work involved in this subset of patients -- likewise, the Medicare frequency of 780 procedures further supports that this is an infrequently performed procedure on a very small but difficult subset of patients.

Conclusion: Current RVW of 12.41 is undervalued and the survey results strongly support an increase in work value to 17.57. The CMD-recommended RVW is incorrect due to a misunderstanding of the current management of a perirenal or renal abscess.

CPT Descriptor: Nephrostomy, nephrotomy with drainage

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment. *Does not entail the total work intensity or manual labor that 63047-laminectomy does. It does not include the time, intensity intra-service work or any aspect that 32100-thoractomy nor the intensity of 35371 - thromboendarterectomy. The increment in work is more similar to 49060 - drainage of abdominal abscess than 49000 - exploratory laparotomy.*

Reference Codes used by CMD:

63047 - Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root(s), (e.g., spinal or lateral recess stenosis), single vertebral segment; lumbar (RVW 12.76)

32100 - Thoractomy, major; with exploration and biopsy (RVW 10.07)

49000 - Exploratory laparotomy, exploratory celiotomy with or without biopsy(s) (separate procedure) (RVW 8.99)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year old man with a solitary right kidney has an obstructed distal ureter due to pelvic malignancy. Access cannot be gained from below. Because of an enlarged liver, percutaneous access is not possible. For this reason, urologist elects to perform an open nephrostomy.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work

A right subcostal flank incision is made, a renal exploration is carried out, the renal pelvis is dissected, the renal artery and vein are identified. A pyelotomy is made, a Randall- stone forceps is passed from a dilated lower pole calyx through the renal parenchymia, a number 18 Foley catheter is then placed through a separate stab wound to the dilated renal pelvis as a nephrostomy tube. A purse string suture is placed around the nephrostomy tube in the renal capsule. The pyelotomy is closed, a drain is placed and the wound is closed in layers.

Description of Post-Service Work

50040

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 4 of 5
Technical skill and physical effort	Median response 4 of 5
Psychological stress	Median response 3 of 5

The Carrier Medical Directors' (CMD) comment compared this procedure to back and chest surgeries. Once again, the CMDs did not understand the recent change in surgical approach to establish a nephrostomy. Most of these procedures are done percutaneously by a radiologist or a urologist. It is very unusual, and indeed rare, for an open nephrostomy to be carried out.

When open nephrostomy is done, as outlined in the vignette, it is done because access cannot be gained by either below (via cystoscopic procedure) or by percutaneous placement of a tube because of an anatomic abnormality. Therefore, this now represents a much more difficult subset of patients. This is again reflected by the Medicare frequency of only 400.

Conclusion: The current RVW of 13.08 is low. The AUA survey RVW of 16.50 more correctly reflects the work for this extremely difficult subset of patients and strongly supports an increase in work value to 16.50.

CPT Descriptor: Percutaneous nephrostolithotomy or pyelostolithotomy, with or without dilation, endoscopy, lithotripsy, stenting or basket extraction; over 2 cm

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment. *An increase of 6.5 RVWs because of a stone that is above 2 cm in diameter is not consistent with the work. Adding 3.0 RVWs to code 50080 is more realistic.*

Reference code(s) used by CMD:

50080 - Nephrostolithotomy; under 2 cm (RVW 13.98)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year old man has a staghorn (branched) calculus filling the entire right renal pelvis and most calyces.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery, scheduling intraoperative fluoroscopic x-ray assessment and any other non "skin-to-skin" work in the operating room. Does not include: consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the prone position to position the head and arms properly to avoid neck and brachial plexus injury.

Description of Intra-Service Work

A guide wire is passed through the previously placed percutaneous tube, the tube is removed and a tract is dilated into the lower pole of the kidney and a 34 French Amplatz sheath is placed. Nephroscopy is carried out, the stone is seen directly at the end of the operating sheath. The ultrasonic lithotripter is used to create a cavity and remove stone in the lower calyx. The stone is sequentially fragmented into multiple pieces with the ultrasonic lithotripter and removed with forceps. The bulk of the stone is removed from the renal pelvis, attention is then directed to each calyx where a stone fragment has to be fragmented and removed. During the procedure, nephroscopy is carried out with a flexible instrument on several occasions to visualize and remove other small stone fragments. At the end of the procedure, a reentry nephrostomy tube is placed.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
-----------------	-----------------------	------------

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

This code was originally identified by the Carrier Medical Directors (CMD) because of a misunderstanding in the meaning of the term "nephrostolithotomy". (Original CMD comment from February list is attached. In the original comments of 2/10/95, the CMDs comment pertained to "nephrolithotomy" which is an entirely different surgical procedure altogether. The CMDs queried why it is more difficult to lift out a stone over centimeters than a stone under two centimeters.

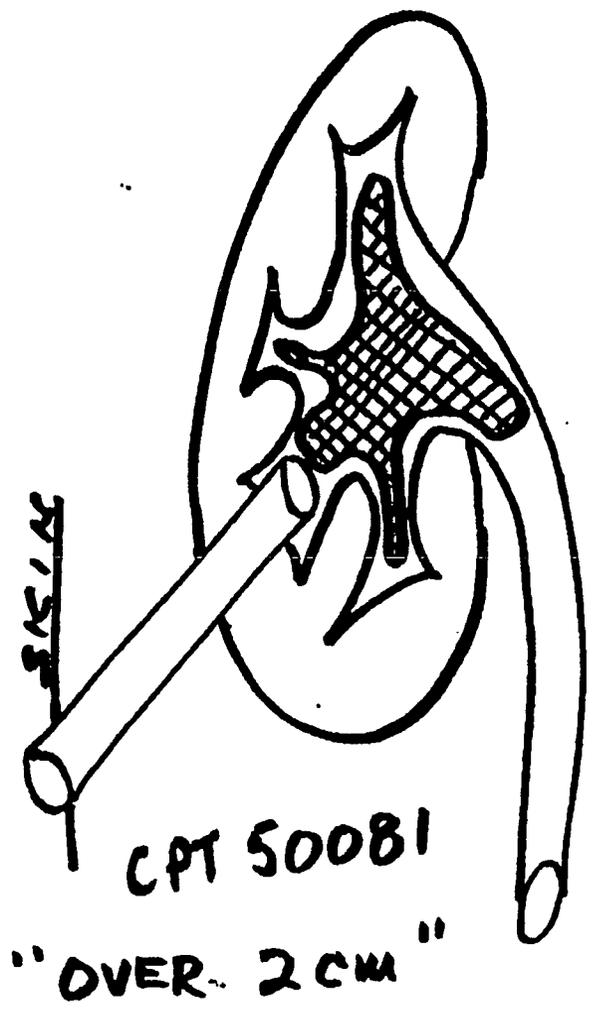

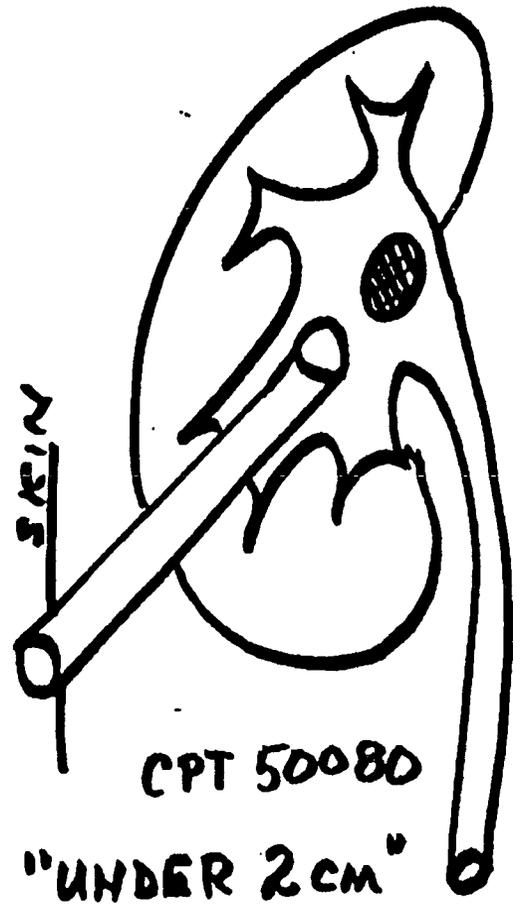

A "nephrolithotomy" CPT 50060 which has not been questioned in the Five-year Review Process is an operation done through a flank incision about ten inches long with a scalpel, scissors and sutures; the kidney is cut open and a stone is removed.

The CMDs did not understand that 50081 is not an open operation. Percutaneous stone surgery has two CPT codes – CPT 50080 (stone under 2 cm) and 50081 (stones over 2 cm). This is because they are very different procedures.

The CPT code identified by the CMDs (50081) "percutaneous nephrostolithotomy" is a percutaneous procedure that has absolutely no resemblance to the nephrolithotomy referenced by the CMDs. This entire code came into question because of the lack of understanding of what is involved in the surgical procedure of a percutaneous nephrostolithotomy.

A "percutaneous nephrostolithotomy" is a procedure done through a percutaneous access whereby a tube about 1 cm in diameter is placed from the skin down into the renal pelvis. Laparoscopic operating instruments are then passed through this tube and a stone is removed. Stones under two centimeters are generally round, free-floating single or multiple stones in the renal pelvis which may be removed by grasping the stone and sometimes fragmenting them if they are too large to fit through the sheath. A nephrostolithotomy of a stone over two centimeters refers to a staghorn calculus which is an entirely different procedure and CPT code (as the enclosed illustration demonstrates) and involves removing stones not only from the renal pelvis, but also the multiple branched components of the stone from multiple calyces. This is a much longer and more difficult surgical procedure and the current RVW of 20.58 may indeed be undervalued for all of the work involved.

Conclusion: The AUA chose not to survey this code because of the misunderstanding by the CMDs in the definition of "nephrostolithotomy" vs "nephrolithotomy." The AUA trusts that the RUC and the CMDs will now understand the complexity of this procedure by this description and will realize that we did not think a survey was indicated. Also, this is an infrequently performed procedure of 805 times in the Medicare population.

DRAFT

CPT CODE 50070 Nephrolithotomy with congenital kidney abnormality

1. 1995 RVUs: 19.15
2. Recommended RVUs: 15.48
3. Reference Code(s): 50060, 50135
4. Rationale for Change:
This is a rational step up in line with the present RVUs. CPT 50135 equates congenital anomalies and reoperation. Companion code to 50060.

CPT CODE 50075 Nephrolithotomy; removal of large staghorn calculus filling renal pelvis and calyces (including anatrophic pyelolithotomy)

1. 1995 RVUs: 24.05
2. Recommended RVUs: 20.00
3. Reference Code(s):
4. Rationale for Change:
This is a rational step up in the same procedure recognizing the complexity and difficulty and intensive of the operation but keeping it in line with the other codes in this series

CPT CODE 50081 Nephrolithotomy; over 2 cm *

1. 1995 RVUs: 20.58
2. Recommended RVUs: 16.98
3. Reference Code(s): 50080 - Slightly increased difficulty from 50080, but not 25 percent more
4. Rationale for Change:
The justification for moving 6½ RVUs because of a stone that is above 2 centimeters in diameter is not justified, therefore, 16.98 was more realistic.

CPT CODE 50120 Pyelotomy; with exploration

1. 1995 RVUs: 15.00
2. Recommended RVUs: 10.00
3. Reference code: 50045 - Recommended 11.18 RVUs
4. Rationale for Change:
The time intensity and difference between the nephrotomy and

CMD Comments

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 50200 Global Period: 000 Current RVW: 2.66 Recommended RVW: 2.88

CPT Descriptor: Renal biopsy; percutaneous, by Trocar or needle (service includes surgical procedure only)

Source and Summary of Comment to HCFA on this service: Survey of nephrologists randomly chosen from Renal Physician Association membership files, given option of participating and sent tool and support package.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 38 yr. old female who has increased weight by 30 lbs. Known nephrotic/nephritic urine with slowly rising serum creatinine. Resistant to standard diuretic therapy.

Description of Pre-Service Work: Obtaining/reviewing pre-biopsy studies. Discussing studies options and rational of biopsy with patient-family. Obtaining informed consent. Arranging for room availability, arranging for pathology. Reviewing x-ray/ultrasound.

Description of Intra-Service Work: Patient positioned - schooled in appropriate breathing and several "trial" patient maneuvers undertaken. Area is anesthetized with local. Depth of kidney is determined with sound/percutaneous measure. Movement of kidney determined by sound/probe relation to breathing. Renal tissue obtained via needle pass/gun. Tissue evaluated for presence of glomeruli - wound pressure applied.

Description of Post-Service Work: Post biopsy orders given. Post biopsy visit also done communicating with patient and family (referring physician) regarding procedure. Early review of biopsy results. Interpretation of results and decision on therapy possibilities. Follow-up with patient in observation regarding appropriateness for release home. Arrange follow-up visits. Discuss with family signs/symptoms and course of action regarding complications.

SURVEY DATA:

*% of respondents using this reference service

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

As reflected above, the biopsy of a kidney requires about the same pre-work, but has a much more involved intra-work component. Since the organ is not as superficial as liver, and biopsy is targeted at a small organ, situated quite deeply, surrounded by other vital organs; prone to movement and subject to bleeding, it becomes more difficult to obtain. The actual work is closer to a rectal Bx. The mental and emotional work associated with this procedure is clearly more involved than liver and closer to that of a rectal Bx. The post-work is less than rectal Bx.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The relative value committee of the RPA met in Baltimore to discuss the results of the survey and establish the appropriate value for submission. Discussion centered around the lack of advances over the past 5 years to facilitate the actual percutaneous biopsy. There have been some advances in localization, however, their services are outside the actual biopsy.

Review of respondents showed a significant stress factor (4.2) involved with the biopsy along with moderately high levels of mental judgement (3.8) and technical skills (3.8) noted.

Other discussion centered on cost analysis of reimbursement per procedure and cost increase for malpractice if procedure is included in coverage. The issue, while not directly involved with work, exemplifies a problem. Malpractice would double. The number of procedures to cover this increase in cost of practice is generally not achieved by most practicing nephrologists.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

50205

CPT Code: 50205 Global Period: 090 Source: Harvard
Current RVW: 12.69 CMD Recommended RVW: 6.75 AUA Survey RVW: 18.50
Medicare Frequency: 877 Proposed reduction: 47% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Renal biopsy, by surgical exposure of kidney

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment. *Open biopsy of kidney requires no more work, time, or effort than 47100 - wedge biopsy of the liver. This procedure is incorrectly valued under the current fee schedule relative to a kidney exploration. Biopsy should be lower than an exploration to be consistent with the relationship of 47010-49000.*

Reference Code(s) Used by CMD:

47100 - Biopsy of the liver, wedge (RVW 6.75)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A renal biopsy is indicated in a 67-year old man with a solitary left kidney and hepatosplenomegaly. The nephrologist cannot gain access to the kidney for a percutaneous biopsy. An open renal biopsy is indicated.

Description of Pre-Service Work:

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work:

A renal exploration is carried out through a left flank incision; the spleen is very large. An incisional wedge biopsy is done. The pathologist examines the tissue. A bolster of fat is placed in the renal biopsy defect and carefully sutured. The wound is closed in layers.

Description of Post-Service Work:

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

1) Time - key reference procedures require less time than 50205.

2) Intensity - key reference procedures are similar in intensity
 Mental effort and judgement Median response 4 of 5
 Technical skill and physical effort Median response 5 of 5
 Psychological stress Median response 5 of 5

The Carrier Medical Directors (CMDs) did not understand the complexity of the procedure and the difficult patient population now involved when an open biopsy of the kidney must be performed. This is incorrectly compared to a wedge biopsy of the liver which is usually done in conjunction with an open exploratory laparotomy. Most renal biopsies are done percutaneously by a nephrologist.

Once again, a subset of patients has been defined in which the nephrologist cannot gain access to the kidney for a percutaneous biopsy. This subset of patients by definition is much more difficult than the standard patient needing a renal biopsy. The vignette used in our survey outlines a patient that might be a candidate for an open biopsy. This is a very difficult patient and this would be a very difficult surgical procedure.

Conclusion: A new subset of patients has been described who would be candidates for an open renal biopsy. This is confirmed by the very low Medicare frequency of 877. The AUA survey result of 18.50 is much closer to the actual work involved rather than the current value of 12.69. The CMD recommended value of 6.75 is grossly incorrect and is based on inaccurate suppositions and the assumption that this procedure is done on "normal" patients. In addition, the survey data is very tight with a 25th percentile of 14.48 and a 75th percentile of 16.50.

Code not identified as overvalued

CPT Descriptor: Nephrectomy, including partial ureterectomy, any approach including rib resection

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment. *Value is 50230 minus one half of 38780. The nephrectomy itself is probably less demanding than the radical procedure.*

Reference Codes Used by CMD:

50230 - Nephrectomy, including partial ureterectomy, any approach including rib resection; radical, with regional lymphadenectomy and/or vena caval thrombectomy (RVW 20.56)

38780 - Retroperitoneal transabdominal lymphadenectomy, extensive, including pelvic, aortic, and renal nodes (separate procedure) (RVW 15.17)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year old woman with hypertension, refractory to drug treatment, has been found to have a small scarred left kidney, renal vein renin is elevated and left nephrectomy is indicated to control hypertension.

Description of Pre-Service Work:

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work:

A left flank incision is made, the 12th rib is resected. Gerota's fascia is opened. The ureter is identified and divided. A renal exploration is carried out. The kidney is mobilized. There is dense scar tissue around the kidney, the renal artery and renal vein are exposed, clamped and tied. The kidney is removed intact. The wound is closed in layers.

Description of Post-Service Work:

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of

2)	50060	Nephrolithotomy; removal of calculus	18.00
3)	50400	Pyeloplasty (Foley Y-pyeloplasty), plastic operation on renal pelvis, with or without plastic operation on ureter, nephropexy, nephrostomy, pyelostomy, or ureteral splinting; simple	18.07

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

1) Time - similar in time to 50230

2) Intensity - key reference procedures are similar in intensity
 Mental effort and judgement Median response 4 of 5
 Technical skill and physical effort Median response 4 of 5
 Psychological stress Median response 4 of 5

The Carrier Medical Directors (CMDs) mistakenly compared this to a radical nephrectomy (50230) and then subtracted the work of one-half of CPT 38780 retroperitoneal transabdominal lymphadenectomy. **First of all, a radical nephrectomy is performed by retaining the protective envelope of the Gerota's Fascia around the kidney. This is an entirely different surgical approach to the kidney than a "simple nephrectomy" which is performed by opening Gerota's Fascia.** (In the "simple nephrectomy" the adrenal gland is dissected off of the kidney retaining the adrenal with the patient. The word **radical** refers to a patient with cancer of the kidney.) However, CPT 50220 is just as demanding if not more demanding than the radical nephrectomy.

The survey results were extremely tight with the 25th percentile being 17.50 and the 75th percentile 19.48. The surveyees appropriately used key reference services of 50230 (20.56 RVW) and 50060 (18.00) as well as a pyeloplasty (50400) at 18.07.

Conclusion: Current RVW of 15.98 is actually undervalued. The AUA surveyed RVW of 18.00 is more appropriate. The CMD recommended RVW of 12.97 is grossly undervalued. In particular, the CMDs did not have an understanding of what is involved in a nephrectomy as evidenced by the comment. "The nephrectomy itself is probably less demanding than a radical procedure."

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

50225

CPT Code: 50225 Global Period: 090 Source: Harvard
Current RVW: 18.93 CMD Recommended RVW: 14.14 AUA Survey RVW: 21.00
Medicare Frequency: 360 Proposed reduction: 25% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Nephrectomy, including partial ureterectomy, any approach including rib resection; complicated because of previous surgery on same kidney

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment. *Same percentage decrease as code 50220 in order to maintain relativity within the nephrectomy family of codes.*

Reference codes used by CMD:

50220 - Nephrectomy including partial ureterectomy, any approach including rib resection (RVW 15.98)

50130 - with removal of calculus (pyelolithotomy, pelviolithotomy, including coagulum pyelolithotomy) (RVW 16.12)

50135 - Pyelotomy; complicated (e.g. secondary operation, congenital kidney abnormality) (RVW 18.14)

50060 - Nephrolithotomy; removal of calculus (RVW 18.00)

50065 - Nephrolithotomy; secondary surgical operation for calculus (RVW 19.62)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year old man has a poorly functioning, painful, chronically obstructed left kidney, there is a history of two previous left pyelolithotomies. Nephrectomy is indicated.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work

Left flank incision, the distal portion of the rib is resected, the Omnitrack retractor system is used, the retroperitoneal space is entered, dense scar tissue surrounds the entire kidney which must be mobilized by sharp dissection, the entire renal pedicle is scarred and the renal artery and vein are located with great difficulty, clamped, tied and divided. Using further sharp and blunt dissection, the kidney is removed. There is significant bleeding. The peritoneum is opened several times during the course of the dissection and must be closed. The wound is closed in layers.

Description of Post-Service Work

50225

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

1) Time - similar in time to reference procedure 50230

2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 4 of 5
Technical skill and physical effort	Median response 5 of 5
Psychological stress	Median response 5 of 5

The Carrier Medical Directors (CMD) rationale to reduce this the same percentage as the previous procedure 50220, is based on the same flawed rationale. This is an extremely demanding procedure and rarely is performed. (Only 360 times in the Medicare population.) The vignette used in the survey demonstrates the problems involved in this type of surgery. These kidneys are typically scarred in, and require a huge amount of work to remove. These are long tedious operations, and once again, they bare no relation to a "radical nephrectomy" as suggested by the CMDs (see also Rationale for 50220).

Conclusion: The current RVW of 18.93 may indeed be low. The AUA survey of 21.00 (with the 25th percentile of 20.00 and the 75th percentile at 23.00) is more accurate. This RVW should be increased to 21.00

Code not identified as overvalued

CPT Descriptor: Nephrectomy, with total ureterectomy, and bladder cuff; through same incision

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment(s). *Similar percentage decrease from revised 50236.*

Reference codes used by CMD

50220 - Nephrectomy, including partial ureterectomy, any approach including rib resection. (RVW 15.98)

50236 - Nephrectomy with total ureterectomy and bladder cuff; through separate incision (RVW 23.33)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year old man with transitional cell carcinoma of the right renal pelvis

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work

A right flank incision is made, the distal portion of the 11th rib is resected, the incision is carried obliquely onto the right lower quadrant. The entire kidney, including lymph node bearing tissue along the vena cava is mobilized and a nephrectomy is carried out. The ureter is mobilized down below the pelvic vessels to the bladder. A circumferential incision is made around the bladder to include the intramural ureter. The defect in the bladder is repaired after the entire specimen (kidney and ureter) is removed. The wound is irrigated and closed in layers.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

RATIONALE

50234

The Carrier Medical Directors (CMD) argue that there should be a "similar percentage decrease from revised 50236." From the discussion of 50236 it should be clear that this is an extremely different procedure than a radical nephrectomy.

In this procedure, a flank incision is made which is extended down into the lower abdomen in curvilinear fashion. A nephrectomy is carried out and the entire ureter is mobilized to the bladder. **The ureter is taken off the base of the bladder, and the bladder defect must also be repaired.** This is two operations.

Conclusion: Retain current RVW of 21.11 or increase RVW to 23.00.

CPT Descriptor: Nephrectomy with total ureterectomy and bladder cuff; through separate incision

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *Should be slightly less than a radical nephrectomy whose RVW = 20.56.*

Reference code(s) used by the CMD

50220 - Nephrectomy, including partial ureterectomy, any approach including rib resection. (RVW 15.98)

50230 - Nephrectomy, including partial ureterectomy; any approach including rib resection; radical, with regional lymphadenectomy and/or vena caval thrombectomy. (RVW 20.56)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old man with transitional cell carcinoma of the right renal pelvis and mid-right ureter.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and **may** include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing of central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. **Does not include:** Consultation or evaluation at which the decision to provide the procedure was made.

Particular attention is given to patients in the lateral "flank" position to pad the axilla to avoid brachial plexus injury and to assure that the operating room table flex does not put undue pressure on the vena cava, causing hypotension.

Description of Intra-Service Work

A right flank incision is made, the distal portion of the 11th rib is resected, the kidney is mobilized using sharp and blunt dissection, lymph node bearing tissue along the vena cava is dissected, a nephrectomy is carried out. The ureter is mobilized down to the back of the bladder through this incision; the kidney and mobilized ureter are placed in the pelvis next to the bladder. The wound is irrigated and closed in layers.

The patient is then taken out of the flank position and placed supine on the operating table, the lower abdomen is re-prepped the patient is entirely re-draped. A midline lower abdominal incision is made, the bladder is exposed and opened. The right ureteral orifice is incised and dissected free from the bladder removing the entire remaining portion of the ureter along with a cuff of bladder including the ureteral orifice. The bladder defect is then closed in layers. The cystotomy for exposure of the bladder is closed in layers. A Jackson-Pratt drain is placed and the lower abdominal incision is closed.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization,

post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

1) Time - key reference procedure 50230 requires less time.

2) Intensity - key reference procedures are similar in intensity
 Mental effort and judgement Median response 4 of 5
 Technical skill and physical effort Median response 4 of 5
 Psychological stress Median response 4 of 5

The Carrier Medical Directors' (CMD) comment that "50236 should be slightly less than a radical nephrectomy whose RVW is 20.56" demonstrates more clearly than any other CPT code singled out their lack of understanding of urologic surgery. This operation is unrelated to a radical nephrectomy. The description of intra service work from the survey describes a patient in which first a flank incision is made. A nephrectomy is done and then with the kidney still attached to the ureter the kidney is placed down on the pelvis and the entire flank incision is closed.

Next, all of the drapes are removed from the patient and the patient is taken out of the flank position and repositioned supine on the operating table while still under anesthesia. This requires a great deal of coordination with the anesthesiologist and the circulating personnel as well as the physicians. The lower abdomen is then prepped and the patient is entirely redraped and the physicians must scrub and regown again.

Finally, a lower abdominal midline incision is made and the bladder is opened and essentially a ureterectomy CPT 50650 with RVW of 16.37 is carried out. After the ureter is dissected free from the bladder along with a cuff of bladder, the entire kidney, ureter and portion of bladder are removed as one specimen. The posterior defect in the bladder must then be closed. A suprapubic tube must be placed, then the bladder must be closed, followed by the lower abdominal incision. This procedure is a huge amount of work and the AUA is hopeful that the CMDs will understand the difference by the above explanation. In addition, the survey data with a 25th percentile of 20.83 and a 75th percentile of 26.11 are very tight, the AUA survey recommendation of 25.00 is closer to the mark.

Conclusion: Retain current RVW of 23.33, or appropriately increase RVW to 25.00

SUMMARY OF RECOMMENDATION

50240

CPT Code: 50240 Global Period: 090 Source: Harvard
Current RVW: 20.24 CMD Recommended RVW: 17.05 AUA Survey RVW: 25.00
Medicare Frequency: 788 Proposed reduction: 16% Harvard (Dum) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Nephrectomy, partial

Source and Summary of Comment to HCFA on this service: Carrier Medical Director Comment. *Maintaining relationship to 50234 and 50236.*

Reference code used by CMD:

47120 - Hepatectomy, resection of liver; partial lobectomy (RVW 19.99)

50234 - Nephrectomy with total ureterctomy and bladder cuff; through same incision (RVW 21.11)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year old woman with a solitary right kidney has a 4 cm renal cell carcinoma occupying the mid and lower portion of the kidney. Treatment alternatives are discussed in detail with the patient and family. Partial nephrectomy is decided upon.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) Communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation and evaluation at which the decision to provide the procedure was made.

Description of Intra-Service Work

An upper abdominal chevron incision is made, the Omnitrack System is used, the right colon is taken down, the duodenum is mobilized and retracted medially, exposing the vena cava and renal vessels. The entire kidney is mobilized and a Rommel type clamp is placed around the renal artery and renal vein. Tapes are placed around the individual renal vessels. A rubber dam is placed around the kidney and it is slushed down with ice, the renal artery is temporarily occluded and the mass is excised. Openings in the pelvis (urinary system) are closed. Intermittently releasing the clamp on the renal artery, multiple bleeders are identified and suture ligated. A large portion of fat is placed in the renal defect and sutured in place. The rubber dam is removed and the renal artery is unclamped, hemostasis is adequate. Drains are left and the incision is closed.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

The Carrier Medical Directors' (CMD) comment was "maintain relationship to 50234 and 50236." A partial nephrectomy is a totally different, completely unrelated procedure to a radical nephrectomy which is inappropriately used as a comparison for 50234 and 50236.

The description of intra service work well-outlines what is involved. A partial nephrectomy is more difficult in many ways than a radical nephrectomy. It is a tissue-sparing operation with a Medicare frequency of only 788.

The procedure involves typically a solitary kidney with cancer. The alternative is a nephrectomy in which case the patient will have to be on dialysis. The renal vascular system must be completely dissected. The renal artery, must be clamped while a portion of the kidney is removed, the kidney must then be repaired and made water tight, the multiple bleeding defects must be stopped. The renal artery must be opened periodically to flush the kidney out to retain viability. These patients go to the ICU afterwards.

The AUA survey results suggest that an appropriate RVW is 25.00. Please notice that this procedure was rated more difficult than a radical nephrectomy.

Conclusion: The CMD rationale is flawed. The CMD rationale is essentially an incorrect premise based on two previous incorrect premises. The current value of 20.24 should be maintained or increased to the survey RVW of 25.00.

 Medicare Frequency: 28,932 Proposed reduction: 32% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Lithotripsy, extracorporeal shockwave

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *Not a surgical procedure. Intra-service work is comparable to one hour of critical care. Added to this are two hospital visits (99221 and 99231) and 2.5 level three office visits. This procedure also needs to be revalued to take into account the change in technology over the past 5 - 6 years and the apparent increase in technician time vis-a-vis physician time.*

CLINICAL DESCRIPTION OF SERVICE:

Vignette: A 66-year old man has a 1.2 cm round calcium oxalate dihydrate stone in the left renal pelvis. The stone was previously obstructing and a ureteral stent was placed one week prior to the date of lithotripsy.

Description of Pre-Service Work:

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) Communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation and evaluation at which the decision to provide the procedure was made.

Description of Intra-Service Work:

Stone position is checked for placement at the F2 focus. Adjustment of anesthesia parameters (heart rate modification with atropine, tidal volume etc) as directed by the urologist to increase the treatment efficacy. Initial treatment energy is determined by the urologist based upon therapeutic individualization for this patient and estimated stone fragility. Treatment commences and periodic and/or continuous monitoring by x-ray/fluoroscopy is performed with interpretation by the urologist who is in continuous attendance throughout the procedure. After 3,000 shockwaves adequate fragmentation occurs.

Description of Post-Service Work:

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

RATIONALE

50590

Please refer to attached "Expanded Rationale".

Expanded Rationale
Re: 50590 Lithotripsy, Extracorporeal Shockwave

Workgroup 3 Discussion

- Although Workgroup 3 agreed with the AUA's contention that lithotripsy requires surgical like qualifications, the American Lithotripsy Society (ALS) study was not compelling enough to convince the group to recommend an increase in work value. The workgroup suggested that the AUA conduct a survey of lithotripsy and present the results to the full RUC Committee.
- The Carrier Medical Directors commented that lithotripsy is "not a surgical procedure. Intra-service work is comparable to one hour of critical care. Added to this are two hospital visits (99221 and 99231) and 2.5 level three office visits. This procedure also needs to be revalued to take into account the change in technology over the past 5 - 6 years and the apparent increase in technician time vis-a-vis physician time."
- The AUA rebutted CMD's comments as follows:

Lithotripsy is performed in the operating room, and anesthesiologist administers anesthesia to the patient. The urologist is always present and must have full operating room credentials. The urologist cannot leave the operating room during the procedure.

Most urologists use lithotripters that require the patient be under general or epidural anesthesia; this represents "old" technology. Newer lithotripters, or lithotripters where anesthesia is not needed, still require that the patient be heavily sedated. These "new" technology machines require up to twice as many shockwaves and take up to twice the amount of time as the older machines.

There has been no decrease in the urologist's involvement in the procedure in the past 11 years. The urologist is still present throughout the procedure as are the technical support staff i.e., nurses, radiologic technologists, nursing assistants, surgical technicians, etc.

American Lithotripsy Society (ALS) Survey

- In response to a request from HCFA in 1993, the American Lithotripsy Society (ALS) asked The Moore Group to perform a detailed analytical survey of the experience of shock wave lithotripsy providers in the U.S. for FY 1992. The ALS, the primary manufacturers of lithotripters, and other sources sent a survey to every site. Roughly 31% returned the completed survey. The surveys were "blinded" in that they were sent to counsel for the ALS who then provided the information to the survey group. The data in this summary is limited to the direct physicians activity in provision of

SWL services for that year and encompasses 52,401 treatments.

- Study data collection: The times associated with ESWL were taken from hospital and anesthesia records. Data was not collected by opinion surveys.
- HCFA made the following assumptions regarding the lithotripsy procedure (Federal Register Vol. 58, No 189, Friday, October 1, 1993, Notices at p. 51359):
 - (1) It takes a urologist 30 minutes to perform the actual lithotripsy procedure;
 - (2) A provider could perform six treatments per day allowing a maximum of 80 minutes per treatment
 - (3) 80 minutes includes:
 - (a) preparing patient for treatment,
 - (b) treatment time,
 - (c) time preparing the procedure room between treatments and
 - (d) recovery room time
- The ALS study, a review of 52,401 medical records, found the following:
 - (1) mean treatment time is 112.9 minutes,
 - (2) shortest treatment time 50 minutes,
 - (3) longest treatment time 345 minutes. HCFA's estimate of a 30-minute treatment time is over 18 standard deviations from the mean.
 - (4) mean pre-treatment time 37 minutes
 - (5) mean post-treatment time 105 minutes

AUA August, 1995 RUC Survey

See attached survey where respondents were asked the type of lithotripter they most commonly used. 28 respondents used "old" technology (range of respondents' RVW 3.01 to 12.00) 17 respondents used "new" technology (range of respondents' RVW 12.00 to 20.00)

Conclusion

The ALS and AUA surveys and the above discussion establishes compelling evidence for an increase in RVW to 11.00.

Vignette Used in Survey: A 72-year old woman with a uric acid stone has had a percutaneous nephrostolithotomy.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

Urologist meets patient in the radiology department, the patient is positioned and a scout film is taken. Contrast is injected under fluoroscopy through the previously placed ureterostomy tube, filling defects are found in the mid ureter and films are taken.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

SURVEY DATA:

Specialty: AMERICAN UROLOGICAL ASSOCIATION

Sample Size: 79 Response Rate (%): 94% (74/79) Median RVW: .75

Office:	<u>0 minutes</u>	<u>0 visits</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	74400	Urography (pyelography), intravenous, with or without KUB, with or without tomography	.49
2)	53670	Catheterization, urethra; simple	.50
3)	76872	Echography, transrectal	.69

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

- 1) Time - key reference procedures are similar in time
- 2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 2 of 5
Technical skill and physical effort	Median response 2 of 5
Psychological stress	Median response 1 of 5

The Carrier Medical Directors' (CMD) comment that "this is a procedure of such low intensity and effort that it will rarely be done by physicians" is totally incorrect. **In fact, this procedure is almost always done by the urologist.** This is most commonly done to assess stone fragments in the ureter after percutaneous stone removal (50081). The patient has a ureterostomy tube or a nephrostomy tube in place, contrast is injected and the urologist then views the fluoroscopy unit to determine if stones are present. He must also then determine the approach to be taken to remove the stones. The assumption that this is "rarely done by physicians" is grossly inaccurate and demonstrates a lack of understanding of how stone disease is treated.

Interestingly, the survey's results of .75 are essentially the same as the current RVW of 0.76

Conclusion: The current value of 0.76 should be maintained or if HCFA wishes to reduce this to the AUA survey result of 0.75 that would be acceptable.

SUMMARY OF RECOMMENDATION

50715

CPT Code: 50715 Global Period: 000 Source: HCFA Refinement panel:
increased value
Current RVW: 17.60 CMD Recommended RVW: 14.00 AUA Survey RVW: 17.60
Medicare Frequency: 1,329 Proposed reduction: 20% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Ureterolysis, with or without repositioning of ureter for retroperitoneal fibrosis

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *It's incorrect to value this procedure higher than 50700 - revision of ureter. It is comparable to 50080 - removal of stone at 14.14. It is not as difficult as 50780 - ureteroneocystostomy which has a value of 17.31.*

Reference code(s) used by CMD:

50700 - Ureteroplasty, plastic operation on ureter (e.g. stricture) (RVW 14.10)

50780 - Ureteroneocystostomy; anastomosis of single ureter to bladder (RVW 17.12)

50080 - Nephrostolithotomy; under 2 cm (RVW 13.98)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old man with vague left flank pain is found to have obstruction of the mid 12 centimeters of the left ureter by a retroperitoneal mass. A left ureteral stent has been previously placed.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) Communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation and evaluation at which the decision to provide the procedure was made.

Description of Intra-Service Work

A midline abdominal incision is made. The left colon is reflected medially, the left ureter is identified just below the renal pelvis. The mid left ureter is encased in dense fibrotic tissue. Frozen sections are compatible with the diagnosis of idiopathic retroperitoneal fibrosis without malignancy. The ureter is gradually mobilized and then freed from the dense retroperitoneal tissue, the ureter is then positioned laterally and intraperitoneally. The incision is closed.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

SURVEY DATA:

1) Time - similar in time to reference procedure 50725

2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 4 of 5
Technical skill and physical effort	Median response 4 of 5
Psychological stress	Median response 4 of 5

The Carrier Medical Directors' (CMD) comments are based on a lack of knowledge of urologic surgery and comparison of this procedure to procedures that are unrelated. Virtually any urologist would comment that 50715 is much more difficult than 50700. 50700, "ureteroplasty, plastic operation of the ureter, eg stricture," is a **normal** ureter lying in **normal** tissue with a narrow spot that must be excised or treated in some such manner.

A "ureterolysis" involves a ureter which is encased in cancer or scar tissue from the renal pelvis typically to the iliac vessels and is a very challenging, long, difficult operation. The CMDs compared this to 50080 a "percutaneous nephrostolithotomy", an endoscopic procedure done with laparoscopic instruments through the flank, which has no relationship to an open surgical procedure.

The survey data is tight. The 25th percentile RVW is 16.50 and the 75th percentile RVW is 19.00.

In addition this CPT code went through HCFA refinement and was assigned a value of 17.60. It seems unreasonable that HCFA would allow this code to be questioned again since its value has already been validated through its own refinement process.

Conclusion: The current RVW of 17.60 is appropriate. The AUA survey is astoundingly close at 17.50. In additional support of this conclusion, one merely needs to compare key reference services chosen by the urologists and compare them to those chosen by the CMDs.

Code not identified as overvalued

CPT Descriptor: Aspiration of bladder; with insertion of suprapubic catheter

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *This procedure is not as difficult in technical skills and training as is 31622- bronchoscopy at 2.83 RVWs. It is much closer to 47000 - biopsy of liver; percutaneous, which has a work value of 1.92.*

Reference code(s) used by CMD:

31622 - Bronchoscopy; diagnostic, (flexible or rigid), with or without cell washing or brushing (RVW 2.80)

47000 - Biopsy of the liver; percutaneous (RVW 1.90)

51000 - Aspiration of bladder by needle (RVW 0.78)

51005 - Aspiration of bladder by trocar or intracatheter (RVW 1.02)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74-year old man is admitted to the ICU with congestive heart failure and given diuretics. His bladder is distended, the urologist is unable to get a catheter or filiform through the urethra into the bladder. There is a lower abdominal scar from previous colon resection.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

A stab wound on the lower abdomen is made 1 cm above the pubis with the tip of a scalpel, a trocar suprapubic tube is inserted into the bladder, the balloon is inflated and the tube is sutured into place, 1200 of clear urine is immediately obtained.

Description of Post-Service Work

Some of the following **may** be included: (1) all post-procedure care on the day of the procedure, **and if applicable** – patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other follow-up care before the patient is discharged; (2) all post-procedure hospital visits and office visits for this procedure for **10 days** after the day of the procedure are considered part of the post-operative work for this procedure (including evaluation of laboratory reports and medication adjustment)

Three (level 2) follow-up ICU visits are made make sure that the catheter is functioning properly and has not

Psychological stress Median response 3 of 5

The Carrier Medical Directors' (CMD) comment, that "This procedure is not as difficult in technical skills and training as is 31622 - bronchoscopy at 2.83 RVWs. It is much closer to 47000 - biopsy of liver, percutaneous which has a work value of 1.92."

The lack of understanding of the setting used or the problem involved will become apparent by reading the vignette and description of intra-service work.

Bronchoscopy and biopsy of the liver are scheduled procedures – done at the convenience of the physician. This is an emergency procedure performed when the referring physician or nursing staff is unable to pass a urethral catheter – most commonly in an elderly male – and a suprapubic catheter must be put in as a life-saving procedure. Therefore, these procedures are done often at night, on the weekends or by interrupting one's office hours to go to the hospital to perform the procedure. There is significant risk involved because many of these patients have had lower abdominal surgery or have an ileus.

The survey data suggests an RVW of 3.24, AUA has felt for years that this procedure is undervalued because of its technical skill and emergent nature, however, we have used restraint in bringing this to the RUC for an increase in RVW.

Conclusion: The current RVW of 2.54 is inappropriately low and this **should be increased** to the survey result of 3.24. There is absolutely no rationale whatsoever to justify the CMD reduction to 1.75. Review of the vignette and description of intra-service work which describe the typical patient confirm this.

CPT Descriptor: Pelvic exenteration, complete, for vesical, prostatic or urethral malignancy, with removal of bladder and ureteral transplantations, with or without hysterectomy and/or abdominoperineal resection of rectum and colon and colostomy, or any combination thereof

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *The large difference between this code and 58240 - pelvic exenteration, female is due to a difference of over two hours in estimated intra-service time in the Harvard Study. There is probably very little real difference in work, so the most practical step would be to average the codes and assign the same RVW to both.*

Reference code(s) used by the CMD:

58240 - Pelvic exenteration, female (RVW 28.79)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old man has biopsy-proven sarcoma of the bladder invading through to the rectum. The Tumor Board has recommended a pelvic exenteration.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation and evaluation at which the decision to provide the procedure was made.

Central arterial and venous lines are placed. The patient is under continuous epidural and general endotracheal anesthesia. The patient is positioned supine, and slightly flexed, with the foot of the table down and the legs apart in Allen leg holders. The patient is shaved and prepped from the nipples to the mid thighs including the genitalia, perineum and anal areas.

Description of Intra-Service Work

A midline abdominal incision is made and the Bookwalter retractor system is used. An exploratory laparotomy is done to rule out metastatic cancer, the liver and other intra-abdominal organs are normal, there is no palpable or visible adenopathy along the great vessels. The small bowel is mobilized onto the abdomen and placed in a Lehey Bag. The large tumor mass involving the bladder and rectum is easily palpated.

The left colon is mobilized and divided leaving a distal stump of sigmoid colon to be included with the surgical specimen. A bilateral pelvic lymphadenectomy is done, including external iliac, hypogastric and obturator nodes. All remaining fatty tissue is dissected down toward the bladder along with the stump of colon. The vessels and nerves in the pelvis are skeletonized, great care is taken to protect the ileoinguinal and genitofemoral nerves. The ureters are identified, clipped near the bladder, divided and tagged; frozen section

The prostate is mobilized, the puboprostatic ligaments are divided, the dorsal venous complex is tied and divided, the urethra is divided, the lateral vascular pedicles of the bladder are mobilized, tied and divided.

Attention is directed to the perineum. The anus is mobilized from below with electrosurgical unit. The posterior aspect of the rectum is mobilized taking a wide margin. The specimen is mobilized and removed as one unit consisting of bladder, prostate, anus, rectum and a portion of sigmoid colon.

Significant bleeding in the pelvis is noted. Time is taken to achieve good hemostasis in the huge pelvic defect with multiple surgical clips, suture ligatures and the electrosurgical unit. The perineal defect is closed as best as possible from below by bringing levator muscles together. The skin is reapproximated.

A colostomy is created in standard fashion.

NOTE: *The urinary diversion (ureterocolon conduit, ureteroileal conduit, or continent diversion) portion of the operation is billed separately and is not included as part of the work for this procedure.*

After the urinary diversion is completed, abdominal, retroperitoneal and perineal drains are placed. The abdomen is closed.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

After the patient is stable in the recovery room, he is transferred to the ICU still intubated and on the ventilator. The patient spends three days in the ICU and 12 days in the hospital.

SURVEY DATA:

2)	55845	Prostatectomy, retropubic radical, with or without nerve sparing, with bilateral pelvic lymphadenectomy, including external iliac, hypogastric, and obturator nodes	26.73

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

1) Time - key reference procedures are similar in time

2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 5 of 5
Technical skill and physical effort	Median response 5 of 5
Psychological stress	Median response 5 of 5

RATIONALE

The Carrier Medical Directors' (CMD) compare this procedure to the female pelvic exenteration but it is a cavalier statement to say "the most practical step would be to average the codes and assign the same RVW to both codes."

This huge operation in either a male or female, is one of the most technically demanding and stressful operations in the surgical armamentarium.

The vignette and description of intra-service work are self explanatory.

The AUA survey revealed an RVW of 35.00, astoundingly similar to the current RVW of 35.27. In addition, these patients spend an average of 4.5 days in the ICU and have extreme fluid and electrolyte management problems.

Conclusion: The current RVW of 35.27 is confirmed by the AUA's survey. The CMD rationale of "averaging two different codes should be rejected by the RUC and HCFA and both codes should have an RVW of 35.27.

SUMMARY OF RECOMMENDATION

51600

CPT Code: 51600 Global Period: 000 Source: HCFA Assigned (1992 only)

Current RVW: .88 CMD Recommended RVW: .50 AUA Survey RVW: .90

Medicare Frequency: 34,372 Proposed reduction: 43% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Injection procedure for cystography or voiding urethrocytography

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *This procedure is more comparable to 46600 - Anoscopy, which has an RVW of .50. This procedure is overvalued compared to other diagnostic procedures. The work involved is less than the 58100 - endometrial biopsy, whose RVW is .71 and 45300 - Proctosigmoidoscopy, whose RVW is .70.*

Reference codes used by CMD:

45300 - Proctosigmoidoscopy, rigid; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure) (RVW 0.70)

58100 - Endometrial and/or endocervical sampling (biopsy), without cervical dilation, any method (separate procedure) (RVW 0.71)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old woman with chronic urinary tract infections and stress urinary incontinence with a history of two previous operations for urinary incontinence.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

A number 16 Foley catheter is placed. The bladder is filled with contrast under fluoroscopy. The catheter is removed and the patient voids in the upright position. A video recording is made.

Description of Post-Service Work

Some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

Mental effort and judgement	Median response 2 of 5
Technical skill and physical effort	Median response 2 of 5
Psychological stress	Median response 1 of 5

RATIONALE

51600

The Carrier Medical Directors' (CMD) comment that "This procedure is more comparable to 46600 - anoscopy which has an RVW of 0.50. This procedure is overvalued compared to other diagnostic procedures."

The CMDs have compared procedures in one specialty with procedures in other specialties in which the CMDs have no expertise and little knowledge. It is noted that anoscopy and proctosigmoidoscopy are procedures that are done at the physician's convenience **in the office setting or in an exam room**. Our procedure, 51600, must be scheduled in a radiology, fluoroscopic suite. Often times the urologist does indeed perform this procedure, evaluating the elderly patient with urinary incontinence. It is important for the urologist to view the dynamic process of voiding for the correct interpretation and choice of treatment. **This procedure has been incorrectly compared to procedures that are performed in the office.**

Conclusion: The AUA survey RVW is appropriately close to the current RVW of 0.88 which should be maintained. It would be inappropriate, and grossly unfair to reduce this procedure by the flawed logic presented to 0.50.

CMD Comments

CPT Descriptor: Injection procedure for retrograde urethrocytography

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *A reduction would bring this service in alignment with this family of codes. Proportionate reduction to 51600. (See also 51600)*

Reference codes used by CMD:

45300 - Proctosigmoidoscopy, rigid; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure) (RVW 0.70)

58100 - Endometrial and/or endocervical sampling (biopsy), without cervical dilation, any method (separate procedure) (RVW 0.71)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year old man with a history of chronic urethral stricture disease refractory to office dilation is being evaluated for urethral stricture surgery.

Description of Pre-Service Work:

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work:

The patient is obliqued on the x-ray table by the urologist, the four prongs of a Brodney penile clamp are applied to the end of the penis which is then stretched and the injection tip is inserted into the urethral meatus. A bolus of contrast is injected into the urethra and an x-ray is exposed.

Description of Post-Service Work:

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

Y

RATIONALE

51610

The Carrier Medical Directors' (CMD) comment that this procedure should be brought into alignment with the "family of codes", once again demonstrates the lack of understanding of what is being performed. This procedure is almost never done by a technician or a radiologist but is usually done by a urologist in the radiology suite. The description of intra-service work describes what is actually involved when performing this procedure.

The AUA survey RVWs are 1.05 compared to the current RVW of 1.59.

Conclusion: The AUA survey indicates that this procedure could be reduced to 1.05 RVWs.

Reference codes used by CMD:

51600 - Injection procedure for cystography or voiding urethrocytography (RVW 0.88)

46600 - Anoscopy, diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure) (RVW 0.50)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old woman with a long history of a female urethral syndrome and interstitial cystitis is treated with DMSO.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

A number 16 Foley catheter is placed and the bladder is drained. 50 CCs of DMSO is placed in the bladder and the catheter is clamped for 15 minutes. The bladder is then drained and the catheter is removed.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

Psychological stress	Median response 1 of 5

RATIONALE

51700

The Carrier Medical Directors' (CMD) comment that this procedure should be compared to 51600 (cystogram) is inappropriate. 51600 is a radiologic procedure performed for diagnosis of urinary incontinence. 51700 is a therapeutic procedure performed in the office. The vignette and description of intra-service work presented is self explanatory.

The AUA survey result of 1.00 is similar to the current RVW of 0.88. The woman with interstitial cystitis, presented in this vignette, is typical. These patients are usually not charged for an office visit unless there is a separately identifiable E&M service performed. These are very unhappy, miserable patients and it is noted in the description of post-service work that all communication with the patient and family is included in this RVW.

Conclusion: The present RVW of 0.88 is appropriate and should be maintained. There is no justification for a 43% reduction in this therapeutic code. The CMDs have inappropriately compared this to a **diagnostic** radiologic procedure and a **diagnostic** anoscopy.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

51720

CPT Code: 51720 Global Period: 000 Source: Harvard
Current RVW: 1.96 CMD Recommended RVW: 1.01 AUA Recommended RVW: 1.96
Medicare Frequency: 148,446 Proposed reduction: 48% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Bladder instillation of anticarcinogenic agent (including retention time)

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *This procedure involves the same amount of time but less skill and intensity than thoracentesis. Increment over 51700 should be no more than that of 62289 - injection into spinal canal, or over 62270 - spinal tap (0.51 RVWs)*

Reference code(s) used by CMD:

51700 - Bladder irrigation, simple, lavage and/or instillation (RVW 0.88)

62270 - Spinal puncture, lumbar, diagnostic (RVW 1.13)

62289 - Injection of substance other than anesthetic, contrast, or neurolytic solutions; lumbar or caudal epidural (separate procedure) (RVW 1.64)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year old man is four weeks post-op TUR of a noninvasive transitional carcinoma of the bladder. He is a candidate for BCG therapy.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

Following OSHA guidelines for the reconstitution and administration of BCG, gown, gloves, protective eyewear and a face mask must be worn. The bladder is catheterized and drained of urine, 50 CCs of BCG is placed in the bladder and the catheter is removed. The catheter, gown, gloves, mask and all equipment used are disposed of in accordance with OSHA regulations. The patient is asked to position himself periodically on his right, left, abdomen and back to make sure that all areas of the bladder are treated during the course of two hours. The patient then voids all of the material from his bladder into the toilet.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
-----------------	-----------------------	------------

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The Carrier Medical Directors (CMD) state that this procedure requires less skill and intensity than thoracentesis. This statement is unsupported by any documentation or attempt at scientific survey evaluation.

The CMDs then state that the incremental difference between 51720 should be the same as the incremental difference between 62270 and 62289. Having, in the CMDs' analysis, incorrectly reduced 51700 (substantiated by the preceding argument with that particular code) they then added 0.51 RVWs, the difference between the spinal codes and added to 0.50 to come up with 1.01.

It is difficult to refute this illogical argument. The AUA did not survey this code because as explained in the executive summary, an discussion of what is involved in this service is sufficient.

Bladder cancer is very common in the Medicare population. It is most commonly associated with a long history of cigarette abuse.

Urologists have become entangled in OSHA regulations for dealing with BCG, the anti- cancer agent that is used when treating non invasive transitional cell bladder cancer (which constitutes 80% of those individuals with bladder cancer).

BCG is not a benign drug. It may reactivate long dormant TB, result in significant hematuria and bladder pain can be a management problem in these patients. It is further noted that this is not an "XXX" code, but rather a **000 code** global period which means all services provided prior, during and following the procedure, on the day of the procedure are included in this current RVW of 1.96.

Furthermore, the urologist grapples with OSHA guidelines when dealing with BCG. For years urologists were able to safely deal with BCG without the current restrictive OSHA guidelines, however now, the catheter, gown, gloves, masks and all equipment used must be done in accordance with OSHA regulations which increases the time and hassle factor. Many of these patients have significant irritative bladder symptoms. They are often on the telephone when not in the office and the physician must deal with these symptoms. Likewise, the day of the treatment the patient often experiences bladder pain and hematuria which must be dealt with by the urologist -- all of these services being included in the current RVW of 1.96.

"Chemotherapy administration" CPT codes (CPT 1995 pg. 336) - The family of CPT codes for "chemotherapy administration includes four codes:

	RVW	PC	PLI	Total
CPT 96440 - Chemo admin into pleural cavity, including thoracentesis	2.37	.81	.06	3.24
CPT 96445- Chemo admin into peritoneal cavity, including peritoneocentesis	2.20	.98	.09	3.27
CPT 51720 - Bladder instillation of anticarcinogenic agent (including dention time)	1.96	.45	.05	2.46
CPT 96450- Chemo admin into CNS (intrathecal, including lumbar puncture	1.89	.87	.06	2.82

Clearly code 51720 "fits" where CPT has placed it. Also, clearly, the "Practice Cost" component is much too low. 51720 has a practice cost component which is 50% of the other codes which are usually done in the

hospital and involve therefore NO cost of equipment or supplies.

Conclusion: Treatment of elderly patients with bladder cancer is not simple. The CMD- recommended RVW of 1.10 is arrived at through a flawed rationale based upon incorrect suppositions, nonexistent data and a comparison between procedures which are totally unrelated – a **diagnostic** spinal procedure compared to a **therapeutic** procedure involving anti-cancer drugs. The AUA recommendation is that this procedure stay at the current RVW of 1.96. This, at first glance, may seem high but, once made aware of what is involved in supplying this therapy to the Medicare population (85% of all bladder cancer patients) hopefully, it is understood that this is indeed a "bargain" at 1.96 units.

96414 infusion technique, initiation of prolonged infusion (more than 8 hours), requiring the use of a portable or implantable pump

(For pump or reservoir refilling, see 96520, 96530)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

51725

CPT Code: 51725 Global Period: 000 Source: HCEA Assigned (1992 only)

Current RVW: 1.51 CMD Recommended RVW: 1.10 AUA Survey RVW: 1.80

Medicare Frequency: 26,700 Proposed reduction: 27% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Simple cystometrogram (CMG) (e.g., spinal manometer)

Source and Summary of Comment to HCEA on this service: Carrier Medical Director comment. *This procedure is overvalued compared to other diagnostic procedures. The work is no more than 85095 - bone marrow aspiration or 31575 - laryngoscopy.*

Reference codes used by CMD:

85095 - Bone marrow; aspiration only (RVW 1.08)

31575 - laryngoscopy, flexible fiberoptic; diagnostic (RVW 1.10)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 66-year old woman complains of urinary frequency, and urgency with residual urine of 120 ml.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Calibrate electronic equipment. Insert urodynamic catheter and measure post-void residual urine. Attach fluid bag to spinal manometer and three-way stop clock. Purge all air bubbles from tubing. Connect catheter to infusion pump.

Description of Intra-Service Work

This is an interactive examination between patient and examiner. The procedural steps vary considerably depending upon the cystometric findings. Infuse fluid into bladder and record bladder sensations and bladder volume at predefined physiologic landmarks. Each rise in vesical pressure must be accounted for by careful observations. If involuntary detrusor contractions are not demonstrated, assist patient to sitting and/or standing position and repeat infusion. Check patient for stress incontinence.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable; (3) interpret results.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

1) Time - key reference procedures are similar in time to 52000

2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 3 of 5
Technical skill and physical effort	Median response 2 of 5
Psychological stress	Median response 1 of 5

The Carrier Medical Directors' (CMD) comment that "This procedure is overvalued compared to other diagnostic procedures. The work is no more than 85095-bone marrow aspiration or 31575 - laryngoscopy." Once again, these are cross-specialty comparisons that bare absolutely no relevance to the procedure in question. The error at this point throws all of the other urodynamic codes into disarray. By way of commenting, a bone marrow aspiration takes only a few minutes, a flexible laryngoscopy in the doctor's office takes less than one minute; however, our argument is not based on these facts.

In understanding that there is nothing "simple" about a "simple cystometrogram", in fact, some would argue that this is more complex than the so called "complex cystometrogram". Many urodynamic purists feel that this is a more accurate procedure which uses a spinal manometer and water. The pre and intra-service work descriptions illustrate an interactive relationship between the physician and the patient.

Global period is '000'. This means that all services provided the day of the service, including the procedure and all post procedure care including communication with the patient and family are included in the RVW. **The CMDs have compared this to 85095 bone marrow, aspiration only; which is an "XXX" global period.** There is a great difference between the global concept of XXX vs 000. The XXX means an office visit or any other code can be billed on the same day and that the RVWs are for the procedure only and none of the pre and post work.

The AUA survey indicated an RVW of 1.80, the current RVW is 1.51.

Conclusion: The CMD recommendation is flawed because of a misunderstanding of what the procedure involves and an overlooking of the different types of global periods. The code should be maintained at its current value of 1.51 or possibly increased to 1.80.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

51726

CPT Code: 51726 Global Period: 000 Source: Harvard
Current RVW: 1.71 CMD Recommended RVW: 1.25 AUA Survey RVW: 1.71
Medicare Frequency: 108.521 Proposed reduction: 27% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Complex cystometrogram (e.g., calibrated electronic equipment)

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *This brings this into correct alignment with this family of codes. Proportionate reduction to 51725 (see 51725)*

Reference codes used by CMD:

85095 - Bone marrow, aspiration only (RVW 1.08)

31575 - laryngoscopy, flexible fiberoptic; diagnostic (RVW 1.10)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 66-year old woman complains of urinary frequency, and urgency with residual urine of 120 ml.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Calibrate electronic equipment. Insert urodynamic catheter and measure post-void residual urine. Connect catheter to infusion pump and pressure transducer and zero transducer to atmospheric pressure. Purge air from tubing.

Description of Intra-Service Work

This is an interactive examination between patient and examiner. The procedural steps vary considerably depending upon the cystometric findings. Infuse fluid into bladder and record bladder sensations and bladder volume at predefined physiologic landmarks. Each rise in vesical pressure must be accounted for by careful observations. If involuntary detrusor contractions are not demonstrated, assist patient to sitting and/or standing position and repeat infusion. Check patient for stress incontinence.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable. (3) interpret results.

SURVEY DATA:

51726

Specialty: AMERICAN UROLOGICAL ASSOCIATION

Sample Size: 79 Response Rate (%): 92% (73/79) Median RVW: 2.00

25th Percentile RVW: 1.50 75th Percentile RVW: 3.00 Low: .20 High: 5.00

Median Pre-Service Time: 25 minutes Median Intra-Service Time: 30 minutes

25th Percentile Intra-Svc Time: 20 minutes 75th Percentile Intra-Svc Time: 45 minutes

Low: 10 minutes High: 75 minutes

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>15 minutes</u>	
ICU:	<u>0 minutes</u>	<u>0 visits</u>
Other Hospital:	<u>0 minutes</u>	<u>0 visits</u>
Office:	<u>0 minutes</u>	<u>0 visits</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	53670	Catheterization, urethra; simple	.50
2)	52000	Cystourethroscopy (separate procedure)	2.01

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

- 1) Time - similar in time to reference procedure 52000.
- 2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 3 of 5
Technical skill and physical effort	Median response 2 of 5
Psychological stress	Median response 1 of 5

RATIONALE

The Carrier Medical Directors (CMD) comments are in error because of a lack of understanding of the steps involved in the pre, intra and post work of a complex cystometrogram. (see vignette and description of work)

Based on the flawed reasoning for 51725, the CMDs suggested reducing the code by 27%.

Conclusion: The AUA survey recommends an RVW of 2.00. The AUA recommends to retain the current RVW of 1.71.

Medicare Frequency: 229,207 Proposed reduction: 27% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Complex uroflowmetry (e.g., calibrated electronic equipment)

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *This brings this into correct alignment with this family of codes. Proportionate reduction to 51725 (see 51725)*

Reference codes used by CMD:

85095 - Bone marrow, aspiration only (RVW 1.08)
31575 - laryngoscopy, flexible fiberoptic; diagnostic (RVW 1.10)

CLINICAL DESCRIPTION OF SERVICE:

Vignette: 73-year old man with symptoms of prostatism.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Instruct patient on how to use flowmeter. Calibrate and check flowmeter.

Description of Intra-Service Work

Patient voids into flowmeter

Description of Post-Service Work

Some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable; (3) interpret results.

Question patient about the flow to determine if he voided in his usual fashion.

RATIONALE

51741

Carrier Medical Directors' (CMD) comments are incorrect. This has been reduced 27% on the basis of the flawed thinking for the simple cystometrogram. It should be noted that this is a 000 global period, not an ~~XXX~~ global period.

Conclusion: The AUA recommends retaining the current RVW of 1.57.

Current RVW: 1.61 CMD Recommended RVW: 1.17 AUA Survey RVW: 1.61
Medicare Frequency: 19,529 Proposed reduction: 27% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Urethral pressure profile studies (UPP) (urethral closure pressure profile), any technique

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *This brings this into correct alignment with this family of codes. Proportionate reduction to 51725 (see 51725)*

Reference code(s) used by CMD:

85095 - Bone marrow, aspiration only (RVW 1.08)

31575 - laryngoscopy, flexible fiberoptic; diagnostic (RVW 1.10)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 66-year old woman complains of urinary stress incontinence 6 months after undergoing an anti-incontinence operation.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Calibrate electronic equipment. Insert urodynamic catheter and measure post-void residual urine. Connect catheter to infusion pump, pressure transducer and catheter puller. Zero transducer to atmospheric pressure. Purge air from tubing.

Description of Intra-Service Work

This is an interactive examination between patient and examiner. The procedural steps vary considerably depending upon the cystometric findings. Infuse fluid and begin to withdraw catheter through the urethra and record bladder sensations and bladder volume at predefined physiologic landmarks. Each rise in urethral pressure must be accounted for by careful observations and annotated. If involuntary detrusor contractions occur, evidenced by voiding around the catheter, the bladder should be emptied. In some instances, the examination needs to be repeated in the sitting and/or standing position. When intra-urethral pressure is at its maximum, then have patient do sustained Valsalva maneuver and several coughs and record changes to urethral pressures.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable; (3) interpret results.

Mental effort and judgement	Median response 2 of 5
Technical skill and physical effort	Median response 2 of 5
Psychological stress	Median response 1 of 5

RATIONALE

51772

The Carrier Medical Directors' (CMD) comment compared this procedure to a simple cystometrogram, urethral pressure profile. There is no similarity between the two procedures. The flawed rationale of reducing this procedure 27% is inappropriate.

This is a 000 global period which includes all of the services on the day of the procedure, the procedure itself and all of the post service work. An "XXX" globe for bone marrow aspiration is for the procedure only. The AUA's survey suggests a RVW of 1.75.

Conclusion: The AUA's recommendation is to maintain the current RVW of 1.61.

Reference Procedures used by CMD:

	<u>Global Period</u>
92265 EMG of extrocular muscles (0.81 RVW)	XXX

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

35- year old man with spinal cord injury presents with a voiding dysfunction. One or two needles ae placed in the pelvic floor muscles (external sphincter) to determine whether the muscles arecoordinated during filling and voiding. The urologist reads the graphic recordings measuring EMG activity during a series of filling and voiding trials. He/she interprets the level of activity and determines whether the muscle activity is increasing and decreasing at appropriate times.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	51784	Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique	1.53
2)	51726	Complex cystometrogram	1.73

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

- 1) Time - key reference procedures are similar in time
- 2) Intensity - key reference procedures are similar in intensity

RATIONALE

This service has already been through the RUC process in 1994. The result was a unanimous vote for the current work value

Also, the CMDs used an XXX procedure as a reference code rather than a 000.

Conclusion:

Retain the current RVW of 1.53

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

51792

CPT Code: 51792 Global Period: 000 Source: Harvard
Current RVW: 1.10 CMD Recommended RVW: .59 AUA Survey RVW: 1.10
Medicare Frequency: 929 Proposed reduction: 46% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Stimulus-evoked response (e.g., measurement of bulboca- vernosus reflex latency time)

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment.
Interpretation only. Comparable to 95935 - "H" or "F" reflex study, by electrodiagnostic testing. The procedure is less extensive than 95925 - Somatosensory testing (e.g. cerebral-evoked potentials), one or more nerves (because 95925 typically involves testing more nerves).

Reference codes used by CMD:

95935 - "H" or "F" reflex study, by electrodiagnostic testing (RVW 0.59)

95925 - Somatosensory testing (e.g. cerebral-evoked potentials), one or more nerves (RVW 0.81)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 65-year old male complaining of impotence with known diabetes mellitus and mild Parkinsonism.

Description of Pre-Service Work:

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. **Attach multiple electrodes to the penis and anus.** Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work:

Stimulate penis and record all results of bulbocavernosis reflex latency time. Repeat this procedure a minimum of ten (10) times.

Description of Post-Service Work:

Some of the following **may** apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

Print out report and explain results to the patient.

SURVEY DATA:

Mental effort and judgement Median response 2 of 5
Technical skill and and physical effort Median response 2 of 5
Psychological stress Median response 1 of 5

RATIONALE

51792

The Carrier Medical Directors (CMD) compare this to electro-diagnostic testing. This is inappropriate. We find it hard to believe that the CMDs had a true familiarity with this procedure. The AUA is in complete disagreement that our procedure is less extensive than 95925. Also, this code is of very low frequency being billed only 929 in one year. This would mean that only one out of every nine urologists does this procedure once a year.

The global period for 51792 is 000, which means that all services provided the day of the procedure, the procedure itself and all after service work (explaining procedure and results to the patient and family) are included in the RVW. In contrast, the reference procedures 95925 and 95935 are both XXX global period procedures. The work values for these procedures do not include any of the pre service work or post service work performed that day and the physician can bill additionally for any other services involved.

The AUA survey of 1.20 is extremely close to the current RVW of 1.10.

Conclusion: The AUA recommends maintaining the current RVW of 51792 at 1.10.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

51795

CPT Code: 51795 Global Period: 000 Source: Harvard
Current RVW: 1.53 Recommended RVW: 1.11 AUA Survey RVW: 1.53
Medicare Frequency: 24,154 Proposed reduction: 27% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Voiding pressure studies (VP); bladder voiding pressure, any technique

Source and Summary of Comment to HCFA on this service: *This brings this into correct alignment with this family of codes. Proportionate reduction to 51725 (see also 51725)*

Reference code(s) used by CMD:

85095 - Bone marrow; aspiration only (RVW 1.08)

31575 - laryngoscopy, flexible fiberoptic; diagnostic (RVW 1.10)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 69-year old man complains of urinary frequency, urgency, weak stream and a post void residual urine of 210 ml.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Calibrate electronic equipment. Insert urodynamic catheter and measure post-void residual urine. Connect catheter to infusion pump and pressure transducer and zero transducer to atmospheric pressure. Purge air from tubing.

Description of Intra-Service Work

This is an interactive examination between patient and examiner. The procedural steps vary considerably depending upon the cystometric findings. Infuse fluid into bladder and record bladder sensations and bladder volume at predefined physiologic landmarks. Ask the patient to try to void when he feels full. Each rise in vesical pressure must be accounted for by careful observations to distinguish detrusor contractions from rises in abdominal pressure.

If detrusor contractions are not demonstrated, assist patient with provocative maneuvers such as turning on running water or helping him relax. If still unable to void, terminate the examination.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable; (3) interpret results

Mental effort and judgement	Median response 2.5 of 5
Technical skill and physical effort	Median response 2 of 5
Psychological stress	Median response 1 of 5

RATIONALE

The Carrier Medical Directors (CMD) compared 51795 to the cystometrogram and reduced our code 27% to bring this into correct alignment once again using bone marrow aspiration as a reference procedure. 51795 is a 000 global period procedure and bone marrow aspiration is an XXX global period procedure. Understanding the global period difference will explain that all pre, intra and post service work is included in the RVW, whereas the bone marrow aspiration has a globe of XXX and none of that work is included. The physician may bill extra.

The AUA survey results revealed a value of 2.00 RVWs.

Conclusion: The AUA recommends maintaining the current RVW of 1.53.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

51797

CPT Code: 51797 Global Period: 000 Source: Harvard
Current RVW: 1.60 CMD Recommended RVW: 1.17 AUA Survey RVW: 1.60
Medicare Frequency: 17.966 Proposed reduction: 27% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Voiding pressure studies (VP); intra-abdominal voiding pressure (AP) (rectal, gastric, intraperitoneal)

Source and Summary of Comment to HCFA on this service: *This brings this into correct alignment with this family of codes. Proportionate reduction to 51725 (see above)*

Reference codes used by CMD:

94010 - Spirometry, including graphic record, total and timed vital capacity, expiratory flow rate measurement(s), and/or maximal voluntary ventilation. (RVW 0.17)

94160 - Vital capacity screening tests; total capacity, with timed forced expiratory volume (state duration), and peak flow rate. (RVW 0.18)

94370 - Determination of airway closing volume, single breath tests (RVW 0.26)

94375 - Respiratory flow volume loop (RVW 0.31)

51797 - Voiding pressure studies (VP); intra-abdominal voiding pressure (AP) (rectal, gastric, intraperitoneal) (RVW 1.60)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 69-year old man complains of urinary frequency, urgency, weak stream and a post void residual urine of 210 ml.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Calibrate electronic equipment. Insert urodynamic catheter into bladder and measure post-void residual urine. Insert urodynamic catheter into rectum. Connect urinary urodynamic catheter to infusion pump. Connect both catheters to respective pressure transducers and zero transducers to atmospheric pressure. Purge air from tubing.

Description of Intra-Service Work

This is an interactive examination between patient and examiner. The procedural steps vary considerably depending upon the cystometric findings. Infuse fluid into bladder and record bladder sensations and bladder volume at predefined physiologic landmarks. Ask the patient to try to void when he feels full. Each rise in vesical pressure must be accounted for by careful observations to distinguish detrusor contractions from rises

in abdominal pressure. If detrusor contractions are not demonstrated, assist patient with provocative maneuvers such as turning on running water or helping him relax. If still unable to void, terminate the examination. During study, record intravesical pressure and abdominal pressure (rectal); subtract abdominal pressure recorded from the total intravesical pressure and record the true detrusor pressure during voiding.

Description of Post-Service Work:

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable; (3) interpret results.

Mental effort and judgement	Median response 3 of 5
Technical skill and physical effort	Median response 2 of 5
Psychological stress	Median response 1 of 5

RATIONALE

51797

The Carrier Medical Directors' (CMD) comment that "the proposed reduction of 27% brings this into correct alignment with this family of codes." This procedure is totally unrelated to a cystometrogram. A review of the intra service work will make this extremely clear. A urodynamic catheter is placed into the rectum, and simultaneous readings are made of the abdominal and voiding pressures, which is completely different than a cystometrogram.

The global period for 51797 is 000. The CMDs have overlooked global periods again. All of the CMD reference procedures, including 94010, 94160, 94370, and 94375 have XXX global periods.

Conclusion: The AUA survey results were 2.00 RVWs. The AUA recommends maintaining the current RVWs at 1.60.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

52007

CPT Code: 52007 Global Period: 000 Source: HCEA Assigned (1992 only)

Current RVW: 3.02 CMD Recommended RVW: 2.37 AUA Survey RVW: 4.50

Medicare Frequency: 1,276 Proposed reduction: 22% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service; with brush biopsy of ureter and/or renal pelvis

Source and Summary of Comment to HCEA on this service: *Brush biopsy involves negligible work beyond ureteral catheterization; bronchoscopy and GI endoscopy values do not increase in value if brushings are done.*

Reference codes used by CMD:

52005 - Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service (RVW 2.37)

31622 - Bronchoscopy; diagnostic, (flexible or rigid), with or without cell washing or brushing (RVW 2.80)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year old man with a 100 + pack per year history of cigarette smoking has a filling defect in the upper left ureter.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

The patient is under general anesthesia. Cystoscopy is performed and the left ureteral orifice is identified and under fluoroscopy, a brush biopsy catheter is positioned (with contrast) at the site of the lesion. After several attempts, small fragments of tissue are obtained and placed in formalin.

Description of Post-Service Work

some of the following **may** apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

SURVEY DATA:

1)	52000	Cystourethroscopy (separate procedure)	2.01
2)	52337	Cystourethroscopy, with ureteroscopy and/or pyeloscopy (includes dilation of the ureter and/or pyeloureteral junction by any method); with lithotripsy	7.97
3)	52235	Cystourethroscopy with fulguration (including cryosurgery or laser surgery) and/or resection of MEDIUM bladder tumor(s) (2 to 5 cm)	5.45

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

- 1) Time - key reference procedures are similar in time
- 2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 3 of 5
Technical skill and physical effort	Median response 3 of 5
Psychological stress	Median response 2 of 5

RATIONALE

52007

The Carrier Medical Directors (CMD) comment states, "Brush biopsy involves negligible work beyond ureteral catheterization; bronchoscopy and GI endoscopy values do not increase in value if brushings are done."

The comparison to bronchoscopy is inappropriate. Bronchoscopy is performed mainly in the physicians' office or the procedure room of an outpatient ASC under local anesthesia.

A brush biopsy of the ureter is done in the operating room under general or spinal anesthesia with a fluoroscopic unit. The description of the patient in pre, intra and post service work for the survey outline this well. For the CMDs to state that this involves "negligible work beyond ureteral catheterization" shows a misunderstanding of the procedure. A ureteral catheter with a small biopsy brush must be positioned under fluoroscopy and repeatedly removed and reinserted and repositioned. The CMDs do not seem to be aware of this which makes their assumptions incorrect.

The AUA survey of 4.50 RVWs and the reference procedures chosen by the surveyees are appropriate.

Conclusion: The AUA recommends increasing RVWs for this procedure to 4.50.

SUMMARY OF RECOMMENDATION

52275

CPT Code: 52275 Global Period: 000 Source: HCFA Assigned (1992 only)

Current RVW: 4.70 CMD Recommended RVW: 4.01 AUA Survey RVW: 4.70

Medicare Frequency: 3,444 Proposed reduction: 15% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Cystourethroscopy, with internal urethrotomy; male

Source and Summary of Comment to HCFA on this service: *The present RVW is nearly double the base cystourethroscopy code. Performance in a male may be more difficult but the difference in work should be as great.*

Reference code(s) used by CMD:

52005 - Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service (RVW 2.37)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 67-year old man with long history of pan-urethral stricture disease.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

The patient is under general anesthesia. A four French filiform is passed to the bladder. A LeForte sound is passed to the bladder and the strictures are dilated up to 20 French. The Otis urethrotome is inserted into the urethra, opened to 35 French and the blade is withdrawn. The procedure is repeated at 3,6,9 and 12:00. A 22 French Foley catheter is placed to straight drainage.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

Psychological stress	Median response 2 of 5

The Carrier Medical Directors' (CMD) argue that "the present RVW is nearly double the base cystourethroscopy code. Performance in a male may be more difficult, but the difference in work should not be that great." This comment shows a lack of understanding of what is involved. This procedure has nothing to do with a cystourethroscopy. It is done with an instrument that bears no relation whatsoever to a cystoscope. This is done with an Otis Urethrotome which is greatly different than a cystoscope. This is a blind procedure – not a visual procedure.

Furthermore, comparison has been made to the female urethrotomy code. This procedure is rarely indicated or done in women. The CMD rationale is inappropriate and to compare this to a cystoscopy, which is a visual examination of the interior of the bladder is incorrect. This procedure involves cutting scar tissue in the male urethra.

The AUA survey shows an RVW of 4.50, remarkably similar to the current RVW of 4.70.

Conclusion: The AUA recommends maintaining the current RVW of 4.70.

CPT Descriptor: Cystourethroscopy, with direct vision internal urethrotomy

Source and Summary of Comment to HCFA on this service: *Reduction proportionate to reduction in 52275 (see also 52275)*

Reference code(s) used by CMD:

52005 - Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service (RVW 2.37)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year old man with multiple sclerosis and a neurogenic bladder is on intermittent self catheterization. He has developed a bulbous urethral stricture.

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

Patient is under general anesthesia. Urethroscopy is done with the 20 French visual urethrotome. A four French ureteral catheter is passed through the stricture. The blade of the urethrotome is used to cut the stricture at 3,6,9 and 12:00. Bleeding is minimal. A number 20 catheter is placed to straight drainage.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

Discharge patient home with catheter.

Psychological stress Median response 2 of 5

RATIONALE

52276

The Carrier Medical Directors' (CMD) comment that "Reduction proportionate to reduction in 52275 (see also 52275)" is inappropriate. That procedure is a nonvisual, blind procedure. 52276 is a more difficult procedure involving endoscopic equipment, visualization of the stricture and use of video equipment. This takes more skill and is more complex than 52275.

The AUA survey of 5.00 RVWs is appropriate.

Conclusion: The AUA recommends increasing current RVWs from 3.93 to 5.00.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

52277

CPT Code: 52277 Global Period: 000 Source: HCFA Assigned (1992 only)
Current RVW: 6.17 CMD Recommended RVW: 3.44 AUA Survey RVW: 7.50
Medicare Frequency: 294 Proposed reduction: 44% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Cystourethroscopy, with resection of external sphincter (sphincterotomy)

Source and Summary of Comment to HCFA on this service: Carrier Medical Director comment. *Increment of work over 52000 is the same as for sphincterotomy or ablation over ERCP*

Reference code(s) used by CMD

52005 - Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service (RVW 2.37)

43260 - Endoscopic retrograde cholangiopancreatography (ERCP); diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure) (RVW 5.96)

43262 - Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy (RVW 7.39)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 38-year old **male quadriplegic** with urinary retention and recurrent episodes of autonomic dysreflexia

Description of Pre-Service Work

Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (administration of general or spinal anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work

The patient is under spinal anesthesia. The urethra is dilated to 30 French. The 27 French resectoscope is introduced. The bladder, bladder neck and prostate are carefully inspected. The anterior prostatic capsule, urinary sphincter, and proximal 1 cm of bulbous urethra are resected down to fat. Bleeding is significant. A 22 French, 3-way 30 cc Foley is placed to bladder irrigation under traction.

Description of Post-Service Work

some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care, prescriptions before the patient is discharged, if applicable.

If patient is stable and bleeding clears, he is dismissed home later that day.

SURVEY DATA:

52277

Specialty: AMERICAN UROLOGICAL ASSOCIATION

Sample Size: 79 Response Rate (%): 100% Median RVW: 7.50

25th Percentile RVW: 5.91 75th Percentile RVW: 9.00 Low: 3.50 High: 12.00

Median Pre-Service Time: 45 minutes Median Intra-Service Time: 45 minutes

25th Percentile Intra-Svc Time: 30 minutes 75th Percentile Intra-Svc Time: 60 minutes
Low: 15 minutes High: 100 minutes

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>40 minutes</u>

Other Hospital:	<u>0 minutes</u>	<u>0 visits</u>
Office:	<u>0 minutes</u>	<u>0 visits</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	52235	Cystourethroscopy with fulguration (including cryosurgery or laser surgery) and/or resection of MEDIUM bladder tumor(s) (2 to 5 cm)	5.45
2)	52601	Transurethral electrosurgical resection of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, and internal urethrotomy are included)	11.51
3)	52000	Cystourethroscopy (separate procedure)	2.01

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

1) Time - More time is required than for performing 52235

2) Intensity - key reference procedures are similar in intensity

Mental effort and judgement	Median response 3 of 5
Technical skill and physical effort	Median response 3 of 5
Psychological stress	Median response 3 of 5

The Carrier Medical Directors comment that "the increment of work over 52000, cystoscopy, is the same as for sphincterotomy or ablation over ERCP." This rarely performed procedure (294 times performed in the Medicare population) is a technically demanding procedure, **performed in the operating room under spinal anesthesia**. The reference procedures are performed under sedation. The patients in the reference procedures are not quadriplegics and do not have all of the associated problems of the management of the quadriplegic patient.

The vignette describes the typical patient and likewise, the intra-service work description is typical. In these patients, the risk of autonomic dysreflexia is high. Also, these patients must be carefully monitored and sometimes the procedure must be abruptly terminated while the anesthesiologist regains control of hypertension.

The AUA survey of 7.50 is appropriate.

To suggest that this technically demanding, rarely performed procedure on quadraplegics be reduced to 3.44 RVWs is not based on rationale arguments.

Conclusion: The AUA recommends maintaining the current RVW of 6.17 or more appropriately, increase the RVWs for this procedure to 7.50.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

52500

CPT Code: 52500 Global Period: 090 Source: Harvard
Current RVW: 7.82 CMD Recommended RVW: 6.82 AUA Survey RVW: 7.82
Medicare Frequency: 8,594 Proposed reduction: 13% Harvard (Dunn) RUC Analysis:
Code not identified as overvalued

CPT Descriptor: Transurethral resection of bladder neck (separate procedure)

Source and Summary of Comment to HCFA on this service: *This is comparable to an 44950-appendectomy with a value of 6.13 or 63780 - insertion of an epidural pump buried with catheter with a value of 6.29. It is less than the value of 29881-knee arthroscopy with a value of 7.52.*

Reference code used by CMD:

44950 - Appendectomy (RVW 6.06)

63780 - Insertion or replacement, subarachnoid or epidural catheter, with reservoir and/or pump for drug infusion, without laminectomy (RVW 6.22)

29881- Arthroscopy, knee, surgical; with meniscectomy (medial OR lateral, including any meniscal shaving) (RVW 7.46)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old man has an AUA symptom index of 29/35. Prior medical treatment with both finasteride and alpha blockers was unsuccessful in improving urination. Peak urinary flow rate is 3 ml/sec, cystometrogram is normal. Cystoscopy reveals a small prostate with a tight, hypertrophied, bladder neck.

Description of Pre-Service Work

Includes services provided from the day before the surgery until the time of the procedure and may include: (1) obtaining and reviewing hospital admission laboratory studies and urologic x-rays before the procedure; (2) communicating with other health care professionals (e.g., family physician, anesthesiologist); (3) Communicating with the patient to explain operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia (e.g., placing central arterial and venous lines, administering general, spinal and/or epidural anesthesia), positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery and any other non "skin-to-skin" work in the operating room. Does not include: Consultation and evaluation at which the decision to provide the procedure was made.

Description of Intra-Service Work

Connecting water, electosurgical unit, video equipment, urethra is dilated to 30F, 27F resectoscope is introduced, prostatic urethra bladder neck and bladder are inspected. The bladder neck is circumferentially resected. All bleeders are coagulated and bladder neck tissue fragments are removed from the bladder using the Ellik Evacuator. A catheter is placed.

Description of Post-Service Work

Includes the following: (1) all post-operative care on the day of the procedure, including patient stabilization, post-operative orders, communicating with the family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the operating room; (2) all post-operative hospital visits and discharge day management; (3) all post-discharge office visits for this procedure for **90 days** after the day of the operation are considered part of the post-operative work for this procedure (including evaluation of periodic laboratory reports and medication adjustment)

RATIONALE

52500

The Carrier Medical Directors' (CMD) comment that, "This is comparable to an 44950-appendectomy with a value of 6.13 or 29881-knee arthroscopy with a value of 7.52." An appendectomy is an open surgical procedure and it does not involve any form of body function after the procedure is completed. Transurethral resection of the bladder neck involves a working organ such as a knee. The patient must be able to urinate after the procedure. This is done for the correction of bladder neck obstruction. The technical skill required performing an endoscopic procedure is generally accepted by most specialties to be greater than to perform the same procedure by open methods (although we will not press that point). Comparing this to an open appendectomy is incorrect because these are totally different procedures.

It should be apparant that the post-operative follow-up in the office is much greater than that for an appendectomy.

The AUA survey suggest RVWs of 9.06.

The 25th percentile of 8.00 and 75th per of 10.95 are fairly tight.

Conclusion: We recommend that the RVW for this procedure be maintained at the current value of 7.82

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Gynecology

The American College of Obstetricians and Gynecologists has had significant and long-standing concerns about the accuracy of the RBRVS for obstetric and gynecologic services. As elaborated in their public comments, ACOG feels that the work RVUs for services provided to women have been historically undervalued when compared to similar services on men or on similar anatomical structures. ACOG presented survey data and or arguments for 45 codes, 44 of which recommended increased RVUs. In addition to providing survey data, ACOG developed rationales based on a "building block" method using survey data on service characteristics and RVUs of established codes. The "building block" method also uses pre-, post-, and intra-service work intervals to assign physician values to the individual components of the global surgical services package. Appropriate E/M services for pre-service and post-service intervals were selected based on length of time, number of visits, clinical setting and judgement of level of care required. Using this method ACOG was able to arrive at work RVU estimates for surgical codes with a variety of global periods. On the basis of the survey, the building block and rational arguments ACOG successfully advocated numerous increases in work RVUs.

The survey data in almost every case supported an increase in RVU. The surveys had a minimum survey sample size of 100 and response rates in excess of 30%. The surveyed intra-service times were consistently and substantially greater than Harvard intra-service times. The RVU that was derived from a survey was in every case greater than the established RVU. When the building block method was used it produce results that confirmed survey data and argued for increased RVUs. Cross specialty comparisons were used by ACOG to validate both survey data and their building block method. Cross specialty comparisons were especially convincing when direct parallels could be drawn to similar services on men or similar procedures to manage like disease in different organs.

The RUC found the multiple independent points of validation convincing. The survey, building block and cross specialty comparisons typically supported the claim for increased RVUs. Generally the RUC was skeptical of the building block approach. It was felt that there was too much room for subjective selection of the E/M services. The RUC also recognized that the whole is not necessarily a sum of its parts. Typically the RUC would recommend the lowest RVU increase as suggested by one of the three methods.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
56307	Laparoscopy; remove adnexa	5.60	10.68	Codes were grouped together because, although they are different procedures on a different patient population, they achieve the same end, the removal of adnexal structures. For all codes typically physician work exceeds 49000, <i>Exploratory laparotomy</i> . As a result, for all these codes the RVU should be greater than 49000, which is valued at 8.99. An exploratory laparotomy is the first step in removing any structures in the abdomen.	Survey data and building block rationale support increased RVUs. Cross specialty comparison to 56340, <i>laparoscopic cholecystectomy</i> , also suggested an increased RVU. Procedures should not be valued above 56340, <i>laparoscopic cholecystectomy</i> , which is a very similar procedure. The RUC recommends that 56307, 58720, 58925 and 59120 be given the same RVU as 56340.	4
58720	Removal of ovary/tube(s)	6.20	10.68			4
58925	Removal of ovarian cyst(s)	6.40	10.68			4
59120	Treat ectopic pregnancy	7.11	10.68			4
56309	Laparoscopy; remove myoma	5.60	13.79	The work required for both of these codes is approximately equal. The stress involved in 58140 may be slightly greater because it is open and these patients generally have larger myomas. Both entail more work than 49000, <i>Exploratory laparotomy</i> , and are valued lower.	Both codes can be compared to 56308, <i>LAVH</i> , which has an RVU of 13.87. Increases are supported by survey data showing median intra-service time of 165 and 110 min. and a median RVU of 14 and 12. Survey data and comparison to 56308, <i>LAVH</i> , are compelling evidence to increase the RVUs. The RUC recommends that the codes be linked to <i>LAVH</i> .	1
58140	Removal of uterus lesion	7.61	13.79			1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
56605	Biopsy of vulva/perineum	0.86	1.10	Both codes are undervalued compared to 54100, <i>biopsy penis</i> , which is valued at 1.90. Codes 56605 and 56606 should be valued the same as 54100. Time, mental effort, technical skill and stress are nearly the same.	Compare to 54100, <i>biopsy penis</i> , which is valued at 1.90. Increases are supported by survey data for 56605 showing median intra-service time of 15 min. and a median RVU of 1.2. The RUC recommends that the codes be linked to 54100, <i>biopsy penis</i> , and 56605 and 56606 should be more in line with 54100.	1
56606	Biopsy of vulva/perineum	0.43	0.55			1
56633	Extensive vulva surgery	12.15	15.00	Code 56633 is undervalued in comparison to 19240, <i>mastectomy, modified, radical</i> , at 14.71 RVUs. Likelihood of infection and wound breakdown is greater for 56633.	Compare to 19240, <i>mastectomy, modified, radical</i> , at 14.71. Increases are supported by survey data which show a median intra-service time of 120 min. and a median RVU of 15. Building block method suggested 18.46 RVUs. Survey data and comparison to 19240 are compelling evidence to increase the RVU. The building block method is too high, but serves to validate the survey and the comparison. The RUC recommends that the RVU be increased.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
57110	Removal of vagina	13.48	13.48	Code 57110 requires more work than 58150, <i>total hysterectomy</i> . Physician times for this procedure are on average 40% greater than for 58150 and are more complex and require a greater intensity of work.	Survey data show a median intra-service time of 120 min. which is greater than Harvard data. However, the difference from the 95 RVU and the building block value of 13.93 is not significant. The RUC recommends that the current value be maintained.	2
57150	Treat vagina infection	0.94	0.55	This code seems to be overvalued compared to 99214, <i>office visit established patient</i> .	Survey data show median intra-service time of 10 min. and a median RVU of 0.55. Building block method was not used. The survey data does not measure up to current values. The RUC recommends that the RVU be reduced.	3
57265	Extensive repair of vagina	7.36	7.36	This code is undervalued in comparison to 57260, <i>Repair of vagina</i> , which is valued at 7.59 RVUs.	The specialty society has withdrawn its comment. The RUC recommends that the current RVU be maintained	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
57270	Repair of bowel pouch	7.36	11.30	Code requires more work than 49000, <i>Exploratory laparotomy</i> , yet is assigned fewer RVUs. Primary difference in work occurs in the intra-service period where 57270 requires greater mental effort, skill and stress.	In each of these cases survey data are significantly greater than current values for intra-service time and RVUs. 57270 had a median intra-service time of 90 min and a median RVU of 11.3. 57280 had a median intra-service time of 115 min and a median RVU of 14.1. The RUC recommends that the RVUs be increased.	4
57280	Suspension of vagina	8.35	14.10			4
57289	Repair bladder & vagina	6.40	10.80	Code is undervalued compared to 51845, <i>Repair bladder neck</i> , which has 9.06 RVUs. Both procedures are performed to correct urinary incontinence. 57305 entails all the procedures in 51845, but also involves a anterior colporrhaphy.	57289 had a median intra-service time of 90 min and a median RVU of 10.80. The value suggested by the building block method are greater than median survey RVU. Survey data shows compelling evidence to increase the RVU. The building block are too high, but serves to validate the survey. The RUC recommends that the RVU be increased.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
57305	Repair rectum-vagina fistula	8.69	12.75	The RVUs are undervalued for 57305 and 57307. These codes greatly exceed the technical skill, mental effort and judgement required for 49000, <i>Exploratory laparotomy</i> . Harvard RVUs per minute are below the level of 49000, even though 57305 and 57307 are more difficult. Both codes make use of 49000, but also entail several additional procedures, 57307 requires a colostomy.	Survey data show median intra-service times of 120 min. and a median RVU of 15.75 for 57305. Building block suggested 14.75 for 57305. Both procedures are compared to similar procedures done in men; 45800, <i>closure recto vesical fistula</i> , and 45805, <i>repair recto vesical fistula with colostomy</i> . Survey data, building block and comparisons provide compelling evidence to increase the RVUs. The RUC recommends that the procedures be linked to similar procedures in men. 57305 is linked to 45800 and 57307 is linked to 45805.	4
57307	Fistula repair & colostomy	10.05	15.08			4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
57400	Dilation of vagina	0.83	2.27	Both codes are undervalued compared to 99221, <i>level 1 initial hospital visit</i> . These procedures entail the risk of general anesthesia which makes them more stressful than 99221.	These codes specify the use of anesthesia. Both procedures do not usually require anesthesia, suggesting that 57400 and 57410 are performed on a special group of patients. Pre and post-service care is comparable to 99222, <i>initial hospital care</i> . Survey data show median intra-service times of 20 and 15 min. and a median RVU of 2.95 and 2.72. Building block suggests 2.27 for 57400. The RUC recommends that the RVUs suggested by the specialty society. Survey, building block and comparisons provide compelling evidence for increase.	1
57410	Pelvic examination	0.59	1.75			1
57415	Removal vaginal foreign body	0.91	2.12	This code is undervalued in comparison to 42809, <i>removal of foreign body from pharynx</i> , which is valued at 1.76. 57415 is performed under general anesthesia not local as in 42809. Also, the impacted nature of procedure makes 57415 more demanding in terms of physical effort and technical skill.	Building block suggests 2.12 RVUs. Building block RVU is accepted. It is lower than the survey RVU which it rests on for validation. The comparison to 42809, <i>removal of foreign body from pharynx</i> , provides further compelling evidence. The RUC recommends that the RVU be increased.	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
57540	Removal of residual cervix	6.01	11.54	These codes are undervalued. Evidence of the low RVUs is Harvard data which shows RVUs per minute for 49000, <i>Exploratory laparotomy</i> , that are greater than 57540 and 57545. Both codes require more technical skill, mental effort and stress than 49000 which has more RVUs. 57545 also requires the extra time and work of a pelvic floor repair.	Survey data show median intra-service time of 75 and 120 min. and a median RVU of 11.54 and 12.3. Building block suggests 11.94 RVUs for 57540. Survey data is accepted for the increased RVU. Building block helps to validate survey. The RUC recommends that the RVU be increased.	4
57545	Remove cervix, repair pelvis	6.63	12.30			4
58120	Dilation and curettage (D&C)	2.45	2.91	Newer procedures such as 58100, <i>Biopsy of uterus lining</i> , and 56350, <i>diagnostic hysteroscopy</i> , have replaced 58120. When 58120 is done the patient is usually sicker because other procedures were not possible due to complications. As a result the work for 58120 has increased.	Survey data show median intra-service time of 25 min. and a median RVU of 3.73. Building block suggests 3.56 RVUs. Survey data and building block are used as a guides. The RUC recommends same value as 59840, <i>abortion</i> .	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
58150	Total hysterectomy	13.00	14.30	Procedures are not done very frequently. The development of <i>LAVH</i> allows many woman to have a vaginal hysterectomy. Patients requiring these procedure are usually sicker because other alternatives were not possible due to complications. Both entail significantly greater work than 49000, <i>Exploratory laparotomy</i> , which is the first part of these procedures.	Survey data show median intra-service times of 120 and 130 min. and median RVUs of 14.3 and 15. Building block suggests 16.33 and 16.57 RVUs. Compare to 58260, <i>vaginal hysterectomy</i> , and 56308, <i>LAVH</i> . Building blocks are too high, but serves to validate survey. The survey data indicate that an increase is in order. However, evidence of increased difficulty for 57180 is not compelling and it is given the same value as 57150. The RUC recommends that the RVUs be increased.	4
58180	Partial hysterectomy	9.06	14.30			4
58200	Extensive hysterectomy	20.34	20.34	Procedure involves greater total work than does 58150, <i>Total hysterectomy</i> . Level of complexity and intensity is also higher for 58210.	Survey data show median intra-service time of 150 min. and a median RVU of 17.5. Building block suggests 20.95 RVUs. Recommended increase is not substantial The survey RVU came out lower than current RVU. The RUC recommends that the current value be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
58210	Extensive hysterectomy	23.97	27.50	Total work for code 58210 is equivalent to 55845, <i>extensive prostate surgery</i> , valued at 26.73. Both codes should be valued the same.	Survey data show median intra-service time of 240 min. and a median RVU of 27.50. Building block suggests 28.23 RVUs. Argue that 58210 is more difficult than 55845, <i>extensive prostate surgery</i> (26.73). Survey data along with building block and comparison offers compelling evidence to increase the RVU. The RUC recommends that the RVU be increased.	4
58240	Removal of pelvis contents	28.79	35.27	Code 58240 is undervalued in comparison to 51597, <i>removal of pelvic structures</i> , which is valued at 35.27. These procedures are virtually identical except that one is done in women and the other is done in men.	Survey data show median intra-service time of 480 min. and a median RVU of 35. Building block suggests 41.20 RVUs. Argue that 58240 is the same as the male procedure, 51597 (<i>removal of pelvic structures</i>), which is valued at 35.27. The RUC recommends that this procedure have an equal number of RVUs to the same procedure on a male. Survey data and building block add further compelling evidence.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
58301	Remove intrauterine device	0.73	1.27	This code is undervalued in comparison to 42809, <i>removal of foreign body from pharynx</i> , which is valued at 1.76. Although 58301 does not entail as much work as 42809, its RVU should be somewhere between 0.73 and 1.76.	Survey data show median intra-service time of 15 min. and a median RVU of 1.5. Society compared the code to 99215, <i>level 5 office visit</i> . The RUC believes that the procedure is more appropriately compared to a <i>level 4 office visit</i> , 99214. The RUC recommends a links to 99214. The recommendation for 58301 will be the same as the recommendation for 99214, 1.27 RVUs.	4
58323	Sperm washing	0.23	0.23	Should have an RVU closer to 99201, <i>Level 1 new patient office visit</i> , which has an RVU of 0.38.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment. The RUC previously recommended a 0.30 in 1993 and the code was through a HCFA refinement panel in 1994.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
58410	Suspension of uterus	6.78	12.00	Requires total physician effort at least equivalent to 49000, <i>Exploratory laparotomy</i> , but is assigned fewer RVUs. Harvard data indicate an intra-service time of 91 min and an intra-service intensity of 0.030 RVUs per minute. This represents more time and lower intensity than 49000, showing the code to be undervalued.	Survey data show median intra-service time of 110 min. and a median RVU of 12. Building block suggests 12.31 RVUs. Accepts survey data. Building block serves to validate survey. Similar code, 58400 (<i>suspension of uterus</i>), was not in five year review. The RUC recommends that the RVU be increased.	4
58520	Repair of ruptured uterus	6.35	11.11	Both codes involve the repair of the uterus. 58520 is the case of a ruptured uterus and is done in an emergency situation. 58540 is the repair of a deformed uterus. Both codes are undervalued when compared to 49000, <i>Exploratory laparotomy</i> , which is part of the procedure for each.	Survey data show median intra-service time of 90 and 120 min. and a median RVU of 12 and 14. Building block suggests 11.11 and 13.96 RVUs. 58520 is comparable in time, mental effort, technical skill and stress to 51860, <i>repair of bladder wound</i> . 58540 requires less work but more time than 59515, <i>cesarean delivery</i> . Building block is less RVUs than surveys or comparisons. Accept building block with survey and comparisons as validation. The RUC recommends that the specialty society suggested RVU be accepted.	1
58540	Revision of uterus	8.58	13.96			1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
58750	Repair oviduct(s)	8.82	14.26	Both codes are undervalued. They require more time, mental effort, technical skill and stress than 49000, <i>Exploratory laparotomy</i> . 49000 is the first part of both procedures and as a result the two codes should be valued higher than 49000.	Survey data show median intra-service time of 120 and 150 min. and a median RVU of 14.26 and 14.5. Building block suggests 15.14 RVUs for both codes. Compare these codes to the combination of 49000, <i>exploratory laparotomy</i> , and 55400, <i>vaso vasostomy</i> . The RUC recommends that the RVU be increased to the level of the survey data. The building block serves to validate survey. Survey data are similar for 58750 and 58752. Both codes are given the same RVU.	4
58752	Revise ovarian tube(s)	7.94	14.26			4
58760	Remove tubal obstruction	7.16	12.50	This code require more time, mental effort, technical skill and stress than 49000, <i>Exploratory laparotomy</i> , but it is valued with fewer RVUs. Harvard data indicate an intra-service time of 88 min and an intra-service intensity of 0.036 RVUs per minute. This represents more time and lower intensity than 49000, showing the code to be undervalued.	Survey data show median intra-service time of 120 min. and a median RVU of 12.50. Building block suggests 12.86 RVUs. compare to 44055, <i>freeing of bowel adhesions</i> (11.92). The RUC recommends the survey data for the new RVU. The building block and comparison serve to validate survey.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
58770	Create new tubal opening	6.96	13.34	Code 58770 require more time, mental effort, technical skill and stress than 49000, <i>Exploratory laparotomy</i> , but it is valued with fewer RVUs. Harvard data indicate an intra-service time of 78 min and an intra-service intensity of 0.039 RVUs per minute. This represents more time and lower intensity than 49000, showing the code to be undervalued.	Survey data show median intra-service time of 120 min. and a median RVU of 13.45. Building block suggests 13.34 RVUs. Building block is less than survey. The RUC recommends the building block for new RVU. The survey data validates the building block.	1
58822	Drainage of ovarian abscess	6.18	9.06	Total work for 58822 is as least as great as 49000, <i>Exploratory laparotomy</i> , but it has fewer RVUs. According to Harvard data the intra-service time for 58822 and 49000 are approximately the same, but 58822 has a lower intensity. This shows that 58822 is undervalued.	Comparison is made to cross specialty reference 49020, <i>drainage abdominal abscess</i> (9.06). Survey RVU was 12 and median intra-service time was 90 min. The RUCs recommendation is for the same RVU as 49020. Believes that comparison is legitimate, very similar procedures.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
58952	Resect ovarian malignancy	21.35	23.35	Total work for 58952 is greater than 49215, <i>Excise sacral spine tumor</i> , valued at 21.05. Intra-service work for 58952 requires more time, mental effort, and technical skill.	Survey data show median intra-service time of 240 min. and a median RVU of 23.35. Building block suggests 23.08 RVUs. Survey and building block estimates are very close. The RUC recommends the survey data for the new RVU. Use the building block as validation.	4
58960	Exploration of abdomen	10.14	13.66	The total work is similar to 49220, <i>multiple surgery abdomen</i> , at 13.66, but is valued less. Code 58960 includes 49000, <i>Exploratory laparotomy</i> , at 8.99 and 38562, <i>Removal pelvic lymph nodes</i> , at 9.65. 58960 is clearly undervalued.	Survey data show median intra-service time of 150 min. and a median RVU of 16. Building block suggests 16.55 RVUs. Compares to 49220, <i>multiple surgery abdomen</i> (13.66). The RUC suggests that 58960 is about as difficult as 49220 and therefore should not have a larger RVU. The RUC recommends the same RVU as 49220.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
59100	Remove uterus lesion	5.96	11.54	Total work for 59100 is greater than 49000, <i>Exploratory laparotomy</i> , but is valued less. Harvard data indicate an intra-service time of 69 min and an intra-service intensity of 0.041 RVUs per minute. This represents as much time and lower intensity than 49000, showing the code to be undervalued.	Survey data show median intra-service time of 60 min. and a median RVU of 14. Building block suggests 11.54 RVUs. Compares to 58520, <i>repair of ruptured uterus</i> . 59100 is seen as more work in that it also requires removal. The RUC recommends the lower value of survey and building block.	4
59121	Treat ectopic pregnancy	6.99	10.99	Total work for 59121 exceeds the work for 49000, <i>Exploratory laparotomy</i> , but is valued lower. 59121 should have at least equivalent RVUs to 49000.	This is an open procedure that is performed on patients who do not respond to other treatments. Often performed in an emergency situation. Survey RVU of 12.00 and median intra-service time of 90 min. Building block suggests 10.99 RVUs. Building block is less than survey. The RUC recommends the building block as the new RVU with survey as validation.	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
59130	Treat ectopic pregnancy	7.88	13.49	Code 59130 and 59136 are undervalued when compared to 49000. These code requires an exploratory laparotomy. Harvard data indicate an intra-service time of 62 min and 76 min an intra-service intensities of 0.066 and 0.065 RVUs per minute. This represents as much time and lower intensity than 49000, showing the code to be undervalued. The RVUs for 59130 59136 does not account for the increased difficulty associated with treating an abdominal pregnancy.	Survey data show median intra-service time of 120 and 90 min. and a median RVU of 13.49 and 12.5. Building block suggests 14.94 and 13.06 RVUs. The RUC recommends the survey data for the new RVU. Building block is close and serves as validation.	4
59136	Treat ectopic pregnancy	8.69	12.50			1
59841	Abortion	3.24	4.80	The profile of patients for 59841 has changed making this procedure undervalued compared to 59840, <i>Induced abortion by D&C</i> . A higher proportion of pregnancies terminated by this method, 59841, are now greater than 16 weeks. This has caused physician work to increase.	Survey data show median intra-service time of 35 min. and a median RVU of 4.8. Building block suggests 5.7 RVUs. The RUC recommends the survey data as the new RVU. Building block was close and serves as validation.	4

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 56307 Global Period: 010 Current RVW: 5.6 Recommended RVW: 11.55

CPT Descriptor: Laparoscopy, surgical; with removal of adnexal structures (partial or total oophorectomy and/or salpingectomy).

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 58720, the open equivalent of 56307. Both should have the same value (note 58720 believed to be undervalued).

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52 year old post menopausal woman has been evaluated for an adnexal mass palpated on routine exam. She had a vaginal hysterectomy 15 years ago for benign disease. Ultrasound documents a 5 cm simple cystic mass arising from the left adnexa. Color doppler flow analysis shows a normal resistive index and CA-125 is 5. Diagnostic laparoscopy confirms a benign appearing cystically enlarged left ovary. Additional operating ports are placed and the left tube and ovary are excised laparoscopically and placed in a bag. If possible they are removed from the abdominal cavity in the bag. Frozen section confirms a benign cystadenoma. The right tube and ovary are free of apparent abnormality and are left in place. The patient is observed in the hospital for 8-24 hours and discharged home with instructions. The patient receives routine office follow-up care during the 10 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A bimanual pelvic examination is done to assess uterine size, position, and mobility before insertion of an uterine cannula. Exposure of the cervix is obtained. The anterior lip of the cervix is grasped with a tenaculum attached to an intrauterine cannula. Pneumoperitoneum is achieved by insertion of a Veress or Touhy needle at the inferior rim of the umbilicus through a 2 mm incision. The peritoneal space is insufflated with carbon dioxide gas to a pressure of 10 mm HG. Once satisfactory displacement of organs is achieved, the 2 mm incision is extended to 1 cm and the laparoscope trocar and sleeve are inserted through the rectus fascia. The trocar is removed from the sleeve, proper placement is documented as the operating laparoscope is advanced down the trocar sleeve into the pelvis. The gas hose is then connected to the trocar.

Once the laparoscope has been inserted a second trocar may be placed for ancillary instruments. The entire abdomen and pelvis is viewed systematically and pathology noted. It may be photodocumented. Upon completion of the exploration additional trocars are placed under direct vision as needed. The infundibulopelvic ligament is isolated and the ureter is protected while the ovarian pedicle is controlled using staples, suture, electrocoagulation or clips. The adnexal structures are separated from the round ligament and any other adhesions or attachments are divided. The structures are now free and must be removed from the abdomen either via a colpotomy incision or by extending one of the abdominal incisions. If the ovary contains a cyst, it may be placed in a sterile bag, allowing the cyst to be aspirated and deflated without spilling its contents intra-abdominally. The pelvis is then carefully observed under water or low CO₂ pressure to assure hemostasis. Ancillary trocars are

then removed under direct vision and the insertion sites are observed for bleeding. The abdomen is deflated. The fascia may be closed separately, then the skin wounds are closed. The patient is transferred to a stretcher and escorted to the recovery room.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 1 day. The patient is discharged on post op day 1 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:

Specialty: ACOG

Sample Size: 100 Response Rate (%): 32 (32%) Median RVW: 10.5

25th Percentile RVW: 9.75 75th Percentile RVW: 12.35 Low: 5.75 High: 15

Median Pre-Service Time: 55 Median Intra-Service Time: 90

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	56340	Cholecystectomy	10.68
2)	56360	Peritoneoscopy without biopsy	4.04
3)	49000	Exploratory laparotomy	8.99
4)	56308	LAVH	13.87

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The physician time, mental effort, skill, and risk associated with CPT 56307 are similar to the work required to perform CPT 56340. CPT 56307 requires slightly less physician work than CPT 56308.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	99215 x 2 - 1.51
Intra-service	90 min. x 0.060/5.4
Same day	99215 1.51

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58720 Global Period: 090 Current RVW: 6.2 Recommended RVW: 11.55

CPT Descriptor: Salpingo-oophorectomy, complete or partial, unilateral or bilateral

Source and Summary of Comment to HCFA on this service: ACOG: Requires physician work at least equivalent to that associated with CPT 49000, but has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54 year old female patient has been evaluated for pelvic pain and was found to have bilateral ovarian cysts. She underwent a vaginal hysterectomy 15 years prior to this time for cervical dysplasia. The patient fails conservative methods of treatment and is taken to surgery where a bilateral salpingo-oophorectomy is performed because of bilateral dermoid cysts. The ovaries are densely adherent to the vaginal vault. Bowel adhesions to both the ovaries and the abdominal wall are present from her prior hysterectomy. The patient has an uneventful post-operative recovery and is discharged from the hospital on the third post-op day. She is seen in the office for a 6 weeks post-op evaluation and is released to her usual activities.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under general anesthesia the abdomen is entered through a lower midline or transverse incision. The bowel contents are packed away and the ovaries and tubes are exposed and isolated. Often-times there will be adhesions that must be lysed in order to expose the appropriate anatomy. The vascular supply of the tubes and ovaries is ligated and divided and the organs are removed. Hemostasis is achieved and the abdomen is closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 200 Response Rate (%): 37 (19%) Median RVW: 1325th Percentile RVW: 10.94 75th Percentile RVW: 14 Low: 9 High: 20Median Pre-Service Time: 52 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 86 75th Percentile Intra-Svc Time: 120 Low: 55 High: 180

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>---</u>	<u>---</u>
Other Hospital:	<u>45</u>	<u>3</u>
Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	56308	LAVH	13.87
3)	58260	Vaginal hysterectomy	11.39
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Pre-service work is greater for CPT 58720 than for CPT 49000: in addition to the usual pre-operative history, physical, and medical record review, the physician performing CPT 58720 must counsel the patient about the removal of the tubes and ovaries, the resulting loss of fertility, and accompanying hormonal changes. During the intra-service period, CPT 58720 includes the work of CPT 49000, in addition to the work required to remove the tubes and ovaries.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	99215	-	1.51
Intra-service	105 min. x .06	-	6.3
Day of service	99214	-	.94
Hospital	99232	-	.88
	99231	-	.51
	99238	-	1.06
Office	99213	-	.55
	99212	-	<u>.38</u>
			12.13

Note: The recommended RVUs equal the recommendation for CPT 56307, the equivalent laparoscopic procedure. The recommended RVU is the average of the survey medians for CPT 58720 and 56307. Patients undergoing 58720 may be more difficult because of the presence of conditions that preclude use of the laparoscopic procedure.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58925 Global Period: 090 Current RVW: 6.4 Recommended RVW: 11.71

CPT Descriptor: Ovarian Cystectomy

Source and Summary of Comment to HCFA on this service: ACOG: Requires equivalent, if not greater physician work than CPT 49000, but has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old G0P0 woman with a persistent 6 cm complex adnexal mass is admitted for definitive therapy. You perform an ovarian cystectomy, including exploratory laparotomy, analysis of minor adhesions, removal of the ovarian cyst(s), and reconstruction of the ovary. Frozen section is done to confirm that the cyst is benign prior to completing closure of the abdomen. After hospital discharge, the patient receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Intra-Service Work:

Exploratory laparotomy. Lysis of minor adhesions. Removal of the ovarian cyst(s). Reconstruction of the ovary. Obtaining hemostasis. Closure of the abdomen.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	56308	LAVH	13.87
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 58925 is greater in total physician work than CPT 49000. In addition to exploring the abdomen, the physician removes a cyst or cysts from one or both ovaries and closes the incision(s) on the ovary(s). Typically, the only patients who undergo an ovarian cystectomy through laparotomy, rather than laparoscopy are those who have very large cysts and/or who are obese. Therefore the technical skill required to safely perform CPT 58925 on the typical patient is greater than required for CPT 49000. In addition, stress is somewhat higher due to risk of future infertility secondary to adhesions formed as a result of the surgery.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 59120 Global Period: 090 Current RVW: 7.11 Recommended RVW: 11.78

CPT Descriptor: Surgical treatment of ectopic pregnancy, tubal or ovarian, requiring salpingectomy and/or oophorectomy, abdominal or vaginal approach

Source and Summary of Comment to HCFA on this service: ACOG: Entails greater mental effort, technical skill, and stress than CPT 49000, but has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 34 year old primigravida presents with signs and symptoms of hypovolemia, a greatly distended abdomen, and signs of hemoperitoneum. She is taken to surgery with fluid replacement and undergoes an exploratory laparotomy with evacuation of the hemoperitoneum. Findings are a ruptured left isthmic tubal pregnancy with a hematosalpinx throughout the remnant of her left fallopian tube. She has a normal contralateral adnexa. A unilateral salpingectomy is performed. After hospital discharge, the patient receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

An incision is made in the lower abdomen, and the pelvic cavity is explored. An inspection of the gestation site is performed for bleeding. All of the products of conception, clots, and free blood are removed. A unilateral salpingectomy is performed due to findings of a ruptured left isthmic tubal pregnancy with hematosalpinx. This is accomplished by cutting a small wedge of the uterine wall at the junction of the fallopian tube and body of the uterus. The pelvis is lavaged with saline solution and the abdomen closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 4 days. The patient is discharged on post op day 4 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 150 Response Rate (%): 45 (35%) Median RVW: 1125th Percentile RVW: 10.85 75th Percentile RVW: 14 Low: 9 High: 18Median Pre-Service Time: 60 Median Intra-Service Time: 9025th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 90 Low: 45 High: 120

Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	58700	Salpingectomy	5.92
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Total physician work for CPT 59120 is approximately equivalent to CPT 49000, plus CPT 58700. Applying the multiple procedure payment rule would yield 11.95 RVUs, so the survey median and building block approach seemed to yield reasonable results.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	99215	-	1.51

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 56309 Global Period: 010 Current RVW: 5.6 Recommended RVW: 13.79

CPT Descriptor: Laparoscopy, surgical; with removal of leiomyomata, subserosal (single or multiple)

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 58140, the open equivalent of 56309. Both should have the same value (note 58140 believed to be undervalued).

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42 year old multigravida woman has been evaluated for an enlarging symptomatic pelvic mass. The uterus has increased from 6 to 12 weeks' size over 8 months and is causing urinary frequency, nocturia, and dyspareunia. Ultrasound documented a leiomyomatous uterus with two separate myomas 4x5 and 3x4 cm. The patient does not want a hysterectomy. She now undergoes laparoscopy which reveals fibroids in subserosal and intramural locations. At the same operative setting, additional operating ports are placed and the myomas excised. Morcellation is accomplished to permit removal of the dense tumors from the abdomen. Intracorporeal suturing is done closing the uterus in layers, and hemostasis is achieved. The patient is observed in the hospital for 8-24 hours and is discharged home. The patient receives routine office follow-up care during the 10 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A bimanual pelvic examination is done to assess uterine size, position, and mobility before insertion of an uterine cannula. Exposure of the cervix is obtained. The anterior lip of the cervix is grasped with a tenaculum attached to an intrauterine cannula. Pneumoperitoneum is achieved by insertion of a Veress or Touhy needle at the inferior rim of the umbilicus through a 2 mm incision. The peritoneal space is insufflated with carbon dioxide gas to a pressure of 10 mm HG. Once satisfactory displacement of organs is achieved, the 2 mm incision is extended to 1 cm and the laparoscope trocar and sleeve are inserted through the rectus fascia. The trocar is removed from the sleeve, proper placement is documented as the operating laparoscope is advanced down the trocar sleeve into the pelvis. The gas hose is then connected to the trocar.

Once the laparoscope has been inserted a second trocar may be placed for ancillary instruments. The entire abdomen and pelvis is viewed systematically and pathology noted. It may be photodocumented. Upon completion of the exploration, uterine incisions are planned and ancillary trocars and instruments are placed as needed. Dilute Pitressin (vasopressin) solution may be injected into the uterine serosa to improve hemostasis. Incisions are made into the uterus overlying the leiomyomata and the tumors are dissected from the myometrium. The uterus is then closed in layers using intracorporeal suturing to achieve hemostasis and adequate reapproximation of the tissues. The fibroids are then morcellated either intra-abdominally or at the abdominal wall to permit extraction from the abdominal cavity. The uterus is observed and hemostasis assured.

Ancillary trocars are then removed under direct vision and the sites are observed for bleeding. The abdomen is deflated. The fascia may be closed separately, then the skin wounds are closed. The patient is transferred to a stretcher and escorted to the recovery room.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 1 day. The patient is discharged on post op day 1 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:

Specialty: ACOG

Sample Size: 100 Response Rate (%): 27 (27%) Median RVW: 14

25th Percentile RVW: 13.6 75th Percentile RVW: 15 Low: 10.1 High: 18

Median Pre-Service Time: 60 Median Intra-Service Time: 165

25th Percentile Intra-Svc Time: 120 75th Percentile Intra-Svc Time: 180 Low: 75 High: 240

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>

Office:	<u>28</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	56308	LAVH	13.87
2)	49000	Exploratory laparotomy	8.59
3)	58140	Myomectomy abdominal approach	7.61
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 56309 requires significantly greater mental effort and technical skill than CPT 49000 due to the removal of myomas and subsequent suturing of the uterus. In addition, stress is higher due to the risk of excessive bleeding. The work of CPT 56309 fairly closely approximates the work of CPT 56308.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	-	99215	1.51
Intra-service	-	165 min. x 0.06	9.9
Same day	-	99232	.88
Hosp.	-	99238	1.06
Office	-	99213	<u>.55</u>
			13.9

Note: The recommended RVUs equal the recommendation for CPT58140, the equivalent open procedure. The recommended RVUs are the average of the results of the building block approach for 56309 and 58140.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58140 Global Period: 090 Current RVW: 7.61 Recommended RVW: 13.79

CPT Descriptor: Myomectomy, excision of fibroid tumor of uterus, single or multiple (separate procedure); abdominal approach

Source and Summary of Comment to HCFA on this service: ACOG: Requires approximately equivalent time and significantly more mental effort, technical skill, and stress than CPT 49000, but work RVUs are lower. More closely approximates the work of CPT 58150

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 37 year old G1P0 woman was referred for abnormal uterine bleeding causing anemia. The patient has been treated pharmacologically and has received a dilatation and curettage during the past year without success. The patient has also experienced heavier and longer menses and dysmenorrhea over the past 6 months. Multiple scattered intramural and subserosal myomata ranging in size from 1 cm to 8 cm were documented by ultrasonography. The patient is given treatment alternatives and still desires childbearing. A myomectomy is indicated and the abdominal approach is recommended because of the location of the fibroids. An exploratory laparotomy is performed. An incision is made in the overlying serosa and myometrium down to the level of the fibroids. Twelve fibroids are removed through a complex interconnected incision. The myometrial defect is closed in multiple layers. The serosa is closed with fine suture to try to decrease the rise of post operative adhesion formation. The abdominal wall is closed in a routine fashion. Following hospital discharge she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under general anesthesia the abdomen is entered through a midline incision. An exploratory laparotomy is performed. The fibroid is identified. An incision is made in the overlying serosa and myometrium down to the level of the fibroid. The fibroid is dissected free. The myometrial defect is closed in multiple layers. The serosa is closed with fine suture to try to decrease the rise of post operative adhesion formation. The abdominal wall is closed in a routine fashion.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 4 days. The patient is discharged on post op day 4 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 200 Response Rate (%): 57 (29%) Median RVW: 1425th Percentile RVW: 12 75th Percentile RVW: 15 Low: 9.9 High: 21.5Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 90 75th Percentile Intra-Svc Time: 132 Low: 60 High: 300

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>----</u>	<u>----</u>
Other Hospital:	<u>60</u>	<u>4</u>
Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	58260	Vaginal hysterectomy	11.39
3)	56308	LAVH	13.87
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

In all elements of physician work, intra-service work for CPT 58140 substantially exceeds CPT 49000. A myomectomy requires an exploratory laparotomy, removal of myomas (frequently multiple, large fibroid tumors), and subsequent suturing of the uterus, entailing about equal time and more technical skill than an exploratory laparotomy. In addition, stress is greater for CPT 58140 due a higher risk of bleeding if multiple, large myomas must be removed.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 56605 Global Period: 000 Current RVW: .86 Recommended RVW: 1.2

CPT Descriptor: Biopsy of vulva or perineum (separate procedure); one lesion

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 54100 - total work is equivalent, but 56605 has about half as many work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year old woman reports a vulvar lesion. An examination of the vulva and perineum discloses a 0.5 cm dysplastic appearing lesion. A vulvar biopsy is warranted to evaluate the etiology of this lesion to determine the appropriate treatment.

Description of Pre-Service Work:

The vignette assumes the procedure is done on the same day as the complaint was noted. The procedure and potential complications are explained in detail and informed consent is obtained.

Description of Intra-Service Work:

The vulva is prepared with an antiseptic solution. Local anesthesia is injected surrounding the site to be biopsied. Using a scalpel or punch biopsy instrument, the lesion is incised or completely excised. Simple suturing may be required.

Description of Post-Service Work:

The biopsy site is observed for bleeding. Prescriptions for analgesics and instructions for perineal care are given to the patient. As this procedure has a 0 day global period, this completes the post-service work. The patient is asked to return for re-evaluation in 1-2 weeks. The pathology report is reviewed and discussed with the patient at that time.

SURVEY DATA:

Specialty: ACOG

Sample Size: 100 Response Rate (%): 34 Median RVW: 1.2

25th Percentile RVW: 1.09 75th Percentile RVW: 1.57 Low: .38 High: 4.0

Median Pre-Service Time: 10 Median Intra-Service Time: 15

25th Percentile Intra-Svc Time: 10 75th Percentile Intra-Svc Time: 20 Low: 5 High: 30

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 10

ICU: ---- ----

Other Hospital:	<u> </u>	<u> </u>
Office:	<u>15</u>	<u>1</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	11420	Excision of benign lesion .5 cm or less	1.01
2)	11421	Excision of benign lesion diameter .6 to 1 cm	1.48
3)	54100	Biopsy of penis-cutaneous	1.90
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Total physician work for CPT56605 is equivalent to CPT11420, 11421 and 54100, so the survey median seemed appropriate.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 56633 Global Period: 090 Current RVW: 12.15 Recommended RVW: 17.95

CPT Descriptor: Vulvectomy, radical; complete

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 19240 - pre-service work is similar, intra-service somewhat greater for 19240, post-service work greater for 56633, but 56633 has lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 77 year old woman has been evaluated for a large vulvar lesion involving both labia, including the clitoris. A biopsy revealed a well-differentiated verrucous carcinoma. A complete radical vulvectomy is indicated and performed in this patient due to the extent of disease. After recovery in the hospital, the patient receives the usual follow-up office care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A radical vulvectomy is performed using a scalpel or cautery. The specimen includes the labia majora, labia minora and clitoris to the level of fascia. The specimens are identified and sent to the pathologist. The surrounding skin and subcutaneous tissue is mobilized. The closure is a primary closure and drains may be placed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding, but this patient may be discharged with foley and drains in place. The physician visits the patient in the hospital for 7 days. The patient is discharged on post op day 7 with instructions for follow-up care. The patient is reevaluated three times postoperatively.

SURVEY DATA:Specialty: ACOGSample Size: 112 Response Rate (%): 52 Median RVW: 1525th Percentile RVW: 14 75th Percentile RVW: 17.21 Low: 12 High: 34Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 95 75th Percentile Intra-Svc Time: 180 Low: 60 High: 240

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>45</u>	
ICU:	<u>25</u>	<u>1</u>
Other Hospital:	<u>100</u>	<u>7</u>
Office:	<u>50</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	19240	Mastectomy, modified, radical	14.71
2)	14041	Adjacent tissue transfer 1.1 to 3.0 sq cm	10.74
3)	11626	Excision of malignant lesion (dia) over 4.0 cm	4.2
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Total physician work for CPT 56633 exceeds total work for CPT 19240. Intra-service work is probably greater for CPT 19240 because of the removal of axillary lymph nodes. However, the difference in intra-service work is outweighed by greater post-service work for CPT 56633. Mastectomy patients typically leave the hospital sooner than vulvectomy patients and have fewer complications related to wound healing. The wound created by a mastectomy can be closed. In contrast, after a vulvectomy has been performed not enough skin remains to close the wound, so it must remain open, making the healing process more difficult. The likelihood of infection and wound breakdown is greater with a vulvectomy because of the high level of bacteria normally present in the perineal area. Patients who have undergone a vulvectomy typically require several post-discharge office visits for perineal wound care.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	-	99215	-	1.51
Intra-service	-	120 min. x 0.060	-	7.2

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57270 Global Period: 090 Current RVW: 7.36 Recommended RVW: 13.19

CPT Descriptor: Repair of enterocele, abdominal approach

Source and Summary of Comment to HCFA on this service: ACOG: Requires greater mental effort, technical skill and stress than CPT 49000, but has lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70 year old female complains of a "bulge" in the vaginal area. She has had a hysterectomy with removal of tubes and ovaries 20 years prior to this time. Examination reveals an enterocele. The patient undergoes repair of this defect by the abdominal approach. She is discharged home on the fourth post operative day and is released to regular activities after her six weeks check-up.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status.

Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

The abdomen is entered and explored. The enterocele defect is located in the pelvis. The defect is repaired by one of several techniques that essentially obliterates the cul-de-sac. Often-times excision of the enterocele sac is necessary. Hemostasis is secured at the end of the case and the abdomen is closed. A foley catheter is placed to promote gravity drainage.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 4 days. The patient is discharged on post op day 4 with instructions for follow-up care. The patient is reevaluated twice post operatively.

1)	49000	Exploratory laparotomy	8.99
2)	57840	MMK	9.78
3)	58260	Vaginal hysterectomy	11.39
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57270 entails greater mental effort, technical skill, and stress than CPT 49000. The surgery is technically difficult because the typical patient has adhesions from previous surgery. In addition, stress is high due to the risk of injury to the bowel or ureters.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57280 Global Period: 090 Current RVW: 8.35 Recommended RVW: 15.42

CPT Descriptor: Colpopexy, abdominal approach

Source and Summary of Comment to HCFA on this service: ACOG: Requires more mental effort, technical skill, and stress than CPT 49000, but has lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 63 year old sexually active G5P5 underwent abdominal hysterectomy twenty years ago for leiomyomata. She developed a symptomatic cystocele and rectocele and was treated with anterior and posterior repair 3 years ago. Now she is being evaluated for discomfort and tissue prolapsing through the introitus. Examination documents prolapse of the vaginal vault through the introitus and good anterior and posterior support. At surgery and abdominal incision is made through all layers. The vagina is identified. The bladder is dissected off the anterior vaginal wall and the posterior wall is freed. The peritoneum overlying the sacrum is incised and the periosteum cleared. Using a variety of techniques the vagina is secured to the periosteum of the sacral promontory. Edges of the "sling" are assessed to prevent internal hernia formation. The abdomen is closed in layers. The patient is observed in the hospital for an average of 4-6 days. She is discharged after normal bowel function has returned and receives routine follow-up care in the office during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

At surgery an abdominal incision is made through all layers. After the abdominal cavity is explored, the vagina is identified. The bladder is dissected off the anterior vaginal wall and the posterior wall is freed. The peritoneal overlying the sacrum is incised and the periosteum cleared. Using a variety of techniques the vagina is secured to the periosteum of the sacral promontory. Edges of the "sling" are assessed to prevent internal hernia formation. The abdomen is closed in layers.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 5 days. The patient is discharged on post op day 5 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 100 Response Rate (%): 36 Median RVW: 14.125th Percentile RVW: 11.78 75th Percentile RVW: 16 Low: 9.78 High: 22.5Median Pre-Service Time: 60 Median Intra-Service Time: 11525th Percentile Intra-Svc Time: 90 75th Percentile Intra-Svc Time: 120 Low: 60 High: 300

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>45</u>	
ICU:	<u>----</u>	<u>----</u>
Other Hospital:	<u>67</u>	<u>5</u>
Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	51840	MMK	9.78
3)	58260	Vaginal hysterectomy	11.39
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57280 requires more total physician work than CPT 49000. During the intra-service period, CPT 57280 requiring more mental effort and technical skill. The colpexy includes an exploratory laparotomy and lysis of adhesions to locate the vagina. A piece of fascia or synthetic graft is then transected and reimplanted to support the vagina. The bowel must be mobilized to allow fixation. Stress is high due to the risk of injury to bowel and ureters. In addition, these patients are generally older, have more frequent comorbidities, and experience more post-operative complications than the typical patients for CPT 49000, 51840, and 58260.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57289 Global Period: 090 Current RVW: 6.4 Recommended RVW: 12.29

CPT Descriptor: Pereya procedure, including anterior colporrhaphy

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 58145 - CPT 57289 includes all services provided with CPT 51845, plus an anterior colporrhaphy (CPT 57240), but has lower work RVUs than CPT 58145.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67 year old female reported symptoms of stress urinary incontinence. Examination revealed a large cystocele with loss of urethro-vesicle support. Formal cystometric evaluation reveals stress urinary incontinence, a normal bladder volume, and no evidence of detrusor instability. The patient undergoes a Pereya procedure with anterior colporrhaphy. She does well post operatively and is discharged on the third post-op day. She is unable to void adequately at the time of discharge, therefore is instructed in self-catheterization. She is seen weekly in the office until she voids adequately approximately 14 days after surgery. She is seen 6 weeks post-op to assess her healing and recovery and is released to her usual activities.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

The vaginal mucosa overlying the bladder is incised and dissected off of the bladder. Through two small lower abdominal incisions a suture is placed retropubically and looped around the neck of the bladder where it joins the urethra. This suture is anchored to the abdominal wall fascia thus suspending the urethrovesicle angle (Pereyra procedure). The peri-vesicle fascia is then plicated in the midline and the previously incised vaginal mucosa is re-approximated thus completing the anterior colporrhaphy. A foley is placed for gravity drainage and a vaginal pack is also placed. The small abdominal incisions are closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated three times post operatively.

SURVEY DATA:Specialty: ACOGSample Size: _____ Response Rate (%): 30 Median RVW: 10.825th Percentile RVW: 10 75th Percentile RVW: 12 Low: 7.5 High: 14Median Pre-Service Time: 60 Median Intra-Service Time: 9025th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 100 Low: 45 High: 120

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>35</u>

Office:	<u>45</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	51845	Vesical needle suspension (Pereya)	9.06
			> 11.76
2)	57240	Anterior colporrhaphy	5.39
3)	51840	MMK	9.78
4)	51860	Cystorrhaphy - simple	11.17

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57289 is equivalent to CPT 51845, plus 57240. However, since performing the Pereya procedure and the anterior colporrhaphy together requires both an abdominal and vaginal approach through separate incisions, strict application of the multiple procedure payment rule (which would dictate that half of the work RVUs for 57240 be added to the work RVUs for 51845) does not make sense. In this instance, the additional work required to perform the anterior colporrhaphy with the Pereya procedure is closer to 60 percent of the work RVUs for 57240.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57305 Global Period: 090 Current RVW: 8.69 Recommended RVW: 14.74

CPT Descriptor: Closure of rectovaginal fistula; abdominal approach

Source and Summary of Comment to HCFA on this service: ACOG: Technical skill and mental effort required exceed skill required for CPT 49000, but 57305 has slightly lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year old patient complained of leaking stool from her vagina 2 weeks following a TAH-BSO for severe endometriosis. The work-up reveals a rectovaginal fistula at approximately 15 cm in the rectosigmoid. You determine that an abdominal surgical approach will yield the best result. She now undergoes closure of the rectovaginal fistula. Following hospital discharge, she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A skin incision is made and carefully carried by layers until the peritoneal cavity is entered. The abdominal cavity is explored and the bowel packed out of the pelvis. The sigmoid is mobilized. The rectovaginal septum is entered and the vagina is bluntly and sharply dissected from the rectum. The fistula is identified and excised. The defect in the rectosigmoid is closed using staples or sutures in a transverse fashion. The defect in the vagina is closed. Once hemostasis is obtained, a drain may be brought out through the vagina or a separate site on the anterior abdominal wall. The bowel is placed back into the pelvis and the closure is in layers. Antibiotics are usually administered intraoperatively.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 6 days. The patient is discharged on post op day 6 with instructions for follow-up care. The patient is reevaluated three times post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 212 Response Rate (%): 53 (25%) Median RVW: 15.7525th Percentile RVW: 13.37 75th Percentile RVW: 17.98 Low: 11 High: 30Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 120 75th Percentile Intra-Svc Time: 150 Low: 70 High: 240

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>40</u>

Other Hospital:	<u>77</u>	<u>6</u>
Office:	<u>32</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	51900	Vesical vaginal fistula closure	11.67
2)	44140	Colectomy - partial with anastomosis	16.97
3)	49000	Exploratory laparotomy	8.99
4)	45800	Closure of recto vesical fistula	12.95

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57305 includes an exploratory laparotomy (CPT 49000), entering the rectovaginal septum, excising fistula tract, and closing the defect in the vagina and rectum. Often a flap of tissue is transplanted in between the vagina and rectum to protect the repair. The technical skill and mental effort/judgment required to perform this repair greatly exceed the skill required to perform CPT 49000. Total physician work for CPT 57305 is slightly less than the work required for CPT 51900 and 44140.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57307 Global Period: 090 Current RVW: 10.05 Recommended RVW: 16.88

CPT Descriptor: Closure of rectovaginal fistula; abdominal approach; with concomitant colostomy

Source and Summary of Comment to HCFA on this service: ACOG: Intra-service skill, mental effort, and stress are substantially greater for this procedure than for 49000 and post-service work is greater due to creation of the colostomy, but the difference in RVUs does not reflect the difference in work.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year old patient complains of leaking stool from her vagina 2 weeks following a TAH-BSO for severe endometriosis. The work-up reveals a rectovaginal fistula at approximately 15 cm in the rectosigmoid. You determine that an abdominal surgical approach will yield the best result.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A skin incision is made and carefully carried by layers until the peritoneal cavity is entered. The abdominal cavity is explored and the bowel packed out of the pelvis. The sigmoid is mobilized. The rectovaginal septum is entered and the vagina bluntly and sharply dissected from the rectum. The fistula is identified and excised. The defect in the rectosigmoid is closed using staples or sutures in a transverse fashion. The defect in the vagina is closed. The operating surgeon may feel a diverting colostomy is needed to insure primary closure of the fistula or feels the risk of breakdown of the fistula repair is high. A diverting colostomy involves isolation of a loop of large bowel proximal to the fistula repair. A separate skin incision is made for the colostomy. A fascial incision is created and the loop of large bowel is brought out of the abdomen through this opening. It is fixed in place with sutures. The stoma can be matured (opened) at a separate setting postoperatively or immediately in the operating room, following closure of the other incision. Once hemostasis is obtained, a drain may be brought out through the vagina or a separate site on the anterior abdominal wall. The bowel is placed back into the pelvis and the closure is in layers. Antibiotics are usually administered intraoperatively.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated three times post operatively.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57400 Global Period: 000 Current RVW: 0.83 Recommended RVW: 2.27

CPT Descriptor: Dilation of vagina under anesthesia

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 99221. Requires pre-service and post-service work at least equivalent to CPT 99221 or 99222, as well as the work and risk of the procedure itself.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year old woman who had a TAH-BSO and radiation treatment for uterine cancer has a markedly stenotic vaginal opening which prevents coitus. The patient's vagina is dilated under anesthesia to relieve obstruction. Arrangements are made for the post procedure follow-up.

Description of Pre-Service Work:

Informed consent is obtained and the procedure is explained to the patient.

Description of Intra-Service Work:

Under general anesthesia a pelvic exam is performed. A series of progressively larger dilators are introduced through the introitus to dilate the vagina.

Description of Post-Service Work:

Following recovery from anesthesia and observation for reaction to the procedure, the patient is released to home with instructions about follow-up care, and possible complications.

SURVEY DATA:

Specialty: ACOG

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57410 Global Period: 000 Current RVW: 0.59 Recommended RVW: 1.75

CPT Descriptor: Pelvic examination under anesthesia

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 99221. Requires pre- and post-service work at least equivalent to CPT 99221 or 99222, as well as the work and risk of the procedure itself.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old Gravida 0 female with oligomenorrhea and severe mental retardation is referred for gynecologic evaluation. Her caregivers report seeing blood on her underclothes 1-2 times every week between periods. The patient is combative and cannot cooperate with having a bi-manual examination or for obtaining a pap smear. It has been four years since the last attempted gynecologic examination. Under general anesthesia, a pelvic examination and pap smear are obtained. The patient is returned to the facility from which she was referred.

Description of Pre-Service Work:

Informed consent is obtained and the procedure is explained to the patient's family. The physician reviews the record to ascertain medical status and waits for anesthesia induction and positioning of the patient.

Description of Intra-Service Work:

Under general anesthesia a pap smear, evaluation of external and internal genitalia and bimanual exam are performed.

Description of Post-Service Work:

Following recovery from anesthesia and observation for reaction to the procedure, the patient is released to home with instructions about follow-up care, and possible complications.

SURVEY DATA:

Specialty: ACOG

Sample Size: 100 Response Rate (%): 39 (39%) Median RVW: 2.72

25th Percentile RVW: 1.2 75th Percentile RVW: 3.35 Low: .5 High: 5.72

Median Pre-Service Time: 30 Median Intra-Service Time: 15

25th Percentile Intra-Svc Time: 10 75th Percentile Intra-Svc Time: 20 Low: 5 High: 40

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 25

ICU: ---- ----

Other Hospital:	<u>10</u>	<u>1</u>
Office:	<u>15</u>	<u>1</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	57505	Endocervical curettage	1.09
2)	99215	Level 5 established patient visit	1.51
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57410 requires total evaluation and management services (pre- and post-service) equivalent to CPT 99215. In addition, assuming that the intra-service work of CPT 57505 accounts for 50% of the total RVUs for 57505 and that the work required to perform the pelvic examination under anesthesia is equivalent to about half the intra-service work of 57505, the survey median of 2.72 RVUs seems unreasonably high. We are therefore recommending 1.75 RVUs for this procedure.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57415 Global Period: 000 Current RVW: .91 Recommended RVW: 2.27

CPT Descriptor: Removal of impacted vaginal foreign body (separate procedure) under anesthesia

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 42809. CPT 57415 requires greater technical skill in the intra-service period, and more post-operative work.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 6 year old female presents with a foreign body lodged in her vagina. Attempts to remove the foreign body are unsuccessful. With appropriate pre-operative assessment, the foreign body is removed under general anesthesia. Satisfactory tetanus vaccination status is confirmed. The patient's parents are given instructions and asked to return in one week.

Description of Pre-Service Work:

Informed consent is obtained and the procedure is explained to the patient's family. The physician reviews the record to ascertain medical status and waits for anesthesia induction and positioning of the patient.

Description of Intra-Service Work:

Under general anesthesia the foreign body is removed and the vaginal vault is lavaged. Simple suturing or placement of a vaginal pack may be necessary.

Description of Post-Service Work:

Following recovery from anesthesia and observation for reaction to the procedure, the patient is released to home with instructions about follow-up care, and possible complications.

SURVEY DATA:

Specialty: ACOG

Sample Size: 200 Response Rate (%): 59 (30%) Median RVW: 3.25

25th Percentile RVW: 1.51 75th Percentile RVW: 3.75 Low: .75 High: 7.0

Median Pre-Service Time: 45 Median Intra-Service Time: 15

25th Percentile Intra-Svc Time: 15 75th Percentile Intra-Svc Time: 30 Low: 5 High: 45

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 30

ICU: ---- ----

Other Hospital:	----	----
Office:	<u>15</u>	<u>1</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	42809	Removal of foreign body from pharynx	1.76
2)	31635	Bronchoscopy with removal of foreign body	3.37
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57415 is typically performed under a general anesthetic, thus requiring a pre-operative history and physical. In contrast, CPT 42809 is performed under a local anesthetic, so the pre-service history and physical are not as extensive. The intra-service work required for CPT 57415 is approximately equivalent than the physician work of removing a foreign body from the pharynx. Safely removing an impacted foreign body from the vagina requires more technical skill and physical effort than does CPT 42809 because the foreign body is impacted. However, stress is probably higher for CPT 42809 because of the immediate risk of airway obstruction. Unlike CPT 42809, CPT 57415 also requires a post-anesthesia visit in addition to any services and the likelihood of infection is higher for CPT 57415, due to the high level of bacteria present in the normal vaginal environment. CPT 57415 is less work than CPT 31635 because it does not include the work of the bronchoscopy.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57540 Global Period: 090 Current RVW: 6.01 Recommended RVW: 11.94

CPT Descriptor: Excision of cervical stump, abdominal approach

Source and Summary of Comment to HCFA on this service: ACOG: Requires approximately equivalent time and significantly more mental effort, technical skill, and stress than CPT 49000, but work RVUs are lower.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year old woman had a subtotal hysterectomy for fibroids 20 years ago. She has been diagnosed with extensive cervical carcinoma-in-situ. She now undergoes excision of the cervical stump via an abdominal approach. Following discharge from the hospital she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A skin incision is made and carefully carried by layers until the peritoneal cavity is entered. The risk of injury to bowel is significant due to adhesions from previous surgery. The adhesions are lysed. The bowel is packed away. The sigmoid colon and bladder are usually adherent to the cervix from the dissection at the time of previous surgery. Care is taken to avoid injury to these structures. The bladder, sigmoid and rectum are carefully dissected off of the cervix. The vessels are clamped, cut and suture ligated. The cervix is removed by clamping across the vaginal cuff. The abdomen is closed in layers and dressings applied. Drains may be used.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:

Specialty: ACOG

Sample Size: 212 Response Rate (%): 55 (26%) Median RVW: 11.54

25th Percentile RVW: 10.45 75th Percentile RVW: 13 Low: 9.5 High: 17

Median Pre-Service Time: 50 Median Intra-Service Time: 75

25th Percentile Intra-Svc Time: 61 75th Percentile Intra-Svc Time: 120 Low: 45 High: 180

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>40</u>	
ICU:	<u>----</u>	<u>----</u>
Other Hospital:	<u>50</u>	<u>3</u>
Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	51900	Closure of vesical vaginal fistula	11.67
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57540 requires significantly more time, mental effort and technical skill than CPT 49000. It includes an exploratory laparotomy, as well as removal of the cervical stump. The surgery is more technically demanding because of the presence of adhesions from the previous hysterectomy. In addition, the patient is typically sicker and requires more post-operative work than for either CPT 49000 or CPT 51900 because of the diagnosis of cancer.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 57545 Global Period: 090 Current RVW: 6.63 Recommended RVW: 14.93

CPT Descriptor: Excision of cervical stump, abdominal approach; with pelvic floor repair

Source and Summary of Comment to HCFA on this service: ACOG: Requires approximately equivalent time and significantly more mental effort, technical skill, and stress than CPT 49000, but work RVUs are lower.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year old woman had a subtotal hysterectomy for fibroids 20 years ago. She has been diagnosed with extensive cervical carcinoma-in-situ. Her pre-operative evaluation also revealed a symptomatic enterocele with pelvic pressure and dyspareunia. She now undergoes excision of the cervical stump and repair of the enterocele via an abdominal approach. Following discharge from the hospital she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A skin incision is made and carefully carried by layers until the peritoneal cavity is entered. The risk of injury to bowel is significant due to adhesions from previous surgery. The adhesions are lysed. The bowel is packed away. The sigmoid colon and bladder are usually adherent to the cervix from the dissection at the time of previous surgery. Care is taken to avoid injury to these structures. The bladder, sigmoid and rectum are carefully dissected off of the cervix. The vessels are clamped, cut and suture ligated. The cervix is removed by clamping across the vaginal cuff. Following removal of the cervix, the pelvic floor is repaired by obliterating the cul-de-sac with sutures placed anterior to posterior or circumferentially from the vaginal vault to the rectosigmoid. The abdomen is closed in layers and dressings applied. Drains may be used.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 212 Response Rate (%): 53 (25%) Median RVW: 12.325th Percentile RVW: 11.18 75th Percentile RVW: 14.31 Low: 10.5 High: 20Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 90 75th Percentile Intra-Svc Time: 150 Low: 60 High: 240Median Post-Service Time: Total Time Number of VisitsDay of Procedure: 40ICU: --- ---Other Hospital: 60 3Office: 30 2**KEY REFERENCE SERVICE(S):**

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	51900	Closure of vesical vaginal fistula	11.67
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 57545 requires significantly more time, mental effort and technical skill than CPT 49000. It includes an exploratory laparotomy, as well as removal of the cervical stump and pelvic floor repair. The surgery is more technically demanding because of the presence of adhesions from the previous hysterectomy. In addition, the patient is typically sicker and requires more post-operative work than for either CPT 49000 or CPT 51900 because of the diagnosis of cancer.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The elements of work are identical to those for CPT 57540, except that CPT 57545 requires approximately 25 additional minutes of intra-service time to perform the pelvic floor repair. At 0.075 RVUs per minute this results in 1.87 additional RVUs for the pelvic floor repair (13.06 for CPT 57540 = 1.87 = 14.93 RVUs)

SUMMARY OF RECOMMENDATION**

CPT Code: 58120 Global Period: 010 Current RVW: 2.45 Recommended RVW: 3.56

CPT Descriptor: Dilation and curettage, diagnostic or therapeutic (non-obstetric)

Source and Summary of Comment to HCFA on this service: ACOG: Typical patient undergoing 58120 has become more difficult since time when Harvard data on which the current RVUs are based were collected.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67 year old G0-P0 woman with postmenopausal undergoes a D&C following a failed endometrial biopsy due to rigid stenotic cervix. She receives routine follow-up care in the office during the 10 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

A pelvic examination is performed. A single toothed tenaculum is applied to the anterior lip of the cervix. An endocervical curettage is performed. The uterus is sounded. Dilatation of the cervix is followed by an endometrial curettage. Because of the tight cervical canal, the dilatation may be more difficult thereby increasing the risk of perforation and bleeding.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 1 day. The patient is discharged on post op day 1 with instructions for follow-up care. The patient is reevaluated once post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 312 Response Rate (%): 70 (22%) Median RVW: 3.7325th Percentile RVW: 3.36 75th Percentile RVW: 4.0 Low: 1.5 High: 7.0Median Pre-Service Time: 35 Median Intra-Service Time: 2525th Percentile Intra-Svc Time: 20 75th Percentile Intra-Svc Time: 30 Low: 7.5 High: 30

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99215	Level 5 established patient office visit	1.51
2)	59820	Surgical treatment of missed abortion-1st trimester	3.73
3)	99213	Level 3 established patient office visit	.55
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Total time is greater than 99215. More risk than 99215 because of possibility of uterus perforation. Technical skill greater than for 59820.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Same-day pre and post-service work = 99215	=	1.51
Intra-service		
.25 minutes X 0.06 RVUs per minute	=	1.50
Office Post-Service = 99213	=	<u>.55</u>
		3.56

Note: The typical patient undergoing a D&C has changed since 1987 when the initial work RVUs for this procedure were established, due to the availability of other, preferred diagnostic techniques such as endometrial sampling (CPT 58100) and diagnostic hysteroscopy (CPT 56350). The result of the increasing use of these substitute technologies is that CPT 58120 is reserved for patients for whom other diagnostic procedures have failed (for example, CPT 58100 could not be performed because of a stenotic cervix) or in whom conditions such as polyps, hyperplasia, or dysfunctional bleeding have been found. Any of these conditions increase the technical difficulty of the procedure and the risk of uterine perforation or hemorrhage. The typical patient now is also more likely to have comorbid conditions that increase the medical risk of the procedure. As a result, the physician work associated with CPT 58120 has increased, making the current procedure undervalued in comparison to the RVUs established for CPT 58120 with data from Phase I of the Harvard study.

Data that directly support the argument that many patients who would previously have received a D&C undergo other diagnostic procedures are scarce. Medicare claims data do, however, suggest that this substitution has occurred. Between 1986 and 1991 Medicare claims submitted by ob-gyns for CPT 58120 increased 17%, from 39,784 to 46,658. Over the same time period, claims submitted for CPT 58100 increased 212% from 13,447 to 42,042 and claims for CPT 56350 increased by 272% from 1,953 to 7,258.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58150 Global Period: 090 Current RVW: 13 Recommended RVW: 16.33

CPT Descriptor: Total abdominal hysterectomy (corpus and cervix), with or without removal of tube(s), with or without removal of ovary(s)

Source and Summary of Comment to HCFA on this service: ACOG: Typical patient undergoing 58150 has become more difficult since time when Harvard data on which the current RVUs are based were collected.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52 year old G0 woman has been evaluated for a large pelvic mass. Ultrasound demonstrated bilateral complex solid and cystic adnexal masses and a leiomyomatous uterus. CA125 is elevated. She now undergoes surgery. Exploratory laparotomy reveals bilateral endometriomas densely adherent to the pelvic sidewalls and total cul de sac obliteration, as well as myomata enlarging the uterus to 10 to 12 weeks size. Total abdominal hysterectomy, bilateral salpingo-oophorectomy is performed. The patient is followed in the hospital for 4-6 days and is discharged home. She receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under general anesthesia the abdomen is entered through a midline incision. An exploratory laparotomy is performed. At exploration she is found to have bilateral endometriomas densely adherent to the pelvic sidewalls and total cul de sac obliteration. Total abdominal hysterectomy, bilateral salpingo-oophorectomy is performed. The supporting pedicles containing the tubes, ligaments, and arteries are clamped and cut free. The uterus and cervix are removed along with a narrow rim or cuff of vaginal lining. The vaginal defect is often left open for drainage. The abdominal incision is closed by suturing.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 5 days. The patient is discharged on post op day 5 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 312 Response Rate (%): 72 (23%) Median RVW: 14.325th Percentile RVW: 13.00 75th Percentile RVW: 17.17 Low: 10.50 High: 28.00Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 120 75th Percentile Intra-Svc Time: 169 Low: 60 High: 240

Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	58260	Vaginal hysterectomy	11.39
3)	56308	LAVH	13.87
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 58150 includes the work of CPT 49000, in addition to the work required to remove the tubes and ovaries. An abdominal hysterectomy requires is more difficult than CPT 58260 or 56308 because the typical patient undergoing the procedure has more anatomic distortion and is more likely to be elderly, have comorbid condition, and to experience post-operative complications.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	99215	-	1.51
Intra-service	120 min. x 0.075		9.00
Same day post	99233	-	1.25
Hospital	99232	-	.88
	99231 x 3	-	1.53
	99238	-	1.06
Office	99213 x 2	-	<u>1.10</u>
			16.33

Note: The work required to perform CPT 58150 for the typical patient in 1995 is undervalued at the level of work RVUs established on the basis of data collected in Phase I of the Harvard study in 1987. According to the National Center for Health Statistics, the overall rate of hysterectomy fell from 43.0 per 10,000 women in 1988 to 39.0 per 10,000 women in 1991. The decline in the hysterectomy rate is primarily due to the availability of other treatments. Therefore, in comparison to the profile of patients undergoing hysterectomy in the mid- to late-1980s, patients have more severe indications for the procedure; women undergoing hysterectomies are those for whom more conservative therapies have failed. More specifically, new surgical techniques and the increasing preference for vaginal surgery have altered the profile of patients undergoing a total abdominal hysterectomy. In particular, the development of the laparoscopic assisted vaginal hysterectomy (LAVH) has allowed many women who would previously undergone an abdominal hysterectomy to have a vaginal hysterectomy. For example, a retrospective review of medical records for 2,563 patients who underwent hysterectomy for benign disease in one large not-for-profit metropolitan hospital found that between January 1991 and December 1993 the proportion of hysterectomies performed abdominally fell from 65% to 36%, while the percentage of hysterectomies performed by LAVH rose from 12% to 45%.

These changes have resulted in an increase in the physician work required to perform CPT 58150. The actual surgical procedure for the typical patient is more technically challenging and the post-operative care frequently more complicated than was the case when the work RVUs for CPT 58150 were established.

In addition, the vignette used in the Harvard Phase I data collection (50-year-old patient with carcinoma in situ of the cervix) does not adequately describe the typical patient undergoing CPT 58150 in 1995 and, in fact did not describe a typical patient for the procedure at that time. Data available from the National Center for Health Statistics indicate that during the period 1985-87, the leading indication for women of all ages undergoing hysterectomy was fibroids. Among Medicare-aged women, a diagnosis of cancer was the indication for surgery for only about one-third of hysterectomy patients. The choice of vignette is significant because the condition described in the vignette does not result in the type of anatomic distortion resulting from fibroids, endometriosis, or chronic infection that is very frequently seen in today's patients and that makes the surgery more difficult.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58180 Global Period: 090 Current RVW: 9.06 Recommended RVW: 16.57

CPT Descriptor: Supracervical abdominal hysterectomy (subtotal hysterectomy), with or without removal of tube(s) with or without removal of ovary(s)

Source and Summary of Comment to HCFA on this service: ACOG: Requires significantly more mental effort, technical skill, and stress than CPT 49000, but work RVUs for CPT 58180 exceed those for CPT 49000 by an insignificant margin.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52 year old G0 woman has been evaluated for a large pelvic mass. Ultrasound demonstrated bilateral endometriomas densely adherent to the pelvic sidewalls and total cul de sac obliteration, as well as myomata enlarging the uterus to 10 to 12 weeks size. During surgery, excessive bleeding and dense pelvic adhesions make removal of the uterine cervix very difficult. Because the patient is not tolerating her anesthetic very well, a decision is made to perform a supracervical hysterectomy. The patient stabilizes in the recovery room and the remainder of her post-op course is uneventful. She is discharged home on the fourth post-op day. She receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under general anesthesia the abdomen is entered through a midline incision. The vascular supply of the uterus is secured in the usual fashion. After the uterine vessels are ligated and tied, the uterine fundus is removed by excision at the level of the internal cervical os. This area is oversewn and hemostasis is achieved. The abdominal incision is closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 4 days. The patient is discharged on post op day 4 with instructions for follow-up care. The patient is reevaluated twice post operatively.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58210 Global Period: 090 Current RVW: 23.97 Recommended RVW: 28.23

CPT Descriptor: Radical abdominal hysterectomy, with bilateral total pelvic lymphadenectomy and periaortic lymph node sampling (biopsy), with or without removal of tube(s), with or without removal of ovary(s)

Source and Summary of Comment to HCFA on this service: ACOG: Requires total physician work approximately equivalent to the work for CPT 55845, but has lower work RVUs.

SGO: Undervalued in comparison to CPT 58150 -- difference in work RVUs does not reflect the actual difference in physician work.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old has been evaluated for a cervical lesion approximately 2 cm in largest diameter which is confined to the cervix. A biopsy revealed a well-differentiated squamous cell cancer. She now undergoes a radical abdominal hysterectomy, with bilateral total pelvic lymphadenectomy and selected periaortic lymph node sampling. After hospital discharge she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Operative Service:

The patient is examined under anesthesia to assess operability. An incision is made and carried by layers until the peritoneal cavity is entered. An exploration of the abdominal and pelvic cavities is performed. The lymph nodes are sent for frozen section. If without evidence of metastases, the uterus, parametria, cervix and upper 1/3 of the vagina are removed by dissecting the ureter from the parametria and tunnel and by cutting, clamping and suturing vascular and supporting pedicles. A radical bilateral pelvic lymphadenectomy is performed either prior to or immediately following the radical hysterectomy. The pelvic lymphadenectomy skeletonizes the common external, hypogastric and obturator vessels. Closed suction drains may be used. The abdomen is closed in layers and dressing applied.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 7 days. The patient is discharged on post op day 7 with instructions for follow-up care. The patient is reevaluated three times post operatively.

3)	55845	Prostatectomy with bilateral lymphadenectomy	26.73
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The total physician work required to perform CPT 58210 is equivalent to work associated with CPT 55845. Mental effort, technical skill and stress are similar for the radical abdominal hysterectomy and the retroperitoneal radical prostatectomy, although CPT 58210 also requires a para-aortic lymph node dissection.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58240 Global Period: 090 Current RVW: 28.79 Recommended RVW: 41.20

CPT Descriptor: Pelvic exenteration, for gynecologic malignancy with total abdominal hysterectomy or cervicectomy, with or without removal of tube(s), with or without removal of ovary(s), with removal of bladder and transplantations, and or abdominoperineal resection of rectum and colon and colostomy, or any combination thereof.

Source and Summary of Comment to HCFA on this service: ACOG and SGO: Undervalued in comparison to CPT 51597 -- procedures are identical, but 58240 has much lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 38 year old patient was treated with radiation therapy for a stage IB squamous cell cervical carcinoma. She has been evaluated for a central recurrence 2 years following therapy. A biopsy of the lesion was consistent with the primary tumor. She undergoes a pelvic exenteration with total abdominal hysterectomy, removal of bladder and ureteral reimplantation and resection of rectum and creation of colostomy. Following hospital discharge, she receives office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Operative Services:

An incision is made and carried by layers until the peritoneal cavity is entered. An exploration of the abdominal and pelvic cavities is performed. The bowel is packed into the upper abdomen. If there is no evidence of metastatic disease, the disease is free of the pelvic sidewalls, the procedure is begun. The uterus, cervix, parametria, all or part of the vagina, bladder and rectosigmoid are removed. An end sigmoid colostomy or colonic reanastomosis is performed. The procedure requires an abdominal and vaginal approach. Drains may be placed. A catheter drains the conduit and ureteral stents are usually placed. The abdomen is closed in layers and dressings applied.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 16 days. The patient is discharged on post op day 16 with instructions for follow-up care. The patient is reevaluated six times post operatively.

SURVEY DATA:

58240			
	51596 REMOVE BLADDER, CREATE POUCH	36.27	090

CMD Comment:

The large difference between this code and 51597 (pelvic exenteration, male) is due to a difference of over two hours in estimated intraservice time in the Harvard study. There is probably very little real difference in work, so the most practical step would be to average the codes and assign the same RVU to both.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58301 Global Period: 0 Current RVW: .73 Recommended RVW: 1.5

CPT Descriptor: Removal of intrauterine device

Source and Summary of Comment to HCFA on this service: ACOG: Undervalued in comparison to CPT 42809 - requires greater technical skill, though somewhat less stress. Pre- and post-service work is similar.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32 year old G1P1 woman requests the removal of her IUD for a planned pregnancy. The string cannot be located in the cervix during an office evaluation. Under aseptic conditions, the cervix is gently dilated sufficient to permit the introduction of a uterine forceps which is used to successfully grasp and remove the IUD.

Description of Pre-Service Work:

Informed consent is obtained and the procedure is explained to the patient.

Intra-Service Work:

A pelvic examination is performed. A single toothed tenaculum is applied to the anterior lip of the cervix. The strings of the IUD are grasped and the IUD is removed.

Description of Post-Service Work:

The patient is observed for possible reaction to the procedure and then given instructions regarding the consequences of unprotected sexual activity.

SURVEY DATA:

Specialty: ACOG

Sample Size: 100 Response Rate (%): 33 (33%) Median RVW: 1.5

25th Percentile RVW: 1.14 75th Percentile RVW: 2.27 Low: .42 High: 3.8

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 10

ICU: ----

Other Hospital:	----	----
Office:	<u>15</u>	<u>1</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99215	Level 5 established patient office visit	1.51
2)			
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Total work is equivalent for CPT 58301 and 99215. Time is similar for both procedures, but CPT 58301 entails the risk of infection and uterine perforation. The survey median seems reasonable.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58410 Global Period: 090 Current RVW: 6.78 Recommended RVW: 12.31

CPT Descriptor: Uterine suspension, with or without shortening of round ligaments, with or without shortening of sacrouterine ligaments; (separate procedure); with presacral sympathectomy

Source and Summary of Comment to HCFA on this service: ACOG: Requires physician work at least equivalent to that associated with CPT 49000, but has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 26 year old female patient has been evaluated for chronic, severe central pelvic pain. On physical examination she has a retro-displaced uterus. Previous laparoscopic examination has documented endometriosis. She has failed all conservative methods of pain management. She wishes to conserve her reproductive capacities. She undergoes a uterine suspension and presacral sympathectomy. Her post operative course is uncomplicated and she is discharged home on the third post operative day. She is seen for 3 and 6 weeks post operative evaluations and reports significantly less pain.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under general anesthesia the abdomen is entered through a low abdominal transverse incision. The bowel contents are packed away. The sigmoid colon is mobilized to expose the peritoneum overlying the sacrum. The retroperitoneal space is entered and the sympathetic nerve supply to the pelvis is isolated. The appropriate nerve bundle bilaterally is ligated and divided (Pre-sacral sympathectomy). The uterine suspension is performed in a variety of ways. Commonly, the round ligaments are shortened by "gathering" the ligaments bilaterally with a running suture. Alternatively, the uterus may be suspended by suturing the round ligaments or other appendage to the anterior abdominal peritoneum or fascia. The abdominal incision is closed and the patient is taken to the recovery room.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 100 Response Rate (%): 22 (22%) Median RVW: 1225th Percentile RVW: 9.5 75th Percentile RVW: 13.2 Low: 9 High: 15Median Pre-Service Time: 60 Median Intra-Service Time: 11025th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 120 Low: 60 High: 180

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>40</u>	
ICU:	<u>----</u>	<u>----</u>
Other Hospital:	<u>60</u>	<u>3</u>
Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	57282	Sacrospinous ligament fixation	8.06
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 58410 is approximately equivalent to one and one-half times the work of CPT 49000 or CPT 57282. The work required to perform the uterine suspension is approximately equivalent to the work of CPT 57272. The additional work required for the presacral sympathectomy is approximately half the work of CPT 57272.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58520 Global Period: 090 Current RVW: 6.35 Recommended RVW: 11.11

CPT Descriptor: Hysterorrhaphy, repair of ruptured uterus (non-obstetrical)

Source and Summary of Comment to HCFA on this service: ACOG: Requires physician work at least equivalent to that associated with CPT 49000, but has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30 year old nulliparous woman on no hormone replacement is evaluated for abnormal glandular cells on Pap smear. At conization a severely stenotic internal os is identified. While attempting to enter the endometrial cavity for D&C the uterus is perforated and brisk bleeding ensues. A laparotomy incision is made and the uterine defect is identified and closed in layers after the internal os is dilated from above and endometrial sampling obtained. After hospital discharge, she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work was conducted during the original procedure. Informed consent had already been obtained for possible complications of the original procedure.

Description of Intra-Service Work:

A laparotomy incision is made and the uterine tear is identified and closed in layers after the internal OS is dilated from above and endometrial sampling obtained.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 4 days. The patient is discharged on post op day 4 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:

Specialty: ACOG

Sample Size: 100 Response Rate (%): 36 (36%) Median RVW: 12

4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 58520 is comparable in time, mental effort, technical skill and stress to CPT 51860 and somewhat less work than CPT 51965. The survey median seems slightly high.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58540 Global Period: 090 Current RVW: 8.58 Recommended RVW: 13.96

CPT Descriptor: Hysteroplasty, repair of uterine anomaly (Strassman type)

Source and Summary of Comment to HCFA on this service: ACOG: Requires greater time, mental effort, technical skill, and stress than CPT 49000, but has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 26 year old female G5 P0 Sab5 has been referred for repair of congenital uterine anomaly as a cause of her repetitive spontaneous pregnancy losses. Hormonal evaluation showed normal luteal phase progesterone, euprolactinemia, and normal thyroid function. Further evaluations revealed the couple to have normal karyotypes, and the female spouse to be free of either infectious or systemic diseases. Hysterosalpingogram and laparoscopy revealed a bicornuate uterus. An exploratory laparotomy is performed. The bicornuate uterus is repaired by making a transverse incision along the superior aspect of the uterine fundus down to the endometrial cavity. Unification of the bi-valved uterus is accomplished by closing the incision along the anterior-posterior axis of the uterus. The myometrial defect is closed in multiple layers and meticulous hemostasis obtained. The serosa is closed with fine suture to try to decrease the risk of post-operative adhesion formation. The abdominal wall is closed in a routine fashion. After hospital discharge, she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

An exploratory laparotomy is performed. The bicornuate uterus is repaired by making a transverse incision along the superior aspect of the uterine fundus down to the endometrial cavity. Unification of the bi-valved uterus is accomplished by closing the incision along the anterior-posterior axis of the uterus. The myometrial defect is closed in multiple layers and meticulous hemostasis obtained. The serosa is closed with fine suture to try to decrease the risk of post-operative adhesion formation. The abdominal wall is closed in a routine fashion.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:

Specialty: ACOG

Sample Size: 100 Response Rate (%): 33 (33%) Median RVW: 14

25th Percentile RVW: 11.97 75th Percentile RVW: 16.81 Low: 9 High: 18.77

Median Pre-Service Time: 60 Median Intra-Service Time: 120

25th Percentile Intra-Svc Time: 82 75th Percentile Intra-Svc Time: 150 Low: 60 High: 180

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>40</u>	
ICU:	<u>----</u>	<u>----</u>
Other Hospital:	<u>50</u>	<u>3</u>
Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	59515	Cesarean delivery including postpartum care	16.55
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 58540 requires slightly less total work than CPT 59515. While 58540 demands more intra-service time than CPT 59515, the cesarean delivery typically includes substantial physician work managing labor.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58750 Global Period: 090 Current RVW: 8.82 Recommended RVW: 15.14

CPT Descriptor: Tubotubal anastomosis

Source and Summary of Comment to HCFA on this service: ACOG: Requires significantly greater time, mental effort, technical skill, and stress than CPT 49000, but has approximately the same RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old gravida 2 para 2 remarried woman desires fertility post tubal ligation. Laparoscopic evaluation showed 4 cm tube distally on right, 3 cm tube proximally on right. The patient had previously undergone a left salpingectomy. There is no other pelvic pathology. She now undergoes tubotubal anastomosis. Operating loops are used for magnification. Microsurgical instruments and suture are used. Chromotubation demonstrates patency following the procedure. After hospital discharge, she receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under appropriate anesthesia, an abdominal incision is made and an exploratory laparotomy performed. The uterus and tubal segments are elevated with appropriate packing and adhesions are lysed as indicated. The segments are mobilized, with attention to maintain hemostasis but retaining blood supply. The blocked portion of the tube is excised and it is sutured cleanly to the unblocked portion. This is done through the use of an operating microscope to obtain micro cautery hemostasis. Patency of the segments is established. The packs are removed and the abdomen closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58752 Global Period: 090 Current RVW: 7.94 Recommended RVW: 15.14

CPT Descriptor: Tubouterine implantation

Source and Summary of Comment to HCFA on this service: ACOG: Requires significantly greater time, mental effort, technical skill, and stress than CPT 49000, but has fewer RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old gravida 2 para 2 remarried woman desires fertility post tubal ligation. Laparoscopic evaluation showed 6 cm tube distally and no proximal tube on the right. The left tube was previously removed. There is no other pelvic pathology. She now undergoes tubouterine implantation. The proximal portion of the tube is opened and implanted into the tunnel created in the uterine cornua. Tubal patency is established by chromotubation. After hospital discharge, the patient receives routine office follow-up during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under appropriate anesthesia, an abdominal incision is made, retractor placed, uterus and tubal segments elevated with appropriate packing, adhesions lysed as indicated. The distal segment is mobilized. The uterine cornu is incised until patency is established. The tubal lumen is approximated via repair of mesosalpinx. The ligated portion of distal tubal segment is excised. The tubal muscularis is approximated with 8-0 sutures. Patency is established, the packs are removed and the abdomen is closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58760 Global Period: 090 Current RVW: 7.16 Recommended RVW: 12.86

CPT Descriptor: Fimbrioplasty

Source and Summary of Comment to HCFA on this service: ACOG: Requires significantly greater time, mental effort, technical skill, and stress than CPT 49000, but has fewer RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old gravida 0010 married woman desires fertility. She is status post left salpingectomy for ectopic pregnancy, age 30, and was noted to have right fimbrial agglutination at that time. She now undergoes fimbrioplasty. Microsurgical instruments and sutures, as well as operating loops for magnification are used. After hospital discharge, the patient receives routine office follow-up during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under appropriate anesthesia, an abdominal incision is made, retractor placed, uterus and tub elevated with appropriate packing, adhesions lysed as indicated. The tube is mobilized, dye injected. Areas of fimbrial agglutination are carefully lysed to allow maximal motion of fimbrial segments. Patency established. Packs removed. Abdomen closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice.

SURVEY DATA:Specialty: ACOG and ASRMSample Size: 150 Response Rate (%): 38 (25%) Median RVW: 12.525th Percentile RVW: 11 75th Percentile RVW: 15.73 Low: 9 High: 25Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 90 75th Percentile Intra-Svc Time: 150 Low: 50 High: 210

1)	49000	Exploratory laparotomy	8.99
2)	44005	Freeing of bowel adhesions	12.52
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 58760 requires work approximately equivalent to CPT 44005.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58770 Global Period: 090 Current RVW: 6.96 Recommended RVW: 13.34

CPT Descriptor: Salpingostomy (neosalpingostomy)

Source and Summary of Comment to HCFA on this service: ACOG: Requires significantly greater mental effort, technical skill, and stress than CPT 49000, but has fewer RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year old gravida 0010 married woman desires fertility. At age 30 she underwent left salpingectomy for an ectopic pregnancy and was noted to have right hydrosalpinx at that time. You now perform salpingostomy. Microsurgical instruments and sutures, as well as operating loops for magnification are used. After hospital discharge, the patient receives routine office follow-up during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under appropriate anesthesia, an abdominal incision is made, retractor placed, uterus and tube elevated with appropriate packing, adhesions lysed as indicated. The tube is mobilized, dye injected. Area of tubal occlusion identified. Stellate incision made. Hemostasis obtained. Leaflets inverted, sutured to serosa with 6-0 sutures. Patency established. Packs removed. Abdomen closed.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOG and ASRMSample Size: 150 Response Rate (%): 37 (25%) Median RVW: 13.4525th Percentile RVW: 11.05 75th Percentile RVW: 15.25 Low: 9.20 High: 30Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 90 75th Percentile Intra-Svc Time: 150 Low: 60 High: 210

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>----</u>	<u>----</u>
Other Hospital:	<u>45</u>	<u>3</u>
Office:	<u>25</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	44005	Freeing of bowel adhesions	12.52
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 58770 requires total physician work slightly greater in technical skill than that associated with CPT 44005.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58822 Global Period: 090 Current RVW: 6.18 Recommended RVW: 12.22

CPT Descriptor: Drainage of ovarian abscess; abdominal approach

Source and Summary of Comment to HCFA on this service: ACOG: Requires approximately equivalent intra-service time, but more mental effort, technical skill and stress than CPT 49000. In addition, post-operative work is likely to exceed that for CPT 49000, but CPT 58822 has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 19 year old female has been admitted to the hospital with severe pelvic pain and high fever. Workup and evaluation revealed the presence of a large right tubo-ovarian abscess following appendectomy. Despite aggressive antibiotic therapy the patient has remained febrile with little or no clinical improvement. A decision is made to drain the abscesses surgically. The patient wishes to conserve her reproductive capacities. The patient undergoes abdominal drainage of the abscesses. At surgery multiple adhesions are released, necrotic tissue debrided, and copious irrigation used. After 5 additional days of antibiotic therapy post operatively, she becomes afebrile and is discharged home. She is seen for a six weeks post-op evaluation and is doing well.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

Under general anesthesia the abdomen is entered through a midline or low transverse incision. The bowel contents are packed away and the pelvis and abdomen are explored. The abscess is localized, incised, and drained. Copious lavage is used. An intra-operative decision is made as to which organs can be preserved. Numerous drains are placed in the area of the abscess and brought out through separate small abdominal incisions. The abdomen is closed and the patient is taken to the recovery room.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 6 days. The patient is discharged on post op day 6 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 100 Response Rate (%): 35 (35%) Median RVW: 1225th Percentile RVW: 11 75th Percentile RVW: 15 Low: 8.99 High: 20Median Pre-Service Time: 60 Median Intra-Service Time: 9025th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 120 Low: 55 High: 180

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>----</u>	<u>----</u>
Other Hospital:	<u>80</u>	<u>6</u>
Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)	49020	Drainage peritoneal abscess	9.06
3)	49060	Drainage retro peritoneal abscess	10.55
4)	44900	I & D appendiceal abscess	7.86

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The technical skill and stress associated with CPT 58822 are greater for CPT 49060 because of the risk of impairing future fertility.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58952 Global Period: 090 Current RVW: 21.35 Recommended RVW: 23.08

CPT Descriptor: Resection of ovarian malignancy with bilateral salpingo-oophorectomy and omentectomy; with radical dissection for debulking

Source and Summary of Comment to HCFA on this service: ACOG: Requires greater time, mental effort, and technical skill than CPT 49215, but has approximately the same work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59 year old woman presented with ascites and a pelvic mass. Evaluation has yielded a presumed diagnosis of ovarian cancer. She now undergoes a resection of ovarian malignancy with radical dissection, which includes a bilateral salpingo-oophorectomy, omentectomy and removal of pelvic tumor and abdominal tumor. Following hospital discharge, she receives follow-up office care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Operative Work:

An incision is made and carefully carried by layers until the peritoneal cavity is entered. Cytologic washings and subdiaphragmatic scrapings are taken. The abdomen and pelvis are explored and the extent of tumor assessed. A bilateral salpingo-oophorectomy is performed by dissecting the pelvic sidewalls, ureters, and sigmoid from the adnexal masses. The pelvic peritoneum may need to be removed as part of the radical resection. An omentectomy is performed. An attempt is made to remove all tumor nodules larger than 1 cm in the abdomen and pelvis. An omentectomy is performed. The abdomen is closed in layers and the dressing applied.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 9 days. The patient is discharged on post op day 9 with instructions for follow-up care. The patient is reevaluated three times post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 112 Response Rate (%): 55 (49%) Median RVW: 23.3525th Percentile RVW: 18 75th Percentile RVW: 30 Low: 13 High: 48.40Median Pre-Service Time: 60 Median Intra-Service Time: 24025th Percentile Intra-Svc Time: 180 75th Percentile Intra-Svc Time: 270 Low: 120 High: 320

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>60</u>	
ICU:	<u>45</u>	<u>2</u>
Other Hospital:	<u>105</u>	<u>7</u>
Office:	<u>45</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49215	Excision presacral tumor	21.05
2)	44140	Partial colectomy	16.97
3)	49000	Exploratory laparotomy	8.99
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Intra-service work for CPT 58952 requires a higher level of time, mental effort, and technical skill/physical effort because CPT 49215 involves only the removal of a single tumor, while CPT 58952 includes upper abdominal tumor debulking as well. Post-service work for CPT 58952 is greater than post-service work for CPT 49215 due to greater blood loss and higher risk of infection.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 58960 Global Period: 090 Current RVW: 10.14 Recommended RVW: 16.55

CPT Descriptor: Laparotomy, for staging for restaging of ovarian malignancy ("second look"), with or without omentectomy, peritoneal washing, biopsy of abdominal and pelvic peritoneum, diaphragmatic assessment with pelvic and limited periaortic lymphadenectomy

Source and Summary of Comment to HCFA on this service: ACOG: Requires total physician work approximately equivalent to CPT 49220, but work RVUs are lower for 58960.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59 year old woman completed 6 cycles of platinum-based chemotherapy following cytoreductive surgery for ovarian cancer. She now undergoes end-staging laparotomy. Multiple specimens of cytology washings of abdominal quadrants, pelvic and subdiaphragm, as well as multiple biopsies are taken. After hospital discharge, the patient receives office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Operative Work:

An incision is made. On opening the peritoneal cavity, care is taken to avoid injury to adherent loops of bowel from previous surgery. Peritoneal washings are taken and subdiaphragmatic scrapings are obtained for cytologic evaluation. Multiple biopsies are taken from the abdominal and pelvic peritoneum. A selected bilateral pelvic and paraaortic lymphadenectomy is performed. An omentectomy is done, if not done at the initial surgery. The abdomen is closed in layers. A dressing is applied.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 5 days. The patient is discharged on post op day 5 with instructions for follow-up care. The patient is reevaluated three times post operatively.

SURVEY DATA:

Specialty: ACOG

Sample Size: 112 Response Rate (%): 55 (49%) Median RVW: 16

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49220	Staging celiotomy	13.66
2)	38562	Limited lymphadenectomy	9.65
3)	49000	Exploratory laparotomy	8.99
4)	38770	Pelvic lymphadenectomy	12.10

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The intra-service work of CPT 58960 is approximately equivalent to the intra-service work for CPT 49220, except that CPT 58960 usually does not include a splenectomy. However, the technical skill and physical effort required to perform CPT 58960 is greater because of adhesions from previous surgery for the ovarian malignancy. In addition, stress associated with CPT 58960 is higher than for CPT 49220 because of the greater risk of bowel damage. The typical patient undergoing CPT 58960 also tends to be sicker because of having undergone chemotherapy, so post-operative work may be greater.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 59100 Global Period: 090 Current RVW: 5.96 Recommended RVW: 11.54

CPT Descriptor: Hysterotomy, abdominal (eg, for hydatiform mole, abortion)

Source and Summary of Comment to HCFA on this service: ACOG: Requires greater mental effort, technical skill, and stress throughout the pre-, intra-, and post-service periods than CPT 49000, but has fewer work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 27 year old G4P3 female with a history of 3 previous cesarean sections is admitted with fetal death in utero at 20 weeks. The cervix is long and closed and leakage of amniotic fluid is noted. After admission, she is noted to be developing early signs of amnionitis. Antibiotics are begun and the patient undergoes hysterotomy. After hospital discharge, she receives follow-up care in the office during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

The surgery is similar to a cesarean section but the abdominal and uterine incisions are smaller. The lower abdominal wall is opened with either a vertical or horizontal incision, and the uterus is entered through the lower uterine segment. The embryo is removed along with any remaining membranes and placenta from the uterine cavity. The abdominal and uterine incisions are closed by suturing.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 4 days. The patient is discharged on post op day 4 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 200 Response Rate (%): 49 (25%) Median RVW: 1425th Percentile RVW: 11.08 75th Percentile RVW: 16 Low: 9 High: 20Median Pre-Service Time: 60 Median Intra-Service Time: 6025th Percentile Intra-Svc Time: 57.5 75th Percentile Intra-Svc Time: 90 Low: 30 High: 180

2)	59515	Cesarean delivery including postpartum	16.55
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Intra-service work for CPT 59100 and CPT 59515 is very similar, except that the abdominal and uterine incisions required for CPT 59100 are smaller. Post-operative work is also similar. The recommended RVUs for CPT 59100 are lower, though, because the RVUs assigned to CPT 59515 reflect the work of managing labor which is not included in CPT 59100.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 59121 Global Period: 090 Current RVW: 6.99 Recommended RVW: 10.99

CPT Descriptor: Surgical treatment of ectopic pregnancy, tubal or ovarian without salpingectomy and/or oophorectomy

Source and Summary of Comment to HCFA on this service: ACOG: Requires more mental effort, technical skill, and stress than CPT 49000, but has lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 36 year old gravida 2, para 1 presents with mild abdominal pain, vaginal spotting, elevating BhCG levels to 6000 without ultrasound evidence of an intrauterine gestation. she has a previous colostomy in place. The patient undergoes mini-laparotomy and is found to have a right ampullary unruptured ectopic gestation. This is evacuated with salpingostomy. After hospital discharge, the patient receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

An incision is made in the lower abdomen, and the pelvic cavity is explored. An inspection of the gestation site is performed for bleeding. All of the products of conception, clots, and free blood are removed. The embryo is manually removed from the tube by making a small incision in the tube. The pelvis is lavaged with saline solution and the incision is closed with sutures.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 150 Response Rate (%): 46 (31%) Median RVW: 1225th Percentile RVW: 10.2 75th Percentile RVW: 14 Low: 3.74 High: 19Median Pre-Service Time: 60 Median Intra-Service Time: 9025th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 94 Low: 40 High: 120

Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	49000	Exploratory laparotomy	8.99
2)			
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The mental effort and judgment required by CPT 59121 to decide whether the tube or ovary affected by the ectopic pregnancy can be salvaged and the technical skill required to complete this procedure are at least equivalent to, if not significantly greater than, the mental effort and technical skill required to perform CPT 49000. In addition, CPT 59121 is performed on an emergency basis on a patient who may be in shock from blood loss and is at high risk of post-operative infection and future loss of fertility so stress is higher for this procedure than for CPT 49000.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	99215	-	1.51
Intra-service	78 min. x .06	-	4.68

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 59130 Global Period: 090 Current RVW: 7.88 Recommended RVW: 14.94

CPT Descriptor: Surgical treatment of ectopic pregnancy, abdominal pregnancy

Source and Summary of Comment to HCFA on this service: ACOG: Requires approximately equivalent time, and significantly greater judgment, technical skill, and stress than CPT 49000, but has lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 36 year old primigravida presents with elevating hCG levels to 6000 without evidence of intrauterine pregnancy and undergoes endoscopic pelvic evaluation with the findings of a mild hemoperitoneum of approximately 100 cc of blood in the cul-de-sac. Examination of the fallopian tubes and ovaries reveal no evidence of a tubal gestation. However, examination of the omentum behind the right adnexa suggests a fixed clot, which upon examination is the likely implantation site for an abdominal pregnancy. Because of the proximity to the transverse colon and the physician's inability to achieve adequate hemostasis endoscopically, an exploratory laparotomy is performed with partial omentectomy and removal of the abdominal pregnancy. After hospital discharge, the patient receives routine office follow-up care during the 90 day global period.

Note: The endoscopic evaluation can be coded separately as CPT 56300 and should not be included in your work RVU estimate.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

After making an abdominal incision, the fetus is removed from the abdomen. The membranes are also removed and the cord is ligated near the placenta. Abdominal lavage is performed and the abdominal incision is closed with sutures.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

SURVEY DATA:Specialty: ACOGSample Size: 150 Response Rate (%): 35 (23%) Median RVW: 13.4925th Percentile RVW: 10.5 75th Percentile RVW: 15.7 Low: 9.5 High: 20Median Pre-Service Time: 60 Median Intra-Service Time: 12025th Percentile Intra-Svc Time: 90 75th Percentile Intra-Svc Time: 120 Low: 45 High: 210

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Total work required for CPT 59130 is approximately equivalent to the total work required for CPT 59515. While CPT 59130 does not include the work of managing labor, this is outweighed by the much higher level of stress and greater intra-service time associated with CPT 59130.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 59136 Global Period: 090 Current RVW: 8.69 Recommended RVW: 13.06

CPT Descriptor: Surgical treatment of ectopic pregnancy, interstitial, uterine pregnancy with partial resection of the uterus

Source and Summary of Comment to HCFA on this service: ACOG: Requires approximately equivalent time, and significantly greater judgment, technical skill, and stress than CPT 49000, but has slightly lower work RVUs.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 26 year old woman with a history of post medical treatment for pelvic inflammatory disease presents with right lower quadrant abdominal pain, BhCG level of 4000, and pelvic ultrasound findings suggestive of an ectopic gestational sac in the proximal left fallopian tube or uterine cornua. An exploratory laparotomy is performed with findings of a cornual pregnancy. This is injected and resected with proximal resection of the fallopian tube. After hospital discharge, the patient receives routine office follow-up care during the 90 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician will admit the patient to the hospital, prepare the hospital records and chart in accordance with hospital policy, will check on the patient, and will review records prior to the surgery. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient.

Description of Intra-Service Work:

An exploratory laparotomy is performed with findings of a cornual pregnancy. The uterine wall is resected and then reconstructed. The proximal portion of the fallopian tube is also resected. Pelvic lavage is performed and the abdominal incision is closed with sutures.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The physician visits the patient in the hospital for 3 days. The patient is discharged on post op day 3 with instructions for follow-up care. The patient is reevaluated twice post operatively.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 59841 Global Period: 010 Current RVW: 3.24 Recommended RVW: 5.45

CPT Descriptor: Induced abortion, by dilation and evacuation

Source and Summary of Comment to HCFA on this service: ACOG: Typical patient has changed since establishment of RVUs. Gestational length of pregnancies terminated with this method now longer, increasing level of skill required and the risk of the procedure.

NAF and AGI: Undervalued in comparison to 59840. The difference in RVUs does not reflect the difference in work.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A pregnant woman at 18 weeks gestation presents for termination of pregnancy. She has already received extensive counseling about the procedure. She now undergoes dilation and evacuation under appropriate anesthesia. She is observed for 6 hours post-operatively and discharged home with dietary and post-operative activity instructions. She has an uneventful recovery and receives routine follow-up care during the 10 day global period.

Description of Pre-Service Work:

Pre-service work includes taking a comprehensive history and performing a comprehensive examination to determine the patient's current medical status. Indications for the procedure and its appropriateness are reviewed. Informed consent is obtained. The physician may admit the patient to the hospital and if so must prepare the hospital records and chart in accordance with hospital policy, check on the patient, and review records prior to the surgery. If done in an outpatient setting, the chart is documented. The physician then scrubs for the procedure, and waits for anesthesia induction and the preparation of the patient. Cervical dilators were used several hours to several days prior to the procedure and are not part of the pre-service work.

Description of Intra-Service Work:

A speculum is inserted into the vagina to view the cervix. A tenaculum is used to grasp the cervix, pull it down, and exert traction. A cannula is placed in the dilated endocervical canal and passes it into the uterus. The suction machine is then activated and the uterine contents are evacuated by rotation of the cannula. Since this pregnancy is later than 16 weeks, the cannula is used to drain amniotic fluid and to draw tissue into the lower uterus for extraction by forceps. A sharp curet may also be used to scrape the uterus to ensure that it is empty.

Description of Post-Service Work:

Following the procedure, the physician writes orders for post-operative care, accompanies the patient to the recovery room, and talks with the patient's family. The patient is then evaluated in the recovery room. The physician dictates the operative procedure and makes periodic checks on the patient's condition. Any drainage catheters are normally removed when the patient is ambulatory and she is monitored for normal voiding. The patient is discharged the same day with instructions for follow-up care. The patient is reevaluated once post operatively.

SURVEY DATA:

Specialty: ACOG

Sample Size: 60 Response Rate (%): 25 (42%) Median RVW: 4.8

25th Percentile RVW: 4.26 75th Percentile RVW: 6.5 Low: 3.59 High: 14.6

Median Pre-Service Time: 45 Median Intra-Service Time: 35

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	59820	Treatment of missed abortion - first trimester	3.73
2)	59821	Treatment of missed abortion - second trimester	4.26
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 59841 requires greater technical skill and entails greater skill than CPT 59821 because of the greater difficulty of terminating a continuing pregnancy and a higher risk of excessive bleeding and infection.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-service	99215	-	1.51
Intra-service	35 min. x .05	-	2.0
Day of procedure	99233	-	1.25
Office	99214	-	<u>.94</u>
			5.45

Note: We believe that since the late 1980s, the profile of patients undergoing an abortion by dilation and evacuation has changed, so that it is now undervalued in comparison to CPT 59840 (Induced abortion, by dilation and curettage). According to the most recent data available from the Centers for Disease Control, more than 87 percent of abortions occur within the first twelve weeks of gestation (the first trimester).

It appears that there has been a shift in the choice of medical technique used to perform the relatively few abortions that occur in the later second trimester and therefore a change in the typical patient undergoing abortion by dilation and evacuation (CPT 59841). Specifically, a higher proportion of the pregnancies terminated by this method are now greater than 16 weeks gestation. The physician work associated with CPT 59841 increases with the length of gestation. More time and greater skill are required for safe completion of the procedure. In addition, the technique itself differs slightly. For pregnancies through 16 weeks, the physician places a cannula in the dilated endocervical canal, the suction machine is activated, and the uterine contents are evacuated by rotation of the cannula. For later pregnancies, the cannula is used to drain the amniotic fluid and to draw tissue into the lower uterus for extraction by forceps. In addition to the difference in intra-service work, patients undergoing a later second trimester abortion require closer follow-up because of the increased risk of infection and hemorrhage.

Data on induced abortion are notoriously out-of-date and incomplete. Information from the Centers for Disease Control Reproductive Health Surveillance Branch reported in **Morbidity and Mortality Weekly Report**, though, are suggestive of a trend toward increasing use of dilation and evacuation for later second trimester abortions. Between 1982 and 1990, the proportion of all abortions that were performed at 16 or more weeks gestation remained constant at about 5 percent. However, the distribution of abortions by technique did change. Over this time period, the proportion of abortions performed by intrauterine saline installation or prostaglandin installation (techniques only used in the late second trimester) declined from 2.5% to 0.8% of all abortions. This change was accompanied by a rise in the percentage of abortions performed by suction curettage (which includes dilation and evacuation) from 89.9% in 1982 to 94% in 1990.

AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE RBRVS FIVE-YEAR REVIEW

RUC RECOMMENDATIONS

Neurosurgery

Comments

The American Association of Neurological Surgeons/Congress of Neurological Surgeons (AANS) submitted comments to HCFA identifying 73 misvalued services, both under- and overvalued. The comments presented a detailed history of the RBRVS for neurosurgery, identifying several problems in the methodology and results of the original Harvard study, particularly in the change from intraoperative work to total work and in the cross-specialty linkage process, and in review by refinement panels. The basic problem is attributed to the Harvard cross-specialty linkage process distorting and compressing the within-neurosurgery relative work ratings. Although this was corrected to some degree in Phase 3 of the study, the 1992 refinement panels did not accept many of the final Harvard numbers for neurosurgical procedures. Even the final Harvard data contain errors in data on postservice work, and they often do not assume any ICU visits when at least several would be provided by the neurosurgeon.

Most of the arguments presented focus on the nontemporal components of physician work, described as "intensity." The comments explain that the current RVUs do not accurately reflect the varying levels of intensity for different neurosurgical procedures, nor within the different components of each service. To identify the specific codes that are misvalued in the current scale, the AANS conducted a survey in 1994. A representative sample of 200 neurosurgeons was surveyed to evaluate in detail the time and intensity of key reference services for neurosurgery using the same categories of time and intensity provided by HCFA in the December 8, 1994 Rule. Surveyed physicians were not asked to reevaluate the total work RVUs for these procedures, however. The time data gathered from this study, which included detailed operative logs on over 1,500 neurosurgical patients, was found to correspond closely to the final Harvard Phase 3 data, and the AANS concluded that the survey provided good validation for the Harvard results for this component of work. The study also attempted to directly measure mental effort and judgement, technical skill and physical effort, and psychological stress, rather than calculating it as a ratio of work to time. This allows for more variation within each component of intensity and greater precision in calculating relative values. This research confirmed the problems initially identified by the AANS, with pre- and postwork for some of the most complex procedures underestimated by 30-40%.

The focus of the AANS comments is on appropriately valuing the codes within neurosurgery by adjusting the rank orders upwards and downwards. To develop its recommendations to the RUC, the AANS conducted a second survey in 1995, which led to some adjustments in the recommended

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

RVUs. In addition, the AANS identified five more misvalued codes that had not been mentioned in its comments to HCFA. The RUC believes it is important to add these codes to the five-year review in order to have correct rank ordering of codes across neurosurgical procedures.

RUC Rationale

The RUC evaluated the approach used to calculate the recommended RVUs and considered it to be reasonable. There was some discussion of "lumping" vs. "splitting," as the AANS methodology of measuring intensity "splits" it out from overall work. On the other hand, the time periods used by the AANS were the same ones used by Harvard, and the time estimates are based on objective data, not on surgeons' opinions about how much time they spend doing each component of work. In fact, for a number of the services studied by the AANS, the resulting RVUs tended to validate the final RVUs from the Harvard RBRVS study. For example, code 61480 [*Craniectomy, suboccipital; for mesencephalic tractotomy or pedunculotomy*] currently has 16.77 RVUs, but the final Harvard RVUs for the service are 25.55 RVUs and the neurosurgery study produced a recommended value of 25.03 RVUs.

The effort appeared to the RUC more as an attempt to bring a higher degree of precision to the relative values for neurosurgery than to split work into more components in order to inflate the relative values. The recommended reductions in some higher frequency codes (i.e., code 63030, *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disk; one interspace, lumbar*, is reduced from 12.11 to 11.10 RVUs and had a frequency of 29,103 in 1994) bolstered this perception. In addition, a number of very low frequency services, including some pediatric codes, were included in the analysis and recommendations (i.e., *Craniectomy, suboccipital; for mesencephalic tractotomy or pedunculotomy*, which had zero claims in 1994). Services which are both highly specialized and very infrequently provided may not have received sufficient attention in the Harvard study. In addition to the individual recommendation forms and data reports, a summary of the AANS arguments and methodology is attached to this recommendation.

To evaluate the results of this approach, the RUC workgroup, which included a general surgeon, an ophthalmologist, and a psychiatrist, first selected out a number of the codes and calculated two ratios: (1) recommended total work RVUs/intraservice time, and (2) recommended total work RVUs/total time. The results of this analysis were very consistent with one another and with other codes on the RBRVS, with nearly all of the codes having a ratio of RVUs to total time of about 0.05 and ratios of RVUs to intratime of 0.10 to 0.14. The highest intrawork ratio was 0.178 for code 61700 [*Surgery of intracranial aneurysm, intracranial approach; carotid circulation*, 48.30 RVUs recommended], and this was found to be appropriate because of the extremely complex and difficult nature of this service, when compared to both other codes within the family of intracranial vascular codes and other major neurosurgical services:

The degree of mental effort and judgement are very high in all three phases of the service, beginning with the immediate preservice decisions regarding the optimal management strategies appropriate to the individual patient circumstances. The intraservice phase requires a sustained near maximal level of judgmental effort to apply to the particular details of the approach, the local anatomy, and the variations in aneurysmal relationships to parent vessels, as well as adjacent neural structures. Small errors at this phase can be lethal. The postservice phase on average requires

five ICU visits, with a very high level of mental input to the frequent problems that occur following this operation, including the development of hydrocephalus or reactive vasospasm due to the blood products released into the subarachnoid space following the original aneurysmal hemorrhage. The contribution of technical skill and effort during the intraservice phase was rated by over 100 neurosurgeons at near maximum for the majority of the 270 minutes of operative time. This was not the typical spiked peak of intensity common to many operations, but was a sustained level of very high technical skill, since virtually all of these procedures are done under high magnification and are dealing with very small structures situated deep beneath the anterior portion of the brain and commonly proximate to the optic nerve and internal carotid artery and branches. The stress and risk component of intensity was also ranked very high by all respondents due to the high morbidity associated with a major subarachnoid hemorrhage as well as the risks of damage to major vessels or neural structures during the aneurysmal dissection and clipping. The stress factor centers on the risk of early rebleeding from the aneurysm before surgery and management of intracranial hypertension. It extends into the postservice phase due to the frequent development of stroke symptoms due to brain ischemia following vasospasm.

The RUC then selected several of the codes for comparison with codes on the MPC with which they were familiar:

- Code 61682 [*Surgery of intracranial arteriovenous malformation; supratentorial, complex, 59.47 RVUs recommended*] was compared with 33870 for transverse aortic arch graft, which has 37.74 RVUs. This service involves the surgical efforts to obliterate and remove a congenital vascular malformation from within the brain, frequently deep within a cerebral hemisphere. Many of the issues that contribute to the high complexity of 61700 also apply to this service, although pre- and postwork complexity is somewhat lower. This service requires 420 minutes of intraoperative time, however, compared to 270 minutes for 61700.
- Code 67107 for repair of retinal detachment (13.99 RVUs) was compared to code 61875 for implantation of neurostimulator electrodes (13.79 RVUs recommended). The intrawork ratio for retinal detachment is 0.13 and the total work ratio is 0.049; for the neurosurgery code the intrawork ratio is 0.115 and the total work ratio is 0.04. The ratio comparisons and the work and time involved in each service appear to be correct. Code 67107 involves 107 minutes of intraoperative time, and code 61875 involves 120 minutes of intraoperative time. The final Harvard RVUs for code 61875 are 14.06.
- The comparison of code 61702 for surgery of intracranial aneurysm (46.31 RVUs recommended) to code 48150 (Whipple procedure, 42.53 RVUs) also seems correct, since 61702

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

involves surgery of a vertebral or basilar artery aneurysm and has the same high levels of mental effort, technical skill, and stress/risk outlined above for 61700.

The RUC concluded that the neurosurgery study produced relative value recommendations that are considerably more precise than the current RVUs for these services.

Three codes in this section were identified for review by the CMDs as well as the AANS, and the RUC reviewed each of these recommendations individually:

- For code 61791 [*Creation by stereotactic method, percutaneous, by neurolytic agent (eg, alcohol, thermal, electrical, radiofrequency); trigeminal medullary tract, 7.29 RVUs*], the CMDs recommended an increase to 13.29 RVUs because the service is substantially more difficult than 61790 for treatment of trigeminal nerve (10.31 RVUs). The RUC recommends a somewhat higher increase to 13.99 RVUs rather than the 13.29 RVUs recommended by the CMDs. The Harvard RVUs for this service are 14.28 RVUs.
- For code 62290 [*Injection procedure for diskography, each level; lumbar, 3.58 RVUs*], the CMDs recommended a reduction to 2.05 RVUs, which would be 25% more than code 62289 for epidural or caudal injection. The RUC agreed with the AANS that 62289 is a poor reference for code 62290 because the techniques are not very comparable and the targets and risks are different. Code 62291 [*Injection procedure for diskography, single or multiple, cervical, 2.91 RVUs*] is considered a better reference. The Harvard time appeared to apply only to a single level study, with a much longer time needed for a two-level or multiple study. 62290 should be reduced from 3.58 to 3.00 RVUs to allow for the fact that lumbar diskography is inherently more difficult than cervical diskography and still correct the rank order problem of the current RVUs.
- For code 64443 [*Injection, anesthetic agent; paravertebral facet joint nerve, lumbar, each additional level, 1.35 RVUs*], the CMDs recommended the code be valued at 50% of code 64442 because it is an add-on code and does not involve pre- and postwork. Although the general rule of major surgical procedures that about 50% of the work is intra- and 50% is pre- and post-, this does not hold true for many minor procedures. In fact, the RVUs for code 64443 were already reduced significantly when the global period was changed. For 64442 and 64443, the AANS found that intrawork is 61% of total work. The RUC recommends, therefore, that the RVUs for 64443 be reduced to 0.98 from 1.35, but not to 0.78 as recommended by the CMDs.

The RUC considered recommending that all the neurosurgery codes in the five-year review be rescaled to make the changes work neutral. Although the AANS recommended changes in a very

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

large number of codes, because some of them have zero or very few Medicare claims annually and because reductions were recommended in some of the high frequency codes, such as 63030 for low back disk surgery, the overall impact of the recommendations is relatively small. An AMA analysis using 1994 frequency data found that acceptance of the recommended changes would increase Medicare expenditures by about \$3.8 million. Rescaling the recommended values to make them work neutral would have required nearly a 4% reduction in all the recommended values, however, and this would have made some of them, particularly those for which reductions are recommended, too low. The RUC recommends, therefore, that all the recommended changes be adopted without any rescaling.

RELATIONSHIP OF 22849 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference services for this service are 22852 (REMOVAL POST. SEGMENTAL INSTRUMENTATION) and 22842 (INSERT POST. SPINE FIXATION DEVICE). The work involved in this service, 22849, is more than that for 22852 and 22842, which matches the Harvard3 total work values as well as the ascending scale of recommended RVWs. The MFS95 RVW for 22849 is out of scale with the associated service RVWs as illustrated in the table above, and it appears that the total Harvard3 work value is a more appropriate valuation of the service, with the converted RVW of 17.55 which matches the Harvard3 RVW converted from the total work value. This is our recommendation for a change in this code.

Several of the anterior discectomy codes are included for perspective on the total RVWs for services from an anterior approach.

PT Code: 22855

RATIONALE for recommendation:

Work:	Changes in past 5 years	Increased frequency of the spinal instrumentation services.
	Rank Order (Ordinal) Valuation:	Rank order of recommended RVWs in table appropriate as listed.
	Initial crosswalk or extrapolation misvaluation:	Initial total work was 1763.
Time:	Harvard3 Database:	As above.
	Mental Effort & Judgement:	Mental effort and judgement above that of 22852.
	Technical Skill & Physical Effort:	Greater than 22852.
	Stress:	Stress levels comparable across reference codes.
	Complexity:	Harvard3 intensity 10.19 compared to Harvard3 intensity of 6.33 for 22855.

RELATIONSHIP OF 61107 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

This service also has a Global period of 000 which means that only the intra-service work relates to the RVW. This code compares most closely to 61106 examined above, also with a Global of ZZZ which excludes the post-service work. We surveyed this procedure and obtained data only for the intra-service time, which measured 30 minutes compared to the 31 minutes reported in Harvard3. However, Harvard3 included pre- and post-service time and work in their calculations, since the Global period was changed to ZZZ subsequent to the Harvard study and the original MFS in 1992 which had a RVW of 8.69. Code 61107 requires more work than 61105 or 61106, including the implantation of a ventricular catheter or recording device, plus the work of connection to an external drainage &/or recording system under aseptic conditions. Since we did not survey on the same basis, we are using rank order comparison to recommend a RVW of 5.00.

RATIONALE for recommendation:

<p>Work:</p> <p>Changes in past 5 years</p> <p>Rank Order (Ordinal) Valuation:</p> <p>Initial crosswalk or extrapolation misvaluation:</p> <p>Prev. RUC or Refinement Valuation:</p>	<p>Improved packaging of equipment to do this service past 5 years. Key to adjusting RVWs within this family of codes.</p> <p>61107 refinement in 1992 reduced RVW from 8.69 to 4.59 by the amount of work attributed to post-service followup, with change to ZZZ from 090.</p>
<p>Time:</p> <p>Op. Logs:</p> <p>AANS94 Survey Key Refs:</p> <p>Harvard3 Database:</p> <p>Undervalued time/Phase I or II & MFS92:</p>	<p>Intra-service time surveyed at 30 min.</p> <p>Harvard3 Pre- and Post- time overvalued due to original global 090.</p>
<p>Mental Effort & Judgement:</p> <p>Technical Skill & Physical Effort:</p>	<p>Slightly greater skill to do same service as 61105 with implantation of a ventricular catheter..</p>
<p>Stress:</p> <p>Intensity/Complexity:</p>	<p>More complex than 61105 or 61106.</p>

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 61210 Global Period: 000 Current RVW: 4.72 Recommended RVW: 5.84

CPT Descriptor: Burr hole(s); for implanting ventricular catheter, reservoir, EEG electrode(s) or pressure recording device (separate procedure)

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended increase in RVW from 4.72 to 5.84.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year old man has a severe closed head injury with a Glasgow Coma Scale of 6 and no focal or lateralizing signs. Admitting CT scan shows no hematomas or shift but obliteration of the basal cisterns. Intracranial pressure monitoring with capability for drainage of ventricular fluid is desired. A frontal ventriculostomy catheter is implanted, and attached to an external monitoring and collection system.

Description of Pre-Service Work: includes review of imaging studies, review of past medical history and appropriate lab studies. Pre-service work includes informed consent with the family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup

Description of Intra-Service Work: A frontal scalp is made under local anesthesia. A twist drill hole is made, and a ventriculostomy catheter is introduced into the anterior horn of the lateral ventricle. The catheter is tunneled beneath the scalp for about 1-2 cm and then brought to the surface via a small stab wound. The catheter is connected to a pressure transducer and drainage tubing system. The system is calibrated to assure patency of the catheter. The scalp is then closed and dressings applied

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of leakage of ventricular fluid or infection. No post-operative services are included in the 000 Global period assigned.

REFERENCE SERVICE(S):

61151	BURR HOLE(S) FOR SERIAL ASPIRATION OF ABSCESS OR CYST	57	57		119	1158		11.53	11.40	
61154	BURR HOLE(S)/EVACUATION OF HEMATOMA, EXTRA- OR SUBDURAL, UNILAT.	65	69		176	1212	1361	12.06	13.67	

RELATIONSHIP OF 61210 TO REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The services in this family are scaled by their rank order valuation comparing each to their neighbors. Several are significantly over-valued and have been recommended for reductions. 61210 is one more step up in work than the reference service, 61107 (twist drill hole/implant vent cath or recording device), discussed above. The Harvard3 RVW is 5.84 and this appears appropriate in the context of the additional work of making a burr hole compared to a twist drill opening in the skull and implanting a reservoir beneath the scalp. This includes an intra-service time of 44 minutes compared to 31 minutes for 61107. The total work value reflects this difference appropriately, and the RVW of 5.84 represents an increase that retains the rank order within this family, compared to the undervalued RVW of 4.72 in the MFS95. We recommend a RVW of 5.84.

Code: 61210

RATIONALE for recommendation:

Work:
Changes in past 5 years:
Rank Order (Ordinal) Valuation: Rank order valuation is a basic tool to restore the appropriate relationships within this family of codes. The values listed in the table above reflects the face validity of these services and are supported by extrapolation from the Harvard3 time and work data.

Initial crosswalk or extrapolation misvaluation:
Prev. RUC or Refinement Valuation: Original RVW for 61210 from Phase I was 8.69 with a global of 090. When the global was changed to 000 in the May 1992 refinement, the RVW was reduced to 4.97 to account for the work

Time:
Op. Logs: Avg. intra- time = 41 min.
Anesthesia databases: Avg. anesthesia time = 85 min.
*AANS95 Survey: Survey data invalid due to respondents failing to adhere to global of 000, despite warnings, and include ICU visits, 7 hospital visits and 3 office visits.
Harvard3 Database: Time and work values appropriately higher than 61107.
Mental Effort & Judgement:
Technical Skill & Physical Effort: Slightly greater skill and effort for 61210 due to use of a burr hole as cranial access to ventricle.

Stress:
Intensity/Complexity: Complexity slightly greater than twist drill 61107 for same target.

RELATIONSHIP OF 61312 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61154 is a Key Reference for comparison, and is a simpler, less complex and shorter procedure than 61312 which involves a craniotomy for removal of a formed intracranial blood clot. Use of 61154 with burr holes implies a liquid collection of subdural blood, and consequently is done in a subacute to chronic stage contrasted to the acute circumstances that usually accompany the discovery of an acute sub- or epidural hematoma.

61312 is also a key reference procedure and was surveyed with values for work and time that resulted in a calculated total work value from the AANS survey of 2194 compared to the Harvard3 total work of 2040 for the same procedure. The intra-service time from the AANS survey was 120 minutes while that from Harvard3 was 150 minutes. The principal differences in total work came from the 28% greater amount of Pre- and especially Post-service time identified in the AANS94 survey, half of which derives from ICU time. When these time/work components are added to the intra-service work, the total exceeds the total work from Harvard3 upon which the existing RVW is based. The total AANS94 work value of 2194 converts to a RVW of 21.83 in the scale of the 1995 fee schedule

Another argument for increasing the RVW for 61312 is based on the evidence of what appeared to be an arbitrary compression of the total work value that was developed during the Harvard/Hsiao Phase II project. The total work value for 61312 delivered to HCFA was 2306, but the final work value after some unexplained adjustments at HCFA was only 2040. This represented an arbitrary reduction of 11.4%, which has remained unchanged since 1992.

Sample #:																		
% response:	48%																	

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

Initial crosswalk or extrapolation misvaluation:

Ordinal comparisons to listed comparable services meet face validity.

The total work from Hsiao Phase II in 11/90 of 2306 was reduced at HCFA in 1991 to only 2039, an 11.4% reduction.

Time:

LOS:

Op. Logs:

LOS=12 days for AANS94 survey, and 12.1 days from HCIA94 data.

Intra time for Harvard3 =150 min. and for AANS94 =120 min. Two clinic op. logs =avg. intra time of 117 min.

Anesthesia databases:

AANS94 Survey Key Refs:

Harvard3 Database:

480 cases=avg. anesth.time of 218 min. Avg. intra time =137 min

Data used in recommendations.

Undervalued time for Post op office visits with 36 min. from Harvard3 compared to 60 min. from AANS94.

Undervalued time/Phase I or II & MFS92:

Note 100 min of ICU time in AANS94 survey not included in Harvard3 data

Mental Effort & Judgement:

Generally greater than 61154 due to decisions required to determine need for craniotomy rather than only burr holes, and related to the usual patient who has a solid clot rather than a collection of subdural fluid.

Technical Skill & Physical Effort:

Skill and effort greater for 61312.

Stress:

Higher acuity of illness in patients suitable for this service.

Intensity/Complexity:

Intensity and complexity significantly greater compared to 61154.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

PT Code: 61313 Global Period: 090 Current RVW: 20.54 Recommended RVW: 22.63

PT Descriptor: **Craniectomy or craniotomy for evacuation of hematoma, supratentorial; intracerebral**

Source and Summary of Comment to IICFA on this service:
AANS recommended increase in RVW from 20.54 to 22.63.

Public Comments by AANS.
Current AANS95 survey to validate time/work data.

CLINICAL DESCRIPTION OF SERVICE:

Signette Used in Survey: A 63 year old man has a spontaneous intracerebral hemorrhage into the basal ganglia in the minor hemisphere. He is hypertensive with normal clotting factors and no arrhythmia. Admitting CT scan shows a large hematoma or with shift and displacement of the medial temporal lobe into the incisura. He has a large sluggish pupil on that same side, suggesting early uncal herniation. A craniotomy is done with exposure and evacuation of the hematoma.

Description of Pre-Service Work: includes review of imaging studies, review of past medical history and appropriate lab studies. Pre-service work includes informed consent with the family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup.

Description of Intra-Service Work: A scalp flap is turned. One or two burr holes are placed and a bone flap elevated. The dura is opened while mannitol is administered. A tract through the cerebral tissue down to the hematoma is developed, and the clot removed. Hemostasis is accomplished and the retractors are removed. The dura is closed, frequently around a drain into the hematoma cavity. The bone flap is replace and secured, and the scalp reapproximated. The drain is connected to a sterile receptacle system. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of leakage of ventricular fluid, infection, or reaccumulation of the hematoma. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

REFERENCE SERVICE(S):

Code	CPT Descriptor	Time in minutes				Work		RVWs

Code: 61313

RELATIONSHIP OF 61313 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61313 and 61312 are both rated at the same RVW of 20.54 in the MFS95. 61313 has a lower work value of 1862 in Harvard3 due to less Pre- and Post-service times. There is no allowance for ICU time/work in Harvard3 although almost all of these patients will spend time in ICU following surgery. The AANS95 Survey reports on average 90 minutes of ICU time for these patients which adds to the shorter post-service time and carries a higher intensity level.

Evaluation of other details of the service indicate this code is undervalued when compared to 61312 to which is similar in many respects. The evacuation of an intracerebral hematoma requires a cerebral incision, which is not part of 61312, and requires additional work in the form of extra time plus intensity factors which include increased judgemental decisions, some margin of technical skill in accurately encountering the hematoma, and the increased stress of entering the brain without stereotactic guidance. Since many of these procedures are done as emergency cases, the stress/risk factor is further increased. We recommend a survey RVW of 22.63.

This code 61313 is less total and intra-service time and approximately the same work as 61514 (CRANIOTOMY FOR EXCISION OF BRAIN ABSCESS, SUPRATENTORIAL) which has a RVW of 23.49 that closely approximates the Harvard3 total work as converted to the MFS95. This has face validity within the family of craniotomy codes and is not a contested value. It represents a more complex and intense service that shares many elements of 61313 in which the brain is entered for removal of an inflammatory abscess capsule rather than a hematoma.

SURVEY DATA:

Specialty: Neurological Surgery

%	20%																	

RATIONALE for recommendation:

Work: Rank Order (Ordinal) Valuation: Face valuation appropriate in table as listed.
 Initial crosswalk or extrapolation misvaluation: Initial valuation of 1862 which is low compared to 61312.

Op. Logs: Avg. time = 201 min.
 AANS95 Survey: 54 respondents support the time and work data in table above.
 Harvard3 Database:
 Undervalued time/Phase I or II & MFS92: Significant ICU time/work is delivered but was not included in the Harvard3 database.

Technical Effort & Judgement: Moderate increase due to invasion of brain tissue to accomplish approach with least damage.
 Technical Skill & Physical Effort: Greater than reference 61312 due to need to find and remove clot at depth in the cerebral tissue.
 Complexity: S1. higher than 61312
 Complexity greater for this service due to above factors.

FIVE-YEAR REVIEW
Comments on MisvaluedCode**

CPT Code: 61330 Global Period: 090 Current RVW: 15.65 Recommended RVW: 21.55

CPT Descriptor: **Decompression of orbit only, transcranial approach**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase RVW from 15.65 to 21.55.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
61500	CRANIECTOMY/CRANIOTOMY FOR TUMOR OF SKULL	67	145		112	1707		16.99	16.93	
61334	EXPLORATION OF ORBIT WITH REMOVAL OF FOREIGN BODY	141	254		453	2232		22.22	17.07	
61304	CRANIECTOMY OR CRANIOTOMY, EXPLORATORY, SUPRATENT	76	161		165	2076		20.66	20.63	
61330	EXPLORATION OF ORBIT (TRANSCRANIAL) OR DECOMPRESSION, UNILATERAL	135	192		630	2165		21.55	15.65	21.55
61332	EXPLORATION OF ORBIT (TRANSCRANIAL) WITH BIOPSY	141	207		453	2444		24.33	26.08	
61333	EXPLORATION OF ORBIT WITH REMOVAL OF LESION	135	265		453	2696		26.83	26.75	

RELATIONSHIP OF 61330 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

This family of codes involving exploration of the orbit is arranged in rank order according to the work and intensity/complexity factors that apply. 61334 (EXPLORATION OF ORBIT WITH REMOVAL FOREIGN BODY) stands out of rank based on the high Harvard3 intra- and post-service times resulting in a higher work value of 2232 when compared to 61304 or 61330, both of which include a transcranial exploration rather than the simpler lateral approach of 61334. Therefore we believe that the times and work for 61334 are inflated and that the proportionately lower RVW from the current fee schedule is appropriate. The present code, 61330 (EXPLORATION OF ORBIT, TRANSCRANIAL, OR DECOMPRESSION, UNILATERAL) was properly valued by the Harvard3 data with a total work value of 2165, which translated to a RVW of 21.55 in terms of the current MFS. The lower value of 15.65 in the MFS95 is anomalous and is not supported by our analysis. We recommend a RVW of 21.55.

RATIONALE for recommendation:

Work:	The work of a transcranial exploration of the orbit is significantly greater than by anterior or lateral approaches.
Changes in past 5 years:	
Rank Order (Ordinal) Valuation:	Ordinal valuation of basic importance in this family.
Initial crosswalk or extrapolation misvaluation:	Suspect that lower RVW in MFS95 related to error in initial survey or extrapolation.
Prev. RUC or Refinement Valuation:	
Time:	
Harvard3 Database:	
Undervalued time/Phase I or II & MFS92:	Harvard3 valuation was appropriate but the RVW was reduced in MFS92 and subsequently.
Mental Effort & Judgement:	The effort & judgement in a transcranial approach is higher.
Technical Skill & Physical Effort:	Skill level slightly higher for 61330 compared to 61334
Stress:	Risk of complications higher with 61330 than 61334.
Intensity/Complexity:	Complexity higher for transcranial approach

Comments on Misvalued Code**

CPT Code: 61340 Global Period: 090 Current RVW: 11.56 Recommended RVW: 17.33

CPT Descriptor: Other cranial decompression (eg, subtemporal), supratentorial

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended increase RVW from 11.56 to 17.33.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVW's		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Harv3	AANS	Harv3 to MFS95	MFS95	Rec.New RVW
61501	CRANIECTOMY FOR OSTEOMYELITIS OF SKULL	92	140		484	1806		17.98	13.59	
61550	CRANIECTOMY FOR CRANIOSTENOSIS, SINGLE SUTURE	113	108		224	1442		14.35	14.24	
61500	CRANIECTOMY/CRANIOTOMY FOR TUMOR OF SKULL	113	145		354	1707		16.99	16.93	
61340	OTHER CRANIAL DECOMPRESSION (SUBTEMPORAL), SUPRATENTORIAL, UNILATERAL	115	121		492	1741		17.33	11.56	17.33
61304	CRANIECTOMY OR CRANIOTOMY, EXPLORATORY, SUPRATENT	133	161		543	2076		20.66	20.63	

RELATIONSHIP OF 61340 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:
 No reference procedures will help position this code in the family. The first is 61500 (CRANIECTOMY FOR TUMOR OF SKULL) with a total work value of 1707, a time of 145 minutes and a current RVW of 16.93. This compares to 61340 total work of 1741 and time of 121 minutes with a current RVW of only 11.56. Since this RVW is low in comparison to the RVW of 61500 which has a total work value that is almost as high as that of 61340, we believe the RVW of 11.56 is out of appropriate rank order in this family.

The second reference service is 61304 (CRANIECTOMY, EXPLORATORY, SUPRATENTORIAL) which is equivalent in many aspects to 61340 and has a total work value of 2076, a time of 161 minutes and a RVW of 20.93.

Since 61340 has work and time intermediate between these two reference codes, we recommend the Harvard3 RVW of 17.33.

RATIONALE for recommendation:

<p>Work:</p> <p>Changes in past 5 years:</p> <p>Rank Order (Ordinal) Valuation:</p>	<p>The relative work units from Harvard3 support an increase in RVW to 17.33.</p> <p>Reduced use of this service due to advanced imaging techniques developed in past 5-10 years.</p> <p>A key element in establishing correction in the relativity to related procedures.</p>
<p>Intellectual Effort & Judgement:</p>	<p>Stepwise increase in all intensity components in this family of services.</p>
<p>Technical Skill & Physical Effort:</p>	<p>This service involves removal of a window of bone in the temporal region beneath the temporalis muscle. It is less demanding than 61304 but more than 61500.</p>
<p>Intensity/Complexity:</p>	<p>The complexity is close to that of 61304 since both services are used in patients with unclear diagnoses that require exploratory approaches to the intracranial space.</p>

FIVE-YEAR REVIEW
Comments on Misvalued Code**

CPT Code: 61470 Global Period: 090 Current RVW: 20.79 Recommended RVW: 24.60

CPT Descriptor: **Craniectomy, suboccipital; for medullary tractotomy**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase in RVW from 20.79 to 24.60.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
61470	CRANIECTOMY, SUBOCCIPITAL, FOR MEDULLARY TRACTOTOMY	132	154		548	2472		24.60	20.79	24.60
61305	CRANIECTOMY OR CRANIOTOMY, EXPLORAT INFRATENTORIAL (POST FOSSA)	140	197		649	2486		24.74	24.77	
61480	CRANIECTOMY, SUBOCCIPITAL, FOR MESENCEPHALIC TRACTOTOMY/PEDUNCULOTOMY	132	151		548	2515		25.03	16.77	25.03

RELATIONSHIP OF 61470 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

These three procedures are related to pain management operations that require opening the posterior cranial fossa and introducing a probe into the substance of the brain stem in order to make a destructive lesion in a pain pathway. The risk factor alone in this procedure is very high due to the anatomy of the target structures and the plan to destroy a specific target area within the brain stem. The MFS95 work value of 61470 appears to be low when compared to the reference service 61305 (CRANIECTOMY FOR EXPLORATION, INFRATENTORIAL) with a total work value of 2486, an intra-service time of 197 minutes and a RVW of 24.77. These two procedures bridge the work and RVW of the reference procedure, supporting the rank order valuation depicted. Therefore, we recommend a RVW of 24.60 for 61470

RATIONALE for recommendation:

Work:	Rank Order (Ordinal) Valuation:	The rank order as listed is appropriate to these services.
Time:	Harvard3 Database:	The Harvard3 time and work data appear to be reliable in correcting this misvalued code.
Mental Effort & Judgement:		The mental effort and judgement in procedures that specifically create a destructive lesion within the brain stem are very high compared to other reference procedures.
Technical Skill & Physical Effort:		
Stress:		The stress and risk factors in this service are high.
Intensity/Complexity:		The complexity and intensity of the procedure are high, as reflected in the Harvard3 calculations of intensity as work/min. at 11.63, among the highest in the whole set of 61000 codes.

RELATIONSHIP OF 61480 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

These two procedures (61480 and 61470) are related pain management operations that require opening the posterior fossa and introducing a probe into the substance of the brain stem in order to make a destructive lesion in a pain pathway. The risk factor alone in this service is very high, as reflected in the intensity numbers. However, the work valuation appears to be low when compared to the reference service 61305 (CRANIECTOMY FOR EXPLORATION, INFRATENTORIAL) with a total work value of 2486, an intra-service time of 197 minutes and a RVW of 24.77. These two procedures bridge the work and RVW of the reference procedure, supporting the rank order valuation depicted. Therefore, we recommend a RVW of 24.60 for 61470, and a RVW of 25.03 for 61480.

RATIONALE for recommendation:

Work:	Rank Order (Ordinal) Valuation:	The rank order as listed is appropriate to these services.
Time:	Harvard3 Database:	The Harvard3 time and work data appear reliable in correcting this misvalued code.
Mental Effort & Judgement:		The mental effort and judgement in procedures that specifically create a destructive lesion within the brain stem are very high compared to other reference procedures.
Technical Skill & Physical Effort:		Skill and effort both high in this type of procedure in area of brain stem and medulla.
Stress:		The stress and risk factors in this service are high.
Intensity/Complexity:		The complexity and intensity of the procedure are high, as reflected in the Harvard3 calculations of intensity as work/min. at 12.15. among the highest in the whole set of 61000 codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
Comments on Misvalued Code**

CPT Code: 61490 Global Period: 090 Current RVW: 15.63 Recommended RVW: 24.20

CPT Descriptor: **Craniotomy for lobotomy, including cingulotomy**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase in RVW from 15.63 to 24.20.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
61514	CRANIOTOMY FOR EXCISION OF BRAIN ABSCESS, SUPRATENTORIAL	137	191		639	2355		23.44	23.49	
61328	CRANIOTOMY/DRAINAGE OF INTRACRANIAL ABSCESS SUPRATENTORIAL	135	174		628	2402		23.91	23.90	
61490	CRANIOTOMY/LOBECTOMY, INCL. CINGULOTOMY, UNILAT.	135	167		556	2431		24.20	15.63	24.20
61510	CRANIOTOMY FOR EXCISION BRAIN TUMOR, SUPRATENT. EXCEPT MENINGIOMA	165	219		634	2328		23.17	23.39	26.77 AANS94

RELATIONSHIP OF 61490 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference service used for comparison is 61320 (CRANIOTOMY FOR DRAINAGE OF INTRACRANIAL ABSCESS, SUPRATENTORIAL) total work value of 2402, a time of 174 minutes and RVW of 23.90.

The total work value for 61490 is 2431, the time 167 minutes, and the recommended RVW 24.20, which fits well on the rank order scale within this family. The key reference 61510 (CRANIOTOMY FOR SUPRATENTORIAL BRAIN TUMOR) is of comparable complexity and work, with somewhat more time in all categories and a current MFS95 value of 23.39.

RATIONALE for recommendation:

Work:	Rank Order (Ordinal) Valuation:	Proper placement in rank order as listed above.
Time:	Harvard3 Database:	Harvard3 time and work data appear well valued.
	Undervalued time/Phase I or II & MFS92:	Significant undervaluation of total work despite Harvard3 data to support a higher RVW.
Mental Effort & Judgement:		Factors comparable to those of listed reference services.
Technical Skill & Physical Effort:		This service shares common technical and skill factors with 61510.
Stress:		
Intensity/Complexity:		The intensity of 61490 is comparable to that of both reference services.

RELATIONSHIP OF 61510 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61510 is a Key Reference procedure that has been undervalued due to the failure to appreciate the amount of post-operative time and work involved in this service. The Harvard3 data that was used to generate the original MFS92 RVWs did not allow for any ICU time, which runs at a higher intensity than other post-op time. It also underestimated the total amount of post-op time and work, as reflected in the table comparison of those values above. For example, the AANS94 survey identified an average of 50 minutes of ICU time and 235 minutes of other post-op services within the 90 day global period. This contributed to the AANS94 survey calculation of work of 2690 which exceeds the original Harvard3 total work calculation of 2287. This supports our argument to increase the RVW to 26.77 which represents the conversion of total work to the scale of the MFS95.

This also fits 61510 into a more satisfactory rank order valuation compared to 61320 (CRANIOTOMY FOR BRAIN ABSCESS) which is slightly less complex and has slightly less time and work than 61510. Two other common procedures, 61154 and 61312, are listed for general comparison to both time, work and RVWs.

Evidence of compression of the work of this code is present in the comparison of values for total work as delivered by Hsiao PhaseII in November 1990 to HCFA for incorporation into the Medicare Fee Schedule. The HsiaoII total work value delivered was 2846, which was reduced to 2322 by the time the cross specialty scale had been adopted at HCFA in June 1991. This was an 18.4% reduction without any reason offered as to the basis for the change. The RVW subsequently adopted was based on the lower work value, and was not approved for an increase when this problem was aired at the May 1992 Refinement Panel

We recommend that the RVW of 61510 be increased to 26.77 based on these considerations and comparisons that more accurately represent a correct value for the service.

61512	CRANIOTOMY FOR EXCISION MENINGIOMA, SUPRATENTORIAL	105	240	50	235		3368			33.51 AANS94

RELATIONSHIP OF 61512 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61512 was surveyed by AANS in Fall 1994 as part of the review of Key Reference Services in the specialty, with results as listed above in the last row of the table. Note that all of the time values exceed those as estimated in the Harvard3 project, with the result that the total work value for the procedure is depressed when compared to the AANS94 survey data as translated into a total work value. The survey intensity factor for 61512 was 9.63 compared to the same factor in Harvard3 of 6.91. This is a more realistic relationship among the intracranial tumor codes and reflects the responses of physicians who actually know the complexity and intensity of these procedures. When the AANS work value of 3368 is converted to the scale of the MFS95, the new RVW is 33.51, which is our recommended value. Also note that the major differences in time are in the post-op period, especially ICU time which amounts to 50 minutes compared to 0 minutes in Harvard3.

When 61512 is compared to the other services in the reference list, it falls in rank order well both in terms of total work units as well as RVWs when converted to the scale of the MFS95. The basis for a higher work value for 61512 is that surgery of an intracranial meningioma is generally more difficult and takes more time and work than resection of a glioma or abscess due to the attachment of the meningioma to dural structures that frequently contain a major dural venous sinus or are wrapped around an important artery or cranial nerve.

61512 (CRANIOTOMY FOR EXCISION MENINGIOMA, SUPRATENTORIAL) was assigned a total work value of 3122 in Harvard/Hsiao Phase II in 1991. This procedure was linked to the orthopedic procedure 27134 (REVISION, TOTAL HIP ARTHROPLASTY) in the cross-specialty linkage process in attempting to develop a common scale of relative values for all procedures. The common link between these two procedures was the intra-service time of 241 minutes for 61512 and 235 minutes for 27134. After the cross-specialty linkage and adjustments, the RVW for 61512 was 25.56 and the RVW for 27134 was 25.86. This analysis supports the argument that compression of the high valued procedures occurred during the Phase II to Phase III transition. The Harvard3 total work value of 2410 listed in the table above was the result of this compression since the original value was substantially higher before the linkage was imposed.

RATIONALE for recommendation:**Work:**

Work difference compared to Harvard3 calculation of total work that reflects greater post-op services than in original MFS.

Changes in past 5 years:**Rank Order (Ordinal) Valuation:**

Rank order valuation appropriate as listed in table.

Initial crosswalk or extrapolation misvaluation:

Hsiao PhaseII total work value of 2846 in 11/90 was reduced to 2408 at HCFA by 6/91, a 22.9% reduction.

Time:**LOS:**

AANS94 survey=7 days; HCIA94=8days.

Op. Logs:

Avg. Intra-service times of 212 min. (18 cases)

Anesthesia databases:

78 cases; avg. time 257 min.

AANS94 Survey Key Refs:

Survey data supports increase in RVW

Harvard3 Database:

Underestimated post-op and ICU time and work

Undervalued time/Phase I or II & MFS92:

MFS92 did not incorporate increases acknowledged in Harvard4 to account for ICU time.

Mental Effort & Judgement:

Planning and strategy for resection of a meningioma is generally more complex than for a glioma.

Technical Skill & Physical Effort:

Technical skill slightly greater than for 61510.

Stress:

Some higher stress levels in this service.

Intensity/Complexity:

Intensity and complexity frequently higher than 61510.

RELATIONSHIP OF 61518 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61518 was surveyed by AANS in Fall 1994 as part of the review of Key Reference Services in the specialty, with results as listed above in the third row of the table. Note that the only significant differences in time are in the 60 minutes of ICU time and the shorter time of 240 minutes for Intra-service time in the AANS94 survey. This Intra-service time has been corroborated from a number of operative logs and anesthesia databases (see below), with an average time of 245 minutes for this portion of the procedure. This conforms very closely to the median survey time of 240 minutes. The reason for a 59 minute difference compared to the earlier Harvard3 database of service times is not entirely clear, although use of some technical advances (the ultrasonic aspirating device for tumor resection) in the past few years may have reduced operative times by up to 15-20 minutes. We suspect the balance of the difference reflects overestimation by the original Harvard teams, especially of intra-operative time. Another difference is the 60 minutes of ICU time identified in the survey, which adds significantly to the total work of the service. Finally, the surveyed intensity factor of 10.19 reflects the degree of complexity and the intensity factors for this service that has a Harvard3 intensity of only 7.47. Allowing that the time data from the AANS94 survey are accurate and the intensity factor representative, the total work value calculated results in a RVW of 35.59.

61518 (CRANIECTOMY/EXCISION TUMOR, INFRATENTORIAL, EXCEPT MENINGIOMA OR CPA TUMOR) was assigned a total work value of 3829 in Harvard/Hsiao Phase II in 1991. This procedure was linked to the urologic procedure 51595 (Total cystectomy with ileal loop) in the cross-specialty linkage process in attempting to develop a common scale of relative values for all procedures. The common link between these two procedures was the intra-service time of 299 minutes for 61512 and 328 minutes for 51595. After the cross-specialty linkage and adjustments, the RVW for 61518 was 34.01 and the RVW for 51595 was 36.09. This analysis supports the argument that compression of the high valued procedures occurred during the Phase II to Phase III transition. The Harvard3 total work value of 3221 listed in the table above was the result of this compression since the original value was substantially higher before the linkage was imposed. This represented a 16% reduction in work value.

RATIONALE for recommendation:

Work:

Changes in past 5 years:

Improvements in technology have facilitated deep tumor resection with some degree of time savings.

Rank Order (Ordinal) Valuation:

Rank order as expressed in table above is appropriate.

Initial crosswalk or extrapolation misvaluation:

The total work value from Hsiao/Harvard Phase II in 11/90 of 3829 was reduced to 3204 at HCFA by 6/91.

Time:

LOS:

AANS94 survey=7 days; HCIA94=8days.

Op. Logs:

Avg. Intra-service times of 245 min. (17 cases)

Anesthesia databases:

27 cases; avg. time 314 min.

AANS94 Survey Key Refs:

Survey data supports decrease in RVW

Harvard3 Database:

Underestimated ICU time and work

Undervalued time/Phase I or II & MFS92:

MFS92 did not incorporate increases acknowledged in Harvard4 to account for ICU time.

Mental Effort & Judgement:

The mental effort and judgment for this procedure in the posterior fossa is approx. the same as for 61512 and sl. less than 61520.

Technical Skill & Physical Effort:

The skill and effort are approx. the same as 61512 and sl. less than 61520.

Stress:

Stress is sl. greater than 61512.

Intensity/Complexity:

See above.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61519 Global Period: 090 Current RVW: 33.84 Recommended RVW: 39.58

CPT Descriptor: **Craniectomy for excision of brain tumor, infratentorial or posterior fossa; meningioma**

Source and Summary of Comment to HCFA on this service:
AANS recommended increase in RVW from 33.84 to 39.58.

Public Comments by AANS.
Current AANS95 survey to validate time/work data.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 44 year old woman has a history of a headaches and dizziness. An MRI scan and angiogram show an enhancing and well vascularized tumor extending into the left cerebellum from the tentorium. A suboccipital craniectomy provides exposure of the cerebellum and the lesion is totally excised.

Description of Pre-Service Work: includes review of the angiogram and imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is lengthy due to the use of a semi-prone position and stabilization of the patient's head in a pin fixation device.

Description of Intra-Service Work: A paramedian suboccipital incision is made to divide the posterior cervical and suboccipital muscles. The suboccipital bone is exposed, retractors applied and a craniectomy is done after placement of one or several burr holes. The dura is opened and retracted, exposing the cerebellar cortex. The cerebellum is retracted to expose the surface of the meningioma which is attached to the under surface of the tentorium near the junction with the petrosal sinus. The margins are dissected away from the cerebellum with serial coagulation and division of the feeding vessels, including those coursing in the tentorium. The tumor is entered and debulked following which the capsule is excised piecemeal. The attachment to the tentorium requires resection of the tumor base attached to the tentorial dura. After complete excision of the lesion and confirmation of hemostasis, the dura is closed. The suboccipital and posterior cervical muscles and fascia and the scalp are closed in layers. A drain may be placed in the extradural space. Dressings are applied after the patient is removed from the fixation device and turned supine.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or spinal fluid leakage. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

Code: 61519

RELATIONSHIP OF 61519 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61519 has not been surveyed since the original Harvard studies and the time data in the table above represents that data. One significant omission is the lack of any ICU time, which is almost always a part of this service. This amounts to 53 minutes in the current survey data. Also note the short post-service time from the survey of only 180 minutes after ICU which probably represents the use of newer technologies for tumor resection that reduce dissection time.

Comparison of 61519 to listed reference services shows an appropriate rank order among the procedures in the table. The results of the AANS95 survey included use of surveyed intensity and complexity factors. Comparison of the work per minute from the Harvard3 of 7.31 units to the AANS95 of 9.54 reflects a more realistic scaling of the intensity for this complicated service.

61530 is a helpful reference service since it shares the some of the same techniques in approach and dissection as 61519 and both are done in the posterior fossa. The complexity of both are comparable while the total time and intra-service time are less for 61519.

Our recommendation is to accept the survey RVW of 39.58.

61530	CRANIECTOMY/EXCISION CPA TUMOR/MID-POST FOSSA APPROACH	156	492		600	4134		41.15	42.35		6.87
61520	CRANIECTOMY/EXCISION OF CEREBELLOPONTINE ANGLE	96	374		183	3878		38.58	38.35		8.29
61520	CRANIECTOMY/EXCISION OF CEREBELLOPONTINE ANGLE	120	360	60	250		5325			52.98 AANS94	11.59 AANS94

RELATIONSHIP OF 61520 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61520 was surveyed by AANS in Fall 1994 with results as listed in the last row of the table above. Note the principal differences are in the post-operative time period, including 60 minutes of ICU service and additional 67 minutes of post-op time after ICU. These add up to an increase in total work from the Harvard3 sum of 3878 to the AANS94 sum of 5325, which translates into a RVW of 52.98 for the MFS95. In addition, the Harvard3 intensity factor for 61520 is 8.29 while the survey factor is 11.59 which more accurately reflects the combination of intensity factors that are present in surgery in the cerebellopontine angle where the pons and cranial nerves are involved in the tumor dissection for extended periods of time. The skill and stress levels in this surgery are comparable to those in dealing with an aneurysm that is located on a major vessel to the dominant hemisphere. Comparison to 61526 and 61530 places 61520 in an appropriate relative position compared to the other procedures listed of similar nature.

Comparison to reference service shows greater times for the various components of the service and an equal total work value. The RVW for 61530 of 42.35 was assigned by HCFA in 1994 and is probably undervalued, although we have no current survey data to apply to this code.

Code: 61520

% response:	48%																	

RATIONALE for recommendation:

Work: Total work as surveyed exceeds that as estimated by Harvard3 and provided for the MFS92, with a resultant increase in the RVW.

Rank Order (Ordinal) Valuation: Appropriate for this set of procedures as listed.

Initial crosswalk or extrapolation misvaluation: Implicit compression of work values for high valued procedures based on example described re: 61512

Time:

LOS: AANS94 survey=7 days; HCIA94=8days.

Op. Logs: Avg. Intra-service times of 352 min. (6 cases)

Anesthesia databases: 245 cases; avg. time 354 min.

AANS94 Survey Key Refs: 100 neurosurgeons responded to survey

Harvard3 Database: Underestimated ICU time and work

Undervalued time/Phase I or II & MFS92: MFS92 did not incorporate increases acknowledged in Harvard4 to account for ICU time.

Mental Effort & Judgement: Mental effort and judgement comparable to 61530.

Technical Skill & Physical Effort: Technical skill greater than 61530.

Stress: Stress slightly higher since most of the cases in 61520 represent patients with larger tumors than those approached by the approach covered in 61530.

Intensity/Complexity: Complexity sl. higher than reference services in this class of tumor.

RELATIONSHIP OF 61521 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:
61521 (CRANIECTOMY FOR EXCISION OF A MIDLINE TUMOR AT THE BASE OF THE SKULL) represents a very complex surgical procedure applied to a difficult to reach area surrounded by delicate and important structures. It is quite similar to 61530 (CRANIECTOMY FOR EXCISION OF A CPA TUMOR BY A COMBINED MIDDLE AND POSTERIOR FOSSA APPROACH) in the difficulty, dangers and amount of work that comprises the service. Also note that the combination of 61597 and 61616 as skull base procedures effectively can be used in place of 61521, with a summation of their RVWs, even with a multiple procedure 50 % reduction for the second procedure, to about 56 RVWs.

The underestimation of the total work of this group of complex procedures has fallen to the same oversight noted for other major intracranial services, i.e., the failure of the original Harvard team to include adequate post-operative time and work and the failure to account for sufficient time and work in the ICU for most of these patients. The AANS94 survey showed an average of 39% underestimation of post-service time and work for the high valued and more complex procedures when compared to the Harvard3 database.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

Rank order valuation appropriate as listed in table.

Initial crosswalk or extrapolation misvaluation:

Implicit compression of work values for high valued procedures based on example described re: 61512.

Time:

Undervalued time/Phase I or II & MFS92:

MFS92 did not incorporate increases acknowledged in Harvard4 to account for ICU time.

Mental Effort & Judgement:

High levels of decision making

Technical Skill & Physical Effort:

Technical skill substantially greater than for 61510.

Stress:

High stress and risk levels due to contents of target area

Intensity/Complexity:

Very high intensity & complexity compared to 61510.

RELATIONSHIP OF 61526 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61526 was surveyed by AANS in Fall 1994 as part of the review of Key Reference Services in the specialty, with results as listed above in fifth row of the table. The significant differences between the Harvard3 data and the AANS94 survey data are in the greater Intra-service time for the AANS94 survey plus the 45 minutes of ICU time not included in the Harvard3 database. The net result of these changes was to increase the total work value from 3459 to 5084, which translates to a current RVW of 50.59, which is our recommendation. This fits well in rank order with allied procedures, including comparisons of total work.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 61531 Global Period: 090 Current RVW: 20.50 Recommended RVW: 12.95

CPT Descriptor: Subdural implantation of strip electrodes through one or more burr or trephine hole(s) for long term seizure monitoring

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended decrease in RVW from 20.50 to 12.95. Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 24-year-old male presents with intractable seizures. He has had extensive EEG monitoring without identification of a convincing seizure focus. One or several burr holes are drilled, and after opening the dura, strip electrodes are slid into the subdural space over the cortex to cover the area under investigation. The electrodes are brought out through the incisions to allow connection to monitoring equipment.

REFERENCE SERVICE(S):

RELATIONSHIP OF 61531 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61531 has not been surveyed previously or valued by either Harvard3 or AANS. The original RVW of 19.26 was recommended after presentation by the AAN to the RUC in June 1992 and was forwarded to HCFA that Fall. HCFA increased the RVW because they felt that the proportional relationship between the reference service 61154 (BURR HOLES (EVACUATION OF HEMATOMA EXTRA- OR SUBDURAL UNILATERAL) and 61531 of 1.5X was appropriate. They applied that multiplier to the value of 61154 which by then had increased to 14.40. The final RVW accepted for the MFS following these adjustments was 1.5 x 14.40 = 21.60. This has since declined to 20.50 due to the budgetary adjustments imposed since 1992.

We believe that the comparisons of the components of intensity between 61531 and 61154 will help to support the relationship of RVWs proposed. The mental effort and judgment involved in 61531 is relatively complicated since it involves selecting the proper areas of the brain to cover with the electrode monitoring strips and correlating the non-invasive EEG data to the other clinical and anatomic information to make a proper location selection. However, the mental effort and judgment in burr holes for evacuation of a subdural, while much easier since the advent of good imaging technology, still requires some complex judgments regarding the best approach, the timing of the procedure, and the other factors of co-morbidity that may influence the how and when of surgery.

The technical skill is roughly comparable with the addition that some extra skill may be required in irrigation of blood clots from the subdural space in areas somewhat remote from the burr hole opening in the skull.

The risk/stress factors are clearly higher in 61154 where the acuity of illness and responses raise the level substantially.

The present recommended value of 12.95 for the RVW is based on rank order valuation within the series of related procedures listed coupled with survey data that indicates a lower amount of work than originally proposed.

Code: 61531

The AANS95 survey had only 3 responses to this service due in part to the very low frequency of the procedure, and the times are listed in the table. However, the times appear reasonable and the total work calculated is very close to that of the reference service 61154. Since the survey intensity is only 3.50 compared to the Harvard3 intensity of 7.00, the final RVW is only 12.95.

Finally, a high end comparison to 61534 (CRANIECTOMY/EXCISION EPILEPTOGENIC FOCUS W/O EEG) which opens the skull and involves resection of areas of cerebral tissue identified as containing epileptogenic foci is offered. This service is clearly more time, work and intensity than 61531 to which it is currently rather closely matched, with MFS95 RVWs of 21.77 and 20.50 respectively. This further supports the impression of over-valuation of 61531 and supports the reduction recommended.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

The rank order valuation listed in the table of reference services is reasonable comparing the components of the services listed.

Prev. RUC or Refinement Valuation :

The RUC recommended a RVW of 19.26 in 1992. HCFA increased the RV to 21.60 by reference to 61154 @ a RVW of 12.54 and increased 61531 by 1 times 61154. When 61154 was raised in refinement to 14.4, the 1.5 times factor resulted in a final RVW for 61531 of 21.60.

Time:

AANS95 Survey :

Time and work data less than 2050 support current RVW of 12.95.

Harvard3 Database:

No data available

Mental Effort & Judgement:

See above for comparisons.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
Comments on Misvalued Code**

CPT Code: 61533 Global Period: 090 Current RVW: 23.41 Recommended RVW: 18.05

CPT Descriptor: **Craniotomy with elevation of bone flap; for subdural implantation of an electrode array, for long term seizure monitoring**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended decrease in RVW from 23.41 to 18.05.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs			Intensity
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW	Hvd3 Intra work/min
61533	CRANIOTOMY/INSERTION SUBDURAL ELECTRODES	74	156		180	2004		19.95	23.41	18.05	8.22
61312	CRANIOTOMY/EVAC HEMATOMA SUPRATENTORIAL EXTRA/SUBDURAL	75	150		253	2040		20.30	20.54	21.54	7.15
61538	CRANIOTOMY/LOBECTOMY W EECG, TEMPORAL LOBE	90	285		164	2832		31.92	28.05	31.92	7.13

RELATIONSHIP OF 61533 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61533 is presently overvalued in the MFS95 rank order valuation with a RVW of 23.41 which is higher than the RVW of 20.54 for 61312 (CRANIOTOMY/EVAC HEMATOMA SUPRATENTORIAL EXTRA/SUBDURAL). Reference to the Harvard3 data on time and total work provides a value of 19.95 for a RVW. This still appears to be high on the scale of values represented by the collection of related procedures ranked by their recommended new values.

Comparison of the Harvard3 time and work values of 61533 to 61312 (CRANIOTOMY/EVAC HEMATOMA SUPRATENTORIAL EXTRA/SUBDURAL) shows greater time for the post-service phase of 61312 and a slightly greater total work value. This is reflected in the Harvard3 total work value of 2040 compared to 2004 for 61533. When these work values are translated to RVWs on the 1995 of MFS95, it would place 61533 very close to 61312 (CRANIOTOMY/EVAC HEMATOMA SUPRATENTORIAL EXTRA/SUBDURAL) which is clearly a more complex and labor intensive service than 61533. This level of rank order for 61533 is inappropriate, since it is a service done in a non-emergency setting, generally with a limited cranial opening to introduce strips of electrodes over the cerebral surface. The Harvard3 time values are questioned in this context especially the intra-service time of 156 minutes. It seems that over two hours to implant subdural electrodes via craniotomy when one can evacuate an epi- or subdural hematoma in less time represents an anomolous high time estimate.

Also, the Harvard3 intensity of 8.22 represents an unrealistic value for the work per minute of this service, and contributes substantially to the high total work value listed. Since the previous code 61531 had a Harvard3 intensity of 7.00, a reduction in intensity for 61533 is in order and if the same value of 7.00 is used, the total work would drop to approximately 1814 with a corresponding RVW of 18.05, which is the RVW we recommend for 61533.

Code: 61533

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:	Rank order appears appropriate as listed in table after revaluation of intensity for service.
Initial crosswalk or extrapolation misvaluation:	6/91 total work of 1962 increased to 2004 in 3/92 crosswalk extrapolation.
Prev. RUC or Refinement Valuation:	This code was revised editorially in 1992 and reviewed by the RUC with no change in RVW.

Time:

Harvard3 Database:	Time and work values appear higher than realistic compared to other members in family of codes.
--------------------	---

Mental Effort & Judgement:

	The mental effort and judgement of this service are probably comparable to 61312.
--	---

Technical Skill & Physical Effort:

	The skill and effort in this service is less than that for 61312 due to the absence of hematomas in the subdural space with preservation of normal and visible landmarks.
--	---

Stress:

	Stress less than 61312 related to acuity of patient in reference service.
--	---

Intensity/Complexity:

	Harvard3 ratings of intra-service intensity inappropriately high for this service and 61531.
--	--

FIVE-YEAR REVIEW
Comments on Misvalued Code**

CPT Code: 61536 Global Period: 090 Current RVW: 29.43 Recommended RVW: 33.49

CPT Descriptor: **Craniotomy with elevation of bone flap; for excision of cerebral epileptogenic focus, with electrocorticography during surgery (includes removal of electrode array)**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase in RVW from 29.43 to 33.49.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Harvd3	AANS	Harvd3 to MFS95	MFS95	Rec.New RVW
61534	CRANIECTOMY/EXCISION EPILEPTOGENIC FOCUS W/O EEG	80	199		197	2478		21.77	19.13	
61538	CRANIECTOMY/LOBECTOMY W EEG, TEMPORAL LOBE	90	285		164	2832	2522	31.92	28.05	25.09
61536	CRANIECTOMY/EXCISION EPILEPTOGENIC FOCUS W EEG	88	298		222	3017		33.49	29.43	33.48
61539	CRANIECTOMY/LOBECTOMY W EEG, OTHER LOBE	88	297		221	3045		34.20	30.05	34.20

RELATIONSHIP OF 61536 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

This group of four procedures are different than the previous set of codes, requiring more complex services including resection of cerebral tissue identified as an epileptogenic focus by electrocorticography done during surgery. The reference procedure is 61534 (CRANIECTOMY WITH EXCISION OF EPILEPTOGENIC FOCUS WITHOUT INTRAOPERATIVE ELECTROCORTICOGRAPHY) with a RVW of 19.13. The table compares the work and time values in this group. The Harvard3 work values are reasonable, and when translated to RVWs, provide corrected values that better establish relativity between the associated services. The RVW of 33.49 for 61536 is one of these values and is recommended for such a change.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:
Initial crosswalk or extrapolation misvaluation:
Prev. RUC or Refinement Valuation:

Rank order valuation appropriate as listed in table.

The existing RVWs from the MFS95 are low when compared to the values as calculated from the Harvard3 data, despite the exposure to the RUC in 1992. The RVWs have not been corrected for more accurate valuation to date.

Time:

Harvard3 Database:

Harvard3 data is consistent with rank order and in reference to reference procedure 61534.

Undervalued time/Phase I or II & MFS92:

Mental Effort & Judgement:

Special knowledge and experience are required to properly use information from intra-operative EEG and to integrate that data into decisions about the location and extent of the resection.

Technical Skill & Physical Effort:

The skill and effort involved in a craniectomy with resection of cerebral tissue is clearly higher than a simple lobectomy for tumor.

Stress:

Intensity/Complexity:

The complexity and intensity of these procedures is clearly higher than a simple hematoma evacuation or fracture repair.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 61538 Global Period: 090 Current RVW: 28.05 Recommended RVW: 25.09

CPT Descriptor: **Craniotomy with elevation of bone flap; for lobectomy with electrocorticography during surgery, temporal lobe**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.
AANS recommended decrease in RVW from 28.05 to 25.09.** Current AAN95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old woman with intractable temporal lobe seizures has had extensive EEG monitoring with identification of a seizure focus in the medial temporal lobe. Supplementary SPECT scanning shows metabolic abnormalities in the same suspect area. A craniotomy with resection of the mesial temporal lobe structures is performed.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs			Intensity

RELATIONSHIP OF 61538 TO KEY REFERENCE SERVICES:

This group of four procedures are different than the previous set of codes, requiring more complex services including resection of cerebral tissue identified as an epileptogenic focus by electrocorticography done during surgery. The reference procedure is 61534 (CRANIECTOMY/EXCISION EPILEPTOGENIC FOCUS W/O EEG) with a RVW of 19.13. The table compares the work and time values in this group. The time values for this service in the Harvard3 database show a shorter pre-service time, and additional 75 minutes of intra-service time, no ICU time, and the same post-service time. With intensity factors of 7.48 from Harvard3 and 7.18 from our survey, the final work values reflect these differences with a lower total work for the AANS95 surveyed service, which converts to the 1995 MFS scale as a RVW of 25.09.

Comparison to the basic procedure for excision of a brain tumor, 61510 (CRANIOTOMY FOR EXCISION BRAIN TUMOR, SUPRATENT EXCEPT MENINGIOMA) which has many of the same components of work as 61538, shows that the total work and RVWs are quite similar. The intensity factors, as listed, are also close, which is reasonable in regard to the components of intensity as listed below.

CPT Code: 61538

SURVEY DATA:

RVW resp	3																		
rate %	1%																		

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:
Initial crosswalk or extrapolation misvaluation:

Rank order valuation appropriate as listed in table.
Total work increased in crosswalk from 2784 to 2832.

Time:

AANS95 Survey :
Harvard3 Database:

Time and work data support a decreased RVW.
Intra-service time appears to be high compared to the survey data

Undervalued time/Phase I or II & MFS92:

Time overvalued in Harvard3 data.

Mental Effort & Judgement:

Special knowledge and experience are required to properly use information from intra-operative EECG and to integrate that data into decisions about the location and extent of the resection.

Technical Skill & Physical Effort:

The skill and effort involved in a craniectomy with resection of cerebral tissue is comparable to a simple lobectomy for tumor.

Stress:

Intensity/Complexity:

The complexity and intensity of these procedures is higher than a simple hematoma evacuation or fracture repair.

Comments on Misvalued Code**

CPT Code: 61542 Global Period: 090 Current RVW: 27.39 Recommended RVW: 29.05

CPT Descriptor: **Craniotomy with elevation of bone flap; for total hemispherectomy**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase in RVW from 27.39 to 29.05.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
61543	CRANIECTOMY/PARTIAL HEMISPHERECTOMY	83	231		206	2745		27.32	20.62	27.32
61542	CRANIECTOMY/TOTAL HEMISPHERECTOMY	85	249		212	2919		29.05	27.39	29.05
61546	CRANIOTOMY FOR HYPOPHYSECTOMY	85	255		214	2942		29.28	29.33	

RELATIONSHIP OF 61542 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

Both of these procedures, 61542 & 61543 require an unusual degree of exposure of the brain for the purpose of removal of most of one cerebral hemisphere in treatment of intractable epilepsy. The work of the service lies between the major basal tumor procedures, and the less complex supratentorial tumor procedures. The reference procedure that they adjoin is 61546 (CRANIOTOMY FOR HYPOPHYSECTOMY) which has a total work value of 2942, a time of 255 minutes and a RVW of 29.33. The services are roughly comparable aside from the size of the resection and specific target areas.

The work and time values for 61542 and 61543 are listed in the table for comparison. We recommend for 61542 a RVW of 29.05, which reflects the Harvard3 valuation calculated from the time data.

RATIONALE for recommendation:

Work:	Rank Order (Ordinal) Valuation:	Ordinal valuation appropriate as listed in table.
Time:	Harvard3 Database:	Harvard3 data on time and work only available source at present.
Mental Effort & Judgement:		Mental effort and judgement equivalent to reference procedure 61546.
Technical Skill & Physical Effort:		Amount of skill and effort comparable to that required during craniotomy for pituitary tumor, 61546.
Stress:		
Intensity/Complexity:		Intensity greater than 61510 for brain tumor.

FIVE-YEAR REVIEW
Comments on Misvalued Code**

CPT Code: 61543 Global Period: 090 Current RVW: 20.62 Recommended RVW: 27.32

CPT Descriptor: **Craniotomy with elevation of bone flap; for partial or subtotal hemispherectomy**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase in RVW from 20.62 to 30.46.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
61543	CRANIECTOMY/PARTIAL HEMISPHERECTOMY	83	231		206	2745		27.32	20.62	27.32
61542	CRANIECTOMY/TOTAL HEMISPHERECTOMY	85	249		212	2919		29.05	27.39	29.05
61546	CRANIOTOMY FOR HYPOPHYSECTOMY	85	255		214	2942		29.28	29.33	

RELATIONSHIP OF 61543 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

Both of these procedures, 61542 & 61543 require an unusual degree of exposure of the brain for the purpose of removal of part of most of one cerebral hemisphere in treatment of intractable epilepsy. The work of the service lies between the major basal tumor procedures, and the less complex supratentorial tumor procedures. The reference procedure that they adjoin is 61546 (CRANIOTOMY FOR HYPOPHYSECTOMY) which has a total work value of 2942, a time of 255 minutes and a RVW of 29.33. The services are roughly comparable aside from the size of the resection and specific target areas.

The work and time values for 61542 and 61543 are listed in the table for comparison. We recommend for 61543 a RVW of 27.32, which reflects the Harvard3 valuation calculated from the time data.

RATIONALE for recommendation:

Work:	
Rank Order (Ordinal) Valuation:	Ordinal valuation appropriate as listed in table.
Time:	
Harvard3 Database:	Harvard3 data on time and work only available source at present.
Mental Effort & Judgement:	Mental effort and judgement equivalent to reference procedure 61546.
Technical Skill & Physical Effort:	Skill and effort also compare closely to 61546.
Stress:	
Intensity/Complexity:	Intensity greater than 61510 for brain tumor.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61545 Global Period: 090 Current RVW: 34.50 Recommended RVW: 41.76

CPT Descriptor: **Craniotomy with elevation of bone flap; for excision of craniopharyngioma**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase in RVW from 34.50 to 41.76. **Current AANS survey .**

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48 year old man has failing vision and headaches. An MRI scan shows enhancement of a 3 by 4 cm suprasellar lesion with cystic compartments that is compressing the anterior third ventricle floor. A craniotomy is done with resection of most of the tumor except for a portion of the wall adherent to the hypothalamus and internal carotid artery.

Description of Pre-Service Work: includes review of previous hospital records from the earlier hemorrhage, evaluation of the imaging studies, review of endocrine data, and appropriate lab studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup.

Description of Intra-Service Work: A scalp flap is outlined and reflected over the fronto-temporal region. The bone flap is turned after placement of one or several burr holes. The lateral sphenoid wing is drilled off. The dura is opened and retracted, exposing the cortex, and the Sylvian fissure is opened to improve access to the suprasellar region. Retractors are placed and the tumor identified beneath and elevating both optic nerves and the chiasm. The margins are dissected away from the regional vessels and brain and cranial nerves. The wall is opened and the center is debulked. All accessible capsule not tightly adherent to adjacent structures is removed. After excision of the lesion and confirmation of hemostasis, the dura is closed, the bone flap replaced and anchored with wires or plates and screws, and the scalp closed in layers. A drain may be placed beneath the scalp. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or hypothalamic malfunction. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

Code: 61545

RELATIONSHIP OF 61545 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61545 (CRANIECTOMY FOR EXCISION OF CRANIOPHARYNGIOMA) is a complex and time/intensive procedure designed to remove a tumor in the suprasellar region, frequently attached to the hypothalamus, pituitary stalk and displacing the optic nerves and carotid arteries and their branches. The reference service that most closely approximates the work and techniques of 61545 is 61546 (CRANIOTOMY FOR HYPOPHYSECTOMY) which is somewhat less complex and has lower time and work values (see table). The work values from Harvard3 translate directly into a RVW of 29.33 for the reference procedure, 61546. The Harvard3 work values for 61545 would give a RVW of 35.15 but the current MFS95 has a lower RVW of 34.50. Note that there is no time listed in the Harvard3 data for ICU time, which would occur in all such patients post-operatively, and usually for a number of days. When the intensity factors are considered, it is evident that the Harvard3 work/min of 61546 at 8.17 is greater than the 7.69 for this service 61545, despite the fact that the mental effort, skill, and risks are all higher for 61545 due to the nature of the tumor and the sensitive structures to which it may attach. When we surveyed this service, the intensity factor was substantially increased in relative order to other services of comparable complexity, and the value in the table of 10.02 was used in the calculation of the recommended RVW of 41.76. This is a very high value but the time and intensity factors all support it in that range. Comparison of the total work values for the family of tumor codes listed in the table above also appears appropriate to the rank order valuation in this group of procedures. The recommended RVW for 61512 (CRANIOTOMY FOR EXCISION MENINGIOMA, SUPRATENTORIAL) is 33.51 and has lower total work values than 61545. The RVW recommended for 61545 is therefore increased to better relate to the other procedures in this family of codes and a value of 41.76 is recommended.

RVW resp	53																	
rate %	19%																	

RATIONALE for recommendation:

Work: Rank Order (Ordinal) Valuation: Rank order of 61545 within family is appropriate per recommended RVW of 36.70.

Prev. RUC or Refinement Valuation: No change in RVW in 5/92 refinement panel.

Time: Op. Logs: 2 cases with avg. time of 310 min.
 AANS95 Survey: See table above.
 Harvard3 Database: Harvard3 data supports an increase in RVW above the current 34.50.
 Undervalued time/Phase I or II & MFS92: It appears that an unexplained reduction in RVW was imposed relative to the Harvard3 database.

Mental Effort & Judgement: High degree of knowledge and judgment during planning and performance of procedure due to the important adjacent structures.

Technical Skill & Physical Effort: High skill required to remove tumor without damage to optic nerves, regional vessels or hypothalamus.

Stress: Mod. high stress carried over into ICU with frequent diabetes insipidus and pituitary insufficiency.

Intensity/Complexity: Very complex with high intensity factor compared to 61546.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61576 Global Period: 090 Current RVW: 33.82 Recommended RVW: 50.08

CPT Descriptor: **Transoral approach to skull base, brain stem or upper spinal cord for biopsy, decompression or excision of lesion; requiring splitting of tongue and/or mandible (including tracheostomy)**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.
AANS recommended increase in RVW from 33.82 to 50.08.** Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59 year old man has ataxia, diplopia and headaches. An MRI scan shows enhancement of a 3 by 5 cm lesion involving the clivus from the pontomedullary junction down to C2. The medulla and pons are displaced posteriorly, with narrowing of the fourth ventricle. A transoral approach to the clivus and C1-2 is done with splitting the tongue and mandible. A prophylactic tracheostomy is also done. After resection of the lower clivus a meningioma is seen attached loosely to the dura. Most of the tumor except for a portion of the wall densely adherent to the dura is resected. After confirmation of hemostasis, the posterior pharyngeal wall is carefully closed, and the tongue and mandible reapproximated.

Description of Pre-Service Work: includes review of hospital records, evaluation of the imaging studies, and appropriate lab studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup.

Description of Intra-Service Work: The mouth and pharynx are exposed with appropriate retractors. A tracheotomy is installed. The tongue and mandible are divided in the midline and retractors are adjusted. The posterior pharyngeal wall is incised in the midline and lifted off the underlying clivus and anterior vertebral surfaces down to C2. Bone is drilled away to expose the tumor. The tumor is debulked and the wall identified. The margins are dissected away from dura to the extent possible. All accessible capsule not tightly adherent to adjacent structures is removed. After excision of the lesion and confirmation of hemostasis, the posterior pharyngeal wall is closed in layers. The tongue and mandible are reapproximated with sutures and wire. Packing is applied to the posterior pharyngeal wall

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of complications and hemorrhage. The hospital visits and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

61576	TRANSORAL APPROACH TO SKULL BASE REQ TONGUE SPLITTING & OR MANDIBLE	128	363	75	223		5033			50.08 AANS95	10.14

Code: 61576

RELATIONSHIP OF 61576 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61576 (TRANSORAL APPROACH TO SKULL BASE REQ. TONGUE SPLITTING &/OR SPLIT MANDIBLE) is a very complex and rarely performed procedure designed to provide access to lesions at the junction between the atlas, axis and the clivus. In terms of work, it compares most closely to the reference procedures 61521 and 61530, both of which describe procedures that deal with tumors in the same general territory of the head. The RVW of 61530 is appropriate in a rank order valuation to the adjoining procedures, and by comparison supports a recommendation that the value of 61576 above 42.40.

The Harvard3 data for 61576 supports a RVW of 38.40, but this is inaccurate due to the failure to include substantial ICU time and work in the total work product, as in the example from the AANS95 survey which includes 75 minutes of ICU time. Also the pre-service and intra-service times from the survey are both substantially higher than from the Harvard3 database. When the survey intensity of 10.14 (which compares closely to the Harvard3 intensity of 10.63) is used to calculate a total work value, the result is 5033, which converts to the MFS95 at a RVW of 50.08.

In another comparison, the combination of 61597 and 61616 as skull base procedures can be used in place of 61521 to approach and resect a midline lesion at the anterior skull base. Using both of these codes, a summation of their RVWs, even with a multiple procedure 50 % reduction for the second procedure, amounts to about 56 RVWs.

survey n	275																	
RVW resp	31																	
rate %	11%																	

RATIONALE for recommendation:

Work: Rank Order (Ordinal) Valuation: Rank order valuation of total work and Rec. RVWs in the table is appropriately ranked.

Initial crosswalk or extrapolation misvaluation: Initial valuation only 3858 total work.

Time: Harvard3 Database: Undervalued total work due to missing ICU time and underestimation of pre- and intra-service times.

Undervalued time/Phase I or II & MFS92: Present MFS95 RVW of 33.82 is undervalued relative to the Harvard3 data and when compared to other procedures in family.

Mental Effort & Judgement: Complex strategy involved in approach and resection of lesions in region of clivus or craniovertebral junction.

Technical Skill & Physical Effort: High level of skill, effort and experience. A tracheotomy is usually required to assure a good airway.

Stress: High risk and stress due to the location of the lesions and danger of infection/meningitis following closure.

Intensity/Complexity: Procedure is very complex considering the unusual approach to the target area through the mouth, possibly with splitting of the tongue and mandible.

CPT Descriptor: **Surgery of intracranial arteriovenous malformation; supratentorial, simple**

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended a decrease in RVW from 36.45 to 29.13. Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50 year old man has seizures related to a small cortical arteriovenous malformation (AVM) of the parietal lobe and a history of a previous hemorrhage. The lesion does not involve the deep venous draining structures. A craniotomy provides exposure of the lesion which is totally excised.

Description of Pre-Service Work: includes review of previous hospital records from the earlier hemorrhage, evaluation of the angiogram and imaging studies, review of EEG information, and appropriate lab studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup.

Description of Intra-Service Work: A scalp flap is outlined and reflected centered over the lesion. The bone flap is turned after placement of one or several burr holes. The dura is opened and retracted, exposing the cortex and the lesion. The margins are dissected away from the cortex and white matter with serial clipping and division of the feeding and then the draining vessels. Any included aneurysmal formations on feeding vessels are clipped and isolated. After complete excision of the lesion and confirmation of hemostasis, the dura is closed, the bone flap replaced and anchored with wires or plates and screws, and the scalp closed in layers. A drain may be placed beneath the scalp. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or seizures. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

Code: 61680

RELATIONSHIP OF 61680 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the increases is based on the AANS94 and 95 surveys (see Table 1 in Appendix and Survey95 results below). Significant differences between the Harvard3 time data and our Survey95 data are present. There is less intra- and post-service time in our survey data but there is 38 minutes of ICU time, which is higher intensity service than regular post-operative visits. In addition, the survey specifically requested an estimation of each of the three components of intensity, along with a rating of the complexity of each phase of the service, pre-, intra- and post-. The survey respondents provided realistic appraisals of the components of intensity for each surveyed service, and the present intensity value listed is a calculated and adjusted average of this same survey data.

When this new time and intensity data are entered into the calculation of work, the AANS95 survey produces a total work value of 2927 compared to the Harvard3 total work of 3562.. When this is converted into RVWs (1995), the total work RVWs are 29.13 which is the recommended value.

The other procedures, 61680 to 61686, are rank ordered above the benchmark 61700, and use of Harvard3 total work comparisons further supports the scaling as indicated. All but 61680 have recommended RVWs based on the Harvard3 database as converted to the 1995 MFS values, and all have comparable Pre- and Post-service time increases over the Harvard3 benchmark valuation. The time data for Pre- and Post-service times for these four codes listed in the Harvard3 database will all be undervalued based on the time compression analysis described in the introduction. The amount of the time compression will not be clear until these codes are surveyed. Consequently, use of the Harvard3 RVWs as translated to the MFS95 are proposed as partially corrected RVWs. The RVW for 61680 places the value as the lowest in this family, below 61700 and the next higher procedure, 61684, since it logically falls into that position on a scale of comparative work, mental effort, technical skill, stress and intensity.

Note that 61680 was assigned a total work value of 3899 in the June 1991 cross specialty scale but was reduced to 3562 in the May 1992 review of the linkages. In May 1992, the Refinement Panel working from a 1992 RVW of 0 recommended a RVW of 1.0 which has resisted subsequent challenges to date.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation: The rank order for this series of codes was carefully developed and verified. It provides the basis for revaluation of 61860.

Initial crosswalk or extrapolation misvaluation: This code was reduced from 3899 total work to 3562 in 1991-1992 crosswalk extrapolation.

Prev. RUC or Refinement Valuation: These codes were considered at the May92 Refinement Panel but the proposed increases were not accepted.

Time:

3 cases; avg. time = 242 min.

Op. Logs: 4 cases; avg. anesth. time = 315 min.

Anesthesia databases: 3 cases; avg. anesth. time=321 min.

Mental Effort & Judgement: High, especially when sustained for several hours.

Technical Skill & Physical Effort: Comparable to a difficult brain tumor procedure.

Stress: Relatively high compared to non-vascular procedures, but relatively low compared to other services in this family.

Intensity/Complexity: Moderately high.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61682 Global Period: 090 Current RVW: 42.21 Recommended RVW: 59.47

CPT Descriptor: **Surgery of intracranial arteriovenous malformation; supratentorial, complex**

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended an increase in RVW fro 42.21 to 59.47. Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 38 year old woman has seizures and during her workup is found to have a large arteriovenous malformation (AVM) deep in the temporal lobe with multiple large arterial feeders and draining into the deep venous structures. A craniotomy is done to expose the lesion and the lesion is isolated from the circulation and excised.

Description of Pre-Service Work: includes review of the angiogram and imaging studies, review of EEG information, and appropriate lab studies. Pre-service work includes extensive informed consent with the patient and family, plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup.

Description of Intra-Service Work: A scalp flap is outlined and reflected over the lesion. The bone flap is turned after placement of one or several burr holes. The dura is opened and retracted, exposing the brain. The AVM is exposed by opening the cortex and white matter over the lesion. The margins are dissected away from the cortex and white matter with serial clipping and division or embolization of the feeding vessels. The draining vessels are isolated and sealed, then divided. Any included aneurysmal formations on feeding vessels are clipped and isolated. After complete excision of the lesion and confirmation of hemostasis, the dura is closed, the bone flap replaced and anchored with wires or plates and screws, and the scalp closed in layers. A drain may be placed beneath the scalp. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or seizures. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

CPT Code: 61682

RELATIONSHIP OF 61682 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the increases is based on the AANS94 and 95 surveys (see Table 1 in Appendix and Survey95 results below). Significant differences between the Harvard3 time data and our Survey95 data are present. There is less intra- but more pre- and post-service time in our survey data as well as 60 minutes of ICU time, which is higher intensity service than regular post-operative visits. In addition, the survey specifically obtained an estimate of each of the three components of intensity, along with a rating of the complexity of each phase of the service, pre-, intra- and post-. The survey respondents provided realistic appraisals of the components of intensity for each surveyed service, and the present intensity value listed is a calculated and adjusted average of this same survey data. Application of this data to calculation of a new RVW for this service results in our recommended RVW of 59.47.

The other procedures, 61680 to 61686, are rank ordered around the benchmark 61700. All have recommended RVWs based on the AANS95 survey data as converted to the 1995 MFS values, and all have comparable Pre- and Post-service time increases over the Harvard3 benchmark valuation. The time data for Pre- and Post-service times for these four codes listed in the Harvard3 database will all be undervalued based on the time compression analysis described in the introduction. The amount of the time compression is most easily seen in the amount of ICU time from our survey. When this work is added back to the work of the other portions of the service, the total work values reflect this increase and help to relieve the compression that occurred in the Harvard3 database. The RVW for 61682 is a calculated value derived from the AANS95 time and work data that places this procedure between 61700 and the next higher procedure, 61686, since it logically falls into that position on a scale of comparative work, mental effort, technical skill, and risk-stress.

Note that 61682 was assigned a total work value of 5668 in the June 1991 cross specialty extrapolation but was reduced to 5156 in the March 1992 review of the linkages. In May 1992, the Refinement Panel working from a 1992 RVW of 0 recommended a RVW of 43.24 which has resisted subsequent challenges to date. If the original June 1991 work value had been maintained, the current RVW would be approximately 50.52.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61684 Global Period: 090 Current RVW: 39.25 Recommended RVW: 38.23

CPT Descriptor: **Surgery of intracranial arteriovenous malformation; infratentorial, simple**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.
AANS recommended a decrease in RVW from 39.25 to 38.23.** Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old man has a history of a previous subarachnoid hemorrhage due to an arteriovenous malformation (AVM) of the cerebellar hemisphere. The lesion does not involve the deep venous structures. A suboccipital craniectomy provides exposure of the cerebellum and the lesion is totally excised.

Description of Pre-Service Work: includes review of previous hospital records from the earlier hemorrhage, evaluation of the angiogram and imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is lengthy due to the use of a prone position and stabilization of the patient's head in a pin fixation device.

Description of Intra-Service Work: A scalp flap is outlined and reflected over the lesion. The bone flap is turned after placement of one or several burr holes. The dura is opened and retracted, exposing the cortex and the lesion. The margins are dissected away from the cortex and white matter with serial clipping and division of the feeding and then the draining vessels. Any included aneurysmal formations on feeding vessels are clipped and isolated. After complete excision of the lesion and confirmation of hemostasis, the dura is closed, the bone flap replaced and anchored with wires or plates and screws, and the scalp closed in layers. A drain may be placed beneath the scalp. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or seizures. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

Code: 61684

RELATIONSHIP OF 61684 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the increases is based on the AANS94 and 95 surveys (see Table 1 in Appendix and Survey95 results below). Significant differences between the Harvard3 time data and our Survey95 data are present. There is less intra- and post-service time but more pre-service time in our survey data as well as 45 minutes of ICU time. In addition, the survey specifically obtained an estimate of each of the three components of intensity, along with a rating of the complexity of each phase of the service, pre-, intra- and post-. The survey respondents provided appraisals of the components of intensity for each surveyed service, and the present intensity value listed is a calculated and adjusted average of this same survey data. The survey intensity factor is 9.20 compared to the Harvard3 factor of 11.01. When these intensity differences are applied to the calculation of total work, the Harvard3 value is 4015 while the result from the AANS95 survey is 3842. This translates to a RVW of 38.23 which is our recommended value.

The other procedures, 61680 to 61686, are rank ordered around the benchmark 61700, and use of Harvard3 and AANS survey total work comparisons further supports the scaling as indicated..

The RVW for 61684 is calculated from the AANS95 survey time and work data and places the value between 61680 and the next higher procedure 61692, since it logically falls into that position on a scale of comparative work, mental effort, technical skill, stress and intensity.

Note that 61684 was assigned a total work value of 4435 in the June 1991 cross specialty scale but was reduced to 4015 in the March 1992 review of the linkages. In May 1992, the Refinement Panel working from a 1992 RVW of 0 recommended a RVW of 40.21 which has resisted subsequent challenges to date. If the original June 1991 work value had been maintained, the current RVW would be approximately 43.46.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

The rank order for this series of codes was carefully developed and verified. It provides the basis for revaluation of 61860.

Initial crosswalk or extrapolation misvaluation:

This code was reduced from 4435 total work to 4015 in 1991-1992 crosswalk extrapolation.

Prev. RUC or Refinement Valuation:

These codes were considered at the May92 Refinement Panel but the proposed increases were not accepted.

Time:

Anesthesia databases:

3 cases; avg. anesth. time=321 min.

Harvard3 Database:

Data in the table suggests undervaluation in the Harvard3 database.

Mental Effort & Judgement:

Very high, especially when sustained for several hours.

Technical Skill & Physical Effort:

In the highest group of codes in the specialty.

Stress:

High considering the narrow margin between success and disaster during dissection of these delicate vessels.

Intensity/Complexity:

Moderately high.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION
Comments on Misvalued Code**

CPT Code: 61686 Global Period: 090 Current RVW: 47.45 Recommended RVW: 62.08

CPT Descriptor: **Surgery of intracranial arteriovenous malformation; infratentorial, complex**

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended increase in RVW from 47.45 to 62.08. Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 28 year old woman has a history of a previous subarachnoid hemorrhage due to an arteriovenous malformation (AVM) of the cerebellar hemisphere that extends into the cerebellar peduncle. The lesion drains into the deep venous structures and there is one aneurysm seen on a feeding vessel within the AVM. A suboccipital craniectomy provides exposure of the cerebellum and the lesion is totally excised.

Description of Pre-Service Work: includes review of previous hospital records from the earlier hemorrhage, evaluation of the angiogram and imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is lengthy due to the use of a prone position and stabilization of the patient's head in a pin fixation device.

Description of Intra-Service Work: A suboccipital incision is made to separate the posterior cervical and suboccipital muscles. The suboccipital bone is exposed, retractors applied and a craniectomy is done after placement of one or several burr holes. The dura is opened and retracted, exposing the cerebellar cortex. The cerebellum is incised to expose the surface of the AVM. The margins are dissected away from the white matter with serial clipping and division of the feeding and then the draining vessels, including those components involving the peduncle. The aneurysm on the feeding vessel is clipped and isolated while sparing the major vessels feeding the brainstem. After complete excision of the lesion and confirmation of hemostasis, the dura is closed. The suboccipital and posterior cervical muscles and fascia and the scalp are closed in layers. A drain may be placed in the extradural space. Dressings are applied after the patient is removed from the fixation device and turned supine.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or seizures. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

RELATIONSHIP OF 61686 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the increases is based on the AANS94 and 95 surveys (see Table 1 in Appendix and Survey95 results below). Significant differences between the Harvard3 time data and our Survey95 data are present. There is less intra- but more pre- and post-service time in our survey data as well as 75 minutes of ICU time, which is higher intensity service than regular post-operative visits. In addition, the survey specifically obtained an estimate of each of the three components of intensity, along with a rating of the complexity of each phase of the service, pre-, intra- and post-. The survey respondents provided realistic appraisals of the components of intensity for each surveyed service, and the present intensity value listed is a calculated and adjusted average of this same survey data. Application of this data to calculation of a new RVW for this service results in our recommended RVW of 62.08.

The other procedures, 61680 to 61686, are rank ordered around the benchmark 61700. All have recommended RVWs based on the AANS95 survey data as converted to the 1995 MFS values, and all have comparable Pre- and Post-service time increases over the Harvard3 benchmark valuation. The time data for Pre- and Post-service times for these four codes listed in the Harvard3 database will all be undervalued based on the time compression analysis described in the introduction. The amount of the time compression is most easily seen in the amount of ICU time from our survey. When this work is added back to the work of the other portions of the service, the total work values reflect this increase and help to relieve the compression that occurred in the Harvard3 database.

The RVW for 61686 is derived from the AANS95 survey data and places the value above 61682 as the highest procedure in this family, since it logically falls into that position on a scale of comparative work, mental effort, technical skill, stress and intensity. The intensity factors that have been described for the earlier codes are 9.35 from Harvard3 and 12.12 from the AANS survey. This high value fits into the scale of the highest intensity factors present in the Harvard3 database, with some of the maximum values reaching slightly over 13.

Note that 61686 was assigned a total work value of 6244 in the June 1991 cross specialty scale but was reduced to 5678 in the March 1992 review of the linkages. In May 1992, the Refinement Panel working from a 1992 RVW of 0 recommended a RVW of 48.61 which has resisted subsequent challenges to date. If the original June 1991 work value had been maintained, the current RVW would be approximately 61.20.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61690 Global Period: 090 Current RVW: 33.82 Recommended RVW: 27.80

CPT Descriptor: **Surgery of intracranial arteriovenous malformation; dural, complex**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.
AANS recommended a decrease in RVW from 33.82 to 27.80.** Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42 year old woman has a subarachnoid hemorrhage with a brief period of unconsciousness. A CAT scan shows blood in the basal cisterns and an angiogram shows an aneurysm at the junction of the right vertebral artery with the basilar artery. A far lateral craniectomy is done in the posterior fossa to expose the lesion. The aneurysm is dissected from the parent vessels and a clip placed across the neck.

Description of Pre-Service Work: includes review of the angiogram and imaging studies and appropriate lab studies. Pre-service work includes extensive informed consent with the patient and family, plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is lengthy due to the use of a prone position and stabilization of the patient's head in a pin fixation device.

Description of Intra-Service Work: A scalp flap is outlined and reflected over the mastoid and suboccipital region. After division of the overlying muscles and exposure of the suboccipital bone, the bone is removed to include the margin of the foramen magnum and arch of C1. The dura is opened and retracted, exposing the cerebellum. The aneurysm is exposed by retraction of the anterior and inferior surface of the cerebellum. The vessels are carefully exposed and the neck of the aneurysm is identified. When the neck is exposed and permits application of a clip, the clip is closed across the neck while excluding the adjacent vessels from the clip. After examination to confirm proper clip placement and completion of hemostasis, the dura is closed, the muscle and fascial layers secured, and the scalp closed in layers. A drain may be placed beneath the scalp. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or seizures. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

CPT Code: 61690

RELATIONSHIP OF 61690 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:
 The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the changes is based on the AANS94 and 95 surveys (see Table 1 in Appendix and Survey95 results below). Significant differences between the Harvard3 time data and our Survey95 data are present. There is less pre-service time but slightly more intra-service time in our survey data as well as 40 minutes of ICU time. In addition, the survey specifically obtained an estimate of each of the three components of intensity, along with a rating of the complexity of each phase of the service, pre-, intra- and post-. The survey respondents provided appraisals of the components of intensity for each surveyed service, and the present intensity value listed is a calculated and adjusted average of this same survey data. The survey intensity factor is 7.28 compared to the Harvard3 factor of 10.00. When these intensity differences are applied to the calculation of total work, the Harvard3 value is 3046 while the result from the AANS95 survey is 2794. This translates to a RVW of 27.80 which is our recommended value. The other procedures, 61680 to 61686, are rank ordered around the benchmark 61700, and use of Harvard3 and AANS survey total work comparisons further supports the scaling as indicated..

 Initial crosswalk or extrapolation misvaluation: This code was reduced from 3358 total work to 3046 in 1991-1992 crosswalk extrapolation.

Time:
 Harvard3 Database: Data in the table suggests undervaluation in the Harvard3 database.
 Mental Effort & Judgement: Less than 61680 but still fairly high.
 Technical Skill & Physical Effort: Moderately high..
 Stress: High stress level for this entire set of complex vascular codes.
 Intensity/Complexity: Moderately high but the lowest in this family of codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61692 Global Period: 090 Current RVW: 37.96 Recommended RVW: 49.74

CPT Descriptor: **Surgery of intracranial arteriovenous malformation; dural, complex**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended an increase in RVW from 37.96 to 49.74. **Current AANS95 survey.**

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42 year old woman has a subarachnoid hemorrhage with a brief period of unconsciousness. A CAT scan shows blood in the basal cisterns and an angiogram shows an aneurysm at the junction of the right vertebral artery with the basilar artery. A far lateral craniectomy is done in the posterior fossa to expose the lesion. The aneurysm is dissected from the parent vessels and a clip placed across the neck.

Description of Pre-Service Work: includes review of the angiogram and imaging studies and appropriate lab studies. Pre-service work includes extensive informed consent with the patient and family, plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is lengthy due to the use of a prone position and stabilization of the patient's head in a pin fixation device.

Description of Intra-Service Work: A scalp flap is outlined and reflected over the mastoid and suboccipital region. After division of the overlying muscles and exposure of the suboccipital bone, the bone is removed to include the margin of the foramen magnum and arch of C1. The dura is opened and retracted, exposing the cerebellum. The aneurysm is exposed by retraction of the anterior and inferior surface of the cerebellum. The vessels are carefully exposed and the neck of the aneurysm is identified. When the neck is exposed and permits application of a clip, the clip is closed across the neck while excluding the adjacent vessels from the clip. After examination to confirm proper clip placement and completion of hemostasis, the dura is closed, the muscle and fascial layers secured, and the scalp closed in layers. A drain may be placed beneath the scalp. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or seizures. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

CPT Code: 61692

RELATIONSHIP OF 61692 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the increases is based on the AANS94 and 95 surveys (see Table 1 in Appendix and Survey95 results below). Significant differences between the Harvard3 time data and our Survey95 data are present. There is less intra- and post-service time but more pre-service time in our survey data as well as 70 minutes of ICU time. In addition, the survey specifically obtained an estimate of each of the three components of intensity, along with a rating of the complexity of each phase of the service, pre-, intra- and post-. The survey respondents provided appraisals of the components of intensity for each surveyed service, and the present intensity value listed is a calculated and adjusted average of this same survey data. The survey intensity factor is 10.51 compared to the Harvard3 factor of 8.90. When these intensity differences are applied to the calculation of total work, the Harvard3 value is 4212 while the result from the AANS95 survey is 4999. This translates to a RVW of 49.74 which is our recommended value.

The other procedures, 61680 to 61686, are rank ordered around the benchmark 61700, and use of Harvard3 and AANS survey total work comparisons further supports the scaling as indicated..

The RVW for 61692 is calculated from the AANS95 survey time and work data and places the value between 61680 and the next higher procedure 61692, since it logically falls into that position on a scale of comparative work, mental effort, technical skill, stress and intensity.

The RVW for 61692 is derived from Harvard3 data and places the value between 617684 and the next higher procedure 61702, since it logically falls into that position on a scale of comparative work, mental effort, technical skill, stress and intensity.

Note that 61692 was assigned a total work value of 4621 in the June 1991 cross specialty scale but was reduced to 4212 in the March 1992 review of the linkages. In May 1992, the Refinement Panel working from a 1992 RVW of 0 recommended a RVW of 38.89 which has resisted subsequent challenges to date. If the original June 1991 work value had been maintained, the current RVW would be approximately 45.28.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

Rank order utilized as described above.

Initial crosswalk or extrapolation misvaluation:

This code was reduced from 4621 total work to 4212 in 1991-1992 crosswalk extrapolation.

Prev. RUC or Refinement Valuation:

These codes were considered at the May92 Refinement Panel but the proposed increases were not accepted.

Time:

Anesthesia databases:

3 cases; avg. anesth. time=321 min.

Harvard3 Database:

Data in the table suggests undervaluation in the Harvard3 database.

Mental Effort & Judgement:

Very high, especially when sustained for several hours.

Technical Skill & Physical Effort:

Among the highest in the specialty.

Stress:

High stress level for this entire set of complex vascular codes.

Intensity/Complexity:

Very high.

RELATIONSHIP OF 61700 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the increases is based on the AANS94 and 95 surveys (see Table 1 in Appendix). Measurements of significantly increased Pre- and Post-service times (+37%), plus an average of 5 days of ICU time for these patients is noted. When this additional time is entered into the calculation of work, the AANS94 survey generates a total work value of 3764 compared to the Harvard3 total work of 3471. When the additional change of an increase in the intensity factor for 61700 is included in the calculation, the total work value reaches 4854. When this is converted into RVWs (1995), it increases the total work RVWs to the recommended value of 48.30.

Note that the increase in intensity (work/minutes of intra-service time) from the Harvard3 value of 8.68 to the survey value of 12.72 is a dramatic shift. The Harvard3 value was calculated as described in the introduction and in Appendix D which introduced factors that had very little to do with the mental effort, technical skill and stress involved in this service. The survey specifically requested an estimation of each of these components of intensity, along with a rating of the complexity of each phase of the service, pre-, intra- and post-. The 101 respondents to the survey ranked 61700 with the highest intensity and complexity values of any service examined, and that is clearly more representative of the relative intensity among this family of services than the values listed in the table from Harvard3. The present value is a calculated and adjusted average of the survey data.

The other procedures, 61680 to 61686, are rank ordered around the benchmark 61700, and use of Harvard3 total work comparisons further supports the scaling as indicated. All but 61680 have recommended RVWs based on the Harvard3 database as converted to the 1995 MFS values, and all have comparable Pre- and Post-service time increases over the Harvard3 benchmark valuation. The time data for Pre- and Post-service times for these four codes listed in the Harvard3 database are all undervalued based on the time compression analysis described in the introduction. The amount of the time/work compression is apparent from the substantially higher total work values surveyed and the higher RVWs as listed.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

The rank order for this series of codes was carefully developed and verified. It provides the basis for revaluation of 61860.

Initial crosswalk or extrapolation misvaluation:

This code was increased from 3458 total work to 3470 in 1991-1992 crosswalk extrapolation.

Prev. RUC or Refinement Valuation:

These codes were considered at the May92 Refinement Panel but the proposed increases were not accepted.

Time:

Op. Logs:

7 cases; avg. intra- time=274 min.

Anesthesia databases:

241 cases, avg. anesth. time = 349 min.

AANS94 Survey Key Refs:

See data table above.

Harvard3 Database:

Data in the table suggests undervaluation in the Harvard3 database.

Undervalued time/Phase I or II & MFS92:

Initial undervaluation to lesser degree than others in family.

Mental Effort & Judgement:

Very high, especially when sustained for several hours.

Technical Skill & Physical Effort:

Among the highest in the specialty.

Stress:

Very high considering the narrow margin between success and disaster during dissection of these delicate vessels.

Intensity/Complexity:

Very high. See comments above.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61702 Global Period: 090 Current RVW: 39.20 Recommended RVW: 46.31

CPT Descriptor: **Surgery of intracranial aneurysm, intracranial approach; vertebral-basilar circulation**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended an increase in RVW from 39.20 to 46.31. **Current AANS95 survey.**

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42 year old woman has a subarachnoid hemorrhage with a brief period of unconsciousness. A CAT scan shows blood in the basal cisterns and an angiogram shows an aneurysm at the junction of the right vertebral artery with the basilar artery. A far lateral craniectomy is done in the posterior fossa to expose the lesion. The aneurysm is dissected from the parent vessels and a clip placed across the neck.

Description of Pre-Service Work: includes review of the angiogram and imaging studies and appropriate lab studies. Pre-service work includes extensive informed consent with the patient and family, plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is lengthy due to the use of a prone position and stabilization of the patient's head in a pin fixation device.

Description of Intra-Service Work: A scalp flap is outlined and reflected over the mastoid and suboccipital region. After division of the overlying muscles and exposure of the suboccipital bone, the bone is removed to include the margin of the foramen magnum and arch of C1. The dura is opened and retracted, exposing the cerebellum. The aneurysm is exposed by retraction of the anterior and inferior surface of the cerebellum. The vessels are carefully exposed and the neck of the aneurysm is identified. When the neck is exposed and permits application of a clip, the clip is closed across the neck while excluding the adjacent vessels from the clip. After examination to confirm proper clip placement and completion of hemostasis, the dura is closed, the muscle and fascial layers secured, and the scalp closed in layers. A drain may be placed beneath the scalp. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of intracranial bleeding or seizures. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period

CPT Code: 61702

RELATIONSHIP OF 61702 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The proposed new RVWs for this group of procedures are based on rank order valuation supplemented by current survey data for the key reference 61700 and several of the other vascular codes. The justification for the increases is based on the AANS94 and 95 surveys (see Table 1 in Appendix). Measurements of significantly increased Pre- and Post-service times (+37%), plus an average of 5 days of ICU time for these patients is noted. When this additional time is entered into the calculation of work, the AANS94 survey generates a total work value of 4654 compared to the Harvard3 total work of 4471. When the additional change of an increase in the intensity factor for 61702 is included in the calculation, the total work value reaches 4854. When this is converted into RVWs (1995), it increases the total work RVWs to the recommended value of 46.31.

The other procedures, 61680 to 61686, are rank ordered around the benchmark 61700, and use of Harvard3 total work comparisons further supports the scaling as indicated. All but 61680 have recommended RVWs based on the AANS95 survey data as converted to the 1995 MFS values, and all have comparable Pre- and Post-service time increases over the Harvard3 benchmark valuation. The time data for Pre- and Post-service times for these four codes listed in the Harvard3 database are all undervalued based on the time compression analysis described in the introduction. Consequently, use of the AANS95 RVWs as translated to the MFS95 are proposed as appropriate to the rank order within this family of intracranial vascular code RVWs.

The RVW and total work for 61702 as surveyed is lower than that for a carotid aneurysm, 61700. The basis for this difference lies in the larger amount of ICU and post-service time surveyed for 61700, plus a higher intensity factor than 61702. This probably reflects a trend for many neurosurgeons to refer basilar aneurysm patients to centers with sufficient experience with these lesions to provide a higher level of care, and thence enjoy time-saving protocols that occur in such settings.

The RVW for 61702 is calculated from Harvard3 time data to place the value between 61692 and the next higher procedure 61682, since it logically falls into that position on a scale of comparative work, mental effort, technical skill, stress and intensity. Note that 61702 was assigned a total work value of 4901 in the June 1991 cross specialty scale but was reduced to 4471 in the March 1992 review of the linkages. In May 1992, the Refinement Panel working from a 1992 RVW of 0 recommended a RVW of 40.16 which has resisted subsequent challenges to date. If the original June 1991 work value had been maintained, the current RVW would be approximately 48.02.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

The rank order for this series of codes was carefully developed and verified. It provides the basis for revaluation of 61860.

Initial crosswalk or extrapolation misvaluation:

This code was reduced from 4901 total work to 4471 in 1991-1992 crosswalk extrapolation.

Prev. RUC or Refinement Valuation:

These codes were considered at the May92 Refinement Panel but the proposed increases were not accepted.

Time:

Op. Logs:

4 cases; avg. time = 463 min.

Anesthesia databases:

11 cases; avg. anesth. time=328 min.

Harvard3 Database:

Data in the table suggests undervaluation in the Harvard3 database.

Mental Effort & Judgement:

Very high, especially when sustained for several hours.

Technical Skill & Physical Effort:

Among the highest in the specialty.

Stress:

Very high considering the narrow margin between success and disaster during dissection of these delicate vessels.

Intensity/Complexity:

Very high.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61720 Global Period: 090 Current RVW: 15.85 Recommended RVW: 15.92

CPT Descriptor: Creation of lesion by stereotactic method, including burr hole(s) and localizing and recording techniques, single or multiple stages; globus pallidus or thalamus

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended increase in RVW from 15.85 to 15.92.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 61 year old male with a history of Parkinsons disease and severe right sided tremor. unresponsive to medications. A radiofrequency lesion is made in the thalamus to reduce the tremor.

Description of Pre-Service Work: includes review of previous medical records, evaluation of the imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family. Positioning is more complex due to the use of a stereotactic frame that requires coordinate indexing to the patient table.

Description of Intra-Service Work: The intra-service work begins with the application of the stereotactic head frame under local anesthesia. The patient is then transported to Radiology where stereotactic imaging studies are obtained. This may be either MRI or CT scanning. The neurosurgeon must position and secure the patient on the imaging table and attach an appropriate stereotactic localizer. He then works with a radiologist or technician to identify the precise areas to be imaged by adjustment of the scanning geometry. Finally, the neurosurgeon verifies that the target is optimally imaged. The patient is then returned to the operating room, still in the frame, and the surgery is begun. A scalp incision is made at an appropriate site for entry of the radiofrequency probe, a burr hole made, and the probe inserted into the stereotactic guide. After confirmation of the desired coordinates, the probe is introduced into the brain to the target depth. A radiofrequency lesion is then made and the patient's tremor checked. Additional radiofrequency lesioning may be delivered depending on the patient's response. When completed, the probe is removed and the scalp would sutured. Dressings are applied. Removal of the frame is done at the end of the service period.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of complications. The hospital visits and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

CPT Code 61720

RELATIONSHIP OF 61720 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) is the reference service for this group of procedures. They have in common the use of stereotactic localization techniques to target a deep intracranial structure for purposes of biopsy, incision, stimulation, or destruction by either radiation or radiofrequency or injection. The reference procedure 61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) has a total work value of 1010 and a time of 82 minutes with a RVW of 10.31. This represents a close translation of the Harvard3 time and work data to the present MFS value for work. The comparable values for the remainder of the procedures in this family are tabulated above for comparison, and the procedures are arranged in ascending rank order for work, using the Harvard3 database for anchor points. We recommend the RVWs listed in the right column for this set of procedures.

In the case of 61720 (CREATION STEREOTACTIC LESION, GLOBUS PALLIDUS OR THALAMUS), this service is designed to ameliorate the tremor of patients with Parkinsonism. It involves more time, skill and risk than 61790. The Harvard3 time and work values appear appropriate in relation to the other procedures listed. However, the data from our survey show substantially less intra- and post-service time, a single ICU visit, and a total work value of 1600 compared to the Harvard3 total work of 1882. The shorter intra- and post-service times (of up to one hour) combine to reduce the total work, despite a slightly greater intensity for the survey responses (7.61) compared to the Harvard3 intensity of 6.13. When the 1600 work value is converted to the scale of the MFS95, the recommended RVW is 15.92.

RATIONALE for recommendation:

Work:

Changes in past 5 years:

Reduced times reflect increased familiarity with the stereotactic technology in the centers providing this service compared to 5-10 years ago.

Rank Order (Ordinal) Valuation:

Ordinal values appropriate as listed in table of reference service 5/92 refinement panel increased RVW from 10.92 to 16.24.

Prev. RUC or Refinement Valuation:

Time:

AANS95 Survey:

Data included in tables above.

Harvard3 Database:

Time and work values appear high relative to both Refinement panel and AANS95 survey data.

Mental Effort & Judgement:

More mental effort and judgment than 61790

Technical Skill & Physical Effort:

Greater skill than 61790

Stress:

Risk factors higher

Intensity/Complexity:

Complexity somewhat greater, working at depth in the brain.

CPT Code: 61735

RELATIONSHIP OF 61735 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) is the reference service for this group of procedures. They have in common the use of stereotactic localization techniques to target a deep intracranial structure for purposes of biopsy, incision, stimulation, or destruction by either radiation or radiofrequency or injection. The reference procedure 61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) has a total work value of 1010 and a time of 82 minutes with a RVW of 10.31. This represents a close translation of the Harvard3 time and work data to the present MFS value for work. The comparable values for the remainder of the procedures in this family are tabulated above for comparison, and the procedures are arranged in ascending rank order for work, using the Harvard3 database and the AANS94 & 95 survey data for reference. We recommend the RVWs listed in the right column for this set of procedures.

In the case of 61735 (CREATION OF SUBCORTICAL LESION, STEREOTACTIC METHOD), this service is designed to ameliorate pain in patients with intractable pain problems. It involves more time, skill and risk than 61790, and the Harvard3 time and work values appear appropriate in relation to the other procedures listed. We recommend a RVW of 18.72.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

Ordinal values appropriate as listed in table of reference service

Prev. RUC or Refinement Valuation:

5/92 Refinement panel increased RVW92 from 12.32 to 17.50.

Time:

Harvard3 Database:

Time and work data appear reasonable.

Undervalued time/Phase I or II & MFS92:

All codes above 61790 undervalued re: Harvard3 data.

Mental Effort & Judgement:

More mental effort and judgment than 61790

Technical Skill & Physical Effort:

Greater skill than 61790

Stress:

Risk factors higher

Intensity/Complexity:

Complexity somewhat greater, working at depth in the brain.

RELATIONSHIP OF 61750 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) is the reference service for this group of procedures. They have in common the use of stereotactic localization techniques to target a deep intracranial structure for purposes of biopsy, incision, stimulation, or destruction by either radiation or radiofrequency or injection. The reference procedure 61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) has a total work value of 1010 and a time of 82 minutes with a RVW of 10.31. This represents a close translation of the Harvard3 time and work data to the present MFS value for work. The comparable values for the remainder of the procedures in this family are tabulated above for comparison, and the procedures are arranged in ascending rank order for work, using the Harvard3 database for anchor points. We recommend the RVWs listed in the right column for this set of procedures.

In the case of 61750 (STEREOTACTIC BIOPSY, ASP. OR EXCIS. OF INTRACRANIAL LESION), this service is used to biopsy lesions in patients with tumors in deep seated cerebral structures. It involves more time, skill and risk than 61790. The intra-service time is 51 minutes greater and the post-service time 90 minutes more than 61790. The Harvard3 total work value appears appropriate in relation to the other procedures listed. We recommend a RVW of 16.67.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation: Ordinal values appropriate as listed in table of reference service
Prev. RUC or Refinement Valuation:

Time:

Anesthesia databases: 98 cases; avg. anesth. time= 170 min.

Mental Effort & Judgement: More mental effort and judgment than 61790

Technical Skill & Physical Effort: Greater skill than 61790

Stress: Risk factors higher

Intensity/Complexity: Complexity somewhat greater, working at depth in the brain.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION
Comments on Misvalued Code**

CPT Code: 61751 Global Period: 090 Current RVW: 15.18 Recommended RVW: 16.66

CPT Descriptor: Stereotactic biopsy, aspiration, or excision, including burr hole(s), for intracranial lesion; with computerized axial tomography

Source and Summary of Comment to HCFA on this service: Public Comments by AANS on Key Reference Procedures. AANS recommended an increase in RVW from 15.18 to 16.66 based on an analysis of survey and other data.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old male with progressive left hemiparesis and a CT scan that shows a ring enhancing lesion in the right thalamus. A stereotactic biopsy of this single lesion is done through a burr hole under sedated local anesthesia.

Description of Pre-Service Work: includes review of previous medical records, evaluation of the imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family. Positioning is more complex due to the use of a stereotactic frame that requires coordinate indexing to the patient table.

Description of Intra-Service Work: The intra-service work begins with the application of the stereotactic head frame under local anesthesia. The patient is then transported to Radiology where stereotactic imaging studies are obtained. This may be either MRI or CT scanning. The neurosurgeon must position and secure the patient on the imaging table and attach an appropriate stereotactic localizer. He then works with a radiologist or technician to identify the precise areas to be imaged by adjustment of the scanning geometry. Finally, the neurosurgeon verifies that the target is optimally imaged including appropriate use of enhancement dosages. The patient is then returned to the operating room, still in the frame, and the surgery is begun. A scalp incision is made at an appropriate site for entry of the biopsy probe, a burr hole made, and the probe inserted into the stereotactic guide. After confirmation of the desired coordinates, the probe is introduced into the brain to the target depth. A series of biopsy specimens are then obtained and reviewed by the pathologist. Additional samples may be obtained depending on the pathologist's input. When completed, the probe is removed and the scalp would be sutured. Dressings are applied. Removal of the frame is done at the end of the service period.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of complications and hemorrhage. The hospital visits and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

PT Code: 61751

RELATIONSHIP OF 61751 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) is the reference service for this group of procedures. They have in common the use of stereotactic localization techniques to target a deep intracranial structure for purposes of biopsy, incision, stimulation, or destruction by either radiation or radiofrequency or injection. The reference procedure 61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) has a total work value of 1010 and a time of 82 minutes with a RVW of 10.05. This procedure represents the process of introducing a needle through the skin of the face and directing it to enter the foramen ovale in the floor of the middle cranial fossa to then enter the Gasserian ganglion immediately posterior to this root of the trigeminal nerve. The purpose is to permit injection of a neurolytic material that will interfere with the pain mechanism of trigeminal neuralgia. The stereotactic aspect of this service simply represents the use of x-ray imaging during the course of needle insertion and positioning to aid in entry of the ganglion. Usually this is done with bi-plane x-rays or fluoroscopy of the patients head to use the bony basal landmarks to augment the needle guidance. It does not regularly include use of a stereotactic frame and tomographic targeting so the additional time and work of that service is not included in 61790. The Harvard3 RVW of 10.05 represents a close approximation to the current MFS95 RVW of 10.31 which appears to reflect a fair representation of the work of this reference service. The comparable values for the remainder of the procedures in this family are tabulated above for comparison, and the procedures are arranged in ascending rank order for work, using the Harvard3 database for anchor points. We recommend the boldface RVWs listed in the right column for this set of procedures.

In the case of 61751 (STEREOTACTIC BIOPSY, ASP. OR EXCIS. OF LESION W COMPUTERIZED AXIAL TOMO), this service is used to biopsy or excise lesions in patients with tumors in deep seated cerebral structures utilizing the CT or MRI scan with the patient in a head frame to develop coordinates for targeting. It involves more time, skill and risk than 61790. The Harvard3 work value appears appropriate in relation to the other procedures listed but does not conform to the calculation of work and RVW based on the AANS94 survey data. That survey data gives a total work value of 1392 (on the scale of Harvard3) which translates to a RVW of 13.85. The principal differences are in a much shorter intra-service time (and work) for the AANS94 survey, amounting to less than 50% or the Harvard3 intra-service time. This shorter time is also reflected in the op. logs and anesthesia time databases listed below, both of which indicate intra-service times in the range of 90 minutes rather than the 187 minutes from Harvard3. We believe that this represents a major underestimation of the intra-service time, since a piecemeal reconstruction of the intra-service components comes much closer to the higher Harvard3 time of 187 minutes.

To illustrate this difference, the steps involved in 61751 with their associated times for an average case are listed as follows:

Application of stereotactic head frame after local anesthetic injected into scalp or induction general anesthesia	30 min
Transport of patient with frame attached to the CT facility and placement on the scanner table	15 min
Connect frame to indexing attachment on CT table and align to scanner geometry	10 min
Select suitable axis for scan, administer contrast to patient, identify the target and complete scans	20 min
Remove patient from CT table and transport to OR and while coordinates plotted	15 min
Place patient on OR table, attach frame to table, adjust positioning, shave scalp and sterilize frame	15 min
Enter stereotactic coordinates to guide system on frame	5 min
Apply drapes, inject local anesthesia into scalp, make incision and cranial bone opening	15 min
Insert stereotactic probe or instrument into targeted lesion, take biopsies, send to pathologist for exam	45 min
Remove probe, close scalp wound and apply dressing, remove stereotactic frame and take patient off OR table	15 min
Total time =	185 min

This total estimated time is a very close match to that from the Harvard3 data and supports our concern that the survey responses of 90 minutes have seriously misallocated the time for this part of 61751. Therefore, we propose that a composite approach to reconstruction of the work and RVW of 61751 be used to help correct this inaccurate data. We suggest using the Harvard 3 pre-service time of 75 minutes, since that seems adequate to cover all of the services provided before the application of the frame, which marks the beginning of the intra-service period. It seems likely that the survey respondents may have lumped time for application of the frame plus some of the scanning time to the pre-service period, as the higher pre-service survey time of 128 minutes suggests.

We also suggest using the survey time of 125 minutes for the post-service period, since that meets face validity as well as our survey time of 123 minutes while the Harvard3 time of 185 minutes seems excessive for post-op time.

When all of these adjusted time factors are used to recalculate a total work value, the result is 1674 which translates to a MFS95 RVW of 16.66 which is our recommended value for 61751.

61770	STEREOTACTIC LOCALIZATION W/ INSERTION OF CATHETERS/BRACHYTHERAPY	71	140		183	1987		19.78	15.14	19.78	8.96
61760	STEREOTACTIC IMPLANTATION DEPTH ELECTODES INTO CEREBREUM/ SEIZURE MONITORING								24.83	21.00	

RELATIONSHIP OF 61760 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:
61770 (STEREOTACTIC LOCALIZATION W/ INSERTION OF CATHETERS/BRACHYTHERAPY) is the reference service for this procedure. This service is used to treat lesions in patients with tumors in deep seated cerebral structures using multiple catheters implanted into the tumor bed for delivery of local radiation therapy. It involves more time, skill and risk than 61735, and the Harvard3 work value appears appropriate in relation to the other procedures listed. 61760 has no previous Harvard3 or current survey data to use for comparison. The basis for ranking this service is a comparison of the work involved in placing a series of depth electrodes into the brain in an area of demonstrated epileptogenic activity for monitoring. The elements of work compare rather well to the reference service, 61770, since both require stereotactic targeting and insertion of multiple catheters or probes connected to various devices outside the scalp for varying periods of time. The intensity elements of mental effort, technical skill, and stress are all comparable. It is probable that slightly more time is required for 61760 and therefore, we recommend a rank order placement slightly above that of 61770 for RVW. The present RVW of 24.83 seems to be out of scale with the other procedures listed and the value seems high. Therefore, we recommend a RVW of 21.00 to accomodate the extra time in 61760 while reducing the current high value.

The values for the remainder of the comparable procedures in this family are tabulated above for comparison, and they are arranged in ascending rank order for work, using the Harvard3 database for anchor points. We recommend the RVWs listed in the right column for this set of procedures.

RATIONALE for recommendation:

Work: Rank Order (Ordinal) Valuation: Ordinal values appropriate as listed in table of reference service

Time: Mental Effort & Judgement: Compares to 61770.

Technical Skill & Physical Effort: Comparable to 61770.

Stress: Risk factors high due to multiple punctures of brain.

Intensity/Complexity: Complexity somewhat greater, working at depth in the brain.

RELATIONSHIP OF 61770 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) is the reference service for this group of procedures. They have in common the use of stereotactic localization techniques to target a deep intracranial structure for purposes of biopsy, incision, stimulation, or destruction by either radiation or radiofrequency or injection. The reference procedure 61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) has a total work value of 1010 and a time of 82 minutes with a RVW of 10.31. This represents a close translation of the Harvard3 time and work data to the present MFS value for work. The comparable values for the remainder of the procedures in this family are tabulated above for comparison, and the procedures are arranged in ascending rank order for work, using the Harvard3 database for anchor points. We recommend the RVWs listed in the right column for this set of procedures.

In the case of 61770 (STEREOTACTIC LOCALIZATION WITH INSERTION OF CATHETERS FOR BRACHYTHERAPY), this service is used to treat lesions in patients with tumors in deep seated cerebral structures using multiple catheters implanted into the tumor bed for delivery of local radiation therapy. It involves more time, skill and risk than 61790, and the Harvard3 work value appears appropriate in relation to the other procedures listed. We recommend a RVW of 19.78.

CPT Code: 61770

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

Ordinal values appropriate as listed in table of reference service

Prev. RUC or Refinement Valuation:

Time:

Op. Logs:

Harvard3 Database:

Undervalued time/Phase I or II & MFS92:

Mental Effort & Judgement:

More mental effort and judgment than 61790

Technical Skill & Physical Effort:

Greater skill than 61790

Stress:

Risk factors higher due to radiation hazards and multiple punctures of brain and tumor with catheters to carry the radioactive pellets.

Intensity/Complexity:

Complexity somewhat greater, working at depth in the brain.

RELATIONSHIP OF 61791 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) is the reference service for this group of procedures. They have in common the use of stereotactic localization techniques to target a deep intracranial structure for purposes of biopsy, incision, stimulation, or destruction by either radiation or radiofrequency or injection. The reference procedure 61790 (STEREOTACTIC LESION, PERCUTANEOUS OF GASSERIAN GANGLION) has a total work value of 1010 and a time of 82 minutes with a RVW of 10.31. This represents a close translation of the Harvard3 time and work data to the present MFS value for work. The comparable values for the remainder of the procedures in this family are tabulated above for comparison, and the procedures are arranged in ascending rank order for work, using the Harvard3 database for anchor points. We recommend the RVWs listed in the right column for this set of procedures.

In the case of 61791 (STEREOTACTIC LESION PERCUTANEOUS OF TRIGEMINAL MEDULLARY TRACT), this service is used to in patients patients with neuralgic pain in the face. It involves more time, skill and risk than 61790, and the Harvard3 work value appears appropriate in relation to the other procedures listed. The Carrier Medical Directors recommended an increase from the present RVW of 7.29 to a new RVW of 13.29. This was an appropriate recommendation and our extrapolated RVW based on the Harvard3 time and work data supports our recommendation of 13.99.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 61793 Global Period: 090 Current RVW: 16.70 Recommended RVW: 17.88

CPT Descriptor: **Stereotactic focused proton beam or gamma radiosurgery**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS**
AANS recommended increase in RVW from 16.70 to 17.88.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75 year old male with a history of renal cell carcinoma, now present in the right cerebellum. He has headaches, dizziness and compression of the fourth ventricle as seen on MRI scan. No other lesions are evident, and the chest exam is normal. The lesion enhances and is 2cm in diameter. Stereotactic radiosurgery is delivered using the gamma knife system.

Description of Pre-Service Work: includes review of previous medical records, evaluation of the imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family.

Description of Intra-Service Work: The intra-service work begins with the application of the stereotactic head frame under local anesthesia. The patient is then transported to Radiology where stereotactic imaging studies are obtained. This may be either MRI or angiography. The neurosurgeon must position and secure the patient on the imaging table and attach an appropriate stereotactic localizer. He then works with a radiologist or technician to identify the precise areas to be imaged by adjustment of the scanning geometry and by timing of the contrast injection(s). Finally, the neurosurgeon verifies that the target is optimally imaged. Dosimetry planning follows in conjunction with radiation oncology and a radiation physicist as well a computer programmer. The programmer processes all of the stereotactic images into the dose planning computer during this phase. This dose planning involves use of a computer based planning module to achieve an optimal dosimetry plan for the patient. A test is then done using the radiosurgical device to assure correct targeting and dosimetry. The patient is then placed in the device while still in the frame. Positioning is more complex due to the use of a stereotactic frame that requires coordinate indexing to the patient table. The treatment is then delivered. For each isocenter treated, the neurosurgeon must set the stereotactic coordinates, verified by other team members. Removal of the frame is done at the end of the service period.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of complications. The recovery room visit and discharge day management are included. Discharge records are prepared and post-discharge office visits are completed during the 90 day global period.

61860	CRANIOTOMY/IMPLANT CORTICAL ELECTRODES	64	100		137	1302		12.96	11.20	19.60	7.47

RELATIONSHIP OF 61850 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference procedure is 61108 (TWIST DRILL, BURR HOLES FOR DRAINAGE OF SUBDURAL HEMATOMA) with a total work value of 956 and intra-service time of 44 minutes. 61850 has a total work of 932 and time of 73 minutes, while 61855 total work is 942 and time is 75 minutes. Based on rank order valuation, we recommend a RVW of 11.50 for 61850.

Comparison to 61860 (CRANIOTOMY FOR IMPLANTATION OF CORTICAL ELECTRODES) also shows that there is substantially more total work involved in the craniotomy compared to the twist drill or burr hole approach. The Harvard3 data strongly support a reduced RVW for 61850 with a total work value of 932 compared to the total work for 61860 of 1302. We recommend a RVW of 11.50 for 61850.

RATIONALE for recommendation:

RELATIONSHIP OF 61855 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference procedure is 61108 (TWIST DRILL, BURR HOLES FOR DRAINAGE OF SUBDURAL HEMATOMA) with a total work value of 956 and an intra-service time of 44 minutes. 61850 has a total work of 932 and time of 73 minutes, while 61855 total work is 942 and time is 75 minutes. Based on rank order valuation, we recommend a RVW of 12.50 for 61855.

Comparison to 61860 (CRANIOTOMY FOR IMPLANTATION OF CORTICAL ELECTRODES) also shows that there is substantially more work involved in the craniotomy compared to the twist drill or burr hole approach. The Harvard3 data strongly support a reduced RVW for 61855 and we recommend a comparable RVW of 12.50 for 61855.

61312	CRANIOTOMY/EVAC HEMATOMA SUPRATENTORIAL EXTRA/SUBDURAL	75	150		253	2040		20.30	20.54		
61312	CRANIOTOMY/EVAC HEMATOMA SUPRATENTORIAL EXTRA/SUBDURAL	80	120	100	325		2194			21.83 AANS94	

RELATIONSHIP OF 61860 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

These procedures all require a cranial opening for placement of intracranial stimulator electrodes. 61860 (CRANIOTOMY FOR IMPLANTATION OF NEUROSTIMULATOR ELECTRODES, CEREBRAL; CORTICAL) requires a small craniotomy for placement of electrodes over the cerebral cortex. The main reference procedure is 61154 (BURR HOLE FOR EVACUATION OF HEMATOMA, EXTRA- OR SUBDURAL, UNILATERAL) with a RVW of 13.67 and an intra-service time 69 minutes and a total work value of 1212. Note that 61154 was surveyed in AANS94 with time and work data that provided a total work value of 1361 which translates to a MFS95 RVW of 13.54, which is only 0.03 RVW less than the current RVW. This provides additional support for the higher total work value of this reference service and use as a reference service in this comparison.

The second procedure for comparison is 61850 (TWIST DRILL OR BURR HOLE/IMPLANT.CORTICAL ELECTRODES) which does the same service using only a twist drill or burr hole to implant the electrodes. The recommended RVW for 61850 is 11.50 RVW compared to the recommended RVW of 19.60 for this code, 61860.

A third reference is 61312 () which involves much of the same work elements as 61860. The fact that this service includes a craniotomy increases the work and complexity of the service into the range of other craniotomy procedures, and placement of the RVW for this service at 19.60 relates well to the references cited.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:
Prev. RUC or Refinement Valuation:

Rank order appropriate for face validation of listed procedures.
MFS92 gave 61154 a RVW of 12.84 which was increased to 14.00 by the May92 Refinement Panel.

Time:

AANS94 Survey Key Refs:

61154 was surveyed in AANS94 with results as noted above.

Mental Effort & Judgement:

Technical Skill & Physical Effort:

Craniotomy increases the amount of time and work relative to a twist drill or burr hole approach for the same purpose.

Public Comments30-Jun-95

61312	CRANIOTOMY/EVAC HEMATOMA SUPRATENTORIAL EXTRA/SUBDURAL	80	120	100	325		2194			21.83 AANS94	

RELATIONSHIP OF 61865 TO KEY REFERENCE SERVICES and Other Rationales for RVW Recommendation:

These procedures all require a cranial opening for placement of intracranial stimulator electrodes. 61860 (CRANIOTOMY FOR IMPLANTATION OF NEUROSTIMULATOR ELECTRODES, CEREBRAL; CORTICAL) requires a small craniotomy for placement of electrodes over the cerebral cortex. The main reference procedure is 61154 (BURR HOLE FOR EVACUATION OF HEMATOMA, EXTRA- OR SUBDURAL, UNILATERAL) with a RVW of 13.67 and an intra-service time 69 minutes and a total work value of 1212. Note that 61154 was surveyed in AANS94 with time and work data that provided a total work value of 1361 which translates to a MFS95 RVW of 13.54, which is only 0.03 RVW less than the current RVW. This provides additional support for the higher total work value of this reference service and use as a reference service in this comparison.

The second procedure for comparison is 61850 (TWIST DRILL OR BURR HOLE/IMPLANT CORTICAL ELECTRODES) which does the same service using only a twist drill or burr hole to implant the electrodes. The recommended RVW for 61850 is 11.50 RVW compared to the recommended RVW of 21.70 for this code, 61865.

Comparison of the total work values and intra-service times in this group of procedures, based on time and work data from Harvard3, supports the relative value rank order as listed in the table.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

Rank order appropriate for face validation of listed procedures.

Time:

Harvard3 Database:

See table above.

Mental Effort & Judgement:

Technical Skill & Physical Effort:

Craniotomy increases the amount of time and work relative to a twist drill or burr hole approach for the same purpose.

Stress:

Intensity/Complexity:

Placement of subcortical electrodes inherently of greater risk. Progressive increase in Harvard3 intensity per rank order.

RELATIONSHIP OF 61870 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61870 (CRANIECTOMY/IMPLANT CEREBELLAR CORTICAL ELECTRODES) involves exposure of the cerebellar surface by means of a craniectomy opening to implant neurostimulator electrodes over the cortical surface. Two reference service for comparison are 61314 (CRANIOTOMY/EVAC. HEMATOMA INFRATENTORIAL, EXTRA/SUBDURAL) and 61305 (CRANIECTOMY OR CRANIOTOMY, EXPLORAT. INFRATENTORIAL (POST. FOSSA)). Both of these services involve a similar approach with exposure of the cerebellum but with different purposes that entail substantially more intra-service and post-service time and work. The total work for these reference procedures are 2293 and 2486, with RVWs of 22.78 and 24.77 respectively. By contrast, the total work for 61870 is 1373 and the Harvard3 translated RVW is 13.67. The present MFS95 RVW is only 5.77 which is grossly undervalued for this type of procedure. This stems from an original MFS92 RVW of 6.02 which was incorporated into the MFS92 before the Harvard3 time and work refinement was completed in March 1992. At that time, the total work of 1373 was published, but despite reviews with the technical consulting groups, the increased value never was included as an update to subsequent editions of the MFS, even to the present.

We recommend an increase in the rank order anomaly for 61870 from 5.77 to 13.67.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

Rank order appropriate as listed in table for total work and recommended RVWs.

Initial crosswalk or extrapolation misvaluation:

The initial low RVW was anomalous when compared to 61860 and 61865, even in the MFS92.

Time:

Harvard3 Database:

Harvard3 total work = 1373, which translates to a RVW of 13.67.

Undervalued time/Phase I or II & MFS92:

Initial MFS92 RVW was 6.08, from extrapolation or charge based conversion.

Mental Effort & Judgement:

The mental and judgment factors are greater than those for 61860 which applies this same service to the brain surface above the tentorium.

Technical Skill & Physical Effort:

The skill and effort of a posterior fossa exposure are more than for a standard craniotomy.

Intensity/Complexity:

CPT Code: 62180

RELATIONSHIP OF 62180 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

62180 (VENTRICULOSTOMY (TORKILDSEN)) involves an occipital burr hole, introduction of a ventricular catheter, tunneling the catheter beneath the scalp into the suboccipital region, and then introducing the distal end of the catheter into the cisterna magna. The purpose is to provide a bypass for an aqueduct of Sylvius obstruction.

The reference procedures for 62180 VENTRICULOSTOMY (TORKILDSEN) are 61210 (BURR HOLES FOR IMPLANTING VENTRICULAR CATHETER) + 61253 (BURR HOLE(S), INFRATENTORIAL). The MFS95 RVW for the occipital burr hole and introduction of the ventricular end of the catheter (61210) is 4.72 revised to 5.84. Since 61210 has a Global of 000, the Post- time and work reduction would indicate about 2.0 units of reduction from the total RVW of 5.84 giving a contribution from 61210 of 3.0 RVW.

The RVW for 61253 and opening the posterior fossa is 13.00 revised to 11.27. The amount of work and time involved in opening the posterior fossa over the cisterna magne is greater than a simple burr hole and requires a midline incision down over the foramen magnum and C1. This requires considerably more time than the listed 71 minutes, and our recent survey median reports 161 intra-service minutes as well as longer pre- and post-service times. The total work from the survey is 1981 compared to a total of 1530 from the Harvard3 data. This warrants an an increase in the recommended RVW from the current 12.72 to 19.71 which is the translation of the survey total work to the MFS95 scale.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation: Rank order valuation appropriate as listed in table above.
 Prev. RUC or Refinement Valuation: May 1992 Panel increased RVW to 13.03 from original 12.72

Time:

AANS95 Survey: See table above for time and work data from current survey.
 Harvard3 Database: Harvard3 time and work data appear to reflect appropriate relativity in this family of services.

Undervalued time/Phase I or II & MFS92: MFS92 RVW appears unchanged to date, reflecting undervaluation from inception of the MFS.

Mental Effort & Judgement:

Mental effort & judgment for 61280 greater than reference services.

Technical Skill & Physical Effort:

Skill and effort at proper placement of shunt catheter and avoidance of CSF leakage greater then reference service.

Stress:

Stress and risk only slightly greater.

Intensity/Complexity:

Complexity and intensity slightly higher. Note 2 ICU visits.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 62180 Global Period: 090 Current RVW: 12.72 Recommended RVW: 19.71

CPT Descriptor: **Ventriculocisternostomy (Torkildsen type operation)**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended an increase in RVW from 12.72 to 19.71. **AANS95 survey.**

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50 year old man has a workup for headaches and visual disturbance and an MRI scan reveals hydrocephalus with stenosis of the aqueduct. After a general workup, a bypass shunt procedure is done by placing a shunt catheter in the posterior portion of one lateral ventricle, tunnelling the distal end beneath the scalp, and introducing and anchoring the distal end in the cisterna magna, thereby bypassing the stenotic aqueduct.

Description of Pre-Service Work: includes review of imaging studies, review of past medical history and appropriate lab studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Additional pre-service work is entailed in positioning the patient since the approach requires either a prone or sitting position on the operating table, with attendant anchoring of the head in a fixation device.

Description of Intra-Service Work: A scalp incision and burr hole are placed over the occiput lateral to midline. A shunt catheter is introduced into the posterior portion of the lateral ventricle. The distal end of the catheter is tunneled beneath the scalp into the suboccipital region, which is opened low in the midline to expose the arch of C1 and the lower portion of the suboccipital bone. The rim of the foramen magnum is enlarged superiorly and the arch of C1 removed. The dura is opened in midline and retracted laterally. The shunt catheter tip is introduced into the subarachnoid space after incision of the arachnoid and anchored to the inner dura. The dura is then closed water-tight, and the muscle and fascia and scalp are closed in layers without drainage. The burr hole wound is also closed. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of leakage of ventricular fluid or infection. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

62190	CREATION OF SHUNT SUBARACH/SUBDURAL-ATRIAL, JUGULAR, AURICULAR	63	103		109	1053		10.48	10.13	

RELATIONSHIP OF 62194 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference service for this code is 62225 which represents the next step up in complexity and intensity, involving penetration of the brain rather than entry to the subdural/subarachnoid space with catheter replacement. The brain entry is clearly more intensive and the Harvard3 times for post-service slightly longer for 62225, but the total work values are 668 compared to 611, so the RVW for 62194 should be slightly lower than 62225 and we recommend a reduction to 4.50 units.

RATIONALE for recommendation:

Work:	Rank Order (Ordinal) Valuation:	Basis for readjusting Harvard3 calculated RVW downward to remain reasonable within same family of services.
Time:	Harvard3 Database:	Data used in estimation of final RVW
Mental Effort & Judgement:	Technical Skill & Physical Effort:	Less than 62225.
Stress:	Intensity/Complexity:	Less than 62225
		Less than 62225

FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 62200 Global Period: 090 Current RVW: 13.24 Recommended RVW: 17.33

CPT Descriptor: **Ventriculocisternostomy, third ventricle**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.
AANS recommended an increase in RVW from 13.24 to 17.33.** **AANS95 survey in progress.**

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50 year old man has a workup for headaches and visual disturbance and an MRI scan reveals hydrocephalus with stenosis of the aqueduct. After a general workup, a spinal fluid diversion procedure is done by a small craniotomy, entry into one lateral ventricle and then the foramen of Monroe to the floor of the third ventricle. A small opening is created in the floor of the third ventricle to allow ventricular fluid to enter the basal cisterns thereby bypassing the stenotic aqueduct.

Description of Pre-Service Work: includes review of imaging studies, review of past medical history and appropriate lab studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup.

Description of Intra-Service Work: A frontal scalp flap is opened and a small craniotomy flap made. The dura is opened in and the underlying cortex is incised to develop a tract to enter the anterior lateral ventricle. After entering the ventricle, the foramen of Monroe is entered and a small opening is made in the floor of the third ventricle. After confirming patency of the opening and hemostasis, the retractors are removed from the cerebrotomy tract, the dura closed and the bone flap replaced and anchored. The scalp is closed in layers without drainage. Dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of leakage of ventricular fluid or infection. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

62201	VENTRICULOSTOMY, THIRD VENTRICLE, STEREOTACTIC METHOD	143	75	13	143		1360			13.54 AANS95
62200	THIRD VENTRICULOCISTERNOSTOMY	71	131		172	1851		18.42	13.24	18.42
62200	THIRD VENTRICULOCISTERNOSTOMY	80	120		153		1742			17.33 AANS95

RELATIONSHIP OF 62200 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The last two procedures in the table, 62201 (VENTRICULOSTOMY, THIRD VENTRICLE, STEREOTACTIC METHOD) and 62200 (THIRD VENTRICLE, VENTRICULOSTOMY) involve a cranial opening for entry into the third ventricle for the purpose of fenestrating the anterior floor into the region of the chiasmatic cistern, thereby bypassing an aqueductal or posterior third ventricle obstruction. The difference in the two codes is that 62201 uses stereotaxis for guidance and targeting while 62200 involves more surgical work in directly opening a tract into the anterior third ventricle, usually via a cerebrotomy into the anterior horn of the lateral ventricle. The reference procedures for 62200 (THIRD VENTRICULOCISTERNOSTOMY) are 61156 (BURR HOLE WITH ASPIRATION OF HEMATOMA OR CYST, INTRACEREBRAL) at RVW 15.23, and 62201 (VENTRICULOSTOMY, THIRD VENTRICLE, STEREOTACTIC METHOD) with a RVW of 15.23. The additional work of a cerebrotomy with entry into the lateral and third ventricle support an additional 2.1 RVWs to a total of 17.33 RVWs, which is the MFS95 conversion from the survey work total.

RATIONALE for recommendation:

Work:

Changes in past 5 years

Increasing interest in this procedure as treatment in some forms of hydrocephalus to avoid a shunt procedure.

Rank Order (Ordinal) Valuation:

The RVW recommended meets reasonable rank order placement for this family

Time:

AANS95 Survey:
Harvard3 Database:

Few responses in survey but data appear reasonable compared to refs. Harvard3 time and work data support rank order & RVWs as listed in table.

Mental Effort & Judgement:

Higher mental effort in this service compared to 61156.

Technical Skill & Physical Effort:

Technical skill higher in order to enter lateral and then anterior third ventricle, then make opening in proper place in floor adjoining hypothalamus.

Stress:

Substantial risk associated with operating inside the third ventricle and entering the cistern in front of the basilar artery.

Intensity/Complexity:

High intensity and complexity.

FIVE-YEAR REVIEW**

Comments on Misvalued Code

CPT Code: 61885 Global Period: 090 Current RVW: 2.35 Recommended RVW: 5.28

CPT Descriptor: **Incision and subcutaneous placement of cranial neurostimulator pulse generator or receiver, direct or inductive coupling**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended an increase in RVW from 2.35 to 5.28.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
61888	REVISION OR REMOVAL INTRACRANIAL NEUROSTIMULATOR RECEIVER	45	34		53	469		4.67	3.10	4.67
61885	INCISION/PLACEMENT OF NEUROSTIMULATOR SUBQ RECEIVER	46	34		64	530		5.28	2.35	5.28
61880	REVISION OR REMOVAL INTRACRANIAL ELECTRODES	47	46		67	517		5.15	5.72	

RELATIONSHIP OF 61885 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:
61885 (INCISION/PLACEMENT OF NEUROSTIMULATOR SUBQ RECEIVER) requires surgical preparation of a subcutaneous pocket for implantation of a neurostimulator receiver and connection to implanted intracranial electrodes. The reference service for comparison is 61880 (REVISION OR REMOVAL INTRACRANIAL ELECTRODES) which describes the surgical management of the intracranial electrodes associated with the neurostimulator receiver. The RVW for this reference service has been stable since MFS92 with a reasonable Harvard3 total work value and RVW. The original RVW for 61885 was only 2.48 and the changes that appeared in Harvard3 in March 1992 were not included in updates to the subsequent editions of the MFS, even to 1995. Consequently, the RVW of 2.35 remains disproportionately low compared to 61880, and does not accurately reflect the greater amount of work that was reflected in the Harvard3 data. We recommend that this be corrected by increasing the RVW to 5.28 which will re-establish relativity within this group of codes.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:	Rank order appropriate as listed in table.
Initial crosswalk or extrapolation misvaluation:	The initial low RVW was anomalous when compared to 61880 in the MFS92.

Time:

Harvard3 Database:	Harvard3 total work = 530, which translates to a RVW of 5.28.
Undervalued time/Phase I or II & MFS92:	Initial MFS92 RVW was 2.48, from extrapolation or charge based conversion.

Comments on Misvalued Code

CPT Code: 61888 Global Period: 010 Current RVW: 3.10 Recommended RVW: 4.67

CPT Descriptor: **Revision or removal of cranial neurostimulator pulse generator or receiver**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended increase in RVW from 3.10 to 4.67.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
61888	REVISION OR REMOVAL INTRACRANIAL NEUROSTIMULATOR RECEIVER	45	34		53	469		4.67	3.10	4.67
61885	INCISION/PLACEMENT OF NEUROSTIMULATOR SUBQ RECEIVER	46	34		64	530		5.28	2.35	5.28
61880	REVISION OR REMOVAL INTRACRANIAL ELECTRODES	47	46		67	517		5.15	5.72	

RELATIONSHIP OF 61888 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

61888 (REVISION OR REMOVAL INTRACRANIAL NEUROSTIMULATOR SUBQ RECEIVER) requires surgical exposure of the subcutaneous pocket that contains an implanted neurostimulator receiver. The reference service for comparison is 61880 (REVISION OR REMOVAL INTRACRANIAL ELECTRODES) which describes the surgical management of the intracranial electrodes associated with the neurostimulator receiver. The RVW for this reference service has been stable since MFS92 with a reasonable Harvard3 total work value and RVW. The original RVW for 61883 was only 3.26 and the changes that appeared in Harvard3 in March 1992 were not included in updates to the subsequent editions of the MFS, even to 1995. Consequently, the RVW of 3.10 remains disproportionately low compared to 61880, and does not accurately reflect the greater amount of work that was represented in the Harvard3 data. We recommend that this be corrected by increasing the RVW to 4.67 which will re-establish relativity within this group of codes.

RATIONALE for recommendation:

Work:
 Rank Order (Ordinal) Valuation: Rank order appropriate as listed in table.
 Initial crosswalk or extrapolation misvaluation: The initial low RVW was anomalous when compared to 61880 in the MFS92.

Time:

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 62201 Global Period: 090 Current RVW: 12.10 Recommended RVW: 13.54

CPT Descriptor: **Ventriculocisternostomy, third ventricle; stereotactic method**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.
AANS recommended an increase in RVW from 12.10 to 13.54.**
AANS95 survey in progress.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50 year old man has a workup for headaches and visual disturbance. An MRI scan reveals hydrocephalus with stenosis of the aqueduct. After a general workup, a spinal fluid diversion procedure is done by stereotactic technique. The floor of the third ventricle is punctured by an instrument introduced via the stereotactic guidance system.

Description of Pre-Service Work: includes review of imaging studies, review of past medical history and appropriate lab studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup.

Description of Intra-Service Work: Initial work includes the application of the stereotactic frame, monitoring of scanning and the calculation of the target coordinates. The patient is returned to the operating room where a frontal burr hole is made. The dura is opened and the underlying cortex is incised to allow the stereotactic probe to pass into the lateral ventricle. The stereotactic coordinates are set into the frame and guidance system. An operating ventriculoscope is attached to the guide on the stereotactic. The ventriculoscope is then introduced through the cortical incision and passed into the lateral ventricle. After entering the ventricle, the foramen of Monroe is entered using visual guidance and a small opening is made in the floor of the third ventricle. After confirming patency of the opening and hemostasis, the ventriculoscope is removed from the operative tract, the dura closed and the scalp is closed in layers without drainage. The frame is removed and dressings are applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of leakage of ventricular fluid or infection. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
62201	VENTRICULOSTOMY, THIRD VENTRICLE, STEREOTACTIC METHOD	68	123		163	1569		15.62	12.10	
62201	VENTRICULOSTOMY, THIRD VENTRICLE, STEREOTACTIC METHOD	143	75	13	143		1360			13.54 AANS95
61750	STEREOTACTIC BIOPSY, ASP OR EXCIS OF INTRACRANIAL LESION	70	133		169	1675		16.67	10.03	16.67
62200	THIRD VENTRICULOCISTERNOSTOMY	71	131		172	1851		18.42	13.24	
62200	THIRD VENTRICULOCISTERNOSTOMY	80	120		153		1742			17.33 AANS95
61751	STEREOTACTIC BIOPSY, ASP OR EXCIS OF LESION W COMPUTERIZED AXIAL TOMO	75	187		185	1838		18.29	15.18	18.29

RELATIONSHIP OF 62201 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference procedures for 62201 are 61750 (STEREOTACTIC BIOPSY, INCLUDING BURR HOLES, FOR INTRACRANIAL LESION), with RVW of 10.03 and 61751 (SAME WITH COMPUTERIZED AXIAL TOMOGRAPHY) RVW of 15.18. Since the targeting of 62201 requires a high risk penetration of the floor of the third ventricle near the anterior hypothalamus, the intensity of this procedure is higher than 61751 which supports our recommendation for a RVW of 13.54.

The rank order valuation based on the service times and total work calculation from Harvard3 are appropriate. The MFS95 RVWs are not scaled properly to the relationships within this family of codes, and the translated Harvard3 RVWs provide a more accurate representation of the work involved in each of these services. This supports our recommended RVW of 13.54 for 62201.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW**

Comments on Misvalued Code

CPT Code: 62223 Global Period: 090 Current RVW: 12.81 Recommended RVW: 11.96

CPT Descriptor: **Creation of shunt; ventriculo-peritoneal, -pleural, other terminus**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS on Key Reference Procedures.**
AANS recommended decrease in RVW from 12.81 to 11.96.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW

62223	CREATION OF SHUNT, VENTRICULO-PERITONEAL, -PLEURAL OR OTHER TERMINUS	55	102		150	1224		12.18	12.81	
62223	CREATION OF SHUNT, VENTRICULO-PERITONEAL, -PLEURAL OR OTHER TERMINUS	90	90		140	1202				11.96 AANS94
62220	CREATION SHUNT, VENTRICULO-ATRIAL, JUGULAR -AURICULAR	63	104		110	1076		10.71	12.06	
62258	SHUNT, REMOVAL COMPLETE SYSTEM WITH REPLACEMENT	64	113		112	1108		11.03	13.60	

RELATIONSHIP OF 62223 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

62223 (CREATION OF SHUNT, VENTRICULO-PERITONEAL, -PLEURAL OR OTHER TERMINUS) is a common procedure for diversion of ventricular fluid into other body cavities capable of absorbing and eliminating the excess. It is a key reference procedure that has been believed to be undervalued since the original Harvard/Hsiao study and the 1992 MFS.

For comparison, the original Hsiao/Harvard Phase II total work value for 62223 in November 1990 was 1359. This was reduced at HCFA by June 1992 to 1227, which is comparable to the value listed in the Harvard3 database, and has been the basis for the subsequent RVWs in the MFS. This also indicates a relative overvaluation of work for this service in the original Hsiao project, since our survey data does not support this amount of total work.

The main reference codes are 62192 (CREATION OF SHUNT: SUBARACH/SUBDURAL-PERITONEAL, -PLEURAL, OTHER) and 62258 (SHUNT, REMOVAL COMPLETE SYSTEM WITH REPLACEMENT) which share most of the same elements of work as 62223. The current data indicates that the MFS95 RVWs are significantly higher than those from the Harvard3 process for both of these codes. Our survey indicates the total work value for 62223 in the Harvard3 data was slightly overvalued, and when the lower intensity value from the survey was applied to the survey intra-service time, the resultant work was only 1202. When converted to the scale of the MFS95, the recommended RVW is 11.96.

However, the two reference codes have not been surveyed for detailed time/work/ intensity data and therefore are only useful in the sense of relative valuation of all three codes. When they are rank ordered to one another using MFS95 RVWs, 62223 should be placed between the two codes, than 62258.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:

The rank order of RVWs listed in the table of procedures in this family has face validity when the AANS94 survey data is used, and supports the placement of the RVW for 62223.

Prev. RUC or Refinement Valuation:

May 1992 panel increased RVW from 13.02 to 13.12.

Time:

Op. Logs:

44 cases with avg. time=86 min.

Anesthesia databases:

467 cases with avg. anesthesia time of 129 minutes

AANS94 Survey Key Refs:

Time and work data used for comparison and scaling with calculation of recommended new RVW.

Harvard3 Database:

See table above.

Mental Effort & Judgement:

The mental effort and judgment are comparable for the three services, except that for initial installation of the ventricular shunt tubing, there is greater judgment and skill required.

Technical Skill & Physical Effort:

The skill of initial installation exceeds that of a removal or replacement procedure.

Stress:

Stress/risk factors are comparable.

Intensity/Complexity:

The intensity/complexity of 62223 as developed from the survey data is lower than the intensity from Harvard3 for 62192 or 62258.

Comments on Misvalued Code

CPT Code: 62268 Global Period: 000 Current RVW: 3.87 Recommended RVW: 4.74

CPT Descriptor: **Percutaneous aspiration, spinal cord cyst or syrinx**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended an increase in RVW from 3.87 to 4.74.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
62284	INJECTION PROCEDURE FOR MYELOGRAPHY, SPINAL OR POST FOSSA	14	25		10	154		1.53	1.54	
62280	INJECTION OF NEUROLYTIC SUBSTANCE, SUBARACHNOID	14	32		11	228		2.27	2.58	
62268	PERCUTAN.ASPIRATION SPINECORD CYST/SYRINX	40	49		16	476		4.74	3.87	4.74
62269	BIOPSY OF SPINAL CORD, PERCUTAN NEEDLE	40	50		19	504		5.02	4.07	5.02
62292	INJECTION PROCEDURE FOR CHEMONUCLEOLYSIS, SINGLE OR MULT, LUMBAR	23	47		83	683		6.80	7.00	
62294	INJECTION PROCEDURE/ARTERIAL/OCCCLUSION AVM SPINAL	41	117		108	1100		10.95	8.05	10.95

RELATIONSHIP OF 62268 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference procedure is 62280 (INJECTION OF NEUROLYTIC SUBSTANCE, SUBARACHNOID) with a RVW of 2.58 and a total work value of 228. 62268 has a total work value of 476, 62269 a work value of 504.

Comparison of the total work values and intra-service times for this group of procedures shows a steady increase in both values with reasonable adherence to the Harvard3 work values when translated to RVWs for 62280 and 62292. However, the RVWs for 62268, 62269 and 62294 were decreased when incorporated into MFS92 and have remained at a level that does not reflect their relative values within their family of procedures.

We recommend that the RVW of 62268 be placed at 4.74 to better represent the true relative value of this service.

RATIONALE for recommendation:

Work:

Changes in past 5 years

A relatively new service, with the advent of reliable imaging (especially MRI) that permits accurate diagnosis and localization of a spinal cord cyst that may be drained by percutaneous aspiration technique.

Rank Order (Ordinal) Valuation:

Ordinal valuation a basic tool for re-establishing relativity in family.

Initial crosswalk or extrapolation misvaluation:

6/91 total work of 328 increased to 476 in 3/92 crosswalk & extrapolat.

Prev. RUC or Refinement Valuation:

Time:

Harvard3 Database:

See table above

Undervalued time/Phase I or II & MFS92:

Time values representative, but conversion from total work to RVWs inaccurate.

Mental Effort & Judgement:

Greater judgment required than for 62280 due to invasion of spinal cord

Technical Skill & Physical Effort:

Greater skill needed to enter cord cyst without additional damage.

Stress:

Risk higher due to danger of hemorrhage in cyst or cord from needle.

Intensity/Complexity:

Intensity higher than 62280.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 62287 Global Period: 090 Current RVW: 4.13 Recommended RVW: 7.43

CPT Descriptor: **Aspiration procedure, percutaneous, of nucleus pulposus of intervertebral disk, any method, single or multiple levels, lumbar**

Source and Summary of Comment to HCFA on this service: **Public Comments by AANS.**
AANS recommended an increase in RVW from 4.13 to 7.43

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25 year old male athlete has had 5 weeks of low back pain with sciatica, an absent ankle reflex, and weakness of the posterior calf muscles. He has not responded to anti-inflammatory Rx and restricted activities. He has a history of a previous similar episode that cleared in 3 weeks. An MRI exam shows a diffuse bulging annulus and disk at L5-S1. The patient refuses to accept a laminotomy but agrees to a percutaneous discectomy, which is done in the operating room using a C arm guidance system.

Description of Pre-Service Work: includes review of previous medical records from the earlier episode, and evaluation the imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is more complex due to the use of a decubitus position and accommodation for the C arm fluoroscope.

Description of Intra-Service Work: The discectomy probe is introduced through the flank and guided into the region of the foramen where it is pushed through the annulus into the disk interspace. Fluoroscopic guidance is required during the insertion and to follow subsequent adjustments in position of the instrument while aspirating and removing disk tissue from the interspace. The probe is removed when no further disk material can safely be removed.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), and monitoring for signs of bleeding. All subsequent visits, including discharge day management are included during the 90 day global period.

REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	Time in minutes				Work		RVWs		
		Pre-Svc	Intra-Svc	ICU	Post-Svc	Hrvd3	AANS	Hrvd3 to MFS95	MFS95	Rec.New RVW
62284	INJECTION PROCEDURE FOR MYELOGRAPHY, SPINAL OR POST. FOSSA	14	25		10	154		1.53	1.54	
62291	INJECTION PROCEDURE FOR DISCOGRAPHY, SINGLE OR MULT. CERVICAL	18	37		11	261		2.60	2.91	
62290	INJECTION PROCEDURE FOR DISCOGRAPHY SINGLE OR MULT LEVELS LUMBAR	17	35		10	240		2.39	3.58	
62292	INJECTION PROCEDURE FOR CHEMONUCLEOLYSIS, SINGLE OR MULT. LUMBAR	23	47		83	683		6.80	7.00	
62287	PERCUTANEOUS DISCECTOMY	30	60		79	723		7.20	4.13	
62287	PERCUTANEOUS DISCECTOMY	70	60		105		747			7.43 AANS95

RELATIONSHIP OF 62287 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference procedures are 62290 (INJECTION PROCEDURE FOR DISCOGRAPHY, LUMBAR) at RVW 3.58, and 62292 (INJECTION PROCEDURE FOR CHEMONUCLEOLYSIS, INCLUDING DISCOGRAPHY, LUMBAR) at RVW 7.00. The work in 62287 as measured in Harvard3 is 723 compared to the work for 62292 of 683. This indicates that the current RVW of 4.13 is clearly undervalued. The total work in the AANS95 Survey is 747 which converts to the scale of MFS95 at a RVW of 7.43, which is our recommendation.

RATIONALE for recommendation:

Work:

Changes in past 5 years

This procedure has increased substantially in the last 5 years due to new techniques directed to identification of sources of spinal pain.

Rank Order (Ordinal) Valuation:

Rank order valuation basic to relative value apportionment in this set of codes.

Prev. RUC or Refinement Valuation:

MFS92 RVW of 9.29 drastically reduced in May92 refinement to 4.24

Time:

AANS95 Survey:

See table above.

Harvard3 Database:

Original Harvard3 time data appear reasonable; to be confirmed by current survey.

Undervalued time/Phase I or II & MFS92:

Mental Effort & Judgement:

Removal of disk by percutaneous approach requires more pre-service mental effort, and more intra-service judgment than 62290.

Technical Skill & Physical Effort:

Skill higher than 62290, and comparable to 62292.

Stress:

Stress and risk are comparable to 62292.

Intensity/Complexity:

Intensity comparable to 62292.

RELATIONSHIP OF 62290 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The CMD comments stated that 62290 has the same pre and post work as 62289, with one third greater intra-service time and slightly more skill, leading to a decision that the RVW of 62289 should be increased by 25% to 2.05 as the RVW proposed for 62290. This analysis has two flaws; first is that selection of 62289 (INJECTION OF SUBSTANCE OTHER THAN ANESTHETIC, CONTRAST, OR NEUROLYTIC SOLUTIONS; LUMBAR OR CAUDAL EPIDURAL (SEPARATE PROCEDURE)) as a reference service for comparison to the service of lumbar diskography is poor. The techniques are not sufficiently comparable and the targets are much different as are the risks of the procedure. Despite similarities in the service times involved, a better choice for comparison would have been 62291 (INJECTION PROCEDURE FOR DISCOGRAPHY, SINGLE OR MULTIPLE, CERVICAL) since it has comparable techniques, skills and risks.

The second flaw was to assume that a 9 minute difference in intra-service time that represents a one third increase in the intra-service time over the reference service 62289 converts to an equivalent change in work. It does not, because the intensity factors for 62289 and 62290 are quite different, leading to work values for the intra-service portion that are different by almost two thirds rather than one third. To extrapolate this difference and apply a 25% adjustment to the existing RVW is inappropriate to correcting the value for this code.

Our review of this problem also reveals that the listed intra-service time for 62290 of 35 minutes is almost certainly for a single level study, despite the descriptor that identifies "single or multiple levels". Our experience with lumbar diskography indicates that an additional level will often double the base time, and it is not unusual for a 2 level study to take over one hour in fluoroscopy to complete. This suggests that the averaging implied by the "single or multiple level" descriptor did not influence the physicians surveyed by the Harvard group in developing this database for 62290, and that the intra-service average time is probably at least 45-50 minutes when the multiple level studies are included. Unfortunately, current survey data are not available, and 62290 does not appear on any of the anesthesia or operative logs that we have used.

To accommodate these concerns, and adjust the RVW for 62290 to relate more reasonably to 62291, it is our recommendation that the RVW be reduced from 3.58 to 3.00. This will allow for the fact that lumbar diskography is inherently more difficult than cervical diskography, and still correct the disproportionate relationship of the present 3.58 value. This also provides a more satisfactory face value for rank order comparisons in this group of procedures.

62294	INJECTION PROCEDURE/ARTERIAL/OCCCLUSION AVM SPINAL	41	117		108	1100		10.95	8.05	10.95

RELATIONSHIP OF 62294 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference services that relate to 62294 (INJECTION PROCEDURE FOR ARTERIAL OCCCLUSION OF A SPINAL CORD VASCULAR MALFORMATION) are 62268 (PERCUTAN.ASPIRATION SPINE CORD CYST/SYRINX) and 62269 (BIOPSY OF SPINAL CORD, PERCUTAN.NEEDLE). Both procedures involve direct invasion of the spinal cord with a needle and entail significant risks, as does 62294. Evaluation of the service times supports the Harvard3 work values which translate to the Harvard4 to MFS95 RVWs. We are recommending that these RVWs based on Harvard3 data be adopted to correct the effects of reductions in the MFS95 RVWs that presently exist.

RATIONALE for recommendation:

Work:	Rank Order (Ordinal) Valuation:	Ordinal values of total work appear correct by face validation.
Time:	Harvard3 Database:	The only available source of time and work reference data for these procedures.
Mental Effort & Judgement:		Substantially more knowledge and judgment required to interfere with the blood supply of the spinal cord therapeutically.
Technical Skill & Physical Effort:		Much training and experience required to minimize rate of complications
Stress:		High stress level due to risk of spinal cord damage from occlusion of blood vessels that supply parts of cord
Intensity/Complexity:		High intensity and complexity, espec. relating to the relative infrequency of the service and highly specialized nature of the techniques.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION**

CPT Code: 63005 Global Period: 090 Current RVW: 13.53 Recommended RVW: 13.88

CPT Descriptor: Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or diskectomy, (eg, spinal stenosis), one or two vertebral segments; lumbar, except for spondylolisthesis

Source and Summary of Comment to HCFA on this service: Public Comments by AANS.
AANS recommended an increase in RVW from 13.53 to 13.88. AANS 95 survey in progress.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55 year male athlete has had 6 months of low back pain with radiation into both upper legs that is notably induced or aggravated by walking only one block. It is slowly growing worse, and he has lost some strength in his left leg. He has not responded to anti-inflammatory Rx and restricted activities. An MRI exam shows a multiple diffuse bulging disks with osteophytes at L2-3, L3-4, and L4-L5. The sagittal canal depth at L3-4 is 7 mm and 8 mm at L4-5. The patient consents to a decompressive laminectomy at the lower two levels.

Description of Pre-Service Work: includes review of previous medical history, evaluation of the imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family, plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is prone on a frame to avoid compression of the abdominal contents.

Description of Intra-Service Work: The incision is in the lumbar midline from L2 to L5. The fascia and muscles are released from the bony attachments and retracted laterally. A localizing lateral X-ray is made for identification of the correct levels. The spinous process and lamina of L3, L4 and the upper portion of L5 are removed bilaterally. Overhanging portions of the hypertrophic facets are removed without total facetectomy. No disk removal is required. After decompression of the dural sac and cauda equina, hemostasis is confirmed and the muscle and fascial layers are closed. A drain may be left in the epidural space. The skin is closed and dressings applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of bleeding. All hospital visits and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

CPT Code: 63005

RELATIONSHIP OF 63005 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The reference procedure is 63047 (LAMINECTOMY/COMPLETE DECOMPRESSION FOR STENOSIS, LUMBAR, ONE LEVEL). The total work value is 1282 and the intra-service time 121 minutes from Harvard3. The Harvard3 total work for 63005 is 1487 and the intra-service time 142 minutes. This time and work difference compared to 63047 supports our recommendation for a higher RVW than the present 13.53. When the data from our current survey for 63005 is included, the times are changed slightly along with a reduced intensity factor from 6.17 to 4.98 with the result that the total work value declines to 1394. When this is converted to the MFS95 scale, the recommended RVW for 63005 is 13.88.

An additional comparison is that 63047 is limited to a decompressive laminectomy at a single lumbar level, while 63005 may include removal of a lamina at an adjacent second level. This adds incrementally to the intra-service work, and the listed difference of 21 minutes is reasonable to cover that additional work.

The original MFS92 RVW for 63005 was 15.52. This was reduced to 13.86 in the May92 Refinement Panel based on that Panel's recommendations. We suspect that the reduction was based upon the downward adjustment imposed on the original Hsiao Phase II total work value of 1581 which would have translated to a RVW of about 15.52. After this work value was delivered to HCFA, there was an unexplained reduction to 1469, which is the value that appeared in the June 1992 and Harvard3 databases.

The AANS95 Survey data on 63005 provides a total work value of 1394, which when translated to the scale of the MFS95 results in a RVW of 13.88. This value fits into the rank order scale of values in this family of procedures and is our recommendation to correct this misvalued code.

rate %	15%																			

RATIONALE for recommendation:

Work:
Rank Order (Ordinal) Valuation: Rank order of boldface RVWs as listed in table above appropriate.
Initial crosswalk or extrapolation misvaluation: Original Hsiao/Harvard Phase II total work value of 1581 in 11/90 was reduced at HCFA in 6/91 to 1469. Initial crosswalk total work value was 1487 in Harvard3.
Prev. RUC or Refinement Valuation: May92 Refinement changed RVW from 15.62 to 13.86.

Time:
Op. Logs: 3 cases; avg. time = 202 min.
Anesthesia databases: 7069 combined cases; avg. anesth. time = 178 min.
69 cases; avg. anesth. time = 223 min.
AANS95 Survey: Survey data used in above recommendations.
Harvard3 Database: The times in the Harvard3 database appear to represent reasonable relativity in this set of codes when no current survey data available..
Undervalued time/Phase I or II & MFS92: It appears tha the original RVW of 15.62 was actually overvalued, and that the Refinement panel came remarkably close to the scale of the current survey data by reducing it below the Harvard3 recommendation. Comparable across this group of procedures.

Mental Effort & Judgement: Comparable within group
Technical Skill & Physical Effort: Stress and risk higher for cervical and re-operation procedures.
Stress: The intensity factors as listed within this family of codes from Harvard3 were relatively good. The changes from our survey of intensity simply adjust some of the codes in their relation to the family and provide validation to the basic Harvard3 numbers.
Intensity/Complexity:

RELATIONSHIP OF 63011 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

63011 (LAMINECTOMY, SACRAL REGION) involves removal of the bony covering over the spinal canal that extends into the upper sacrum, which is similar in technique and approach to 63047 (LAMINECTOMY/COMPLETE DECOMPR STENOSIS, LUMBAR, ONE LEVEL). 63011 has a Harvard3 total work value of 1346 based on slightly greater intra- and post-service times than 63047 or 63709. The original MFS92 had a RVW of 13.62 for 63011, which was reduced to 11.38 based on the May92 Refinement Panel recommendations. It has not been adjusted subsequently other than from budget neutrality changes, thence is presently at 11.11. This is low related to the time and work data available from Harvard3 that supports a higher RVW. The reference procedure is 63709 REPAIR OF DURAL/CSF LEAK OR PSEUDOMENINGOCOELE, WITH LAMINECTOMY with a total work value from Harvard3 of 1289 and an intra-service time of 146 minutes. The total work value for 63011 is 1346 and time is 126 minutes. This places 63011 at slightly more total work then the reference service, and supports our recommendation for an increase in RVW to 13.40. Reference to the Harvard3 data also supports this recommendation, since that is the value originally accepted (before adjustments) and is the translation RVW from the Harvard3 total work value.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:	Rank order valuation appropriate as listed in the table above.
Initial crosswalk or extrapolation misvaluation:	Initial total work of 1284 increased to 1364.
Prev. RUC or Refinement Valuation:	Refinement Panel reduction noted above in MFS92.

Time:

Anesthesia databases:	2 cases; avg. anesth. time = 171 min.
Harvard3 Database:	See above.

Mental Effort & Judgement:

Technical Skill & Physical Effort:

Technique similar to 63709

63016	LAMINECTOMY FOR EXPLORATION/DECOMP THORACIC CORD > 2 SEGS	128	162		155	1790		17.82	17.43		6.80
63015	LAMINECTOMY FOR EXPLORATION/DECOMP CERVICAL CORD > 2 SEGS	59	161		142	1763		17.55	16.59		7.17
63015	LAMINECTOMY FOR EXPLORATION/DECOMP CERVICAL CORD > 2 SEGS	90	150	21	166		1785		16.59	17.77 AANS94	7.00 AANS94

RELATIONSHIP OF 63015 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

63015 (LAMINECTOMY FOR EXPLORATION/DECOMP. CERVICAL CORD, > 2 SEGS) involves a decompressive laminectomy of the cervical canal and contents for more than two vertebral segments, and usually includes 3 or 4 lamina to decompress a stenotic spinal canal. The reference service of most relevance is 63001 (LAMINECTOMY FOR EXPLORATION/DECOMP CORD, 1 OR 2 SEGS, CERVICAL) which is the same service limited to 1 or 2 lamina or segments. The additional laminectomy is covered in 63048 (LAMINECTOMY/COMPLETE DECOMPR. STENOSIS, EA ADDTL SEGMENT, ANY LEVEL) with a RVW of 3.26 and no previous Harvard3 time/work values.

If the RVWs from these two reference services are combined, 63001 with a RVW of 14.50 + 63048 RVW of 3.26 = 17.76 for the combination, which is a close approximation to the RVW of 17.77 recommended by the AANS for 63015.

Comparison of the time and work values is helpful in this family. Note that the Pre- and Post-service times for 63015 are significantly higher in the AANS94 survey than from the Harvard3 data, while Intra-service time is slightly less. The net result is a work value derived from the calculations of AANS94 surveyed time that is 1810 compared to the Harvard3 work value of 1763. This would ordinarily translate to a RVW of 17.55 rather than the present RVW of 16.59 which reflects the degradation of work values from budget neutrality changes. We recommend that the RVW be 17.77 to restore relativity to this service.

63015	LAMINECTOMY FOR EXPLORATION/DECOMP CERVICAL CORD > 2 SEGS	90	150	21	166		1786		16.59	17.77 AANS94	7.00 AANS94

RELATIONSHIP OF 63017 TO KEY REFERENCE SERVICES and Other Rationales for RVW Recommendation:

63017 (LAMINECTOMY FOR EXPLORATION/DECOMP. LUMBAR CORD OR CAUDA EQUINA, > 2 SEGS) involves a decompressive laminectomy of the lumbar canal and contents for more than two vertebral segments, and usually includes 3 or 4 lamina to decompress a stenotic spinal canal. The reference service of most relevance is 63005 (LAMINECTOMY FOR EXPLORATION/DECOMP CORD, 1 OR 2 SEGS, LUMBAR) which is the same service limited to 1 or 2 lamina or segments. The additional laminectomy is covered in 63048 (LAMINECTOMY/COMPLETE DECOMPR. STENOSIS, EA. ADDTL SEGMENT, ANY LEVEL) with a RVW of 3.26 and no previous Harvard3 time/work values.

If the RVWs from these two reference services are combined, 63005 with a RVW of 13.88 + 63048 RVW of 3.26 = 17.24 for the combination, which is substantially more than the RVW of 14.90 recommended by the AANS for 63017. When the basis for this difference is examined, the total work value of 1498 for 63017 from the survey is greater than the Harvard3 total work for 63005 of 1394. However, the intensity factors are significantly different, with the survey intensity for 63017 at 5.68 compared to the Harvard3 intensity for the same service at 6.31. This reduction, when applied to the computation of a total work value for the time values surveyed results in the lower total work of 1498, which then translates to a RVW of 14.90.

This reduced intensity factor is derived from the survey which compared the components of intensity for each of the three components used in the MFS as well as the three phases of service, pre- intra- and post-service times. This provided a prospective and provider based approach to a more rational use of intensity as a key component of the total work and thence, RVWs that represent a particular service.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation:
Initial misvaluation:

Boldface RVW values in table meet face validation.
Original Hsiao Phase II total work from 11/90 was 1719. This was reduced by HCFA in 6/91 to a total work value of 1665. This was then increased to 1667 in the Phase3 extrapolation.
The original MFS92 RVW for 63017 was 17.51, but the May92 Refinement Panel reduced total work from 17.51 to 16.24.

Prev. RUC or Refinement Valuation:

Time:

Op. Logs:
Anesthesia databases:
AANS94 Survey Key Refs:
Harvard3 Database:

2 cases; avg. time = 170 mmin
111 cases; avg. anesth. time 213 min.
See table and comments above
Time data still quite appropriate.

Mental Effort & Judgement:
Technical Skill & Physical Effort:
Stress:
Intensity/Complexity:

Comparable to ref. services.
Slightly more effort than ref. services due to greater extent of surgery.
Stress factors approx. the same.
See above for intensity factors.

RELATIONSHIP OF 63020 TO KEY REFERENCE SERVICES and Other Rationales for RVW Recommendation:

63020 (LAMINOTOMY, ONE LEVEL FOR HERNIATED DISK, UNILATERAL, CERVICAL) is a common surgical service provided to patients with a ruptured cervical disk that requires decompressive surgery and disk excision. It is compared to 63030 (LAMINOTOMY, ONE LEVEL FOR HERNIATED DISK, UNILATERAL, LUMBAR) except that this reference procedure involves less pre- and intra-service time with significantly less total work of 1115. This is reflected in the RVW of 11.10 for 63030. The time and work values for 63020 are greater than 63030 except for post-service work, and the total work for 63030 from the survey is 1115 compared to the survey data of total work of 1384 for 63020. Consequently, the RVW for 63020 should be more than that of 63030 to reflect the greater amount of total work.

The Harvard3 data for 63020 translates to a 1995 RVW of 12.53, while the AANS94 survey of 63020 gives a RVW of 13.77. This survey data is both current and broad based, with confirmation of the intra-service time data from operative logs and anesthesia time databases. When the surveyed total work for 63020 of 1384 is translated to the MFS95, the recommended RVW is 13.88.

63017	LAMINECTOMY/EXPL/DECOMP LUMBAR CORD OR CAUDA EQUINA > 2 SEGS	90	150		145		1498			14.90 AANS94	5.68 AANS94

RELATIONSHIP OF 63030 TO KEY REFERENCE SERVICES and Other Rationales for RVW Recommendation:

63030 (LAMINOTOMY, ONE LEVEL FOR HERNIATED DISK, UNILATERAL, LUMBAR) is a common surgical service provided to patients with a ruptured lumbar disk that requires decompressive surgery and disk excision. It is compared to 63020 (LAMINOTOMY, ONE LEVEL FOR HERNIATED DISC, UNILATERAL, CERVICAL) except that this reference procedure involves more pre- and intra-service time with significantly more total work of 1384. This is reflected in the recommended RVW of 13.77 for 63020. The time and work values for 63020 are greater than 63030 except for post-service work, and the total work for 63030 from the survey is 1115 compared to the survey data of total work of 1384 for 63020. Consequently, the RVW for 63030 should be less than that of 63020 to reflect the lesser amount of total work.

The Harvard3 data for 63030 translates to a 1995 RVW of 10.75, while the AANS94 survey of 63030 gives a RVW of 11.10. This survey data is both current and broad based, with confirmation of the intra-service time data from operative logs and anesthesia time databases. The present MFS95 RVW of 12.11 was the result of a Refinement Panel change made in May 1992 when the original value of 11.46 was increased to 12.40. It has since declined to 12.11 with budget neutrality adjustments. The problem posed by that increase was that 63030 and its original RVW of 11.46 were the benchmark for all neurosurgery codes, and shifting the RVW upward by 11% should have changed every other value proportionately in the same direction. Those changes did not happen and that left 63030 as an anomalous value while voiding the benchmark against which all the other procedures in the neurosurgical code section had been measured or estimated.

If the resource based methodology of developing and supporting changes in the relative values for different services is to be maintained as designed, then it is necessary to be consistent in application of that methodology to revisions in the 5 Year Review and in particular, in the case of 63030. Despite the apparent arbitrary changes made to the RVW in 1992, the original data and now current survey of the same procedure support a lower value. Therefore, we recommend a RVW of 11.10.

RELATIONSHIP OF 63042 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

These four codes (63030, 63020, 63047 & 63042) are key reference services, with 63047 representing the current benchmark service for the entire set of nervous system codes. Each code was surveyed by the AANS and the time, work and intensity data compiled from the survey allowed calculation of RVWs as noted above in the darker shaded rows labelled AANS94. We have ranked the services in order of their final recommended or existing RVWs indicated in boldface. Comparison of the total work values listed and the intensity factors from Harvard3 or the AANS94 survey also support the proposed rank value order.

A significant difference in the intra-service time for 63042 appeared when the AANS94 survey intra-service time of 120 minutes was compared to the Harvard3 time of 159 minutes. The average time from our operative log database of several hundred patients was 128 minutes, again more than 30 minutes shorter than the earlier Harvard/Hsiao study. The reason for this difference is not clear unless the possible inclusion of multiple level reoperations may have been mixed with single level procedures to extend the intra-service time, since the code does not specify one or many levels. The other time components are reasonably well matched, so the intra-service time is the principal difference between the two sources. One operative log includes 20 cases of 63042 with an intra-service time of 126 minutes, and the same log reports two cases of 63042 + 63048 (EACH ADDITIONAL SEGMENT) with intra-service time of 157 minutes. These times are remarkably close to those in the AANS94 survey of 120 minutes and the Harvard3 time of 159 minutes. (Note that the AANS94 survey vignette specified a patient with a one level lesion.) We suspect that the Harvard3 time data was high due to inclusion of some cases done at more than a single level mixed in with single level cases thereby contributing to a higher intra-service time value.

We suggest that a compromise value between the calculated 15.65 RVW and the current MFS RVW of 17.27 be adopted to accommodate the unmeasured frequency and impact of including and extra 1-2 levels in the procedure, and thence extending the intra-service time and work. A reasonable interim RVW would be 16.56 which splits the difference between the two values. This also is virtually the same as the original MFS92 RVW of 16.67 (see Federal Register, Nov. 25, 1992, p. 55930 for Refinement Panel codes).

RATIONALE for recommendation:

Work:

Changes in past 5 years

Steady increase in frequency of reoperation for spinal disease with development of spinal surgery programs and clinics

Rank Order (Ordinal) Valuation:

Rank order listed in table appropriate to family of codes

Initial crosswalk or extrapolation misvaluation:

Original Hsiao Phase II total work value of 1811 in 11/90. This was reduced by HCFA in 6/92 to 1571 which was the initial crosswalk value.

Prev. RUC or Refinement Valuation:

MFS92 RVW of 16.67 increased by May 1992 Refinement Panel to 17.69

Time:

Op. Logs:

20 cases; avg. time = 126 min.
2 cases with 63048 for extra level; avg. time = 157 min.

Anesthesia databases:

327 cases; avg. anesth. time = 175 min.

AANS94 Survey Key Refs:

AANS94 survey results above.

Harvard3 Database:

See reference service table above.

Undervalued time/Phase I or II & MFS92:

Original MFS92 RVW was 16.67.

Mental Effort & Judgement:

Significantly higher than for other ref. services.

Technical Skill & Physical Effort:

Higher than all of the ref. services cites due to the difficulty involved in most reoperations in the spinal canal.

Stress:

Higher than the other ref. services due to risks of injury to dura or nerve roots as well as failure to relieve pain.

Intensity/Complexity:

Highest in the family per AANS94 survey data.

RELATIONSHIP OF 63047 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:
These four codes (63030, 63020, 63047 & 63042) are key reference services, with 63047 representing the current benchmark service for the entire set of nervous system codes. Each code was surveyed by the AANS and the time, work and intensity data compiled from the survey allowed calculation of RVWs as noted above in the darker shaded rows labelled AANS94. We are concerned that the values for 63047 with a higher calculated total work value than the Harvard3 value of 1282 will require the RVW for the MFS95 to be increased and shift our benchmark procedure value once again (see comments under 63030). However, the concurrence of intra-service time data between Harvard3 and our survey indicates that the principal differences lies in the intensity factor applied to the intra-service time in calculation of work plus some additional pre- and post-service time. Our survey data serves to validate our survey methodology in attempting to replicate the detailed input of time and intensity data into a formula process to derive work values and thence, RVWs that do represent a more accurate relative value scale. A similar observation applies to the survey data and recommended RVW from 62020.

The match between the Harvard3 times and the survey pre-, intra- and post-service times for 63047 indicates that the survey process of measuring each of the components of a total service is consistent between the two models. The survey and calculation of an intra-service intensity factor is also reassuring since the Harvard3 value of 6.63 is quite close to the AANS94 survey intensity value of 6.22. When this factor is multiplied by the total times for the service, the total work values result as noted above. The difference and increase from the Harvard3 total work value and the translated RVW of 12.76 to the AANS94 values and RVW of 13.57 are important. We believe that 63047 should be adjusted to reflect the recommended increase in RVW to 13.57.

The rank order valuation of services as listed in the table above also supports the placement of 63047 at the recommended level. Progressive increases in total work, RVWs and intensity all support this recommendation.

63075	DISKECTOMY, ANTERIOR APPROACH, WITHOUT FUSION, SINGLE, CERVICAL	80	120		125		1471			18.50 AANS94
63077	DISKECTOMY, ANTERIOR APPROACH, WITHOUT FUSION, SINGLE, THORACIC	79	202		145	2113		21.03	20.25	
63081	VERTEBRAL CORPECTOMY, ANT. DECOMPR. CORD, CERV. SINGLE SEGMENT	76	175		169	2200		21.90	22.08	

RELATIONSHIP OF 63075 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

This is a key reference code and requires comment since our survey reported time data that suggested this procedure has changed since the original MFS92. The Harvard/Hsiao Phase II time for 63075 (DISKECTOMY, ANTERIOR APPROACH, WITHOUT FUSION, SINGLE, CERVICAL) was 138 minutes and a total work value of 1566 was reported. This particular code was used as one of the cross-specialty linkages in 1992 and was matched to 60500 (EXPLORATION FOR PARATHYROID ADENOMA) based on the same intra-service time of 138 minutes. However, 60500 had a Phase II total work value of only 1230. When the two procedures were linked and the scale adjusted to a common scale for all services, the result was a reduction in the RVW for 63075 to 14.42 compared to the the RVW for 60500 at the higher value of 16.23. Without this dislocating linkage adjustment to 63075, the equivalent RVW in the scale of 1995 would have been 15.49.

Further revaluation occurred in the May 1992 refinement process. At that time, the RVW of 14.42 was increased to 20.26 and has subsequently declined to its current value of 19.77 due to the budget neutrality adjustments in the ensuing years.

It appears that the component services in this procedure have changed in the sense that the intra-service times in large series now range from 120 to 157 minutes. This may reflect greater ease in performing the procedure. However it usually includes some additional work that is not accounted for in the current valuation, i.e. use of the operating microscope (61712). In the past several years it has become the usual procedure to use the operating microscope, with increasing attention to a detailed and complete decompression of the anterior spinal canal and foramina through the disk interspace, coupled with frequent resection of the posterior longitudinal ligament to assure complete decompression and removal of all osteophytes and disk fragments. 61712 (MICRODISSECTION WITH THE OPERATING MICROSCOPE) is not an allowed service with 63075 but it is still used in most cases and simply not billed, or not reimbursed if billed. The extra work associated with 61712, which on average adds 31 minutes to the intra-service time, is still provided as part of the service, but the additional RVW of 3.49 are lost.

The nearest comparison codes are 63081 (VERTEBRAL CORPECTOMY, ANTERIOR DECOMPRESSION OF CORD, CERVICAL SINGLE SEGMENT), and 63077 (DISKECTOMY, ANTERIOR APPROACH, SINGLE, THORACIC). Both of these procedures utilize a similar approach to the anterior spine including removal of disk and posterior osteophytes. However, the corpectomy has an average time of 175 minutes compared to the 138 + 31 = 169 minutes for 63075. The present RVWs are 22.08 for 63081 and 19.77 for 63075. We estimate that a RVW of 18.50 would better reflect the relationship of 63075 to other procedures in the family and recommend that this value be considered as a compromise based on the above considerations.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW
SUMMARY OF RECOMMENDATION
Comments on Misvalued Code**

CPT Code: 63087 Global Period: 090 Current RVW: 27.56 Recommended RVW: 33.91

CPT Descriptor: Vertebral corpectomy (vertebral body resection), partial or complete, combined thoracolumbar approach with decompression of spinal cord, cauda equina or nerve root(s), lower thoracic or lumbar; single segment

Source and Summary of Comment to HCFA on this service:
AANS recommended increase in the RVW of 27.56 to 33.91.

Public Comments by AANS and AAOS.
Current AANS95 survey.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62 year old woman with a history of CA of the breast has had 5 weeks of back pain with increasing weakness of the proximal leg muscles, patchy perineal numbness, and some incontinence. The X-rays show a lytic lesion in L1 and an MRI exam shows diffuse involvement of L1 body with enhancing tumor which extends into the lumbar spinal canal anteriorly, compressing the conus. An anterior approach to the T12-L1 area is made and the body of L1 entered and all accessible tumor removed. Tumor extending into the ventral epidural space is also removed.

Description of Pre-Service Work: includes review of previous medical records regarding the breast tumor and it's therapy, evaluation the imaging studies, and appropriate lab and screening studies. Pre-service work includes informed consent with the patient and family plus the day-of-service work of pre-op prep, scrub, positioning and equipment setup. Positioning is more complex due to the use of a decubitus position and need to enter both the retroperitoneal area as well as the lower chest.

Description of Intra-Service Work: The position is a modified decubitus to allow access to the thoraco-lumbar junction. This usually requires release of the diaphragm and a rib resection to reach the T12-L1 level. When the vertebral surface is exposed, the regional nutrient vessels are identified, tested for safety of division, and subsequently sectioned and ligated. The body of L1 is identified and entered after removal of the overlying great vessels and muscular attachments. Tumor in the bone is removed along with both end plates and the two adjacent disks. Tumor extending into the ventral epidural space is removed to bare dura. When the corpectomy is completed, some type of arthrodesis and stabilization are required but are not included in the scope of this specific procedure code. In closing, the diaphragm requires reattachment, a chest tube is placed, and the muscle and fascial layers are closed. The skin layer is also closed, and dressings applied.

Description of Post-Service Work: includes patient stabilization, communication with the family and referring physician (including written and telephone reports and orders), removal of a drain, if used, and monitoring for signs of bleeding or neurologic deterioration. All hospital visits, ICU visits, and discharge day management are included. Discharge records are prepared and post-discharge office visits for wound and general care are completed during the 90 day global period.

63087	VERTEBRAL CORPECTOMY,T-L APPR./DECOMP.CORD,ROOTS SINGLE SEG.	105	265	30	180		3408			33.91 AANS95	8.91 AANS94

RELATIONSHIP OF 63087 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:
 The Harvard3 time and total work data for 63087 (VERTEBRAL CORPECTOMY, T-L APPR/DECOMP. CORD. ROOTS SINGLE SEG.) and the other reference codes in this family appear to have face validity as well as an ascending scale of values that reflect the progressive increase in work. The present MFS95 RVWs also reflect a reasonable translation of the Harvard3 total work to the MFS95. The reduced value of 14.43 for 63087 suggested by the AAOS is completely out of relative order to the reference codes.

63090 (VERTEBRAL CORPECTOMY, RETROPERITONEAL/DECOMP. CORD. ROOTS, T OR L, SINGLE) is an alternate approach to the same target. It involves a flank exposure with reflection of the peritoneum and contents to the opposite side in order to expose the anterior and lateral aspect of the lumbar spine. When applied to the L1 or T12-L1 level, it then becomes 63087, since it requires the additional services described below. 63090 has a total work value and RVW that are in general rank order with 63087.

The closest comparison as a reference service is 63085 (VERTEBRAL CORPECTOMY, ANT DECOMPR. CORD. ROOTS, THOR. SINGLE SEGM. LEVEL) with comparable time and work values. However, there is a critical difference in that 63087 involves more labor in exposure of the vertebral surfaces at the thoracic-lumbar junction since it requires a detachment of the diaphragm in order to expose the target. This also increases the stress and the overall intensity. The intensity factors as listed from Harvard3 for the intra-service work are all relatively close, except for a reduction to 7.33 for 63087 to the same level as 63081 (VERTEBRAL CORPECTOMY, ANT DECOMPR. CORD. CERV SINGLE SEGMENT), which is a substantially less complex and intense service. These additional work factors support an increase in the RVW for 63087. Our AANS95 Survey of 63087 shows a higher total work value of 3408, which converts to the current scale of RVWs to 33.91.

SURVEY DATA:

RVW resp	40																		
rate %	15%																		

RATIONALE for recommendation:

Work:
 Rank Order (Ordinal) Valuation: Basis for validating current RVWs.
 Initial crosswalk or extrapolation misvaluation: Increase in 6/91 total work from 2585 to 3/92 work of 2771.
 Prev. RUC or Refinement Valuation: 5/92 RVW of 27.44 increased to 28.24.

Time:
 AANS95 Survey: See table above.
 Harvard3 Database: Harvard3 data appears reasonable to support RVW values.

Mental Effort & Judgement: Slightly greater for 63087.
Technical Skill & Physical Effort: Greater skill and effort due to difficult approach.
Stress: Stress and risk higher with both chest, abdomen and diaphragm open.
Intensity/Complexity: Higher complexity due to entrance into chest + take down of diaphragm for exposure of spine.

63740	CREATE SHUNT, LUMBAR, SUBARACH-PERITONEAL, PLEURAL OR OTHER	64	116		115	1042		10.37	10.43	10.37

RELATIONSHIP OF 63655 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

These procedures are related in both content and type/intensity of work, but are listed in a rank order progression that is supported by the table of comparative times and work from the Harvard3 database as listed above.

The reference procedure for this set is 63685 (INCISION AND SUBQ PLACEMENT OF SPINAL NEUROSTIMULATOR PULSE GENERATOR OR RECEIVER..) which has a RVW of 6.29 which appears appropriate. The rank order of the procedures that follow 63685 are arranged to reflect their total work and relative values appropriately. The RVW's from the Harvard3 data are converted to the scale of the 1995 MFS for reference. We recommend an increase in the RVW to 9.30 for 63655. This will also assure that the laminectomy that is done as a part of this service is included in the total work value.

RATIONALE for recommendation:

Work:

Rank Order (Ordinal) Valuation: The listed rank order progression of time, total work and translated RVW's are appropriate.

Initial crosswalk or extrapolation misvaluation: Initial total work of 888 increased to 934

Prev. RUC or Refinement Valuation:

Time:

Harvard3 Database: The increase above the MFS95 RVW, compared to the reference service 63685, is based on substantial increases in the intra- and post-service time and work. The Harvard3 data appear appropriate to the services listed above.

RELATIONSHIP OF 63750 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

These procedures are related in both content and type/intensity of work, but are listed in a rank order progression that is supported by the table of comparative times and work from the Harvard3 database as listed above.

The reference procedure for this set is 63685 (INCISION AND SUBQ PLACEMENT OF SPINAL NEUROSTIMULATOR PULSE GENERATOR OR RECEIVER ..) which has a RVW of 6.29 which appears appropriate. The rank order of the procedures that follow 63685 are arranged to reflect their total work and relative values appropriately. The RVWs from the Harvard3 data are converted to the scale of the 1995 MFS for reference. We recommend an increase in the RVW to 7.81 for 63750.

RATIONALE for recommendation:

Work:
 Rank Order (Ordinal) Valuation: The listed rank order progression of time, total work and translated RVWs are appropriate.
 Initial crosswalk or extrapolation misvaluation: Initial work value of 718 increased to 785.

Time:
 Harvard3 Database: The increase above the MFS95 RVW, compared to the reference service 63685, is based on substantial increases in the intra- and post-service time and work. The Harvard3 data appear appropriate to the services listed above.

RELATIONSHIP OF 64443 TO KEY REFERENCE SERVICES and Other Rationale for RVW Recommendation:

The CMD comments identified 64442 (INJECTION, ANESTHETIC AGENT; PARAVERTEBRAL FACET JOINT, LUMBAR, SINGLE LEVEL) as the reference service for this code. This is an appropriate choice since 64443 represents the same service at each additional level. The key difference cited by the CMD in recommending a reduction of 50% in the RVW is the different global period for the two codes; 64442 has a 000 global period while 64443 has a ZZZ global which means it falls under the global period of the parent procedure, ie, 64442. The general rule for a ZZZ is that it will have only 50% of the work value of the primary procedure, since that is a crude average of the ratio between intra-service work and total work for many major procedures. Unfortunately, with many minor procedures, that ratio does not hold true. For these two codes, the ratio is approximately 61%. Also consider that these global periods have been changed since the MFS92 when they were all 010, with only a 25% reduction in RVWs when changed to a 000 global period. 64443 was reduced 33% in the same period, probably reflecting the change to a ZZZ global. To impose an additional 50% reduction at this time is not appropriate, since the only overlap that may still remain in the present RVW is represented by the 20 minutes of post-service time listed for 64443, which would not be allowed under the ZZZ rules. If the work of that post-service period is subtracted from the total work of 64443, the resulting work will be 147 which translates to a RVW of 0.98. It appears reasonable to recommend that a RVW of 0.98 be adopted rather than the double reduction that the CMD recommendation contained.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Ophthalmology

The specialty society is responding to recommendations by the Carrier Medical Directors that the RVUs for 11 cataract related codes should be reduced. In addition, the society has surveyed several codes and recommended increases in their work RVUs. Arguments for changes in RVUs were supported by surveys, comparisons to cross specialty codes and other rationale for why the procedure has changed and now requires adjusted work RVUs. The response rates and resulting samples were of sufficient size to validate the study.

Generally the RUC found the data, comparisons and arguments convincing. The threshold for the RUC was to show compelling evidence that the procedure changed, the patient population changed, or that the code had been originally undervalued or overvalued. When the RUC recommended a different RVU, it typically attempted to rectify new survey data and rationale with Harvard data, producing final recommended RVU increases below those recommended by the specialty society. In all; 7 codes were reduced in value, 12 codes were increased in value, and for 29 codes the RUC recommended to retain the current value.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
65101	Removal of eye	6.52	6.52	Code 65101 should be increased to 12.75.	No compelling evidence was presented to change the code. The specialty society provided no further evidence to support this comment. The RUC recommends that this code maintain its current value.	2
65205	Remove foreign body from eye	0.78	0.71	CMD: Reduce RVU to 0.55; The total work for this service which has a global period of zero should be no more than 15 minutes office visit (code 99213, RVU = 0.55).	The specialty society argued that the work intensity is greater than 65220, <i>Remove foreign body from eye</i> , because the foreign body can be more difficult to find in 65205. Survey RVU came out to .80 and intra-service time was 5 min. The RUC was not convinced that the intensity was greater than 65220. The RUC recommends that the RVU be set equal to 65220.	5
65430	Corneal smear	0.87	1.47	Code 65430 should be increased. It requires greater time and cognitive intensity than 68761, <i>Close tear duct opening</i> , at 1.31.	Survey data show median intra-service time of 10 min. and a median RVU of 1.51. Similar to <i>biopsy of the eye</i> . A comparison to 65410, <i>biopsy of cornea</i> , would be more appropriate. The RUC recommends that the RVU be set equal to 65410.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
65450	Treatment of corneal lesion	3.07	3.07	A clinic recommended increasing the RVU to be compatible with 67208, <i>destruction localized lesion of retina</i> , with a value of 6.40.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends that the current RVUs be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
65710	Corneal transplant	9.52	11.75	These codes are undervalued. They are the most stressful of all eye operations. The patient is awake under local anesthesia and a large hole is cut into the eye. The procedures are open and are at risk for hemorrhagic expulsion of the inner eye contents, forever blinding the eye. The corneal transplant also requires substantial pre-service clinical data.	65710 and 65730 were surveyed. Intra-service time of 90 min. for both and median RVUs of 12.00 and 13.50 were greater than current values. The technology has changed because the use of corneal topography has caused intensity and post-service work to increase. Much of this is due to increased expectations on the part of patients for a better outcome. The corneal topography is not billed as a separate service. Survey data and rationale for increased pre and post-service time increases are compelling. The increased precision offered by the corneal topography would add to the intensity of the procedure. The RUC recommends that the RVU be increased, but that the same ratio between the services be maintained.	1
65730	Corneal transplant	11.83	13.50			1
65750	Corneal transplant	12.58	14.25			4
65755	Corneal transplant	12.58	14.25			4
65820	Relieve inner eye pressure	7.60	7.60	Code 65820 should be increased. The code was never directly studied by Harvard; the values were derived.	Procedure is only performed on children. Survey data show median intra-service time of 60 min. and a median RVU of 8.00. Intensity has increased. The recommended increase in RVU is not significant. The current value should be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
65855	Laser surgery of eye	4.65	4.15	CMD: Reduce to 4.15; Once the treatment series is completed, there are few follow up visits following 65855 unless there is uveitis or another complication. The procedure itself involves less time and intensity than 65865, <i>Incise inner eye adhesions</i> . In total work, it is closer to 65860, <i>Incise inner eye adhesions</i> , than 65865.	The survey data show a median intra-service time of 15 min. and a median RVU of 4.65. The society believed that the CMDs comparison was not valid. Service is more similar to 66761, <i>Revision of iris</i> . The RUC agreed with the CMDs and believed that the work has changed. Current use of drugs lessens the anxiety and need for speed. This has served to reduce the intensity.	3
66170	Implant eye shunt	11.31	11.26	Code 66180 is undervalued relative to 67107, <i>Repair of retinal detachment</i> , at 13.99 and 66172, <i>Implant eye shunt</i> , at 13.67.	The specialty society comment was withdrawn. A rank order anomaly exists among the codes. 66180 is the most complex and least used. Appropriate increases and reductions were made based on the frequency with which the procedures are performed. The RVU changes should be work neutral. The rank order problem is apparent. The RUC recommends that the RVUs be changed as suggested by the specialty society.	3 Add
66172	Implant eye shunt	13.67	13.62			3 Add
66180	Implant eye shunt	12.63	14.00			1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
66821	After cataract laser surgery	2.78	2.78	CMD: Reduce to 2.30; The technical skill and work intensity for 66821 are significantly lower than 66820, <i>Incision secondary cataract</i> . Intra-service time is about half. Outpatient visits are fewer.	The survey data show median intra-service time of 11 min. and a median RVU of 3.42. Intra-service skill and complexity is the same as 66761, <i>revision of iris</i> , and 67031, <i>laser surgery eye strands</i> . Less time and complexity than 66820, <i>Incision secondary cataract</i> . The survey data and comparisons are compelling. The procedure is similar to 66820, <i>Incision secondary cataract</i> . The RUC recommends that the current values be maintained.	2
66825	Reposition intraocular lens	7.73	7.73	Code 66825 is undervalued relative to 66984, <i>Remove cataract, insert lens</i> , at 9.89 RVUs.	Survey data show median intra-service time of 60 min. and a median RVU of 9.50. Code is a combination of 65920, <i>remove implant from eye</i> , and 66985, <i>insert lens prosthesis</i> . The RUC reviewed this code in 1992 and HCFA accepted the recommendation of the RUC at that time. HCFAs agreement for 8.15 RVUs appeared in the Federal Register for November 25, 1992. The RUC recommends that the current values be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
66830	Removal of lens lesion	7.80	7.80	<p>CMD: Harvard Phase III data indicate 54 minutes of intra-service time for 66984. This number appears excessive in light of current practice. With current technology, 66984 is not a highly stressful procedure. 44950, <i>Appendectomy</i>, at 6.13, average procedure time exceeds 66984--may be more difficult. Still carries considerable morbidity and mortality. The rest of the codes in this family are reduced in proportion to 66984.</p> <p>Several clinics and specialty societies wrote letters during the public comment period stating their belief that code 66984 is undervalued.</p>	<p>The society surveyed 66984. Survey data show median intra-service time of 50 min. which compares to the established survey time of 54 min. The survey median RVU was 11.00 which compares to the established RVU of 9.89. The comparison to 44950, <i>appendectomy</i>, is erroneous. This procedure has an intra-service time of 37 min. and a work RVU of 6.06. The time and work involved are clearly different from 66984. Based on the survey data and the faulty comparison to 44950, the current value should be maintained for 66984. Since the CMDs based their reduction of all these codes on the reduction of 66984, the RUC recommends that all these codes maintain their current value.</p>	2
66840	Removal of lens material	7.51	7.51			
66850	Removal of lens material	8.66	8.66			
66852	Removal of lens material	9.52	9.52			
66920	Extraction of lens	8.46	8.46			
66930	Extraction of lens	9.73	9.73			
66940	Extraction of lens	8.48	8.48			
66983	Remove cataract, insert lens	8.54	8.54			
66984	Remove cataract, insert lens	9.89	9.89			
66985	Insert lens prosthesis	7.89	7.89			
66986	Exchange lens prosthesis	11.78	11.78			
67005	Partial Removal of eye fluid	6.63	5.50	<p>CMD: Reduce to 5.50 RVUs; CPT code 67005 is overvalued compared to reference CPT code 67010 which is a more thorough and technically involved procedure than 67005.</p>	<p>The RUC recommends that the CMD recommendation for a reduction be accepted.</p>	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
67015	Release of eye fluid	6.69	6.69	CMD: Increase to 7.50; This procedure is performed under emergency circumstances and has a great deal of associated morbidity. Intensity is greater than 67010 and time is slightly greater.	No compelling reason to increase the RVUs. Societies provided no evidence to support this recommendation. The RUC recommends that the current value be maintained.	2
67312	Revise two eye muscles	7.55	8.19	The intra-service work for 67312 is twice that for 67311. If two muscles in one eye undergo surgery, essentially all the intra-service tasks must be performed twice.	67311, <i>Revise eye muscle</i> , is a single muscle operation. It is valued at 6.3 RVUs. According to second procedure rule 67312 should be valued at 50% of 67311. Since it is really only the intra-service time that is doubled, 50% of the intra-service time of 67311 will be added to 67312. The intra-service time accounts for 60% of the RVU. The RUC recommends that the values be increased.	4
67316	Revise two eye muscles	8.02	9.26			4
67420	Orbitotomy with bone flap or window	13.36	19.00	Code 67420 is undervalued. The work involved exceeds that of epiretinal membrane stripping which is valued at 20.69 RVUs, and 61333, Explore orbit, remove lesion, at 26.75.	Survey data show median intra-service time of 180 min. and a median RVU of 20.00. Compare to 21267, <i>orbital repositioning</i> , which is less time, skill and stress. 67420 is under valued relative to other codes in the family. The survey and rationale are compelling. Tumor removal is more difficult. Rank order needs to be corrected. The RUC recommends that the RVU be increased.	1

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
67900	Repair brow defect	4.54	5.84	CMD: Raise RVU to 5.84; This procedure is essentially the beginning of a craniotomy. Furthermore, this procedure carries with it the risk of 7th cranial nerve damage, hair loss and significant infection.	Survey data show median intra-service time of 70 min. and a median RVU of 7.90. The RUC recommends that the CMDs rationale and recommendation for an increase be accepted.	1
67904	Repair eyelid defect	5.96	5.96	Code 67904 should have a greater work value than 14040, Skin tissue rearrangement, which has 7.18 RVUs.	Survey data show median intra-service time of 60 min. and a median RVU of 9.00. One code has been extracted from a family of codes. An increase would affect the rank order.	2
67911	Revise eyelid defect.	5.09	5.09	Society commented that code should have a greater RVU than 26121, Release palm contracture, at 7.34.	No compelling evidence to increase the RVU. The RUC recommends that the current value be maintained.	2
67924	Repair eyelid defect	5.64	5.64	Society commented that the code requires more work and should have a higher RVU than 14040, <i>skin tissue rearrangement</i> .	No compelling evidence to increase RVU. The RUC recommends that the current value be maintained.	2
67966	Excision and repair of eyelid	6.39	6.39	This code requires more work and should have a greater work value than 14040, <i>skin tissue rearrangement</i> , valued at 7.18 RVUs.	Recommendation for increase has been withdrawn. The RUC recommends that the current value be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
68720	Create tear sac drain	7.68	8.56	The closest reference code is 31205, <i>Removal of ethmoid sinus</i> , with 9.65 RVUs. However, in 68720 special steps are taken in addition to excision in order to give the best chance of a post-surgical patent fistula. These are part of the procedure and reveal how 68720 is undervalued.	Survey data show median intra-service time of 90 min. and a median RVU of 11.17. Compare to 21385, <i>open repair orbital for fix</i> , at 8.56 RVUs and 21275, <i>secondary revision of orbitofacial</i> , at 10.50 RVUs. The RVU for 68720 is under valued in comparison. Survey data and comparisons are compelling. The RUC recommends that the RVU be increased to equal 21385, <i>open repair orbital for fix</i> .	4
68745	Create tear duct drain	8.23	8.23	The RVUs of 68745 and 68750 are reversed. 68750 is more difficult than 86745. The RVUs of both should be increased and the ratio among the codes changed to reflect the difference in work.	No compelling reason to increase the RVUs. The rank order of these two codes is currently correct. The RUC recommends that the current values be maintained.	2
68750	Create tear duct drain	8.21	8.21			2
68830	Re-open tear duct channel	2.12	2.12	The RVU should be similar to 30115, <i>Removal of nose polyp(s)</i> , at 4.25. Both codes involve intranasal surgery.	No compelling reason to increase the RVU. The society provided no further evidence to support the comment. The RUC recommends that the current value be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
92018	New eye exam & treatment	1.51	1.51	CMD: Reduce to .88 and .38; This is usually done for evaluation of a child. The ophthalmologist may need to bring additional equipment, but this procedure is no more difficult and the risk is no greater than 57400, <i>dilation of vagina under anesthesia</i> , 57410, <i>pelvic examination under anesthesia</i> , and is certainly not the same as 99215 (the most difficult return office visit patient).	92018 was surveyed. Survey data show median intra-service time of 30 min. and a median RVU of 2.50. Comparisons made by the CMDs are incorrect in terms of type of service delivered and time of service. Survey results and rationale are compelling. Use of general anesthesia increases risk of procedure. However, no compelling reason to increase RVU. The RUC recommends that the current value be maintained.	2
92019	Eye exam & treatment	1.31	1.31			2
92020	Special eye evaluation	0.37	0.37	CMD: Reduce RVU to .16; CPT describes this as a separate procedure, but Medicare allows this to be billed with an eye exam. This is a unilateral exam compared to 92081 which is a bilateral exam. The interpretation is not as difficult as 71020, <i>chest X-ray</i> .	Two surveys were done by different societies. Survey data show median RVUs of .55 and .60. The code is similar to 99213, <i>Office visit</i> , which has an RVU of 0.55. Comparison to 71020 is flawed. 92020 is a much more dynamic procedure. The RUC recommends that the current value be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key *
92060	Special eye evaluation	0.50	0.69	CMD: Reduce RVU to 0.23; This is no different than what a neurologist does for the examination of any parietic muscle. CPT definition is that this is a separate procedure and Medicare pays for it along with any other exam.	Survey data show median intra-service time of 30 min. and a median RVU of 1.40. The nature and scope of this service is greater than indicated by the CMDs. Survey data was compelling in that it showed intra-service times in excess of the original data. The RUC recommends that the RVU be returned to the Harvard value.	4
92070	Fitting of contact lens	0.70	0.70	This code should be increased to 1.05 RVUs. It is undervalued when compared to the reference code 99202, <i>office visit new patient</i> , and 99214, <i>office visit established patient</i> .	No compelling evidence to increase the RVU. The society provided no evidence to support the comment. The RUC recommends that the current value be maintained.	2
92275	Electroretinography	1.01	1.01	CMD: Reduce RVU to 0.40; This test is very similar to visual evoked response except that the recording instrument is placed on the cornea.	Survey data show median intra-service time of 45 min. and a median RVU of 1.47. Work involved is very different from VER. The RUC recommends that the current value be maintained.	2
92283	Color vision examination	0.26	0.17	CMD: Reduce to 0.17; This is almost always done by non-physicians. The physician work involved is less than the interpretation of an electrocardiogram or chest X-ray.	The RUC recommends that the CMD recommendation for a reduction be accepted.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Source and Summary of Comment to HCFA on this service:

CMD Comments:

Recommended RVUs: 7.90

Reference Codes: 44950, 65235

Rationale for Change: Harvard Phase III data indicate 54 minutes of intra-service time. This number appears excessive in light of current technology, this is not a highly stressful procedure.

Appendectomy at 6.13, average procedure time exceeds 66984 -- may be more difficult. Still carries considerable morbidity and mortality.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used by American Academy of Ophthalmology in Survey: "70 year old female complains of vision problems. Examination reveals that a cataract in her right eye has matured to the point of visual impairment. She has difficulty reading and recently failed a driving test. Cataract surgery is performed and an intraocular lens is implanted. Recovery is monitored and the patient is examined through regularly scheduled postoperative visits."

Vignette Used by American Optometric Association in Survey of Post Operative Care: "A 68 year old male returns one week after successful cataract surgery on the right eye with implantation of a posterior IOL, for continuing post surgical care."

Description of Pre-Service Work: Preparation of the patient begins in the surgical holding area. It is the ophthalmic surgeon's responsibility to ascertain the correct eye to be operated upon. The eye is briefly examined to rule out any substantive changes since the last examination. The adequacy of pupillary dilation is checked. Preoperative topical antibiotics may be administered to the operative eye. The patient is greeted and any final questions or concerns are addressed. The surgeon checks pertinent aspects of the patient's chart and notes vital signs, laboratory, radiologic and electrocardiographic data. If not previously performed, an appropriate history and physical is performed. The ophthalmic surgeon may then perform a peribulbar or retrobulbar anesthetic block. This may be performed while short-acting intravenous neuroleptic anesthesia is given. The patient's vital signs are closely monitored to guard against respiratory arrest or other such potential emergency. The surgeon may then elect to place an ocular compressive device on the eye to reduce intraorbital pressure. This may remain in place for several minutes during which time the patient's vital signs are monitored.

Description of Intra-Service Work: Once the patient is transported to the surgical suite, it is the surgeon's responsibility to position the patient properly for intraocular microsurgery. This will vary by patient based on the patient's physiognomy. The surgeon then performs or supervises the prepping and draping of the operative site. The adequacy of the anesthetic block must be checked. If a peribulbar or retrobulbar anesthetic block is not used, the application of topical or subconjunctival anesthetic is carried out. The surgeon then performs a proper surgical scrub and gowns. Automated cataract extraction devices such as phacoemulsification units must be checked to assure that the proper irrigation, aspiration and phacoemulsification parameters are entered. The surgeon must check that the machine operates properly. The microscope then is positioned to assure an adequate light reflex. Communication with the anesthesiologist or anesthesiologist is necessary to assure the patient's intraoperative physical stability. The surgeon then places a lid speculum and possibly a bridle-suture(s) to assure proper position of the eye. A flap of conjunctiva might be raised to lend access to the surgical limbus. Hemostasis is accomplished with a proper cautery instrument. A precise side-port incision is made away from the surgical incision. The manner of surgical incision varies: It may be a "clear-corneal" incision performed with a diamond keratome; a surgical limbus incision; or a "scleral-tunnel" incision which requires a partial thickness scleral incision with forward tunneling into clear cornea with a crescent knife. In the case of the latter incision, the actual configuration of the incision may be arcuate, tangential or parallel to the limbus. A viscoelastic substance is usually employed to insufflate the anterior chamber. The anterior chamber is then entered with a sharp blade to a precise incision size of 3.2 millimeters. A sharp bent needle or cystotome is used to fashion an opening in the anterior capsule of the cataract. This is done in a circular fashion to ensure strength and integrity. Its diameter routinely measures 5 to 8 millimeters. The cataractous lens is then loosened by injecting fluid between the lens and its capsule, a process known as hydrodissection. The surgeon may also choose to inject fluid between the lamella of the lens material itself, a process known as hydrodelamination. Additional viscoelastic material may then be injected into the anterior chamber prior to phacoemulsification. The function of the phacoemulsification handpiece is checked again. If satisfactory, the tip is inserted into the eye. Careful and precise phacofragmentation with simultaneous aspiration of the lens material is carried out. The lens must be rotated and is commonly "disassembled" to avoid inadvertent trauma to intraocular structures. It is common to employ a two-handed technique to accomplish this disassembly. The side-port incision is used to allow access to a second instrument used in the non-dominant hand. The dense cataractous material is thus removed from the eye. The phacoemulsification tip is removed from the eye. An irrigation-aspiration tip is introduced into the eye to commence cleanup of the residual cortical lens material. The thin, transparent lens capsule is then carefully vacuumed and polished in an attempt to avoid future secondary membrane formation. At this point, the anterior segment is ready to receive the intraocular lens. Depending on the lens style deemed appropriate by the surgeon, the incision may need to be opened to a larger chord-length. Many different methods are used to deliver intraocular lenses. It is critical to assure proper positioning and centration of the intraocular lens. It is generally agreed that this is best accomplished by ensuring that the prosthesis is precisely located in the empty lenticular capsule. The integrity of this fragile, transparent membrane is of paramount importance. Some surgeons elect to create a peripheral iridectomy in the iris. The surgeon must now evacuate the viscoelastic substance from the eye to prevent post-operative complication. This is generally accomplished with the irrigation and aspiration handpiece.

CPT Code: 66984

The anterior chamber must be properly pressurized and the incisional site must be assessed for the need of sutures to guarantee a water-tight closure. A miotic solution may then be injected into the eye to produce pupillary miosis. If a conjunctival flap was prepared, it must be securely fastened at its point of insertion. The bridle suture(s) and lid speculum are removed. It is common to inject an antibiotic and steroid in the subtenons space. An antibiotic ointment may be placed on the eye. A soft patch and a rigid shield is then positioned on the operative eye by the surgeon. The patient is then prepared to leave the operative suite.

Description of Post-Service Work: This work usually begins immediately after the surgery. The surgeon will commonly speak with the patient and the patient's family. Instructions are given and explained, questions are addressed and a prognosis is given. It is the surgeon's responsibility to ascertain the patient's ability to leave the surgical facility. The patient is seen the next day in the ophthalmic office. All follow-up examinations include a history of the postoperative course, an examination of the operative eye including vision, intraocular pressure, and ophthalmic evaluation of the anterior and posterior segment, and further instructions are given for medication use, patient activity and future follow-up. Corneal keratometry and topography are commonly performed post-operatively to ascertain surgical stigmatism. The global surgical period for CPT code 66984 is 90 days. It is common to see the patient up to six times in that time period. A post-operative spectacle examination is carried out usually between weeks three and six and a spectacle prescription is dispensed if the refraction is stable. If complications occur, these add to the time and intensity of the postoperative work.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

44950

The Carrier Medical Director suggested that appendectomy (44950) has an average procedure time which exceeds cataract surgery (66984) and may be a more difficult procedure. The comparison is erroneous

- o First, there is evidence that appendectomy is undervalued. The ACS is recommending an increase for appendectomy from 6.13 to 9.09 and the ASGS is recommending an increase to 8.22.
- o Intra-service time for cataract surgery is still higher. Harvard data indicates that the intra-service time for cataract surgery has fallen from 54 minutes to 50.
- o Cataract surgery still requires more post-operative care. Harvard data indicates that there are 45 minutes of post-operative work in appendectomies (2.5 10 minute hospital visits and 2 additional 10 minute office visits). Cataract surgery requires more follow-up work. The Harvard data indicates that there were 82.5 follow-up minutes (5.5 15 minute visits). The AAO's survey indicates that there are 4 visits and 68 follow-up minutes. Optometrists (using a vignette which describes only the follow-up care more than one week after surgery) reported 4 visits and 92 minutes. AHCPR's cataract guidelines recommend 4 post-operative visits and a larger survey conducted by Johns Hopkins indicates that 88% of patients had 4 or more follow-up visits within a 4 month period.
- o Appendectomies are performed by 1st year residents and 4th year medical students. Cataract surgeries are generally not performed until the second year of ophthalmic residency.

66985

Most respondents (17) identified 66985 as a reference procedure. That procedure has 7.89 RVUs. Our survey data indicates the intra-service time for 66985 is 30 minutes and all other time data for the two procedures is virtually identical. Intra-service time for 66984 is 50 minutes. Code 66985 has an average intensity level of 3.48 which is lower than cataract surgery's 3.95. We believe that the current RVU differential of 2.00 RVUs is appropriate given the additional time and intensity of 66984.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The current intra-service time for cataract is now slightly less than when it was first surveyed by Harvard because of the increased use of phacoemulsification in the last five years. Today about 60% of cataract extractions employ phacoemulsification while only 5-10% of surgeries involved phaco when 66984 was first studied. Both procedure are billed as 66984.

Extracapsular surgery requires a large incision which necessitates more intra-service time to close. However, it is technically easier and safer than operating through the small incision used in phacoemulsification. Most respondents (19 to 31) agreed that the work has changed but only 2 said that the work is now easier. They rated the technical difficulty to be 4.17. This newer technique is more stressful, technically difficult, and fraught with greater iatrogenic risk. This reflected in the increasing numbers of cataract nuclei which are lost into the vitreous cavity intra-operatively with phacoemulsification. The second leading cause of malpractice claims related to cataract extraction is now due to these iatrogenic complications. The greater skill in phacoemulsification is the delay in residents performing cataract surgery from their first year when using extracapsular technique to the second or third years for phacoemulsification in most training programs.

The nature of the pre-service work has changed in the last five years. Patients not only expect to see better post-operatively but to see better without glasses. This requires more pre-service planning of the wound construction and location to decrease the patient's underlying astigmatism. This often requires that the surgeon to operate in a more awkward position. The post-service has also changed because of the reporting demands of managed care and the need to maintain an on-going program of outcomes assessment.

Despite the marketing claims of some high volume cataract surgeons, the average intra-service time has declined little since the Harvard study (see Table 1). The RUC is directed to study and evaluate the work in the average patient, with average pathology, by the average surgeon in the routine setting - not the work of the occasional high volume surgeon operating in dedicated facilities. The AAO feels that the slight decrease in intra-service time is offset by the greater intensity, skill and iatrogenic risk and that the current value of 66984 should be maintained. It should be noted that the RUC has not decreased the RVW of procedures which have less intra-service time because of the use of smaller incision e.g. open cholecystectomy.

Cataract surgery still involves more intra-operative and total time than appendectomies. Median intra-operative time has fallen from 54 to 50 minutes for cataract surgery and are 37 times for appendectomy. The median total amount of time required is now about 183 minutes (45 pre + 50 + intra + 20 post, 5 same day post + 68 office). Appendectomies require 163 minutes (31 pre + 27 intra + 40 post, 10 same day post + 45 hospital and office visits).

The Carrier Medical Directors comments erroneously compared cataract surgery with appendectomies. Cataract surgery is more difficult to perform and takes more time. In rating the amount of work involved in a procedure, the RUC generally focuses on physician work and stress, not (as the CMD did) the risk to patients. The recommended reductions should be rejected and the current value maintained.

TABLE 1: CATARACT SURGERY: INTRA-SERVICE TIME DATA

MINUTES

54	Harvard Intra Service Time
50	AAO RUC Survey
52	University of Virginia ASC Operating Room Logs: Procedure Time for 8 ophthalmologists and 299 cataract surgeries

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 65205 Global Period: 000 Current RVW: 0.78 Recommended RVW: 0.71

CPT Descriptor: Removal of foreign body, external eye; conjunctival superficial

Source and Summary of Comment to HCFA on this service:

CMD Comment:

Recommended RVUs: 0.55

Reference Codes: 65220

Rationale for Change: The total work for this service which has a global period of zero should be no more than 15 minutes office visit (code 99213, RVU= 0.55)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "28 year old carpenter enters complaining of sudden onset of tearing, light sensitivity and pain in the right eye. Upon eversion of the upper lid, a small wood fragment is found."

Description of Pre-Service Work: The chart is reviewed. The emergency room chart is reviewed.

Description of Intra-Service Work: A past ocular and general medical history is taken. An external exam, evaluation of distant vision and slit lamp with fluorescein is performed. This shows multiple superior abrasions in the cornea. The cornea is anesthetized, the lid is everted, and the foreign body is removed with forceps. The eye is patched over antibiotics for 24 hours. The patient is counseled for the delayed sequelae of recurrent corneal erosion and infection.

Description of Post-Service Work: Communication with the family and any referring physicians is performed.

SURVEY DATA:Specialty: American Academy of OphthalmologySample Size: 103 Response Rate (%): 26 Median RVW: 0.8025th Percentile RVW: 0.60 75th Percentile RVW: 1.00 Low: 0.20 High: 3.00Median Pre-Service Time: 5 Median Intra-Service Time: 525th Percentile Intra-Svc Time: 5 75th Percentile Intra-Svc Time: 10 Low: 2 High: 20

Median Post-Service Time:

	<u>Number of Visits</u>	<u>Total Time</u>
Day of Procedure:	<u>5</u>	<u> </u>
ICU:	<u> </u>	<u> </u>
Other Hospital:	<u> </u>	<u> </u>
Office:	<u> </u>	<u>n/a</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	65205	Remove foreign body from eye	0.78
2)	65220	Remove foreign body from eye	0.71
3)	99213	Office/outpatient visit, est.	0.55

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The preservice and post service of 65220 and the key reference codes 99213 and 65220 are basically the same. The time of the service is the same as 99213 but 65205 includes the manipulation and removal of the foreign body in addition to the history taking and counseling normally provided with 99213. The time involved, the technical skill and iatrogenic risk are almost identical to 65220. However, the work involved in locating and removing the foreign body is greater than in 65220 because the foreign body is not as visible or as accessible as in 65205. For these reasons we feel that the current RVU of .78 for 65205 is appropriate.

We concur with the RUC's Multi-disciplinary Workgroup 6 that an RVW of .71 (same as 65220) is reasonable.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

See above (Relationship of Code Being Reviewed to Key Reference Services).

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 65430 Global Period: 000 Current RVW: 0.87 Recommended RVW: 1.47

CPT Descriptor: Scraping of cornea, diagnostic, for smear and/or culture

Source and Summary of Comment to HCFA on this service:

The AAO recommended an increase in the value of this procedure.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A forty-five year old, soft contact lens wearing gardener complains of pain, redness and photophobia and rapid loss of vision in his left eye for the past three days. He felt a foreign body sensation in his eye then noted a white spot in his cornea. He has a past history of cold sores on his lips. Examination reveals a 2 mm diameter corneal ulcer which has eroded through half the corneal thickness and no foreign body."

Description of Pre-Service Work: After ophthalmologist performs a comprehensive history and physical examination, particular attention is paid to the conjunctiva, and measurements and drawings of the corneal ulcer. Corneal sensation and lacrimal function are assessed. Contact lenses and cases are inspected and cultured.

Description of Intra-Service Work: After application of topical anesthetic, an eyelid speculum is inserted. Observing with a slit lamp biomicroscope, a sterile platinum spatula is used to repeatedly scrape the edges of the corneal ulcer. Scrapings are smeared onto glass slides which are treated with gram, giemsa and fungal stains. Additional scrapings are inoculated onto a variety of microbiological cultures to detect aerobic and anaerobic bacteria, fungi and in special cases culture media for herpes virus and protozoa. The stained smears are promptly examined, usually by the ophthalmologist, with light microscopy to determine the type of cellular response and to search for infectious agents. The need for immediate evaluation and interpretation of smear is necessitated by the avascular nature of the cornea and its inability to fight infection like tissue. The cultures are promptly incubated.

Description of Post-Service Work: Based on the interpretation of the smears, anti-infectives are selected and treatment started.

SURVEY DATA:Specialty: American Academy of OphthalmologySample Size: 103 Response Rate (%): 34 Median RVW: 1.5125th Percentile RVW: 1.03 75th Percentile RVW: 2.48 Low: 0.50 High: 11.50Median Pre-Service Time: 10 Median Intra-Service Time: 1025th Percentile Intra-Svc Time: 7 75th Percentile Intra-Svc Time: 15 Low: 5 High: 55

Median Post-Service Time:

	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u> </u>	<u>8</u>
	<u> </u>

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	65205	Removal of foreign body	0.78
2)	65410	Biopsy of cornea	1.47

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The code being reviewed is more complex and time consuming than the reference code. (65205 - which according to Harvard data takes 17 minutes and our recent study says it takes 15 minutes). Scraping of the cornea (65430) requires debridement of infected tissue for diagnostic purposes and takes 28 minutes. The infected tissue is then cultured on a variety of microbiologic media and microscopic glass slides for subsequent staining and microscopic examination. Care must be taken in doing the scraping of the normally clear cornea to minimize the damage from the procedure and to obtain the best material for culture which are considerations. Removal of conjunctival foreign body has no such concerns.

We concur with the work group that this procedure is very similar to a biopsy of the cornea (CPT code 65410) and an RVW of 1.47 is reasonable.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Scraping of the cornea is like taking a small biopsy of the eye for diagnostic purposes. A titanium spatula is used to scrape the bed and edges of the corneal ulcer to remove infected corneal tissue for microbiological and cytological study. Multiple scrapings are done to obtain sufficient material for each type of study.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 65710 Global Period: 090 Current RVW: 9.52 Recommended RVW: 11.75

CPT Descriptor: Keratoplasty (corneal transplant); lamellar

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A fifty-five year old man complains that his contact lens keeps falling out resulting in a sudden loss of sight. Examination reveals the inferior edge of both corneas had thinned so much that the normal intraocular pressure caused the weakened cornea to bulge. Because the edge of the cornea was involved a partial thickness corneal graft was needed to correct the pellucid marginal degeneration."

Description of Pre-Service Work: After the diagnosis has been made by performing comprehensive history and physical examination, the ophthalmologist counsels the patient about the procedure, complications, and expectations and special diagnostic procedures are done. Topographical corneal mapping is done to map out the surface topography of the affected area to be excised. Ultrasonic pachymetry is used to develop a corneal map showing the different thickness of the thin and healthy areas.

Description of Intra-Service Work: Under monitored local anesthesia or general anesthesia, the area of the diseased cornea to be excised is outlined on the surface of the cornea using the preoperative corneal map. The ultrasonic pachymeter may be used in surgery to confirm the junction of normal and thinned cornea. With a controlled depth-setting diamond blade knife set at a depth to cut partially into the thickness of the recipient's cornea, the diseased cornea is excised in a manner to allow a patch of lamellar graft to fit into the surgical site. A sheet of vinyl is used to make a pattern outlining the borders of the recipient's site and then is transferred onto the corneal surface of the whole donor globe. The diamond blade knife makes a partial thickness cut following the pattern. The edge of the cut is grasped and a layer of cornea of measured thickness is peeled off the donor globe with a knife. Aqueous is removed from the eye to soften the eye and the graft is then sutured in place with interrupted 10-0 nylon suture.

Description of Post-Service Work: The number of post-operative examinations depends on how well the patch graft heals. During the first month, there are at least three post-operative visits and then two monthly visits. During the post-operative period, the eye is monitored for infection, inflammation and healing problems. Sutures may be removed depending upon the rate of healing and vascularization.

SURVEY DATA:Specialty: American Academy of OphthalmologySample Size: 103 Response Rate (%): 28 Median RVW: 12.0025th Percentile RVW: 10.00 75th Percentile RVW: 13.60 Low: 7.00 High: 30.00Median Pre-Service Time: 35 Median Intra-Service Time: 9025th Percentile Intra-Svc Time: 65 75th Percentile Intra-Svc Time: 120 Low: 30 High: 140

Office:	<u>90</u>	<u>6</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	65285	Repair of eye wound	12.06
2)	67107	Scleral buckle procedure	13.99

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Lamellar keratoplasty is more complex than repairing corneal laceration. In repairing a corneal laceration, the edges of the wound are sutured together in a manner to achieve a water tight wound with the least impairment of visually important center of the cornea. In lamellar keratoplasty the diseased area of the cornea is partially excised and a partial thickness piece of donor tissue is cut to match the area of excised disease tissue and sutured in place. The lamellar keratoplasty requires skill to tailor the patch to fit the excised diseased area to achieve a smooth spherical corneal surface. The level of skill is greater than that requiring sewing the edges of the laceration together.

The subject code is about as complicated as repairing a retinal detachment with the scleral buckle procedure. A lamellar keratoplasty takes much more time and the precision of suturing and cutting is much greater than for a scleral buckle procedure. Because the corneal surgery has a greater impact on the post-operative refractive status of the greater technical skill is needed for lamellar keratoplasty.

The post-operative care of the lamellar keratectomy case is more intense than than for the repair of a corneal laceration or scleral buckle.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This is an uncommon procedure requiring a high level of skill. It has an additional difficulty because donor tissue is currently difficult to obtain because most donated tissue only involves part of the eye, the cornea, and a rim of sclera and not the whole eyeball. To harvest donor tissue for a lamellar keratectomy one needs a whole eyeball. The availability of whole globes has declined as eye banks have changed their harvesting procedures.

A high level of skill is necessary to design the shape and thickness of the donor material to the diseased area that needs to be excised. This match and size and size of graft to wound size would increase the chance of complications and reduce the chance of improving vision. The suturing is done with care, not to induce astigmatism or cause scarring in the visual axis.

This procedure requires a large number of post-operative visits to monitor the transplanted graft for healing problems and infections and time the removal of sutures.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Codes: 65730, 65750 & 65755 Global Period: 090 Current RVW: 11.83, 12.58, & 12.58
Recommended RVW: 13.50, 14.25, 14.25

CPT Descriptor: Keratoplasty (corneal transplant); penetrating except in aphakia

Source and Summary of Comment to HCFA on this service:

The AAO recommended that the values of these codes be increased.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A thirty-two year old woman with bilateral keratoconus can no longer tolerate the discomfort of wearing her custom fit contact lenses. The cornea is bulging and the apex of the cornea is now scarred and half of its normal thickness. Her best correctable vision is worse than 20/100. The irregular astigmatism is so severe that a keratometer could not measure the corneal surface irregularity."

Description of Pre-Service Work: After the diagnosis has been made by performing a comprehensive history and physical examination, the ophthalmologists counsels the patient about the procedure, complications and expectations, special diagnostic procedures are done. Topographical corneal mapping is done to map out the surface topography of the affected area to be excised. Ultrasonic pachymetry is used to develop a corneal map showing the different thickness of the thin and healthy areas. The size of the trephine cut is determined.

Description of Intra-Service Work: Under monitored local anesthesia or general anesthesia, the area of the diseased cornea to be excised is inspected to determine if the planned corneal trephine size is appropriate. A slightly larger corneal trephine is used to punch out the donor corneal tissue from the donor corneal-scleral tissue. A wire ring is sutured into episcleral tissue to prevent the eye from collapsing after trephination. The properly centered corneal trephine blade then partially cuts through the recipient cornea and the cut is completed with scissors taking care not to damage the iris or lens. After the cornea is removed, the donor corneal button is positioned with four sutures. The corneal button is sewed in place using a single 10-0 continuous running nylon suture, a double running 10-0 and 11-0 suture or a combination of interrupted and continuous sutures or just 16 interrupted stitches. The wound is then tested for leaks.

Description of Post-Service Work: The number of post-operative examinations depends on how well the corneal graft heals. During the first month, there is at least three post-operative visits ten visits every four to six weeks of the first year. During the post-operative period the eye is monitored for infection, inflammation, healing problems, and secondary glaucoma and transplant rejection. In some problematic cases, post-operative visits are as frequent as weekly during the first phase of surgery or during untoward effects of surgery. Approximately 10 weeks after surgery corneal topographical mapping is done. If there is significant residual irregularities; in the shape of the cornea the continuous running nylon suture may be adjusted at the slit lamp microscope in the office to reduce the astigmatism. The continuous running suture may be removed at one year or left in place indefinitely. Visual rehabilitation with glasses or contact lens is done at six months and needs to be repeated at one year. Patient is discharged from care about 15 months after surgery.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	65285	Repair of eye wound	12.06
2)	67107	Scleral buckle procedure	13.99

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Penetrating keratoplasty is more complex than repair of the corneal transplant for several reasons. A transplant procedure requires obtaining donor tissue and cutting it for placement in the patients eye. The corneal laceration does not require additional tissue but just closure of the corneal tissue present.

A penetrating keratoplasty is just as complex as a scleral buckle procedure for retinal detachment but requires more intense care during the first 90 days. Because the effects of corneal surgery has a greater impact on the post-operative refractive status of the eye, greater attention is needed to suturing for the penetrating keratoplasty than for the scleral buckle.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Over the past five years, the amount of work to do corneal transplant has increased. Because of information received from corneal topography, the procedure is done frequently to follow the healing and the shape of corneal surface. If there is suture induced astigmatism, the sutures are adjusted during the first three months in hopes of achieving a spherically shaped cornea and the least amount of surgically induced astigmatism. Because of greater attention to try to achieve more than a clear graft and to try to achieve emmetropia -- good vision without optical correction -- greater stress is placed on the surgeon. In addition, there is added stress, in not causing a cataract from the surgical manipulation in patients with their own natural lenses.

Other connected procedures: 65750 and 65755. We originally recommend the same percentage change for these procedures because they are similar to survey procedure. The RUC's Multidisciplinary Workgroup 6 suggested an identical increment. We agree with the multi-disciplinary work group and have reduced our recommended increase.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 65855 Global Period: 090 Current RVW: 4.65 Recommended RVW: 4.15

CPT Descriptor: Trabeculoplasty by laser surgery, one or more sessions (defined treatment series)

Source and Summary of Comment to HCFA on this service:

CMD Comment:

Recommended RVUs: 4.15

Reference Codes: 65860, 65865

Rationale for Change: Once the treatment series is completed, there are few follow up visits following 65855 unless there is uveitis or another complication. The procedure itself involves less time and intensity than 65865. In total work, it is closer to 65860 than 65865.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "65 year old African American male with uncontrolled intraocular pressure on maximally tolerated medical therapy has had progressive visual field loss and optic disc cupping. The patient has early cataracts. He states he is totally faithful with his medical regimen because he is very much afraid of going blind."

Description of Pre-Service Work: The preoperative laser history is filled out. The chart is reviewed and the laser is tuned. The eye is pre-treated with mioptic drops and the pressure is checked. The procedure and technique is explained to the patient and the patient is positioned at the laser and the appropriate laser settings are determined. Topical anesthetic drops are applied.

Description of Intra-Service Work: The laser gonio lens is placed on the cornea and gonioscopy is performed. The aiming beam is focused on the anterior trabeculum and tests are fired until pigment blending occurs. Between 60-100 beams are placed circumferentially. The lens is rinsed and the eye is irrigated and post treated with anti-coagulants and anti-inflammatory drops.

Description of Post-Service Work: Case is discussed with patient and family. Arrangements are made for a follow-up visit within 24 hours. Patient is seen, as appropriate, over next three months to ensure that normal inflammations subside. Visits typically occur at 1 day, 1 week, and 2 months. Operative notes are dictated and discussion with family takes place.

SURVEY DATA:

Specialty: American Academy of Ophthalmology

Sample Size: 103 Response Rate (%): 30 Median RVW: 4.65

25th Percentile RVW: 4.10 75th Percentile RVW: 4.95 Low: 1.75 High: 5.86

Median Pre-Service Time: 15 Median Intra-Service Time: 15

25th Percentile Intra-Svc Time: 15 75th Percentile Intra-Svc Time: 26.25 Low: 5 High: 60

Median Post-Service Time:

	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>10</u>	<u> </u>
ICU:	<u> </u>	<u> </u>
Other Hospital:	<u> </u>	<u> </u>
Office:	<u>30</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	65860	Incise inner eye adhesions	3.37
2)	65865	Incise inner eye adhesions	5.42
3)	66761	Revision of iris	3.77

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre-service time of 66761 is the same as 65855. The post-service time for 65855 is greater as is the intra-service time. The localization of the trabeculum is a dynamic process and requires more skill than 65860 or 65865. the post-operative time is greater for 65855 than for 65860, 65865 or 66761.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The CMD's incorrectly suggested that there are few follow-up visits for 65855. The original Harvard data found 3, 15 minute follow-up visits and this survey found 3, 10 minute follow-up visits. No time data is available on the reference codes suggested by the CMDs.

The respondents felt that 66761 was a more appropriate reference service than 65860 or 65865. The intra-service work is greater for 65855 than 66761.

The RUC Multidisciplinary Workgroup 6 rejected the CMD's rationale but, felt that the nature of the work for 65855 had decreased in the last couple of years because of the pre-operative use of newer anti-glaucoma drops. This agent dramatically reduced the intensity of the post-operative care on the day of the procedure thus decreasing the iatrogenic risk of post-operative visual field loss. For these reasons we accept the CMD RVW of 4.15.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 66180, 66170 & 66172 Global Period: 090 Current RVW: 12.63, 11.31, 13.67
Recommended RVW: 14.00, 11.26, 13.62

CPT Descriptor: Aqueous shunt to extraocular reservoir (eg Molteno, Schocket, Denver-Krupin)

Source and Summary of Comment to HCFA on this service:

The American Society of Cataract and Refractive Surgery recommended increasing this value to 14.00.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Description of Pre-Service Work:

Description of Intra-Service Work:

Description of Post-Service Work:

SURVEY DATA:

This procedure was not surveyed.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	66170	Glaucoma surgery	11.31
2)	66172	Incision of eye	13.67

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

There exists a rank order anomaly in the glaucoma filtering codes. Codes 66180 is the most complex and least frequently used among these codes. We recommend an increase from 12.63 RVWs to 14 for 66180. The AAO feels that the base code for glaucoma filtering surgery, 66170, with 11.31 RVWs and glaucoma filtering with scarring from previous ocular surgery, 66172, with 13.67 RVWs are appropriately valued. If HCFA feels that it is necessary to make this change revenue neutral among this small family of codes, small reductions in 66170 and 66172 may be reasonable. Since the annual volume of 66170 and 66172 (59,000 approx.) dwarfs the number of 66180s, (2,000 approx.) the RVW reductions necessary to maintain budget neutrality should be no more than 0.05 RVWs.

The chart below is based on the latest available volume data provided by AMA's Kurt Gillis and the most current RVWs. It shows that this recommended changes would be revenue neutral.

CPT CODE	1994	1995	1994/1995	1996 (est.)	1996 (est.)	1996 (est.)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 66821 Global Period: 090 Current RVW: 2.78 Recommended RVW: 2.78

CPT Descriptor: Discission of secondary membranous cataract (opacified posterior lens capsule and/or anterior hyaloid); laser surgery (eg. YAG laser) (one or more stages)

Source and Summary of Comment to HCFA on this service:

CMD Comments

Recommended RVUs: 2.30

Reference Codes: 66820

Rationale for Change: The technical skill and work intensity for 66821 are significantly lower than 66820. Intra-service time is about half. Outpatient visits are fewer.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "Eight months after surgery, a 70-year old female complains of diminished vision in her operated eye. An eye examination reveals posterior capsular opacification of sufficient severity to warrant treatment. Laser surgery is performed. The patient is examined postoperatively for signs of complications."

Description of Pre-Service Work: A complete ophthalmological examination is performed, including slit lamp examination and fundusopic examination. It is noted that the patient has decreased visual acuity and opacification of the posterior capsule. Careful examination of the macula including use of the potential acuity meter is required to rule out macular diseases that cause visual loss. Informed consent is obtained. Patients chart, past history and last ocular examination are reviewed. Topical steroids, anti-glaucoma medications, and topical anesthetic are instilled.

Description of Intra-Service Work: The patient is seated at the laser, and a contact lens is applied. Multiple applications of laser energy are delivered, caution being taken not to damage the intraocular lens implant or other structures. Test burns are applied to confirm the adequacy of the YAG energy, the burst mode and the power are adjusted to achieve optimal vaporization.

Description of Post-Service Work: The patient is monitored approximately two hours after the procedure for elevated intraocular pressure, which is a recognized complication of YAG laser capsulotomy. In the case of elevated intraocular pressure, medical treatment is usually sufficient for control. The patient is seen one to two weeks following the procedure for a refraction and evaluation of the results of treatment. The patient is seen again at one to three months following the procedure for a dilated retina examination to look for evidence of retinal hole formation or retinal detachment.

CPT Code: 66821

SURVEY DATA:

Office:	<u>30</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	66761	Revision of iris	3.77
2)	66820	Incision, secondary cataract	3.76
3)	67031	Laser surgery, eye strands	3.42

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The pre-service work of 66821 is almost identical with that 66761, 67031, and 66820. The intra-service skill and complexity of 66821 is the same as 66761 and 67031 but is less the time and complexity 66820. The post-operative care and time are similar for all three. The iatrogenic risks and complications for 66821 and the open procedure, 66820, are the same and include a 2% incidence of retinal detachment. The dissection of a secondary membrane using an open technique, 66820, has the same pre-service and post-service work as the closed procedure performed with the YAG laser, 66821, but does involve more intra-service time. They both have the same risk of retinal detachment.

The RUC has adopted the policy of valuating open and closed procedures the same i.e., laparoscopic versus open cholecystectomy. Currently, 66821, the "closed procedure" for opening opacified posterior capsule is valued at 2.78 work RVWs while the "open procedure", 66820 is valued higher at 3.76. For these reasons the AAO feels that YAG capsulotomy is not overvalued and recommends that the current RVW of 2.78 be retained.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 67312 Global Period: 090 Current RVW: 7.55 Recommended RVW: 8.19

CPT Descriptor: Strabismus surgery, recession or resection procedure (patient not previously operated on); two horizontal muscles

Source and Summary of Comment to HCFA on this service:

The American Academy of Ophthalmology and the American Academy of Pediatrics recommended that the work valued of this procedure be increased.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 6 year old boy developed comitant estropia at age 5 years. A severe amblyopia in the right eye developed. The amblyopia was partially corrected by patching. The patient's parents consented to the repair of the strabismus to restore the ocular alignment and single binocular vision. The patient was placed under general anesthesia and the face and eyes prepped. The right medial rectus muscle was isolated, placed on an absorbable suture, detached from the globe, and recessed 5 mm reattaching the muscle to the globe with two scleral passes of the suture. The right lateral rectus muscle was isolated, the anterior portion resected 7 mm, and the remaining muscle then reattached to the globe with sutures through the sclera. Separate conjunctival incisions were used for each of the muscles operated. The patient returned for post-operative examinations on post-operative days 2, 14, 28, and 63."

Description of Pre-Service Work: The chart and physical examination are reviewed. The pre-operative outpatient history and physical form is completed. The patient is briefly examined in the pre-op area to check for infection. The surgical plan is reviewed. The patients family is counseled in the pre-op area prior to induction. Topical medications are ordered and applied.

Description of Intra-Service Work: 67312 requires two conjunctival incisions, at least four scleral passes and 50 percent more operative time and effort than that required for 67311. (67311 requires two scleral passes without one muscle operated). With each muscle, there is a separate conjunctival incision, identification of the muscle, separation of the muscle from its fascial attachments, imbrication of the muscle with suture and replacement of the muscle on the surface of the globe by means of high risk, low margin for error scleral passage. Each passage carries a risk for scleral perforation (penetration of the needle to the underlying choroid or retina) with the possibility of intraocular infection (endophthalmitis, intraocular hemorrhage or retinal detachment).

With CPT 67312 there are twice as many scleral passes as with 67311 and therefore twice the risk of scleral perforation. This event is associated with many complications.

The average length of operative time to complete 67312 is twice that required for 67311.

Description of Post-Service Work: The post service work for 67312 is approximately the same as for 67311. The work includes one follow up exam (office) within the first week of surgery. During this exam the vision in each eye is compared to pre-operative values, the motility and muscle balance are assessed and slit lamp and fundus exams are performed to rule out the possibility of occult perforation, intraocular or periocular infection or dry spots on the cornea due to sub optimal corneal lubrication.

Two or three additional exams occur during the post operative period. These include all of the above mentioned procedures plus refraction, placement of compensatory temporary prisms and institution of eye muscle exercises (orthoptics) if necessary.

Lens prescription changes, if necessary, are made during one of the post operative exams.

SURVEY DATA: None gathered

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	63780	Insertion of subarachnoid catheter	6.22
2)	49525	Repair of inguinal hernia	6.97
3)	66850	Removal of lens material	8.66
4)	67412	Revise two eye muscles	9.14

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 67311 (one horizontal muscle) is the most common eye muscle operation performed in this country and is felt to be the "index procedure" to which all eye muscle procedures are compared. 67311 has a RVW of 6.30 units. It is bracketed by codes 63780 (Insertion of subarachnoid catheter) at 6.55 and CPT 49520 (Repair of inguinal hernia, any age, recurrent) at 6.97.

From discussion with colleagues in other specialties and other areas of ophthalmology we feel that 67311 appears to be fairly placed between these two reference services when time required, mental effort and judgement, technical skill and stress are taken into account.

67312 requires twice the operative effort as 67311. We believe the work is greater in scope than 66850 (8.66) but less than 67412 (9.14).

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

67312 represents a doubling of the intra-service work, or essentially performing a second surgery through a second incision compared to 67311. HCFA has previously noted that a second procedure generally warrants 50% of the recommended value to account for the increased intra-service work. We concur with this opinion. 67311, which is a single muscle operation, has a relative work value of 6.3 units. We believe that 67312 should have an incremented value of approximately 50% or 3.15 additional work value units. This increase acknowledges that the increase should not be applied to the other components of total work.

The proposed value of 9.0 is consistent with the idea that a second procedure is being performed on these patients with a second separate intra-service work. We acknowledge that pre-service and post-service work for the procedure are essentially identical. For that reason, we recommend a relative value of 9.0 units, slightly less than a 50% increment of the value of the parent procedure 67311.

We believe that this procedure is fairly placed with this relative value between codes 66850 and 67412. We believe that the work involved in a two muscle operation exceeds that in a unilateral inguinal hernia repair but would be similar to that of a bilateral hernia repair. Of additional note, most of these procedures are performed on children with extended pre-service time for discussion with parents as well as appropriate child discussions that were not part of the initial Hsiao studies or the surveys of ophthalmologists.

The AAO accepts the multi-disciplinary work groups methodology for increasing the RVW of 67312 to 8.19.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 67316 Global Period: 090 Current RVW: 8.02 Recommended RVW: 9.26

CPT Descriptor: Strabismus surgery, recession or resection procedure (patient not previously operated on); two or more vertical muscles (excluding superior oblique)

Source and Summary of Comment to HCFA on this service:

The AAO & AAPed recommended an increases in the RVWs of this procedure.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 65 year old patient suffered a brainstem infarction, which resulted in a unilateral upgaze paresis of the left eye. the eye movements did not recover over one year and the patient was troubled with vertical diplopia. The patient was taken to the operating room. Intravenous sedation was administered. Local infiltration anesthesia was performed in the left orbit. The inferior rectus muscle was localized through an inferior conjunctival incision, placed on a suture, disinserted from the globe, and recessed. The superior rectus muscle was approached through a superior conjunctival wound, isolated, 7 mm removed, and then reattached to the surface of the globe with sutures. The conjunctival wounds were closed. The patient was followed up on postoperative days 1, 7, 28, and 56.

Description of Pre-Service Work: The chart and physical examination are reviewed. The pre-operative outpatient history and physical form is completed. The patient is briefly examined in the pre-op area to check for infection. The surgical plan is reviewed. The patients family is counseled in the pre-op area prior to induction. Topical medications are ordered and applied.

Description of Intra-Service Work: 67316 requires two conjunctival incisions, at least four scleral passes and 50 percent more operative time and effort than that required for 67314. (67311 requires two scleral passes without one muscle operated). With each muscle, there is a separate conjunctival incision, identification of the muscle, separation of the muscle from its fascial attachments, imbrication of the muscle with suture and replacement of the muscle on the surface of the globe by means of high risk, low margin for error scleral passage. Each passage carries a risk for scleral perforation (penetration of the needle to the underlying choroid or retina) with the possibility of intraocular infection (endophthalmitis, intraocular hemorrhage or retinal detachment).

With CPT 67316 there are twice as many scleral passes as with 67314 and therefore twice the risk of scleral perforation. This event is associated with many complications.

The average length of operative time to complete 67316 is twice that required for 67314.

Description of Post-Service Work: The post service work for 67316 is approximately the same as for 67314. The work includes one follow up exam (office) within the first week of surgery. During this exam the vision in each eye is compared to pre-operative values, the motility and muscle balance are assessed and slit lamp and fundus exams are performed to rule out the possibility of occult perforation, intraocular or periocular infection or dry spots on the cornea due to sub optimal corneal lubrication.

Two or three additional exams occur during the post operative period. These include all of the above mentioned procedures plus refraction, placement of compensatory temporary prisms and institution of eye muscle exercises (orthoptics) if necessary. Lens prescription changes, if necessary, are made during one of the post operative exams.

SURVEY DATA: None collected

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	63780	Insertion of subarachnoid catheter	6.22
2)	49525	Repair of inguinal hernia	6.97
3)	66850	Removal of lens material	8.66
4)	67314	Revise eye muscle	7.12

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

67316 represents a doubling of the intra-service work, or essentially performing a second surgery through a second incision compared to 67314. HCFA has previously noted that a second procedure generally warrants 50% of the recommended value to account for the increased intra-service work. we concur with this opinion. 67314, which is a single muscle operation, has a relative work value of 7.12 units. We believe that 67316 should have an incremented value of approximately 50% or 3.56 additional work value units. This increase acknowledges that the increase should not be applied to the other components of total work.

The proposed value of 9.5 is consistent with the idea that a second procedure is being performed on these patients with a second separate intra-service work. We acknowledge that pre-service and post-service work for the procedure are essentially identical. For that reason, we recommend a relative value of 9.5 units, slightly less than a 50% increment of the value of the parent procedure 67314.

Of additional note, most of these procedures are performed on children with extended pre-service time for discussion with parents as well as appropriate child discussions that were not part of the initial Hsiao studies or the surveys of ophthalmologists.

The AAO accepts the RUC multi-disciplinary work groups methodology. Therefore we have lowered our recommended new value to 9.26.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 67420 Global Period: .090 Current RVW: 13.36 Recommended RVW: 19.00

CPT Descriptor: Orbitotomy with bone flap or window, lateral approach (e.g. Kroenlein); with removal of lesion

Source and Summary of Comment to HCFA on this service:

The AAO recommended an increase in the work value of this procedure.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 68 year old gentleman is referred to his ophthalmologist by his primary care physician because of unilateral proptosis of the right eye. The patient has complained of double vision for two weeks. A CT scan of the orbit reveals a well-circumscribed, intraconal mass which is lateral and superior to the optic nerve. It slightly enhances with contrast."

Description of Pre-Service Work: Admission protocols for hospitalization are carried out. Once in the operating room and after general anesthesia is induced, patient is positioned as necessary to perform the procedure. Ancillary equipment such as microscope, ultrasound or laser are prepared for use.

Description of Intra-Service Work: The operation is performed in some cases via lateral canthotomy incision which provides exposure to the superior maxilla and inferior frontal bone as well as the zygoma and the zygomatic arch. Often a bicoronal incision is required as well, to provide access to the superior orbital regions. Additional removal of this rim is frequently required to provide adequate visualization of the tumor. Intraorbital dissection follows the removal of bone and this proceeds deliberately to avoid injury to the nerves (including the optic nerve) that innervate the eyeball as well as extraocular muscles. The tumor is first isolated out and then a series of maneuvers are carried out to further define isolate the tumor from the surrounding tissues to prevent harm during removal of the tumor. Once the proper protective measures have been instituted, the tumor is removed, usually under microscopic control. This process usually requires one to two hours. Following the removal of the tumor the bone is replaced and fixated with mini plates and the skin wounds are closed.

Description of Post-Service Work: The postoperative work includes monitoring of the patient closely during the first 24 hours. The patient is then examined on a daily basis and is usually discharged within 3-5 days after surgery. The postoperative care is directed toward providing the appropriate wound care instructions and monitoring for appropriate healing.

2)	21267	Orbital repositioning, periorbital osteotomies	17.66
3)	67108	Repair of retinal detachment; with vitrectomy	19.90
4)	21433	Open treatment of craniofacial separation	23.69

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above. See below.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Comparing a lateral orbitotomy with removal of lesion (67420) is easily demonstrated using the above reference codes. The current RVW of 13.36 is undervalued. Pre-service time, effort and skill for a scleral buckling of a retinal detachment (67107) {RVW 13.99} is less than the lateral orbitotomy (67420) since the orbitotomy requires the review of CT or MR scans, consultation with non-ophthalmic surgeons such as neurosurgeons and/or otolaryngologists (depending on the size and position of the lesion), and coordination with other physicians to rule out possible systemic origins of the lesion such as metastatic disease elsewhere or, for example, systemic lymphoma with orbital involvement.

Intra-service time, effort, skill and stress is greater than orbital repositioning (21267) {RVW 17.66} because the lateral orbitotomy requires the removal of an orbital lesion along with the osteotomies to remove the lateral orbital bone. Orbital repositioning does not involve manipulation of the delicate intraorbital tissues and structures in order to remove a lesion that is usually intimately attached to these structures. Similar orbitotomy techniques are used in both, however, no bone grafts are required in the lateral orbitotomy (the lateral orbital bone, however, is repositioned and replaced as if it was a grafted material).

The intra-service work time is less than an open treatment of craniofacial separation (21433) {RVW 23.69}, however, the effort, skill and stress are probably quite similar.

The post-service work and effort of the lateral orbitotomy is slightly less than that of a repair of retinal detachment with vitrectomy (67108) {RVW 19.90}, however, the pre-service work and effort is greater for the reasons mentioned above (see comparison with 67107). The intra-service time would be very comparable related to effort, skill, stress and time. This would place the appropriate RVW value slightly higher than 67108 (RVW 19.90) and much lower than 21433 (RVW 23.69).

An RVW value of 19.00 is suggested to reflect these differences in pre-, intra-, and post-service work time, effort stress, and skill which is significantly higher than 67107 (RVW 13.99), slightly lower than 67108 (RVW 19.90) but lower than 21433 (RVW 23.69).

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 68720 Global Period: 090 Current RVW: 7.68 Recommended RVW: 8.56

CPT Descriptor: Dacryocystorhinostomy (fistulization of lacrimal sac to nasal cavity)

Source and Summary of Comment to HCFA on this service:

The AAO recommended an increase for this procedure.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 72 year old female is referred to her ophthalmologist with a swollen area over her right lacrimal sac. She admits to a 6 month history of chronic tearing and has been treated for chronic conjunctivitis for at least the last 4 months. Pressure on the lacrimal sac reveals a purulent reflux through the lower canaliculus. Irrigation of the right lacrimal system reveals a blockage distal to the common canaliculus."

Description of Pre-Service Work:

Description of Intra-Service Work:

Description of Post-Service Work:

2)	21275	Revision of orbitofacial bones	10.50

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

See below.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The current RVW for a dacryocystorhinostomy (DCR) is undervalued at 7.68. When compared to the above reference codes, it should be valued somewhere between open treatment of an orbital floor fracture (Caldwell-Luc procedure) (21285) {RVW 8.56} and secondary revision of orbitocraniofacial reconstruction (21275) {RVW 10.50}. All three procedures require techniques and skills that cross multiple surgical disciplines, i.e., ophthalmology and otolaryngology, since both the orbit and the sinus/nasal cavity is involved.

Pre-service time is relatively similar in the DCR and the Caldwell-Luc (C-L). The procedure requires reviewing scans pre-operatively since fractures are present. The DCR requires more of a pre-operative work-up since the source of "tearing" must first be determined. Tear dye disappearance tests and lacrimal system irrigation is routinely performed. The latter has a separate CPT code but is not paid on the same day as the consultation or examination when it is done. Typically, the DCR requires extra pre-service time to reduce or resolve the acute infectious process (acute dacryocystitis) leading to the blockage in the lacrimal apparatus. The orbital fracture is a one time event awaiting repair.

Intra-service time is definitely more in the DCR than the C-L. Both require entry incisions (skin in the DCR, mucosa in the C-L). Both require osteotomies. The DCR is performed in a smaller space. Reduction of the fracture is very similar to creating preparing the nasal mucosa and lacrimal sac flaps. The DCR includes intubation of the lacrimal system with silicone tubing. The C-L has no such comparison. The closures are similar in both. Both have the risk of juxtabulbar or retrobulbar hemorrhage with subsequent visual compromise.

The post-service time and effort is significantly different due to the addition of an extra procedure that is associated with the DCR and not the C-L. Usually around 3 months post-operative, the silicone tubing must be removed in the office which requires an instrument set-up and procedure. The lacrimal system is, once again, irrigated to confirm the patency of the lacrimal system. These procedures are included in the DCR code.

An RVW value of 8.81 suggested to reflect these differences in pre, intra, and post-service work time, effort, stress and skill. This is moderately higher than the C-L procedure (21385) {RVW 8.56} and substantially lower than the secondary revision of orbitocraniofacial reconstruction (21275) {RVW 10.50}. However, the AAO accepts the multi-disciplinary work group recommendation of 8.56.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Codes: 92018 & 92019¹ Global Period: ~~XXX~~ Current RVW: 1.51 & 1.31 Recommended RVW: 2.50 & 2.17

CPT Descriptor: Ophthalmological examination and evaluation, under general anesthesia, with or without manipulation of globe for passive range of motion or other manipulation to facilitate diagnostic examination; complete

Source and Summary of Comment to HCFA on this service:

CMD Comments:²

Recommended RVUs: 0.88

Reference Codes: 57400, 57410, 45910, 99215

Rationale for Change: This is usually done for evaluation of a child. The ophthalmologist may need to bring additional equipment, but this procedure is no more difficult and the risk is no more greater than 57400, 57410 and is certainly not the same as 99215 (the most difficult return office visit patient).

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 3 month old male is referred by his pediatrician for cloudy corneas. Epiphora has been present for 3-4 weeks. The right cornea is enlarged and edematous with no fundus view. The left eye is mildly edematous. There are no apparent Descemet breaks. Retinoscopy cannot be accomplished. Discomfort and photophobia prevent meaningful measurement of intraocular pressure in the office."

Description of Pre-Service Work: The chart and physical examination are reviewed. The pre-operative outpatient history and physical form is completed. The patient is briefly examined in the pre-op area to check for infection. The surgical plan is reviewed. The patients family is counseled in the pre-op area prior to induction. Topical medications are ordered and applied

¹ 92019 represents a limited ophthalmological examination under anesthesia. This means that a detailed examination of an affected portion of the eye is performed. These are typically performed in children who are monitoring intraocular pressure associated with glaucoma surgery or following corneal transplant, or patients who cannot be examined in the office. The medical decisionmaking, like that of 92018, is typically of high complexity.

The RVW for 92019 currently is 1.31. Based upon the detailed examination and a level of medical decisionmaking similar to that found for 92018, we believe that the value of this procedure should be increased rather than decreased. A similar percentage increase would raise the value of this procedure to 2.16 RVWs. This would be less than 99244, an office consultation, or 99205, an office outpatient visit. However, because of the high complexity of the medical decisionmaking, and the detailed examination, it should be more than that for 99215. We therefore believe that it is logical to extrapolate to 2.17 RVWs.

² For 92019, CMD's cited same reference procedures and recommended a reduction from 1.31 to 0.38 and the only rationale was "This is reduced by the same percentage as 92018." Note: the CMD's math was incorrect.

Description of Intra-Service Work: A standardized form is used to record data during the EUA. Intraocular pressure is measured immediately upon adequate anesthesia prior to intubation. Other parts are completed after intubation. Horizontal corneal diameter is measured with a caliper. The slit lamp is used to examine the anterior segment if available. The operative microscope is used with a gonioscopy lens to examine the chamber angle. Direct and indirect ophthalmoscopy are used to examine the posterior segment. If possible a careful scleral depression examination of the entire retina is performed. Refraction is performed using the retinoscope and trial lens bar if the view permits. The data obtained is analyzed and a decision made to awaken the patient or to proceed with other procedures based on the EUA data and the desires of the family obtained pre-operatively.

Description of Post-Service Work: The data obtained is presented and interpreted for family. Appropriate follow up or additional procedure arrangements are made. Letters are dictated to other physicians.

6)	99223	Initial hospital care	2.57

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

See below.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Code 92018 is a complete ophthalmological examination of a single system of the body, the eye, albeit under anesthesia. The intra-service work is complicated by the fact that most of these patients are children, most have severe ocular problems, usually cataract, aphakia, corneal scarring, graft or transplant, or glaucoma. These complicated problems create substantial medical decisionmaking. Pre-service work is far more than would be for an outpatient examination in that the patient has to be seen and the parents consented for a procedure under general anesthesia. As with any pediatric patient, this requires extensive discussion and explanation with the patients parents.

Survey data reveal a total service time of 75 minutes f the physician in attendance with the family. Appropriate reference procedures might include 99205 with 60 minutes face-to-face time with 2.28 RVWs and 99223, an in-patient evaluation and management service with 70 minutes and 2.57 RVWs. Survey data by the American Academy of Ophthalmology found a median RVW of 2.5. We, therefore, propose 2.5 RVW as a value for this undervalued procedure. This procedure cannot be reported if another intervention is performed.

With respect to the comparison of this procedure with dilation of vagina (57400) or pelvic examination (57410) under anesthesia, there is no comparison. This ophthalmological procedure carries a comprehensive ophthalmological examination rather than a portion of the gynecological examination. Further, this is often performed on a pediatric patient which makes the examination more complicated. There is substantial medical decisionmaking associated with the typical diagnosis of glaucoma, cataract and aphakia that far exceed the medical decisionmaking found with the reference procedures noted by the carrier medical directors. Harvard data for those two codes revealed 40 minutes total time for 57400 and 33 minutes for 57410. We believe that, based upon the high complexity of the medical decisionmaking as well as the comprehensive examination required for 92018, the work exceeds that required for the work of 99215. In addition, there is pre-service examination including history that must be part of this examination which is not accounted for in 99215.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 92020 Global Period: XXX Current RVW: 0.37 Recommended RVW: 0.37

CPT Descriptor: Gonioscopy with medical diagnostic evaluation (separate procedure)

Source and Summary of Comment to HCFA on this service:

CMD Comments:

Recommended RVUs: 0.16

Reference Codes: 92081, 71020

Rationale for Change: CPT describes this as a separate procedure, but Medicare allows this to be billed with an eye exam. This is a unilateral exam compared to 92081 which is a bilateral exam. The interpretation is not as difficult and 71020.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 53 year old hyperopic female with a family history of angle closure glaucoma was previously noted to have an intraocular pressure of 22. She returns for further diagnostic evaluation by gonioscopy."

Description of Pre-Service Work: The previous record and charts are reviewed.

Description of Intra-Service Work: The history of the patient's ocular hypertension is explained to her along with the familial incidence of angle closure glaucoma. The need to assess the status of the angle to determine whether it was open or closed is explained to the patient and the implications of that. She's also explained the nature of the procedure. At this point a drop of topical anesthetic is placed in the inferior cul-de-sac of each eye. The patient's head is placed in the slit lamp and the patient's given a fixation target to look at. The gonioscopy lens is carefully placed on the cornea. It is slowly rotated 360 degrees so that the angle can be viewed in its entirety. The lens is rotated on the patient's eye and the patient is occasionally asked to look in different directions of gaze with the lens on the eye to better facilitate the view of the angle. When the angle structures are narrow, compression is performed with the lens against the cornea to diagnostically push the iris away from the angle to see if they can be opened manually. The gonioscopy lens is then removed from the eye. The Goniosol solution is irrigated from the patient's eye and the patient is given topical drops for the subsequent irritation. The patient is then explained the nature of the findings and the symptoms of angle closure.

Description of Post-Service Work: Arrangement is made to see the patient in follow up in six months. Because of the familial nature of the problem, telephone calls are usually fielded within the first six months on the implications of angle closure in the patient.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	92081	Visual field (examination(s))	0.36
2)	71020	Chest x-ray	0.22
3)	99213	Office/outpatient visit, est	0.55

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The time involved in providing 92020 is almost the same as 99213 with .55 RVW. Unlike 71020 with .22 RVW gonioscopy is an active, dynamic procedure with direct manipulation of the diagnostic lens on the patient's cornea under topical anesthesia which has the not uncommon iatrogenic risk of corneal abrasion. This involves more time and interpretation than the interpretation of a (71020). The interpretation of the viewed results during gonioscopy is as difficult as 71020 but requires direct patient to physician contact unlike 71020.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The time of 92020 is similar to 99213 with .55 RVW. The AAO feels that the CMDs' didn't understand the nature of gonioscopy or they would never have compared it to 71020. The interpretation involved in 92020 is a dynamic, real-time evaluation more analogous to fluoroscopic exams of the chest e.g. 71023 with .38 RVW. For these reasons the AAO recommends retention of the current value of .38 rather than the survey mean RVW of .55-.60 or the CMD recommendation of .16.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 92060 Global Period: XXX Current RVW: 0.50 Recommended RVW: 0.69

CPT Descriptor: Sensorimotor examination with multiple measurements of ocular deviation and medical diagnostic evaluation (eg, restrictive or paretic muscle with diplopia) (separate procedure)

Source and Summary of Comment to HCFA on this service:

CMD Comments:

Recommended RVUs: 0.23

Reference Codes: 94060, 72050

Rationale for Change: This is no different than what a neurologist does for the examination of any paretic muscle. CPT definition is that this is a separate procedure and Medicare pays for it along with any other exam.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 45 year old woman with known thyroid ophthalmopathy and diplopia has been stable for 18 months. She has vertical and horizontal separation of images unless she tilts her head back in an extreme manner. She is now seeking help for her diplopia."

Description of Pre-Service Work: Referral letters and medical records are reviewed.

Description of Intra-Service Work: The nature of the examination is explained to the patient including the possible risk of discomfort or conjunctival hemorrhage associated with forced duction and forced generation testing which may be necessary to perform. Verbal permission is obtained for these maneuvers. Ocular alignment is evaluated in nine positions of gaze for distance and in at least primary position and downgaze for near. Measurements of ocular alignment may be made either by alternate cover testing or a subjective sensory method (sometimes both will be required). Torsion is measured subjectively (double maddox rod test) and objectively (observation of fundus torsion). If the patient is unable to move an eye fully into a position of gaze, forced duction testing is completed (the eye is locally anesthetized and forceps are used to grasp the conjunctiva and attempt to rotate the eye into the position of gaze in question). If forced ductions do not suggest that restriction explains the problem, force generation testing is performed (the eye is grasped and the patient attempts to rotate the eye into the gaze position in question against the examiners resistance to assess the ability to generate force in that direction).

Description of Post-Service Work: The significance of the data obtained is discussed with the patient. Letters are dictated to other physicians involved in the patients care. Follow up visits, surgical dates, or other testing scheduled. The sensorimotor exam may be performed without forced duction or forced generation testing in some patients.

SURVEY DATA:Specialty: American Academy of OphthalmologySample Size: 103 Response Rate (%): 27 Median RVW: 1.4025th Percentile RVW: 1.05 75th Percentile RVW: 1.50 Low: 0.50 High: 2.00Median Pre-Service Time: 5 Median Intra-Service Time: 3025th Percentile Intra-Svc Time: 19.25 75th Percentile Intra-Svc Time: 40 Low: 10 High: 60

3)	99203	Office/Outpatient Visit New	1.14
4)	99214	Office/Outpatient Visit Established	0.94

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

See below.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Code 92060 is an extensive examination of the motor and sensory aspects of ocular motility. The descriptor requires multiple recorded measurements as well as physician supervision and interpretation of results (see new code descriptor). This is a separate stand-alone procedure. The Carrier Medical Directors suggested that this was no different than what a neurologist does for the examination of any paretic muscle. It would be an unusual neurologist who would perform such a lengthy procedure as part of their evaluation (see Attachment). Most neurologists and ophthalmologists might obtain such a set of measurements through consultation with an ocular motor specialist. While a neurologist may use a red glass and determine that the images deviate, 92060 is an actual quantified measurement in nine diagnostic positions of gaze both at distance and near, as a minimum. Further there is an evaluation of sensory function as part of 92060 that is not included in a neurological examination or the basic ocular motility, part of the ophthalmological exam codes, 92002 et. seq.

This sensorimotor examination has a median intra-service time of 30 minutes. There is also a pre-service and post-service time spent in preparation of patient materials and reports. The time of service is equivalent to that of 99203, (a level 3 E&M service) or slightly less than a Level 4 return visit (99214). The service, however, bears no relationship in scope and far exceeds the work found in 94060, the evaluation of simple wheezing, or that found in an x-ray of the neck and spine. The Harvard intra-service time for 94060 was 7 minutes and no time data was collected on 70250. There is far more physician face-to-face time with 92060.

The survey of the American Academy of Ophthalmology members found a 30 minute intra-service time and a median RVW recommended of 1.40. We believe that the appropriate RVW is at the least 1.14, matching that of CPT code 99203. We believe the Carrier Medical Directors made an error in their interpretation of the scope of this service and therefore greatly underestimated its value. Further, we believe this is a grossly undervalued code based on earlier extrapolated data where it may have not been considered a separate procedure.

The AAO upon further analysis during the presentation to the multi-disciplinary work group felt that the vignette was more complicated than the typical patient to whom the service was provided. This service was more commonly performed in the pediatric age group with strabismus. For this reason we agree with the multi-disciplinary work group rationale of decreasing the AAO RVW of 1.14 to 0.69. This represents the work involved in the original Harvard study.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 92275 Global Period: XXX Current RVW: 1.01 Recommended RVW: 1.01

CPT Descriptor: Electroretinography, with medical diagnostic evaluation

Source and Summary of Comment to HCFA on this service:

CMD Comments:

Recommended RVUs: 0.40

Reference Codes: 99280

Rationale for Change: This test is very similar to visual evoked response except that the recording instrument is placed on the cornea.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "The patient is an 18 year old Caucasian male with a history of night blindness for three years. An initial eye exam showed some abnormal pigment in the peripheral retina."

Description of Pre-Service Work: The referring letters are reviewed as well as copies of previous eye exams.

Description of Intra-Service Work: The patient's vision is measured at distance and near. The pupils are maximally dilated. The patient is dark-adapted for 30-45 minutes. Electroretinograms are then performed.

Topical anesthesia is applied, a reference electrode is placed on the forehead, and a contact lens electrode is placed on the anesthetized eye. The patient is seated in front of a full-field light source. Patients are tested with single flashes of blue, red, and white light, then white flickering light and then single flashes of white light on a white background. The test is performed on one eye and then the other. If the electroretinographic (ERG) responses are not detectable with conventional recording, computer-averaged ERG responses are obtained.

Electroretinograms are read taking into account the refractive error, pupil size, clarity of the ocular media, and age. Recordings are measured and checked both for their size and temporal aspects (time between stimulus and peak responses). The recordings are interpreted against standard norms and correlated with other functional tests, including the visual field, dark adaptation, and color vision tests.

Description of Post-Service Work: A clinical interpretation of the ERG findings is generated and recorded in the patient's medical record.

CPT Code: 92275

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	92280	Special eye evaluation	0.35
2)	99203	Office/Outpatient Visit, new	1.14

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 92275 (ERGs) have very little in common with the reference service cited by the CMDs - 99280 (VERs). The pre, intra and post service time and intensity of 92275 are much similar to those of a level 3 new patient visit (99203). Code 99280 is an electrophysiologic test, however, it merely tests the conduction pathway from the eye to the brain and takes approximately a third of the time necessary to perform 92275. There is no Harvard data relating to the time involved to 99280; however, the Harvard data for 92275 compares very closely with the median intra-service time of 38 minutes obtained in this current survey. With regard to the time and effort involved, we feel very strongly that 92275 is more closely related to 99203.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Both the Harvard study and the current survey have concluded that this test requires approximately 34 to 38 minutes as the median intra-service time. There is approximately a 10-minute pre-service time required in addition. In contrast to the 99280, which does not require the patient to be dilated and does not require multiple tests, the 92275 requires that a patient have eye drops instilled and that the patient be dilated. Then the patient must spend approximately 30 minutes to dark adapt and then the patient is tested under various conditions. First the patient is tested in a dark adapted state with a blue light, a red light and a bright white flash. Each of these are done separately and independently, and results in a separate and independent tracing. Then the patient is allowed to light adapt for approximately 10 minutes and then another bright light flash is obtained, again, independently from the previous tracings. Then a flicker, white, a flicker red and a flicker blue are performed in the light adapted state, again each of which is a separate tracing in a separate test.

As far as the interpretation, the VER results in a single tracing. The ERG consists of multiple independent tracings each of which need to be evaluated separately and independently reported by the physician. The readings must take into account the patient's refractive error, pupil size, clarity of the ocular media and age; all of which require review of the patient's medical record or performing the test to obtain the measure. These recordings are interpreted against standard norms and correlated with other functional tests. The accuracy of such report is extremely important and may markedly affect the patient's outlook with regard to visual prognosis and genetic counselling.

Therefore, we suggest that the 1995 RVW of 1.01 be maintained.

Dear Doctor Bagley:

As you know, a key issue addressed in the May 3, 1996 Notice of Proposed Rulemaking on the five-year review of the RBRVS was whether and how the increases in the relative work values for evaluation and management services should be incorporated into the work values for global services. In the November 22, 1996 Final Rule containing the 1997 Medicare RBRVS, the Health Care Financing Administration (HCFA) summarized the comment on this issue that was submitted by the American Medical Association/Specialty Society RVS Update Committee (RUC), responded to this comment, and indicated its final decision on this issue, as follows:

Comment: The RUC recommended that we include the relationship between evaluation and management services and global surgical services in a future review of work RVUs so that this aspect of the Medicare physician fee schedule can be updated in 1998. We plan to revisit this issue next year.

Response: We look forward to a RUC recommendation on this issue. We hope to receive the recommendation next year to assist us as we further examine whether a change in the work RVUs for global surgical services is warranted because of the increases in the RVUs for evaluation and management services.

Final Decision: With the exception of the services described above that have an MMM global period, at present we are making no adjustments to the work RVUs assigned to global surgical services as a result of the increases in the RVUs of evaluation and management services. However, we will reevaluate this policy next year. The extra year will allow time for us to closely examine our data and for the RUC to present us with additional data and a recommendation on this issue. Any further changes that we may make will be effective in 1998.

The RUC considered this issue at its September 1996 meeting and adopted the following recommendations from the Research Subcommittee:

1. There is an evaluation and management component of the global service package.
2. The subcommittee accepts Dr. Dunn's report for informational purposes.
3. The subcommittee recommends that the RUC adopt the principle that evaluation and management services have equivalent work value across all physician specialties.
4. The subcommittee recommends that the RUC request that HCFA adjust global service relative values to incorporate changes in the evaluation and management service relative values as published in the May 3, 1996 *Federal Register*.

The question of *how* the changes in the evaluation and management service relative values should be incorporated in the global service relative values was further addressed at the February 1997 RUC meeting. The attached report was prepared by Daniel Dunn, PhD, to reflect the RUC recommendations adopted at this meeting. Dr. Dunn's analysis is, therefore, based on the following assumptions:

- The increases in global service work should be calculated on a code-by-code basis for each code with a global period of 010 or 090.
- The work of postoperative hospital visits has increased in a similar way to that of other subsequent hospital visit services. The full 1997 increase in evaluation and management work for these CPT codes (99231, 99232, 99233, and 99238) should be incorporated into global service work relative values.
- The work of postoperative office visits has also increased. However, due to the nature of these services when performed following surgery, the full 1997 increase in evaluation and management service work for these CPT codes (99211, 99212, 99213, 99214, and 99215) should not be incorporated into global surgical work. Instead, the intrawork per unit time for postoperative office visits should be increased by 10% (consistent with HCFA's assumption for the evaluation and management codes), and pre- and postservice work for these services, as a percentage of intrawork, should be increased by 12% (rather than the 25% increase HCFA applied to the office visits).
- The most recent and accurate data should be used to determine the number and level of hospital and office visits included in global service work. Dr. Dunn's analysis includes data from both the Harvard and the RUC surveys. HCFA may wish to adjust these data if more recent data on numbers of visits or lengths of stay are available from other sources.

The RUC is unanimous in recommending that HCFA adopt these assumptions and the approach reflected in the attached analysis. The RUC understands, however, that the actual relative values in Dr. Dunn's report may be adjusted based on other data that may be available to HCFA. The attached report concludes that the recommended increases to global surgical evaluation and management work would result in payment increases of approximately 2% for many surgical subspecialties, while minimally impacting other specialties.

The overall Medicare Payment Schedule budgetary impact is estimated to be 0.6%. As you know, the other changes in physician work relative values resulting from the five-year review were made budget neutral for Medicare through use of a separate adjustment factor. This meant that the budget neutrality adjustment was not necessarily passed on to other public and private payers using the RBRVS. Likewise, the budgetary impact of this five-year review change should be addressed through use of a separate budget neutrality adjustment factor.

Thank you for your prompt consideration of this RUC recommendation. We understand that HCFA intends to address this issue in its Spring Proposed Rule and that there will be an additional opportunity for comment following publication of this Notice.

Sincerely,

Grant V. Rodkey, MD

*Incorporating the 1997 Changes in Work RVUs for E&M Services into the Work RVUs
for Global Surgery -- Report to the RUC*

Daniel L. Dunn, PhD, Integrated Healthcare Information Services, Inc.
February 28, 1997

Executive Summary

One area of debate surrounding the changes in work relative values units (RVUs) for the 1997 Medicare Fee Schedule (MFS) focused on the impact of increases in work RVUs for evaluation and management (E&M) services on global surgical work. In addition to the procedure itself, a global surgery includes the related pre- and post-operative visits a surgeon performs within a defined period of time. With the exception of selected maternity care and delivery services, HCFA decided to make no adjustment to global surgical work RVUs for the 1997 MFS as a result of increases in E&M service RVUs. Instead, HCFA proposed to undertake a more thorough review of this issue and reevaluate their decision for 1998, including obtaining further input from the American Medical Association/Specialty Society Relative Value Update Committee (RUC) and collecting additional data on the E&M components of global surgeries.

The study described in this report addressed four key components of the reevaluation of global surgical work. First, the study assembled a detailed database on the number and level of post-operative hospital and office visits for a large number of global surgeries. These data include the most recent estimates of these visits from the RUC and data from the Harvard RBRVS study. Second, the study proposed a methodology for incorporating changes in E&M service work into global surgical work. Third, new values for total work were computed for almost all global surgeries in the 1997 MFS. Finally, the impacts of changes in global surgical work on Medicare payments to individual services, categories of service and specialties were computed.

The study findings show that increases in global surgical work from incorporating changes in E&M service work would not be large, but they would be systematic. Typical changes in work RVUs for global surgeries range from 4 to 7 percent, depending on the global package definition for a service ('010' or '090'). Since practice and malpractice expense RVUs are held constant, the changes in total RVUs are approximately half of those found for work and average 2 to 4 percent. These changes are similar across different categories of surgical services.

A simulation of the effect of changes in global surgical work on Medicare specialty payments found again that the impacts are not large, but they are systematic. For surgical specialties, the overall impact on Medicare payments is an increase of 1.8 percent, while the impact on payments to all other specialties is negligible. The overall MFS budgetary impact of these changes is 0.6 percent.

*Incorporating the 1997 Changes in Work RVUs for E&M Services into the
Work RVUs for Global Surgery*

Report to the AMA/Specialty Society Relative Value Update Committee (RUC)

Daniel L. Dunn, PhD, Integrated Healthcare Information Services, Inc.
February 28, 1997

On November 22, 1996 the Health Care Financing Administration (HCFA) issued a rule finalizing the 1997 Medicare Fee Schedule (MFS) for physician and professional services. Included in this rule were revisions to the work relative value units (RVUs) for a large number of services resulting from the legislatively mandated 5-Year Review of the MFS. Among these revisions were systematic changes in the work values for evaluation and management (E&M) services. The work RVUs for the majority of the 98 visit and consultation services were increased -- by an average of 17 percent.

One area of debate surrounding the 1997 MFS focused on the impact of the changes in work RVUs for E&M services on global surgical work. In addition to the procedure itself, a global surgery includes the related pre- and post-operative activities a surgeon typically performs within a defined period of time. As specified in the Harvard RBRVS study which served as the basis for the initial MFS work values, these activities include patient hospital and office visits before and after the procedure. Work RVUs for these E&M services were incorporated explicitly by Harvard into the work RVUs for a global surgery.

With the exception of selected maternity care and delivery services, HCFA decided to make no adjustments for 1997 to global surgical work as a result of the increases in RVUs for E&M services. Instead, HCFA proposed to undertake a more thorough review of this issue and reevaluate their decision for 1998, including obtaining further input from the American Medical Association/Specialty Society Relative Value Update Committee (RUC) and collecting additional data on the E&M components of global surgical work.

Two important issues in the evaluation of global surgical work concern the availability of data on the post-operative hospital and office visits involved in performing a surgery and the potential impacts of incorporating changes in E&M service work into the work for individual global surgeries. The study described in this report addresses these two issues.

This study involved three major steps: (1) using data from the RUC and the Harvard RBRVS study, a database was constructed describing the post-operative hospital and office visits involved in performing a large number of global surgeries; (2) for each surgery, the impact of incorporating the 1997 changes in work RVUs for follow-up hospital and office visits was computed; and (3) estimates of the impacts of these changes on Medicare payments to individual services, categories of service, and specialties were computed.

I. Construction of a Post-Operative Visit Database for Global Surgical Services

Data required and data sources. In order to compute the impacts of incorporating the changes in E&M service work into global surgical work, data on the number, duration, and level of post-operative hospital and office visits for individual global surgeries were required. In particular, for each global surgery, an estimate of the number of these visits by E&M CPT code was needed. For follow-up visits in the hospital, this involved obtaining estimates of the number of these visits qualifying as CPT code 99231, 99232, 99233, and 99238. For office visits, the number of 99211, 99212, 99213, 99214, and 99215 visits were required. In this way, the increases in work RVUs for E&M service codes could be translated directly into increases in work for the post-operative visits making up each global surgery.

As specified by the RUC, this study focused only on those post-operative visits within the global period defined by the MFS. For hospital visits, these included ICU and other visits after the day of the procedure.

Study data were obtained from two sources: (1) information collected by the RUC and (2) information from the Harvard RBRVS study, as assembled by Dunn and Latimer for their investigation of practice expenses for the MFS¹. The RUC data were collected previously as part of the annual MFS update process for revisions to CPT and as part of the RUC's evaluation of services included in the 5-Year Review. This information included (in varying levels of completeness) the number, duration and level of post-operative hospital and office visits for more than 700 global surgeries. The Harvard data were collected during the various phases of the Harvard RBRVS Study and included the number and duration of post-operative visits for more than 3,000 global surgeries. A hierarchy was established by the RUC for the use of the Harvard and RUC data for this study. Where RUC data were available, these estimates were employed. For the remaining estimates, Harvard data, if available were used.

Determining the number of visits and average visit duration. For most global surgeries, the study data included the number and average duration of post-operative hospital and office visits. The Harvard data included these estimates for all global surgeries in that database. For the RUC data, these estimates were also available for most services. However, for some services, average length of hospital stay, rather than the number of hospital visits, was recorded. For other RUC services, the number of hospital or office visits was recorded without average visit duration. For the RUC data, where necessary, the number of post-operative hospital visits was estimated as the average length of stay recorded by the RUC minus 1.0 (since these visits represent visits after the day of the procedure). Further, where the RUC average visit duration was missing it was estimated using the average duration from the Harvard data for the same or a similar procedure.

¹ D.L. Dunn and E.Latimer, "Derivation of Relative Values for Practice Expenses Using Extant Data: Final Report to the Health Care Financing Administration," Harvard University, April, 1996.

Assigning visits to CPT levels. Post-operative visits were assigned to CPT levels using the visit durations recorded in the study database. This duration represents visit intra-service time and can be compared with the typical times included in the CPT guidelines for each E&M CPT code. For example, CPT states that for code 99231 the physician typically spends 15 minutes at the bedside and on the patient's hospital floor. Therefore, post-operative hospital visits in the database with a duration of 15 minutes or less were assigned a CPT code of 99231. Visits with average durations of approximately 25 and 35 minutes were similarly assigned to CPT codes 99232 and 99233, respectively. Where typical durations did not exactly fit into the CPT guidelines for a hospital visit, combinations of CPT codes were used. For example, three post-operative hospital visits totaling 55 minutes in intra-service time (average duration 18.3 minutes) were assigned two 99231s and one 99232.

CPT guidelines were also used to assign CPT codes to post-operative ICU visits. According to CPT, ICU visits with a total duration less than 30 minutes are to be coded using subsequent hospital visit CPT codes 99232 or 99233. ICU visits were assigned to these two codes using this approach. Although recorded separately in the study database, post-operative ICU visits were then treated in the same way as all other 99232 and 99233 visits for the analysis.

Finally, since a post-operative hospital stay involves a patient discharge service, for each global surgery involving a hospital stay, one of the hospital visits recorded was assigned to CPT code 99238 -- "Hospital discharge day management, 30 minutes or less."

For a large number of office visits, the RUC data included surveyed estimates of the number of visits, by CPT level -- i.e., the number of 99211's, 99212's, 99213's, etc.. Where available, these were employed. For all other services, visit levels were assigned using average visit duration and a method similar to that described above for hospital visits.

Non-global services. By definition, non-global surgical and other services exclude post-operative office and hospital visits. No visits were assigned to these services.

Database Summary. Table 1 summarizes the source of data for global surgical post-operative hospital and office visits for the study. As shown, the Harvard study is the source of data for the majority of the 4,901 services included in the study database (global and non-global surgeries). For a small number of services in the 1997 MFS, neither RUC or Harvard were available. These services are identified in Appendix Table A-1 and were excluded from further study analyses.

Table 2 provides examples of the study data for selected global surgeries.

II. Incorporating the 1997 Increases in E&M Service Work into Global Surgical Work.

The method used to incorporate E&M work changes into global surgical work was straightforward. First, the amount of increase in work RVUs for 1997 for each relevant E&M CPT code was computed. Second, for each global surgery, the number of visits assigned to each E&M code was multiplied by this increase. Third, the results were added across E&M codes to compute the increase in work for the global surgery. Finally, this additional work was added to the 1997 MFS total work for the global surgery to compute the "new" work RVUs.

Increases in Work RVUs for E&M Services. As reported in the May 3, 1996 Federal Register, HCFA increased the work RVUs for E&M services for 1997 based on two separate assumptions:

- the intra work per unit of time for E&M services, in general, was undervalued relative to other services and should be increased, by approximately 10 percent and
- pre and post E&M service work has changed since the original work RVUs were developed -- pre and post work as a percentage of intra work should be increased by 25 percent.

The RUC evaluated HCFA's assumptions in increasing E&M service work and assessed their relevance for changes in global surgical work. The RUC made the following recommendations:

- The work of post-operative hospital visits has changed in a similar way to that of other subsequent hospital visit services. The full 1997 increase in E&M service work for these CPT codes (99231, 99232, 99233, 99238) should be incorporated into global surgical work.
- The work of post-operative office visits has also increased. However, due to the nature of these services when performed following surgery, the full 1997 increase in E&M service work for these CPT codes (99211, 99212, 99213, 99214, 99215) should not be incorporated into global surgical work. Instead, the intra-service work per unit of time for post-operative office visits should be increased by 10 percent and pre and post service work for these services, as a percentage of intra work, should be increased by 12 percent.

The change in E&M service work for post-operative hospital visits is straightforward to compute and is simply the difference between the 1997 and 1996 work values for these services. To measure changes in the work of post-operative office visit services using the RUC's assumptions, three estimates are required for each relevant E&M CPT code:

- (a) intra-service time (IST);
- (b) 1997 intra-service work per unit time (IWPUT97); and
- (c) pre- and post-service work as a percentage of intra-service work -- assuming a 12 percent increase over 1996 levels (PPW_IW12%).

To compute new work values for post-operative office visits, the following formula is then used:

$$\text{New Office Visit Total Work} = (\text{IST} * \text{IWPUT97}) * (1 + \text{PPW_IW12}\%).$$

The difference between this new work value and the 1996 work RVUs provides the change in post-operative office visit work to be used in this study.

Table 3 shows the change in work RVUs for each of the E&M CPT codes relevant for the study and the assumptions used in their computation.

Computing New Work Values for Global Surgical Services. An example may help to further illustrate the method used to compute global surgical work:

For global surgical CPT Code XXX:

Total Work, 1997 MFS	15.00
Post-op Hospital Visits	2 X 99231; 1X 99232; 1X 99238
Post-op Office Visits	3 X 99213
1997 increase in work for 99231	0.09 per visit
1997 increase in work for 99232	0.18 per visit
1997 increase in work for 99238	0.22 per visit
1997 assumed increase in work for 99213	0.10 per visit

New work for Code XXX is:

$$15.88 = 15.00 + (2 \text{ X } .09) + (1 \text{ X } .18) + (1 \text{ X } .22) + (3 \text{ X } .10).$$

RVUs from the 1997 MFS and the visit data from the study database were used for all of these computations.

III. Impacts of Changes in Global Surgical Work RVUs on Individual Services, Categories of Service, and Specialty Payments.

Individual services. Table 4 provides examples of RVUs for the 1997 MFS and values computed using the method described above. As shown, the increases in RVUs for most individual surgeries are not large, but they are systematic.

Table 5 summarizes the changes in global surgical work, by global package. Global surgeries fall into the '010' (10 day post-op period), '090' (90-day post-op period) and 'MMM' (maternity and delivery) global package categories. Only the results for services with physician work are included in this summary. The change in work is expressed as the ratio of new work to 1997 MFS work.

As expected, no change is shown for non-global services. As described above, these services include no post-operative office and hospital visits after the day of the procedure.

Further, little change is shown for 'MMM' services. Since HCFA incorporated changes in E&M service work into almost all of these maternity services for the 1997 MFS, no additional work was added to these amounts.

For the '010' globals, the mean and median increases are 4 and 3 percent, respectively. Almost all increases for these services are between 1 and 9 percent (as expressed by the values for the 5th and 95th percentiles).

The '090' globals show a somewhat larger change. The mean and median increases for these services are 7 percent. Most increases are between 3 and 13 percent.

Table 6 presents the same type of results as in Table 5, except for total rather than work RVUs. Since practice and malpractice expense RVUs are held constant, the changes in total RVUs are approximately half of those shown for work and average 2 to 4 percent.

Tables 7 and 8 present changes in work and total RVUs, respectively, by category of service, as defined by ranges of CPT codes. As shown, the mean and median changes are quite similar across surgical categories of service.

Table 9 provides a summary of a simulation of the impacts on Medicare specialty payments. These impacts were measured using a national summary of 1995 Medicare Part B claims, by CPT, modifier, and specialty. All services in the 1997 MFS (with non-zero total RVUs) with available data were included in the simulation. These include all non-global services and global surgeries for which both study data and 1995 Part B data were available. Study data on global visits were unavailable for approximately 280 of the global surgeries defined in the 1997 MFS. Part B data were unavailable for a small number of global surgeries which are new CPT codes since 1995.

As shown in Table 9, the impacts on Medicare specialty payments are not large but are again systematic, depending on specialty-type. For surgical specialties, the impacts vary from 0.7 percent for otolaryngology to 2.6 percent for cardiac surgery, general surgery, plastic surgery, surgical oncology, thoracic surgery and vascular surgery. The impacts on payments to all other specialties are negligible, with the exception of dermatology which would experience a 0.6 percent increase in payments.

Table 9 also summarizes the total impacts on Medicare payments, by specialty-type (see "Sub-Total" amounts). For surgical specialties as a group, payments would increase by 1.8 percent. No measurable impact is observed for all other specialty-types.

Finally, the effect on total Medicare payments to all specialties would also be small. The overall MFS budgetary impact is estimated to be 0.6 percent. (See the "Total" amounts at the bottom of Table 9.) If the changes in work were implemented in a budget neutral fashion, all specialty impacts reported here would be adjusted downward by 0.6 percent.

IV. Comments

This study addressed four key components of the reevaluation of including 1997 changes in E&M work into global surgical work. First, the study assembled a detailed database on the number and level of post-operative hospital and office visits for a large number of global surgeries. These data include the most recent estimates from the RUC and data from the Harvard RBRVS study. Second, the study proposed a methodology for incorporating changes in E&M service work into global surgical work. Third, new values for total work were computed for almost all global surgeries in the 1997 MFS. Finally, the impacts of changes in global surgical work on Medicare payments to individual services, categories of service and specialties were computed. The data, methods and results of this study provide a useful approach for reassessing the incorporation of the new E&M service work values into global surgical work for the 1998 MFS.

Some comments regarding the data and methods used in the study are warranted. First, data on post-operative visits were unavailable for approximately 280 global surgeries in the 1997 MFS (see Appendix Table A-1.). A strategy is required for deriving estimates for these services.

Second, visit estimates from two different sources were combined to produce the study database. Although these data represent the most current estimates available for the purposes of the study, the methods used to collect data for the two sources and the time period during which they were collected may vary. As a result, some inconsistencies and rank order anomalies for selected services may exist. Further review of the study database and the new work values produced using these data may be warranted for selected services.

Finally, the study employed a number of assumptions in constructing estimates of the number and level of post-operative visits and incorporating changes in work for these visits into global surgical work. Although these assumptions are supported by extensive data and research on physician's work and the MFS, they may warrant further discussion and review before their use in constructing final work RVUs for the 1998 MFS.

Table 1. Source of Study Data on Post-Operative Visits

Source	Hospital Visits		Office Visits	
	Number	Percent	Number	Percent
RUC	664	13.5	719	14.7
Harvard	2972	60.6	2913	59.4
Non-Global	994	20.3	994	20.3
Missing	271	5.5	275	5.6
Total	4901	100	4901	100

Note: the study database is restricted to global and non-global surgical services included in the MFS.

Note: ICU32 and ICU33 indicate post-operative ICU visits. According to CPT, ICU visits with a total duration less than 30 minutes are to be coded using subsequent hospital visit CPT codes 99232 or 99233. These visits were coded using this approach when constructing the study data. ICU32 and ICU33 indicate ICU visits coded as 99232 and 99233, respectively.

Table 3. Work Relative Value Units for Established Patient Office and Subsequent Hospital Visits
Assumptions used to Increase RVUs for Global Surgical Visits

CPT	Intra Time	1996 Work RVUs	1997 Intra-Service Work Per Unit Time	Study Assumption for Pre-Post Work as a % of Intra Work	Study 1997 Work RVUs	Difference from 1996 Work RVUs
99211	5	0.17	0.031	39.3%	0.17	0.00
99212	10	0.38	0.031	39.3	0.43	0.05
99213	15	0.55	0.031	39.3	0.65	0.10
99214	25	0.94	0.031	39.3	1.08	0.14
99215	40	1.51	0.031	39.3	1.73	0.22
99231	15	0.51	-	-	0.64	0.13
99232	25	0.88	-	-	1.06	0.18
99233	35	1.25	-	-	1.51	0.26
99238	30	1.06	-	-	1.28	0.22

Note: Work RVUs for each global surgery were adjusted based on the number of post-operative visits assigned to each E&M CPT code and the incremental increase in the work RVUs for that code (amount in column: Difference from 1996 Work RVUs). The full 1997 increase in work RVUs for subsequent hospital visits was used in the study. For post-operative office visits, 1996 intra-service work per unit of time was increased by 10 percent (from 0.028 to 0.031) and 1996 pre- and post-service work as a percent of intra-service work was increased by 12 percent (from 35.1 to 39.3). No change in work RVUs was employed for CPT code 99211.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Imaging

The RUC considered public comments submitted by the American College of Radiology (ACR), the American College of Cardiology (ACC), and the Society of Cardiovascular and Interventional Radiology (SCVIR). In a public comment letter submitted to HCFA, ACR cited nine radiology codes that it believes are misvalued. The ACR noted that a multi-disciplinary approach was used to identify these nine procedures. Specifically, radiologists in each specialty of radiology were asked to review the procedures they perform and determine whether or not the RVU reflected the procedure. The selected procedures were then reviewed by a multi-disciplinary panel of radiologists and the ACR Commission on Economics. These nine procedures were determined to have an adequate case for reconsideration of their relative values.

Most of the codes reviewed in this section were reviewed because of comments from the CMDs. The CMDs stated that; "a large number of the suggested revisions are based upon a general overvaluation of plain film studies relative to more complex radiographic studies, ultrasound studies, and the most common CT and MRI studies. The relevant reference procedures are 70450 (revised upward), 70551, 70420, 74280, 74400, 75650, 76700, and 78605. The values listed below largely reflect differences in time and need for supervision, as well as slightly less intensity in interpretation. These services also appear markedly overvalued relative to the Evaluation and Management services which involve broader cognitive skills and much more time. For example, the equivalence of a level 3, 15 minute established patient visit to reading 2.5 chest x-rays (70210) has no face validity. A visit may involve the review of two or three radiographic studies as less than half of the work of the visit." The CMDs also presented the following three basic rationales for the changes that they suggested. 1) Simple planar contrast S&I procedures, such as aortography, have been decreased to equate the readings of these films with that of noncontrast films of the same parts. The presence of contrast medium makes it easier to read. The technical difficulties of injection are included in the associated surgical procedure. 2) MRIs should be revalued to reflect the fact that the work involved in interpreting MRIs is sufficiently comparable across various anatomic locations, that the same values should be assigned regardless of location. The interpretation of an MRI with contrast should not have a higher RVU since the work of interpreting may be easier rather than more difficult. 3) CT scans should be revalued to reflect the fact that the work involved in interpreting CT scans is sufficiently comparable across various anatomic locations, that the same values should be assigned regardless of location. The interpretation of an CT scan with contrast should not have a higher RVU since the work of interpreting may be easier rather than more difficult.

ACR Public Comments

As part of their report outlining the relative value recommendations to the RUC, ACR prepared an comprehensive rebuttal of the CMD comments. Specifically, ACR noted that: 1) The current physician work relative values (RVUs) for plain film studies accurately reflect the work involved in the procedure and, therefore, should be maintained. Contrary to the CMDs comments, plain film studies require physician involvement and, ACR survey data supports that the interpretation time

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it added to the five-year review.

of plain film studies requires more time than the evaluation and management code 99212 to which those studies were most often compared. 2) The current RVUs for contrast material should be retained since they reflect physician work. When contrast is used, physicians must interpret more images which increases their work. 3) Time data and intensity analysis prepared by ACR confirm the fact that the current values for CT scans reflect the physician work involved. The ACR also noted that the number of images varies by the site that is being imaged during a CT scan, which rebuts the CMD notion that the RVUs for CT scan be the same regardless of site. 4) ACR reported that the presence of contrast material increases the physician work of an MRI since the physician can visualize more anatomy.

The complete ACR report is attached. The RUC believes that extensive compelling evidence was presented by the specialty society and supports maintaining the current RVUs. These are presented in Table 1.

Table 2 contains the recommendations that were made by the specialty societies that were not covered by the ACR report. The RUC agreed with all of the recommended changes based on evidence that was presented by the ACR. For the codes that were presented by SCVIR, although the RUC agreed that the services were undervalued, they did not believe that SCVIR presented compelling evidence for the increases that they requested. Instead, the RUC adopted an increased RVU, but lower than the specialty recommended.

TABLE 2

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
70336	Magnetic image jaw joint	0.95	1.48	The ACR believes that all of the joint MRI codes are undervalued.	ACR noted that MRI has new technology designed specifically for joint MRI, involving pulse sequences. The new pulse sequences add to the number of images the must be interpreted. ACR recommended an RVU of 1.48 which also represented their survey median. The RUC determined that compelling evidence was presented that this procedure is undervalued and recommends an increased RVU.	1
73221	Magnetic image, joint of arm	0.95	1.48			1
73721	Magnetic image, joint of leg	0.95	1.48			1
74330	X-ray,bile/pancreas endoscopy	0.70	0.90	The ACR believes that this code is undervalued.	ACR reported that during this procedure the radiologist must study and interpret images of both the biliary and pancreatic ducts. ACR also noted that therapeutic biliary procedures have been developed in the past five years, significantly increasing the time associated with this procedure. The RUC determined that compelling evidence was presented that this procedure is undervalued and recommends an increased RVU.	1

Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
75630	X-ray aorta, leg arteries	1.31	1.79	In their comments to HCFA, the specialty society noted that they believe that this code is undervalued relative to the amount of physician required to provide this service.	<p>SCVIR reported that it did not conduct a survey on this procedure. SCVIR did note this code describes the radiological supervision and interpretation of aortography and bilateral arteriograms. The radiologic S&I service described by this procedure involves the evaluation of the aorta and lower extremity arteries to the distal circulation. SCVIR noted that the S&I of an abdominal aortogram (75625) and S&I of for bilateral extremity arteriography (75716) are valued at 1.14 and 1.31 RVUs respectively. Therefore, since 75630[Aortography, abdominal plus bilateral iliofemoral lower extremity, catheter, by serialography, radiological supervision and interpretation] involves the work of both 75625 and 75716, SCVIR believes that the work of 75630 can be derived by adding the RVUs of 75625 and 75716 for an RVU of 2.45.</p> <p>The RUC agreed with the specialty society that this procedure is undervalued. However, they noted that although 75630 is a combination of 75625 and 75716, there is probably some overlap of the two procedures when they are part of 75630. Therefore, the RUC suggested a new RVU of 1.79 which is equal to: [75625] 1.14+(0.50)[75716] 1.31=1.79 or 1.14+(0.50)1.31=1.79</p>	4

Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
76090	Mammogram, one breast	0.25	0.58	In their comments to HCFA, the specialty society noted that they believe that these codes are undervalued relative to the amount of physician required to provide these services.	In their presentation, the ACR noted that mammography has undergone the most significant change in the amount of physician work required during the past five years. They reported that at the time the work value was established for this procedure, there was no distinction between screening and diagnostic mammography. Patients now come in for diagnostic mammography for a problem detected in their breast, these patients are either referred by another physician or self referred. Also the patient usually expects to have some indication of her diagnosis before she leaves the mammography suite. ACR identified three major changes in mammography that have affected physician work. 1) In addition to the basic mammography views, supplemental views are also needed to evaluate significant abnormalities found on the basic views. 2) Radiologists face increased documentation requirements. 3) In the past, it was not standard for the radiologist to interact with the patient, this is expected today. The ACR recommended an RVU of 0.58 for 76090 and 0.69 for 76091 which represent the survey medians for both procedures. The RUC determined that compelling evidence was presented to increase the RVUs of these procedures.	1
76091	Mammogram, both breasts	0.41	0.69			1
76825	Echo exam of fetal heart	0.98	1.67	In their comments to HCFA, the specialty society noted that they believe that this code is undervalued relative to the amount of physician required to provide this service.	The ACC reported that the requirements for mental effort and clinical judgement in performing a fetal echocardiogram are significant. This exam requires a comprehensive knowledge of the forms of congenital heart disease and their morphology and associated malformations; and a complete understanding of fetal cardiocirculatory physiology. The physician must obtain enough views with enough visual clarity to avoid a false-positive diagnosis (with the possibility of termination of pregnancy) or a false negative result with the risk of missing a major cardiovascular malformation. The ACC recommended a value of 1.67 for this procedure. The RUC determined that compelling evidence was presented to warrant an increased RVU for this procedure.	1

Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
78070	Parathyroid nuclear imaging	0.51	0.82	The CMDs noted that 78070[Parathyroid imaging] is the equivalent of doing the two reference codes 78010[Thyroid imaging; only] and 78011[Thyroid imaging; with vascular flow] (since two different isotopes are used, two different procedures with similar pre-, intra-, and post-times are required).	<p>The ACR reported that the technique of this procedure has changed in the last five years. Physicians now, must spot smaller images in the parathyroid that are localized by radioisotopes, while at the same time correlating this information with other clinical data either from a previous surgery or some other imaging exam. The ACR felt that the work involved in this procedure is most similar to the key reference service 78018(0.95) - Thyroid carcinoma metastases; whole body. The ACR recommended an RVU of 0.95 for this procedure which is also the survey median.</p> <p>The RUC felt that this service was more comparable to 78015(.67) - thyroid carcinoma metastases imaging; limited area (eg, neck and chest only). The ACR noted that 78070 is a 2 phase study and noted that it is more difficult to spot parathyroid radioisotope images than thyroid metastases. The ACR did note however that 78070 is similar to 78016(0.82) - thyroid carcinoma metastases imaging; with additional studies (eg, urinary recovery). Based on this information, the RUC determined that 0.82 would be a more appropriate RVU for 78070.</p>	4

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
78195	Lymph system imaging	0.70	1.20	In their comments to HCFA, the specialty society noted that they believe that this code is undervalued relative to the amount of physician work required to provide this service.	<p>Although the ACR survey results indicate that nearly two-thirds of the respondents felt that the work involved in this procedure has not changed in the last five years, there ACR noted that there have been some changes to this procedure which have some bearing on the amount of physician work required to perform this test. Specifically, the procedure has benefitted from the development of small improved colloids, better imaging techniques, and the use of hand-held detectors to precisely localize sentinel nodes. Based on the results of this procedure, the patient can be spared extensive lymph node resection, treatment of lymphedema may be improved because of improved localization of lymph nodes at risk for tumor spread. Based on their survey median, the ACR recommended an RVU of 1.47 for this procedure. Nuclear physicians also provide this service and they reported that this service is performed infrequently and has become increasingly complex. The nuclear physicians also noted that because so few physicians provide this service, a survey would not be reflective of the physicians that provide this service.</p> <p>The RUC agreed that the work of this procedure has changed. However, given that it is performed infrequently by a handful of physicians, the RUC recommends an RVU of 1.20 for this procedure which reflects the 25th percentile of the survey.</p>	4
78805	Abcess imaging, ltd area	0.73	0.73	At the request of ACR, HCFA made technical corrections to CPT codes 78805 and 78806. ACR requests that these codes be removed from the five year review.	The RUC recommends maintaining the current values for these codes.	2
78806	Abcess imaging, whole body	0.73	0.73			2

A Report on the Physician Work Relative Values for Radiology

A Presentation to the RUC Five Year Review
Workgroup on Radiology

Friday and Saturday
July 28th and 29th, 1995

Executive Summary

- The ACR's RVS was accepted by the Health Care Financing Administration (HCFA) without changes to the relative values.

The current relative values for radiology were derived by the ACR using a process similar to that used by Hsiao in the RBRVS. However, the radiology RVS offers several improvements over the RBRVS. First the radiology RVS relied on both data and physician expertise to determine the relative relationships, while the RBRVS relied almost exclusively on data. Furthermore, nearly 1200 radiologists participated in the radiology RVS, compared to 100 in the RBRVS.

- Time data (and other data collected by the ACR RVS survey) are used to substantiate the current RVWs for radiology.

Contained in the document are charts depicting procedural time estimates from the ACR RVS survey. This data, plus time estimates from Hsiao and the AMA's RVS Update Committee, are used to demonstrate that the existing relative values reflect the current practice of radiology and are in proper relationship to other medical services.

- The current physician work relative values (RVWs) for plain film studies accurately reflect the work involved in the procedure and, therefore, should be maintained.

Contrary to the carrier medical directors' (CMDs) comments, plain film studies require physician involvement. Moreover, there is more work associated with interpreting a study than reviewing one. With respect to other radiologic modalities (e.g. MRI, CT, ultrasound), plain film studies exhibit the proper relationship. These points are well supported by time data from the ACR, an intensity (RVW/time) analysis, and comparisons to evaluation and management services. The CMDs, on the other hand, offer no objective foundation for their recommendations.

- The current RVWs for contrast studies should be retained since they reflect the work involved.

The CMDs recommendations for contrast studies fail to take into account the nature of the procedure and the physician work required. Radiologists are integrally involved in performing contrast studies. A radiologist must ensure

the quality of the study and interpret both the resulting fluoroscopic and plain film images. In addition, the radiologist may interpret other pertinent studies as part of the study. Contrast material adds to the clinical information to be interpreted; thus making the procedure harder, not easier to interpret (as the CMDs believe).

- Objective data and analyses support the current RVWs for MRI.

The existing RVWs for MRI are well supported by time data, an intensity analysis, and comparison to evaluation and management services. The same cannot be said about the CMD-proposed values since no objective data supporting their recommendations were presented. Furthermore, the number of images per study speaks against the CMDs' contention that the RVW for MRI should be the same regardless of anatomic site imaged.

- Unlike the CMDs' RVW recommendations, the existing RVWs for CT are well supported by data and analysis.

Time data and an intensity analysis confirm the fact that the current values reflect the work involved in CT. Furthermore, the number of images per CT study rebuts the CMDs' notion that the RVWs for CT should be the same regardless of site imaged. Consequently, the current RVWs for CT should be maintained.

- The presence of contrast material adds to the physician work for MRI and CT studies.

Contrast material allows more anatomy to be visualized. In addition, there is the work of injecting the contrast (usually done by the radiologist) which is included in the basic study. Finally, there is the risk associated with contrast reactions.

- The current RVWs for radiology were based on extensive survey data and statistical analyses. Current data and analyses substantiate these values. The CMDs' proposed values, which are not based on objective sources, should be discarded in favor of the current values.

Introduction:

The purpose of this report is to respond to the comments from the carrier medical directors regarding radiology. In doing so, we will present both qualitative and quantitative arguments based on data collected by the RUC, Hsiao, and the ACR.

The report is divided into seven major sections:

- I. Development of the Radiology Relative Value Scale (RVS)
- II. Physician Work Relative Values (RVWs) for Plain Film Studies
- III. Physician Work Relative Values (RVWs) for Simple Planar Contrast Studies
- IV. Physician Work Relative Values (RVWs) for MRI Studies
- V. Physician Work Relative Values (RVWs) for CT Studies
- VI. Physician Work Relative Values (RVWs) for MRI and CT with Contrast
- VII. Conclusion
- VIII. Technical Discussion
- IX. Attachments and Appendix

I. Development of the Radiology Relative Value Scale (RVS)

The Omnibus Budget Reconciliation Act of 1987 (OBRA87) provided for relative value scales for radiology, as well as anesthesiology and pathology. Accordingly, the ACR set out to develop an RVS for radiology.

To estimate physician work, the ACR defined "complexity" as overall time plus Hsiao's components of physician effort or intensity (technical skill and physical effort, mental effort and judgment, quality control and assurance, and iatrogenic risk). Complexity was measured using magnitude estimation. The benchmark procedure used for the radiology RVS was the intravenous pyelogram or IVP (CPT code 74400). The IVP was chosen because it is commonly done and well understood by radiologists. The magnitude estimation survey covered 45 procedures (with vignettes) and went out to over 2,000 radiologists, of which 1,173 responded.

In addition to magnitude estimation, a charge survey was mailed to all of the nearly 3,000 radiology groups in the United States; responses were received from nearly 1,800. The practices provided 1987 professional and global charges for each procedure and the frequency with which each procedure was performed.

A consensus panel process assigned relative values to procedures. A steering committee, in which rested final authority regarding relative values, was in charge of the process. Reporting to the steering committee were seven specialized panels. The panels represented each of the major radiologic subspecialties: general radiology, interventional radiology, computerized tomography (CT) and magnetic resonance (MR), nuclear medicine, radiation oncology, and ultrasound. (The seventh panel dealt with technical component costs.) Composition of the panels ranged from four to eleven members; each was chaired by a steering committee member, and all steering committee members served on a panel. To provide broad experience and perspective, the members of both the steering committee and specialty panels came from academic and nonacademic practices, all geographic regions in the United States, many radiologic subspecialty organizations, and all subspecialties. In total, nearly forty radiologists and radiation oncologists participated in the process, each spending approximately 200 hours.

For the professional RVS (which includes the physician work relative value), the nearly 800 radiologic procedures were divided among the six subspecialty panels according to the subspecialty that performed the procedure most frequently. Each panel received magnitude estimate-derived relative values and charge-based relative values for procedures

within its purview. (For examples of the worksheets used by the panels, see Attachment 1.) Each of the relative values had the IVP as its base. (The IVP also happens to be one of the CMDs' reference procedures for radiology.) Although the magnitude estimation survey was limited to 45 procedures, they represented the broad spectrum of radiologic practice. Related procedures were grouped around these 45 "primary" procedures in families or "trees." This process was expanded until every radiology procedure was classified as either "primary," "secondary," or "tertiary."

The subspecialty panels began their work by first setting the relationships between the primary procedures. Their instructions were to compare the various sources of relative value information (e.g. charge, magnitude estimation) and apply their professional expertise and experience. "Outlier" procedures were identified through a comparison of the charge-based RVS to magnitude estimates. To help ensure objectivity, the subspecialty panels had to justify their recommendations in writing. Once each subspecialty panel completed its work on its primary procedures, it turned to the secondary and tertiary procedures in a similar manner. A computer spreadsheet program automatically re-calibrated the intra-family RVS on the basis of any change.

The work of the subspecialty panels was aggregated and presented to the steering committee, with each panel chair defending its values. With the intra-specialty values established by the subspecialty panels, the steering committee concentrated its efforts on the interspecialty relationships. The steering committee adhered to the same process and documentation requirements that the subspecialty panels followed.

The professional component relative values, when finalized, contained substantial changes. Relative to charge-based relative values, average (unweighted) changes by subspecialty were as follows: general radiology, -2%; interventional radiology, +7%; CT and MR, -12%; ultrasound, -2%; nuclear medicine, -16%; and radiation oncology, +6%.

In the context of the carrier medical directors' evaluation of radiology procedures, there are some important points that need to be emphasized regarding the radiology RVS:

- **The ACR's RVS was accepted by the Health Care Financing Administration (HCFA) without changes to the relative values.**
- **The radiology RVS was calculated to be budget neutral less three percent (per HCFA). Therefore, there was no incentive to "game" the procedures.**

- The Physician Payment Review Commission (PPRC) estimated that radiology was “overvalued” relative to the rest of medicine by 21 percent. However, because of the way the radiology RVS was incorporated into the RBRVS by Hsiao (through the use of “equivalent” links rather than “identical” links), total reductions scheduled to occur through 1996 are 35 percent – 14 percent more than the PPRC’s original estimate.
- The radiology RVS offers several improvements over the RBRVS . The radiology RVS relied on both data and physician expertise to determine the relative relationships. The RBRVS relied almost exclusively on data. The radiology RVS was derived using more data. Nearly 1,200 radiologists participated in the ACR’s magnitude estimation surveys, compared to 100 physicians (not all of whom were diagnostic radiologists) under the RBRVS.

II. Physician Work Relative Values (RVWs) for Plain Film Studies

Description of Procedure

Plain film radiography requires physician involvement. Prior to the study, the radiologist reviews the patient’s history. In addition, the radiologist is responsible for ensuring that the appropriate views are obtained and that the films are of diagnostic quality. Once satisfied that the films are to specifications, the radiologist then will interpret them. Also, when appropriate, the radiologist will review other pertinent exams in order to correlate the findings with the current exam and with the clinical findings. This information will be conveyed to the referring physician in a written report and verbally, if appropriate.

Relativity

Plain film studies currently exhibit the proper relationship with respect to other radiology procedures (e.g. MR, CT, ultrasound, and interventional radiology). When developing the relative values for plain film studies, the IVP (code 74400) was the benchmark, and six of the eight CMD reference codes (70551, 74020, 74280, 74400, 76700, 76805) served as primary or anchoring codes. It was the responsibility of the steering committee to ensure that the modalities were in proper relationship to one another. (See Section I.) Since the steering committee was comprised of radiologists, and radiologists perform the vast majority of radiology procedures, there was no other group better suited to accomplish such a task.

Within plain film studies, there are differences in physician work. Such variables as the number of views and the complexity of the anatomy

impact upon the RVW. Currently, the RVWs for plain film radiography range from 0.10 (single view teeth) to 0.45 (two views of the entire spine). Flat reductions, such as those proposed, would disrupt these relationships.

Other sections in medicine are affected by the CMDs' recommendations for plain film radiography. Many codes in the pathology section (80000 series of CPT) and the medicine section (90000 series of CPT) were judged to require less physician work than a two view chest x-ray (code 71020). (For example, see the CMDs' recommendations for codes 94240, 94350, 94720, and 94725.) However, in comparison to these procedures, the chest x-ray has the same or lower RVW.

Time and Intensity

Table 1 presents the time estimates for plain film radiography. The two sources of time data are from ACR and Hsiao. Both sources relied on surveys to collect time estimates. In the ACR survey, between 443 to 910 radiologists provided time estimates for the codes listed. Radiologists participated in the Hsiao studies, although far fewer than those in the ACR survey. The CMDs, on the other hand, offer no time data to support their conclusions.

Table 1: Time Estimates for Plain Film Radiography

CPT Code	Description	Mean Time in Minutes	Median Time in Minutes	Source(s) of Time Data
70150	X-ray exam, facial bones	5	5	Hsiao IV
70220	X-ray exam, sinuses	5	5	ACR
70260	X-ray exam, skull	8.05	8.6	ACR, Hsiao I
71010	X-ray exam, chest one view	5	5	Hsiao IV
71020	X-ray exam, chest two views	6.18	5.7	ACR, Hsiao I & IV
71111	X-ray exam, ribs and chest	9.5	9.5	Hsiao I
72020	X-ray exam, spine	3	3	Hsiao IV
72110	X-ray exam, lumbar spine	8.56	9.8	ACR, Hsiao I
73110	X-ray exam, wrist	6.88	5	ACR
73140	X-ray exam, finger(s)	6.70	3	ACR
73510	X-ray exam, hip	8	8	Hsiao I
73562	X-ray exam, knee	7.39	5	ACR
73610	X-ray exam, ankle	5.7	5.7	Hsiao I
73620	X-ray exam, foot	3	3	Hsiao I
74020	X-ray exam, abdomen	7.28	7.15	ACR, Hsiao I & IV

Using the time data for radiology procedures from Table 1 and the 1995 RVWs, RVW/time ratios (i.e. intensity) were calculated for 15 plain film studies from the CMDs' list. (For more information, refer to the Technical Discussion.) This analysis revealed no outliers. Therefore, plain film procedures have RVWs that are consistent with respect to procedure intensity.

Time Comparison to E/M Services

Comparison to E/M services on basis of time offers a further validation of the current values for plain film studies. One E/M service that offers a meaningful comparison to plain film studies is code 99211 (a level one office visit). This procedure is noteworthy in this discussion because its RVW (0.17) is comparable to that of plain film studies (range 0.10 to 0.45, most between 0.16 to 0.28). Furthermore, code 99211 is for the evaluation and management of an established patient that may not require the presence of a physician. The presenting problems are minimal and five minutes are spent performing the service. Examples are:

- Office visit with 12 year old male, established patient, for cursory check of hematoma one day after venipuncture.
- Office visit with 31 year old female, established patient, for return to work certificate.
- Office visit for a 42 year old established patient to read tuberculin test.
- Office visit for a 14 year old female, established patient, to re-dress an abrasion.
- Office visit for a 45 year old female, established patient, for a blood pressure check.
- Office visit for a 23 year old established patient for instruction in use of a peak flow meter.

Plain film studies, on the other hand, require the involvement of a physician. Only a physician can interpret a study and from that render a report. Therefore, a serious flaw would be created in the RBRVS if physician services are valued at or below services not requiring physician work.

Another comparison to E/M services that serves to support the current values for plain film studies involves code 99213 (a level 3 visit). As purported by the CMDs, code 99213 involves 15 minutes of physician time. A radiologist spends a total of 6 minutes for a two view chest x-ray (code 71020). Comparing the two times results in a ratio of 0.40 (6/15). It

follows then -- if code 71020 is properly valued, its RVW should be 40 percent of that for code 99213. Multiplying the RVW (0.55) for code 99213 by 0.40 results in an RVW of 0.22 which happens to be the current RVW for code 71020. This same approach was applied to the other plain film studies identified by the CMDs, and the results support the current RVWs. (See the Technical Discussion for the analysis.)

In conclusion, the comparison of plain film studies to E/M services on the basis of time alone supports the current RVWs rather than the CMDs' recommendations. The CMDs' proposed values fare much worse with respect to E/M services.

Need for Supervision

As mentioned in the discussion on the development of the radiology RVS, quality control and assurance was one of the components of physician effort or intensity measured by the ACR. The need for supervision would fall within this component of physician work.

The ACR defined quality control and assurance as:

- The time and expense needed to acquire and maintain technical skills for the physician and staff.
- The effort needed to make the procedure technically excellent and keep the radiation dosage as low as reasonably possible.
- The effort needed to monitor and train staff and to document monitoring activities.
- Any other activities that assure the quality of the professional services or consultation.

Since quality control and assurance effort is a component of physician work, it follows then that the two should be positively related. In other words, procedures requiring less quality control and assurance effort should have lower RVWs than procedures requiring more effort. One would expect to find plain film radiography at the lower end of the quality control spectrum and procedures such as MRI or interventional radiology towards the other end. This hypothesis was tested by comparing the current RVWs to the quality assurance score from the radiology RVS. This analysis showed a positive relationship between quality assurance and RVW. In addition, the quality assurance-RVW relationship was uniform within the modalities. (For more information, see the Technical Discussion.) Consequently, the current relative values with respect to quality control and assurance effort are appropriate.

Broader Cognitive Skills

A general radiology residency is of five years duration (many residents take an extra fellowship year or two in a subspecialty). During those five years, a radiologist must acquire cognitive knowledge (85% of the time is spent in interpreting images versus performing procedures) that crosses virtually the entire spectrum of medicine.

Reviewing vs. Interpreting Radiologic Examinations

The physician work expended by a radiologist when interpreting a radiographic study is different and considerably greater than simply reviewing a set of films. It is inappropriate to equate the two.

There are many facets in a radiological interpretation or consultation. (See Attachment 2 for more details.) Prior to interpreting the films, the radiologist must evaluate the quality of the films. The radiologist is responsible for ensuring that the films convey the needed information on which to render a diagnosis. In addition, the radiologist is required to report all findings from the films, not just those in the area of interest. In order to reach a conclusion, previous films and/or reports may be consulted, when appropriate. Finally, the results are communicated to the referring physician, if appropriate, and placed in a written report.

In addition, the "review" of studies does not expose the "reviewing" physician to the malpractice risk assumed by the radiologist who interprets the exam and puts his/her name on the report. Among the most common causes for malpractice claims against radiologists are alleged misdiagnoses of breast cancer on mammograms, lung cancer on chest films, and missed fractures on bone films.

Given the attention to detail a radiologist commits to plain film studies, it would be incorrect to believe that several studies could be "reviewed" during most visits to address a problem of "low to moderate severity."

III. Physician Work Relative Values (RVWs) for Simple Planar Contrast Studies

Description of Procedure

The inability of plain film studies to image soft tissues (e.g. cartilage) can be overcome by introducing a contrast material. Contrast agents block the passage of x-rays through the area of interest. For contrast procedures (e.g. arthrograms, myelograms), the contrast material must be injected into the desired location.

Radiologists are integrally involved in performing contrast studies. Prior to performing a myelogram for example, the radiologist reviews the patient's history (particularly for contraindications) and ensures that the patient is ready to undergo the study (e.g. proper hydration, vital signs and neurologic level within acceptable limits). Once the radiologist is satisfied that the patient is properly prepared, contrast is injected by the radiologist or another physician (separately reported). Afterwards, under fluoroscopic monitoring, the radiologist positions the patient and obtains appropriate fluoroscopic spot films. The resulting films and fluoroscope images are interpreted by the radiologist. In addition to images from the study, other pertinent studies may be reviewed in order to reach a diagnosis. Post-procedure care involves adequate hydration and observation for possible signs of contrast reactions. If a contrast reaction occurs, the radiologist must be ready to manage the complication. The results of the study are prepared in a final report and communicated to the referring physician, if appropriate. Although the physician work described above is for a myelogram, the other contrast studies (e.g., arthrograms) share the many of the same characteristics.

Relativity

The argument for lowering the RVWs for contrast studies (e.g. arthrograms, myelograms) to the level of plain film studies fails to take into account how and why these procedures are performed.

Contrast material adds to the clinical information to be interpreted, thus making contrast procedures harder, not easier, to interpret. Contrast material is injected to visualize anatomy not evident on plain films (e.g., joint cartilage, spinal cord and its membranes, bronchial tree, and ductal system). Consequently, the structures visualized by the injected contrast material must be evaluated.

Preliminary films can be obtained prior to the injection of contrast material and, if so, are included in the work of interpreting a contrast study. Alternatively, previous studies could be used, if available. In either case, the plain film studies must be reviewed. In total, there are two to three times more films to interpret in these examinations than for plain film studies. For example, a shoulder exam may consist of only two views, while an arthrogram of the same site requires at least six views. As another example, at least eight views comprise a lumbar myelogram, while a lumbosacral spine x-ray may have only two.

Finally, the fact that fluoroscopy is an integral part of the work of these procedures (only exception is dacrocystography) was overlooked. Fluoroscopy is not separately billed in addition to the primary code.

One of the accepted ways of developing a relative value for a comprehensive service is through a building-block approach in which the relative values for component codes are added together to form the new value. Following this approach, the current RVWs for contrast studies are well justified. For example, it was reported earlier that a shoulder arthrogram requires fluoroscopy and six views. The RVW for a shoulder arthrogram then would equal –

Code 73030 (Two view shoulder), RVW = 0.18

Code 76000 (Fluoroscopy), RVW = 0.17

Code 73040 (Shoulder arthrogram), $RVW = 3*(0.18) + (0.17) = 0.71$

[A shoulder arthrogram currently has an RVW of 0.54.]

Similarly, for a lumbar myelogram –

Code 72100 (Two view lumbosacral spine), RVW = 0.22

Code 76000 (Fluoroscopy), RVW = 0.17

Code 72265 (Lumbar myelogram), $RVW = 4*(0.22) + (0.17) = 1.05$

[A lumbar myelogram currently has an RVW of 0.83.]

Although the sum of the component procedure results in an RVW that is higher than the current value, these procedures are not considered to be undervalued. These examples fail to take into account the economy of scale associated with interpreting multiple films during the same session.

V. Physician Work Relative Values (RVWs) for MRI Studies

Description of Procedure

Magnetic resonance imaging (MRI) creates images by placing the body in a magnetic field and using radio waves to obtain responses from the body. The magnetic field aligns the atoms in the patient's body in a polar formation. When a radio signal is introduced, the protons spinning in the hydrogen atoms in the body are momentarily knocked off course. When the signal is turned off and the protons return to their orbit, the atoms emit a faint radio signal. These signals are translated into dots on the computer screen. These dots, in turn, form images to be interpreted.

The radiologist is involved in all aspects of an MRI study. Before the procedure is performed, the radiologist discusses the examination with the patient and instructs the technologist as to the appropriate pulse sequences. The patient then is placed into the scanner and imaged. The radiologist ensures that the examination provides images with suitable contrast characteristics, spatial resolution, signal-to-noise ratio, and section geometry relevant to the specific clinical indication. Afterwards,

the radiologist interprets the images and determines if additional pulse sequences or studies are needed. The results are conveyed to the referring physician through a written report dictated by the radiologist. The radiologist may also contact the referring physician with the results, if appropriate.

Time

Table 2 presents the time estimates for MRI. The two sources of time data are from ACR and the RUC. Both sources used extensive surveys to estimate time. For the three MRI procedures in the ACR survey (70551, 71550, 72148), between 379 and 749 radiologists provided time estimates. Physicians from multiple specialties (radiology, interventional radiology, cardiology and neurology) participated in the RUC survey, with at least sixty radiologists providing time estimates. Conversely, the CMDs offer no time data to support their recommendations.

Table 2: Time Estimates for MRI

CPT Code	Description	Mean Time in Minutes	Median Time in Minutes	Source(s) of Time Data
70541	MR angiography, head	Not Reported	40	RUC
70551	MRI, brain	49.41	20	ACR
71550	MRI, chest	54.55	30	ACR
71555	MR angiography, head	Not Reported	40	RUC
72148	MRI, l-spine, w/o contrst	50.35	20	ACR
72159	MR angiography, spine	Not Reported	45	RUC
72198	MR angiography, pelvis	Not Reported	35	RUC
73225	MR angiography, up. ext.	Not Reported	40	RUC
73725	MR angiography, lw. ext.	Not Reported	40	RUC
74185	MR angiography, abdomen	Not Reported	40	RUC
75552	MRI, myocardium	Not Reported	90	RUC
75554	MRI, myocardium	Not Reported	150	RUC
75555	MRI, cardiac function	Not Reported	100	RUC

Relativity

Physician work for MRI is related (but not entirely) to the number of images to interpret. Any argument that assigns the same the RVWs regardless of site ignores the fact that large sites require more slices (resulting in more images) than do small sites. In addition, some sites (such as joints) require more elaborate imaging sequences (e.g. narrower slices, multiple projections, reconstruction) in order to properly image the area than do other sites. Consequently, in either case, this leads to more

images to interpret, thus more physician time. (See Attachment 3 for the number of images associated with MR.)

As for plain film studies, a comparison to E/M services supports the current values for MRI. It is estimated that the total physician time for code 72148 (MRI, lumbar spine, without contrast) is 35 minutes. Based on times estimates alone, code 72148 should have an RVW between that for code 99235 (30 minutes; RVW = 1.47) and 99215 (40 minutes; RVW = 1.51). With an RVW of 1.48, code 72148 is properly valued with respect to the two E & M codes cited. Again, this comparison (like that for code 71020) underscores the point that MRI services are properly valued.

V. Physician Work Relative Values (RVW) for CT Studies

Description of Procedure

Computerized axial tomography (CAT or CT) employs x-rays to image the body in cross-sectional "slices." A computer is used to reconstruct the images into a three-dimensional image.

The radiologist is an integral part of a CT study. Before the procedure is performed, the radiologist discusses the examination with the patient and instructs the technologist regarding the area to be imaged and the width of the "slices." The patient is then placed into the scanner and imaged. The radiologist ensures that the examination provides images that are suitable and relevant to the specific clinical indication. Afterwards, the radiologist interprets the images and determines if additional slices or other studies are needed. The results are conveyed to the referring physician through a written report dictated by the radiologist. The radiologist may also contact the referring physician with the results, if appropriate.

Time

Table 3 presents the time estimates for CT. The two sources of time data are from ACR and Hsiao. Both sources relied on surveys to collect time estimates. In the ACR survey, between 424 to 885 radiologists provided time estimates for the codes listed. Radiologists participated in the Hsiao studies, although far fewer than those in the ACR survey. (Hsiao's time estimate for code 70450 is suspected to be in error; 10 minutes is more appropriate.) The CMDs, on the other hand, offer no time data to support their conclusions.

Table 3: Time Estimates for CT

CPT Code	Description	Mean Time in Minutes	Median Time in Minutes	Source(s) of Time Data
70450	CT, brain, w/o contrast	6	6	Hsiao IV
70470	CT, brain, w/o & w/contrast	33.06	20	ACR
71250	CT, chest, w/o contrast	34.50	20	ACR
72131	CT, l-spine w/o contrast	34.60	20	ACR
74160	CT, abdomen, w/o contrast	24.5	22.4	ACR, Hsiao I & IV

Relativity

Similar to MRI, physician work for CT is related to the number of images to interpret. Therefore, assigning the same RVW to CT procedures without considering the work involved would create a flaw in the RBRVS. As in MRI, the number of images depends on the body site and the complexity of the anatomy under consideration. That is, large or complicated sites require more work than small or less demanding areas. (See Attachment 4 for the number of images associated with CT.)

VI. Physician Work Relative Values (RVWs) for MRI and CT Studies With Contrast

Description of Procedure

For CT and MRI, as for contrast studies, the presence of contrast material visualizes additional anatomy, both normal and abnormal, for the radiologist to evaluate, thus increasing the work. In addition, the pattern and intensity of the vascular enhancement of structures, both normal and abnormal, by the injected contrast material must be evaluated and the appropriate significance attached.

Also, there is work and risk associated with the injection of contrast material. In most facilities, contrast material is injected by the radiologist and not separately reported.

Contrast media reactions are not rare. Most side effects are mild to moderate and occur in 5-12% of patients. Serious reactions occur in one or two per 1,000 examinations (ACR Manual on Iodinated Contrast Media, 1991).

Deaths are reported in one per 40,000 (Ansel G. Adverse reaction to contrast agents: scope of the problem. *Invest. Radiology* 1970; 5: 374-379) to one per 170,000 examinations (Katayama H., et al. Adverse reactions to ionic and non-ionic contrast media. *Radiology* 1990; 175: 621-628).

Selective usage of low osmolar contrast material has lowered the incidence of minor to moderate reactions. However, there is no evidence that its use has decreased severe reactions significantly, nor has it decreased the number of deaths. Besides the risk of systemic reactions to contrast material, there is the additional risk of extravasation leading to significant local tissue damage.

It is the responsibility of the radiologist to appropriately treat contrast reactions. The radiologist usually treats minor or moderate reactions without assistance. The radiologist may or may not be assisted by other physicians in the treatment of severe reactions. In any case, the radiologist does not submit additional codes for the work involved in treating these contrast reactions.

Relativity

Comparable reference codes for the injection part of the study have RVWs ranging from 0.18 (code 36000) to 0.95 (code 36005).

VII. Conclusion

The current relative values for radiology were based on extensive survey data and statistical analyses. Moreover, there is no evidence to suggest that the physician work values have changed since originally valued. This data and others from the RUC and Hsiao have confirmed that, for the procedures identified by the CMDs, the current physician work relative values are appropriate.

VIII. Technical Discussion

Intensity Analysis

Physician work is defined as the product of the time it takes a physician to perform a procedure and the intensity of the physician's effort. [In other words, $Work = Time \times Intensity$.] Intensity, therefore, can be expressed as the ratio of work per unit of time. [Mathematically, $Intensity = Work/Time$.]

This concept can be used to test for the presence of misvalued procedures. A procedure that has a high intensity estimate but low RVW could be

undervalued. Conversely, a low intensity score and a high RVW could be indicative of an overvalued procedure. However, it would be difficult, if not meaningless, to look at individual intensity estimates without a frame of reference. The aggregate intensity for a specialty or family of codes provides such a basis for comparison.

Using the three main sources of time data for radiology procedures (RUC, Hsiao, and ACR), RVW/time ratios (i.e. intensity) were calculated for nearly eighty radiology procedures. (See Attachment 5.) In addition, the same analysis was conducted for the plain film studies, CT, and MRI procedures identified by the CMDs. (See Attachment 6, 7, 8 respectively.) All but one of the radiology codes analyzed had ratios within two standard deviations around the mean (or in other words, a 95% confidence interval). The sole outlier, code 70450, is one because of an erroneous time estimate from Hsiao. If Hsiao's time estimate for code 70450 is replaced with one more appropriate (10 minutes), then this procedure would no longer be an outlier. (It is ironic that this procedure has a proposed RVW-increase.) Therefore, this analysis shows that radiology procedures, even those identified by the CMDs, have RVWs that are consistent with respect to intensity.

Time

Many of the arguments presented in this report for retaining the current RVWs are based on time data collected in 1988. It is important, therefore, to ascertain whether or not the 1988 data are relevant today. First of all, there is no evidence of changes in procedure time for radiology in the peer-review literature. Besides ACR time, the report's analyses include time data from Hsiao and the RUC.

Another source of current time data for radiology is from the survey conducted as part of the Five-Year Review of the RBRVS. The survey questionnaire requests for time estimates for each reference code used to estimate the RVW for the code being rated. The time estimates for the reference codes, once aggregated, can be used to test the 1988 time estimates.

Since the survey questionnaire does not restrict the respondent to specific reference codes, the resulting database consists of a wide range of services – many of which have only a few respondents. Therefore, in order to control for variability, only codes which had a minimum of ten respondents were used in the analysis. In addition, the analysis utilizes median time estimates. As the following below table shows, three procedures were surveyed both in 1988 and 1995 and passed the aforementioned stipulations.

The procedures in the analysis provide valuable insight into the stability of the ACR's time data. First of all, the three procedures in the analysis are from the CMDs' list. Also, two of the three radiologic modalities identified by the CMDs (MRI and plain film) are included in the analysis. Finally, two of the three procedures in the analysis (70551 and 71020) were used by the CMDs as references in developing their proposed values (70551 for radiology, 71020 for non-radiologic services).

Comparison 1988 ACR Time Estimates to 1995 ACR Time Estimates

CPT Code	Description	1988 ACR Median Time	1995 ACR Median Time (# obs)	Ratio: 1995 ACR Time to 1988 ACR Time
70551	MRI, brain, w/o contrast	20	24 n=14	1.20
71020	X-ray exam, chest two views	5	5 n=52	1.00
72148	MRI, l-spine, w/o contrast	20	20 n=124	1.00

In summary, the ACR's 1988 time data appear to reflect the current practice of radiology. Furthermore, the analyses in this report incorporate more recent time data (e.g. RUC, Hsiao). Therefore, this report's conclusions are unaffected by the use of previous survey data.

Quality Assurance Versus RVW Analysis

Since quality control and assurance effort are components of physician work, it follows then that the two should be positively related. To test this hypothesis, the median quality control and assurance score from the ACR magnitude estimation survey was plotted against RVW for the fifteen codes identified by the CMDs to be misvalued. (See Attachment 9.) As predicted, there is a positive linear relationship between quality control and assurance and the current RVWs. In fact, there is a rather tight fit between the two variables (a Pearson's correlation coefficient of 0.95, where 1.0 is perfect). Furthermore, the points for the various radiologic modalities (plain film, CT, MR) clustered within the same area. The clustering of the data points illustrates the internal consistency of the radiology RVS with respect to the radiology modalities.

Comparison to E/M Services

Intra-specialty comparisons serve to address questions of internal consistency. However, comparisons outside of one's specialty

demonstrate the relationship with respect to all of medicine. Linkages to E/M codes have the major advantage of being the "common denominator" for medicine since the majority of physicians use the codes.

Earlier in this report, the RVW for a two view chest x-ray (code 71020) was compared to two E/M services (codes 99211 and 99213) on the basis of time. This analysis upheld the current RVW for code 71020. Taking this approach one step further, the RVWs for the other plain film studies identified by the CMDs are estimated using code 99213 as the benchmark. As the following table demonstrates, the current RVWs are a much better match to the code 99213-based RVWs than the proposed new values.

Code	1995 RVW	Estimated RVW (with code 99213 as base)	CMD Proposed RVW	Difference 1995 RVW vs. Estimated RVW	Difference CMD RVW vs. Estimated RVW
70150	0.26	<u>0.18</u>	0.20	+6	+2
70220	0.25	<u>0.18</u>	0.19	+7	+1
70260	0.34	<u>0.30</u>	0.28	+4	-2
71010	0.18	0.18	0.12	0	-6
71111	0.32	<i>0.35</i>	0.26	-3	-9
72020	0.15	<u>0.11</u>	0.10	+4	-1
72110	0.31	0.31	0.25	0	-6
73110	0.17	<i>0.22</i>	0.11	-5	-11
73140	0.13	<i>0.18</i>	0.19	-5	+1
73510	0.21	<i>0.29</i>	0.15	-8	-14
73562	0.18	<i>0.23</i>	0.12	-5	-11
73610	0.17	<i>0.21</i>	0.11	-4	-10
73620	0.16	<u>0.11</u>	0.10	+5	-1
74020	0.27	0.27	0.21	0	-6
				Average -0.29	Average -5.2

For the fourteen plain film codes analyzed in the manner described earlier, there were three exact matches (in bold) between the current RVWs and the estimated values. In addition, six procedures (in italics) would have their RVWs increased and five (underlined) would have their RVWs reduced. Conversely, there were no exact matches between the estimated and CMD-proposed values. Furthermore, most of the CMD-proposed values were below the estimated ones.

Sampling Analysis

It is common statistical convention to base a sample on a 95 percent confidence interval. The ACR's 1988 RVS survey achieved this standard. Consequently, a repeat of that survey would produce similar results because the population has not change appreciably, nor have the basic procedures being sampled changed. In addition, any re-survey, in order for it to have the same validity as the 1988 survey, would require a sample size comparable to that used in 1988.

By studying a limited number of cases (i.e. a sample), one can make inferences from the survey results about the total population. In order for these inferences to be accurate, the sample must be of the appropriate size. Sample size is influenced by two basic factors: (1) the population to which inferences will be made, and (2) the desired precision (i.e. confidence interval, variance). Simply put, the larger the population and the greater the desired accuracy, the larger the sample size. However, a population increase does not require a proportionate sample size increase. For example, a population of 1,000 would require a sample size of 696; a population of 20,000, a sample of 1013; a population 500,000 or more, a sample of 1065. (Source: Nan Lin *Foundations of Social Research*,.)

In 1988, the number of board certified radiologists in the U.S. (including nuclear medicine physicians) totaled approximately 19,000. Today, the number of board certified radiologists is approximately 23,000. (Source: *AMA Physician Characteristics and Distribution in the U.S.*) Therefore, in 1988 the sample size required to achieve a 95 percent confidence interval was 1,010, and would change only to 1,020 today. The ACR's 1988 RVS survey went out to 2,000 radiologists and nuclear medicine physicians, of which 1,173 responded. Therefore, duplicating the 1988 survey would not produce different results because the sampling requirements needed for accurate results in both 1988 and 1995 are basically the same.

WORK INVOLVED IN THE INTERPRETATION OF A RADIOGRAPHIC EXAMINATION BY A RADIOLOGIST

The following steps are involved in the interpretation of a radiographic examination by a radiologist and in the communication of the results to the referring physician:

1. **EVALUATION OF THE QUALITY OF THE FILMS.**
The radiologist is responsible for the supervision of the technologist who performs the examination. The films are critiqued for appropriate technique (exposure, correct views, positioning, degree of inspiration, labeling).
2. **EVALUATION OF ALL ANATOMY ON THE FILMS, NOT JUST THE AREA OF CLINICAL INTEREST.**
For example, a radiologist makes numerous observations when evaluating a PA and lateral chest exam, including soft tissues, bony structures, diaphragms, mediastinum, cardiovascular structures, and lungs/pleura.
3. **REVIEW OF PRIOR REPORTS, WHEN APPROPRIATE.**
4. **COMPARISON OF CURRENT EXAMINATION WITH PREVIOUS EXAMINATIONS OF THE SAME AREA, WHEN APPROPRIATE.**
5. **CORRELATION OF FINDINGS ON CURRENT EXAM WITH THOSE FROM OTHER IMAGING STUDIES, WHEN APPROPRIATE.**
6. **REEVALUATION OF OBSERVATIONS AND DETERMINATION OF THE SIGNIFICANCE OF ANY VARIATIONS FROM THE NORM.**
7. **PREPARATION AND DICTATION OF A REPORT IN COMPLIANCE WITH THE ACR STANDARD ON COMMUNICATION.**
A precise diagnosis should be given whenever possible and a differential diagnosis when appropriate.

Recommendations for follow-up and additional diagnostic studies to clarify or confirm one's impression should be given when appropriate.
8. **IMMEDIATE COMMUNICATION OF RESULTS TO THE REFERRING PHYSICIAN WHEN APPROPRIATE (e.g., UNUSUAL, UNEXPECTED, OR URGENT FINDINGS WHICH MAY REQUIRE IMMEDIATE CASE MANAGEMENT DECISIONS).**
9. **PROOFREADING AND AUTHENTICATION OF FINAL WRITTEN REPORT.**
10. **"SECOND-LOOK" CONSULTATIONS WITH REFERRING PHYSICIAN OR WITH OTHER PHYSICIANS INVOLVED IN THE CARE OF THE PATIENT.**

Attachment 3

The following table illustrates the point that the number of images depends on the anatomic site and contrast usage: (Please note – the number of images interpreted varies according to the protocol used at the institution and the clinical question to answer.)

Number of Images: MR

Anatomic Site (CPT Codes)	Without Contrast (If applicable)	With Contrast (If applicable)	Without and With Contrast (If applicable)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
 FIVE-YEAR REVIEW PROCESS
 SUMMARY OF RECOMMENDATION

CPT Code: 70336 Global Period: XXX Current RVW: .95 Recommended RVW: 1.48

CPT Descriptor: Magnetic resonance (eg, proton) imaging, temporomandibular joint

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Thirty year old female with pain and clicking in the region of the TMJ on chewing.

Description of Pre-Service Work:

See Attachment

Description of Intra-Service Work:

See Attachment

Description of Post-Service Work:

See Attachment

SURVEY DATA:

Specialty: American College of Radiology

Sample Size: 507 Response Rate (%): N = 165 (32.5%) Median RVW: 1.48

25th Percentile RVW: 1.30 75th Percentile RVW: 1.50 Lowest RVW: 0.45 Highest RVW: 2.00

Median Total Service Time: 20 minutes 25th Percentile Total Service Time: 15 minutes

75th Percentile Total Service Time: 25 minutes Lowest Total Time: 4 minutes

Highest Total Time: 60 minutes

Median Complexity Source (1 = least complex, 5 = most complex):

Factor	70336	72148	70551	73220	Average of all References
Mental Effort and Judgement	4.0	4.0	4.0	4.0	4.0
Technical Skill and Physical Effort	3.0	3.0	4.0	3.0	3.3
Psychological Stress	3.0	3.0	3.0	2.5	2.83

Median Total Time (Minutes):

70336	72148	70551	73220	Average of all References
20	20	22.5	20	20.83

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 72148	Magnetic resonance (eg, proton) imaging, spinal canal and contents, lumbar; without contrast material	1.48
2) 73720	Magnetic resonance (eg, proton) imaging, lower extremity, other than joint	1.48
3) 73220	Magnetic resonance (eg, proton) imaging, upper extremity, other than joint	1.48

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 70336 is nearly identical to its key reference services (codes 72148, 73720, and 73220) with respect to total procedure time. Furthermore, code 70336 and its references have comparable intensity scores.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 70336 is the survey's median value (1.48). The results of the survey confirm the belief that code 70336 is comparable to other non-contrast MRI procedures in terms of both time and intensity. It, therefore, should have the same RVW.

The survey respondents were split over whether or not the work has changed over the last five years (51.9 percent of the respondents thought the work has changed, 48.1 percent did not). [For a discussion of how the work has changed, see the following paragraph.] The majority of the respondents (63.8 percent) did not believe that technology lessened the amount of work involved in the procedure. On the other hand, 41.3 percent of the respondents thought that their patients have become more complex (54.1 percent indicated no change). The procedure's site of service has not changed (95.4 percent). Lastly, nearly all of the respondents (92.0 percent) agreed with the vignette.

Although the survey results were unclear with respect to changes in physician work, since the time the procedure was originally valued, new pulse sequences have been developed which are of value in studying the temporomandibular joint. These new pulse sequence add to the number of images that must be interpreted, thus increasing physician time. Code 70336 was undervalued originally and, therefore, should be brought up to the level of comparable examinations.

ATTACHMENT
SERVICE DESCRIPTION

Code Being Rated: 70336

Magnetic resonance (eg, proton) imaging, temporomandibular joint

Pre-Service:

1. Discuss examination with patient and review history.
2. Instruct technologist as to appropriate pulse sequences.

Intra-Service:

1. Review images from various pulse sequences.
2. Determine if additional pulse sequences or studies are necessary.

Post-Service:

1. Dictate report to referring physician.
2. Communicate findings to referring physician.

SURVEY DATA:

Specialty: American College of Radiology

Sample Size: 507 Response Rate (%): N = 180 (35.5%) Median RVW: 1.48

25th Percentile RVW: 1.48 75th Percentile RVW: 1.54 Lowest RVW: 0.80 Highest RVW: 2.80

Median Total Service Time: 20 minutes 25th Percentile Total Service Time: 15 minutes

75th Percentile Total Service Time: 30 minutes Lowest Total Time: 5 minutes

Highest Total Time: 63 minutes

Median Complexity Source (1 = least complex, 5 = most complex):

Factor	73221	72148	73220	73720	Average of all References
Mental Effort and Judgement	4.0	4.0	4.0	4.0	4.0
Technical Skill and Physical Effort	4.0	3.0	3.0	3.0	3.0
Psychological Stress	3.0	3.0	2.0	3.0	2.83

Median Total Time (Minutes):

73221	72148	73220	73720	Average of all References
20	20	25	20	21.67

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	72148	Magnetic resonance (eg, proton) imaging, spinal canal and contents, lumbar; without contrast material	1.48
2)	73220	Magnetic resonance (eg, proton) imaging, upper extremity, other than joint	1.48
3)	73720	Magnetic resonance (eg, proton) imaging lower extremity, other than joint	1.48
4)	73721	Magnetic resonance (eg, proton) imaging, any joint of lower extremity	0.95

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 73221 is nearly identical to its key reference services (codes 72148, 73720, and 73220) with respect to total procedure time. Furthermore, code 73221 and its references have comparable intensity scores.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 73221 is the survey's median value (1.48). The results of the survey confirm the belief that code 73221 is comparable to other non-contrast MRI procedures in terms of both time and intensity. It, therefore, should have the same RVW.

The majority of the respondents (69.5 percent) believe that the work involved in the procedure has changed over the last five years (30.5 percent did not). [For a discussion on how the work has changed, see next paragraph.] Furthermore, the majority of the respondents (77.4 percent) did not believe that technology lessened the amount of work involved in the procedure. Almost half (47.8 percent) of the respondents thought that their patients have become more complex (50.7 percent indicated no change). The procedure's site of service has not changed (93.4 percent). Lastly, nearly all of the respondents (92.2 percent) agreed with the vignette.

Over the past few years, new pulse sequences of value for the shoulder and other upper extremity joints have been developed. As a consequence, the procedure now takes longer to perform since it results in more images for the radiologist to interpret. Code 73221 was undervalued originally and should be brought up to the level of comparable examinations.

20	16.5	15	20	25	19.12

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 70551	Magnetic resonance (eg, proton) imaging, brain (including brain stem); without contrast material	1.48
2) 72141	Magnetic resonance (eg, proton) imaging, spinal canal and contents, cervical; without contrast material	1.60
3) 72148	Magnetic resonance (eg, proton) imaging, spinal canal and contents, lumbar; without contrast material	1.48
4) 73220	Magnetic resonance (eg, proton) imaging, upper extremity, other than joint	1.48

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 73721 is nearly identical to its key reference services (codes 70551, 72141, 72148, 73720) with respect to total procedure time. Furthermore, code 73221 and its references have comparable intensity scores.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 73721 is the survey's median value (1.48). The results of the survey confirm the belief that code 73721 is comparable to other non-contrast MRI procedures in terms of both time and intensity. It, therefore, should have the same RVW.

The majority of the respondents (72.2 percent) believe that the work involved in the procedure has changed over the last five years (27.8 percent did not). [For a discussion on how the work has changed, see next paragraph.] Furthermore, the majority of the respondents (77.7 percent) did not believe that technology lessened the amount of work involved in the procedure. Slightly over half (51.4 percent) of the respondents thought that their patients have become more complex (47.9 percent indicated no change). The procedure's site of service has not changed (92.1 percent). Lastly, the vast majority of the respondents (88.9 percent) agreed with the vignette.

Since the time the procedure was originally valued, new pulse sequences of value have been developed for the knee, hip, and other joints. These new pulse sequences add to the time it takes to perform the procedure and the time necessary to interpret the resulting images.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
 FIVE-YEAR REVIEW PROCESS
 SUMMARY OF RECOMMENDATION

CPT Code: 74330 Global Period: XXX Current RVW: .79 Recommended RVW: 0.90

CPT Descriptor: Combined endoscopic catheterization of the biliary and pancreatic ductal systems, radiological supervision and interpretation

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Forty eight year old female with acute pancreatitis and elevated liver function enzymes. Suspect common duct stone. Rule out pancreatic mass.

Description of Pre-Service Work:

See Attachment

Description of Intra-Service Work:

See Attachment

Description of Post-Service Work:

See Attachment

SURVEY DATA:

Specialty: American College of Radiology

Sample Size: 511 Response Rate (%): N = 182 (35.6%) Median RVW: 0.90

25th Percentile RVW: 0.75 75th Percentile RVW: 1.20 Lowest RVW: 0.3 Highest RVW: 3.0

Median Total Service Time: 30 minutes 25th Percentile Total Service Time: 15 minutes

75th Percentile Total Service Time: 45 minutes Lowest Total Time: 2 minutes

Highest Total Time: 130 minutes

Median Complexity Source (1 = least complex, 5 = most complex):

Factor	74330	74329	74240	75820	75980	Average of all References
Mental Effort and Judgement	3.0	3.0	3.0	3.0	4.0	3.25
Technical Skill and Physical Effort	2.0	2.0	3.0	2.0	3.5	2.62
Psychological Stress	2.0	2.0	2.0	2.0	3.0	2.25

Median Total Time (Minutes):

74330	74329	74240	75820	75980	Average of all References
30	20	15	13.5	52.5	25.25

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 74329	Endoscopic catheterization of the pancreatic ductal system, radiological supervision and interpretation	0.70
2) 74240	Radiologic examination, gastrointestinal tract, upper; with or without delayed films, without KUB	0.69
3) 75820	Venography, extremity, unilateral, radiological supervision and interpretation	0.70
4) 75980	Perctaneous transhepatic biliary drainage with contrast monitoring, radiological supervision and interpretation	1.44

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

In many regards, code 74330 is comparable to its key reference procedures (74329, 74240, 75820, and 75980). First of all, code 74330 is clinically similar to code 74329, with the exception that both the biliary and pancreatic ducts are studied (rather than just the pancreatic ducts). Next, it shares with its reference procedures many of the same intensity scores. With respect to time and RVW, code 74330 approaches code 75980 (RVW = 1.44), than the other reference codes (RVW 0.69 to 0.70).

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 74330 is the survey's median value (0.90). The results of the survey confirm the belief that code 74330 should be rated higher than code 74329, since both biliary and pancreatic ducts are studied.

The majority of the respondents (61.2 percent) felt that the work involved in the procedure has not changed over the last five years (38.8 percent did). In addition, the majority of the respondents (83.8 percent) disagreed with the premise that technology lessened the amount of work involved in the procedure. Most radiologists (61.9 percent) felt that their patients are now more complex (38.1 percent indicated no change). The procedure's site of service has not changed much, only 15.1 percent indicated a change (mostly from inpatient to outpatient). Lastly, the vast majority of the respondents (87.2 percent) agreed with the vignette.

The proposed RVW for code 74330 corrects the mistake made when it was assigned the same RVW as code 74329. The time commitment for radiologists during catheterization of both the pancreatic duct and common bile duct by the endoscopist is clearly more than that for a single duct. Although the physician work associated with the interpretation of images for a single duct system has not changed, work associated with interpreting images to evaluate both systems is clearly greater.

In addition, therapeutic interventional biliary procedures (e.g. sphincterotomy, stone extraction, stent placement) have been developed in the past five years, significantly increasing the time associated with this procedure.

ATTACHMENT
SERVICE DESCRIPTION

Code Being Rated: 74330

Combined endoscopic catheterization of the biliary and pancreatic ductal systems, radiological supervision and interpretation

Pre-Service:

Review case history, previous films, and clinical record.

Intra-Service:

Fluoroscope, supervise procedure, advise endoscopist and interpret images.

Post-Service:

Review films with endoscopist, dictate report.

2)	75716	Angiography, extremity, bilateral radiological supervision and interpretation	1.31
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

See Rationale

RATIONALE

This code describes the radiological supervision and interpretation of aortography and bilateral lower extremity arteriograms. The radiologic supervision and interpretation service described by this code involves evaluation of the aorta and lower extremity arteries to the distal circulation. We note that the supervision and interpretation of an abdominal aortogram (75625) and supervision and interpretation for bilateral extremity arteriography (75716) are valued at 1.14 RVW and 1.31 RVW respectively. Since CPT 75630 involves the work of both 75625 and 75716, we believe that the work of 75630 can be readily derived by adding the work values of 75625 and 75716 for a total of 2.45.

15	15	5	10	10.0

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 74240	Radiologic examination, gastrointestinal tract, upper; with or without delayed films, without KUB	0.69
2) 71020	Radiologic examination, chest, two views, frontal and lateral	0.22
3) 76645	Echography, breast(s) (unilateral or bilateral), B-scan and/or real time with image documentation	0.54

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Mammography is one of the most demanding studies to interpret and the results reflect this. With respect to intensity, code 76090 surpasses many of its reference codes (74240, 71020, and 76645) individually and collectively. Furthermore, its total time estimate places it in the vicinity of code 74240, with an RVW of 0.69.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 76090 is the survey's median value (0.58).

The majority of the respondents (61.9 percent) felt that the work involved in the procedure has changed over the last five years (38.1 percent did not). [For a discussion of how the work has changed, see the following paragraphs.] In addition, the vast majority of the respondents (95.4 percent) disagreed with the premise that technology lessened the amount of work involved in the procedure. Most radiologists (62.2 percent) felt that their patients are now more complex (37.8 percent indicated no change). Nearly ninety percent (89.4 percent) of the respondents indicated that the procedure's site of service has not changed. Lastly, the vast majority of the respondents (91.8 percent) agreed with the vignette.

Mammography has experienced fundamental changes since originally valued in 1988. In 1988 and 1989, landmark articles (attached) established that supplemental views are frequently needed to evaluate potentially significant abnormalities identified on the basic views. These additional diagnostic views have become a standard part of mammographic examinations (see enclosed tables from "Quality Determinants of Mammography" Physician Insurers Association of America, "Practical Solutions to Common Mammographic Problems: Tailoring the Examination", Breast Masses: Mammographic Evaluation") and add physician work. Prior to publication of the articles (and the seminars that followed) mammography basically consisted of two standard views (CC and MLO) of each breast. This was the norm at the time mammography was valued during the radiology RVS. The vignette used in 1988 to set the relative values for 76091 ("for bilateral breast pain") would more appropriately apply to code 76092 (screening mammography) today.

Radiologists face increased communication requirements. In 1988, it was not standard for the radiologist to interact with the patient (e.g. history taking, physical examination if indicated, discussion of results, and recommendations). This is expected today. Also, it is no longer sufficient to simply supply a formal dictated report to the referring physician. Reports in lay-person terms are sometimes prepared and sent to the patient. If the report is abnormal it must be communicated by phone to the referring physician or to the patient if she has no referring physician (Quality Determinants of Mammography, US Department of Health and Human Services, AHCPR, October, 1994, page 42. Also requirements of Mammography Quality Standards Act, and some state regulations).

In addition to the added number of views and the extra time required to interpret them, the malpractice risk (psychological stress) has substantially increased. According to the June 1995 Physician Insurers Association of America (PIAA) breast cancer study (attached), malignant neoplasm of the female breast are the most frequently filed medical insurance claims. Furthermore, radiologists were the most frequent defendants having been named in 24% of the cases (1995), up from 11.4% in 1990. In addition, the awards per case have risen 36% since 1990.

ATTACHMENT
SERVICE DESCRIPTION

Code Being Rated: 76090

Mammography, unilateral

Pre-Service:

1. Review pertinent mammograms.
2. Discuss examination with patient and obtain clinical history.
3. Examine breast for any palpable abnormality in the area of concern, and mark skin with B-B if appropriate.
4. Instruct technologist as to appropriate views.

Intra-Service:

1. View additional films and compare with previous films.
2. Determine if additional views or studies (e.g., ultrasound) are indicated.
3. Interpret significance of findings on the films, and correlate with the physical findings.
4. Discuss findings and recommendations with the patient. Inform patient when to expect the final results and recommendations from her referring physician.

Post-Service:

1. Dictate report to referring physician.
2. If an abnormal exam requiring biopsy, communicate results by phone to referring physician.
3. Prepare written notification of results and further steps to be taken, in lay language, to be sent to the patient.

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Mammography is one of the most demanding studies to interpret and the results reflect this. With respect to intensity, code 76091 surpasses many of its reference codes (74240, 71020, and 74400) individually and collectively. Furthermore, its total time estimate places it on par with code 74240, which has an RVW of 0.69.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 76091 is the survey's median value (0.69).

The majority of the respondents (59.8 percent) felt that the work involved in the procedure has changed over the last five years (38.1 percent did not). [See the following paragraphs for a discussion of how the work involved in the procedure has changed.] In addition, the vast majority of the respondents (94.3 percent) disagreed with the premise that technology lessened the amount of work involved in the procedure. As with code 76090, most radiologists (62.2 percent) felt that their patients are now more complex (37.8 percent indicated no change). Nearly ninety percent (87.3 percent) of the respondents indicated that the procedure's site of service has not changed (12.2 percent suggested a change to an outpatient setting). Lastly, the vast majority of the respondents (93.7 percent) agreed with the vignette.

Mammography has experienced fundamental changes since originally valued in 1988. In 1988 and 1989, landmark articles (attached) established that supplemental views are frequently needed to evaluate potentially significant abnormalities identified on the basic views. These additional diagnostic views have become a standard part of mammographic examinations (see enclosed tables from "Quality Determinants of Mammography" Physician Insurers Association of America, "Practical Solutions to Common Mammographic Problems: Tailoring the Examination", Breast Masses: Mammographic Evaluation") and add physician work. Prior to publication of the articles (and the seminars that followed) mammography basically consisted of two standard views (CC and MLO) of each breast. This was the norm at the time mammography was valued during the radiology RVS. The vignette used in 1988 to set the relative values for 76091 ("for bilateral breast pain") would more appropriately apply to code 76092 (screening mammography) today.

Radiologists face increased communication requirements. In 1988, it was not standard for the radiologist to interact with the patient (e.g. history taking, physical examination if indicated, discussion of results, and recommendations). This is expected today. Also, it is no longer sufficient to simply supply a formal dictated report to the referring physician. Reports in lay-person terms are sometimes prepared and sent to the patient. If the report is abnormal it must be communicated by phone to the referring physician or to the patient if she has no referring physician (Quality Determinants of Mammography, US Department of Health and Human Services, AHCPR, October, 1994, page 42. Also requirements of Mammography Quality Standards Act, and some state regulations).

In addition to the added number of views and the extra time required to interpret them, the malpractice risk (psychological stress) has substantially increased. According to the June 1995 Physician Insurers Association of America (PIAA) breast cancer study (attached), malignant neoplasm of the female breast are the most frequently filed medical insurance claims. Furthermore, radiologists were the most frequent defendants having been named in 24% of the cases (1995), up from 11.4% in 1990. In addition, the awards per case have risen 36% since 1990.

ATTACHMENT
SERVICE DESCRIPTION

Code Being Rated: 76091

Mammography; bilateral

Pre-Service:

1. Review previous mammograms.
2. Discuss examination with patient and obtain clinical history.
3. Examine area of concern in breast(s).
4. Mark area of clinical concern (if applicable) with lead B-B marker on skin.
5. Instruct technologist as to appropriate views.

Intra-Service:

1. Review films and compare with previous examinations (e.g., determine if area of clinical concern is included on the films and that mammographic abnormality, if any, corresponds to the area of clinical concern).
2. Interpret significance of findings on the films and correlate with the physical findings.
3. Determine if additional views or additional studies (e.g., breast ultrasound) are indicated.
4. Discuss findings and recommendations with the patient. Inform patient when to expect the final results and recommendations from her referring physician.

Post-Service:

1. Dictate report to referring physician.
2. If an abnormal exam, requiring biopsy, communicate results by phone to referring physician.
3. Prepare written notification of results and further steps to be taken, in lay language, to be sent to the patient.

Quality Determinants of Mammography

Table 1. Diagnostic views for mammography

Projection/view (abbreviation)	Indications	How it provides higher quality images and how the information improves interpretation and patient management
Spot compression (Can be done in any of the projections below)	To confirm an abnormality is real. To better define a lesion obscured by overlying tissue.	Separates tissues overlying and obscuring an area of interest; provides increase in local compression (bringing object closer to film). Eliminates the need for biopsy if lesion is shown to be factitious. Can confirm need for biopsy.
Magnification (M) (Can be done in any of the projections below)	To better define calcifications and margins of masses.	Improved definition of abnormality will help determine whether it is suspicious and requires biopsy or whether it is probably benign and can be followed.
90° lateral (ML, LM)	To localize an abnormality (in conjunction with CC). To confirm presence of a lesion seen on only one standard view. To demonstrate gravity- dependent material (milk- of-calcium).	Provides view directly at right angles to CC, allowing 3-dimensional localization so that mammographic finding can be correlated with clinical breast examination and, if nonpalpable, can be removed by needle localization, resulting in minimal biopsy scar. As a third view, can confirm whether lesion is real or factitious. If calcifications are shown to be gravity dependent, they represent benign "milk-of-calcium" and a biopsy can be avoided.

See note at end of table.

Activities During the Examination

Table 1. Diagnostic views for mammography (continued)

Projection/view (abbreviation)	Indications	How It provides higher quality images and how the information improves interpretation and patient management
Exaggerated craniocaudal (XCCL)	To localize an abnormality seen on MLO but not CC and expected to be in the posterolateral part of the breast or axillary tail. May be needed to image the lateral-most portion of the breast in some women with prominent axillary tissue.	Images posterolateral breast tissue, which is not always demonstrated with standard CC positioning. Allows localization of lesions in outer breast for correlative examination and, if suspicious, for needle localization.
Cleavage (CV)	To localize an abnormality seen on MLO but not CC and expected to be in the deep medial breast.	Images posteromedial breast tissue, which may not be seen with standard CC positioning, allowing for correlative examination or needle localization.
Axillary tail (AT)	To localize an abnormality high in the tail of Spence and not seen on standard views.	Images axillary tail of breast tissue.
Tangential (TAN)	To depict a palpable lesion that is obscured by overlying dense tissue. To verify the dermal location of calcifications or skin lesions.	By placing a palpable lesion that is obscured by overlying tissue directly over radiolucent subcutaneous fat, the lesion may be seen so that it can be characterized as benign or suspicious. By directing the beam tangential to skin calcifications, a suspected dermal location can be confirmed and unnecessary biopsy avoided.

See note at end of table.

Quality Determinants of Mammography

Table 1. Diagnostic views for mammography (continued)

Projection/view (abbreviation)	Indications	How it provides higher quality images and how the information improves interpretation and patient management
Roll (RL, RM)	To bring a lesion that is obscured by overlying tissue into view. To estimate the location of a lesion seen in only one view by observing how it moves on roll views.	By rolling the breast, the relationship between a lesion and overlying tissues will be changed and the lesion may be better visualized. The direction the lesion moves may help in determining its location. It may be useful in better defining or localizing a lesion seen on only one view.
Caudocranial (FB) (from below)	To better define the nature of a mass in the upper part of the breast or include more of it on the image. To improve positioning of some patients with problematic body habitus. May also be used for preoperative needle localizations of lesions near the inferior skin surface.	Because an abnormality high in the breast will be closer to the film on the FB, it can be better defined. Because the compression plate will be moving against movable rather than fixed tissue, more of the deep superior tissues can be included on the image.
Lateromedial oblique (LMO)	To improve positioning of some patients with problematic body habitus (kyphosis) and pacemakers. To better depict lesions in the superomedial part of the breast.	By reversing the location of compression device and Bucky, more tissue can be included and better compression achieved in some patients. Lesions in the superomedial aspect of the breast will be closer to the film.
Superolateral to inferomedial oblique (SIO)	For needle localization of lesions seen in AT view but not CC.	Can be done at 90° to AT view, allowing needle localization and wire placement for abnormalities that are seen on AT view but not on CC or XCCL views.

See note at end of table.

Table 1. Diagnostic views for mammography (continued)

Projection/view (abbreviation)	Indications	How it provides higher quality images and how the information improves interpretation and patient management
Implant displacement (ID)	To better image patients with augmentation mammoplasties.	By displacing the implant posteriorly and pulling tissue anteriorly away from the implant, more compression can be applied to improve visualization of tissues.
Imaging mastectomy site	To identify recurrent breast cancer at chest wall.	It is controversial whether this is an effective procedure. Most recurrences at the chest wall are clinically detected. When performed, a mediolateral oblique projection of the mastectomy site or an axillary view is done.
Conservatively treated breast: preradiotherapy magnification views over site of segmental resection	To identify residual tumor at the surgical site, particularly calcifications of nonpalpable intraductal cancer.	Identifying residual tumor and removing it before radiotherapy may decrease incidence of recurrent breast cancer at the surgical site.
Conservatively treated breast: postradiotherapy magnification views over site of segmental resection	Performed at regular intervals to identify recurrent cancer.	By placing a wire directly over the surgical site and using magnification films at regular intervals, it may be possible to identify changes of recurrent cancer as early as possible.
Specimen radiography	To verify that a nonpalpable lesion is present in a biopsy specimen from a mammographically guided localization procedure. Locates abnormality for the pathologist's attention on the area of concern (the area requiring detailed histological evaluation).	Verification of the presence of the lesion on the specimen radiograph ensures that the suspicious finding has been removed for pathologic evaluation. If the lesion is not present in the first specimen radiograph, additional tissue will be excised and radiographed.

Note: CC = craniocaudal. MLO = mediolateral oblique.

Practical Solutions to Common Mammographic Problems: Tailoring the Examination

Edward A. Sickles¹

It is quite common for standard two-view-per-breast mammography to produce inconclusive results, especially among symptomatic patients and in interpreting baseline screening examinations. Many of these cases are read as indeterminate simply because the imaging evaluation is incomplete. In such circumstances, additional views prove invaluable in solving the mammographic problems raised on the standard examination. The ability to decide which extra views to obtain, and when to use them, is an important part of the expertise that every mammographer should develop.

In discussing the problem-solving approach to mammography, I have assumed the use of dedicated mammographic equipment, capable of imaging in the cranio-caudal projection with a vertical X-ray beam, in the lateral projection with a horizontal X-ray beam, and in all intermediate degrees of the oblique projection. I also have assumed that a properly designed breast compression device is used [1]. These features are essential for screen-film mammography and preferable for xeroradiography as well [1]. Use of a ceiling-mounted X-ray unit produces acceptable xeroradiographic images in standard projections, but the radiologist using this general-purpose equipment is limited in the ability to take full advantage of many special projections devised to solve mammographic problems. Every busy xeroradiographic breast imaging practice should have at least one dedicated mammographic unit available for such problem-solving examinations.

There are so many potential approaches to completing the evaluation of inconclusive mammography examinations that an almost innumerable array of imaging permutations exists from which the radiologist may choose. To simplify the subject, I have concentrated on some of the more commonly encountered mammographic problems, indicating those solutions most likely to succeed. The reader is advised at the outset that every mammographic problem can be solved by a variety of acceptable methods and that my failure to discuss one of your personal favorites indicates only my own preference rather than the inadequacy of a specific alternative approach.

Lesion Seen on Only One Standard Projection

The most common mammographic problem, and the one most frequently left unsolved by inexperienced radiologists, is that of the lesion identified on only one standard projection. This usually involves a mass or asymmetric density, but can also occur with a cluster of tiny calcifications. The major decision to make in this situation is whether an abnormality indeed exists, or whether the "lesion" represents a fortuitous superimposition of otherwise innocuous overlapping shadows. Especially with considerable experience, this decision often can be made simply by analyzing the standard views, trying to convince oneself that a superimposition is present (Fig. 1). However, even in the most skilled hands this is not always possible. Furthermore, some radiologists are reluctant to engage in over-attempting such an

Fig. 1.—Recognizing the presence of superimposition on two standard views only.
A, Mediolateral oblique view shows dense mass of irregular contour.
B, Craniocaudal view shows several vague opacities of somewhat lower density, each at a distance from the nipple consistent with the location of the mass seen on oblique view. Many experienced radiologists will recognize the combination of findings as representing superimposition of benign retropectoral structures with a sufficient degree of confidence that a confirmatory additional view is not necessary.

assessment. In any circumstance, one must resist the temptation to bypass the abnormality-vs-superimposition decision by interpreting all such findings as being suspicious for malignancy. This only puts off the problem until the almost inevitable preoperative needle localization, at which time it usually is too late to decide in favor of superimposition because the patient and surgeon have been irreversibly primed for biopsy. The result when superimposition truly is present is either unnecessary surgery, or correct identification of the error at the expense of lost confidence by the patient and surgeon in the reliability of mammography as a whole and in the skill of the offending radiologist in particular.

The proper approach to determining the importance of a finding seen on only one standard projection is to obtain an additional view or views that resolve the situation. The initial step in this process is an assessment of whether the lesion is located too deep in the breast to have been included on the second standard view. A rough approximation that may be useful is comparison of the distance between the lesion and the nipple on the first view and the distance between the nipple and back of the film on the second view [2]. If there is any doubt that the lesion may not have been included on the second view, then its location on the first view will govern which of many additional projections should be obtained next. Most of the available extra views are described later in this article.

Once the radiologist is convinced that the finding could not have been cut off the view on which it is not seen, the next step is to establish or exclude the possibility of superimposi-

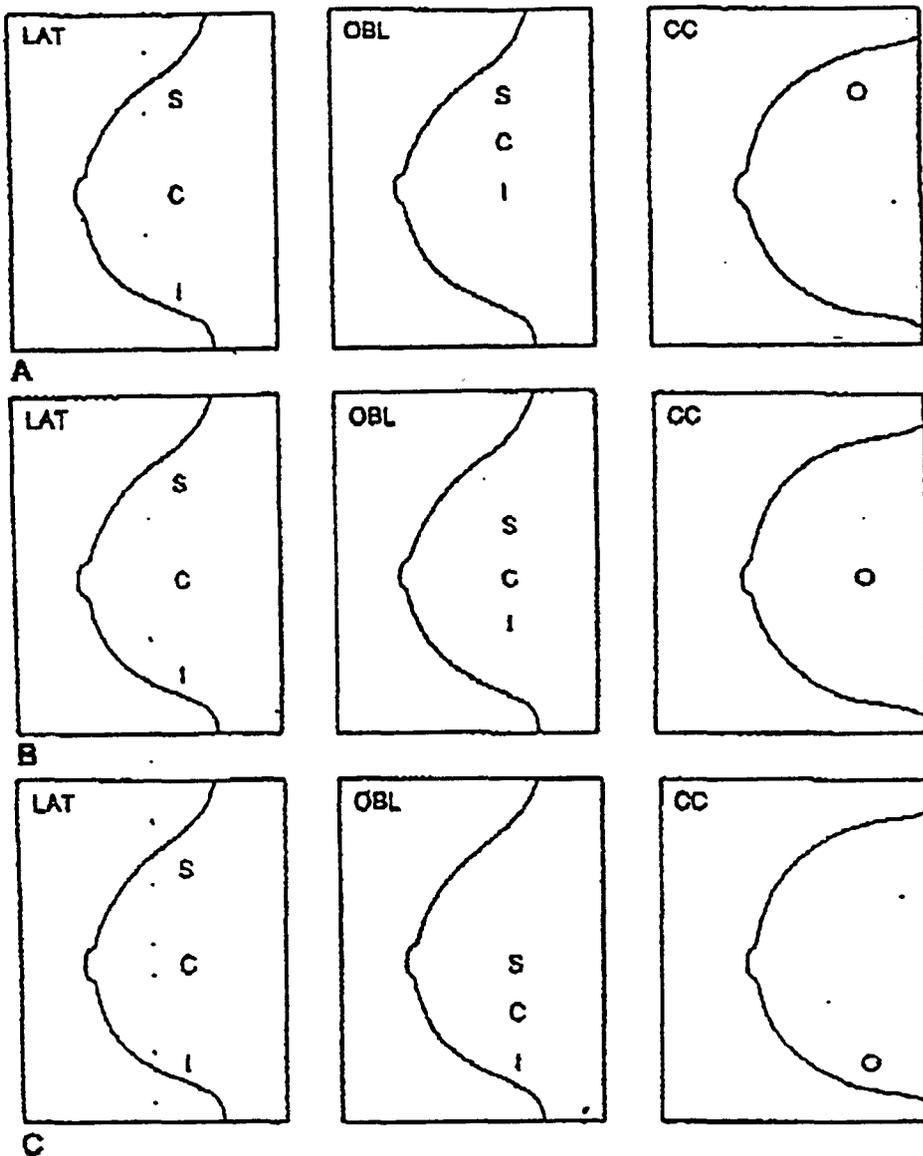

tion. This is best done by taking an additional view in projection only slightly different from the one in which the lesion was first seen. The rationale behind this approach is that a real abnormality will be seen readily when the obliquity of the X-ray beam changes slightly, whereas superimposed normal structures will present a very different, much less worrisome radiographic appearance. Several methods have been proposed to achieve this result, including simply repeating the initial standard view with the expectation that a minor variation in projection is bound to occur [3, 4]; intentional changing the obliquity of the X-ray beam [4], usually by 10-15° from the initial standard view [5]; or changing orientation of the breast itself by "rolling" it slightly with respect to the positioning device (Fig. 2). These techniques almost always are effective in projecting the breast tissue in a somewhat different manner, except that the experienced technologist may be so successful in reproducing standard views that for her the latter methods will work best.

Two other techniques also are helpful in differentiating between a true abnormality and superimposed normal structures. One is to use increased breast compression, or, because this spreads apart overlying islands of dense tissue permitting more accurate diagnosis [5]. Most effective in regard is the use of a spot compression device or at least use of a device that is so small that it compresses only the area of interest, not the entire breast. In addition, any compression translates readily into superior magnification because geometric unsharpness is lessened and magnification is increased. Also, if tighter beam collimation

APR 151, JULY 1988

CUSTOMIZED MAMMOGRAPHY

Fig. 4.—Standard lateral (LAT), oblique (OBL), and craniocaudal (CC) projections of breast show expected locations of lesions on lateral view if they were seen initially only on craniocaudal and oblique views. Lesion is lateral (L), central (C), and medial (M) parts of breast on craniocaudal views. Note three possible locations of this lesion on oblique view (S = superior, C = Central, I = inferior), and then find corresponding locations on lateral view.

lesions often are not included at all on the mediolateral oblique view and may not be imaged completely on either standard craniocaudal or lateral views. An exaggerated medial craniocaudal view usually will include the entire abnormality, as may a lateromedial lateral view (see following). However, for the deepest of these lesions, the best available view is an oblique projection with the X-ray beam passing from superolateral to inferomedial location, the so-called "reverse oblique" projection [5].

Lesions located very high up on the chest wall.—These usually are readily imaged on either the standard lateral or oblique view, but often are the most difficult abnormalities to include on the craniocaudal view because the vigorous compression needed to display breast structures with proper detail usually does not permit the uppermost portions of the

breast to be imaged (Fig. 6). Several approaches can help resolve this problem. The best method is to simply include under the compression device only the uppermost breast tissues, producing a so-called "lumpogram" (Fig. 7). If the lesion is palpable, a small metal marker should be used to provide proper correlation of its location with that of the mammographic abnormality (Fig. 8). Otherwise, the lateral, central, or medial location of the lesion on the craniocaudal projection should be deduced by triangulation from lateral and oblique views, as described before. This will permit the appropriate portion of the upper breast to be included in the lumpogram. Another method to produce vertical-beam images of very superiorly located lesions is to support the bottom of the breast with a wedge-shaped sponge, permitting more effective breast positioning so that deeper tissues are

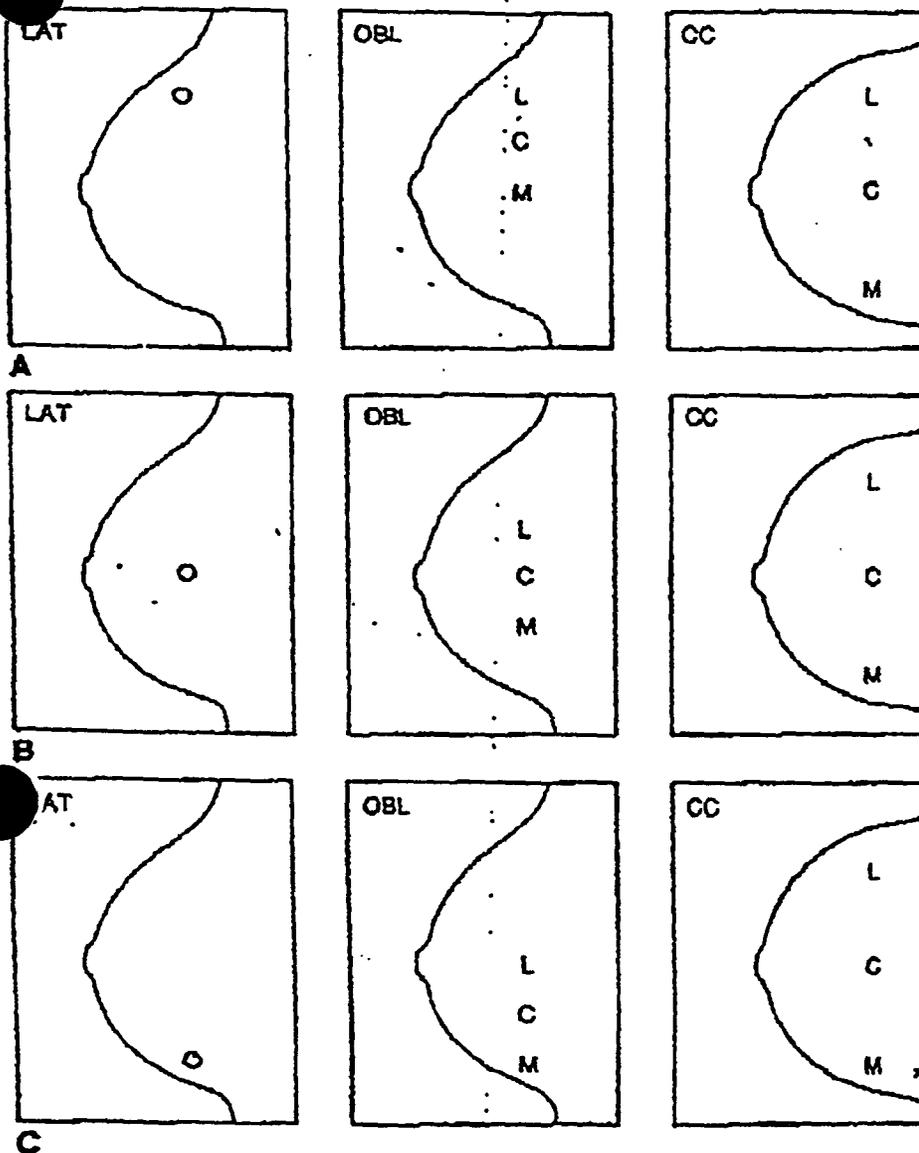

Fig. 5.—Standard lateral (LAT), oblique (OBL), and craniocaudal (CC) projections of breast show expected locations of lesions on craniocaudal view if they were seen initially only on lateral and oblique views. Lesion is in superior (A), central (B), and inferior (C) parts of breast on lateral view. Mark three possible locations of this lesion on oblique view (L = lateral, C = central, M = medial), and then find corresponding locations on craniocaudal view.

included on the craniocaudal projection [12]. Unfortunately, the use of such a sponge precludes vigorous breast compression, severely limiting the value of this method. Two other techniques, available with only a few dedicated mammography units, involve either imaging in the caudocranial projection or varying the obliquity of the craniocaudal beam slightly off true vertical in a posteroanterior direction. These techniques also allow deeper breast structures to be included in the radiographic field.

Lesions located so close to the chest wall that nothing else works.—It must be exceedingly rare for a palpable lesion to defy inclusion on any of the previously discussed mammographic views; in over 100,000 cases, I have never needed to resort to further inventive maneuvers. However, sooner or later every busy radiologist will encounter that most difficult

of lesions for which truly heroic efforts are required. The most interesting suggestion I have seen for this problem is to use coned-down compression along with an independent restraining device that pulls the lesion away from the chest wall ~~when~~ the exposure is taken. A metal coat hanger appears to be an ideal restraining device because it is malleable enough to mold into whatever shape is necessary, strong enough to hold the lesion in place, and thin enough not to interfere with breast compression [5].

Further Characterize an Already Detected Abnormality

Just as there are numerous special mammographic projections available to more effectively include a lesion in a

Oct 15, July 1988

CUSTOMIZED MAMMOGRAPHY

37

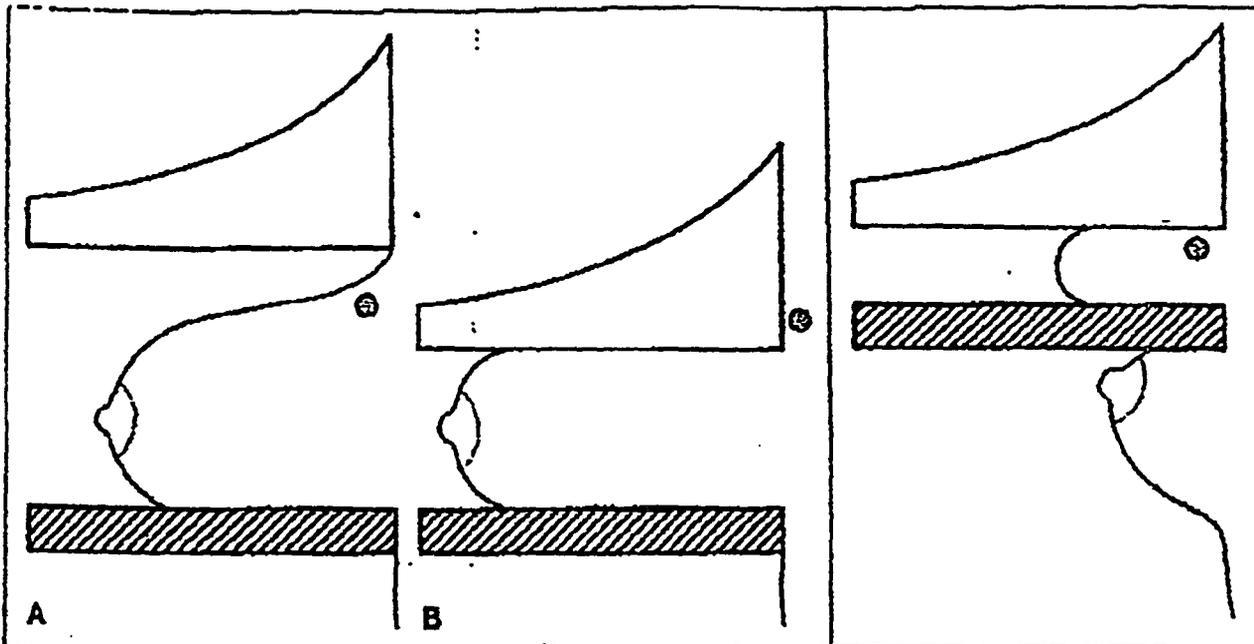

Fig. 6.—How proper breast compression prevents inclusion on standard craniocaudal view of lesion very high up on chest wall.

A. Lesion located far superiorly in breast, before compression is applied for imaging in craniocaudal projection.

B. While vigorous compression is applied (which would be done to optimize image quality and flatten out breast to uniform thickness), compression plate has traveled so far down chest wall that lesion is not included in craniocaudal image.

Fig. 7.—Same lesion as in Fig. 6, with imaging of only the uppermost breast tissues ("tempogram"). This permits lesion to be included in craniocaudal projection image while vigorous compression is applied.

mographic view, so are there a wide variety of techniques to better characterize abnormalities that are imaged with less than optimal clarity. Several among these are so obvious that they do not deserve special discussion, including the correction of under- or overexposure or under- or overpenetration, elimination of inadvertent patient motion, and repeat imaging after removal of confounding artifacts.

Lateromedial vs mediolateral lateral views.—Because most breast cancers occur in the outer half of the breast, the standard image in the lateral projection is obtained with a mediolateral X-ray beam, because this places the outer aspect of the breast closer to the cassette to minimize geometric unsharpness. However, when an abnormality is detected in the inner breast, it is preferable to take any repeat lateral projection exposures with a lateromedial beam [2]. This will produce sharper images of the lesion.

Full range of oblique views.—The standard mediolateral oblique projection is obtained with the plane of breast compression parallel to that of the pectoralis major muscle. This usually results in an X-ray beam obliquity of 45–60° off horizontal. On the other hand, dedicated mammography units are capable of imaging in any plane of obliquity, including reverse oblique projections. When a lesion is partly obscured by overlying dense fibroglandular structures on one or both standard views, it may be helpful to take an additional exposure with a nonconventional degree of beam obliquity. The

rationale behind this approach is to project the lesion so that it overlies an area of fatty tissue, where its border characteristics can be analyzed more readily. Often more than one attempt is needed to achieve proper results, especially in women with dense breasts.

Tangential view.—One possible purpose for obtaining a tangential view of a breast abnormality is to establish or exclude dermal location for a lesion. Skin lesions are important to recognize because invariably they are benign, never representing primary breast carcinoma. Most common among such lesions are clustered dermal calcifications, which can be confused with those of malignancy when they are very small, when they project over the breast parenchyma on both standard views, and when they do not show characteristically benign radiolucent centers [14–16]. Experienced technologists often can obtain a tangential view of such calcifications, or of any lesion suspected of being located in the skin, simply by estimating the degree of needed change in X-ray beam or breast obliquity. There is also a foolproof method that requires one extra exposure before the tangential view is taken [17]. A tiny metal marker is placed on the breast so that it is seen to precisely overlie the lesion on an additional craniocaudal view (the marker is placed on the top of the breast if the lesion projects superiorly on the lateral view; otherwise it is positioned on the underside of the breast). If the lesion indeed is dermal in location the marker will again superimpose on

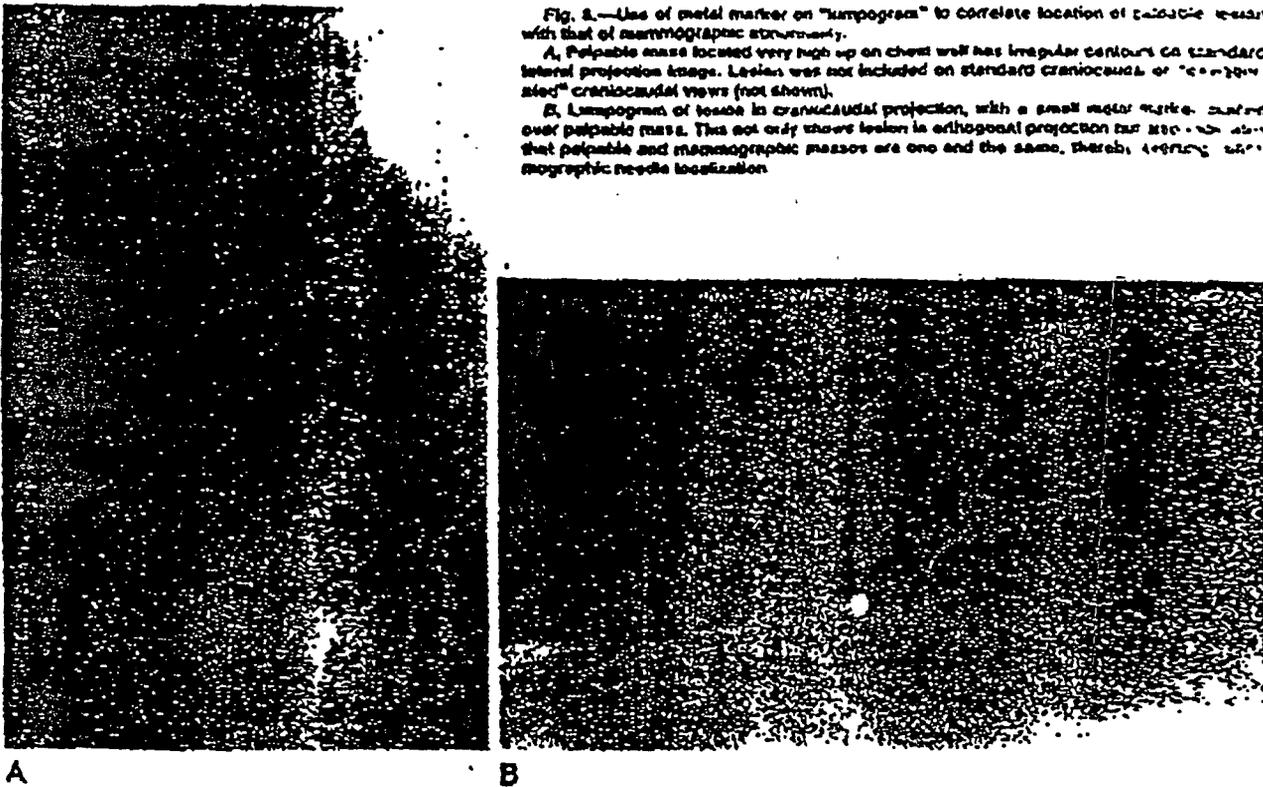

Fig. 2.—Use of metal marker on "Lumpogram" to correlate location of calcific lesion with that of mammographic abnormality.

A. Palpable mass located very high up on chest wall has irregular contours on standard lateral projection image. Lesion was not included on standard craniocaudal or "conventional" craniocaudal views (not shown).

B. Lumpogram of same in craniocaudal projection, with a small metal marker placed over palpable mass. This not only shows lesion in orthogonal projection but also shows that palpable and mammographic masses are one and the same, thereby, allowing mammographic needle localization.

the lesion when any other projection is obtained, although a tangential view of the marker produces the most convincing results.

A second purpose for obtaining a tangential view involves parenchymal abnormalities: to project the lesion as close as possible to the subcutaneous fat, where its margins may be seen with greater clarity. This approach is especially useful when standard-projection mammograms show only dense fibroglandular tissue despite the presence of a palpable mass or focal area of skin dimpling [5]. Many radiologists will routinely obtain an extra tangential view of any palpable lesion that is not readily seen on conventional mammograms.

Coned-down compression view.—The many imaging advantages to vigorous breast compression include reduced patient motion, decreased geometric unsharpness, increased contrast, and the spreading apart of superimposed islands of fibroglandular tissue [1]. A spot-compression device is especially effective in producing these improvements in image quality, because its compressive force is applied to a relatively small area of interest, rather than being spread out over the entire breast as would be necessary to provide conventional uniform-thickness compression. If tighter beam collimation is used along with spot compression, this even further increases radiographic contrast. As a result, many radiologists will obtain an additional coned-down spot-compression view of any lesion not seen with optimum clarity on standard-projection mammograms.

Magnification views.—The technique of direct radiographic

magnification also is widely acknowledged to produce superior-quality mammographic images. This has been verified both in the laboratory and in clinical trials [6, 18-20]. However, to be successful, magnification technique requires the use of an X-ray tube with a tiny focal spot. For example, the required (not nominal) focal spot size should be less than 0.3 mm for 1.5X magnification [21]; even smaller focal spots are required for the higher degrees of magnification provided by some current mammographic units. The radiologist, having proper equipment should consider obtaining extra magnification views whenever a lesion is seen with less than optimal clarity on conventional mammograms. In this clinical setting, magnification mammography has been shown to correctly guide management decisions in many cases, either toward prompt biopsy if malignancy is present or toward further diagnostic examinations for benign lesions [5, 6, 19, 22]. Magnification and spot compression techniques can be used simultaneously. Furthermore, these two techniques can be combined either singly or together, with any of the other techniques described previously.

Conclusions

This article describes a systematic approach to solving some of the more commonly encountered mammographic problems. In tailoring such examinations to the specific needs of individual patients, the neophyte mammographer should proceed in a step-by-step manner, using the techniques

51, July 1988

CUSTOMIZED MAMMOGRAPHY

39

at a time. This is advisable primarily because it will be much easier to learn the strengths and limitations of each imaging maneuver separately, as it actually works on your own patients, with your own equipment, in the hands of your own technologists. However, once sufficient experience is gained, it will be advantageous to devise successful combinations of these extra views, with the aim of using as few exposures as possible. Why try to limit the number of films taken? One important reason is that the imaging advantages of several maneuvers often are additive, producing a single picture of even better image quality than would occur if the same maneuvers were undertaken separately. Other reasons, of lesser significance, are that radiation dose is lowered and that examination time and interpretation time are shortened, thereby reducing operating costs. Finally, it is worthwhile to minimize the number of extra exposures because repeated requests for "just one more film" may cause the patient to lose confidence in the specific personnel involved and perhaps in the practice of mammography as well.

Breast Masses: Mammographic Evaluation¹

MAMMOGRAPHY frequently demonstrates masses within the breast in both symptomatic and asymptomatic women. Occasionally, these masses have characteristically benign radiographic features, causing little difficulty in diagnosis. Even less commonly, masses may demonstrate typically malignant mammographic features that are just as easy to recognize as their clearly benign counterparts. However, most masses exhibit at least some image properties intermediate between benign and malignant, thereby prompting indeterminate mammographic interpretations and leading to further, often invasive diagnostic procedures. Some radiologists are considerably more successful than others in differentiating benign from malignant masses.

The purpose of this article is to provide a systematic and practical approach to the imaging evaluation of noncalcified breast masses. The reader is encouraged to interpret each mass in the step-by-step manner indicated in the text that follows. Establish the presence of a mass and then evaluate its size, location, density, shape, clarity of margins, and interval change.

To a great extent this problem-solving process requires additional images to supplement the standard craniocaudal and side views taken of

each breast. Dedicated mammography equipment, especially when used with vigorous breast compression, substantially enhances the radiologist's ability to make more definitive interpretations (1,2), as do the capability to produce fine-detail spot compression magnification mammograms and the interpretive skill to utilize the additional radiographic information provided by these high-resolution images (3,4).

SYSTEMATIC ANALYSIS OF BREAST MASSES**Differentiation of True Masses from Masslike Findings**

The first step in any evaluation of breast masses is to define exactly what does and does not constitute a mass, to distinguish true masses both from (benign) asymmetric areas of increased density and from summation shadows produced by fortuitous superimposition of normal fibrous and glandular structures. Masses have an outwardly convex contour, are at least as dense centrally as at the periphery, and are demonstrated on at least two different mammographic projections, preferably orthogonal views. In contradistinction, asymmetric densities characteristically have scalloped concave contours and are interspersed with fatty elements (5,6), while summation shadows cannot be visualized on more than one projection, even with only minor degrees of variation in x-ray beam obliquity (2,7).

Size

The size of a breast mass as measured with mammography is not particularly helpful in predicting either benign or malignant origin, because benign masses substantially outnumber cancers for lesions of all sizes. However, there is a clear trend to-

ward detection of smaller and smaller breast cancers. In the 1970s fewer than 10% of cancers detected at the University of California San Francisco (UCSF) Medical Center were smaller than 1 cm, but since 1985 the median size of screening-detected malignancies has decreased to 1.2 cm and fewer than 20% of our cancers are 2 cm or larger.

The size of a mass does have considerable impact on its subsequent management. For a large mass, especially one greater than 2-3 cm, aspiration or biopsy probably will be done independent of mammographic features, simply because of the increased likelihood that it will be palpable and that the findings of physical examination themselves will prompt a further invasive diagnostic procedure. Similarly, for a small mass, ultrasound (US) examination may not be undertaken even if it otherwise would be indicated, principally because very small nonpalpable lesions often are missed using handheld US units. The smallest size amenable to sonographic study varies from 0.5 cm to 1 cm, depending on the US equipment, the skill of the examiner, the location of the mass (deeper lesions are harder to identify), and the amount of time one is willing to allot for sonographic detection of a mass. There also is a lower limit in size below which most radiologists totally discount the importance of a mass with benign-appearing mammographic characteristics. This limit usually ranges from 0.5 cm to 1 cm, based primarily on one's own personal definition of what constitutes "benign-appearing" features. In establishing such a definition, each radiologist must weigh the opportunity to detect well-circumscribed cancers when they are very small against the morbidity and expense involved in further evaluating lesions for which the likelihood of malignancy is extremely low.

Biopsy Results as a Function of Quadrant Location for Mammographically Visible Noncalcified Masses

Location	Benign	Preadmalignant	Malignant
Upper outer	132 (56)	14 (48)	91 (52)
Upper inner	40 (14)	6 (21)	26 (15)
Lower outer	28 (10)	3 (10)	19 (11)
Lower inner	21 (7)	1 (3)	14 (8)
Retroaxillar	41 (15)	5 (17)	25 (14)

Source.—Data from all UCSF mammography examinations, both symptomatic and asymptomatic women, 1985–1998.

Note.—Numbers in parentheses are percentages.
 1 Lesion location determined by retrospective review of mammograms. Lesion situated equally between quadrants allocated half and half to each quadrant. Retroaxillar location—more than half of lesion within axillary margin.
 2 Preadmalignant: lobular carcinoma in situ, atypical hyperplasia with cellular atypia.
 3 Malignant: ductal carcinoma in situ, all types of carcinoma.

Location

Just as is observed for lesion size, the location of a breast mass usually is not helpful in differentiating benignity from malignancy. Radiologists generally are familiar with the frequency distribution of breast cancers by quadrant location, most common in the upper outer quadrant and least common in the lower inner quadrant (8,9). Less well known are the parallel data for mammographically detectable benign masses, which show an identical quadrant distribution (Table). It may well be that the tendency for both benign and malignant masses to predominate in the upper outer quadrant is due to the disproportionately large amount of residual glandular tissue in that quadrant among women above age 35–40.

Even if quadrant location is not a reliable predictor of the nature of a mass, the location of a mass can be used to guide mammographic decisions in several specific circumstances. First, any mass shown to be located within the skin will not be a primary breast carcinoma. Because skin lesions may project over parenchymal tissues on both of the standard mammographic views (10,11), the radiologist should obtain an additional tangential view of any potentially superficial mass before indicating mammographic suspicion of malignancy (Fig 1). Second, lesion location is important in the mammographic diagnosis of intramammary lymph nodes. Although intramammary nodes are found histologically throughout the breast, virtually all nodes large enough to be visualized with mammography are located in the outer half of the upper outer quadrant (12,13). Therefore, the confident radiographic diagnosis of such a lesion should not be made unless it conforms to this location. Finally, the

location of some palpable breast masses may indicate the need for additional mammography. If a palpable lesion is located so peripherally as not to be included on either standard mammographic view, then one must obtain exaggerated cranio-caudal, alternative oblique, or "lumpogram" projections to image it satisfactorily (27).

Density

Breast masses may be classified by density into either fat, water (fibroglandular tissue), or mixed-density categories. This is an important distinction since virtually all malignant breast masses are of water density, and therefore, any fat or mixed-density mass can be considered benign.

A completely fatty mass surrounded by water-density tissue will be recognized by its relatively lower density and convex margins, whereas when enveloped by fatty tissue such a mass will be identified if its thin fibrous "capsule" is imaged (Fig 2). The differential diagnosis of fat-density masses includes lipoma, fat necrosis, galactocele, and focal collection of normal breast fat that simulates a mass on mammograms. There is no clinical significance in differentiating among these benign lesions, so biopsy is not necessary for the purpose of tissue diagnosis and follow-up is not needed to assess for possible interval change (14–16). However, as an academic exercise, one can often suggest the correct histologic diagnosis: Large (greater than 2-cm) masses tend to be lipomas, the lipid-containing cysts of fat necrosis often are seen at sites of prior surgery or trauma, and galactocysts usually occur during or shortly after lactation.

Mixed-density masses contain both fat and water-density elements. One

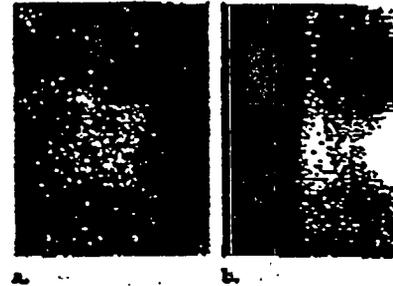

Figure 1. Skin lesion mimicking intramammary mass. Diagnosis: infected epidermal inclusion cyst. (a) Cranio-caudal projection demonstrates poorly defined mass overlying breast parenchyma. There were similar findings on lateral projection (not shown). (b) Tangential view of mass indicates its dermal location, thereby eliminating mammographic suspicion of malignancy.

Figure 2. Fat density mass. Diagnosis: lipoma. Thin radiodense "capsule" is readily visible where fatty tissue is immediately adjacent to mass (white arrow). "Capsule" not seen where dense tissue is adjacent to mass (black arrow).

such lesion is the hamartoma, otherwise known as lipofibroadenoma or fibroadenolipoma (Fig 3). Radiographic diagnosis of this benign lesion requires demonstration of a thin "capsule" at the edge of the mass, permitting one to appreciate that it contains not only water-density but also fatty components (4,17–20). The other, much more commonly en-

Figure 2. Mixed-density mass. Diagnosis: unaroma. Note thin radiolucent "capsule" demonstrating borders of mass, thereby indicating that it contains fat as well as water-density elements.

Figure 3. Water-density mass. Diagnosis: infiltrating duct carcinoma. Cancer (arrow) appears more dense than other water-density structures of similar size.

numbered, mixed-density mass is the intramammary lymph node. This kidney-shaped lesion characteristically displays a radiolucent hilus of variable size, indicating replacement at its hilus (1,4,13-15,19,21). Demonstration of the fatty hilus is crucial to mammo-

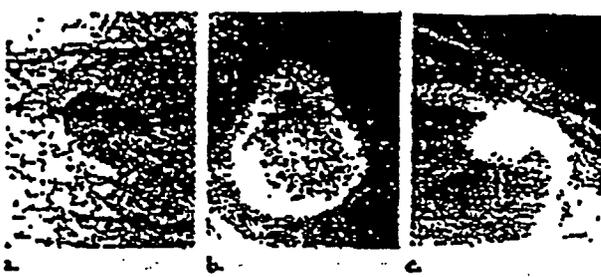

Figure 4. Mixed density masses. Diagnosis: intramammary lymph nodes. (a) Fatty hilus imaged tangentially, showing defect in contour of mass. (b) Fatty hilus imaged en face, showing central lucency. (c) Smallest mammographically visible fatty hilus (arrow) will be recognized only if imaged tangentially.

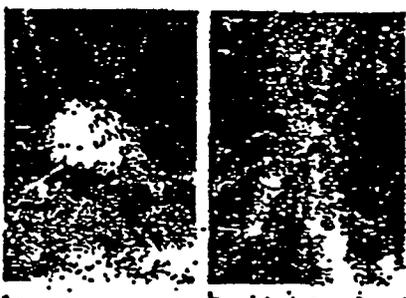

Figure 6. Stellate masses. (a) Note dense central area, irregular contour, and numerous fine spiculations radiating out from mass, representing typical mammographic features of malignancy. Diagnosis: infiltrating duct carcinoma. (b) Note relative lack of central density and several radiolucent lines radiating out from center of mass. Diagnosis: radial scar.

graphic diagnosis; the hilus will be seen as a contour defect if imaged tangentially, or as a central lucency if imaged en face (Fig 4). Intramammary nodes, like all other lymph nodes, undergo changes in response to infection, inflammation, or neoplasm. Independent of the underlying cause, the pathologic intramammary node loses its characteristically benign mammographic appearance, becoming more rounded in contour, enlarging beyond 1 cm, and no longer displaying a radiolucent hilus (1).

Water-density masses account for the remainder, and the vast majority, of breast masses. The main differential diagnosis for these lesions involves cyst, fibroadenoma, and carcinoma. When possible, mammographic differentiation is based primarily on those radiographic features discussed later in this article. However, assessment of density can also be helpful occasionally. Since some breast cancers appear to be slightly more dense than adjacent areas of fibroglandular tissue, whereas most

benign lesions do not (1,4,6,9,19,21) (Fig 5). This observation cannot be explained on the basis of inherently increased density within breast cancer; assessment with computed tomography has demonstrated lack of meaningful difference in x-ray attenuation between benign and malignant water-density tissue (22,23). Rather, the increased density of some malignancies is much more apparent than real, probably resulting from the fact that these cancers contain disproportionately large amounts of sclerotic and fibrous elements (21), causing them to flatten out to a lesser degree when vigorous breast compression is applied (9). The less compressible carcinoma therefore retains greater thickness during mammographic imaging, thereby stopping more x-ray photons and appearing to be denser than adjacent benign tissues. Note that visualization of this subtle difference in apparent density requires the use of a high-contrast screen-film recording system (1,9), vigorous breast compression (6,9), and comparison of breast structures that are approximately equal in volume (21).

Shape

Some breast masses have characteristically benign or malignant shapes. The typical cancerous mass has a stellate or starburst appearance, with an irregular contour often accompanied by fine linear strands (spiculations) radiating out from the edges of the mass (Fig 6a). Most masses with these mammographic features prove to be malignant, but not infrequently a benign lesion will also appear in a similar fashion (1,4,6,19,24), emphasizing the need to establish a tissue diagnosis of malignancy before definitive cancer treatment is begun (6). The most common benign stellate mass is caused by scarring from prior biopsy,

but the differential diagnosis also includes radial scar, fat necrosis, abscess, hematoma, and any other mass that contains substantial areas of fibrosis. Careful analysis of accompanying mammographic features may allow the radiologist to suggest one of these benign entities. For example, the radial scar usually lacks central density and has thin radiolucent lines radiating out from its middle (Fig 6b). Past or present medical history and correlative physical findings also may prove helpful, in that prior biopsy at the site of the stellate mass suggests fat necrosis, prior trauma and accompanying ecchymosis favors hematoma, and recent onset of pain, tenderness, and overlying erythema increases the likelihood of abscess. However, as a rule, none of these benign lesions can be distinguished from malignancy with sufficient reliability to avert biopsy (1,4,6,24). On occasion, if clinical suspicion of hematoma or abscess is high, repeat mammography after 1 month may be ordered to document the expected disappearance or substantial resolution of the lesion (4). Also, a stellate mass thought to represent scarring at a recent biopsy site may be followed mammographically to demonstrate stability or partial resolution (4,24).

The typical benign mass has a very different mammographic appearance, showing smooth contours and a round or ovoid shape (Fig 7). The great majority of these lesions are cysts or fibroadenomas, but many other solid tumors can also display similar radiographic findings. Occasionally, even a well-circumscribed carcinoma may have a characteristically benign appearance, at least on conventional mammograms (1,4,24). This observation has great significance, since it suggests that the mammographic features of a (water-density) mass should not be the only indicator used to arrive at a benign diagnosis (6). If such a mass is palpable, the findings of physical examination are important and traditionally take precedence in guiding subsequent management should they raise the suspicion of malignancy. On the other hand, when physical findings are benign or normal, the likelihood of carcinoma is very low, probably in the range of 1%-2% (25,26). For these lesions, several additional procedures are available to distinguish solid and complex masses from simple cysts. Palpable masses often undergo aspiration with or without cytologic analysis and/or pneumocystography,

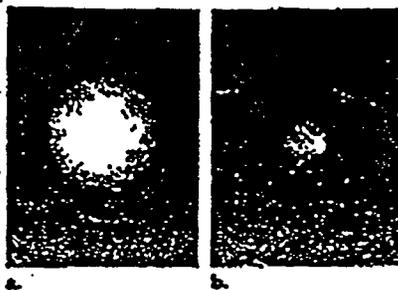

Figure 7. Masses with smooth round contour, suggesting benign nature. (a) 1.5-cm mass, containing few calcifications. Diagnosis: fibroadenoma. (b) 0.5-cm noncalcified mass. Diagnosis: simple cyst, established with US examination.

while nonpalpable lesions frequently are examined with US (1,4,6,21,27,28). Uncomplicated cysts do not require further evaluation for purposes of tissue diagnosis, since they always are benign (6). The management of solid benign-appearing masses usually involves periodic clinical and mammographic follow-up rather than biopsy (6,29).

Most mammographically visible masses cannot be classified with confidence into either a typically malignant or benign category. Many of these lesions simply are irregular in shape. Any deformity in contour should prompt further evaluation, even if other portions of the mass have typically benign features (Fig 8). A wide variety of additional mammographic techniques can be applied. Even the most smooth and rounded of carcinomas demonstrate some irregularities in contour on fine-detail images (1,21,24), especially if spot compression magnification technique is utilized (Fig 9).

The presence of lobulations within a mass often complicates interpretation. In general, the likelihood of malignancy increases as does the number of lobulations. Multinodular (knobby) masses frequently prove to be invasive duct carcinomas (Fig 10); these lesions should always undergo biopsy (21). On the other hand, the majority of nodular masses represent fibroadenomas that have only one or two gentle lobulations, often not raising sufficient radiographic suspicion of malignancy to trigger biopsy (4,21). An uncommon lobulated tumor is the cystosarcoma phylloides (giant fibroadenoma), notable mammographically for its very pronounced although not too numerous lobulations. This potentially malignant lesion usually undergoes biopsy

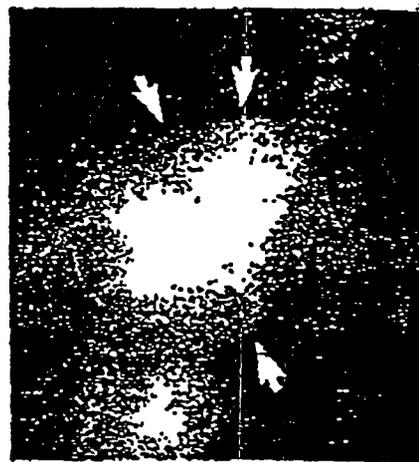

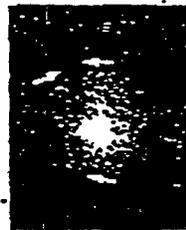

Figure 8. Mass with indeterminate features by analysis of shape. Some margins are smooth and rounded (arrows), while others are irregular. Diagnosis: infiltrating duct carcinoma.

Figure 9. Mass with generally smooth rounded contour, which on close inspection displays few fine radiating spiculations (arrows). Diagnosis: infiltrating duct carcinoma. Medullary and mucinous (colloid) carcinomas often have similar mammographic appearance.

not only because of its prominent lobulations but also due to its large size.

Clarity of Margins

Breast masses also may be classified according to the sharpness with which their margins are visible on mammograms. Such an analysis provides still another parameter to assist in radiographic diagnosis, because benign masses typically have very sharply defined margins (Fig 7), whereas the edges of most breast cancers are poorly defined (Fig 6a). However, many masses display border characteristics intermediate between those that can confidently be evaluated as benign or malignant. Commonly, a benign mass is found adjacent to areas of normal fibroglandular breast tissue, so that, although some of its margins are seen to be very well defined, others are obscured by the adjacent isodense tissue (Fig 11). This usually confounds mammographic interpretation, resulting in an equivocal or indetermi-

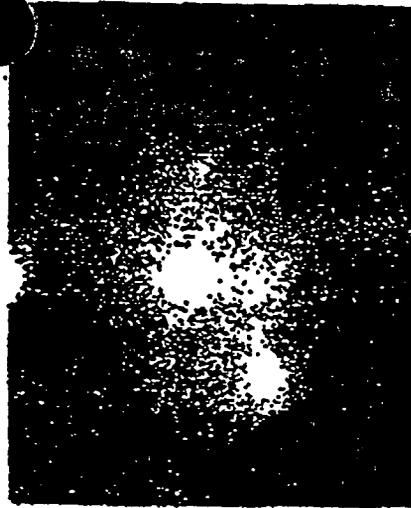

Figure 10. Mass with multiple small lobulations, prompting mammographic suspicion of malignancy. Diagnosis: infiltrating duct carcinoma.

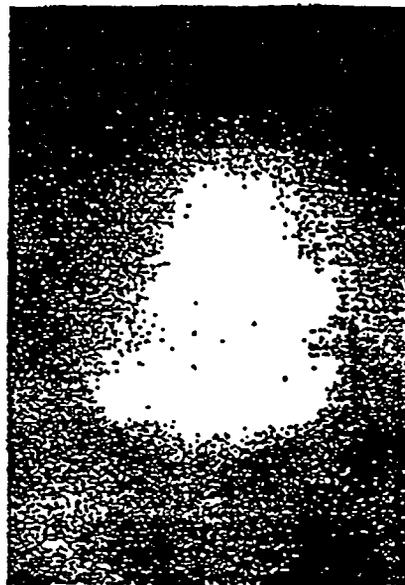

Figure 11. Mass with sharply defined margins, some of which are obscured by adjacent dense tissue, making mammographic interpretation more difficult. Diagnosis: fibroadenoma.

Figure 12. Mass demonstrating "halo sign." Note this radiolucent band (arrow) immediately external to one part of border of mass. Diagnosis: fibroadenoma.

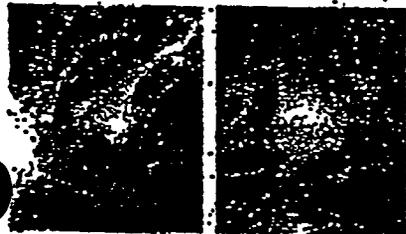

Figure 13. Water-density mass: (a) Conventional mammogram shows somewhat ill-defined margins, suggesting equivocal mammographic interpretation; (b) Spot compression magnification mammogram shows margins to be much more sharply defined and contour to be smooth and round, indicating benign mammographic interpretation. Diagnosis: benign, established by lack of interval change on subsequent screening mammograms over 7-year period.

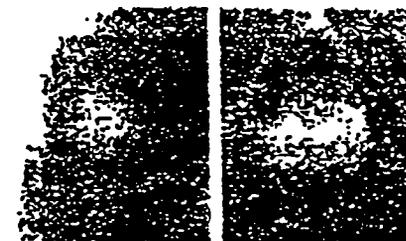

Figure 14. Water-density mass: (a) Conventional mammogram shows sharply defined margins and smooth contour, except from 6 o'clock to 9 o'clock position, suggesting equivocal mammographic interpretation; (b) Spot compression magnification mammogram shows margins to be much less well defined and contour to be much more irregular, indicating increased mammographic suspicion of malignancy. Diagnosis: infiltrating duct carcinoma.

nate diagnosis. A supplementary spot compression-mammogram may prove helpful in this circumstance if it spreads apart nearby dense structures to reveal all the borders of a mass whose silhouette is partially obscured (7,30).

Several radiologists rely heavily on one aspect of border analysis in justifying selected benign interpretations when portions of the margins of a mass are hidden by adjacent dense tissue. To them, benignity is indicated by the "halo sign," the presence of a thin, 1-mm-wide zone of radiolucency immediately external to some of the edges of the mass (1,19) (Fig 12). While the great majority of masses demonstrating this sign indeed are benign, occasional exceptions compromise its clinical value (4,21,31,32). The halo itself appears to represent a Mach band, an optical illusion of enhanced background contrast seen at any sharply defined interface (21,32). Since portions of the borders of both benign and malignant masses can be very well defined, the presence of a peritumoral halo is not pathognomonic for benign lesions (21,31,32).

With the current trend toward expanded utilization of mammography to screen asymptomatic women, we are encountering an increasing proportion of cancerous masses that display less than the fully characteristic radiographic features of malignancy

(33). As a result, most cancers now do not appear as spiculated masses but simply as nondescript lesions having poorly defined margins or irregular contour. Especially with such indeterminate findings, assessment of the marginal clarity of a given mass should be based on images of the finest detail available. The combination of spot compression and magnification techniques usually is preferred (2,7), permitting definitive interpretation for many benign and malignant masses that otherwise would receive equivocal readings (Figs 13, 14).

Interval Change

Reasonable attempts should be made to locate and obtain prior mammograms for comparison if a current examination indicates the presence of a mass. The demonstration of mammographic stability reduces the likelihood of malignancy, substantially so; if the interval between studies spans several years. Under these circumstances, continued mammographic follow-up usually is the preferred alternative to biopsy. On the other hand, the appearance or growth of a mass after an interval raises some suspicion of malignancy (Fig 15), because the breast is an involuting organ whose natural history involves progressive fatty replacement (34). Indeed, developing densities account for approximately 6% of nonpalpable cancers detected with mammography (33). It is important to realize that the radiographic demonstration of interval change is a non-specific finding, since benign masses appear de novo and grow just as malignancies do. However, despite the discovery of malignancy in only 10%-15% of such cases (34,35), subsequent management of enlarging masses usually involves prompt per-

nate diagnosis. A supplementary spot compression mammogram may prove helpful in this circumstance if it spreads apart nearby dense structures to reveal all the borders of a mass whose silhouette is partially obscured (7,30).

Several radiologists rely heavily on one aspect of border analysis in justifying selected benign interpretations when portions of the margins of a mass are hidden by adjacent dense tissue. To them, benignity is indicated by the "halo sign," the presence of a thin, 1-mm-wide zone of radiolucency immediately external to some of the edges of the mass (1,19) (Fig 12). While the great majority of masses demonstrating this sign indeed are benign, occasional exceptions compromise its clinical value (4,21,31,32). The halo itself appears to represent a Mach band, an optical illusion of enhanced background contrast seen at any sharply defined interface (21,32). Since portions of the borders of both benign and malignant masses can be very well defined, the presence of a peritumoral halo is not pathognomonic for benign lesions (21,31,32).

With the current trend toward expanded utilization of mammography to screen asymptomatic women, we are encountering an increasing proportion of cancerous masses that display less than the fully characteristic radiographic features of malignancy

(33). As a result, most cancers now do not appear as spiculated masses but simply as nondescript lesions having poorly defined margins or irregular contour. Especially with such indeterminate findings, assessment of the marginal clarity of a given mass should be based on images of the finest detail available. The combination of spot compression and magnification techniques usually is preferred (2,7), permitting definitive interpretation for many benign and malignant masses that otherwise would receive equivocal readings (Figs 13, 14).

Interval Change

Reasonable attempts should be made to locate and obtain prior mammograms for comparison if a current examination indicates the presence of a mass. The demonstration of mammographic stability reduces the likelihood of malignancy, substantially so: if the interval between studies spans several years. Under these circumstances, continued mammographic follow-up usually is the preferred alternative to biopsy. On the other hand, the appearance or growth of a mass after an interval raises some suspicion of malignancy (Fig 15), because the breast is an involuting organ whose natural history involves progressive fatty replacement (34). Indeed, developing densities account for approximately 6% of nonpalpable cancers detected with mammography (33). It is important to realize that the radiographic demonstration of interval change is a non-specific finding, since benign masses appear de novo and grow just as malignancies do. However, despite the discovery of malignancy in only 10%-15% of such cases (34,35), subsequent management of enlarging masses usually involves prompt per-

formance of further diagnostic procedures (aspiration, US, biopsy) rather than follow-up examinations, because interval change already has occurred (6).

DISCUSSION

In most cases the step-by-step evaluation of the mammographic features of a mass (size, location, density, shape, clarity of margins, interval change) will not give clear-cut indication of benignity or malignancy (1). In fact, for any given mass several of these assessments probably will be indeterminate, perhaps even contradictory. Overall mammographic interpretation involves a synthesis of all these separate analyses, into which one must also factor the findings of physical examination and the woman's breast cancer risk profile (age, personal history of breast cancer, strong family history of breast cancer, etc.) Judicious acquisition of supplementary mammographic images, as described previously, should help convert some initially equivocal interpretations into more definitive radiographic diagnoses.

Not infrequently, several masses will be found on a mammography examination. In the great majority of these cases additional invasive procedures are not indicated, because a multiplicity of (more than two) similar breast lesions argues strongly for benignity (1,4,15,21,36). Indeed, the more masses that are identified, the less chance they represent cancer. The radiologist's task in interpreting such examinations is to seek out the one mass that has mammographic features that differ from the others, and if present, to direct further work-up specifically to the evaluation of this lesion (36). Of course, the possibility of multifocal carcinoma cannot be discounted completely, but discovery of three or more carcinomas with mammography is extremely unusual. If multiple masses having malignant radiographic features are encountered, biopsy of the largest or otherwise most suspicious lesion usually will be done first, with management of the others deferred until a histologic diagnosis is obtained. Much more commonly, multiple masses will display primarily but not entirely benign mammographic features, since portions of their margins probably will be obscured either by each other or by coexisting dense fibroglandular tissue. However, unlike the parallel situation for one or two such lesions, aspiration or US exami-

Figure 15. Water-density mass showing interval change. (a) Normal baseline mammogram. (b) Screening mammogram 1 year later demonstrates new 4-mm poorly defined mass (arrow). Diagnostic: infiltrating duct carcinoma.

nation often will not be done for multiple masses. It is difficult and time-consuming to identify each individual mass, and frequently not all of them are found to be simple benign cysts, resulting in the dilemma of having to decide which of the several mammographic masses represents the solid tumor that may require prompt tissue diagnosis. A more prudent approach to the management of multiple "probably benign" masses is periodic mammographic follow-up to determine whether one of the masses changes disproportionately in comparison with the others (15). One should also remember to add metastases to the differential diagnosis of such lesions, especially if there is a prior history of melanoma, lymphoma, or leukemia (4,37,38).

It is beyond the scope of this article to discuss the evaluation of masses that contain calcifications. Suffice it to say that some calcified masses are characteristically benign (degenerating fibroadenomas, calcified hematomas, and calcified lipid-containing cysts of fat necrosis), while others are highly suggestive of malignancy (tiny clustered linear, curvilinear, or branching calcifications within any mass) (11).

SUMMARY

The systematic mammographic evaluation of a breast mass involves independent assessments of its size,

location, density, shape, clarity of margins, and interval change from prior examination. Additional fine-detail mammograms should be obtained to facilitate this analysis, especially when an equivocal interpretation is planned. Definitively benign masses (those localized to the skin, of fat density, or of mixed density) will not require more attention. Among the remaining water-density lesions, those that have an even slightly stellate appearance should be considered suspicious for malignancy; virtually all of them will undergo biopsy. Well-circumscribed masses should next be evaluated by aspiration or US examination to establish or exclude the diagnosis of simple benign cyst. Only solid and indeterminate lesions will require further evaluation, with the ultimate decision for biopsy versus mammographic follow-up depending on the probability of malignancy determined by the combination of mammographic and physical findings as well as pertinent data from the medical history. ■

Physician Insurers Association of America

**Breast Cancer Study
June 1995**

INTRODUCTION

The 1995 Breast Cancer Study is the latest in a series of special studies authorized to date by the PIAA Board of Directors. The delay in the diagnosis of breast cancer continues to be a leading cause of malpractice claims in terms of frequency and cost. This study was conducted for its loss prevention value to aid physicians treating female patients to recognize the factors critical in diagnosing this condition at an early stage. It is the second endeavor in which breast cancer claims were examined in detail, with the first study being published in 1990. Previous studies reviewed claims arising from the diagnosis of colorectal and lung cancer, medication errors, and, most recently, laparoscopic procedures.

These special studies are by-products of the PIAA Data Sharing Project. The Data Sharing Project began in 1985 and was developed to provide member companies with credible data on medical malpractice claims. Data elements captured in the Data Sharing System include loss causation information, expense and indemnity information, and demographics of policyholders, claimants and institutions. At the present time, twenty-one domestic member companies of the PIAA participate in the Project and these companies collectively insure more than 90,000 physicians in the United States.

The Data Sharing Project is an ongoing data collection effort to which data is reported semi-annually. As of this writing, the Project includes information on over 117,000 claims and suits, 35,700 of which are closed with total indemnity payments of over \$4 billion and an average indemnity payment of over \$139,500. Claims and suits reported in the latest semi-annual cycle ending June 30, 1994 have an average indemnity payment of \$184,000.

The most recent compilation of Data Sharing information reveals that malignant neoplasms of the female breast continue to be the condition for which a patient most frequently files a medical malpractice claim. Since 1985, 2,448 claims and suits involving breast cancer have been reported to the Data Sharing System. Breast cancer is the second most expensive condition in terms of indemnity dollars, next to claims resulting from neurologically impaired newborns. Almost 44% of all claims involving breast cancer result in an indemnity payment to the claimant. The average indemnity payment is over \$190,000 per claim during the period 1985 through 1993. Claims and suits involving this condition reported in the latest semi-annual cycle have an average indemnity payment of over \$307,000.

For the completion of this study, the survey form that was developed and utilized for the previous study was modified slightly and forwarded to member companies of the PIAA along with a request for participation. The study is intended to evaluate only those paid claims that occurred since January of 1985. This date coincides with the wide use of enhanced mammography equipment. The survey form was designed to identify the adverse incidents resulting from the delay in diagnosis of breast cancer and to identify demographic features of patients.

A total of thirty-six PIAA member companies responded to the request to participate, with thirty-three companies having claims that fit the criteria of the study. A listing of companies contributing data is found in Appendix A. These companies range from the very smallest to one of the

PIAA Breast Cancer Study**June 1995**

largest malpractice insurance companies and are situated throughout the United States. Also included is data from a PIAA member company from New South Wales, Australia. The total indemnity value is over \$146 million, and in addition, member companies spent an additional \$14 million in allocated loss adjustment expenses to handle these claims. Thus, it is apparent that breast cancer claims remain a significant source of concern for the medical malpractice insurance industry and the doctors that the PIAA member companies insure.

DISCUSSION AND CONCLUSIONS

The PIAA Data Sharing Reports indicate that the most prevalent and second most expensive condition resulting in claims against physicians is malignant neoplasm of the breast. The purpose of this study is to investigate the circumstances surrounding the high frequency and severity of claims arising from this condition. This study focuses on 487 paid cases reported by 33 PIAA member companies which specifically involve the delay in the diagnosis of breast cancer.

The results of this study are also compared to a previous Breast Cancer Study published by the PIAA in 1990. The comparative value of the studies will serve to emphasize and reinforce the problems in the diagnosis of this condition. By comparing the studies, the differences in the relative claim patterns will become apparent.

ANALYSIS OF CURRENT BREAST CANCER CLAIM DATA

The diagnosis of breast cancer continues to be a major source of loss for those physician specialties that have patients at risk for this condition. This study requested information on claims that resulted from the delay in the diagnosis, primarily to gather insight into diagnostic patterns that would result in the identification of patients with this disease.

The major findings are:

- ◆ The major focus of this study is the delay in diagnosis by the physician. The findings indicate many reasons why a delay may have occurred, several revolving around the fact that a significant proportion of the claims involved pre- and perimenopausal women, who are considered to be less likely candidates of this disease. Breast cancer is more difficult to detect and thought to be less common among younger women, which often causes a physician to be less impressed by a patient's complaints.
- ◆ More than 60% of the patients represented in this study are under the age of 50. These claims account for over 71% of the total reported paid indemnity. The average indemnity payment for those claimants under the age of 50 is more than 50% higher than for those claimants 50 and older. More than 30% of the claimants are under the age of 40, and these claims have 37% of the total reported indemnity.
- ◆ Radiologists are the specialists most frequently claimed against in this study. It is likely that radiologists are largely involved with the diagnosis of this condition in the interpretation and reporting of results of mammograms, x-ray studies, and bone scans. While members of this specialty group are less likely to have direct contact with the patient, they are still being named as defendants in these cases.

- ◆ The number of claimants reporting a positive or negative family history made no significant difference in claim frequency or in the average indemnity payment to the patient. More than 40% of the cases in this study indicated the family history as unknown. In many cases, this unknown family history could reflect the failure to ask or document this fact in the medical record. Where the family history is positive, an even more aggressive pursuit of a tissue diagnosis should be made. This may help lead to early detection of a lesion and eliminate the delay in the diagnosis, thereby giving the patient the benefit of prompt treatment and reducing the frequency and severity of claims.
- ◆ The patient most commonly found the lesion initially (60% of all cases). The physician should order follow-up studies in those cases where a patient reports a symptom that could be even remotely related to carcinoma. In all cases, it is imperative that the physician follow through until all possibility of malignancy is ruled out.
- ◆ A mass with no pain was reported in almost 50% of the cases for which the presenting symptom was recorded. However, reports of pain and tenderness, with or without the presence of a mass, were reported in more than one-quarter of the cases. This finding is significant, as pain is not commonly believed to be characteristic of breast cancer.
- ◆ In almost 80% of all cases in this study, the mammogram results were reported as negative or equivocal, when, in fact, a lesion was present. False negatives and equivocal results appear to occur more frequently in the females under 40 years of age. This large percentage of patients with either negative or equivocal results demonstrates the fact that a high index of suspicion and further testing may be warranted in diagnosing breast cancer. This is particularly important in younger women whose breasts are denser, making a lesion more difficult to detect on plain film mammography. This shows that mammography cannot be relied on as the only tool in diagnosing breast cancer. Follow-up studies may be critical, especially in cases of an equivocal mammogram result.

ANALYSIS OF COMPARATIVE RESULTS FROM PREVIOUS STUDY

In the previous PLAA study of breast cancer cases conducted in 1990, the survey forms included many of the same questions utilized in this study. This makes it possible to evaluate whether the same trends appear in both studies. Of particular interest are areas such as claimant age, use of mammography and the associated results, and payment patterns.

- ◆ Radiologists were the most frequent defendants in the current study, having been named in more than 24% of the cases. In the previous study, 11.4% of the claims were filed against radiologists. This increase is striking. OB/Gyns, at

PIAA Breast Cancer Study**June 1995**

22.8%, were the second most prevalent specialty group in this study, but were the most frequently named specialists in the 1990 study (38.6%). The percentage of primary care physicians involved in the cases changed very little, 26% in 1995, down slightly from 29% in the previous study.

- ◆ The patient discovered the lesion in 60% of the cases compared to 70.3% in the previous study where the information was known. A screening mammogram was responsible for identifying the lesion in 10.7% of the cases which is a noticeable increase from the previous study, in which a screening mammogram initially identified the lesion in only 4% of the cases.
- ◆ The mammogram had a negative or equivocal result reported in almost 80% of the cases compared to only 68% in the previous study. This result is rather surprising as it would seem that diagnostic accuracy should be better given the improving technology of mammography equipment and the increasing number of radiologists practicing solely in facilities dedicated to the diagnosis of breast disease.
- ◆ The average and median claimant age is two years higher in the current study. In this study, the average and median ages were 46 and 45 respectively. Just over 30% of the claimants are under age 40, which is a sharp decrease from the previous findings in which 40% of the claimants were under 40.
- ◆ The average indemnity payment for each case rose 36% in the five years (\$301,460 compared to \$221,524). In addition, allocated loss adjustment expenses rose almost 50% per case (\$28,700 compared to \$19,400).
- ◆ The average delay in the diagnosis was slightly higher in this study (14 months vs. 12.7 months).

RISK MANAGEMENT RECOMMENDATIONS

These recommendations are the result of the most prevalent problems described in the narrative summaries prepared for each case of the 487 cases. Risk management suggestions are provided with the intention of improving patient care and minimizing malpractice losses. The following is by no means an all-inclusive listing, however, following these suggestions may reduce liability risks. At the same time, the patient will undergo a comprehensive evaluation that will assist in a timely diagnosis.

ALL PRACTITIONERS INVOLVED IN THE DIAGNOSIS OF BREAST CANCER

- Document all patient complaints relative to the breast.
- Document any family history of breast cancer.
- Document the results of any previous mammographic studies.
- Document the recommendations for subsequent diagnostic studies and follow up.
- Remember to follow-up with other physician consultants regarding test results, etc.
- A palpable mass with a negative mammogram unequivocally requires a tissue diagnosis.
- Pregnancy should not cause delay of appropriate diagnostic studies.

PRIMARY CARE PHYSICIANS, INCLUDING OBSTETRICIAN/GYNECOLOGISTS

- Do not abandon diagnostic pursuit because you are unimpressed by the physical findings.
- Perform a thorough breast examination on each female patient as part of a physical examination, regardless of age or complaints.
- If a mass is palpated or suspected by physician, additional studies must be done to rule out malignancy.
- Be sure the patient understands the need for subsequent studies, and document this fact.
- Perform regular follow-up examinations on patients who present with complaints related to the breast.

RADIOLOGISTS

- If a mammogram results in a film of poor technical quality, repeat the study.
- If the mammogram results are equivocal, recommend a repeat study, additional views, follow-up studies, other imaging modalities, etc., as appropriate.
- Be sure an adequate physical examination was performed and documented.

PIAA Breast Cancer Study**June 1995**

RADIOLOGISTS (continued)

- Compare the results of the present study to all previous studies that were performed.
- Promptly report your findings to the referring physician; if the patient was self-referred, the results of the study should be mailed directly to her. If there is any suspicion of an abnormality, the patient should be so advised and told to consult promptly with her primary care physician or OB/GYN.
- If you are performing a screening mammogram on a self-referred patient, be sure to do a thorough breast exam, or advise the patient of the importance of a physical breast exam to complement the mammographic study. In cases in which the patient is self-referred, you are responsible for ensuring she receives proper follow-up visits.

SURGEONS

- When a patient is referred, always perform an adequate examination and document your findings, especially when the referring physician's findings were unimpressive.
- When performing a biopsy, be sure the correct lesion is being removed, in both open and needle procedures. A specimen x-ray of the biopsy should always be obtained.
- Promptly report consultation and biopsy results to referring physician.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 76825 Global Period: XXX Current RVW: 0.98 Recommended RVW: 1.67

CPT Descriptor: Echocardiography, fetal, cardiovascular system, real time with image documentation

Source and Summary of Comment to HCFA on this service: American College of Cardiology and the American Society of Echocardiography reviewed these services and determined that they remain undervalued compared to other services within the Medicare Fee Schedule which require similar physician work effort.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32 year old mildly obese, multiparous, diabetic woman is referred by her obstetrician, who has completed her office OB ultrasound examination for verifying fetal age and growth. While completing the examination of cranial, abdominal and thoracic structures, the obstetrician has difficulty obtaining a clear 4-chamber view of the heart. The examination is undertaken at 20 weeks estimated gestational age. The physician reviews the obstetrical history and the family history regarding congenital heart disease, as well as ultrasounds sent by the referring obstetrician, perinatologist or radiologist. The pregnant woman is gowned and draped in an appropriate manner; special care is taken to assure her comfort and to avoid nausea, caval compression and dizziness caused by prolonged supine position, and immobility during pregnancy. The ultrasound probe is manipulated on the abdomen to obtain cardiac, 4-chamber, inflow and outflow views of the fetal vena cava, pulmonary artery, ductus arteriosus, aortic arch and both the atrial and ventricular septae. Views must be obtained with minimized shadowing and, depending on fetal mobility or position, windows for each individual view must be obtained widely over the maternal abdomen with readjustments of instrument settings for each view. Videotaped or digitally recorded views are reviewed by the physician for detailed interpretation and measurement. In most situations the family is informed of the general results of the examination before being dismissed. When the fetal heart is found to be abnormal, prolonged counseling about strategies is often necessary.

Description of Pre-Service Work: The physician reviews the obstetrical history and the family history regarding congenital heart disease, as well as ultrasounds sent by the referring obstetrician, perinatologist or radiologist. The pregnant woman is gowned and draped in an appropriate manner; special care is taken to assure her comfort and to avoid nausea, caval compression and dizziness caused by prolonged supine position, and immobility during pregnancy.

Description of Intra-Service Work: The ultrasound probe is manipulated on the abdomen to obtain cardiac, 4-chamber, inflow and outflow views of the fetal vena cava, pulmonary artery, ductus arteriosus, aortic arch and both the atrial and ventricular septae. Views must be obtained with minimized shadowing and, depending on fetal mobility or position, windows for each individual view must be obtained widely over the maternal abdomen with readjustments of instrument settings for each view.

Description of Post-Service Work: Videotaped or digitally recorded views are reviewed by the physician for detailed interpretation and measurement. In most situations the family is informed of the general results of the examination before being dismissed. When the fetal heart is found to be abnormal, prolonged counseling about strategies is often necessary.

3)	99215	Office visit, est, level 5	1.51
4)	99245	Office consultation, level 5	2.96

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The mental effort of conducting a comprehensive evaluation with clinical management of a new patient requiring decision making of moderate complexity (99244) is considerable. At this level, there are some confounding co-morbid factors. The patient may have multi-system disease processes. The differential diagnosis is more complex and must be more complete. The judgement process in reaching the single best approach to resolution or treatment of the questions posed may be difficult.

Compared to the referenced E&M service (99244), physician work in performing a fetal echo evaluation is somewhat higher. A comprehensive review of clinical data and a comprehensive examination are common parts of both services. The level of complexity is somewhat higher for the fetal examination, since the fetus is very small, difficult to visualize, and the ramifications of fetal abnormalities can be profound. Considerable diagnostic skill is required to evaluate the patient and develop a plan of care appropriate to the patient's condition and required follow-up care.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The requirements for mental effort and expert clinical judgement in performing a fetal echocardiography are significant: expert conceptual judgement and ability to interpret the data; a comprehensive knowledge of the forms of congenital heart disease and their morphology and associated malformations; and, a complete understanding of the fetal cardiocirculatory physiology and the morphogenic and maturational changes inherent in cardiac growth and molding during the second and third trimesters of pregnancy. The physician must obtain enough views with enough visual clarity to avoid a false-positive diagnosis (with the possibility of choice of termination of pregnancy) or a false-negative diagnosis with the risk of missing a major cardiovascular malformation. Note: Mental effort and judgement at level 4-5, technical skill and physical effort at level 4, psychological stress at level 4. The majority of respondents indicated the work of this code has changed in the last five years, although the familiarity with the technology is stable. Basically, the patients requiring this service are increasingly complex. All agree that the vignette describes their typical patient.

Because the fetus is small and far away from the transducer and because maternal abdominal wall and uterine size may vary, all scanning maneuvers, which are already difficult during congenital heart disease echocardiography, are compounded by distance, fetal mobility and variable fetal position. When the spine is up or the head is closest to the transducer, shadowing by skeletal structures can be a major problem. Prolonging the examination often results due to needs to try different maternal positions, different window positions on the maternal abdomen, and different probe frequencies and configurations to deal with variable distance of the fetus, and varying structures in the beam path between the transducer and the fetal heart with the different views. The fine maneuvers required for scanning these small structures and optimizing their visualization clarity requires extreme spatial understanding, patience and manual dexterity in scanning technique and a very high level of understanding of physical principles of ultrasound examination and instrumentation factors of resolution, reverberation, shadowing and artifacts as determinants of imaging results.

This type of examination challenges the physician's conceptual and manual skills. The complexity of the fetal anatomy, variability of image clarity and the possible outcome of pregnancy termination when heart disease is diagnosed in utero, combine to generate considerable psychological stress for the physician. The decisions and discussions, when an unborn fetus is abnormal, are burdensome and difficult.

The College believes this service, fetal echocardiography, has a significantly higher work value than that currently assigned. Although the median survey value is 2.57, we believe a value of 1.67 is appropriate and urge the RUC to adopt this recommendation.

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 78006	Thyroid imaging, with uptake; single determination	0.49
2) 78018	Thyroid carcinoma metastases imaging; whole body	0.95
3) 78223	Hepatobiliary ductal system imaging, including gallbladder, with or without pharmacologic intervention, with or without quantitative measurement of gallbladder function	0.84
4) 78472	Cardiac blood pool imaging, gated equilibrium; single study at rest or stress (exercise and/or pharmacologic), wall motion study plus ejection fraction, with or without additional quantitative processing	0.98

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 78070 compares extremely well to its key reference services (78006, 78018, 78223, and 78472) with respect to intensity and time. With respect to intensity, code 78070 meets or surpasses its reference codes individually and collectively. Furthermore, its estimate of total time is comparable to the other reference procedures.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 78070 is the survey's median value (0.95).

Nearly two-thirds of the respondents (65.1 percent) felt that the work involved in the procedure has changed over the last five years (34.9 percent did not). [See the next paragraph for a discussion of how the work involved in the procedure has changed.] In addition, the vast majority of the respondents (70.9 percent) disagreed that technology lessened the amount of work involved in the procedure. The patients undergoing this procedure have not changed, according to 63 percent of the respondents (32 percent thought that patients were more complex and 5 percent thought they were easier). The majority of the respondents (95.8 percent) indicated that the site of service remained the same (4.2 percent thought it changed to the outpatient setting). Lastly, the vast majority of the respondents (88.4 percent) agreed with the vignette.

Since the time procedure was originally valued, the physician work has changed. The patients presenting for the today have had either surgery or some other imaging modality. Therefore, there is more clinical data to consider and correlate with respect to the study's findings.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the total-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 78195 compares extremely well to its key reference services (78018, 78306, 78223, and 78465) with respect to intensity and time. With respect to intensity, code 78195 is comparable to the reference codes, even surpassing them in terms of technical skill and physical effort. Furthermore, its estimate of total time exceeds the other reference procedures.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACR's recommended RVW for code 78195 is the survey's median value (1.47).

Nearly two-thirds of the respondents (64.1 percent) felt that the work involved in the procedure has not changed over the last five years (35.9 percent did). In addition, the vast majority of the respondents (82.8 percent) disagreed that technology lessened the amount of work involved in the procedure. The patients undergoing this procedure have not changed, according to 55.1 percent of the respondents (43.5 percent thought that patients were more complex and 1.4 percent thought they were easier). The majority of the respondents (77.6 percent) indicated that the site of service remained the same (3 percent thought it changed to the inpatient setting and 19.4 percent believed it changed to the outpatient setting). Lastly, the vast majority of the respondents (92.2 percent) agreed with the vignette.

Although the survey's results suggest otherwise, there has been some changes to this procedure that have a bearing on the physician work required. The procedure has benefited from the development of improved small colloids, better imaging techniques, and the use of hand-held detectors to precisely localize sentinel nodes. Based on the results of the procedure, patients may be spared extensive lymph node resection, treatment of lymphedema may be improved, and improved localization of lymph nodes at risk for tumor spread.

ACNP/SNM

American College of Nuclear Physicians/Society of Nuclear Medicine
GOVERNMENT RELATIONS OFFICE

MEMORANDUM

TO: Grant V. Rodkey, M.D.
Chairman, AMA RVS Update Committee (RUC)

John Tudor, Jr., M.D.
Chairman, RUC Five-Year Review Subcommittee

FROM: The American College of Nuclear Physicians (Terence Beven, M.D., RUC Advisor)
The Society of Nuclear Medicine (Kenneth McKusick, M.D., RUC Advisor)

DATE: August 21, 1995

SUBJECT: Extraction of Code 78195 (Lymphatics and lymph glands imaging) from the RUC
Consent Calendar

In keeping with the report from Workgroup 5, the American College of Nuclear Physicians and the Society of Nuclear Medicine would like to extract code 78195 from the consent calendar so that additional information on this procedure can be provided.

Lymphatics imaging is a procedure undergoing change. A few years ago, the study consisted of only imaging the lymph nodes. Today, in addition to basic imaging, the identification of the sentinel node is of primary importance. (See attached article.) The ability to localize the sentinel node is made possible through improved small colloids, better imaging techniques, and the use of hand-held detectors; all of which add to the physician work required. The procedure also is used to map out obstructed lymphatics in cases of lymphema.

Another significant factor in the physician work associated with the procedure has to do with the administration of the radiopharmaceutical. In fact, four to six separate intradermal injections are required, all of which are performed by the physician and not billed additionally. (In a mini-survey of nineteen physicians experienced with the procedure, eighteen indicated that they performed the injection.) The same survey estimated that the median time required to do just the injections was 18 minutes. These injections are performed at the tumor site, either before or after excision. In melanoma cases, the injections are made in highly visible parts of the patient's body (e.g. face, arm, leg). The patients, therefore, are upset over having cancer and concerned over the injections. As a result, there is a sizable amount of patient interaction.

Although there are no other lymphatics codes in Nuclear Medicine for comparison, one reference procedure that shares some of the basic characteristics of code 78195 is code 78630 [Cerebrospinal fluid flow, imaging (not including introduction of material); cisternography], which has an RVW of 0.68. Like code 78195, the physician performs the injection. However, the injection for code 78630 is separately reportable using a code like 62289 (Injection of substance other than anesthetic, contrast, or neurolytic solutions; lumbar or caudal epidural), which has an RVW of 1.64. The imaging and injection codes, when combined, bring the total number of relative values to 2.32. Although the injections for code 78195 are more numerous than that for 78630, they also are less intensive. Therefore, the additional 0.77 RVUs requested for code 78195 (current RVW = 0.70) are justified by the injections alone.

Thank you for your consideration of this request.

Lymphoscintigraphy in High-Risk Melanoma of the Trunk: Predicting Draining Node Groups, Defining Lymphatic Channels and Locating the Sentinel Node

Roger F. Uren, Robert B. Howman-Giles, Helen M. Shaw, John F. Thompson and William H. McCarthy

Nuclear Medicine and Diagnostic Ultrasound, Camperdown and Sydney Melanoma Unit, Royal Prince Alfred Hospital, Sydney, New South Wales, Australia

Lymphoscintigraphy was performed in 209 patients with high-risk melanoma of the trunk referred to the Sydney Melanoma Unit and considered for lymph node dissection. Lymphoscintigraphy accurately defined the draining lymph node groups and was 94% sensitive in detecting draining sites that contained metastases. When combined with the clinical finding of palpable lymph nodes, the sensitivity rose to 98%. Most patients showed lymph drainage to one or two node groups and only 22 patients showed drainage to 3 or more node groups. The major lymph channels could also be marked on the skin prior to incision/dissection. Most patients had multiple draining lymph channels and these often diverged significantly from each other in the path to the draining node group. The number and location of interval nodes could be determined and marked on the skin. These and the major lymph channels could thus be excised at the time of surgery. Unusual drainage patterns were sometimes seen; for example, three patients displayed a new lymph pathway with direct drainage from the back anteriorly to the para-aortic nodes. The location of the sentinel nodes in each draining lymph-node group could also be marked on the skin prior to surgery, enabling quick and accurate identification of this node, using the blue-dye technique if biopsy were to be performed. These findings lead us to recommend lymphoscintigraphy prior to wide local excision in patients with truncal melanoma who are candidates for surgery. Lymphoscintigraphy results will help plan surgery and lead to minimum surgical intervention, consistent with effective surgical management.

J Nucl Med 1993; 34:1435-1440

In patients with clinically impalpable lymph nodes and melanomas thicker than 1.5 mm, micrometastases are detected in nodes excised during elective lymph node dissection in up to 37% of patients (1). Consequently, prognosis of high-risk melanoma of intermediate thickness is im-

proved by early lymph node dissection (ND) performed at the same time as wide local excision (WLE) (2-5).

The difficulty with trunk melanomas is determining which lymph node groups are potential sites of micrometastases and candidates for surgical removal. Many studies using lymphoscintigraphy (LS) have shown the lymphatic watershed concept based on Sappey's work (6) to be incorrect in approximately half the patients (7-9). Clinical judgment based on this concept is thus of no practical use in an individual patient when a node dissection or biopsy is contemplated. LS has itself been used to define which node groups drain a cutaneous lesion, and surgical correlation in some patients has validated this approach (7). The number of patients in such studies has always been small.

The aims of our study were to (1) use LS prospectively prior to WLE and ND in order to define the draining lymph node groups in a large number of patients with truncal melanoma; (2) determine its accuracy in predicting the location of melanoma metastases to lymph nodes; (3) define the number and distribution of the major lymph channels involved in each patient; (4) document the degree of divergence from each other and the expected path to the draining node group; (5) define the number and location of any interval nodes and (6) determine if LS could be used to locate the sentinel node or nodes in each of the draining lymph node groups. The sentinel node is the first to accept and retain the tracer in each draining lymph node group.

METHODS AND MATERIALS

From October 1986 to July 1992, cutaneous LS was performed on 209 patients—159 males and 50 females. Technetium-99m-antimony sulphide colloid ($^{99m}\text{Tc-Sb}_2\text{S}_3$) was prepared on site for each patient, using kits supplied by the Royal Adelaide Hospital radiopharmacy. Technetium-99m was supplied daily by Australian Radioisotopes and produced in the nuclear reactor at Lucas Heights in Sydney. Particle size varied from 3 to 12 μm (10,11). Multiple, small-volume (0.1 ml) intradermal injections were used to surround the biopsy excision site or, in some patients, the primary lesion. All studies were performed prior to wide local excision, which is essential to a good quality study. Specific

Received Nov. 3, 1992; revision accepted Apr. 27, 1993.
For correspondence or reprints contact: Dr. Roger Uren, Missenden Medical Centre, 54-60 Briggs Street, Camperdown, NSW 2050, Australia.

activity of the dose varied from 50–70 MBq/ml, so that each injection contained 5–7 MBq. Between 4 and 14 injections were used, although most patients received 6–8 injections. This delivered a radiation dose of 0.2–0.5 Sv to the injection site. This injection site was completely excised as part of the WLE in all patients within one week.

Careful technique was required to ensure accurate intradermal injections and avoid contamination of the rest of the skin, which greatly complicates interpretation, especially in the definition of interval nodes. A large, waterproof incontinence sheet was used to cover the patient's trunk and a small window cut in the sheet to expose the lesion. Gloves were essential. In addition, because the intradermal injection was under pressure, swabs were placed over the area before the needle was withdrawn to prevent spraying the radionuclide over the patient and provider.

All scans were performed using a large, rectangular field-of-view digital gamma camera (Toshiba 90B) with a low-energy, high-resolution collimator. Each scan view was collected over 10 min. Scanning was commenced immediately and the major lymph channels defined at this stage. The digital camera was important so that the computer image could be enhanced to reveal even the faintest channels, which were drawn on the skin using an indelible marker after the channel had been followed with a radioactive source. We used a drop of ^{99m}Tc in the tip of a needle cap.

Calibrated rulers were provided surgeons so patient measurements could be checked directly with patient scans at the time of surgery. Delayed scans were performed at 2.5 hr and anterior views of the axillary and inguinal areas obtained. If a lesion was high on the back, a posterior view was obtained to check drainage to posterior triangle nodes. Lateral or oblique views were done, if necessary, to define the anterior or posterior position of a node or clarify unusual drainage patterns. Computer enhancement of the image was important, and any discernible activity above background in recognized node group was regarded as a positive finding on delayed scans. Interval nodes were said to be present if focal uptake along one of the lymph channels in early scans was seen as a persisting focal area of uptake in the same spot on delayed scans.

In the last 6 mo of the study, the skin overlying the sentinel node or nodes was marked with an indelible pen for each node group receiving lymph flow from a lesion site. The sentinel node was the first draining lymph node to accumulate the tracer; in delayed images it was the node with the most activity because of significant hold up of colloid particles in the lymph nodes. The more proximal nodes showed less and less activity compared with the sentinel node. Accurate marking of the sentinel node required considerable care and imaging at several angles to avoid parallax error. The marking procedure must be performed with the patient in the normal position for surgery. In the case of axillary nodes, this is supine with the arm at right angles to the body. If this varies, the skin mark will not overlie the node. At surgery, patent blue is injected intradermally at the lesion site (1) and a small incision made at the site of the marked sentinel node, identified with the aid of blue dye.

One of us reported the scans at the time of the study. To test reproducibility of the reporting method for determining drainage sites, the first 51 patients, sorted in alphabetic order, were re-read by two of us separately, without knowledge of the clinical history, physical findings, original report or the other physician's new report.

Wide local excision with or without split-skin grafting was performed on all patients; ND also was performed, unless LS

TABLE 1
Lymph Drainage

Node groups	Patients
1	88 (42%)
2	99 (47.5%)
3	19 (9%)
4	2 (1%)
5	1 (0.5%)

revealed flow to three or more node groups, or the patients refused such surgery or some other contraindication to surgery existed. Lymph nodes excised surgically were examined histologically by hematoxylin and eosin staining to determine the presence of metastatic melanoma.

Patients were followed at regular intervals at the Sydney Melanoma Unit and further resection with histology performed if palpable nodes developed.

RESULTS

Lymphoscintigraphy Reproducibility

The reproducibility study showed 84 positive lymph node groups in 51 patients. Both physician readers agreed on 83 of the 84 node groups. In one patient with a lesion high on the back in the mid-line at the nape of the neck, both agreed there was flow to the supraclavicular node groups but disagreed about a small node in the posterior triangle close to the lesion site.

PATIENT STUDIES

Node Groups

Lymph drainage patterns in the 209 patients are summarized in Table 1. One hundred and eighty-seven patients (89%) had drainage to one or two node groups and were potential candidates for ND.

Drainage to the different node groups is described in Table 2. One hundred and twenty patients had drainage to one axilla; 73 had drainage to both axillary node groups. Flow to at least one axilla thus occurred in 193 patients (92%). Three patients, all of whom had lesions in the loin, displayed an unusual drainage pattern. These patients

TABLE 2
Draining Node Groups

Site	Patients
Right axilla	126 (60%)
Left axilla	141 (67%)
Right supraclavicular	16 (8%)
Left supraclavicular	21 (10%)
Right inguinal	11 (5%)
Left inguinal	17 (8%)
Right posterior triangle	5 (2.5%)
Left posterior triangle	7 (3%)
Para-aortic	3 (1.5%)
Right cervical	3 (1.5%)
Left cervical	4 (2%)
Submental	1 (0.5%)
Internal mammary	1 (0.5%)

showed drainage to the axilla or groin as well as a dominant channel passing posteriorly, medially and superiorly to the midline until, at the level of the upper abdomen or the inferior mediastinum, the lymph channel passed anteriorly to the para-aortic area. Activity then passed superiorly and tracer was seen in the thoracic duct on delayed scans (Fig. 1). Another patient with an umbilical lesion showed drainage to the left axilla and the right internal mammary chain (Fig. 2).

Lymph Channels

A total of 592 major lymph channels were seen draining the lesion site in the 209 patients with an average of 2.8 channels per patient. The number of channels varied from 1 to 7, and only 33 patients (16%) had one lymph channel draining to the regional node group. The remaining 176 patients averaged 3.2 channels per patient. Only 40 patients (19%) had channels that passed straight to the draining node group along the expected path; 23 of these had only one major lymph channel. Thus, only 16 of 176 patients (9%) with multiple lymph channels showed straight-forward drainage to a relevant node group. One hundred and sixty patients with multiple lymph channels showed some divergence of channels on their way to the lymph node group. Ten patients with only one channel showed divergence from the expected pathway up to a maximum of 4 cm. In patients with multiple channels, 88 showed a divergence of 5 cm or greater, 22 a divergence of 10 cm or

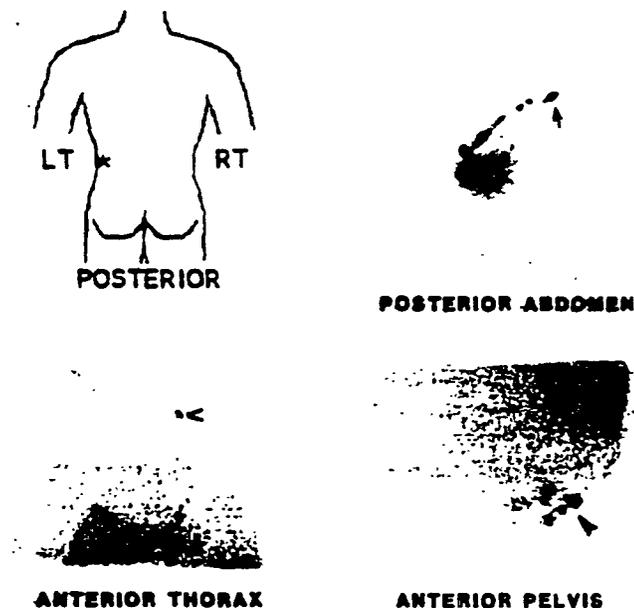

FIGURE 1. Patient with left loin lesion has lymph drainage to left inguinal nodes and para-aortic nodes. The early study posteriorly over the abdomen shows two dominant channels passing superiorly toward midline. Activity was seen in the para-aortic area at this time and on the delayed Anterior view of the thorax (small arrow). Activity was also seen in upper thorax just to the left of midline (open arrowhead) in the thoracic duct region. Delayed scans over the pelvis anteriorly show drainage to the left inguinal nodes (small arrowhead). Three patients showed such para-aortic drainage.

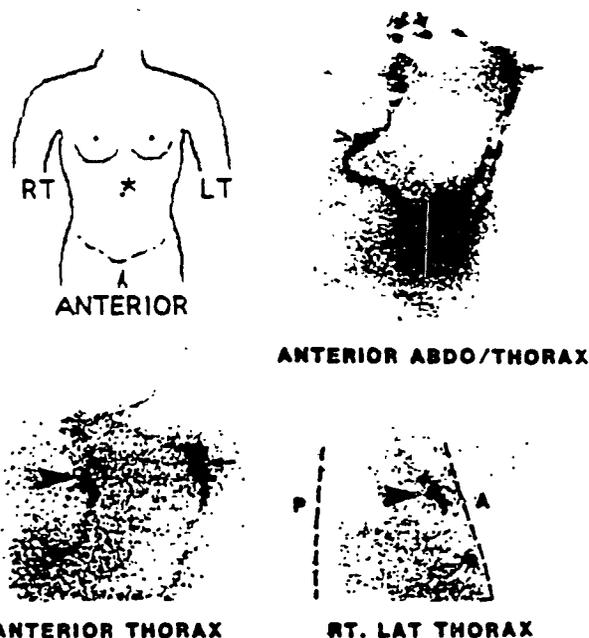

FIGURE 2. Patient with lesion just above and to the left of the umbilicus and with lymph drainage to the right internal mammary chain and the left axilla. Early dynamic phase of the study performed anteriorly over the abdomen and thorax shows dominant channels passing superiorly to the left axilla (small arrow) but also a dominant channel passing superiorly to the right before it turns once more to the left and meets an interval node (open arrowhead). The channel then enters the right internal mammary chain and continues superiorly. Internal mammary lymph nodes can be seen in the anterior and right lateral view of the thorax (large arrowhead). Two small bold arrows on the anterior view of the abdomen and thorax superiorly point to markers for manubrioclavicular joints.

greater and 3 a divergence of 15 cm. The path to draining node groups varied greatly from patient to patient, as did the number of channels draining what appeared to be identical sites on the skin in different patients (Fig. 3).

Interval Nodes

Seventy-seven interval nodes were detected in 45 of 209 patients with an average of 1.7 nodes per patient and from 1 to 7 interval nodes in each patient. Twenty-nine patients had only one interval node. Of the remaining 16, an average of 3 nodes per patient was detected.

Sentinel Nodes

Over the last 6 mo of the study, nodes were marked in 18 patients, involving 29 separate draining node groups with one sentinel node.

Initial Surgery

In 22 of 209 patients, lymph drainage to 3 or more node groups was identified (Table 1), and 20 of these patients had WLE only. Forty-eight patients refused node dissection or had some other contraindication, and had WLE only. The remaining 141 patients had WLE and ND within one week of LS. In 30 patients there were 34 draining node groups that showed metastases.

Lymphoscintigraphy correctly predicted lymphatic

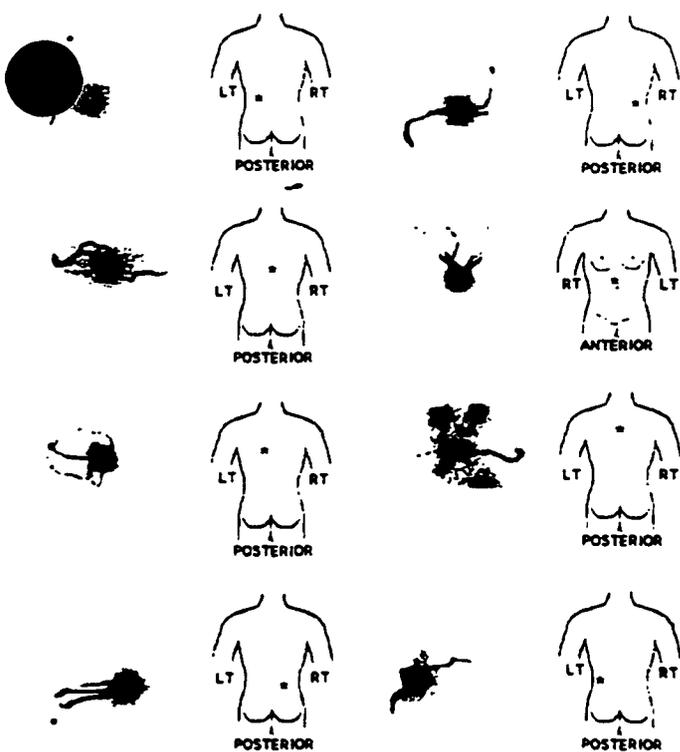

FIGURE 3. Figure illustrates the large variation in the pattern and number of draining lymph node channels. The early phase image is on the left in each case, with the position of the lesion marked on the corresponding torso to the right. Lesions in similar sites in different patients have dramatically different lymphatic drainage, which the study consistently reinforced. If an incisional dissection is performed with the intent to remove major lymph channels and interval nodes, LS information would appear essential.

drainage to 32 of the 34 sites. Of the two incorrect cases, the first patient had a lesion in the low back just to the left of midline and palpable nodes in the right inguinal area. The early LS showed a dominant channel passing to the left. Despite activity in the right and left inguinal areas on delayed scans (left more than right), the scan was misinterpreted and drainage diagnosed to the left inguinal area only. In view of clinical findings, the surgeons ignored scan results and performed a node dissection on the right groin at the site of the clinically palpable nodes and found metastases to multiple nodes in the groin, which might explain less uptake in the right inguinal nodes than in the left. Both physicians correctly reported bilateral inguinal drainage in a subsequent re-read as part of the reproducibility study.

The second patient had a lesion in the right loin posteriorly and laterally. LS showed drainage to the right axilla only. Nodes were clinically palpable in the left axilla and contained metastases at surgery. Even in retrospect no activity could be seen in the left axilla on the LS study.

Among 18 patients with marked sentinel nodes one patient's sentinel node contained a tumor; the other 13 nodes were normal. Sentinel nodes in the remaining 17 patients were normal.

Subsequent Follow-up

In 14 patients, 17 node groups subsequently developed metastases. Sixteen sites originally were predicted on LS to be potential sites of micrometastases. One patient with a lesion on the upper back to the right of midline showed dominant channels passing to the right axilla, with a small truncated channel passing superiorly and to the left for 3-4 cm. Delayed scans showed activity in the right axilla only. In retrospect, there may have been a faint trace of activity in the left axilla on the anterior view. At the time of the study, there were no palpable nodes in either axilla and, because of age, the patient received a WLE only. The course of disease was extremely rapid: Metastases developed in both axillary node groups within 5 mo and the patient died with bone metastases 18 mo after WLE.

DISCUSSION

The reproducibility study shows that interpretation of LS studies is reproducible to an acceptable degree with 99% agreement. It is reasonable to expect a similar accuracy among other nuclear medicine physicians; detecting the presence of activity as a positive finding is much easier than detecting decreased activity as a positive finding. The most difficult area for interpretation is around the neck; lateral and superior oblique views may be required here.

Axillary Drainage

We have shown that most patients (92%) with truncal melanoma have drainage to at least one axilla. Slightly more than half (58%) have more than one draining node group, although only 10.5% have drainage to three or more node groups. Our study reemphasizes the extreme variability of lymphatic drainage in individuals, which makes general rules inappropriate when predicting draining groups clinically (Fig. 3). Many patients showed surprising drainage across the midline, even when the lesion site was quite lateral. Lesions do not have to be near the midline, Sappey's line or the shoulder to have ambiguous drainage.

We also described a small group of patients who displayed unusual drainage patterns. Three included para-aortic drainage (12), which has not previously been described. Since completing the study, we have seen two more patients with this drainage pattern. We also have seen a patient with internal mammary drainage. Norman et al. (8) recently attempted to redefine lymph drainage patterns and enlarge the ambiguous drainage zone in which they advise LS. However, our experience favors LS in any patient with truncal melanoma considered for ND, regardless of the site of the lesion.

Sensitivity of Lymphoscintigraphy

The sensitivity of LS in detecting drainage sites that may contain metastases is 94%, or 96% if the one obvious misinterpretation is removed. The two remaining false-negative cases indicate that some node groups do not accumulate sufficient tracer to be detected with this technique, although they are potential drainage sites. If LS were combined with clinical findings of palpable lymph nodes, there

would have been 98% sensitivity. This overall degree of sensitivity means that LS can reliably be used prospectively to guide surgical intervention in patients with truncal melanoma. It removes the uncertainty associated with clinical judgment regarding node groups that contain micrometastases, thus limiting surgical resection to only those node groups that are potential sites of spread.

It has been postulated that melanoma metastases can block the lymph channels and replace the lymph nodes (8), causing nonvisualization of potential drainage sites on LS. This was not a significant problem in this study; in fact, good channels were sometimes seen despite clinically obvious, in-transit metastases in the lymph channels (Fig. 4).

Mapping Drainage Channels

We mapped the major lymph drainage channels by drawing the path of the channels on the patient's skin. This dramatically demonstrates great variation in the distribution of the draining lymph channels from patient to patient even when the lesion site is almost identical (Fig. 3). Early in the study, it was obvious that lymph channels often took a tortuous path to the draining lymph node group, indicating that an incision to the node group along the usual path would frequently miss much of the channel. If an incision is to be performed with intent to remove the major lymph channels and any interval

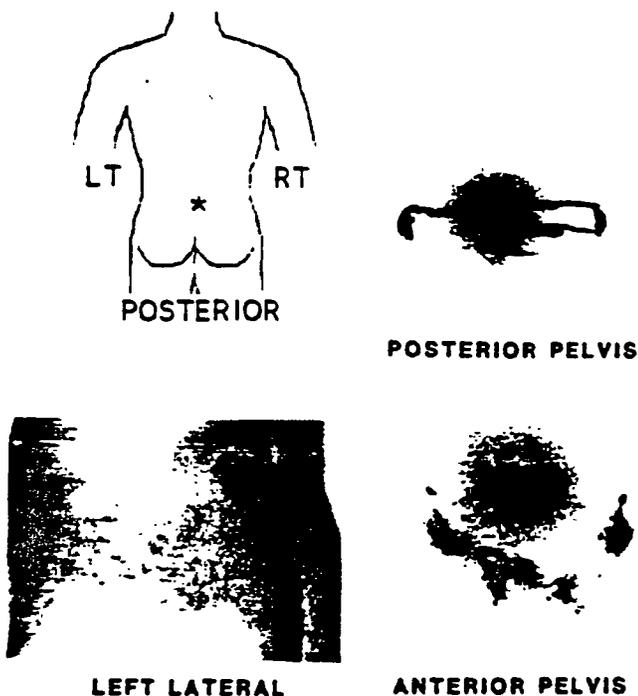

FIGURE 4. Patient with visually obvious metastases in major lymph channels passing from low back in midline to inguinal regions bilaterally (left lateral photograph). The major lymph channels, despite presence of intransit metastases, were clearly visualized on LS in the early dynamic phase performed posteriorly over the pelvis. On the delayed image anteriorly over the pelvis, little activity was seen in the inguinal nodes and most of the tracer remained in the lymph channels, suggesting that the rate of lymph flow was reduced by the metastases.

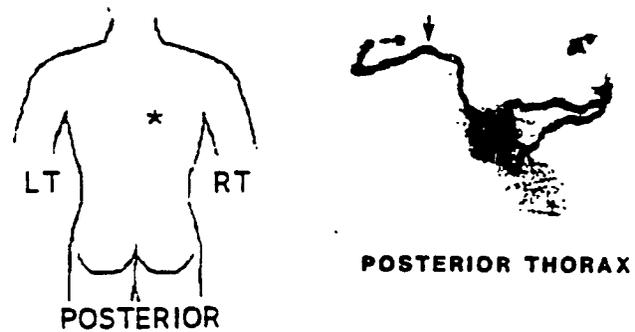

FIGURE 5. Patient with lesion on the mid back to the right of midline. Early dynamic phase performed posteriorly over the thorax shows two dominant channels passing to the right axilla and a tortuous single dominant channel passing to the left. The channel takes a superior path before turning toward the left axilla. An incision was performed on the left without exact correlation with the LS findings and a narrow strip of tissue removed followed by primary closure. The strip was below the actual path of the channel on the left; an intransit metastasis developed later at the site of the original high channel on the left (arrow).

nodes, it would be important to define the exact location of these structures. Drawing the major lymph channels on the skin demonstrates the practicality of performing an effective incision. In patients with a single dominant channel only, one can excise a thin strip containing the lymph channel, with primary closure. In patients with multiple divergent channels, a much wider resection, possibly with grafting, may be necessary. Figure 5 illustrates this point well. It was this case that led us to change from simply supplying the surgeon with LS films and a calibrated ruler, to actually drawing the path of the major lymph channels on the patient's skin with an indelible pen.

Locating the Sentinel Node

During the last 6 mo of the study we marked the sentinel node in each draining node group. This has proved to be one of the most useful aspects of LS; in the 6 mo since completion of the study, we performed sentinel node marking in another 100 patients. Locating and examining the sentinel node makes sense: If the sentinel node is normal, the likelihood that other nodes will contain metastases is low. A more radical node dissection can be avoided, with little chance that micrometastases will be missed.

LS speeds up the location of the sentinel node using the dye technique and identifies patients with interval nodes between the lesion site and the draining lymph node group. This approach is less technically demanding than dissecting the lymph channels (1).

Using LS to locate the sentinel node is also relevant for melanoma on the upper and lower limbs. Screening the node group by removing only the sentinel node should markedly decrease the incidence of lymphedema if the node is negative and a radical dissection can be avoided. Surgical resection was generally not done if there were drainage to more than two node groups. With the ability to mark the sentinel node, multiple sentinel node biopsies can be performed in different node groups, with radical dissec-

tion confined to groups with metastases in the sentinel node. The approach makes surgery available to more patients.

Great care should be taken in marking the sentinel node or nodes: The LS technique and multiple-orthogonal views must be used to avoid parallax error when marking the node site on the skin. The patient must also be in the same position as that used for surgery.

CONCLUSION

This study demonstrates that LS makes available considerable information to assist surgical management of patients with melanoma of the trunk. It can accurately define node groups draining the lesion site and identify sites of potential micrometastases in patients who do not have palpable lymph nodes. The number of node groups draining the lesion site may determine if surgery is practical. The number and actual path of the draining lymphatic channels can be defined and marked on the patient's skin prior to surgery; continuity dissection includes all of the major lymph channels and any interval nodes.

The sentinel node in each draining lymph node group can be marked on the skin, allowing rapid location of the sentinel node during surgery using the blue-dye technique. Patients who have a negative sentinel node may be spared a radical-node dissection and will have only a small incision over the sentinel node itself. We have confirmed previous studies that demonstrate great variability of lymph drainage in individuals and have also shown a new drainage pathway from the back to the para-aortic nodes. These findings lead us to conclude that LS is indicated in any patient with melanoma of the trunk who is being considered for surgical resection of the lymphatics and lymph nodes.

ACKNOWLEDGMENTS

The authors thank Ian Dyer, NMT, Sally Raymond, NMT, Kim Ioannou, NMT, and Tracey Larnach, NMT, for the high-quality technical assistance so essential in performing lymphoscintigraphy over the six years of the study. We thank Sandra Pascoe for professional secretarial assistance. We also are indebted to the Melanoma Foundation for partial financial support for H.M. Shaw's work.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Cardiology and Interventional Radiology

The RUC considered comments submitted by the Society of Cardiovascular and Interventional Radiology (SCVIR), the Society of Critical Care Medicine (SCCM), and the American College of Cardiology (ACC) on twenty-five cardiology and interventional radiology procedures.

SCVIR reported to the RUC that it did not conduct a RUC survey. Instead, SCVIR sent a survey containing all of the interventional radiology codes to 60 interventional radiologists which asked the physicians to evaluate the 1995 RVU for each code and select those codes that they believed were misvalued. For the codes selected, the respondents were instructed to indicate which CPT code they felt more accurately described the service in terms of time and intensity. These responses were then evaluated by a small working group formed by SCVIR consisting of physicians that are familiar with CPT, RBRVS, and the RUC process. Those codes that were identified by the working group, and misvalued were the codes that the society commented upon. In their comments to HCFA and during the RUC presentation, SCVIR mentioned that the physician work for vascular ultrasound studies is equal to all other diagnostic ultrasound services including those in the abdomen, chest, pelvis, retroperitoneum, and heart. The relative value recommendations are based on values for either "limited" or "complete" ultrasound exams in those areas.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
35470	Repair arterial blockage	8.63	8.63	The CMDs note that HCFA's objective has been to pay the same amount for open and percutaneous angioplasties, atherectomies, and stent placements. However, when percutaneous procedures are reported, a code for access to the vessel (36011 - 36012 and 36215 - 36248) and a code for radiologic interpretation (75960, 75962 - 75968, 75978 and 75993 - 75996) are reported in addition to the code for the definitive procedure. For example, for code 35474[Transluminal balloon angioplasty, percutaneous; femoral-popliteal] the physician can also report 36246[Selective catheter placement, arterial system; initial second order abdominal, pelvic, or lower extremity artery branch, within a vascular family] and 75962[Transluminal balloon angioplasty, peripheral artery, radiological supervision and interpretation]. In contrast, for an open procedure such as 35456[Transluminal balloon angioplasty, open; femoral-popliteal], the physician would only report one code.	The SCVIR explained that open revascularization procedures are typically done by surgical arteriotomy (or venotomy) as an adjunct to the performance of bypass procedures. For example, angioplasty of the iliac artery would be done in order to improve inflow for a subsequent femoral-popliteal bypass. Open angioplasty is also performed as a substitute for percutaneous angioplasty, atherectomy, or stenting, or open angioplasty is performed by direct percutaneous puncture of the artery. SCVIR contends that open vascular recanalization techniques are legitimate techniques when they are used by at the time of surgery either in an adjunctive manner or in a situation in which percutaneous access is impossible or too dangerous. Further, SCVIR contends that the utilization of open angioplasty when percutaneous techniques should be used is inappropriate since it typically involves more cost and subjects patients to the additional risk of general anesthesia. Thus, the use of the open percutaneous revascularization codes is necessarily limited to a relatively small group of patients with highly specific circumstances, usually those in which surgical bypass is being used. SCVIR also noted that for cases of noncoronary intervention, angioplasty is described separately from the arterial or venous access and the interpretation of the procedure. In the case of coronary angioplasty, a single CPT code is used to describe the entire activity including access to the vessel.	2
35471	Repair arterial blockage	10.07	10.07			2
35472	Repair arterial blockage	6.91	6.91			2
35473	Repair arterial blockage	6.04	6.04			2
35474	Repair arterial blockage	7.36	7.36			2
35475	Repair arterial blockage	9.49	9.49			2
35476	Repair venous blockage	6.04	6.04			2
35490	Atherectomy, percutaneous	11.08	11.08	The CMDs contend that the percutaneous procedures are, therefore, overvalued in relation to the similar open procedures. The CMDs note that the exact amount of overvaluation depends on the RVUs for the primary procedure, the code that would be used to report the access, and the radiologic supervision and interpretation codes.	2	
35491	Atherectomy, percutaneous	7.61	7.61		2	
35492	Atherectomy, percutaneous	6.65	6.65		2	
35493	Atherectomy, percutaneous	8.10	8.10		2	
35494	Atherectomy, percutaneous	10.44	10.44		2	
35495	Atherectomy, percutaneous	9.49	9.49		2	
37205	Transcatheter stent	8.28	8.28		2	
37206	Transcatheter stent	4.13	4.13	2

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

• = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
93000	Electrocardiogram, complete	0.17	0.17	CPT codes 93000 and 93010 were identified as overvalued by the CMDs. The CMDs noted that the interpretation of the majority of ECGs involves relatively few parameters in comparison to history and physical examination. They also noted that the intra-service time of this procedure which has been directly measured and reported in literature is approximately one minute. They also noted that physicians have been observed to read thirty to forty ECGs in one hour.	The specialty societies noted that the physician does the interpretation for this procedure. Although ECGs are interpreted by computer, particularly in the hospital setting, these results are "over read" by a physician. This code was surveyed by ACP and the survey median was 0.20. Although this value is slightly higher than the current value of the code the specialty society recommended maintaining the current value of the code at 0.17. The RUC noted that the Harvard time was 8 minutes for 93000 and 5 minutes for 93010. The specialty societies reported a median intra-service time of 5 minutes for both procedures. The RUC recommended maintaining the current values for these codes.	2
93010	Electrocardiogram report	0.17	0.17			2
93278	ECG/signal-averaged	0.35	0.25	This code was identified as overvalued by the CMDs. The CMDs noted that the physicians simply interpret computer generated data and this represents less physician work than the reference codes 71020[Radiologic examination, chest, two views, frontal and lateral] (0.22) and 93010[Electrocardiogram, routine ECG with at least 12 leads; interpretation and report](0.17).	The specialty societies agreed that this service may be overvalued. However, while they agree that 93278[Signal-averaged electrocardiography (SAECG), with or without ECG (0.35)] is not twice the physician work of a standard 12-lead ECG [93010(0.17)], it does involve more physician work than 93010. They recommended a value of 0.25 for this procedure which also represents the survey median. Based on the survey data of the specialty society, the RUC recommended accepting the specialty society recommendation of lowering the RVU for this procedure to 0.25.	3

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
93307	Echo exam of heart	0.78	1.06	In their comment letter to HCFA, the specialty society noted that while many of the echocardiography procedures in the Medicare Fee Schedule have been reviewed, and in some instances revised, it is apparent that several echocardiography services including 93307[Echocardiography, real-time with image documentation (2D) (with or without M-Mode recording); complete], continue to be undervalued in comparison to other services that require similar physician work effort.	<p>The specialty society reported that the field of echocardiography has changed significantly in the past five years, in both clinical utility and diagnostic complexity. Although the technical innovations of the past five years have made this an easier service to perform, the patients that require this service are more complex, which has resulted in an increased amount of physician work. The physicians are viewing and making judgements on constantly moving objects, which increases the possibility of misinterpretation. Often this service is provided in acute care settings or emergency situations which increase physician stress. The information derived from this study is used in the development of critical management decisions. The risk of misdiagnosis, in both emergent and non-emergent situations, can lead to potentially fatal events.</p> <p>Although the RUC agreed that the code is undervalued based on the amount of physician work that is required to perform this study and the increased amount of information that can now be derived from echocardiography, they felt that the specialty society recommendation was too high and suggested the Harvard value for this procedure which is 1.06.</p>	4

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
93312	Echo exam of heart	1.57	2.39	In their comment letter to HCFA, the specialty society noted that while many of the echocardiography procedures in the Medicare Fee Schedule have been reviewed, and in some instances revised, it is apparent that several echocardiography services, including 93312[Echocardiography, real-time with image documentation (2D) (with or without M-Mode recording), transesophageal; including probe placement, image acquisition, interpretation and report], continue to be undervalued in comparison to other services that require similar physician work effort.	The specialty society noted that the mental effort required to perform a transesophageal echo is considerable. As described in the previous discussion of 93307, the heart is constantly moving, increasing the possibility of misinterpretation which could lead to misdiagnosis. There is an added technical skill required by the physician to insert the probe into the esophagus and the stomach of a critically ill patient. This procedure is often performed in the emergency setting while the patient is under conscious sedation. In 1992, the ACC recommended an RVU for this service of 2.50. If the budget neutrality adjustments implemented since the inception of the MFS are applied to this value of 2.5, a 1995 value of 2.39 results. As a point of reference, Harvard Phase III data show a value (adjusted, per HCFA standards, to be on a scale equivalent to 1995 values) of 2.76 for CPT code 43235, the MPC code being used in this comparison. The Harvard Phase III value for TEE of 3.17, modified to be on the 1995 scale, reduces it to a value of 2.76 RVUs. The value is higher than both the existing value of 1.59 and the 2.39 value recommended by ACC. The specialty recommended an RVU of 2.39. The RUC agreed with the specialty society rationale, and recommended an increased RVU.	1

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
93320	Doppler echo exam, heart	0.38	0.38	In their comment letter to HCFA, the specialty society noted that while many of the echocardiography procedures in the Medicare Fee Schedule have been reviewed, and in some instances revised, it is apparent that several echocardiography services, including 93320[Doppler echocardiography, pulsed wave and/or continuous wave with spectral display; complete], continue to be undervalued in comparison to other services that require similar physician work effort.	The ACC noted that this procedure is an add-on service to the 2D/mode echo [93307(0.78)] and is always reported with 93307. Doppler echo is a diagnostic ultrasonic technique. A spectral Doppler echo provides multiple functional measures including systolic and diastolic vascular performance. The RUC was informed that because of improved technology, generation of images that require more in depth analysis, has significantly changed the work of this procedure since 1993. Evidence was presented by the specialty society that during the 15 minute intra-service time of this procedure, the physician measures systolic and diastolic parameters and pulmonary pressures, while at the same time looking at images of flow velocities. Also during the intra-service time, the physician is calculating results by hand or with the assistance of a computer, and comparing this information to the data generated during 93307. The RUC recommended maintaining the current value of this procedure.	2

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
93503	Insert/place heart catheter	2.43	2.43	In their comments to HCFA, and their presentation SCCM noted that this procedure has been historically undervalued in relationship to the service that is being provided.	<p>CPT code 93503 describes the placement of the Swan-Ganz catheter. Although the actual catheterization procedure is the same as the right heart catheterization [93501(3.02)], right heart catheterization is performed under the controlled conditions of the cardiac catheterization lab. The work intensity of the 93503 is greater since it is usually performed in an emergency situation. The post service times of these procedures are also different as the right heart catheter stays in place for 1-2 hours, but the Swan-Ganz catheter is in place for five days. Because the Swan-Ganz catheter remains in place considerably longer, there is a significantly increased risk of sepsis, venous thrombosis, and pulmonary infarction.</p> <p>The RUC noted that Swan-Ganz catheters are also placed in the operating room which is usually a controlled atmosphere. They felt that although this code represents a higher work intensity for the critical care physician, this is not the case 100% of the time. The RUC did not feel that there was compelling evidence to increase the value of the code and recommended maintaining the current value of 2.43 for this procedure.</p>	2
93505	Biopsy of heart lining	4.56	4.38	In their comment letter to HCFA, the specialty society noted that they believe 93505 is slightly overvalued with an RVU of 4.56 relative to a left heart catheterization code 93510 with an RVU of 4.33. The specialty society also believes that the work RVU of 4.33 for a left heart catheterization be applied to 93505, as the physician work in both procedures is similar.	The RUC accepted the specialty society argument that 93505 is overvalued and recommends reducing the RVU of this procedure to 4.33 RVUs, which is the same RVU as the left heart catheterization CPT code 93510.	3
93527	Rt & Lt heart catheters	7.28	7.28	Although ACC submitted a public comment, after further review, the ACC believes that these codes are correctly valued and recommend no change.	The RUC agreed with the specialty society, and recommended maintaining the current value.	2
93529	Rt, Lt heart catheterization	4.80	4.80			2

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/Rationale	Key
93539	Injection, cardiac cath	0.29	0.40	In their comments to HCFA, the ACC noted that although all of the injection codes (93539-93545) were valued 0.29 RVUs. HCFA recognized that CPT code 93540 does involve additional physician work and raised the RVU to 0.43 for this procedure. The ACC concurs with HCFA that all of the injection procedure codes do not involve the same amount of physician work, therefore each code should be placed on a scale of relative value units based on the actual work involved to maintain consistency within the RBRVS.	The RUC agreed with the specialty society rationale, and agreed to increase the RVU for this code. The RUC noted that this increased value for 93540 is due to the complexity associated with injecting into smaller vessels, and that this increase will maintain consistency within the family of codes.	1
93544	Injection for aortography	0.29	0.25	In their comments to HCFA, the ACC noted that although all of the injection codes (93539-93545) were valued 0.29 RVUs. HCFA recognized that CPT code 93540 does involve additional physician work and raised the RVU to 0.43 for this procedure. The ACC concurs with HCFA that all of the injection procedure codes do not involve the same amount of physician work, therefore each code should be placed on a scale of relative value units based on the actual work involved to maintain consistency within the RBRVS.	In this case, the amount of physician work involved in CPT code 93544[Injection procedure during cardiac catheterization; for aortography] is actually less than what the current RVU of this procedure reflects. Therefore, the specialty society recommended decreasing the RVU for this procedure from the current RVU of 0.29 to 0.23 RVUs. The RUC agreed with the specialty society rationale, and agreed to decrease the RVU for this code. 0.25	3
93545	Injection for coronary x-rays	0.29	0.40	In their comments to HCFA, the ACC noted that although all of the injection codes (93539-93545) were valued 0.29 RVUs. HCFA recognized that CPT code 93540 does involve additional physician work and raised the RVU to 0.43 for this procedure. The ACC concurs that all of the injection procedure codes do not involve the same amount of physician work, therefore each code should be placed on a scale of relative value units based on the actual work involved to maintain consistency within the RBRVS.	The RUC agreed with the specialty society rationale, and agreed to increase the RVU for this code. The RUC noted that this increased value for 93540 is due to the complexity associated with injecting into smaller vessels, and that this increase will maintain consistency within the family of codes.	1
93561	Cardiac output measurement	1.15	0.50	The CMDs commented that they felt the pre-, intra-, and post-service times of this code were inaccurate. They also noted that the methodology of this procedure has changed, with the procedure being performed by critical care nurses.	The RUC accepted the the CMD recommendation to decrease the RVUs for codes 93561 and 93562.	3
93562	Cardiac output measurement	0.37	0.16			3

93641	Electrophysiology evaluation	5.93	5.93	In their public comment letter to HCFA the Mayo foundation requested that HCFA reconsider the RUC recommendation of 8.60 RVUs for this procedure to better reflect the physician work that is involved in providing this service. The letter notes that when compared to the additional work of testing the generator to code 93724[electronic analysis of an antitachycardia pacemaker system (4.94 RVUs), physicians indicate that the pulse generator testing involves more physician work. Physician work and risk to the patient are increased as life-threatening ventricular arrhythmias are induced to determine the initial settings.	<p>When the RUC reviewed this procedure in 1993 it recommended an RVU of 8.60. Although HCFA agreed that there was more physician work required to provide the service described by 93641 vs. 93640[Electrophysiologic evaluation of cardioverter-defibrillator leads (includes defibrillation threshold testing and sensing function) at time of initial implantation or replacement (3.52)] however, HCFA disagreed that the work was worth 5.00 more RVUs than the work of 93640. Instead, HCFA reasoned that the additional work of 93641 requires 1/2 hour of moderately high intensity intraservice work, which HCFA valued at 2.00 RVUs. Thus, HCFA established an initial value of 5.52 RVUs for this procedure.</p> <p>This code was presented to the RUC again in 1994. The RUC recommended to HCFA that the RVU of this procedure 5.93 which is the current value of this procedure. Since this procedure was recently reviewed by the RUC, the RUC recommends maintaining the current value of this procedure.</p>	2
93733	Telephone analysis, pacemaker	0.17	0.17	In the public comment letter submitted by Cardiac Datacorp-CardioCare which is a cardiac monitoring company that provides transtelephonic monitoring services, they noted that it is their belief that for dual chamber pacemakers, code 93733, the RVUs for physician work are disproportionately low and should be adjusted slightly upward. Specifically, they noted that for dual chamber pacemaker, more time is required for testing, interpretation and intervention relative to single chamber devices code 93736. They believe that this differential should be reflected in the work RVUs for telephone analysis, just as it is for clinical analysis. They conclude that the physician work RVUs for telephone analysis are currently undervalued by 20%.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2

93922	Extremity study	0.25	0.25	In their comments to HCFA the specialty society noted that they considered CPT code 93922[Noninvasive physiologic studies of upper or lower extremity arteries, single level, bilateral (eg, ankle/brachial indices, Doppler waveform analysis, volume plethysmography, transcutaneous oxygen tension measurement)] undervalued relative to the amount of physician work involved in performing this procedure.	SCVIR reported that although this service is bilateral, it involves only limited evaluation of a single arterial level, and as such is equivalent to limited studies of the pelvis 76857[Echography, pelvic (nonobstetric), B-scan and/or real-time with image documentation; limited or follow-up (eg, for follicles) (0.38)] and heart 93320[Doppler echocardiography, pulsed wave, and/or continuous wave with spectral display; complete (0.38)]. The RUC did not accept the specialty society's arguments as compelling, and recommended maintaining the current value.	2
93923	Extremity study	0.45	0.45	In their comments to HCFA the specialty society noted that they considered CPT code 93923[Noninvasive physiologic studies of upper or lower extremity arteries, multiple levels, or with provocative functional maneuvers complete bilateral study (eg, segmental blood pressure measurements, segmental Doppler waveform analysis, segmental volume plethysmography, segmental transcutaneous oxygen tension measurements, measurements with postural provocative tests, measurements with reactive hyperemia)] undervalued relative to the amount of physician work involved in performing this procedure.	SCVIR reported that this scan describes a "complete bilateral" study which is essentially equivalent in physician work to CPT codes 76700(0.81), 76770(0.74), and 93307(0.78). SCVIR also noted that scanning of the extracranial arteries also involves the same technology and instrumentation of 93307. The RUC did not accept the specialty society's arguments as compelling, and recommended maintaining the current value.	2
93924	Extremity study	0.50	0.50	In their comments to HCFA the specialty society noted that they considered CPT code 93924[Noninvasive physiologic studies of lower extremity arteries, at rest following treadmill stress testing, complete bilateral study] undervalued relative to the amount of physician work involved in performing this procedure.	SCVIR reported that this is a labor intensive service involving the evaluation of all lower extremity arteries before and after exercise testing. The recommended RVU for this procedure therefore, is related to the work involved in 93922 and 93923. The RUC did not accept the specialty society's arguments as compelling, and recommended maintaining the current value.	2
93925	Lower extremity study	0.58	0.58	In their comments to HCFA the specialty society noted that they considered CPT code 93925[Duplex scan of lower extremity arteries or arterial bypass grafts; complete bilateral study] undervalued relative to the amount of physician work involved in performing this procedure.	SCVIR noted that this procedure is labor intensive and should be valued according to the above mentioned method for a "complete" study. The RUC did not accept the specialty society's arguments as compelling, and recommended maintaining the current value.	2

Grant V. Rodkey, M.D.
AMA/Specialty Society RVS Update Process
American Medical Association
515 North State Street
Chicago, Illinois 60610

Dear Dr. Rodkey:

Re: SCVIR Comments on Percutaneous Revascularization Codes 35470 - 37206

On behalf of the Society of Cardiovascular and Interventional Radiology (SCVIR), a 2500 member organization composed of practicing vascular and interventional radiologists, we are pleased to include our comments on percutaneous vascular recanalization codes 35470 through 37206 which were commented upon by the Medicare carrier medical directors as part of the 5-Year Review Process. The carrier medical directors' comments were based upon a comparison between the codes for open angioplasty/atherectomy/stenting of vessels versus the percutaneous performance of the same procedures. In their comments they stated that the open and percutaneous procedures should be similarly paid but felt that the total work units paid for percutaneous revascularization procedures were greater because of the inclusion of arterial access as well as the inclusion of and supervision and interpretation codes.

During the initial phases of the RUC's work on the 5-Year Review process and public comments, the RUC recommended that the work values for percutaneous revascularization remain unchanged. We agree with this decision since we strongly believe that these percutaneous revascularization codes are appropriately valued having undergone the methodologic rigor of an extensive survey and scrutiny by the RUC. Nevertheless, we think that it is important for us to counter any misconceptions that might be present. These percutaneous revascularization procedures are an extremely important part of the practice of modern medicine. Changes in work values for these procedures and thus decreases in payments to physicians for providing these services would clearly negatively impact access to these services by Medicare beneficiaries.

The codes in question by the carrier medical directors include percutaneous angioplasty codes 35470 through 35476 which encompass percutaneous balloon angioplasty of the lower extremity vessels, renal, brachiocephalic arteries, and veins, as well as CPT codes 35490 through 35495 which describe percutaneous

atherectomy of the lower extremities, aorta, renal, and brachiocephalic arteries (there is no code for atherectomy of veins). Finally, 2 codes describe the percutaneous placement of stents in noncoronary vessels 37205 and 37206. The percutaneous codes are matched by CPT codes describing the open (surgical) performance of these same procedures.

Definition and Use of Open Revascularization Codes

For purposes of definition, it should be noted that open procedures are typically done by surgical arteriotomy (or venotomy) as an adjunct to performance of bypass procedures. The use of open angioplasty would occur for example in a situation in which a patient with an iliac artery stenosis proximal to an occluded superficial femoral artery required treatment of both lesions for adequate revascularization of the lower extremity. In this situation, the operating surgeon may choose to perform both procedures in the OR and angioplasty of the iliac artery would be done after exposure of the common femoral artery in order to improve inflow for subsequent femoral-popliteal bypass. A similar situation might be encountered in which an angioplasty is performed distal to a recently placed bypass graft in order to improve outflow after stenoses were visualized at the time of surgery. Another way in which open angioplasty is sometimes performed is as a pure substitute for percutaneous angioplasty, atherectomy, or stenting. In this situation a patient is brought to the operating room and a cut-down performed on the artery whereupon the artery is punctured with a needle (as in the percutaneous technique) and the procedure performed in that manner. In still other situations open angioplasty is simply performed in the operating room by direct percutaneous puncture of the artery in a totally analogous manner to that performed using percutaneous techniques. It is our contention that open vascular recanalization techniques are legitimate techniques when they are used at the time of surgery either in an adjunctive manner or in a situation in which percutaneous access is impossible or too dangerous. We believe that the utilization of open angioplasty when percutaneous techniques can and should be done is inappropriate since it typically involves more cost (operating room time) and subjects patients to the additional risk of general anesthesia. Thus, the use of the open percutaneous revascularization codes is necessarily limited to a relatively small group of patients with highly specific circumstances, usually those in which a surgical bypass procedure is being used.

Our rationale for retaining the current work values for these percutaneous recanalization codes is based on 3 separate issues: 1) History of the derivation of these values. 2) The equivalence of work with other percutaneous vascular interventions, specifically cardiac catheterization and coronary angioplasty. 3) Actual utilization of open angioplasty codes.

I. Construction and Valuation of Vascular (Coronary and Noncoronary) Access and Recanalization Codes

The current system of coding for peripheral vascular access, diagnostic arteriography, and percutaneous intervention dates to 1991 when a new group of codes for interventional radiology services was introduced into CPT and valued during the construction of the Medicare RBRVS. Further refinement of these codes by redefinition of angioplasty codes to include only balloon angioplasty and the introduction of new codes for atherectomy and stenting (with their subsequent valuation by the RUC) was completed in 1992 and 1993. At roughly the same time, coronary diagnostic and interventional services were also revised and revalued. The basis for the work values for angioplasty (introduced in 1992) and atherectomy and

stent (introduced in 1993) was careful survey of participating and practicing physicians including interventional radiologists, cardiologists, and vascular surgeons. Hsiao-based surveys were used to gather the data. Work values for these services were derived and presented to the RUC and accepted (with slight modifications by HCFA) as documented in the Federal Register, November 25, 1991 and November 25, 1992. One of the overriding concepts in valuation of all vascular recanalization codes was that the work involved in open and percutaneous procedures be identical.

II. Equivalence of Work with Other Percutaneous Vascular Interventions

It should be noted that for cases of noncoronary intervention, angioplasty is described separately from the arterial or venous access and the interpretation of the procedure. In the case of coronary angioplasty, a single CPT code is used to describe the entire activity including access to the vessel. This system has been carefully constructed to yield appropriate values for the physician work involved in these important therapeutic services and permits physicians to very accurately describe their activity. This coding system yields valid and reproducible comparisons between services, as we will illustrate. Below, we note 5 scenarios for percutaneous intervention in the coronary, renal, and lower extremity arteries with their associated work values.

Scenario 1

Diagnostic aortography and runoff arteriography combined with iliac angioplasty.

<u>CPT</u>	<u>Description</u>	<u>RVW</u>
36200	Aortic Cath Intro	1.51 (50 Percent Reduction)
75630	Aortogram and Runoff S&I	1.31
35473	Iliac Angioplasty	6.04
75962	Supervision and Interpretation of Iliac Angioplasty	0.54
	Total RVW	9.40

Scenario 2

Percutaneous iliac angioplasty alone.

<u>CPT</u>	<u>Description</u>	<u>RVW</u>
35473	Iliac Angioplasty	6.04
75962	Supervision and Interpretation of Iliac Angioplasty	0.54
36200	Aortic Catheterization	1.51 (50 Percent Reduction)
	Total RVW	8.09

Scenario 3

Left heart catheterization with coronary angioplasty.

<u>CPT</u>	<u>Description</u>	<u>RVW</u>
93510	Left Heart Catheterization	2.17 (50 Percent Reduction)
93543	Injection procedure for ventriculography	0.29
93545	Injection procedure for coronary arteriography	0.29
93555	Imaging supervision and Interpretation for Ventriculography	0.81
93556	Imaging Supervision and Interpretation for Coronary Arteriography	0.81
92982	PTCA Single Vessel	10.98
	Total RVW	15.35

Scenario 4

PTCA single vessel (CPT 92982), RVW 10.98.

Scenario 5

Femoralpopliteal angioplasty alone.

<u>CPT</u>	<u>Description</u>	<u>RVW</u>
35474	Femoralpopliteal Angioplasty	7.35
36246	Arterial Access	2.64 (50 Percent Reduction)
75962	Supervision and Interpretation for Angioplasty	0.54
	Total RVW	10.53

As the above illustrations show, there is a clear ranking of these various services using the current conventions. In these examples, the procedures ranked from least to most work are iliac angioplasty alone, iliac angioplasty with diagnostic arteriography of the aorta and lower extremities, femoral popliteal angioplasty alone (including access), coronary angioplasty of a single vessel without a diagnostic study, and full left heart catheterization with coronary angioplasty performed at the same sitting.

III. Actual Utilization of Open Codes

Where then does an open angioplasty fit in this coding scheme? The carrier medical directors contended that because open angioplasty/atherectomy/stenting is coded by itself and without arterial access, payment for open services is less, thereby violating the convention that open and percutaneous procedures should be equivalent. We believe that the reality of clinical practice and appropriate use of these codes leads to the conclusion that open (and percutaneous) revascularizations are properly valued. We make this statement for two reasons. First, examination of the clinical practice of open revascularization by evaluation of 1992 Medicare claims data shows that open revascularization procedures are often accompanied by other surgical codes. For open iliac and femoral-popliteal artery angioplasty, 65 to 75 percent of claims included another service (other than an E&M service) with the most common services being bypass grafts, thromboendarterectomy, other open angioplasties, or vascular injection procedures. For example, 61 percent of open iliac artery angioplasties are billed with a bypass graft, embolectomy, endarterectomy, exploratory, or repair procedure. Detailed enumeration of the codes billed with open femoral-popliteal and iliac angioplasty can be found in Tables 1 and 2. Second, the realities of appropriate clinical practice dictate that open revascularization codes are only appropriate when accompanied by another surgical procedure such as bypass graft or thromboendarterectomy or embolectomy. In these situations, open revascularization codes are used as an adjunct to the primary surgical bypass procedure or operation and, therefore, are properly valued. If the only procedure which is to be performed is a balloon angioplasty, stent or atherectomy, we strongly believe that it is inappropriate for a patient to be brought to the operating room and have these procedures performed in an open manner when percutaneous techniques accomplish the same result with less morbidity due to general anesthesia and less cost due to performance in a nonoperating room environment.

In summary then, we contend that percutaneous revascularization codes 35470 through 37206 are indeed properly valued when the history of their introduction and subsequent evaluation is examined. These codes also are properly valued in relationship to percutaneous coronary revascularization codes when they are either performed as separate procedures or combined with diagnostic arteriography. Finally, examination of the actual utilization of the codes shows that open revascularization codes are indeed properly billed with other surgical procedures in the majority of cases.

We appreciate the opportunity to comment on this important matter. If you have any questions, do not hesitate to contact us.

Sincerely yours,

Robert L. Vogelzang, M.D.

RLV:dw

TABLE 1

Codes Billed on Same Day as Femoral-Popliteal Open Angioplasty (Code 35456)
1992 Medicare Standard Analytical File -- Physician/Supplier Part B¹

Open angioplasty billed with:		Percent of Open Angioplasties Billed with Code in Specified Range ^{2,3}	Specialty Most Likely to Bill Code in Specified Range with an Open Angioplasty
Description	Code Range		
No other code		31%	Thoracic surgery Cardiovascular disease General surgery Vascular surgery
No other code except an E&M code	99201-99499	4%	Cardiovascular disease
Arterial embolectomy or thrombectomy / venous thrombectomy	34001-34490	8%	Thoracic surgery General surgery
Direct repair of aneurysm / graft insertion for aneurysm	35001- 35162	4%	Thoracic surgery General surgery
Repair arteriovenous fistula / repair blood vessel	35180-35286	2%	Thoracic surgery
Thromboendarterectomy	35301-35381	10%	Thoracic surgery General surgery
Open transluminal angioplasty (excluding femoral-popliteal)	35450-35460	9%	Thoracic surgery General surgery
Percutaneous transluminal angioplasty	35470-35476	3%	General surgery Cardiovascular disease

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 93010+93000 (Global) Global Period: XXX Current RVW: 0.17 Recommended RVW: 0.17

CPT Descriptor: Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only.

Source and Summary of Comment to HCFA on this service: CMD's identified this procedure as overvalued, based on two articles stating a machine can appropriately read an ECG. In 1993 the ACC and the American Society of Internal Medicine successfully refuted this assertion based on clinical evidence, resulting in the repeal of the ECG law.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 69 year old man is seen in the office for evaluation of chest tightness and palpitations. A 12-lead electrocardiographic (ECG) tracing is obtained by technical personnel along with clinical and drug therapy data. The tracing is reviewed by the physician, appropriate measurements are made (including axis, intervals, and voltages), an overall interpretation is made. The tracing is compared to previous ECG tracings, when available. Potential etiologies for any electrocardiographic findings observed, such as myocardial infarction, hypokalemia or digoxin toxicity, etc. are proposed. A report is prepared, signed and transmitted to the patient's medical record.

Description of Pre-Service Work: The rationale for the ECG request is reviewed along with any pertinent patient history.

Description of Intra-Service Work: The tracing is reviewed by the physician, appropriate measurements are made (including axis, intervals, and voltages), an overall interpretation is made. The tracing is compared to previous ECG tracings, when available. Potential etiologies for any electrocardiographic findings observed, such as myocardial infarction, hypokalemia or digoxin toxicity, etc. are proposed.

Description of Post-Service Work: A report is prepared, signed and transmitted to the patient's medical record.

[ACP KEY REFERENCE SERVICE(S)]

5)	93000	12-lead ECG, complete	0.17
6)	94010	Spirometry	0.17
7)	71010	Chest x-ray, single view	0.18

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The interpretation of a standard 12-lead ECG is equivalent to that of interpreting a chest x-ray (71010). Both of these services are valuable diagnostic tools used for a wide range of patient conditions.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The Medicare carrier medical directors (CMDs) base their assertion that this is an overvalued procedure on the statement that ECGs are typically interpreted by computer. Although most hospitals are equipped with this technology, physicians offices typically are not. Furthermore, even when interpreted by a computer, the ECGs must be over read by a physician. Current computer applications frequently misread normal ECGs as abnormal and arrhythmias are problematic for the computers as well. In patients being followed with serial ECGs, clinical information is important to the correct interpretation and this information cannot be assimilated by a computer. Survey respondents indicated this service requires a mental effort and judgement at level 3, technical skill and physical effort at level 2, and psychological stress at level 2-3. Overall, the work, technology, typical patient and usual site of service have not changed in the last five years.

We strongly recommend therefore, that the current value of 0.17 for this vital diagnostic service remain unchanged. Our survey results overwhelmingly support this recommendation.

CMD Comments

	99213 OFFICE/OUTPATIENT VISIT, EST	0.55	XXX
	99243 OFFICE CONSULTATION	1.47	XXX

CMD Comment:

The interpretation of the great majority of electrocardiograms is straightforward and involves relatively few parameters in comparison to history and physical examination. The risk involved is no different than the risk of the E & M service prompting the order. The time involved in ECG interpretation has been directly measured and reported in the literature. The time of interpretation (intraservice time), taken from a sample selected to be far more difficult than typically encountered (90% abnormal), averaged less than one minute (Medical Decision Making, 1992; 12:331). Physicians have been observed to read 30 to 40 electrocardiograms in one hour, with total time (interpretation and report), averaging 97 seconds (American Journal of Cardiology, 1978; 41:175-183). The recommended value equates 99213 (intraservice time 15 minutes, total time 21 minutes) with eleven ECGs and 99243 (intraservice time 40 minutes, total time 56 minutes) with 30 ECGs.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 93307 Global Period: XXX Current RVW: 0.78 Recommended RVW: 1.48

CPT Descriptor: Echocardiography, real-time with image documentation (2D) with or without M-mode recording, complete

Source and Summary of Comment to HCFA on this service: American College of Cardiology and the American Society of Echocardiography reviewed these services and determined that they remain undervalued compared to other services within the Medicare Fee Schedule which require similar physician work effort.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75 year old man with chest pressure and shortness of breath is admitted with cardiomegaly and pulmonary congestion on chest and ECG changes of left bundle branch block. The physician reviews existing information (e.g. request for a consult) and relevant clinical data to clarify the indications for the procedure and determine the clinical questions that needed to be answered. A sequence of tomographic images from multiple views is obtained and recorded: the physician may verify the suitability of the images prior to the completion of the study and obtain additional views if necessary. Video-taped or digitally recorded views of the heart are reviewed, the structure and dynamics of the heart chambers, valves, and great vessels are analyzed and measured, and a complete interpretation is developed. Evaluations of quantitative, anatomic and functional measures such as left ventricular size, wall thickness, ejection fraction, regional wall motion, and left ventricular mass, atrial and aortic root dimensions, etc. are made. Multiple sets of tomographic views are evaluated and compared to previous studies for quantitative and qualitative changes. A report is dictated and the findings may be reviewed in detail with the referring physician.

Description of Pre-Service Work: The physician reviews existing information (e.g. request for a consult) and relevant clinical data to clarify the indications for the procedure and determine the clinical questions that needed to be answered.

Description of Intra-Service Work: A sequence of tomographic images from multiple views is obtained and recorded; the physician may verify the suitability of the images prior to the completion of the study and obtain additional views if necessary. Video-taped or digitally recorded views of the heart are reviewed, the structure and dynamics of the heart chambers, valves, and great vessels are analyzed and measured, and a complete interpretation is developed. Evaluations of quantitative, anatomic and functional measures such as left ventricular size, wall thickness, ejection fraction, regional wall motion, and left ventricular mass, atrial and aortic root dimensions, etc. are made. Multiple sets of tomographic views are evaluated and compared to previous studies for quantitative and qualitative changes.

Description of Post-Service Work: A report is dictated and the findings may be reviewed in detail with the referring physician.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	78465	Myocardial perfusion imaging, SPECT, multiple studies	1.48
2)	99215	Office visit, est, level 5	1.51
3)	93015	Exercise ECG, supervision, I&R	0.75
4)	99214	Office visit, est, level 4	0.94

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Two-D, M-mode echocardiography and SPECT thallium imaging (78465) are important and somewhat similar cardiovascular diagnostic tools. Each service provides different information; however, the work effort involved in both services is comparable. There is considerable mental effort involved in the interpretation of SPECT thallium images that require skill in nuclear physics and cardiovascular medicine. The physician must know coronary anatomy, physiology of coronary circulation, anatomic variation, left ventricular function, kinetics of radiotracer, attenuation, scatter, partial volume effect, and cardiac and extracardiac causes of artifacts. The interpreter should be aware of the relationship between coronary flow and tracer concentration in relation to the type of tracer and the type of stress test used. The recognition of soft tissue attenuation artifacts is necessary to maintain a high specificity.

The mental effort in interpreting an echocardiogram is considerable. The physician must evaluate a large number of cardiac structures and their dynamics, keeping in mind the wide range of both congenital and acquired diseases that can affect the heart. These judgements must be made despite the fact that the heart is constantly moving, increasing the possibility of a misinterpretation. Ultrasonic artifacts must be recognized for an appropriate evaluation to be

completed. Mental acuity under pressure is required when study interpretation is done in the setting of acute patient care situations. The quality of the examiner directly affects the data derived for final interpretation. Considerable technical skill is required for both the performance and the interpretation of the study, as many structures must be located, properly identified and assessed for pathological processes.

Note: Mental effort and judgement were surveyed at level 4, technical skill and physical effort at level 3-4, psychological stress at level 2. About half of the respondents indicated the work of this code has changed in the last five years because the patients requiring this service are increasingly complex. All agree that the vignette describes their typical patient.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The mental effort in interpreting an echocardiogram is considerable. The physician must evaluate a large number of cardiac structures and their dynamics, keeping in mind the wide range of both congenital and acquired diseases that can affect the heart. These judgements must be made despite the fact that the heart is constantly moving, increasing the possibility of a misinterpretation. Ultrasonic artifacts must be recognized for an appropriate evaluation to be completed. Mental acuity under pressure is required when study interpretation is done in the setting of acute patient care situations. The quality of the examiner directly affects the data derived for final interpretation. Considerable technical skill is required for both the performance and the interpretation of the study, as many structures must be located, properly identified and assessed for pathological processes.

Echocardiography is not only applied in the clinically stable patient but also at the bedside of critically ill patients and in the emergency setting. The information derived from the study is used in the development of critical management decisions. The risk of misdiagnosis, which can lead to potentially fatal events, in both emergent and non-emergent settings, adds an additional stress factor.

Based on this information, the College recommends that a concensus value of 1.48 be adopted, given the median survey value of 1.50 and the similarity of work effort for this echocardiography service and that of SPECT thallium.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 93312 Global Period: XXX Current RVW: 1.57 Recommended RVW: 2.39

CPT Descriptor: Echocardiography, real-time with image documentation (2D) with or without M-mode recording, transesophageal, complete

Source and Summary of Comment to HCFA on this service: American College of Cardiology and the American Society of Echocardiography reviewed these services and determined that they remain undervalued compared to other services within the Medicare Fee Schedule which require similar physician work effort.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year old woman with a prosthetic mitral valve has developed new onset of fever, chills and tachycardia, but no change in murmur and no apparent mass (vegetation) by transthoracic echocardiography. She has been taking antibiotics for a "bronchitis" and six sets of blood cultures are negative. The physician reviews the request for the consult, as well as previous clinical data and lab results, to clarify the indications for the procedure and determine the clinical questions for which the referring physician is seeking an answer. A preliminary evaluation of the patient, including history and physical examination is performed to determine the relative risks and benefits. The patient is prepared for upper endoscopy, including management of the airway. The oral pharynx is anesthetized. Intravenous access is established and the patient is given conscious sedation, anxiolytics and/or prophylactic antibiotic treatment as necessary. Vital signs such as blood pressure, pulse rate and arterial oxygen saturation are monitored. The physician inserts the probe into the esophagus and stomach, and the structures of the heart are identified in multiple views. Each of the valves and chambers is visualized, and the great vessels are also imaged. Considerable physician effort is required to obtain proper images of the structure and function of the heart and great vessels, from multiple positions and orientations. In each view of the heart, recorded on video tape or disk, a detailed interpretation of the anatomy, dynamics and function is made. For example, mobility, thickness and excursion of a valve's leaflets, possible regurgitation, heart function and presence of intracardiac shunts are noted throughout the heart cycle from each view. After the procedure the patient is monitored (BP, heart rate, respirations, arterial oxygen saturation) to ensure complete recovery from the sedation.

Description of Pre-Service Work: The physician reviews the request for the consult, as well as previous clinical data and lab results, to clarify the indications for the procedure and determine the clinical questions for which the referring physician is seeking an answer. A preliminary evaluation of the patient, including history and physical examination is performed to determine the relative risks and benefits. The patient is prepared for upper endoscopy, including management of the airway.

Description of Intra-Service Work: The oral pharynx is anesthetized. Intravenous access is established and the patient is given conscious sedation, anxiolytics and/or prophylactic antibiotic treatment as necessary. Vital signs such as blood pressure, pulse rate and arterial oxygen saturation are monitored. The physician inserts the probe into the esophagus and stomach, and the structures of the heart are identified in multiple views. Each of the valves and chambers is visualized, and the great vessels are also imaged. Considerable physician effort is required to obtain proper images of the structures and function of the heart and great vessels, from multiple positions and orientations. In each view of the heart, recorded on video tape or disk, a detailed interpretation of the anatomy, dynamics and function is made. For example, mobility, thickness and excursion of a valve's leaflets, possible regurgitation, heart function and presence of intracardiac shunts are noted throughout the heart cycle from each view.

Description of Post-Service Work: After the procedure the patient is monitored (BP, heart rate, respirations, arterial oxygen saturation) to ensure complete recovery from the sedation.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	43235	Upper gastrointestinal endoscopy (diagnostic)	2.39
2)	33010	Drainage of heart sac	2.24
3)	92950	CPR	3.80
4)	93224	ECG monitor/report, 24 hours	0.52

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Both transesophageal echocardiography (TEE) and diagnostic upper GI endoscopy use endoscopic imaging methods to evaluate structural and functional abnormalities - the former in the cardiovascular system and the latter in the upper GI tract. One factor which increases the physician work effort for TEE is that the esophageal probe must be blindly placed. This increases the risk of airway obstruction in patients undergoing TEE. Physician work and complexity are comparable for pre-, intra-, and post-service components. Although the upper GI evaluation involves several organs (the esophagus, stomach and upper small bowel), the TEE evaluation involves a complex and constantly moving organ with multiple component structures (the heart).

The psychological stress and gravity of the decision making in TEE is significant. Decisions involving the need for and approach to cardiac valve surgery, the need for immediate surgery for dissecting aortic aneurysm, the need for long term anticoagulation to reduce the risk of stroke, and the length of treatment for endocarditis, are all common in daily practice with TEE. Additional psychological stress is related to informing the cardiovascular surgeon that the repair of a valve is inadequate and reestablishment of cardiopulmonary bypass (with its attendant increased risk of morbidity and mortality) is recommended.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The mental effort in performing and interpreting a transesophageal echocardiogram is considerable. The physician must keep in mind all cardiac diseases and disorders (both congenital and acquired). Further, the heart is constantly moving, increasing the possibility of misinterpretation and presence of artifacts which must be distinguished for an appropriate evaluation to be completed. Patients are often ill and may have a host of co-morbidities such as heart failure, cardiac trauma, rupture of major vessel, other organ system failure, hypotension, infection or recent stroke. In the operating room scenario, during and after cardiopulmonary bypass, assessment of valve dynamics and function is critical as blood pressure is returning to normal values.

There is an added technical skill required related to the insertion of the probe into the esophagus and stomach in a critically ill patient. The interpretation of the study is also demanding, as many structures must be located, properly identified, and assessed carefully for abnormalities. This includes the assimilation of the two dimensional images into a three dimension concept to assess flaws in the heart.

Transesophageal echocardiography is frequently applied in the emergency setting and the information derived from the study is used in the development of critical treatment protocols. The management of a patient with conscious sedation, as well as the passing of the endoscope blindly past the airway in critically ill patients, adds significantly to the stress. The risk of misdiagnosis, which could lead to patient death, in both emergent and non-emergent settings, adds an additional stress factor.

In summary, mental effort and judgement are estimated at level 4-5, technical skill and physical effort at level 4-5, psychological stress at level 4. The majority of respondents indicated the work of this code has changed in the last five years, although the familiarity with the technology is stable. Basically, the patients requiring this service are increasingly complex. All agree that the vignette describes their typical patient.

In 1992, the College recommended a RVU for this service of 2.5. If the budget neutrality adjustments implemented since the inception of the MFS are applied to this value of 2.5, a 1995 value of 2.39 results. As a point of reference, Harvard Phase III data show a value (adjusted, per HCFA standards, to be on a scale equivalent to 1995 values) of 2.76 for CPT code 43235, the MPC code being used in this comparison. HCFA lowered the Phase III value by 15 percent to 2.39. The Harvard Phase III value for TEE of 3.12, modified by the same corrections (including the reduction of 15 percent), reduces it to a value of 2.76 RVUs. This value is higher than both the existing value of 1.59 and the 2.39 value recommended by the College. **The College's survey results indicate a median value of 3.0 RVUs. We believe a consensus value of 2.39 should be adopted.**

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 93539 Global Period: XXX Current RVW: 0.29 Recommended RVW: 0.40

CPT Descriptor: Injection procedure during cardiac catheterization; for selective opacification of arterial conduits (e.g., internal mammary), whether native or used for bypass

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old man or woman with previous saphenous vein strippings for varicose veins and coronary angiographic evaluation suggesting that bypass surgery is the treatment of choice.

This is an add-on procedure during a cardiac catheterization that entails selecting, exchanging, if necessary, and positioning the proper catheter in the arterial conduits used or to be used for bypass surgery and then positioning the patient and the X-ray properly. The physician must decide on the type and amount of contrast and injection method to best present the needed data in the particular patient's situation. The catheter may be connected to the mechanical injector but the injection is usually manual and administered by the cardiologist. The panning (movement) of the x-ray table during the injection and filming must be expertly performed to assure full visualization of the artery or conduit. The radiologic angle or angles must be expertly chosen to provide full visualization of the artery or conduit so that accurate anatomic decisions can be made. The force and duration of the manual injection must be expertly performed in order to assure complete opacification of the target artery or conduit with contrast (and without a "streaming" phenomenon mixture of blood and contrast). The conscious patient may experience a "hot flush" of varying intensity and be subject to potential serious cardiac arrhythmias and even fluid overload with possible heart failure and/or myocardial depression in addition to potential embolic phenomena during the injection or peri-injection. Air must be carefully eliminated from the catheter as air emboli pose a significant risk to the patient. An additional risk during this type of angiogram is extravascular extravasation of the contrast material which has the potential to produce arrhythmias, myocardial damage, even significant pericardial effusions which could lead to cardiac tamponade. Anxiety and allergic contrast reactions are often experienced and also must be coped with immediately and can produce an emergent situation. An immediate decision on the acceptability of the recorded angiogram must be made, and if not acceptable, a repeat angiogram must be considered. These arterial conduit angiograms range from 4 to 10 cc's in volume and because multiple injections are typically required, consideration regarding overload contrast can become a significant factor in a patient with renal impairment and necessitate close follow-up and extra therapy such as fluid loading and diuretics to counteract the problems.

Description of Pre-Service Work: N/A

Description of Intra-Service Work: See clinical vignette above

Description of Post-Service Work: N/A

SURVEY DATA:Specialty: American College of CardiologySample Size: 114 Response Rate (%): 53 (47%) Median RVW: 0.4025th Percentile RVW: 0.30 75th Percentile RVW: 0.44 Low: 0.23 High: 0.55Median Pre-Service Time*: 0 Median Intra-Service Time: 10.025th Percentile Intra-Svc Time*: 7.0 75th Percentile Intra-Svc Time: 15.0 Low: 5.0 High: 23.0

* Time is reported in minutes

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>N/A</u>	
ICU:	<u>N/A</u>	<u>N/A</u>
Other Hospital:	<u>N/A</u>	<u>N/A</u>
Office:	<u>N/A</u>	<u>N/A</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	93540	Injection procedure during cardiac cath for selective opacification of aortacoronary venous bypass grafts, one or more coronary arteries	0.43
2)	93543	Injection procedure during cardiac cath for selective left ventricular or left atrial angiography	0.29

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The physician work involved in the series of cardiac angiography injection codes varies depending on the nature of the structures being filmed and the difficulty in accessing these. This surveyed service, injection for the selective opacification of arterial conduits, requires more work than most of the other services in the series.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Based on the comparative note above, the ACC recommends the median physician RVU of 0.40 be adopted.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 93545 Global Period: XXX Current RVW: 0.29 Recommended RVW: 0.40

CPT Descriptor: Injection procedure during cardiac catheterization; for selective coronary angiography

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-60 year old man with exceptional chest pain of recent duration, heavy smoker (now or in past) with family history of heart attacks.

This is an add-on procedure during a cardiac catheterization that entails selecting, exchanging, if necessary, and positioning the proper catheter in each of the coronary arteries and then positioning the patient and the X-ray properly. The physician must decide on the most appropriate type and amount of contrast and injection method to obtain the needed data in the particular patient's situation. The catheter may occasionally be connected to the mechanical injector and the injection undertaken under very close supervision by the cardiologist. Generally, manual injections of contrast are used and the force and duration of these injections must be sufficient to assure full opacification of the target artery with duration sufficient to visualize the entire arterial system. Manual panning of the x-ray table must be expertly performed to assure complete visualization. Selection of angiographic angled views must be expertly determined to yield the necessary visual information the multi-branched coronary arterial system which is always in motion due to the continual movement of the beating heart. The conscious patient may experience a mild "hot flush" of varying intensity and be subject to potential serious cardiac arrhythmias and even fluid overload with possible heart failure and/or myocardial depression in addition to potential embolic phenomena during the injection or peri-injection. Air must be carefully eliminated from the catheter as air emboli can pose a significant risk to the patient. An additional risk during this type of angiogram is a dissection of the coronary artery which has the potential to produce arrhythmias, myocardial damage, even significant pericardial effusions which could lead to cardiac tamponade. Anxiety and allergic contrast reactions are often experienced and also must be coped with immediately and can produce an emergent situation. An immediate decision on the acceptability of the recorded angiogram must be made, and if not acceptable, a repeat angiogram must be considered. These coronary artery angiograms range from 4 to 10 cc's in volume and because multiple injections are typically required, consideration regarding contrast overload and also can become a significant factor in a patient with renal impairment and necessitate close follow-up and extra therapy such as fluid loading and diuretics to counteract the problems.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Lab and Pathology

The review of lab and pathology procedures primarily addressed CMD comments on codes that they identified as overvalued. In response, the College of American Pathologists (CAP), provided recommendations to the RUC to maintain or increase the RVUs for these codes. Based on survey results, comparisons to the final Harvard study results, comparisons to key reference services, and analysis of Medicare claims data, the RUC believes that CAP provided compelling evidence for maintaining the current values of these procedures and, for code 86327, for increasing the RVUs from their current level.

The American Society of Hematology (ASH), provided recommendations to the RUC on four codes. Based on survey results and comparisons to key reference services, the RUC increased the RVUs of all four codes. However, in two instances the RUC did not feel that the specialty society had provided enough compelling evidence to adopt the increase that the specialty society recommended.

The Medical Oncology Association of Southern California submitted comments to HCFA requesting increased RVUs for two bone marrow codes. Since no evidence was presented to support their comment, the RUC recommended maintaining the current value of these codes.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
38230	Bone marrow collection	3.16	4.22	In their public comments ASH noted that this procedure is undervalued, taking into account the amount of time associated with bone harvesting.	<p>The specialty society noted that this procedure is performed in the operating room under general anesthesia. The specialty society noted that the survey median was not reflective of the work intensity of this procedure which can vary by site depending on whether or not physicians were affiliated with major allogenic centers.</p> <p>The RUC felt that the specialty society did not present compelling evidence to increase the RVU of this procedure to 7.0. The RUC did feel that the survey median of 4.22 was a more accurate reflection of the work involved in this service.</p>	4
83020	Assay hemoglobin	0.37	0.37	The CMDs commented that the interpretation of this service required less time than a PA/Lateral chest x-ray which has a Harvard time of 5 minutes.	The specialty society reported that the interpretation and reporting of the electrophoretic pattern of hemoglobin represents the most specific method for determining the presence of hemoglobinopathy such as sickle cell anemia. The specialty society noted that the survey median total time for this procedure of 14 minutes, is well above the time it takes to interpret a chest x-ray. The specialty society is recommending 0.43, the survey median for this procedure. The RUC felt that compelling evidence was presented to maintain the current value of the code, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
83912	Genetic examination	0.37	0.37	The CMDs commented that as more PCR tests become available, the interpretation of these reports will become easier. The time involved in interpreting these reports is the same as 94060[Bronchospasm evaluation: spirometry as in 94010, before and after bronchodilator (aerosol or parenteral) or exercise. (0.31)]. 94060 has a Harvard time of 7 minutes.	<p>The specialty society reported that this procedure is the southern blot test. This test detects the DNA of a microbacteria in specimen. The pathologists survey results refuted the CMD claim that this service is comparable in time to 94060[Oxygen uptake, expired gas analysis; rest, indirect (separate procedure)]. Instead this service is more reflective of the reference services 80500[Clinical pathology consultation; limited, without review of patient's history and medical records (0.37)] and 85060[Blood smear, peripheral, interpretation by physician with written report (0.45)].</p> <p>The specialty society recommended an RVU of 0.40 which was the survey median. The RUC felt that compelling evidence was presented to maintain the current value of the code.</p>	2
84165	Assay serum proteins	0.37	0.37	The CMDs commented that the interpretation of this service required less time than a PA/Lateral chest x-ray which has a Harvard time of 5 minutes.	<p>CAP reported that the interpretation and report of this procedure involves several different professional services. First an agarose gel plate with the electrophoretic pattern of the patient and serum control pattern are compared by the pathologist. Then densitometer tracings of the patient control patterns are evaluated for abnormalities. The report of this evaluation would include a differential diagnosis of the pattern abnormalities that could require other laboratory studies. The survey median total time was 13 minutes for this procedure. The survey respondents placed the work of this service between the reference codes 80500[Clinical pathology consultation; limited, without review of patient's history and medical records (0.37)] and 85060[Blood smear, peripheral, interpretation by physician with written report(0.45)]. CAP recommended the survey median of 0.40 for this procedure. The RUC felt that compelling evidence was presented to maintain the current value of the code.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
84181	Western blot test	0.37	0.37	The CMDs commented that the interpretation of western blot tests has become easier as the quality and technique of the test have improved. They also note that an error in the interpretation of this test is no more significant than missing a tumor when reading a frontal chest x-ray 71020 (0.22).	The western blot test is used to detect antibodies specific for a particular protein in a mixture of antibodies and proteins. This test is the confirmatory test for HIV, which has significant implications for the physician and patient in the event of a misdiagnosis. In contrast to the CMD comments, CAP reports that this test has become more complex which is associated with an increased chance for the detection of false positives. CAP recommended the survey median of 0.39 for this procedure. The RUC felt that compelling evidence was presented to maintain the current value of the code, but not to increase it.	2
84182	Protein, western blot test	0.37	0.37	The CMDs commented that the interpretation of western blot tests has become easier as the quality and technique of the test have improved. They also note that an error in the interpretation of this test is no more significant than missing a tumor when reading a frontal chest x-ray 71020 (0.22).	CAP reported that this is another type of western blot test which uses immunological probe for band identification to detect the antigens for particular organism in a mixture of proteins. CAP recommended the survey median of 0.40 for this procedure. The RUC felt that compelling evidence was presented to maintain the current value of the code, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
85095	Bone marrow aspiration	1.08	1.08	In their public comments to HCFA, the Medical Oncology Association of Southern California noted that they believe that CPT codes 85095[Bone Marrow; aspiration only] and 85102[Bone marrow biopsy, needle or trocar] are undervalued. Specifically, they cite the advancement of technology in cytogenetics, flow cytometry chemotherapy sensitivity assays, and immunohistochemistry, has made it necessary for oncologists, in the last 1-2 years, to acquire more specimens and perform additional steps to perform tests that can assist the physician in treatment of the cancer patient.	The specialty provided no compelling evidence to support their comment, so the RUC recommends that the current RVUs of these procedures be maintained.	2
85102	Bone marrow biopsy	1.37	1.37			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
85390	Fibrinolysin screen	0.37	0.75	<p>The CMDs commented that the value of this procedure should be reduced on the basis that a fibrinolysin screen requires less time and expertise than the interpretation of PA/lateral chest x-ray 71020 (0.22), with a Harvard time of five minutes.</p> <p>In their public comment, ASH requested that the value of this procedure be increased to 1.19. ASH compared this service to 88331[Pathology consultation during surgery; with frozen section(s), single specimen], which has a relative value of 1.19 and Harvard time of 20-24 minutes.</p>	<p>In their presentation to the RUC CAP and ASH noted that this procedure is the evaluation of a coagulopathy. It was also noted that this procedure has never been surveyed and that its current value was assigned by HCFA. The specialty societies recommend an RVU of 1.20 which is the survey median for this procedure.</p> <p>The RUC agreed that the physician work of providing this service has changed during the past few years. The patients are more complex, the tests are more technical, and the physician is required to run more tests. However, the RUC did not feel that these changes warranted an increase in RVUs to 1.20. Instead the RUC believes that this service is comparable in physician work to the key reference service selected by the respondents, 88305[Level IV Surgical pathology, gross and microscopic examination] which has an RVU of 0.75. The RUC recommends 0.75 RVUs for CPT code 85390.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
85576	Blood platelet aggregation	0.37	0.37	The CMDs commented that the value of this procedure should be reduced on the basis that a fibrinolysin screen requires less time and expertise than the interpretation of PA/lateral chest x-ray 71020 (0.22), with a Harvard time of five minutes.	CAP reported that this procedure is the determination of platelet response to aggregating agents. The current value of this procedure was assigned by HCFA based on the general pathology clinical consultation code 80500. 85576[Platelet; aggregation (in vitro), each agent] was not studied by Harvard however, Harvard data on 80500 showed mean total times of 11-13 minutes, lower than the current survey total time of 18.5 minutes for 85576. Survey respondents rated the 85576 between the 80500[Clinical pathology consultation; limited, without review of patient's history and medical records] and the 85060[Blood smear, peripheral, interpretation by physician with written report] in terms of complexity. The survey time also exceeds the reference service chosen by the CMDs. CAP recommended an RVU of 0.50 for this procedure. The RUC felt that there was compelling evidence to support maintaining the current value of this procedure but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
86077	Physician blood bank service	0.37	0.94	In their public comment to HCFA, ASH requested that the RVU of this code be increased to 0.94.	<p>For their survey ASH selected 86078[Blood bank services; investigation of transfusion reaction including suspicion of transmissible disease, interpretation and written report (0.94)] as a reference service. ASH noted that the work of 86077[Blood bank services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report] and 86079[Blood bank services; authorization for deviation from standard blood banking procedures (eg, use of outdated blood, transfusion of Rh incompatible units), with written report] are similar to 86078 and should have the similar relative values. Based on the results of their survey ASH recommended an RVU of 0.99, the survey median for this procedure. The RVU of 0.99 is higher than what ASH recommended to HCFA in their comment letter.</p> <p>The RUC felt that compelling evidence was presented to warrant an increased RVU for this code. However, the RUC determined that based on similarity of work to 86078, the RVU of 0.94 would be more appropriate.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
86079	Physician blood bank service	0.37	0.94	In their public comment to HCFA, ASH requested that the RVU of this code be increased to 0.94.	For their survey ASH selected 86078[Blood bank services; investigation of transfusion reaction including suspicion of transmissible disease, interpretation and written report (0.94)] as a reference service. ASH noted that the work of 86077[Blood bank services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report] and 86079[Blood bank services; authorization for deviation from standard blood banking procedures (eg, use of outdated blood, transfusion of Rh incompatible units), with written report] are similar to 86078 and should have the similar relative values. ASH recommended an RVU of 0.94 for this procedure. The RUC felt that compelling evidence was presented to warrant an increased RVU for this code.	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
86255	Fluorescent antibody; screen	0.37	0.37	The CMDs asked that the relative value for this procedure be reduced on the basis that the interpretation of the fluorescent antibody screen, each antibody, requires less time and physician work than interpretation of a PA/lateral chest x-ray. They also suggest that screens are always performed on 3 antibodies, and since the physician can report each antibody the total RVU 1.11 is excessive.	In response to the CMD comment, the specialty society noted that when performing 86255[Fluorescent antibody; screen, each antibody] and 86256[Fluorescent antibody; titer each antibody], there is no economy of scale if one section is done or three. The study of each auto-antibody is a study unto itself since different tissue/cells are used to demonstrate reactions for different antibodies. During this procedure microscopic examination is done on frozen tissue sections to detect fluorescence which would be given off by autoantibodies of various cell constituents. If fluorescence is detected than a fluorescent antibody titer is performed. The current value of this procedure was assigned by HCFA based on the value of the clinical pathology code 80500[Clinical pathology consultation; limited, without review of patient's history and medical records (0.37)]. The survey respondents rated 86255 slightly more complex than 80500, but slightly less complex than 85060[Blood smear, peripheral, interpretation by physician with written report (0.45)]. The recommended RVU is 0.40. The RUC felt that there was compelling evidence to support maintaining the current value of this procedure, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
86256	Fluorescent antibody; titer	0.37	0.37	The CMDs asked that the relative value for this procedure be reduced on the basis that the interpretation of the fluorescent antibody screen, each antibody, requires less time a physician work than interpretation of a PA/lateral chest x-ray. They also suggest that screens are always performed on 3 antibodies, and since the physician can report each antibody the total RVU 1.11 is excessive.	In response to the CMD comment, the specialty society noted that when performing 86255 and 86256, there is no economy of scale if one section is done or three. The study of each auto-antibody is a study unto itself since different tissue/cells are used to demonstrate reactions for different antibodies. During this procedure microscopic examination is done on frozen tissue sections to detect fluorescence which would be given off by autoantibodies of various cell constituents. If fluorescence is detected than a fluorescent antibody titer is performed. The current value of this procedure was assigned by HCFA based on the value of the clinical pathology code 80500[Clinical pathology consultation; limited, without review of patient's history and medical records (0.37)]. The survey respondents rated 86256 slightly less complex than 85060[Blood smear, peripheral, interpretation by physician with written report (0.45)], and comparable to 86255[Deoxyribonucleic acid (DNA) antibody; native of double stranded]. The recommended RVU is 0.39. The RUC felt that there was compelling evidence to support maintaining the current value of this procedure, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
86320	Serum immunoelectrophoresis	0.37	0.37	The CMDs commented that the value of this procedure should be reduced on the basis that a serum immunoelectrophoresis requires less time and expertise than the interpretation of PA/lateral chest x-ray 71020 (0.22), with a Harvard time of five minutes.	CAP reported that a serum immunoelectrophoresis involves the physician reviewing and interpreting dispersed patterns of patient serum and comparing those patterns to controls. Interpretation requires a judgement as to whether the shape and density of the sample is sufficiently different from the control to detect an abnormality. The median survey time was 16.5 minutes, well above the CMD radiology reference service. Survey respondents rated the complexity of this service the same as 85060[Blood smear, peripheral, interpretation by physician with written report (0.45)]. CAP recommended an RVU of 0.48 for this procedure. The RUC felt that there was compelling evidence to support maintaining the current value of this procedure, but not to increase it.	2
86325	Other immunoelectrophoresis	0.37	0.37	The CMDs commented that the RVU for this procedure be reduced, because they feel that 86325 is less time than 71020 - PA/lateral chest x-ray.	The specialty society noted that the current RVU for this procedure was assigned by HCFA. CAP also noted that the vignette for this code was studied by Harvard and had a mean time of 11 minutes, well above the time of 71020. CAP reported that this procedure is similar to 86320[Immunoelectrophoresis; serum] and should have a similar value. CAP recommended 0.45 for this procedure. The RUC felt that there was compelling evidence to support maintaining the current value of this procedure, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
86327	Immunoelectrophoresis assay	0.37	0.45	The CMDs commented that the RVU for this procedure be reduced, because they feel that 86327[Immunoelectrophoresis; crossed (2-dimensional assay)] requires less time than 71020 - PA/lateral chest x-ray.	<p>The specialty society noted that the current RVU for this procedure was assigned by HCFA. CAP also noted that the vignette for this code was studied by Harvard and had a mean time of 11 minutes, well above the time of 71020. CAP reported that this procedure is for the separation and investigation of protein multimers. The crossed immunoelectrophoresis is a very low volume service with only a relatively small number of physicians providing these interpretations. CAP recommended an RVU of 0.60 for this procedure.</p> <p>The RUC did not feel that there was compelling evidence to increase the value of this procedure to 0.60. They determined that this service was similar in work to 86325[Immunoelectrophoresis; other fluids (eg, urine, CSF) with concentration] and suggested an increase to 0.45 for this procedure.</p>	4
86334	Immunofixation procedure	0.37	0.37	The CMDs commented that the RVU for this procedure be reduced, because they feel that 86334[Immunofixation electrophoresis] requires less time than 71020 - PA/lateral chest x-ray.	CAP reported that the CMDs noted that 86334 requires more expertise than the interpretation of a serum electrophoresis and cited 86325 and 86327[Immunoelectrophoresis; crossed (2-dimensional assay)]. CAP also noted that the serum electrophoresis vignette 86320[Immunoelectrophoresis; serum] was studied by Harvard and had a mean time of 11 minutes. CAP noted that this procedure is used to detect monoclonal processes in patient specimens. CAP recommended an RVU of 0.45 for this procedure. The RUC recommended maintaining the current value of this procedure, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
88170	Fine needle aspiration	0.50	1.27	In a public comment submitted to HCFA the endocrine society noted that 88170(0.50) - fine needle aspiration and 88171(1.05) - deep tissue fine needle aspiration, are undervalued compared to the breast biopsy code 19100(1.27).	The ACR conducted a survey on codes 88170 and 88171 and noted that the majority of the survey respondents reported that the new technology associated with this procedure has not lessened physician work. Instead many respondents noted that because their patients are increasingly more complex, physician work has also increased. ACR noted that although the work involved for 88170 is similar to 19100, the risk of complication is greater with 88170. ACR recommended a value of 1.27, the same RVU as 19100[Biopsy of breast; needle core (separate procedure)] for these procedures. The RUC also agreed with the information presented by ACR, that suggested that these codes should be valued equal to one another. The RUC determined that the specialty society presented compelling evidence to recommend increased RVUs for these procedures.	1
88171	Fine needle aspiration	1.05	1.27			1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
88172	Evaluation of smear	0.60	0.60	The CMDs commented that the relative value of 88172[Evaluation of fine needle aspirate with or without preparation of smears; immediate cytohistologic study to determine adequacy of specimen(s)] should be reduced, since the immediate evaluation of a fine needle aspirate requires no more time than the interpretation of cytopathological fluids as described by code 88104[Cytopathology, fluids, washings or brushings, except cervical or vaginal; smears with interpretation (0.56)], with a Harvard time of 17 minutes.	<p>CAP noted that the immediate cytohistologic evaluation to determine FNA specimen adequacy generally requires the presence of the pathologist at the patient bedside or the CAT scan facility. CAP noted that their survey median for this service is 1.10, which is twice the RVU of 88104 and somewhat less than the RVU of 88331[Pathology consultation during surgery; with frozen section(s), single specimen (1.19)]. CAP recommended an RVU of 1.10 for this procedure.</p> <p>The RUC noted that there was compelling evidence to maintain the current value for this procedure, but not to increase it.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
88173	Interpretation of smear	1.08	1.08	The CMDs commented that the relative value of 88173[Evaluation of fine needle aspirate with or without preparation of smears; interpretation and report] should be reduced, since the FNA of the breast requires no more time than the interpretation of cytopathological fluids as described by code 88104(0.56), with a Harvard time of 17 minutes.	CAP reported that a fine needle aspiration (FNA) is usually performed to establish a diagnosis on a tumor. The evaluation and definitive diagnosis of an FNA involves the examining a minimum of 8-10 slides. CAP noted that in their comments to HCFA the only service that was identified as undervalued was 88173. Specifically, CAP requested that the RVU for 88173 be increased from 1.08 to 1.60, because there has been a change in the physician work since it was studied by Harvard in 1990. New technology has made it possible to identify and sample lesions at an earlier stage of the disease process. These "early" lesions contain fewer diagnostic cells and require more physician effort to arrive at a diagnosis. The CMDs stated that they felt the time and expertise to interpret 88173 was comparable to 88104, and recommended that the RVU of 88173 be reduced from 1.08 to 0.56. CAP conducted a survey of 88173 the results of which indicate a median of RVU of 1.59, which is almost three times the RVU of 88104, clearly indicating that the physician work of 88173 is not comparable to 88104. CAP recommended an RVU of 1.59 for this procedure. The RUC noted that there was compelling evidence to maintain the current value for this procedure, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
88180	Cell marker study	0.36	0.36	The CMDs commented that the RVU of the procedure be decreased based on the number of cell surface markers billed for each submission of this code.	CAP reported that 88180 [flow cytometry, each cell surface marker], requires significant technical skill. This code generally determines whether or not a patient has leukemia, lymphoma, or an immunodeficiency state such as AIDS. Flow cytometry is specialized and not widely provided. The patients who receive this treatment are generally more complex than 5 years ago. The CAP survey showed a median time of 25 minutes per cell surface marker or a total of 250 minutes for the 10 marker average stated by the CMDs as the average case. This is significantly more time than that involved in a tracheostomy (31600) which is 82 minutes or one hour of critical care. CAP recommended an RVU of 0.80 for this procedure. The RUC noted that there was compelling evidence to maintain the current value for this procedure, but not to increase it.	2
88182	Cell marker study	0.77	0.77	The CMDs commented that the RVU of the procedure be decreased based on the number of cell surface markers billed for each submission of this code.	CAP reported that the procedure described by 88182[Flow cytometry; cell cycle or DNA analysis], is two separate tests which require significant technical skill. This code represents new technology with significant prognostic implications in many cell tumor types. 88182 describes 2 types of service, DNA cell cycle and ploidy analysis. The CMDs suggested that the RVU be reduced to 0.34 for this procedure, because on average, the physician would bill 10 units per claim, and 10 times 0.77 is 7.70, an extreme for this code. The basis for this reduction is erroneous since 88182 describes two types of service, DNA cell cycle and ploidy analysis. The maximum number of units for any single patient specimen would be two; two times the current relative value unit for 88182 is 1.54. CAP recommended an RVU of 0.75 for this procedure. The RUC noted that there was compelling evidence to maintain the current value for this procedure, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five-year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	RUC/ Rationale	Key
88311	Decalcify tissue	0.24	0.24	The CMDs requested that the physician work relative value unit for this procedure be reduced to 0.00 with the rationale that is a technical procedure that does not require physician work.	CAP reports that decalcification is a time critical procedure that requires physician work. The time is different depending on the specimen based on variables of size and density, and must be established by empirical testing which is done by the physician. Underdecalcification results in a specimen which is difficult to section yielding extensive histological artifact. Overcalcification results in loss of nuclear and cellular detail. In order to achieve optimal decalcification the physician must test the specimen periodically. CAP recommended that the current RVU of 0.24 be maintained. The RUC noted that there was compelling evidence to maintain the current value for this procedure.	2
89060	Exam, synovial fluid crystals	0.37	0.37	The CMDs asked that the relative value be reduced to 0.16 because the time and expertise required to examine fluid for crystals is no greater than the interpretation of a PA/lateral chest x-ray 71020(0.22) with a Harvard time of 5 minutes.	CAP reported that this interpretation involves the evaluation of wet preparations of body fluids, including joint and biliary fluids, and is useful in the determination of crystal material within joint fluid. The specimen is examined first by the pathologist who notes the gross characteristics. CAP noted that the median survey time for this procedure from their survey is 15 minutes, well above the 5 minutes of 71020. Based on the median survey results, CAP recommended an RVU of 0.45 for this procedure. The RUC noted that there was compelling evidence to maintain the current value for this procedure, but not to increase it.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

Code: 38230 Global Period: 010 Current RVW: 3.16 Recommended RVW: 7.0

CPT Descriptor: Bone marrow harvesting for transplantation.

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 42 year old woman with Stage II breast cancer involving 15 axillary lymph nodes is admitted for marrow harvest for high dose chemotherapy. She has a hematocrit of 34. All other laboratory results are normal. Under general anesthesia, she has about 150 bone marrow aspirations from the posterior iliac crests, collecting about a liter of marrow for transplantation after high dose chemotherapy. During the procedure, she requires 2 units of packed red cells to replace blood and marrow loss. At the completion of the procedure, a pressure dressing is applied over the four 1 cm incisions. She leaves the OR for the recovery room in stable condition with an order for frequent monitoring of vital signs and narcotics for pain relief. That evening, she is transferred to the oncology unit from the recovery room. Her evening hematocrit is 29. The next morning, the patient is prepared for hospital discharge. The dressing is removed and adhesive bandages are applied. The morning hematocrit is 30. A prescription for narcotics is written and she is given an appointment to return for a check-up.

Description of Pre-Service Work:

Physical examination; review of laboratory results.

Description of Intra-Service Work:

Approximately four 1 cm incisions; collection of about 150 bone marrow aspirations from posterior iliac crests; transfusion of red cells; application of pressure dressing.

Description of Post-Service Work:

Re-evaluation of vital signs; review post-procedure laboratory results; change dressing; write prescription for narcotics; follow-up office visit.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

SEE EXPLANATION BELOW

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Bone marrow harvesting is a 90 minute operating room procedure, performed under general anesthesia, and followed by an office visit during the 10-day global period. During the procedure, bone marrow is aspirated approximately 150 times from the posterior iliac crests.

The current RVU for bone marrow harvesting [3.16 RVUs] clearly undervalues this service. As a point of comparison, the current work value of a level 3 hospital admission [CPT 99223], which is assumed to involve 70 minutes of floor time, is 2.57 RVUs and a Level 3 office visit [CPT 99213] is 0.55 RVUs. It is not credible that an OR procedure of this complexity is valued similarly to, if not less than, E&M services of comparable duration.

Work involved in harvesting is similar in nature to that of a bone marrow aspiration [CPT 85095 – 1.08 RVUs] and a bone marrow biopsy [CPT 85102 – 1.37 RVUs]. The primary differences relate to 1) intra-service time and 2) post-service visits.

1. A bone marrow aspiration or biopsy typically takes 15 minutes; harvesting requires on average 90 minutes of intra-service work, a six-fold increase in time of procedure.
2. Bone marrow aspiration and biopsy do not include a global period; bone marrow harvesting has a 10 day global period during which one office visit is anticipated.
3. Intensity is generally greater for harvesting than for aspirations; psychological stress associated with harvesting is greater than for biopsies.

In developing a recommendation, ASCO relied on comparison with aspiration and biopsy codes, and included work associated with the subsequent visit.¹

1. Based on a 15 minute procedure, aspirations are valued at .072 RVU/minute.
2. Based on a 15 minute procedure, biopsies are valued at .091 RVU/minute.
3. The intensity (RVU/minutes) reflected in the existing RVUs for aspirations and biopsies implies, for the 90 minute harvesting procedure, an RVU of 6.48 - 8.19.
4. Accounting for one level 3 visit during the global period would increase the appropriate range for the bone marrow harvesting RVU to between 7.03 and 8.74.
5. The 75th percentile of the RVU recommended by survey participants is 7.0, comparable to the intensity comparison with bone marrow aspiration.

¹ Data related to pre- and post-service times were difficult to interpret. It appears that many of the physicians surveyed included total time the patient was in the care of a health care provider, not just that which directly involved the doctor. As a result, ASCO's recommendations do not reflect time and intensity associated with pre- and post-service time on the day of the procedure. As such, the Society views its recommendation as a "floor."

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 83020 Global Period: N/A Current RVW: 0.37 Recommended RVW: 0.43

CPT Descriptor:

Hemoglobin, electrophoresis (eg, A2, S, C)-interpretation and report.

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.16 on the basis that interpretation of hemoglobin electrophoresis requires less time and expertise than interpretation of a PA and lateral chest x-ray; the time and skill involved, once learned, is significantly less than the time and skill involved in evaluation and management of a patient for level 99212. The current value for the 71020 PA and lateral is 0.22 and the Harvard total time is 5 minutes. The current value of the 99212 is 0.38 and the CPT time is 10 minutes face-to-face.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of hemoglobin electrophoresis and related laboratory data from a three year old child with mild anemia and reduced MCV.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The interpretation and reporting of the electrophoretic pattern of hemoglobin represents the most specific method of determining the presence of a hemoglobinopathy. The electrophoretic plate is interpreted together with a chemical determination of the hemoglobin A2 level and peripheral blood red cell parameters to determine which if any abnormal hemoglobins are present and to diagnose the hemoglobinopathy. The collation of this data and ultimate narrative report for the medical record constitutes the interpretive service for this code. On certain occasions, such as a preoperative evaluation of a possible hemoglobinopathy, the service may require that the interpreting physician discuss the case with the patient's attending physician.

The survey median total time for interpretation of the hemoglobin electrophoresis is 14 minutes, well above the time of the CMD's radiology reference service time and above the intra-service time for the 99212 office visit that has a value of 0.38. Survey respondents rated the 83020 comparable in complexity to their chosen reference services but the 83020 median time is greater than the total times of each of these two references. The survey median physician work value for the 83020 is 0.43, between the values of the two reference services chosen by survey respondents.

Survey respondents agreed that the work of performing this service has not changed in the past five years and that the survey vignette describes their typical patient.

The College of American Pathologists recommends a physician work relative value of 0.43 for the hemoglobin electrophoresis interpretation based on the median survey value and comparison to reference services.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 83912 Global Period: NA Current RVW: 0.37 Recommended RVW: 0.40

CPT Descriptor: Nuclear molecular diagnostics; interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.30 on the basis that nuclear molecular diagnostics interpretation and report is a new field and that as more PCR tests have become available interpretation is significantly easier. CMDs said that the time involved in interpreting the test requires no more time than interpretation of a before and after bronchodilator study and cited two reference services: 72050 Radiologic examination, spine, cervical; minimum of four views (RV=0.31) and 94060 Bronchospasm evaluation: spirometry, including graphic record, total and timed vital capacity, expiratory flow rate measurement(s), and/or maximal voluntary ventilation, before and after bronchodilator (aerosol or parenteral) or exercise (RV=0.31). The 94060 Bronchodilator study was studied by Harvard and has a total time of 7 minutes from that study. The radiology reference apparently was not studied by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Using PCR, evaluation and report of DNA probe study of vaginal swab obtained from pregnant 28 year old suspected of gonococcal infection.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

Specialty: Pathology - College of American Pathologists

Sample Size: 16/16 Response Rate (%): 100% Median RVW: 0.40

3)	N/A		
4)	N/A		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
83912	5	10	5	3.5	2.5	3
80500	0	12.5	1	3.5	2.5	3.5
85060	5	12	5	3	3	2

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The 83912 code is for interpretation of molecular diagnostics, tests performed to detect the presence of a specific segment of DNA code. In the testing/technical process, a test specimen, eg., a vaginal swab, is treated to isolate the DNA present, containing, in part, the DNA from the putative infectious organism. This DNA is heated to separate the strands of the double helix. Before it cools (and thus reforms the double helix) a sample of "tagged" single strand DNA from gonococcus (in this vignette) is added. The DNA is allowed to anneal and this permits complementary fragments to form double helices. If tagged test DNA is incorporated in these double helices, this is evidence that the test organism that served as the origin of the test DNA was present in the original patient sample. Polymerase chain reaction (PCR) is a means of amplifying small amounts of DNA to make detection more sensitive. Detection is by electrophoresis to separate DNA fragments and, by identifying the "tag," to look at the distribution of "tagged" fragments. Sufficient incorporation of DNA from a specific organism is interpreted as indicative of presence of an organism.

Interpretation of the results of the technical process requires intimate knowledge of the process, an understanding of the potential microbiology involved, and understanding of the amount and pattern of double helix formation (DNA segments) necessary to indicate significant clinical presence. For each organism (and DNA probes for new ones are constantly being developed) the DNA segments are unique and it is necessary for the physician to have a detailed knowledge of the various DNA patterns.

The median survey total time for the molecular diagnostics interpretation is 20 minutes. Survey respondents chose the general clinical pathology consultation service, 80500, and the peripheral blood smear interpretation service, 85060, as references and placed the value of the 83912 between these two services. The total time given for the 80500 is 13.5 , with 22 minutes given for the 85060. The three services were reported to be generally comparable in complexity. The CMDs' chosen bronchodilator reference service is significantly lower in total time.

This is a very low volume service. Of the 16 provider/respondents, 14 indicated that the work of performing the service has changed in the past five years, but there was a split as to whether the new technology has become more familiar. Most respondents said that there has been no change in patient complexity. Survey respondents also indicated no change in site-of-service, although the BMAD data show an increase in the percentage of inpatient volume from 1992 to 1994. . Seventy-five percent of survey respondents said the survey vignette describes their typical patient.

The College of American Pathologists recommends a physician work value of 0.40 for the molecular diagnostics interpretation based on median survey data and comparison to reference services.

CMD Comments

	94060 EVALUATION OF WHEEZING	0.31	XXX

CMD Comment:

Nuclear molecular diagnostics, interpretation and report is a new field. As more PCR tests have become available, interpretation is significantly easier. The time involved in interpreting the test requires no more time than the interpretation of a before and after bronchodilator study.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 84165 Global Period: N/A Current RVW: 0.37 Recommended RVW: 0.40

CPT Descriptor:

Protein, electrophoretic fractionation and quantitation - interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs requested a reduction in relative value to 0.16 on the basis that the time involved in interpretation of serum protein electrophoresis is less than that in interpretation of a PA and lateral chest x-ray, none of the services provided for the interpretation of serum protein electrophoresis are greater than the interpretation of the x-ray, and the time and effort involved is definitely less than evaluation of a patient in an office visit level 99212. The current relative value of the 71020 PA and lateral x-ray is 0.22 and the Harvard time is 5 minutes. The value of the 99212 is 0.38 and the CPT time is 10 minutes face-to-face.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of protein electrophoresis and related laboratory data from a 59 year old man with elevated total serum protein and bony defects of the skull.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
84165	3	5	5	3	3	3
80500	5	6.5	4	3	2	3
85060	6.5	10	8	4	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also

describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The interpretation and report of this laboratory procedure involves several different professional services. An agarose gel plate containing the patient's electrophoretic pattern and a serum protein control pattern provided by the laboratory technical staff are compared by the pathologist. The densitometer tracings of the patient control patterns are then evaluated and any abnormality in one of more of the five peaks usually present on such a pattern is described with a subsequent written narrative report. This report would include a differential diagnosis of the pattern abnormalities noted and may require an evaluation of other laboratory studies including hematologic, serologic and biochemical data as well as demographic data obtained through the laboratory computer system. Any possible technical problems noted in either the control or patient data would also need to be evaluated in consultation with the laboratory staff.

The survey median total time of 13 minutes for the 84165 is well above the time for the radiology reference service chosen by the CMDs and above the intra-service time for the 99212 office visit that has a value of 0.38. Survey respondents chose the 80500 general clinical pathology consultation service and the 85060 peripheral blood smear interpretation as their reference services and placed the complexity of the 84165 between those two services. The median work value for the 84165 is 0.40, compared to 0.37 and 0.45 for the two survey reference services.

The College of American Pathologists recommends a physician work relative value of 0.40 for the 84165 protein electrophoresis interpretation based on the survey median and comparison to reference services.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 84181 Global Period: NA Current RVW: 0.37 Recommended RVW: 0.39

CPT Descriptor:

Western blot, with interpretation and report, blood or other body fluid

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.16 on the basis that interpretation of Western Blot tests has become easier as the quality and technique of the test has improved. Error in interpretation of Western Blot testing carries no greater significance than error in interpretation of a chest x-ray of a patient with possible malignancy or tuberculosis. CMDs chose a Reference Service of 71020 Radiologic examination, chest, two views, frontal and lateral (RV=0.22).

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of Western blot pattern in a patient with repeatedly reactive HIV-1 antibody EIA who had multiple transfusions in the late 1970s.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

3)	N/A		
4)	N/A		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
84181	7.5	7	5	3.5	3	3
80500	2.5	5	5	3	2	2
85060	1	12	1	3	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also

describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Western Blot testing is used to detect the antibodies specific for a particular protein in a mixture of antibodies and proteins. Typically a mixture of microbial antigen proteins derived from a pure microbial culture is electrophoresed to separate the individual protein species. A strip containing the protein species is then "blotted" against a material containing test patient serum. Antibodies specific for individual proteins in the original mixture will form immune complexes and precipitate at the location of the electrophoresed protein component. Excess non-precipitated protein is washed away and the strip is stained to reveal specific bands of precipitate that are given numbers corresponding to their molecular weight.

The interpreting physician must have a knowledge of the antibodies considered specific for a particular organism, as these studies permit discrimination between non-specific antibodies related to a particular class of organisms, eg., spirochetes, and those for a specific organism such as Borrelia bergdorffii. The physician reviews one or more electrophoretic strips and compares the patient study with the control to determine the presence of specific bands. The presence of the bands is a means of indicating the immune status of the patient. Precipitation bands are indicative of the antibody specific to individual proteins derived from the microbial agent in question.

Difficulties in interpretation arise when the test results fit neither the positive nor the negative criteria, perhaps as a result of an abnormal patient response or the presence of an abnormal or different microbial antigen preparation. Western Blot studies for new or different organisms present still new problems. The interpreting physician must understand the reasons for antigen variability (batch to batch) depending on the specific strain used to prepare the antigen mixture.

The CMDs statement that interpretation of Western Blot testing has become easier as the quality and technique of the test has improved is incorrect. The Western Blot is a dynamic test with constant changes as new knowledge is gained and information about new organisms is defined. While the test itself has become more widely available with technological advance, the skills needed and work involved in interpretation of the test results are at least as demanding as previously. Patients who are being studied are also being treated by a variety of modalities, and their disease progresses to different stages before being arrested, making interpretation ever more difficult.

Survey responses are split on whether the work has changed in the last five years, and among those who indicated a change the responses are split as to whether the service is more or less familiar/difficult, probably reflecting differences in familiarity with the service five years ago. Seventy percent of respondents agreed that the vignette described their typical patient.

The current value of 0.37 for this interpretation was assigned by HCFA based on the value of the general clinical pathology consultation code 80500. The 84181 was not studied by Harvard or otherwise surveyed until now. The survey data from Harvard on the 80500 showed mean total times of 11-13 minutes, lower than the current survey total time of 19.5 minutes for the 84181. This survey time significantly exceeds the times for the two reference services chosen by the CMDs. Survey respondents chose the 80500 clinical pathology consultation and the 85060 peripheral blood smear interpretation as reference services, with values of 0.37 and 0.45, respectively, and assigned a median value of 0.39 to the 84181.

The College of American Pathologists recommends a physician work relative value of 0.39 for the 84181, Western Blot interpretation, based on the survey median and comparison to reference services.

4)	N/A		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
84182	4.5	10	5	4	3	3
80500	10	15	10	3	3	3
85060	2.5	15	4.5	3	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Western Blot with immunological probe for band identification is used to detect the antigens specific for a particular organism in a mixture of proteins, eg., from body cavity exudate. Typically such an exudate containing microbial antigen proteins is electrophoresed on a strip to separate the individual protein species. The strip is then blotted against a material containing an individual specific probe antibody, ie., antibodies each known to react with specific antigens in a particular microbial agent. Antibodies specific for individual proteins in the original mixture will form immune complexes and precipitate at the location of the electrophoresed protein component. Excess, non-precipitated protein is washed away and the strip stained to reveal specific bands of precipitate. These bands are given numbers corresponding to their molecular weight, eg., 35 kD.

The interpreting physician reviews the bands to discern the proteins of specific molecular weights that are associated with specific pathogenic micro-organisms. Differentiation of non-specific reactions from specific reactions is required and consideration of the likelihood of a particular pathogen being present in a certain anatomical location, in relation to the patient's clinical status. This requires discrimination between non-specific microbial antigens and ones that can be considered specific evidence of a particular infectious organism. Studies for different organisms are markedly different.

The CMDs statement that interpretation of Western Blot testing has become easier as the quality and technique of the test has improved is incorrect. As with the 88181 Western Blot interpretation, this service is a dynamic challenge with constant changes as new knowledge is gained and information about new organisms is defined. Physician work involved is at least as demanding as previously.

More than half of the survey respondents indicated that the work of performing this service has changed in the last five years, with those respondents indicating that patients are now more complex. They were split on whether the service is new technology that has become more familiar. Sixty-five percent of respondents agreed that the survey vignette describes their typical patient.

The current value of 0.37 for this interpretation was assigned by HCFA based on the value of the general clinical pathology consultation code 80500. The 84182 was not studied by Harvard or otherwise surveyed until now. The survey data from Harvard on the 80500 showed mean total times of 11-13 minutes, somewhat lower than the current survey total time of 19.5 minutes for the 84182. This survey time significantly exceeds the times for the two reference services chosen by the CMDs. Survey respondents chose the 80500 clinical pathology consultation and the 85060 peripheral blood smear interpretation as reference services, with physician work values of 0.37 and 0.45, respectively, and assigned the 88182 a median value of 0.40.

The College of American Pathologists recommends a physician work relative value of 0.40 for the 84182, Western Blot interpretation with immunological probe, based on the survey median and comparison to reference services.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 85390 Global Period: N/A Current RVW: 0.37 Recommended RVW: 1.20

CPT Descriptor:

Fibrinolysins or coagulopathy screen, interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs requested that the value be reduced to 0.16 on the basis that interpretation of a fibrinolysin screen requires less time and expertise than interpretation of a PA and lateral chest x-ray (71020) and a level 2 office visit (99212). Note: the current relative value of the 71020 is 0.22 and the Harvard time is 5 minutes. The value of the 99212 is 0.38 and the CPT time is 10 minutes face-to-face.

The American Society of Hematology requested that the value be increased to 1.19 and chose as a Reference Service the 88331 Pathology consultation during surgery; with frozen section(s), single specimen. The 88331 has a relative value of 1.19; Harvard mean total times for these vignettes were 20-24 minutes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of fibrinolysin screening panel in a 40 year old male with massive diffuse post operative bleeding.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

88305	3.5	23.5	5	4	3	3.5
88331	4	23	10	4	4	4

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The College of American Pathologists and American Society of Hematology used the same vignette and descriptions of pre-, intra- and post-service work to survey for this service and produced a combined recommendation of 1.20, the median RWV. The current value of 0.37 was assigned by HCFA based on comparison to the general code for clinical laboratory consultations, 80500. The 85390 was not studied by Harvard or otherwise surveyed. The survey data from Harvard on the 80500 showed mean total times of 11-13 minutes, lower than the current survey data on the 85390. Although the 80500 was not chosen as a reference service by those responding to the 85390 survey, others reporting estimates on the 80500 on other surveys of clinical laboratory test interpretations rate it lower in time and work than the ratings given for the 85390 on this survey.

Similarly, the reference services chosen by the CMDs have lower times and relative values than is appropriate for the fibrinolysins/coagulopathy screen. The radiology reference service Harvard time of 5 minutes total and the level 2 office visit time of 10 minutes face-to-face are both lower than the median survey time for the 85390 of 34.5 minutes total. In light of these data the recommendation of the CMDs is difficult to understand and we suspect they are not familiar with the service.

The evaluation of laboratory data in patients with coagulopathies is performed by physicians dealing with critical patient conditions. The physician will frequently be presented with data from several different areas of laboratory testing including coagulation and hematology. The data are reviewed in the historical context of the patient's previous laboratory parameters, often utilizing the clinical laboratory's computer information system and clinical data available to the interpreting physician through the computer's clinical diagnosis and patient demographics section. Other areas that may be part of the interpretation include evaluation of test control data and other variables of a technical nature to ensure the validity of the particular patient's test data and consultation with technical laboratory staff. A presumptive or differential diagnosis will then be provided with recommendations for additional testing as necessary to complete the diagnosis. This more sophisticated approach to clinical laboratory interpretation than technology previously allowed, although more time-consuming and mentally demanding for the physician, makes the service a much more comprehensive and valuable one than previously provided.

In the more critical situations, direct consultation with the clinician may be required in addition to the written narrative report. The amount of physician work involved in the 85390 is considerably higher than that provided in the typical 80500 to which the current 85390 relative value is indexed and certainly greater than the 0.16 value requested by the CMDs.

Sixty-three percent of survey respondents indicated that the work of performing this service has changed in the past 5 years, agreed that the service does not represent technology that has become more familiar and said that patients requiring the service are now more complex. The usual site of service has not changed. Ninety-two percent of respondents said the vignette described their typical patient.

The American Society of Hematology and College of American Pathologists recommend a physician work relative value of 1.20 based on the increase in physician work for the service, the median survey data and comparison to other available data.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 85576 Global Period: N/A Current RVW: 0.37 Recommended RVW: 0.50

CPT Descriptor:

Platelet; aggregation (in vitro) each agent—interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.16 on the basis that interpretation of platelet aggregation requires less time and expertise than interpretation of a PA and lateral chest x-ray and a level 2 office visit. The current relative value of the 71020 PA and lateral x-ray is 0.22 with a Harvard mean total time of 5 minutes. The level 2 office visit has a current value of 0.38 and a CPT time of 10 minutes face-to-face.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of platelet aggregation profile and related laboratory data from a 69 year old man admitted for transurethral resection (TUR) with abnormal preoperative bleeding time.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

4)	N/A		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
85576	5	7.5	6	3	3	3
80500	5	3	4	3	2	3
85060	5	10	7	4	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

In the platelet aggregation procedure the ability of platelets to aggregate (or be inhibited from aggregation) is measured by a continuous recording device. The result of the test is a family of curves depicting the patient's response to a number of specific agents at varying concentrations from which disorders of platelet function can be diagnosed and specific measures can be recommended to prevent future problems.

The interpreting physician must have a knowledge of the testing methodologies employed, the specific agents studied, and their actions on platelets and ability to interact with one another. Frequently, a number of concentrations are run for each agent studied, leading to an interpretation that has both qualitative and quantitative aspects. Since the test is relatively time consuming and infrequently performed, the interpreting physician often must review the test controls related to each agent and compare the results to the test patient to ensure validity.

The current value of 0.37 for this interpretation was assigned by HCFA based on the value of the general clinical pathology consultation code 80500. The 85576 was not studied by Harvard or otherwise surveyed until now. The survey data from Harvard on the 80500 showed mean total times of 11-13 minutes, lower than the current survey total time of 18.5 minutes for the 85576. Survey respondents rated the 85576 between the 80500 and the 85060 in terms of time and complexity. The survey time significantly exceeds the times for the two reference services chosen by the CMDs.

About one-third of survey respondents indicated that the work involved in platelet aggregation interpretation has increased in the last five years because the patients requiring the service are more complex. Survey respondents agreed that the survey vignette describes their typical patient.

The College of American Pathologists recommends a physician work relative value of 0.50 for the Platelet aggregation interpretation, based on the survey median and comparison to reference services.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 86077 Global Period: N/A Recommended RVW: 0.99

Current RVW: 0.37

Source and Summary of Comment to HCFA on this Service: The American Society of Hematology requested the work relative values be increased to 0.94 in our comments to the Health Care Financing Administration, February 6, 1995. CPT 86078 -- Physician blood bank service, investigation of transfusion reaction including suspicion of transmissible disease, was chosen as the reference service which has a work relative value of 0.94. Harvard mean total time for the reference is 37 minutes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Evaluation of a positive red cell antibody screen performed on a preoperative blood sample and preparation of a report recommending the procedure(s) to identify compatible blood for a transfusion.

Description of Pre-Service Work: Includes work from the time the service is begun and may include obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to the actual performance of the evaluation.

Description of Intra-Service Work: Evaluation and interpretation of the screen, review of serological results, comparison to previous serology reports; any review of literature during examination of test results; determination of clinical significance or serologic findings; selection of appropriate blood components; clinical determination of urgency of transfusion; assessment of potential risks and benefits of transfusion; determination of best cross match technique; clinical monitoring for adverse effects; and any dictation or report preparation performed during the examination of the test results.

Description of Post-Service Work: Includes report preparation and finalization; written and telephone communications with other professionals, patients and families; obtaining and reviewing the results of other diagnostic studies, including examination of previous reports, after examination of the test results; arranging for future studies or services.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre, intra, and post-service time and intensity (mental effort and judgement; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference service listed above.

CPT Code	Pre	Intra	Post	Mental	Technical	Psychological
86078	N/A	37	N/A	4	3	3
86077	N/A	40	N/A	4	3	3

RATIONALE

The American Society of Hematology believes the survey results adequately indicate that a work RVU of 0.99 is justified. Currently, CPT 86077 is assigned 0.37 work RVUs. This code was

not included in the Harvard study, or otherwise surveyed. The survey data from Harvard on the reference service, CPT 80678 -- Physician blood bank service, investigation of transfusion reaction including suspicion of transmissible disease, showed a mean total time of 37 minutes, slightly lower than the current survey data on CPT 86077 at 40 minutes. CPT 86078 is assigned 0.94 work RVUs.

Conclusion: The American Society of Hematology recommends a physician work relative value of 0.99 for CPT 86077 based upon the increase in physician work for this service, the median survey data and comparison to the other available data. ASH believes the current RVW of 0.37 is undervalued. Though ASH did not receive a large return on the survey since this is a low volume service for hematologists (Medicare was only billed 3 times in 1993 for this service by a hematologist); we believe the interest of ASIM, CAP and ASCP in commenting on CPT 86077 amplifies the survey results in favor of an increase.

Has the work in this service changed in the past 5 years? 1 Yes 6 No. If yes, complete a -

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 86079 Global Period: N/A Recommended RVW: 0.94

Current RVW: 0.37

Source and Summary of Comment to HCFA on this Service: The American Society of Hematology requested the work relative value be increased to 0.94 in our comments to the Health Care Financing Administration, February 6, 1995. CPT 86078 -- Physician blood bank service, investigation of transfusion reaction including suspicion of transmissible disease, was chosen as the reference service which has a work relative value of 0.94. Harvard mean total time for the reference is 37 minutes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Evaluation of a 40 year old man whose last whole blood donation was less than 56 days ago and preparation of a report accepting him as "dedicated directed" blood donor for his son.

Description of Pre-Service Work: Includes work from the time the service is begun and may include obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to the actual performance of the evaluation.

Description of Intra-Service Work: Clinical assessment of the urgency of the transfusion; selection of appropriate cross match or other laboratory procedures; selection of appropriate blood components; any review of literature or research during the examination of test results; determination of potential risks and benefits of transfusion (or product donation) in order to make transfusion therapy recommendations; clinical monitoring of the recipient or donor for adverse effects of the transfusion or donation, including reassessment of decision based upon changing clinical status; and any dictation or report preparation performed during the examination of the test results.

Description of Post-Service Work: Includes report preparation and finalization; written and telephone communications with other professionals, patients and families; obtaining and reviewing the results of other diagnostic studies, including examination of previous reports, after examination of the test results; arranging for future studies or services.

86079	N/A	30	N/A	4	3	4

RATIONALE

The American Society of Hematology believes the survey results adequately indicate that a work

RVU equal to that of the reference service of 0.94 is justified. Currently, CPT 86079 is assigned 0.37 work RVUs. This code was not included in the Harvard study, or otherwise surveyed. The survey data from Harvard on the reference service, CPT 80678 -- Physician blood bank service, investigation of transfusion reaction including suspicion of transmissible disease, showed a mean total time of 37 minutes, only slightly higher than the current survey data on CPT 86079 at 30 minutes.

Conclusion: The American Society of Hematology recommends a physician work relative value of 0.94 for CPT 86079 based upon the increase in physician work for this service, the median survey data and comparison to the other available data. ASH believes the current RVW of 0.37 is undervalued. ASH did not receive a large return on the survey since this is a low volume service for hematologists (Medicare was only billed 5 times in 1993 for this service by a hematologist). Despite the low survey response, we believe the RUC should still consider a change in the value and obtain the views of ASIM, CAP and ASCP who expressed interest in commenting on CPT 86079.

Has the work in this service changed in the past 5 years? 1 Yes 6 No. If yes, complete a -

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 86255 Global Period: N/A Current RVW: 0.37 Recommended RVW: 0.40

CPT Descriptor:

Fluorescent antibody; screen, each antibody -- interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.16 on the basis that interpretation of fluorescent antibody screen, each antibody, requires less time and expertise than interpretation of a PA and lateral chest x-ray. Furthermore, since this is for "each antibody" and screens are done usually for 3 antibodies, the total relative value of 0.37 (1.11) is excessive. The 71020 PA and Lateral chest x-ray is currently valued at 0.22 and has a Harvard total time of 5 minutes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of immunofluorescence antibody screen study in a patient suspected of having Systemic Lupus Erythematosus (SLE).

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

Specialty: Pathology--College of American Pathologists

Sample Size: 31/50 Response Rate (%): 62% Median RVW: 0.40

3)	N/A		
4)	N/A		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
86255	3	5	5	4	3	2
80500	5	5	6	3	2.5	3
85060	4	12	4	3.5	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Fluorescent antibody screen is used for detection and quantitation of autoantibodies to various cell constituents, eg., anti-mitochondria or anti-nuclear antigen (ANA). A thin layer of cells from either a cell culture or animal tissue is placed on a slide, patient serum is diluted and added, the slide is incubated, and non-adhering protein is washed off. Then a fluorescent-tagged animal antibody to human IgG (eg., FI-rabbit-anti-human IgG) is added and after a suitable period the unbound FI-tagged antiserum is washed away. The slide is then examined by the interpreting physician with a fluorescent microscope and the nature of the organelles showing fluorescence are identified.

Interpretation of the prepared slide requires extensive knowledge of the procedure and its limitations and a very comprehensive knowledge of the anatomy of the tissue/cells being examined. Using a fluorescent microscope the interpreting physician examines the fluorescent stain of animal tissues making a determination as to whether the cells fluoresce positively, which part of the cell is adsorbing antibody, and regarding the pattern of fluorescence. The interpreting physician must always be aware of the potential for artifacts of both the system (reagents, tissue, equipment) and of the patient. A disease or unexpected immunity within the test subject could contribute to a false negative or a false positive result and the interpreting physician must always be on guard for such situations. For example, a patient with an immunologic sensitivity to bovine protein, eg., bovine serum albumin (BSA), might show an extraordinary response to an attempt to examine serum for autoantibody using tissue culture cells grown in the presence of BSA.

The CMDs' statement that, since screens are usually done for 3 antibodies, the total of 3 times 0.37 (or 1.11) is excessive is inappropriate. The study of each auto-antibody is essentially a study unto itself since different tissues/cells are used to demonstrate reactions for different antibodies--there is little if any economy in physician work if multiple antibodies are examined.

The current value for the fluorescent antibody screen interpretation was assigned by HCFA based on the value of 0.37 for the general clinical pathology consultation code 80500. The 86255 was not studied by Harvard and has not been surveyed until now. The current survey mean total time for the 86255 is 13 minutes, above that for the CMDs' reference service. Survey respondents rated the 86255 slightly more complex than the 80500, but slightly less complex and requiring less time than the 85060 peripheral blood smear interpretation that has a current value of 0.45.

Survey respondents said that the work has not changed in the last five years and that the survey vignette does describe their typical patient.

The College of American Pathologists recommends a physician work value of 0.40 for the fluorescent antibody screen interpretation, based on the median survey value and comparison to reference services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Fluorescent antibody titer is used for detection and quantitation of autoantibodies to various cell constituents, eg., anti-mitochondria or anti-nuclear antigen (ANA). A thin layer of cells from either a cell culture or animal tissue is placed on a slide, patient serum is diluted and added, the slide is incubated, and non-adhering protein is washed off. Then a fluorescent-tagged animal antibody to human IgG (eg., Fl-rabbit-anti-human IgG) is added and after

a suitable period the unbound FI-tagged antiserum is washed away. The slide is then examined by the interpreting physician with a fluorescent microscope and the nature of the organelles showing fluorescence are identified.

The titer interpretation involves determination of the amount of auto-antibody present, a semi-quantitative determination made by the interpreting physician. As with the screen, the interpretation requires extensive knowledge of the procedure and its limitations and a very comprehensive knowledge of the anatomy of the tissue/cells being examined. The interpreting physician must review the results of the titer technical studies to be certain that the fluorescence seen is constant within the organelle so that only a single antibody is being studied. As with the screen, the determination of each titer is essentially an individual study since different tissues/cells are generally used to demonstrate reactions for different antibodies. It is not appropriate to link multiples together as one service or to discount work for multiple titers.

The current value for the fluorescent antibody titer interpretation was assigned by HCFA based on the value of 0.37 for the general clinical pathology consultation code 80500. The 86256 was not studied by Harvard and has not been surveyed until now. The current survey mean total time for the 86256 is 13 minutes, above that for the CMDs' reference service. Survey respondents rated the 86256 slightly less complex and requiring less time than the 85060 peripheral blood smear interpretation that has a current value of 0.45, and comparable in time and complexity to the 86255 fluorescent antibody screen.

The College of American Pathologists recommends a physician work value of 0.39 for the fluorescent antibody titer, based on median survey results and comparison to reference services.

CMD Comment:

The interpretation of fluorescent antibody titer, each antibody, requires less time and expertise than the interpretation of a PA and lateral chest X-ray.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 86320 Global Period: N/A Current RVW: 0.37 Recommended RVW: 0

CPT Descriptor:

Immunoelectrophoresis; serum--interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.17 on the basis that interpretation of serum immunoelectrophoresis requires less time and expertise than interpretation of a PA and lateral chest x-ray; however, it requires slightly more expertise than interpretation of a serum electrophoresis (84165) which CMDs asked to be reduced to 0.16. The current relative value of the 71020 PA and lateral x-ray is 0.22 with a mean Harvard time of 5 minutes. The 86320 vignette described below was studied by Harvard, had a mean total time of 11 minutes, and has a current value of 0.37 on the basis of the Harvard data.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of a serum immunoelectrophoresis study in a 59 year old male with monoclonal gammopathy.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
86320	4.5	9	3	3	3	3
80500	5	10	5	3	2	2
85060	5	13.5	2	3	3	3
84165*	3	5	5	3	3	3

*Selected by CMDs not survey respondents

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Interpretation and report of a protein immunoelectrophoresis is a follow-up study in patients that have an existing proteinopathy. The interpreting physician reviews dispersed patterns of patient serum and compares them to controls looking at at least five such patterns. Interpretation requires a judgment as to whether the shape and density of the sample is sufficiently different from that of the control to establish an abnormality. With the more extensive use of clinical laboratory computers (laboratory information systems), additional data related to this proteinopathy can be evaluated with a more complete and useful clinical interpretation of the protein abnormality.

The median survey total time for the serum immunoelectrophoresis was 16.5 minutes, well above the total time for the radiology reference service chosen by the CMDs. Survey respondents chose the 80500 general clinical pathology consultation and the peripheral blood smear interpretation as reference services, gave those services somewhat higher times than the 86320, but rated the complexity of the service the same as the 85060 that has a work value of 0.45. The survey median for the 86320 is 0.48.

Survey respondents agreed that the work of performing this service has not changed in the past five years and that the survey vignette does describe their typical patient.

The College of American Pathologists recommends a physician work relative value of 0.48 for the serum immunoelectrophoresis interpretation based on the survey median and comparison to reference services.

SUMMARY OF RECOMMENDATION**

CPT Code: 86325 Global Period: N/A Current RVW: 0.37 Recommended RVW: 0.45

CPT Descriptor:

Immunoelectrophoresis; other fluids (eg, urine, CSF) with concentration—interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.17 on the basis that interpretation of immunoelectrophoresis of other fluids (urine, CSF) requires less time and expertise than interpretation of a PA and lateral chest x-ray. CMDs said the 86325 interpretation is similar to 86320 and requires slightly more expertise than the 84165 that they asked be reduced to 0.16. The current relative value of the 71020 PA and lateral x-ray is 0.22 with a Harvard time of 5 minutes. The 86320 vignette was studied by Harvard, had a mean total time of 11 minutes, and has a current value of 0.37 on the basis of the Harvard data.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of urine immunoelectrophoresis study for the presence of Bence Jones proteins in a patient with suspected monoclonal gammopathy.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

85060	5	12	0	3	3	2.5
84165*	3	5	5	3	3	3
86320*	4.5	9	3	3	3	3

*Selected by CMDs not survey respondents

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Interpretation of a urine protein immunoelectrophoresis is similar to that performed in a serum immunoelectrophoresis. It is a service provided to patients that are being followed for existing proteinopathy as a method of following their therapy. The interpreting physician reviews dispersed patterns of patient urine, compares them to controls looking at at least five such patterns, and correlates this information with findings of the serum immunoelectrophoresis or other such studies. Interpretation requires a judgment as to whether the shape and density of the sample is sufficiently different from that of the control to be abnormal. Use of laboratory information systems that allow access to additional data related to the proteinopathy make this a more complete and useful interpretation of the protein abnormality.

This service should be valued approximately the same as the 86320 serum immunoelectrophoresis; the CMDs apparently agree with that premise. The median survey total time for the 86325 immunoelectrophoresis is 14 minutes, well above the mean total time for the radiology reference service chosen by the CMDs and closer to the time for the 86320 and the 84165. Survey respondents chose the general clinical pathology consultation service (80500) and the peripheral blood smear interpretation as their reference services and rated the complexity of the 86325 similar to that of those services. The median survey value for the 86325 is 0.45, the same as the 85060 reference service.

Survey respondents indicated that the work of performing this service has not changed in the past five years and that the survey vignette describes their typical patient.

The College of American Pathologists recommends a physician work relative value of 0.45 for interpretation of immunoelectrophoresis of other (than serum) fluids based on the median survey value and comparison to reference services.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 86327 Global Period: NA Current RVW: 0.37 Recommended RVW: 0.60

CPT Descriptor:

Immunoelectrophoresis; crossed (2-dimensional assay)--interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.18 on the basis that interpretation of crossed (2-dimensional) immunoelectrophoresis requires less time and expertise than interpretation of a PA and lateral chest x-ray. CMDs said it does require more expertise than interpretation of serum electrophoresis or immunoelectrophoresis services and cited 84165 (protein electrophoresis), 86320 (serum immunoelectrophoresis) and 86325 (immunoelectrophoresis of other fluids) as reference services. CMDs asked that these reference services be reduced in value to 0.16, 0.17 and 0.17, respectively. The current relative value of the 71020 PA and lateral x-ray is 0.22 with a Harvard mean total time of 5 minutes. A serum immunoelectrophoresis vignette was studied by Harvard, had a mean total time of 11 minutes, has a current value of 0.37, based on the Harvard data, and has been surveyed in the five-year refinement (see below). The 84165 and 86325 have also been surveyed in the five-year refinement process (see below) but were not previously studied.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Crossed immunoelectrophoresis for evaluation of multimeric composition of von Willebrand's factor to define whether it is a Type I or Type II deficiency, interpretation and report.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

86325*	3	8	3	3	3	2

*Selected by CMDs not survey respondents; data are from the separate survey of each of these services

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Crossed (2-dimensional) immunoelectrophoresis is used to characterize complex mixtures of antigens or antibodies. It is invaluable for the separation and investigation of each monoclonal protein (as indicated in the vignette) to identify the type of von Willebrand's factor that is deficient. In the test, the patient serum specimen is electrophoresed along one edge of a rectangular agarose gel. Once appropriate separation has been accomplished the strip is electrophoresed at right angles into gel containing a mixture of dilute, specific antibodies. Specific peaks of precipitate are formed for each individual protein within the original patient specimen for which an antibody was also present on the second electrophoresis.

The physician's interpretation requires knowledge of the patient's clinical history and the procedure process and its limitations. The interpreting physician must review a pattern composed of a series of intersecting "curves" each having the appearance of a bell-shaped curve. Understanding of the molecular structure of the protein under investigation is required so that the appropriate curve can be discerned and an accurate interpretation rendered. Interpretation of crossed immunoelectrophoresis is much more difficult than other immunoelectrophoreses because all of the antisera are mixed and the plate must be carefully examined and compared with the control to properly identify the absence of an expected protein or the presence of an unexpected protein. In other immunoelectrophoreses the physician examines a series of separate electrophoresis strips each with a single defined antibody so that when a reaction is detected the antigen-antibody is known.

The reference services chosen by the CMDs are inappropriate to the 86327 crossed immunoelectrophoresis because of the differences in time and complexity. CAP respondents in the 86327 survey did not chose these services as reference services but separate survey of the CMD-chosen references (because they are targeted for possible reduction) indicates that the 86327 requires significantly more time and difficulty (see data above). The median total survey time for the 86327 is 23.5 minutes, and the 86327 is rated higher in complexity than the other services. The crossed immunoelectrophoresis is a very low volume service with only a relatively small number of physicians providing these interpretations.

Survey respondents were split on whether the work in performing the service has changed in the last five years, with those saying yes indicating that patients requiring the service are now more complex. Two of the 11 respondents indicated that the survey vignette did not describe their typical patient.

The College of American Pathologists recommends a physician work relative value of 0.60 for the 86327 crossed (2-dimensional) electrophoresis based on the survey median and comparison to identified reference services.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 86334 Global Period: NA Current RVW: 0.37 Recommended RVW: 0.45

CPT Descriptor:

Immunofixation electrophoresis—interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.18 on the basis that interpretation of an immunoelectrophoresis requires less time and expertise than interpretation of a PA and lateral chest x-ray. CMDS said that it does require more expertise than interpretation of a serum electrophoresis or immunoelectrophoresis and cited 86325 and 86327 as additional reference services. The 71020 PA and lateral chest x-ray has a relative value of 0.22 and a Harvard total time of 5 minutes. A serum immunoelectrophoresis vignette was studied by Harvard, had a mean total time of 11 minutes, has a current value of 0.37 based on the Harvard data, and has been surveyed in the five-year refinement (see below). The 86325 has also been surveyed in the five-year refinement process (see below) but was not previously studied.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Evaluation and report of the immunofixation electrophoresis study in an 84 year old man with abnormal electrophoretic peak and equivocal immunoelectrophoretic study of serum protein.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

Specialty: Pathology--College of American Pathologists

Sample Size: 38/40 Response Rate (%): 95% Median RVW: 0.45

25th Percentile RVW: 0.37 75th Percentile RVW: 0.60 Low: 0.20 High: 2.22

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	80500	Clinical pathology consultation; limited, without review of patient's history and medical records	0.37
2)	85060	Blood smear, peripheral, interpretation by physician with written report	0.45
3)	NA		
4)	NA		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
86334	3.5	6	5	3	3	2
80500	5	6.5	0	3	3	3
85060	3.5	10	3	3	3	3
86325*	3	8	3	3	3	2
86327*	5	13.5	5	4	3.5	3

*Chosen by CMDs not survey respondents; data are from the separate surveys of these services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Immunofixation electrophoresis is used to detect monoclonal processes in patient specimens. The patient specimen is electrophoresed along multiple strips of agarose gel and then each strip is treated with a dilute, specific anti-human serum protein (eg., rabbit anti-gamma). After washing away non-precipitated proteins, the presence of patient monoclonal protein is detected by staining the precipitated protein-antibody complexes. This allows determination of the presence of monoclonal protein and its characterization (eg, gamma-kappa).

The interpreting physician must have a knowledge of the patient's clinical history and of the procedure and its limitations. Review of the patient's clinical chemistry study results, especially the serum protein electrophoresis results, is part of the interpretation process. Identification of additional studies that are required to establish the correct nature of the monoclonal protein is part of the interpretation and report.

With the increase in sensitivity of the detection of monoclonal proteins by the use of newer serum protein electrophoretic procedures, the number and complexity of these patterns has increased. We are seeing increased numbers of patients with small amounts of monoclonal proteins and frequently biclonal processes. With the advent of better medical care leading to increased longevity of chronically ill patients, coupled with increased sensitivity of the techniques used to study patients, apparent artifacts are coming to the surface that need to be separated from true indicators of disease, eg., the ladder effect in the kappa chain studies of urine.

As the BMAD data indicate, this service is replacing immunoelectrophoresis as this technique is more definitive with less chance of a false negative result.

The survey median total time for the 86334 is 14.5 minutes, compared to 5 minutes for the radiology reference service chosen by the CMDs. Survey respondents chose the 85060 peripheral blood smear interpretation as a reference service for immunofixation electrophoresis, and the general clinical pathology consultation code 80500, not the pathology services chosen by the CMDs. The survey data for the 86334 and 85060 are similar and the 85060 has a current value of 0.45.

Most survey respondents agreed that the work of performing this service has not changed in the past five years and that the survey vignette describes their typical patient.

The College of American Pathologists recommends a physician work value of 0.45 for the immunofixation electrophoresis interpretation based on median survey data and comparison to reference services.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 88170 Global Period: XXX Current RVW: .50 Recommended RVW: 1.27

CPT Descriptor: Fine needle aspiration with or without preparation of smears; superficial tissue
(eg, thyroid, breast, prostate)

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

- Vignettes Used in Survey: (1) A 55 year old female presents with a palpable breast mass. Attempted aspiration reveals that it is not cystic. Fine needle aspiration biopsy is performed.
- (2) patient presents with a thyroid nodule discovered during a routine physical examination. A TSH was performed and showed normal thyroid function. A fine needle aspiration biopsy of the thyroid nodule was performed.

KEY REFERENCE SERVICE(S):

American College of Radiology:

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 20206	Biopsy, muscle, percutaneous needle	0.99
2) 32405	Biopsy, lung or mediastinum, percutaneous needle	1.93
3) 47000	Biopsy of liver, needle; percutaneous	1.90
4) 49180	Biopsy, abdominal or retroperitoneal mass, percutaneous needle	1.49

The Endocrine Society:

1) 19100	Biopsy of breast; needle core	1.27
2) 55700	Biopsy, prostate; needle or punch, single or multiple, any approach	1.57

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The work involved in code 88170 is very similar to the work required for code 19100. (As a result, code 88170 was assigned the same RVW as that for code 19100.) Moreover, the risk of complication is greater with code 88170 than for code 19100. HCFA recognized reference service code 19100 was undervalued from the Hsiao study and increased its value, but never appropriately increased the value of code 88170.

Furthermore, code 88170 compares extremely well to its key reference services from the ACR's survey (20206, 32405, 47000, and 49180) with respect to intensity and time. It was judged to be less intensive and time consuming as codes 32405, 47000, and 49180, but more than code 20206.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The majority of the respondents (ACR, 63.5 percent; ES, 63.2 percent) felt that the work involved in the procedure has not changed over the last five years. In addition, the vast majority of the respondents (ACR, 83.1 percent; ES, 85.7 percent) disagreed that technology lessened the amount of work involved in the procedure. The patients undergoing this procedure have not changed, according to half of the ACR's respondents. However, a nearly equal number (46.4 percent) thought that patients were more complex. The majority of the respondents (71.4 percent) to the Endocrine Society's survey thought that the patients were more complex. The majority of the respondents (ACR, 62.7 percent; ES, 73 percent) indicated that the site of service had not changed, but 36.1 percent of the ACR's respondents and 15.8 percent of the Society's respondents indicated a shift to outpatient settings. Lastly, the vast majority of the respondents (ACR, 88.6 percent; ES, 90.1 percent) agreed with the vignette.

ATTACHMENT
SERVICE DESCRIPTION

Code Being Rated: 88170

Fine needle aspiration with or without preparation of smears; superficial tissue (eg, thyroid, breast, prostate)

Pre-Service:

1. Obtain a clinical history.
2. Perform a physical examination of both breasts.
3. Review any available mammograms - current and previous exams.
4. Explain procedure and its purpose to the patient, including potential complications.
5. Obtain informed consent.

Intra-Service:

1. Clean biopsy site with disinfectant.
2. Inject local anesthesia (optional).
3. 21-23 gauge needle with attached syringe inserted into mass. Numerous short up and down excursions are performed with negative pressure applied to the syringe.
4. Needle withdrawn and material expressed onto slides or into a fixative.
5. Above process repeated usually once.
6. Apply compression.

Post-Service:

1. Dictate report of procedure to referring physician.
2. When results received dictate addendum to report.
3. If positive, call report to referring physician.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 88171 Global Period: XXX Current RVW: 1.05 Recommended RVW: 1.27

CPT Descriptor: Fine needle aspiration with or without preparation of smears; deep tissue under radiologic guidance

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

- Vignettes Used in Survey: (1) A forty-nine year old female has a non-palpable mass identified on a screening mammogram. An ultrasound exam reveals that the mass is not a simple cyst. Fine needle aspiration biopsy of the mass is performed under ultrasonic guidance. (Radiologic guidance is separately reportable.)
- (2) A patient is referred for a thyroid scan because of diffuse thyroid enlargement. A "cold" nodule is identified on the scan. The nodule is not palpable. The patient is referred for a thyroid ultrasound exam and the nodule is shown to be non-cystic. Fine needle aspiration biopsy is performed under ultrasound guidance. (Radiologic guidance is separately reportable.)

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1) 20206	Biopsy, muscle, percutaneous needle	0.99
2) 32405	Biopsy, lung or mediastinum, percutaneous needle	1.93
3) 47000	Biopsy of liver, needle; percutaneous	1.90
4) 49180	Biopsy, abdominal or retroperitoneal mass, percutaneous needle	1.49

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Code 88171 is no different from codes 88170 and 19100 with respect to physician work. It therefore should have the same RVW.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The majority of the respondents (56.6 percent) felt that the work involved in the procedure has not changed over the last five years (43.4 percent did). In addition, the vast majority of the respondents (76.9 percent) disagreed that technology lessened the amount of work involved in the procedure (23.1 percent agreed). The patients undergoing this procedure are now more complex, according to 58.1 percent of the respondents. (Nearly 41 percent of the respondents believed that the patient has not changed.) Slightly over two-thirds (68.5 percent) the respondents indicated that the site of service had not changed, but 31.5 percent believed that it shifted to outpatient settings. Lastly, the vast majority of the respondents (92.3 percent) agreed with the vignette.

SERVICE DESCRIPTION

Code Being Rated: 88171

Fine needle aspiration with or without preparation of smears; deep tissue under radiologic guidance. (The radiologic guidance is separately reportable.)

Pre-Service:

1. Obtain a clinical history.
2. Perform a physical examination of both breasts.
3. Review any available mammograms - current and previous exams.
4. Explain procedure and its purpose to the patient, including potential complications.
5. Obtain informed consent.

Intra-Service:

1. Clean breast with disinfectant.
2. Clean ultrasound transducer with disinfectant.
3. Inject local anesthesia (optional).
4. Localize mass under ultrasound.
5. Under ultrasound guidance, a 21-23 gauge needle with attached syringe inserted into mass. Numerous short up and down excursions are performed with negative pressure applied to the syringe.
6. Needle withdrawn and material expressed onto slides or into a fixative.
7. Repeat the above process.
8. Apply compression.

Post-Service:

1. Dictate report of procedure to referring physician.
2. When results received dictate addendum to report.
3. If positive, call report to referring physician.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 88172 Global Period: N/A Current RVW: 0.60 Recommended RVW: 1.10

CPT Descriptor:

Evaluation of fine needle aspirate with or without preparation of smears; immediate cytohistologic study to determine adequacy of specimen(s).

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.56 on the basis that immediate evaluation of a fine needle aspirate to determine the adequacy of a specimen for cytohistologic study requires no more time or expertise than interpretation of cytopathological fluids, washings, brushings or smears (88104); it is the same type of examination, they said. CMDs also commented that in actuality it requires only a notification that the material is "adequate" for study, does not require a definite tissue interpretation, and the pathologist is required to render this judgement in an unscheduled setting. The CMDs choose 88104, Cytopathology, fluids, washings or brushings, except cervical or vaginal; smears with interpretation as their Reference Service. The 88104 has a current relative value of 0.56 and the Harvard mean total time is 17 minutes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A fine needle aspiration is being performed for evaluation of a 1.0 cm lung nodule in a 56 year old male with Chronic Obstructive Pulmonary Disease (COPD). You are asked to immediately evaluate the smears to determine if the specimen is adequate to make a definitive diagnosis.

Description of Pre-Service Work:

Preparing to examine the specimen; obtaining and reviewing the history and diagnostic studies, including examination of previous slides or reports; review of literature or research and communicating with other professionals prior to examination of the specimen.

Description of Intra-Service Work:

Performing the gross examination, handling and processing; microscopic examination; any required photography or research as necessary to make a final diagnosis; any dictation or report preparation performed during the specimen examination; communicating with other professionals during the examination.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

When a fine needle aspiration (FNA) procedure is performed, it is impossible to know if the lesion has been sampled adequately unless a slide is immediately examined microscopically. This is important because if the sample appears inadequate for diagnosis, the FNA can be repeated while the patient is still present - obviating the need to repeat the FNA at a later date, thus sparing the patient needless anxiety, inconvenience, and expense.

This immediate cytohistologic evaluation to determine FNA specimen adequacy generally requires the presence of the pathologist in the CAT scan facility or at the patient's bedside. Typically, the patient's history is reviewed with the attending physician before the procedure, and the CAT scan or ultrasound image is reviewed with the radiologist prior to collecting the sample. When the sample is received, smears are prepared and the pathologist selects a slide to stain and examine immediately under the microscope. In order to determine that the specimen is adequate, diagnostic cells (usually malignant) must be identified - often resulting in a provisional diagnosis as well. The definitive diagnosis is deferred until all the slides can be stained and examined. If the specimen is judged to be inadequate for diagnosis, the FNA is repeated. This immediate cytohistologic evaluation requires considerable expertise. It is done under great pressure, since the decision to repeat or terminate the FNA procedure is contingent upon the result, which both the operating physician and patient are awaiting.

In comments made to the HCFA in 1992 concerning the initial Medicare RV's, the CAP requested that the RV for 88172 be increased from 0.64 to 1.13. This was denied. This request was again made in 1993 - and again denied. Although we continued to feel that the 88172 was undervalued, we did not request an increase in value as part of the five-year refinement process because we thought that physician work for this service had not changed. Subsequently, the CMD's stated that they felt the time and expertise for 88172 was comparable to that of the cytologic evaluation of Body Fluids, Washings, and Brushings (88104) - and recommended that the RV be reduced from 0.60 to 0.56. We felt that the 88104 was an inappropriate Reference Service, since diseases evaluated by cytologic evaluation of fluids, washings, and brushings are usually in a more advanced Stage productive of many more diagnostic cells than the earlier Stage lesions typically evaluated by FNA - thereby requiring less mental effort and judgement. In addition, while an equivocal cytology diagnosis on fluids, washings, and brushings necessitates at most a non-invasive biopsy, an equivocal FNA diagnosis usually will be followed by an invasive surgical procedure - thus increasing the pressure/stress to make a definitive diagnosis without asking for additional material. In fact, the 88172 is similar to the 88131, frozen section during surgery, since both involve an immediate diagnosis, made under pressure, with significant implications for patient management.

As a result of the CMD's recommendation, the CAP conducted a Survey of 88172 for physician work. The results indicate a median RVW of 1.10, which is twice the RVW of the 88104 and somewhat less than the RVW (1.19) for the frozen section (88131) - clearly indicating that the physician work of 88172 is not comparable to the 88104. In addition, 73% of respondents felt this service has become more complex over the past 5 years - apparently because the immediate evaluation of FNA specimens is no longer restricted to a determination of specimen adequacy, but expanded to the rendering of a provisional diagnosis as well. Had the CAP fully appreciated this change in the physician work for 88172, we would have requested an increase in the RVW as part of the five-year refinement process. We are now requesting that the RVW for 88172 be increased to the Survey median of 1.10.

CPT Code: 88173 Global Period: N/A Current RVW: 1.08 Recommended RVW: 1.59

CPT Descriptor:

Evaluation of fine needle aspirate with or without preparation of smears; interpretation and report.

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.56 on the basis that the interpretation of a FNA of the breast required no more time or expertise than interpretation of cytopathological washings from a transbronchial brushing or washing (88104). The current relative value of the 88104, Cytopathology, fluids, washings or brushings, except cervical or vaginal; smears with interpretation, is 0.56 and the Harvard mean total time is 17 minutes.

The College of American Pathologists asked that the relative value be increased to 1.60 on the basis of a change in the physician work since Harvard studied the service. In brief, the types of specimens composing FNA specimens are much more difficult to definitively diagnose than in 1990 when Harvard surveyed and the expectation that a definitive diagnosis will be rendered without additional invasive procedure(s) has increased, thus increasing the work of the physician. The CAP also chose the 88104 as the Reference Service but commented that the work involved in the 88104 is less demanding than in 88173 services provided today.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Definitive diagnosis of a 1.0 cm lung nodule in a 56 year old male with Chronic Obstructive Pulmonary Disease (COPD), interpretation and written report.

Description of Pre-Service Work:

Preparing to examine the specimen; obtaining and reviewing the history and diagnostic studies, including examination of previous slides or reports; review of literature or research and communicating with other professionals prior to examination of the specimen.

Description of Intra-Service Work:

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
88173	15	25	10	5	3	4
88307	10	21	10	4	4	4
88104	5	15	0	3	3	3

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A Fine Needle Aspiration (FNA) is usually performed to establish a diagnosis on a tumor. The evaluation and definitive diagnosis of an FNA specimen involves examining a minimum of 8-10 slides, each of which must be examined very thoroughly so that the small number of diagnostic cells typically present (often malignant) are not overlooked. This service was studied by Harvard in 1990 and assigned a RWV of 1.18. This RWV was reduced to 1.06 when the final RVS was implemented in 1991, which was approximately twice the value of interpreting a peripheral blood smear (PBS). Yet, the interpretation of a PBS involves looking at only a single slide, usually does not involve a diagnosis of malignancy, and requires considerably less skill and effort. Therefore, in 1992 when the CAP submitted written comments to the HCFA regarding the initial Medicare RV's, we requested that the 88173 RWV be restored to its original RWV of 1.18. This request was denied. This request was again made in 1993 - and again denied.

In comments made to the HCFA this year concerning the five-year refinement process, the only service which we identified as being undervalued was the 88173, FNA interpretation. Specifically, we requested that the RWV for 88173 be increased from its current value of 1.08 to 1.60, because there has been a change in physician work since this service was studied by Harvard in 1990. At the time of the Harvard study, FNA was a relatively new procedure performed primarily on advanced lung, thyroid, and breast tumors (96,954 frequency in 1991). Since then additional organs such as liver, kidney, adrenal, pancreas, lymph nodes, and salivary gland have become common sites for FNA diagnosis (157,890 frequency in 1994). Even more importantly, improvements in CAT scan and diagnostic ultrasound technology have made it possible to identify and sample much smaller lesions at an earlier Stage of the disease process. This means we are now seeing specimens from borderline and/or early lesions, which contain fewer diagnostic cells - resulting in more effort to arrive at a diagnosis. Cytologic changes are often more subtle than they are in more advanced Stage lesions, thus requiring more mental effort and judgement. In addition, at the time of the Harvard study, the FNA was thought of as a screening procedure to identify lesions which should receive confirmatory biopsy. Today the FNA is regarded as a definitive diagnostic procedure, which is expected to minimize the costs and risks associated with confirmatory biopsy - thereby increasing physician stress during the interpretation and increasing the subsequent liability risk resulting from misdiagnosis.

We selected the cytologic diagnosis of fluids, washings, and brushings (88104) as a Reference Service (RWV 0.56), since it too was studied by Harvard as a total work service - thereby facilitating comparison. We felt that the 88104 was a much less demanding service, because lesions evaluated from fluids, washings, and brushings are usually in a more advanced Stage productive of many more diagnostic cells than the earlier Stage lesions typically evaluated by FNA - thereby requiring less mental effort and judgement. In addition, while an equivocal cytology diagnosis on fluids, washings, and brushings necessitates at most a non-invasive biopsy, an equivocal FNA diagnosis is usually followed by an invasive surgical procedure - thus increasing the pressure/stress to make a definitive diagnosis without asking for additional material.

Subsequently, the CMD's stated that they felt the time and expertise required to interpret a breast FNA (88173) was comparable to the cytologic evaluation of transbronchial washings or brushings (88104) - and recommended that the RV be reduced from the current 1.08 to 0.56. The CAP conducted a Survey of 88173 for physician work. The results of this survey indicate a median RWV of 1.59, which is almost three times the RWV of the 88104 - clearly indicating that the physician work of 88173 is not comparable to the 88104. In addition, 100% of respondents answering Step 4b felt this service has become more complex over the past 5 years - confirming that there has been an increase in physician work since the Harvard study. This Survey also validates our initial request for an increase in the RVW to 1.60, and we are now requesting that the RVW for 88173 be increased to the Survey median of 1.59.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 88180 Global Period: N/A Current RVW: 0.36 Recommended RVW: 0.60

CPT Descriptor:

Flow cytometry; each cell surface marker

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced on the basis that the average number of cell surface markers billed for each submission of this code is 10, equating to a total relative value of 3.60, and that the skill and time involved at the level of 3.60 does not equal the skill and time involved with 77430 Weekly radiation therapy management; complex (RV=3.60), 31600 Tracheostomy, planned (separate procedure) (RV=3.62), or 99291 Critical Care, evaluation and management of the critically ill or critically injured patient, requiring the constant attendance of the physician; first hour (RV=3.64). CMDs said that reduction of the relative value to 0.16 equals a total of 1.60 which better equates with 88325 (Pathology) Consultation, comprehensive, with review of records and specimens, with report on referred material (RV=2.22) and 88307 Level V Surgical pathology, gross microscopic examination (RV=1.59). The 31600 Tracheostomy was studied by Harvard and has a mean total time of 82 minutes. The radiology service was apparently not studied by Harvard.

	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
88180	5	10	10	4	4	4
85060	1.5	6	2	3	3	3
88305	2	22.5	4	4	4	4

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Flow Cytometry, each cell surface marker (88180) requires significant technical skill, mental effort and judgment and stress. This code generally involves the diagnosis and determination of whether or not a patient has leukemia, lymphoma, or an immunodeficiency state. The clinical implications and consequences of such serious diagnoses include chemotherapy and radiation therapy, treatments with significant morbidity and mortality. The diagnosis of immunodeficiency has significant associated psychosocial and prognostic implications (AIDS). Therefore, correct diagnosis is associated with significant mental effort, judgment and stress.

Pre-service work for 88180 often includes communication with a clinician (e.g., hematologist, oncologist, internist, or surgeon) to obtain clinical information, history and physical exam findings. The pathologist is often required to discuss with the clinician proper collection, handling and transport of specimens because cell viability is crucial for performance of these studies. The pathologist must review other clinical laboratory data, including the CBC and peripheral blood smear to determine the presence of abnormal cells.

Intra-service work includes gross examination of the specimen, and selection of a portion of the tissue for flow cytometry studies while retaining sufficient tissue for surgical pathology examination. The tissue must then be disaggregated to make a single cell suspension. If the specimen is blood or bone marrow, smears must be reviewed to determine the presence of abnormal cells and their percentage in order to make a determination of what type of preparation and staining method should be used (e.g., whole blood versus density gradient separation). Similar touch imprints, smear, or cytopsin review of lymph node cells is required. The pathologist must review the viability of the specimen. The pathologist selects the appropriate panel of antibodies depending on clinical history and morphologic impression. If the sample is limited, the pathologist must prioritize which antibodies will be used to characterize/immunophenotype the abnormal cell population.

After the technologist stains the sample and begins to run the samples on the flow cytometer, the pathologist verifies that the correct population is bit mapped (electronically selected) for analysis. After all tubes are run, the pathologist reviews the histograms in conjunction with morphologic findings (histologic sections, blood or bone marrow smears) and other lab results (e.g., cytochemical stains, TdT, cytogenetics) to determine the composite immunophenotype and final diagnosis. The pathologist dictates or writes the final report.

Post service work includes finalization of the report often requiring review of current literature. Results are usually discussed with multiple individuals (i.e., surgeon, oncologist, hematologist, radiation therapist, internist). Because of the sophisticated and specialized expertise required for interpretation of these results, the pathologist must spend considerable time and effort in helping clinicians understand the results as they relate to correct diagnosis, guiding appropriate therapy and determining prognosis. Additional studies may be recommended (eg. cytogenetics, molecular methods) if flow studies are inconclusive or other studies can contribute to treatment decisions or prognosis.

The CAP survey data show a median total time of 25 minutes per cell surface marker or a total of 250 minutes for the 10 marker average stated by the CMDs as the average case. This is significantly more time than that involved in either the 31600 tracheostomy (82 minutes) or the hour of critical care (99291). Survey respondents chose as reference services the 85060 peripheral blood smear interpretation (valued at 0.45) and the 88305 level IV surgical pathology examination (valued at 0.75) and rated the flow cytometry marker between the two in value at 0.60. This corresponds to survey responses that place the median time for the flow cytometry marker between the times for the two references (but closer to the time of the higher valued service) and place the flow cytometry complexity equal to that of the higher valued reference.

Flow cytometry is a specialized service not widely provided. Those who do provide it generally agreed that the work of performing the service has changed in the last 5 years. Approximately half of respondents felt that patients requiring the service are now more complex, but generally did not feel that the technology has become more familiar and thus less work. Survey respondents agreed that the survey vignette described their typical patient.

Flow cytometry was not studied by Harvard and the current value is based on extrapolation. During the first HCFA refinement opportunity in 1992 the CAP identified the 88180 as undervalued and asked that its value be tripled on the basis of the amount of work required in the service. The service remains undervalued as demonstrated by the current survey data.

The College of American Pathologists recommends a value of 0.60 for the 88180 flow cytometry service based on the median survey data and comparison to reference services.

	88325 COMPREHENSIVE REVIEW OF DATA	2.22	XXX
	99244 OFFICE CONSULTATION	2.23	XXX

CMD Comment:

The average number of cell surface markers billed for each submission of this code is 10. This equates with the 1995 RVUs of 0.36, to a total of 3.60. The skill and time involved at level of 3.6 does not equal the skill and time involved with 77430, 31600, or 99291. Reduction of the RVUs to 0.16 equals a total RVUs of 1.60, which better equates with 88325 and 88307.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 88182 Global Period: N/A Current RVW: 0.77 Recommended RVW: 0.75

CPT Descriptor:

Flow cytometry; cell cycle or DNA analysis

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.34 on the basis that the number of billings on each claim for this code averages 10; ten times this value is 7.60 (actually 7.70), an extreme value for this code. If the same percentage reduction is applied that was used for 88180, the value for this code would be 0.34. The CMDs chose the 88180 flow cytometry, each cell surface marker as the reference service.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

DNA cell cycle (S-phase) analysis on a 2 cm mammographically suspicious breast mass biopsy in a 63 year old female, interpretation and report.

Description of Pre-Service Work:

Preparing to examine the specimen; obtaining and reviewing the history and diagnostic studies, including examination of previous slides or reports; review of literature or research and communicating with other professionals prior to examination of the specimen.

Description of Intra-Service Work:

Performing the gross examination, handling and processing; microscopic examination; any required photography or research as necessary to make a final diagnosis; any dictation or report preparation performed during the specimen examination; communicating with other professionals during the examination.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

Specialty: Pathology--College of American Pathologists

3)	N/A		
4)	N/A		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
88182	4	10	6	4	3.5	2
85060	3	7	2	3	3	3
88305	2	16	5	4	3.5	4

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Flow Cytometry (FCM), cell cycle or DNA analysis (88182), two separate tests, require significant technical skill, mental effort and stress. This code represents new technology with significant prognostic implications in many tumor cell types. This technology may also be used as an adjunct in the diagnosis of malignancy in body fluids.

Pre-service work includes communication with surgeons and clinicians on the correct methods of specimen collection and transport and patient history.

Intra service work includes examination of the specimen, selection of representative tumor while maintaining the integrity of the specimen for surgical pathology gross and microscopic examination, and selection of appropriate diploid control tissue. The pathologist or technologist will mechanically or enzymatically disaggregate cells for isolation of nuclei. The pathologist will work with the technologist to select the best nuclear preparation technique. Once the sample is stained, the pathologist will assist the flow cytometry technologist in instrument settings and selection (bitmapping) of the nuclear/cell population of interest. The pathologist examines the histograms and selects the appropriate mathematical model (software) for analysis of this non-parametric data. The pathologist determines whether 1) there is a cell population with an abnormal DNA content (aneuploid), and 2) if there is an increase in the proliferating cell population usually expressed as five phase fraction; thus code 88182 involves two units of service, each a different test. The DNA ploidy and cell cycle analysis results are reported in conjunction with review of the surgical pathology microscopic findings, tumor grade, stage, and review of a nuclear preparation to confirm that the specimen analyzed is representative of the tumor cell population. A report is prepared and issued with a narrative interpretation.

Post-service work often includes discussion of results and diagnostic and prognostic implications with clinicians, especially surgeons and oncologists. The pathologist may suggest other adjunctive, complimentary, or more specific studies such as molecular biology or cytogenetics.

The CMD's have suggested that the RVW be reduced to 0.34 on the basis that the number of units for billing on each claim for this code averages ten and ten times 0.77 is 7.70, an extreme for this code. The basis for the reduction is erroneous. The 88182 code describes two types of service, DNA cell cycle and ploidy analysis. The maximum number of units for any single patient specimen would be two; two times the current relative value for the 88182 is 1.54.

The median survey RVW for the 88182 is 0.75, affirming the current relative value. Survey respondents chose the 85060 peripheral blood smear interpretation (relative value 0.45) and the 88305 level IV surgical pathology examination (relative value 0.75) as the reference services. The survey median total time for the 88182 is 20 minutes, close to the time for the 88305 and well above the time for the 85060. Respondents rated the 88182 between the 85060 and the 88305 in complexity.

Half of the 24 survey respondents felt that the work of performing this service has changed in the past five years, probably because of the wealth of literature to review and digest and the more sophisticated software analysis and data interpretation required for these studies. There was no agreement on whether the technology is more familiar or on whether patients are more complex or have not changed (no respondent indicated that patients are less complex). Twenty of 24 respondents felt that the survey vignette described their typical patient.

The College of American Pathologists recommends a physician work relative value of 0.75 for the 88182 flow cytometry cell cycle or DNA analysis based on median survey data and comparison to reference services.

4)	N/A		

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CODE	TIME IN MINUTES			COMPLEXITY		
	PRE	INTRA	POST	MENTAL	TECHNICAL	PSYCH
88311	0	5	2	2	2	1.5
88302	2	5	4	2	2	2
88304	3	5.5	3	2	2	2

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Decalcification is a time critical procedure. The time is different from specimen to specimen based on variables of size and density, and must be established empirically by testing. Underdecalcification results in a specimen which is difficult to section yielding extensive histological artifact. Overdecalcification results in loss of nuclear and cellular detail and stain avidity. Both yield less than optimal, frequently unsatisfactory specimens. To achieve the appropriate level of decalcification, the physician must test the specimen periodically during the process to determine if adequate decalcification has been achieved. This is accomplished by manipulating the tissue by hand and/or with instruments such as forceps and scalpel to feel for evidence of residual calcification.

Decalcification was studied by Harvard and had a total time of 5 minutes. The same vignette that was used by Harvard was used by the CAP in its survey. The CAP survey median intra-service time for the 88311 is 5 minutes and 10 of 31 respondents indicated that there is also post-service time (median 2 minutes). There really is no pre- or post-service time included in the 88311 for the decalcification procedure. Any pre- or post-service activities that are associated with the decalcification procedure are included in the pre- and post-service time of the associated primary surgical pathology examination. We surmise that survey respondents did not understand that coding and/or payment convention.

Removing the post-service time reported by a minority of survey respondents, the median total time for the decalcification procedure (which is intra-service only) is the same as the Harvard mean total time and the same as the two reference services' intra-service time, affirming that there is physician work and that the Harvard survey time is probably accurate. In addition, survey respondents agreed that the work of performing the service has not changed in the past 5 years and that the survey vignette describes their typical patient. The survey median work value for the decalcification procedure is 0.24, the same as the current physician work relative value.

The College of American Pathologists recommends that the current physician work value for the decalcification procedure 88311 be maintained at 0.24 based on median survey data that support both the current value and the fact that there is physician work involved in the service.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 89060 Global Period: N/A Current RVW: 0.37 Recommended RVW: 0.45

CPT Descriptor:

Crystal identification by light microscopy with or without polarizing lens analysis, any body fluid (except urine)-interpretation and report

Source and Summary of Comment to HCFA on this service:

CMDs asked that the relative value be reduced to 0.16 on the basis that the time and expertise for examining fluid for crystals is no greater than the interpretation of a PA and lateral chest x-ray. The current value for the 71020 PA and lateral x-ray is 0.22 and the Harvard time is 5 minutes.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Preparation direct and polarized light evaluation and report of fluid from the swollen knee joint of a 55 year old man.

Description of Pre-Service Work:

Obtaining and reviewing the history and diagnostic studies, including examination of previous study reports; review of literature or research and communicating with other professionals prior to interpretation of the test result.

Description of Intra-Service Work:

Interpretation of the test result; comparison to previous study reports; consideration of relevant statistical variations; identification of clinically meaningful findings; any review of literature or research during examination of the test result; any dictation or report preparation performed during examination of the test result.

Description of Post-Service Work:

Report preparation and finalization; written and telephone communications with other professionals, patients and family; obtaining and reviewing the results of other diagnostic studies, including examination of previous slides or reports, after examination of the specimen; arranging for further studies or other services.

SURVEY DATA:

Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This interpretation involves the evaluation of wet preparations of body fluid, including joint and biliary drainage fluids, and is especially useful in determination of crystal material within joint fluid in conditions such as gout and pseudogout. The specimen is first evaluated by the pathologist visually and gross characteristics are noted. Technical staff will then usually centrifuge the specimen for concentration and produce two or more wet preparations for microscopic examination. This microscopic study is generally performed using a polarized light attachment. Prior to the polarization the interpreting physician will review data from the joint fluid analyses. Polarization of this specimen is then performed with evaluation of positive and negative birefringence of the crystalline material and semiquantitation of the amount of this crystalline material present. A written report of the findings and a presumptive diagnosis is rendered.

The median survey time for the crystal identification 89060 is 15.5 minutes, well above the total time for the radiology reference service chosen by the CMDs. Survey respondents chose the general clinical pathology consultation 80500, the peripheral blood smear interpretation 85060, and the nongynecological cytopathology fluids interpretation as reference services, and gave the crystal identification time and complexity estimates inside the range of estimates for those services. The physician work relative values for the reference services are 0.37, 0.45 and 0.56, and the median work value for the 898060 is 0.45.

Survey respondents agreed that the work of performing this service has not changed in the past five years and that the survey vignette describes their typical patient.

The College of American Pathologists recommends a physician work value of 0.45 for the crystal identification based on median survey data and comparison to reference services.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Other Medical and Therapeutic

The review of the other medical and therapeutic procedures primarily addressed comments submitted by the Carrier Medical Directors (CMDs) on codes that they felt were in most cases overvalued. Based on recommendations from the National Association of Medical Directors of Respiratory Care (NAMDRC), the American Thoracic Society (ATS), the American College of Chest Physicians (ACCP), the Joint Council of Allergy, Asthma and Immunology (JCAI), and the American Academy of Electrodiagnostic Medicine (AAEM), the RUC recommended maintaining the current values of most of the procedures that were identified by the CMDs. These recommendations were based on survey results, comparisons to final Harvard study results, comparisons to key reference services, and analysis of Medicare claims data.

The American Academy of Neurology (AAN) submitted a comment to HCFA on an EEG code, for which the RUC felt that AAN had provided enough compelling evidence to warrant increasing the RVU of the procedure. This recommendation was based on a survey 60 neurologists, comparisons to final Harvard study results, and comparisons to key reference services.

The Medical Oncology Association of Southern California, Inc., submitted recommendations on three chemotherapy codes for which the RUC recommended maintaining the current RVUs. These recommendations were based on the fact that one of the procedures had been recently reviewed by the RUC and the fact that the BMAD data showed that the other chemotherapy procedures are infrequently performed.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
90900	Biofeedback, electromyogram	0.89	0.89	These codes were identified as overvalued by the CMDs. The CMDs commented that biofeedback is provided in a group setting, and that the actual patient encounter is 15 minutes.	The specialty society noted that the biofeedback codes 90900 and 90915 had never been surveyed before. APA-HCPAC noted that the use of biofeedback by a psychologist is part of integrated behavioral therapy coupled with a psychotherapy component. APA-HCPAC also noted that this procedure is not performed in a group setting and typically requires 50 minutes of individual face-to-face time. The specialty society noted that there seems to be some confusion between biofeedback training and biofeedback therapy. Based on their survey results, APA-HCPAC recommended an increased RVU of 1.95 for 90900 and 90915. Which represent the survey medians for both codes.	2
90915	Biofeedback, unspecified	0.89	0.89			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
90902	Biofeedback, nerve impulse	0.89	0.43	These codes was identified as overvalued by the CMDs. The CMDs commented that biofeedback is provided in a group setting, and that the actual patient encounter is 15 minutes.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe that a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to refute the CMD comment. Therefore, the RUC agreed to accept the proposed reduction of RVUs for these codes.	3
90904	Biofeedback, blood pressure	0.89	0.43			3
90906	Biofeedback, blood flow	0.89	0.43			3
90908	Biofeedback, brain waves	0.89	0.43			3
90910	Biofeedback, oculogram	0.89	0.43			3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
90911	Anorectal biofeedback	2.15	2.15	This code was identified as overvalued by the CMDs. The CMDs believe that CPT code 90911[Biofeedback training; anorectal, including EMG and or manometry] does not have the intensity or time of 90937[Hemodialysis procedure requiring repeated evaluation(s) with or without substantial revision of dialysis prescription] or 90801[Psychiatric diagnostic interview examination including history, mental status, or disposition]. CPT code 46606[Anoscopy; with biopsy, single or multiple] requires less time, but is greater risk than 90911.	During anorectal biofeedback, the physician places into the anal canal an anal probe to measure anal sphincter pressure or electrical activity. This procedure can use manometry or EMG to measure sphincter activity. This procedure is lengthy taking at minimum 30 minutes, but typically lasting 45-60 minutes. For the patient this procedure is very uncomfortable particularly due to the length of time that the procedure requires. This procedure is more intense and requires more physician work than anoscopy (46606). This procedure is similar in its intensity to 90801 (psychiatric diagnostic interview examination). CPT code 90911 a was a new procedure that was added to the RBRVS in 1994. The RUC recommendation for this procedure was accepted by HCFA. Therefore, the RUC recommends maintaining the current value for this procedure.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
91000	Esophageal intubation	0.99	0.73	The CMDs are unclear as to why 91000[Esophageal intubation and collection of washings for cytology, including preparation of specimens (separate procedure)] has a 50% greater RVUs than 89100[Duodenal intubation and aspiration; single specimen (eg, simple bile study or afferent loop culture) plus appropriate test procedure] or 89130[Gastric intubation, aspiration, diagnostic each specimen, for chemical analyses or cytopathology]. If these are the same tests (with 2 different CPT numbers), then the values should be the same. The CMDs do not believe that intubation with collection of washings is no more difficult than 93015 - cardiovascular stress test and is not as difficult as 99214 - a moderate level office visit code.	There was no request by the specialty to survey this procedure. Therefore the RUC recommends that the proposed reduction be accepted.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
91010	Esophagus motility study	1.65	1.25	These codes were identified as potentially overvalued by the CMDs. The CMDs noted that the work and intensity of 91010, 91011, 91012, 91020, and 91030 is not as great as CPT code 99204[Office visit of moderate complexity]. The physician is allowed to code esophagoscopy (42300) with 91010, 91011, 91012, 91020, and 91030 if the esophageal pressure measuring device is placed during esophagoscopy. The interpretation of esophageal motility (91010,91011,91012), esophageal manometry (91020), and acid perfusion (91030), should be no more work than 78262[gastroesophageal reflux study (0.68)].	There was no request by the specialty to survey this procedure. Therefore, the RUC agreed to accept the proposed reduction of RVUs for these codes.	3
91011	Esophagus motility study	1.98	1.50			3
91012	Esophagus motility study	1.92	1.46			3
91020	Esophagogastric study	1.89	1.44			3
91030	Acid perfusion of the esophagus	1.20	0.91			3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
91032	Esophagus, acid reflux test	1.59	1.21	CPT codes 91032 and 91033 were identified by the CMDs as potentially overvalued. The CMDs noted that the work and intensity of this procedure is not as great as CPT code 99204. The CMDs noted that a physician is allowed to code esophagoscopy (43200) with 91032 and 91033 if the ph electrode is placed during esophagoscopy. The interpretation of acid reflux should be no more than the interpretation of 78262[Gastroesophageal reflux study (0.68)]. The risk and work (less risk, more work) of 91032 and 91033 is similar to 36489[Percutaneous placement of a central venous catheter] and 90935[Hemodialysis procedure with single physician evaluation]. The CMDs recommended an RVU of 1.12 for code 91032 and 1.30 for 91033.	There was no request by the specialty to survey this procedure. Therefore, the RUC agreed to accept the proposed reduction of RVUs for codes 91032[Esophagus, acid reflux test, with intraluminal ph electrode for detection of gastroesophageal reflux] and 91033[Esophagus, acid reflux test, with intraluminal ph electrode for detection of gastroesophageal reflux; prolonged recording].	3
91033	Prolonged acid reflux test	1.71	1.30			3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
91052	Gastric analysis test	1.71	0.79	The CMDs noted that the work for 91052 is the same for 89135[Gastric intubation, aspiration, and fractional collections (eg, gastric secretory study); one hour]. Much of that work may be performed under the supervision of a physician rather than by a physician. It certainly does not require the mental work of 99204.	There was no request by the specialty to survey this procedure. Therefore, the RUC agreed to accept the proposed reduction of RVUs for these codes.	3
91055	Gastric intubation for smear	1.28	0.94	The CMDs noted that this code was not any different than 89135 or 89100, and should be reduced to 0.94.		3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
91065	Breath hydrogen test	0.45	0.20	The CMDs do not believe that this is a physician test. They note that although the test takes three hours, this is not physician time. The patient takes, by mouth, lactose and then the expired helium is measured and compared to the baseline. The physician interpretation of this test is no greater than the physician interpretation of 96480 [Oxygen uptake, expired gas analysis; rest and exercise, direct, simple]. The expense of this test should be in the technical component and not the work RVUs.	There was no request by the specialty to survey this procedure. Therefore, the RUC agreed to accept the proposed reduction of RVUs for these codes.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
94060	Evaluation of wheezing	0.31	0.31	In their comment letter to HCFA, the specialty society noted that currently the physician work units for 94375 and 94060 are valued at 0.31. The ATS contends that the work required for the bronchospastics evaluation is at least twice that required for the flow volume loop, and therefore, the RVU should be increased to 0.50	<p>The ATS noted that spirometric studies are most commonly plotted and presented as a flow volume loop. From the flow volume loop, vital capacity and flow rate can then be calculated. Since the bronchospastic examination requires <u>two flow volume loops</u>, plus the administration of a <u>bronchodilator</u>, there is significant increased intra-service time involved. The bronchospastic evaluation (94060) requires more physician time, skill and judgement in the interpretation of the test results. There is also stress concerning the side effects of the bronchodilator and post-service component of observation because of the loop alone.</p> <p>The RUC was concerned about the CPT descriptor of this procedure. They suggested that ATS propose a new code 94XXX [Bronchospasm evaluation with flow volume loops] that clearly illustrates that the procedure involves flow volume loops. The RUC would be comfortable recommending 0.50 if the code descriptor was revised. However, the procedure now indicates that this service is specifically related to spirometry and does not reflect the work that is described in the ATS comments. The RUC recommends maintaining the current value of 94060.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
94160	Vital capacity screening	0.18	0.18	The CMDs noted that the work of 94160 is less than 94010[Spirometry, including graphic record, total and timed vital capacity, expiratory flow rate measurements(s), and/or maximal voluntary ventilation]. They also noted that the test can be performed using a hand held instrument.	The ACCP and ATS strongly recommend that codes 94150[Vital capacity, total(separate procedure)] and 94160[Vital capacity screening tests: total capacity, with timed forced expiratory volume (state duration), and peak flow rate] should be combined under the code <u>94160</u> . The vital capacity screening includes the 1) vital capacity measurement and 2) timed forced expiratory volume from which from which pulmonary flow are derived and 3) the peak flow rate. 94160 should be increased to an RVU of .20 In response to the CMD comment the ATS and ACCP also noted that this test is not done using a hand held instrument. The RUC agreed to maintain the current value of this code, based on the ATS presentation and survey data.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
94240	Residual lung capacity	0.26	0.26	The CMDs noted that this test is performed primarily by technicians. They also noted that this service requires less physician time than the interpretation of a PA/lateral chest x-ray CPT code 71020.	<p>The ATS noted that this test is used to measure lung volume. This procedure involves the risk of giving patients with emphysema 100% oxygen. This could result in loss of respiratory drive which increases the production of carbon dioxide. The ATS also reported that the survey results of 94240 indicate that the median RVU for this service is 0.26. Because this is the same physician RVU currently assigned to this procedure, ACCP and ATS are recommending that this RVU remain the same. No change is indicated. It was noted that the physician provides supervision and interpretation for this procedure.</p> <p>The RUC disagreed with the CMD recommendation to decrease the value of this code. In particular, the RUC took issue with the CMD contention that the service should be valued less than the interpretation of a PA/Lateral chest x-ray (CPT code 71020). The RUC agreed to maintain the current value.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
94350	Lung nitrogen washout curve	0.26	0.26	The CMDs noted that this test is performed primarily by technicians. They also noted that this service requires less physician time than the interpretation of a PA/lateral chest x-ray CPT code 71020.	<p>The specialty society reported that this test is used to measure lung volume. This procedure involves the risk of giving patients with emphysema 100% oxygen. This could result in loss of respiratory drive which increases the production of carbon dioxide. The ATS reported that the survey results of 94240 indicate that the median RVU for this service is .26. Because this is the same physician RVU currently assigned to this procedure, ACCP and ATS are recommending that this RVU remain the same. No change is indicated. It was noted that the physician provides supervision and interpretation for this procedure.</p> <p>The RUC agreed to maintain the current value of this code, based on the survey results and the fact that the CMDs did not have a full realization of the risk of this procedure.</p>	2
94360	Measure airflow resistance	0.26	0.26	The CMDs noted that this test is performed primarily by technicians. They also noted that this service requires less physician time than the interpretation of a PA/lateral chest x-ray CPT code 71020.	<p>The specialty society reported that this test is performed to measure lung resistance. It requires patients to sit in a body box. Approximately 10% of the patients will not comply. This test requires specialized equipment and must be performed in a sophisticated laboratory. ATS recommended that the RVU for this procedure be increased to 0.31 RVUs. It was noted that the physician provides supervision and interpretation for this procedure.</p> <p>Based on compelling evidence presented by the specialty society, the RUC disagreed with the CMD rationale to lower the RVU for this procedure, and recommended maintaining the current value.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
94375	Respiratory flow volume loop	0.31	0.31	The CMDs noted that a respiratory flow volume loop is now used for the majority of measurements of the values obtained under 94010. 94375[Respiratory flow volume loop] adds an inspiratory limb, the interpretation of which is relatively easy and does not add much work.	The specialty society recommends maintaining the current value for this procedure. It was noted that the physician provides supervision and interpretation for this procedure. The RUC agreed that the current value for this code be maintained, as it involves interpretation of more data than 94010.	2
94720	Monoxide diffusing capacity	0.26	0.26	The CMDs noted that this test is performed primarily by technicians. They also noted that this service requires less physician time than the interpretation of a PA/lateral chest x-ray CPT code 71020.	The specialty society reported that this test is used to measure how well the patient transfers oxygen from the air to blood. Carbon monoxide is used as the transfer agent in this test. This test is used in the evaluation of shortness of breath. The specialty society recommended an increased RVU for this procedure. It was noted that the physician provides supervision and interpretation for this procedure. Based on patient risk and the ATS survey results, the RUC disagreed with the CMD recommendation to lower the value of this procedure. They recommend maintaining the current value for this procedure.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
94725	Membrane diffusion capacity	0.26	0.26	The CMDs noted that this test is performed primarily by technicians. They also noted that this service requires less physician time than the interpretation of a PA/lateral chest x-ray CPT code 71020.	<p>The specialty society reported that this test is used to trace the pathway of an oxygen molecule to the red blood cell. This test is very complex and is not commonly performed. It is considered more difficult than 94720. The specialty society believes that this test is "grossly" undervalued at 0.26 RVUs. It was noted that the physician provides supervision and interpretation for this procedure.</p> <p>Based on the sophistication of the test and the ATS survey results, the RUC disagreed with the CMD recommendation to lower the value of this procedure. They recommend maintaining the current value for this procedure.</p>	2
94770	Exhaled carbon dioxide test	0.20	0.15	The CMDs noted that this test is performed primarily by technicians. They also noted that this service requires less physician time than the interpretation of a PA/lateral chest x-ray CPT code 71020.	<p>The specialty society noted that this test is a monitoring tool used to determine the placement of an endotracheal tube and the adequacy of mechanical ventilation. The recommended RVU is also the survey median for this code, which at 0.15 would represent a slight decrease in the RVUs for this code. It was noted that the physician provides supervision and interpretation for this procedure.</p> <p>The RUC agrees that this code is overvalued and recommended the ATS survey median of 0.15.</p>	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
95075	Ingestion challenge test	0.95	0.95	The CMDs commented that 95075[Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance such as metabisulfite)] is most commonly performed to determine the effect of certain substances on the patient airway. The patient ingests a substance, is then asked to perform repetitive spirometry or flow volume loops. They feel that this procedure is analogous to 94070[Prolonged postexposure evaluation of bronchospasm with multiple spirometric determinations after test dose of bronchodilator (aerosol only) antigen, exercise, cold air, methacholine or other chemical agent, with spirometry as in 94010].	<p>The specialty society reports that this code is used to test for allergic reaction to foods, drugs, or other substances. This procedure was never surveyed by Harvard. This test is done at the physician office and usually requires 30 minutes of face-to-face physician time. Unlike 94070 which takes 2 hours, this procedure requires 6-8 hours of physician monitoring. The specialty society has requested an increase in the RVU for this procedure.</p> <p>The RUC felt that the specialty society presented compelling evidence to maintain the current value of the code. The RUC reviewed, and made a recommendation on this procedure in 1993.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
95851	Range of motion measurements	0.28	0.16	The CMDs commented that measuring range of motion is the same physician work as interpreting a PA/Lateral chest x-ray CPT code 71020.	There was no request by the specialty to survey this procedure. Therefore, the RUC agreed to accept the proposed reduction of RVUs for these codes. The RUC agreed with the CMD recommendation to lower the value of this procedure.	3
95852	Range of motion measurements	0.19	0.11			3
95867	Muscle test, head or neck	0.62	0.79	The CMDs recommended an increase for this procedure code 95867[Needle electromyography, cranial nerve supplied muscles, unilateral] proportional to the decrease that they recommended for 95868[Needle electromyography, cranial supplied nerve muscles, bilateral]. This change was made so that the bilateral procedure 95868 is 150% of the unilateral procedure.	The AAEM supports the CMDs recommendation to increase the RVU of 95867 and decrease the RVU of 95868. Based on the CMD and the AAEM comments, the RUC agreed to the changes to these codes suggested by the CMDs.	1
95868	Muscle test, head or neck	1.50	1.18			3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
95937	Neuromuscular junction test	0.60	0.65	The CMDs commented that the work, expertise, and intensity of 95937[Neuromuscular junction testing (repetitive stimulation, paired stimuli), each nerve, any one method] does not equal 99213[Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity].	<p>The specialty society noted that this test involves a complex analysis of compound muscle action potential waveforms. These waveforms are analyzed with respect to amplitude and configuration and, sometimes area, following one or more trains of repetitive nerve stimulation. This procedure tests muscle weakness, and is also used to determine if the patient has myasthenia gravis. The specialty society reported that their survey respondents indicated that the work of performing this service has changed little over the past five years. AAEM also noted that overutilization of this code in the BMAD data may be reflective of miscoding of procedures.</p> <p>AAEM has requested an increased RVU for this procedure. Based on compelling evidence that was provided by AAEM the RUC recommends an increased RVU for this procedure code. The RUC noted that the Harvard value for this procedure is 0.77 and the Harvard time for this procedure is 29 minutes, which is twice the intra-service time of the reference procedure 99213 cited by the CMDs.</p>	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
95951	EEG monitoring/video-record	3.80	6.00	In their public comment letter to HCFA the specialty society requested an increase in RVUs from 3.80 to 6.75 (this request was amended to 6.00 based on the results of their survey).	<p>Video recorded EEG is performed primarily on patients that are being considered for brain surgery in an attempt to alleviate the debilitating effects of intractable epilepsy. Video monitoring is precisely coordinated with EEG recordings in order to correlate behavioral changes with EEG changes. The physician is required to provide analysis and interpretation of each seizure which can take 15 to 45 minutes depending on location, duration and case complexity. The EEG correlation with clinical activity must be done on a second to second basis. Analysis of EEG data recorded over a 24 hour period, review of video recordings, and synthesis of the EEG data with which the video information and other clinical findings and observations takes an average of 60-90 minutes.</p> <p>Clinical symptoms such as aphasia, focal clonus, aversive posturing and behavioral changes provide clinical information that is not available with routine EEG (95819), ambulatory EEG (95950), or computerized EEG (95953). Physicians use this procedure to localize the seizure source, which is very important since this information determines which part of the temporal lobe will be removed. If the wrong part of the temporal lobe is removed the limbic system will be disabled resulting in severe brain damage.</p> <p>The RUC recommends increasing the RVU for this procedure from 3.8 to 6.0 based on the compelling evidence that the specialty society presented. The RUC agreed that this procedure requires a significant amount of physician time as patients undergoing a comprehensive epilepsy evaluation are most often monitored continuously. The RUC also agrees with the specialty society assertion that the physician work of this service is very intense. The specialty society noted in their presentation that providing this service is very stressful for the physician and requires a great deal of mental effort and judgement to use the data of the test to make a determination about the region of the brain to be removed at neurosurgery.</p>	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
96405	Intralesional chemo admin	0.52	0.52	In their comment letter to HCFA, the specialty society noted that CPT codes 96405[Chemotherapy administration, intralesional; up to and including 7 lesions] and CPT code 96406[Chemotherapy administration, intralesional; more than 7 lesions] are inappropriately valued because they are valued the same as the nonspecific intralesional injection codes 11900[Injection, intralesional; up to and including seven lesions] which has an RVU of 0.52 and 11901[Injection, intralesional; more than seven lesions] which has an RVU of 0.80.	These codes were reviewed by the RUC when they were introduced in 1993 and HCFA accepted the RUC recommendations. The specialty did not provide additional evidence, so the RUC recommends that the current RVUs be maintained.	2
96406	Intralesional chemo admin	0.80	0.80			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code

	Descriptor	95 RVU	RUC Rec RVU	Comment	Rationale	Key
96440	Chemotherapy, intracavitary	2.37	2.37	In their public comment letter to HCFA, the Medical Oncology Association of Southern California, Inc., noted that the RVUs of CPT codes 96440[Chemotherapy administration into pleural cavity, requiring and including thoracentesis] and 96445[Chemotherapy administration into peritoneal cavity, requiring and including peritoneocentesis] should be increased due to the increased amount of physician work involved.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty society provided no compelling evidence to support their comment. Therefore, the RUC recommends maintaining the current RVUs for 96440 and 96445.	2
96445	Chemotherapy, intracavitary	2.20	2.20			2
96450	Chemotherapy, into CNS	1.89	1.89	This code was identified as undervalued in a public comment letter submitted by the Medical Oncology Association of Southern California. In a letter dated June 28, 1995 the American Society of Clinical Oncology (ASCO) asked that this code be recommended for no change.	ASCO conducted a survey of this code in 1992, and at that time HCFA accepted the RUC recommendation. Based on a recent RUC evaluation, the RUC recommended that the current value of this procedure be maintained.	2

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90900 Global Period: _____ Current RVW: 0.89 Recommended RVW: 1.95

CPT Descriptor: Biofeedback training; by electromyogram application (eg, in tension headache, muscle spasm).

Source and Summary of Comment to HCFA on this service:

The comments from the Carrier Medical Director review process indicated their proposed reduction in the Relative Work Value for 90900 from 0.89 to 0.43. The present Work Value of 0.89 was provided to HCFA by Harvard, but was not based on survey data from psychologists who perform this service. The CMD comments suggest that 90900 is a service often provided in a group setting and that the actual encounter time with an individual patient may be comparable to a 15 minute hospital visit (99231) but considered the intensity of service to be less. Biofeedback procedures as typically provided by a psychologist are a behavioral medicine treatment modality integrated into a psychotherapy framework. This service is not typically provided in group settings and requires approximately 50 minutes of individual face-to-face encounter time. The American Psychological Association felt it appropriate to survey 90900 to determine research-based Relative Work Values for the service.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 47-year-old man, referred by his internist for biofeedback, has a chronic history of muscle spasms in the neck and shoulders, and tension-type diagnosed headaches. He has not responded well to a prior history of treatment with anti-anxiety medications and physical therapy.

Description of Pre-Service Work:

Preparing to see patient, preparation of biofeedback equipment, and review of records.

Description of Intra-Service Work:

History of problem and symptoms since last office visit and assessment of present physical symptoms and mental status. Assessment of treatment efficacy since last visit and review of assignments with patient (relaxation training log, daily pain/symptom index, etc.). Application of EMG biofeedback electrodes to target body region (eg, frontalis muscle). Patient guidance and instruction for integrating biofeedback stimulus and their physiological responses. Relaxation induction using patient-specific relaxation modality. Direct behavioral suggestions regarding symptom reduction and symptom management with interpretation of patient's present behavior and ability to change and control symptoms. Discussion of intersession assignments for target symptom management.

Description of Post-Service Work:

Arranging next visit. Documentation of services, including dictating report. Cleaning equipment and supplies. Communication with third party payors as necessary. Periodic telephonic consultation with referring physician, other professionals, and family for continuity of care. Review of new medical or lab studies when relevant.

SURVEY DATA:Specialty: American Psychological AssociationSample Size: 120¹ Response Rate (%): 26%(31) Median RVW: 1.9525th Percentile RVW: 1.71 75th Percentile RVW: 2.10 Low: .50 High: 5.18Median Pre-Service Time: 5 Min. Median Intra-Service Time: 50 Min.25th Percentile Intra-Svc Time: 45 Min. 75th Percentile Intra-Svc Time: 55 Min. Low: 30 High: 90

Median Post-Service Time:

	<u>Total Time</u>
Documentation of service provided	<u>10</u>
Arranging for further services	<u>5</u>
Reviewing results of studies	<u>5</u>
Communication further with patient, family, and other professionals including reports	<u>8</u>
Providing written or telephone reports to Medicare or other third party payors	<u>9</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99204	Office visit, moderate to high severity (45 minutes)	1.71
2)	99404	Preventive medicine counseling to an individual (approx 60 min)	1.95

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90900	5	50	37	3	4	3
99204	5	50	25	3	3	3
99404	5	50	18	2	2	2

¹The American Psychological Association sampled a total of 546 psychologists, of which 120 were targeted to this code.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The survey results support increasing the current RVW of 0.89 to 1.95 for 90900, and do not support the CMD recommendation to reduce the RVW to 0.43. The proposed reduction in value was based on comments suggesting that this service is typically performed in groups and involves only 15 minutes of face-to-face low intensity encounter. However, the survey respondents indicated a median intra-service time of 50 minutes and 94% rated the vignette as representing a typical patient. In addition, 79% of the sample reported increased work required to document the services provided, and 100% of the sample reported increased physician work and time in providing communication with 3rd party payors. The frequency of 90900 is relatively low, with 13,860 procedures reported by Medicare in 1994. At present, payment policy for 90900 reimburses for the procedure only when the procedure is used for a limited number of rehabilitative services, such as neuromuscular re-education. The use of biofeedback training for neuromuscular re-education would not typically be performed in groups. Although it is conceivable that in some settings biofeedback may be performed in groups, the service as performed by psychologists typically involves individual contact of substantially greater intensity and complexity than the CMD comments suggest. Should the RUC not adopt the current recommended RVW for 90900 it may indicate that referral to the CPT process is appropriate.

CMD Comments

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90915 Global Period: _____ Current RVW: 0.89 Recommended RVW: 1.95

CPT Descriptor: Biofeedback (other)

Source and Summary of Comment to HCFA on this service:

The comments from the Carrier Medical Director review process indicated their proposed reduction in the Relative Work Value for 90915 from 0.89 to 0.43. The present Work Value of 0.89 was assigned by HCFA and was not based on survey data from psychologists who perform this service. The CMD comments suggest that 90915 is a service often provided in a group setting and that the actual encounter time with an individual patient may be comparable to a 15 minute hospital visit (99231) but considered the intensity of service to be less. Biofeedback procedures as typically provided by a psychologist are a behavioral medicine treatment modality integrated into a psychotherapy framework. This service is not typically provided in group settings and requires approximately 50 minutes of individual face-to-face encounter time. The American Psychological Association felt it appropriate to survey 90915 to determine research-based Relative Work Values for the service.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 35-year-old woman has a history of migraine headache, low back pain, irritable bowel syndrome, and cervical strain. She has been referred by her neurologist for biofeedback, with the statement that "primary diagnosis for treatment is unclear."

Description of Pre-Service Work:

Preparing to see patient, preparation of biofeedback equipment, and review of records.

Description of Intra-Service Work:

History of problem and symptoms since last office visit and assessment of present physical symptoms and mental status. Assessment of treatment efficacy since last visit and review of assignments with patient (relaxation training log, daily pain/symptom index, etc.). Application of biofeedback temperature sensor and/or EMG electrodes to target body regions (eg, finger tip, trapezius muscle, etc.). Patient guidance and instruction for integrating biofeedback stimulus and their physiological responses. Relaxation induction using patient-specific relaxation modality. Direct behavioral suggestions regarding symptom reduction and symptom management with interpretation of patient's present behavior and ability to change and control symptoms. Discussion of intersession assignments for target symptom management.

Description of Post-Service Work:

Arranging next visit. Documentation of services including dictating report. Cleaning equipment and supplies. Communication with third party payors as necessary. Periodic telephonic consultation with referring physician, other professionals, and family for continuity of care. Review of new medical or lab studies when relevant.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90915	8	50	38	4	4	3
99204	5	45	17	3	3	3
99404	5	50	20.5	2	3	2

¹The American Psychological Association sampled a total of 546 psychologists, of which 120 were targeted to this code.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The survey results support increasing the current RVW of 0.89 to 1.95 for 90915, and do not support the CMD recommendation to reduce the RVW to 0.43. The proposed reduction in value was based on comments suggesting that this service is typically performed in groups and involves only 15 minutes of face-to-face low intensity encounter. However, the survey respondents indicated a median intra-service time of 50 minutes and 94% rated the vignette as representing a typical patient. In addition, 85% of the sample reported increased work required to document the services provided, and 100% of the sample reported increased physician work and time in providing communication with 3rd party payors. The frequency of 90915 is quite low, with only 5,056 procedures reported by Medicare in 1994. At present, payment policy for 90915 reimburses for the procedure only when the procedure is used for a limited number of rehabilitative services, such as neuromuscular re-education. The use of biofeedback training for neuromuscular re-education would not be performed in groups. Although it is conceivable that in some settings biofeedback may be performed in groups, the service as performed by psychologists typically involves individual contact of substantially greater intensity and complexity than the CMD comments suggest. Should the RUC not adopt the current recommended RVW of 1.95 for 90915, it may indicate that referral to the CPT process is appropriate.

	99231 SUBSEQUENT HOSPITAL CARE	0.51	XXX

CMD Comment:

Biofeedback is often provided in a group setting. The 1995 RVUS: of 0.89 are excessive. The actual encounter time with an individual patient may be comparable to a 15 minute hospital visit (99231), but the intensity is less.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 94160 Global Period: XXX Current RVW: .18 Recommended RVW: .2

CPT Descriptor: Vital capacity screening tests: total capacity, with timed forced expiratory volume and peak flow rate.

Source and Summary of Comment to HCFA on this service:
Carrier of Medical Directors

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 60 year old man with a history of chronic obstructive pulmonary disease (COPD) with chronic cough and shortness of breath is being evaluated as a new patient.

A 30 year old woman with a history of intermittent wheezing is being evaluated because of symptoms of shortness of breath.

Description of Pre-Service Work:

1. Explanation of procedure to patient and sometimes to other family members.
2. Explanation of the indications for doing the procedure.
3. Explanation of potential complications.

Description of Intra-Service Work:

Performing and monitoring the procedure.

Description of Post-Service Work:

1. Review and interpret results of procedure.
2. Explain implication of results to patient and sometimes other family members.
3. Discuss follow-up treatment options with patient and sometimes other family members.

SURVEY DATA:

Specialty: Pulmonary Medicine

Sample Size: 31 Response Rate (%): 50 Median RVW: .20

25th Percentile RVW: .16 75th Percentile RVW: .30 Low: .09 High: 2.40

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	94375	Respiratory Flow Volume Loop	.31
2)			
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

This procedure is very similar to the pre, intra and post-service work involved in doing a respiratory flow volume loop. 94160 includes the measurement of the timed forced expiratory volume from which pulmonary flows are measured and/or a flow volume loop is measured. The same respiratory maneuvers are used and sometimes equipment is also used in 94375. 94160 is currently valued at .18 RVW's and 94375 is valued at .31 RVW's.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The ACCP and ATS strongly recommend that codes 94150 and 94150 should be combined under the code **94160**. The vital capacity screening includes the 1) vital capacity measurement and 2) timed forced expiratory volume from which from which pulmonary flow are derived and 3) the peak flow rate. 94160 should be increased to an RVW of .20.

CMD Comments

	Short Descriptor	RVU	Global
94160			
94010	BREATHING CAPACITY TEST	0.17	XXX
94690	EXHALED AIR ANALYSIS	0.07	XXX

CMD Comment:

The work of 94160 is actually less than 94010 (0.17) as the code requires only the total vital capacity, some timed forced expiratory volume and peak flow rate. 94010 includes the peak flow rate (although not stated), total spirometry, the timed vital capacity, and several expiratory flow rate measurements. The three values required for 94160 (total vital capacity, forced expiratory volume, and peak flow rate) can be obtained from a hand-held instrument.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	94350	Determination of maldistribution of inspired gas; multiple breath nitrogen washout curve including alveolar nitrogen or helium equilibration time.	.26
2)			
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre, intra, and post-service time and intensity of 94250 is quite similar to that of reference service 94350.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The findings of our survey of 94240 indicate that the median RVW for this service is .26. Because this is the same physician RVW currently assigned to this procedure, ACCP and ATS are recommending that this RVW remain the same. No change is indicated.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	94240	Residual Lung Capacity	.26
2)			
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre-, intra-, and post-service time and the intensity of 94350 and reference service 94240 are nearly identical.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The RVW that is currently assigned to the code, .26, is nearly identical to the RVW extrapolated from our survey data. Therefore, the ATS and the ACCP recommend no change in the RVW for CPT Code 94350.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre-, intra-, and post-service time and the intensity of 94360 is quite similar to both reference service 94375 and reference service 94400.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The measurement of lung resistance is a very complex procedure only performed in the most sophisticated laboratories. It requires the use of specialized equipment, including a body box. We recommend that the RVW be increased from .26 to a minimum of .31, the current RVW of 94375, in light of the highly complicated nature of the test.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 94375 Global Period: XXX Current RVW: .31 Recommended RVW: .31

CPT Descriptor: Respiratory Flow Volume Loop

Source and Summary of Comment to HCFA on this service: Carrier Medical Directors

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 60 year-old man with history of chronic obstructive pulmonary disease (COPD) with chronic cough and shortness of breath is being evaluated as a new patient.

A 30 year-old woman with a history of intermittent wheezing is being evaluated because of symptoms of shortness of breath.

Description of Pre-Service Work:

- 1) Explanation of procedure to the patient and sometimes family members.
- 2) Explanation of indications for performing the procedure to the patient and sometimes family members.
- 3) Explanation of potential complications to the patient and sometimes family members.

Description of Intra-Service Work:

Performance and monitoring of the procedure.

Description of Post-Service Work:

- 1) Review and interpretation of the results of the procedure.
- 2) Explanation of the implications of the results to the patient and sometimes family members.
- 3) Discuss follow-up treatment options with patient and other family members.

SURVEY DATA:

Specialty: Pulmonary Medicine

Sample Size: 30 Response Rate (%): 49 Median RVW: .31

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre-, intra-, and post-service time and the intensity of 94375 is quite similar to reference service 94060.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The current RVW, .31, is identical to the RVW that we are recommending as substantiated by our data. The ATS and ACCP recommend that the RVW for CPT code 94375 remain at .31.

94375			
	94010 BREATHING CAPACITY TEST	0.17	XXX

CMD Comment:

A respiratory flow volume loop is now used for the majority of measurements of the values obtained under 94010. This adds an inspiratory limb, the interpretation of which is relatively easy and does not add much work and adds almost no additional time.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre-, intra-, and post-service time and the intensity of 94720 is quite similar to reference service 94400 and is more complex than reference service 94375.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Monoxide diffusing capacity is a very complex test that exceeds 94375 (Respiratory flow volume loop) in its complexity. 94375 has a RVW of .31, whereas the current RVW for this test is only .26. Therefore we recommend, at a minimum, an RVW that is in line with 94375, or .31.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre-, intra-, and post-service time and the intensity of 94725 is quite similar to reference service 94400 and is more complex than reference service 94720.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This is a very complex test that is uncommonly performed. It involves measuring the diffusing capacity at least twice. With a current RVW at only .26 it is grossly undervalued and merits an increase. The ATS and ACCP recommend an RVW of .33 as substantiated by our data. It should be noted, however, that this test is performed in only the most sophisticated laboratories and, as such, our survey respondents may not have been familiar with the complexities of the test and thus, may have undervalued it to some extent.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 95010 Global Period: XXX Current RVW: 0.15 Recommended RVW: 0.70

CPT Descriptor: Percutaneous tests (scratch, puncture, prick) sequential and incremental, with drugs, biologicals or venoms, immediate type reaction, specify number of tests

Source and Summary of Comment to HCFA on this service:

CMDs have recommended a decrease in the RWV to 0.07. Our median RVW survey results indicate a value of 0.70.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old male inpatient with a history of skin rash, possibly urticarial, after taking penicillin and worsening of asthma after being given Ceftin, developed subacute bacterial endocarditis. Patient is seen by infectious disease consultant who recommends penicillin as the most suitable drug and you are asked to evaluate the patient for penicillin allergy.

Description of Pre-Service Work: Determination of which antibiotic is to be tested, determination of risk factors for safe testing, i.e., cardiac disease, beta blocker presence. Ordering appropriate test materials, including appropriate dilutions of drugs. Obtaining informed consent from patient. Explaining all risks, including anaphylaxis and treatment for ana-phyllaxis. Preparation of materials for treatment of anaphylaxis.

Description of Intra-Service Work: Apply prick/puncture type tests (usually three) sequentially every 20 minutes. Observe patient for development of positive skin test and possible anaphylaxis. If test is positive, prepare schedule for oral desensitization. If test is negative, write orders for administration of penicillin. Physician should be present in room for entire intra-service period to observe for presence of anaphylaxis.

Description of Post-Service Work: Write or dictate procedural report.

SURVEY DATA:

Specialty: Joint Council of Allergy, Asthma and Immunology

Sample Size: 55 Response Rate (%): 61.82 Median RVW: 0.70

25th Percentile RVW: 0.20 75th Percentile RVW: 1.60 Low: 0.04 High: 2.76

25th Percentile Intra-Svc Time: 17.5 75th Percentile Intra-Svc Time: 47.5 Low: 1 High: 150

Median Post-Service Time / Day of Procedure: 5

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
94010	Spirometry, including graphic record, total and timed vital capacity, expiratory flow rate measurement(s), and/or maximal voluntary ventilation.	0.17
95180	Rapid desensitization procedure, each hour (eg, insulin, penicillin, horse serum).	2.01
99222	Initial hospital care, per day, for the evaluation and management of a patient, which requires these three key components: a comprehensive history; a comprehensive examination; and, medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.	1.84

Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

COMMENTS ON CHOICE OF REFERENCE SERVICES

94010 describes a pulmonary function study to obtain baseline pulmonary function readings. It involves a relatively short period of time on the part of the physician who needs to insure that the equipment has been calibrated and that the technician is familiar with the procedure for doing pulmonary function testing. The duration of physician work involved in 94010 is about the same amount that is involved in doing a single prick puncture test for drug, biologic or venom.

95180 describes hourly physician work in desensitization to penicillin or other anti-biotics, or drugs, e.g. insulin. It is a procedure which carries great mental stress because of the risk of anaphylaxis. It also requires determination of which drug dose is a safe starting dose and what incremental challenge amount should be given at each sequential challenge. It involves careful observation by the physician of the patient for 15-30 minutes after each dosage to determine if there has been a reaction. The physician must then assess whether it is safe to proceed to the next dosage level. The risk for this code is substantially higher for this test than for prick/puncture testing.

99222 involves an approximate 50 minute visit of a physician to a newly admitted patient to the hospital. It requires a comprehensive history and physical examination and medical decision making of moderate complexity. The magnitude of physician work for this code is substantially greater than for the testing, but the physician time involved in total is the same for both the surveyed and the reference code.

DESCRIPTION OF THE PHYSICIAN WORK COMPONENTS**A. PRE-SERVICE WORK**

Pre-Service Work Clinical Description: Median Pre-Service Time (min.): 10 min.

The work pre-service will vary if the test allergen is a venom or biologic where test protocols already exist which include recommended concentrations of test materials. If a test item is a drug, then the physician will

not only have to determine the nature and severity of the previous drug reaction, but whether the test drug is the same to which the patient reacted or an analog where the risk may be somewhat less depending on the degree of cross reactivity. Physicians will have to determine the amounts of cross reactivity. The physician will have to determine probable safe starting test doses for the prick/puncture tests.

In addition, the physician will need to take a history and perform a physical examination to insure that the patient's critical status on the day of testing will make testing safe. In particular, the physician must insure that the patient does not take any drugs that will interfere (antihistamine) with or contraindicate (beta blocker) testing. If the patient has asthma, the physician will need to insure that the pulmonary status is sufficiently stable to allow for safe testing. A physical examination is necessary to establish a baseline should there be a systemic symptom as a result of testing.

Finally, the patient will have to be fully informed of the risks of testing, including anaphylaxis; consent must be obtained. Since the determination of safe test doses and obtaining informed consent is only done once, the total time involved in all these procedures is about 30 minutes. Most protocols for three test doses - the time for these procedures should be divided equally among all three tests.

While the carrier medical directors suggest the average number of prick/puncture tests is 30 and drug, biologic and venom testing, our data show it to be much closer to 3.

Comparison to Reference Service(s) Including Pre-Service Work Time and Intensity:

The total physician time and pre-service spirometry is approximately the same as in pre-service prick/puncture testing, but the risk of anaphylaxis and the need to obtain a much more detailed consent is substantially greater, therefore the values for spirometry is equal to that of single prick/puncture test. The total time in 95180 - rapid desensitization - is about the same as in prick/puncture testing, since rapid desensitization involves selection proper dose of antigens to start the desensitization and the obtaining of informed consent of the same nature. The pre-service work of an initial hospital visit involves the review of prior medical records when available and probably involves the same amount of work as prick/puncture testing.

B. Intra-Service Work

Intra-Service Work Clinical Description: Median Intra-Service Time (min.): 25 min.

The proper application of the test takes 5 minutes and the patient is then observed for 20 minutes to determine whether there is a skin reaction. At the same time, the patient must be constantly observed for the development of systemic reactivity. The total average number of tests is 3, so the total testing time is 75 minutes since these tests are done sequentially.

Comparison to Reference Service(s) Including Intra-Service Work Time and Intensity

Intra-service work in prick/puncture testing is much more stressful than in pulmonary function testing because of the continuing need to access for the presence of systemic anaphylactic reaction and the need to be ready to treat this once it occurs. It also requires the proper skill in reading the skin reactivity. The intra-service work would be equal to the intra-service work in rapid desensitization, but on a per test basis - would be for a much shorter period. The amount of work in a level 2 - initial hospital admission - would be similar in time, but the initial hospital visit would probably be more complex in medical decision making as well as involving a more extensive history and physical examination.

C. POST-SERVICE WORK

Post-Service Work Clinical Description: Median Post-Service Time (min.) 5 min.

The main post-service work involves insuring that the patient is assessed for any reaction and determining whether it is safe to continue with intra-cutaneous tests if prick/puncture tests where negative.

Comparison to Reference Service Including Post-Service Work Time and Intensity:

The amount of post-service work in time and intensity is approximately equal to that of pulmonary function testing and rapid desensitization and might be less than the extent of the therapy initiating process associated with initial hospitalizations.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Please see above.

Reference Services:

	Short Descriptor	RVU	Global
95010			
	93510 LEFT HEART CATHETERIZATION	4.33	000

CMD Comment:

This code allows for the billing of number of tests done per visit. The average number of tests done per visit from our data is 30 tests with RVUs of 0.15 for each scratch test (done commonly by the nurse). The total RVUs for that service are 4.50. This would relate to a little more than the reference code 36215 and would be 0.17 RVUs greater than the reference code 93510. Neither of these latter procedures are done "incident to" and both require greater intensity and skill. Reducing the RVUs to 0.07 per service, reduces the average total RVUs to 2.10. Which is approximately the mid- point between reference codes 99204 and 99205. Even at that, the service could still be overvalued.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 95015 Global Period: XXX Current RVW: 0.15 Recommended RVW: 0.70

CPT Descriptor: Intracutaneous (intra dermal) tests, sequential and incremental, with drugs, biologicals, or venoms, immediate type reaction, specify number of tests

Source and Summary of Comment to HCFA on this service:

CMDs have recommended a decrease in the RVW to 0.07. Our median RVW survey results indicate a value of 0.70.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year old male is stung by an unknown stinging insect while mowing his back yard. He has been stung before without reaction. Within 30 minutes he develops generalized urticaria, throat tightening and some transient difficulty in breathing. He is brought to an emergency room and appropriately treated. He is then referred by his primary care physician to you for testing.

Description of Pre-Service Work: Informed consent is obtained for testing, patient warned of risks of anaphylaxis. Risk factors for testing are determined, including asthma history, cardiovascular history, and presence of beta blockers. Seven prick/puncture tests including positive and negative controls are applied. All tests are negative except for positive control.

Description of Intra-Service Work: Sequentially stronger intracutaneous tests to honeybee, white and yellow-faced hornet, yellow jacket and wasp are applied. Patient develops wheal 12 mm and flare 35 mm to yellow jacket at 0.01 mcg/ml concentration and 15 mm wheal and 28 mm flare to white-faced hornet at 0.1 mcg/ml concentration. All other tests are negative. A total of 17 intracutaneous tests are applied. Each test set is five or fewer (fewer if patient reacted to lower concentration of test material) and each test set takes ten minutes to apply. The patient is then observed for ten minutes for positive test and/or for the development of anaphylaxis. Physician is prepared to treat anaphylaxis. Physician determines safety to apply next set of skin tests.

Description of Post-Service Work: Patient is informed of positive tests and recommendations made for 1) venom immunotherapy for a minimum of five years, 2) risks and benefits of immunotherapy explained, 3) alternative therapy if no immunotherapy but carrying Epi-pen explained to patient, 4) patient instructed in avoidance measures for stinging insect, 5) report prepared and sent to primary care physician.

94010	Spirometry, including graphic record, total and timed vital capacity, expiratory flow rate measurement(s), and/or maximal voluntary ventilation.	0.17
99243	Office consultation for a new or established patient, which requires these three key components: a detailed history; a detailed examination; and, medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.	1.47
99242	Office consultation for a new or established patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; and , straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient(s) and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.	1.11

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

DESCRIPTION OF THE PHYSICIAN WORK COMPONENTS**A. PRE-SERVICE WORK**

Pre-Service Work Clinical Description: Median Pre-Service Time (min.): 10 min.

For CPT Code 95015 to be undertaken, the patient would already have had an informed consent discussion as part of 95010 which must precede 95015. The risk of anaphylaxis is greater with intra-cutaneous testing. In

this testing, therefore, the patient has a brief reminder of potential reactions. Physician's must access the patient for the development of anaphylaxis from the immediately preceding prick/puncture testing and then determine safe starting doses for testing.

B. INTRA-SERVICE WORK

Intra-Service Work Clinical Description: Median Intra-Service Time (min.) 30 min.

Intra-service work in venom, drug and biologic testing involves determination of whether there was a reaction - skin or anaphylaxis - to the previous test set and whether it is safe to proceed onto the next test.

Comparison to Reference Service(s) Including Intra-Service Work Time and Intensity:

Each of these test sets involves 1-5 tests applied at the same time with approximately 5 groupings of 1-5 tests for venoms, and a variable number, but generally 5 for drugs and biologics. These tests are applied sequentially. The larger number of tests are done for venom testing and we calculate that on average patients have a total of 17 tests divided in 5 sequential groups. The stress of possible anaphylaxis from the previous test set is again substantially greater than for spirometry and is equal to that or greater than that of a Level III Consultation. While there are fewer diagnostic choices and therapeutic choices in skin testing than in an E&M code, the increase stress more than makes up in the differences in intensity in testing and doing a detailed history and physical with low complexity (99243) and much more than makes up for the difference with 99242.

The time involved in 95015 is that of doing 5 different test groups and waiting for 10 minutes to read the tests, as well as, in each instance, determining the presence or absence of anaphylaxis in the safety to proceed to the next sequential test group. The physician must be present for the entire period of time. The total intra-service time for approximately 5 test groups is 17 minutes for each test set. This would involve, therefore, about 85 minutes as compared to 99243 (40 minutes) or 99242 (30 minutes). It is impossible to separate pre- and intra- service test times because these tests are applied in sequential groups of 1-5. One test set application depends upon there being no reaction to the previous test group.

C. POST-SERVICE WORK

Post-Service Work Clinical Description: Median Post-Service Time (min.) 11.5 min.

The post-service time involves explaining to the patient the results of the prick/puncture and intra-cutaneous testing and making recommendations to the patient for environmental controls (venoms), immunotherapy (venoms) and safety of taking or not taking the drug or biologic tested. In addition, the post-service work involves sending a report to the attending physician with recommendations.

Comparison to Reference Service Including Post-Service Work Time and Intensity:

The post-service work is greater than the reference code 94010 because the interpretation of pulmonary function testing is generally less complex than making recommendations about administration of venom immunotherapy or administration of test drugs and possible reactions. There is relatively little difference between this testing and a Level III Consultation, but the time and complexity of testing is greater than that of a Level II Evaluation and Management visit.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Please see above.

	Short Descriptor	RVU	Global
95015			
	93510 LEFT HEART CATHETERIZATION	4.33	000

CMD Comment:

This code allows for the billing of number of tests done per visit. The average number of tests done per visit from our data is 30 tests with an RVUs of 0.15 for each scratch test (done commonly by the nurse). The total RVUs for that service are 4.50. This would relate to a little more than the reference code 36215 and would be 0.17 RVUs greater than the reference code 93510. Neither of these latter procedures are done "incident to" and both require greater intensity and skill. Reducing the RVUs to 0.07 per service, reduces the average total RVUs to 2.10. Which is approximately the mid- point between reference codes 99204 and 99205. Even at that, the service could still be overvalued.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 95075 Global Period: XXX Current RVW: 0.95 Recommended RVW: 1.15

CPT Descriptor: Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance such as metabisulfite)

Source and Summary of Comment to HCFA on this service:

CMDs have recommended a decrease in the RVW to 0.60. Our median survey results indicate a value of 1.15. 102 physicians, including both internal medicine allergists and otolaryngic allergists were surveyed. The response rate was about 55 percent. The top reference service chosen (99214) was identical for both groups even with different reference lists.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 47 year old male is seen complaining of nasal congestion with sneezing and rhinorrhea. A previous airborne allergy workup was negative. His ear, nose and throat exam is normal except for pale, edematous, wet, and swollen mucosa in the nasal airway. His food diary suggests that foods containing wheat may be a problem. He is given a wheat elimination diet for two weeks, but is non-compliant. His skin test for wheat is equivocal. After re-counseling by the physician and 3 days of strict wheat avoidance, the patient's nasal symptoms have improved. An oral challenge with wheat flour on the 5th day of wheat-containing food avoidance diet is given in the physician's office. The patient experiences a significant return of his nasal symptoms within 30 minutes of the food challenge. Wheat avoidance measures are explained. A return appointment in one month is given.

Description of Pre-Service Work: Physician determines from the patient evaluation that food hypersensitivity may be present. Written instructions regarding the dietary elimination of specific foods are explained and given to the patient in preparation for the food ingestion challenge.

Description of Intra-Service Work: A technician reviews the protocol for patient preparation for the test. The patient's suspected allergy-related signs and symptoms are noted and recorded. If the preparations are met and the physician is present, the technician administers the food. For the next hour the patient, technician and, when appropriate, the physician record signs and symptoms that may occur. If a reaction occurs during the first hour and it is not severe, the test is considered positive and is ended (may perform a similar test with placebo control a week to a month later if there has not been a severe food reaction, or obvious, objective signs of an allergic response, such as profuse rhinorrhea, a decrement in pulmonary functions or the like). If there is no reaction after one hour, 1/2 of the original portion is administered and the same observation occurs for the next hour. If there is no reaction after the second meal, the test is considered negative.

Description of Post-Service Work: Interpretation of test results is documented. If the test is positive, detailed information is given to the patient on avoidance and management of an adverse reaction if it occurs during future exposures, and the patient is given a prescription for epinephrine and instruction in self-administered injections. If the test is negative, consideration is given to other possible offending allergens.

SURVEY DATA (JOINT):

Specialty: American Academy of Otolaryngology - Head and Neck Surgery
Joint Council of Allergy, Asthma, and Immunology
American Academy of Otolaryngic Allergy

25th Percentile Intra-Svc Time: 17.5 75th Percentile Intra-Svc Time: 60 Low: 5 High: 240

Median Post-Service Time / Day of Procedure: 15

KEY REFERENCE SERVICE(S):**Allergy and Immunology:**

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
99214	Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.	0.94
94070	Prolonged postexposure evaluation of bronchospasm with multiple spirometric determinations after test dose of bronchodilator (aerosol only) antigen, exercise, cold air, methacholine or other chemical agent, with spirometry as in 94010.	0.60
99213	Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.	0.55

Otolaryngology - Head and Neck Surgery:

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RW</u>
99214	Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.	0.94
99284	Emergency department visit for the evaluation and management of a patient, which requires these three key components: a detailed history, a detailed examination; and, medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of high severity, and require urgent evaluation by the physician but do not pose an immediate significant threat to life or physiologic function.	1.68

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Allergy and Immunology:**DESCRIPTION OF THE PHYSICIAN WORK COMPONENTS****A. PRE-SERVICE WORK**

Pre-Service Work Clinical Description: Median Pre-Service Time (min.) 15 min.

(See clinical description above.) This period involves explaining to the patient the nature of the testing and obtaining informed consent by explaining risks and benefits of test procedure.

Comparison to Reference Service(s) Including Pre-Service Work Time and Intensity:

Pre-service work of ingestion challenge is much more intense because of the informed consent discussion than is the pre-service work in 99214 which involves primarily review of former records. There is little if any difference in pre-service work in 95075 and the reference code 94070 since both involve similar procedures. Pre-service work in 99213 is substantially less than 99214 noted above and therefore substantially less than 95075 for reasons already stated.

B. INTRA-SERVICE WORK

Intra-Service Work Clinical Description: Median Intra-Service Time (min.) 30 min.

The patient has a blinded food or placebo administered every 30 minutes in sequentially increasing concentrations. While each test takes about 30 minutes, the whole test period is between 4 and 8 hours. During each test period, the patient is observed for both a decrease in air flow (pulmonary function test) as well as other clinical symptoms and determination made for safety to administer the next test dose.

Comparison to Reference Service(s) Including Intra-Service Work Time and Intensity:

99214 Intra-service time is much shorter than the 4-8 hour period of 95075 and the intensity of potential systemic reactions makes this at least as complex the Level IV established patient. There is no difference in intra-service work with 94070, but the time involved is about double for 95075. CPT Code 95075 also has greater time and intensity than a Level III established patient visit; 99213 which generally is a follow-up visit.

C. POST-SERVICE WORK

Post-Service Work Clinical Description: Median Post-Service Time (min.) 15 min.

Interpretation of test results is documented. If the test is positive, the patient is given detailed information on avoidance and management should an adverse reaction occur on accidental ingestion. Patient is given a prescription for epinephrin and instructed in self administration. If the test is negative, consideration is given to other offending allergens; report is prepared and sent to referring physician.

Comparison to Reference Service Including Post-Service Work Time and Intensity:

There is about the same time and intensity in 95075 as in 94070 and 99214, but substantially greater intensity in ingestion challenge than in a Level III Established Patient Visit (99213)

Otolaryngology - Head and Neck Surgery:

See Allergy and Immunology reference service comparisons discussed above. In addition, the reference services chosen by otolaryngologists in the survey include #99214 and #99284. Taking #99214 and #95075, an "established patient" is involved, which means that most pre-service work has been accomplished at a prior (separately billed) visit. This is in contrast to the #99284 situation where the physician must take a phone call from an emergency room, travel to an emergency department rather than the routine office setting and review the emergency room record prior to seeing the patient. The intra-service work and physician time for #95075 is substantially greater than for #99214, as though both involve further detailed medical history and some physical examination the #95075 service entails at least a one hour period of observation after the aforementioned, and possibly two hours during which time the physician is involved depending on the patient's symptoms and technician/nurse needs (not less than an additional 15-30 minutes of patient contact).

In intra-service work #95075 would involve similar or more time than would #99284. The psychological stress and mental effort might be similar in #95075 and #99284, more for #95075 should the patient develop a systemic allergic response. For post-service time, #95075 requires substantially more physician time than #99214, and the same or more time than #99284 as a food elimination diet must be explained to the patient, and instruction in self-administration of epinephrine may be needed. The intensity of physician effort for #95075 is somewhere between #99214 and #99284, as patient observation in allergy food test can range from prolonged but mundane observation to a serious allergic reaction requiring emergent intervention.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Please see above.

Also, there has been no substantial change in the ingestion challenge food test over the past 5 years. Attached are 3 reprints, 2 written by general allergists, and another by an otolaryngic allergist. As per the #95075 vignette, the main component of physician involvement is intra-service work, consisting of a brief physical examination and a history review to confirm that the patient has eliminated specific foods from the diet prior to the test. The physician will be involved in periodic patient evaluation during the 1 to 2 subsequent hours of challenge ingestion food testing, and will need to evaluate potential allergic responses, life threatening in rare instances, and thereafter to counsel the patient regarding dietary elimination (and, possible epinephrine usage if food sensitivity has been confirmed by the ingestion test. Physician physical effort is minimal unless there is a (rare) severe allergic reaction; mental effort and judgement are moderate; time period is substantial (1.5-2.5 hours albeit not in constant patient contact); stress is related to the severity of any allergy reaction.

Preface

In my "Bela Schick Memorial Lecture" to the American College of Allergists (on the subject of food allergy, I presented some of the results of our studies on the consequences of feeding cow's milk formulas instead of human breast milk to human babies and the problems created by the too-early introduction of solid foods, especially to infants from allergic families. One of the titles of the talk was "Food Allergy in Children and Adults: Overt to Covert," since we, pediatricians, see twice as much disease owing to allergy as do the internists and perhaps ten times more food allergy than they do. As a result, there is a tendency for internists and family physicians to overlook the not so rare adult with symptoms caused by the ingestion of a food.

This book is modeled after a European effort on a related topic, which is an invaluable reference work (2). We have addressed five topics within the text of *Food Intolerance in Infancy: Allergology, Immunology, and Gastroenterology*. In order to better understand the clinical aspects, we examined the biology and physiology of both the digestive and immune systems; we explored the various types of food intolerance we discussed the diagnosis, prevention, amelioration, and treatment of milk intolerance; and we introduced to the United States a new hypoallergenic infant formula.

You will note that each section of this book is introduced, not necessarily by a worker in the field, but by an experienced and critical academic physician, each of whom briefly introduces the subject of the section. Each was responsible for seeing to it that none of the authors told you "more than you ever wanted to know about 'X'." I have rigorously edited the discussions which follow each section and therefore take full responsibility for any errors of omission or commission.

The Carnation Company provided me with the opportunity to organize a symposium and to assemble world-class authorities on food intolerance, including food allergy, many of whom are friends. Thus, we had the added pleasure of working with friends in the presentation of our studies and the discussion of our ideas. My hope is that you enjoy the book based upon the Food Allergy Symposium held in New York City, September 29 and 30, 1988, as much as we did preparing it.

This book will be of interest to all those who care for infants and children, especially pediatricians, family physicians, general practitioners, allergists, nutritionists, and nurses, as well as gastroenterologists and immunologists.

rare in and even the acquired variety causing clinically significant
nge is und
Our task at this meeting is to illuminate as much as possible what is known about
immunologic problems associated with infant feeding. We need just to see if there
solutions to the problems already at hand; perhaps most important, we need to
see those problems for which we now have the scientific basis for resolution.
Having identified myself as a skeptic, I now propose to introduce a session on the
techniques for diagnosing food allergy, keeping an open mind as we all evaluate the
evidence.

In Vivo Diagnosis of Food Allergy

Sami L. Bahna

*Department of Allergy and Immunology, The Cleveland Clinic Foundation,
Cleveland, Ohio 44195-5305*

The diagnosis of food allergy is predominantly clinical. Information on the offending food(s) may be obtained from the medical history, a food/symptom diary, trials of elimination diets, and skin testing. To verify the role of suspected foods, each should be subjected to well-controlled oral challenge testing.

Skin testing is probably the most commonly utilized diagnostic procedure in food allergy. Its reliability, however, is generally suboptimal and varies from one food to another. It has an overall positive predictive accuracy of 48% and a negative predictive accuracy of 74%.

Elimination-challenge testing is the most definitive procedure for verification of the role of suspected foods. Placebo-controlled blind challenges are ideal, yet have limitations; disguising an adequate quantity of food or choosing an appropriate placebo may be difficult. The challenge method also may be very different from the method of natural exposure. The test should be done under medical supervision to document the occurrence of reaction and to treat any potentially severe ones.

In evaluating patients suspected of having food allergy, information on the offending food may be pursued in several ways (1). Medical history, food/symptom diary, trials of elimination diets, and skin testing are widely used (Table 1). Certain *in vitro* tests may also be used and are addressed in *this volume*. To verify the role of a certain food in inducing a particular symptom, appropriate challenge tests should be conducted.

The underlying hypersensitivity mechanism, however, may be difficult to document, although it may be guessed by the nature of symptoms and time of onset following exposure to food. A positive immediate-type skin test or an increased serum level of specific immunoglobulin E (IgE) antibodies supports an IgE-mediated reaction. More than one immunologic mechanism, however, may be involved in the same patient, particularly when there are multiple manifestations (2).

MEDICAL HISTORY

A thorough history may provide valuable information to support or exclude food allergy. Occasionally the medical history may be so obvious as to settle the diagno-

sis without the need for further tests. This would be the case in patients whose symptoms are objective and well defined (e.g., urticaria, angioedema, or wheezing), have occurred intermittently, and on multiple occasions have appeared shortly after exposure to a particular food. The history may reveal the involvement of other factors in addition to food (e.g., physical exercise, emotional events, or premenstrual time).

FOOD/SYMP TOM DIARY

A regular tabular recording by date and time of all foods eaten and the appearance or exacerbation of symptoms may assist in suspecting the offending foods. The food/symptom diary is most effective when the symptoms are well defined, occur intermittently, last for a short time, and appear shortly after exposure to a food that is not eaten on a daily basis. The recording should encompass a few recurrences of symptoms.

The diary is of little help if the recording is incomplete, if the offending food is incorporated in frequently eaten dishes, or in cases of delayed-onset reactions. The patient may not be aware of a "hidden" food allergen in a commercially prepared food, either because it is not listed on the label or is listed under a name unfamiliar to the public (e.g., whey, casein, calcium caseinate, ovalbumin, ovomucoid, or ovomucin).

In addition to foods, other events may need to be recorded, such as places visited, social activities, emotional events, menses, and physical exercise. Any such factors may contribute to the patient's symptoms or potentiate the effect of food allergens.

In these cases, recording may be done only whenever symptoms occur and should include a sequential recording of foods eaten and events happening during the preceding 12 to 24 hr.

DIAGNOSTIC ELIMINATION DIETS

Certain elimination diets may be tried in patients whose symptoms are frequent or persistent and whose medical history suggests food allergy without pointing to any particular food. Some conventional diets are devised to be devoid of certain group(s) of commonly allergenic foods. Rowe Elimination Diets Number 1, 2, 3, and 4 are widely known examples (3,4). Elemental formula (Tolerex or Standard Vivonex by Norwich Eaton Pharmaceuticals, or Vivasorb by Phrimer A/S) is a strict elimination diet. The protein in this formula consists of synthesized amino acids (5,6). These elimination diets have some advantages and several disadvantages (7). In infants, a hypoallergenic formula may be given, e.g., casein hydrolysate (Nutramigen by Mead Johnson Nutritional Division) or the recently available whey hydrolysate (Good Start H.A. by Carnation).

Selection of the initial elimination diet may vary from one patient to another. If no improvement in symptoms is noted within 2 to 4 weeks, other elimination diets may be tried. Once improvement occurs, the eliminated foods are reintroduced one at a time to identify the offending ones.

SKIN TESTING

In evaluating patients for food allergy, physicians have shown divergent attitudes towards the usefulness of skin testing. At one extreme are those who do not use food extracts for skin testing, and at the other extreme are those who diagnose food allergy by skin testing alone. At present, skin testing is probably the most commonly used procedure in evaluation of food allergy. Reports on its reliability, however, have shown inconsistent results (8-12).

The allergen extract is usually applied epicutaneously (i.e., by scratch, prick, or puncture techniques). Commercial food extracts for epicutaneous testing are mostly provided in a concentration of 1:20 or 1:10 w/vol (50% glycerinated). Fresh food, however, may be superior to the commercial extracts (13-15). If the test is negative to the foods suspected from the history, intracutaneous testing may be performed by injecting 0.02 ml of aqueous extract, usually 1:1,000 w/vol. Performing epicutaneous testing first minimizes the risk of systemic or large local reactions that might result from intradermal administration of an allergen to which the patient is highly sensitive.

The test sites are inspected after 15 to 20 min for the size of the wheal-and-flare response, which reflects an IgE-mediated reaction. A score from 0 to 4+ is given as compared with the response to a diluent and to histamine (2). Most allergists con-

challenge

We studied allergy patients, mostly children, whose histories were highly suggestive of food allergy (16). They were subjected to scratch testing with commercial food extracts; whenever the reaction score was 1+ or 0 and the food was suspected from the history, intradermal testing was done. Double-blind, placebo-controlled oral challenges were performed with the food that showed a positive skin test (2+ or greater) or were suspected from the history. The results of skin testing and challenge were concordant in 63% of all instances (Table 2). In the positive challenge group, skin testing was positive in 58% of instances, but varied from one food to another, being lowest for tomato (33%) and highest for fish (83%). In the negative challenge group, skin testing was negative in 65% of instances, lowest for fish (50%) and highest for orange (89%). The overall positive predictive accuracy of skin testing was 48%, lowest for crab (33%) and highest for fish (83%). The overall negative predictive accuracy was 74%, lowest for cow's milk (44%) and highest for egg white (89%). The presenting symptoms in our series were asthma and/or rhinitis in 76%, atopic dermatitis in 47%, urticaria/angioedema in 47%, gastrointestinal symptoms in 27%, and systemic anaphylaxis in 12%. Nevertheless, the results previously reported on atopic dermatitis patients were not much different (17).

A discordance between the results of skin testing and challenge testing might be caused by any of several factors, such as technical errors, non-IgE-mediated reactions, the specific reagents being more localized in the shock organ, or the presence of subclinical hypersensitivity (2).

The suboptimal reliability of skin testing with the currently available food extracts should not deter its use as a screening test, particularly since none of the currently available *in vitro* tests has optimal reliability (1). In a series of 102 adults who had a history of idiopathic anaphylaxis, skin testing with food extracts assisted in identifying the cause in 7 subjects (18).

A high concordance rate between positive skin-test reaction and challenge testing has been noted in studies that used purified allergen extracts, such as codfish (9) and peanut (19). Purification and standardization of food allergy extracts are complex processes, but may be forthcoming (20).

TABLE 2. Concordance between the results of skin testing and double-blind oral food challenge

Group	N	Concordance, %		
		Overall	Lowest	Highest
All challenges	107	62.6	53.3 (milk)	75.0 (fish)
Positive challenge group	38	57.9	33.3 (tomato)	83.3 (fish)
Negative challenge group	69	65.2	50.0 (fish)	88.9 (orange)

ELIMINATION CHALLENGE TEST

To verify the role of foods suspected (by history, diary, trials of elimination diet, skin testing, or *in vitro* tests), the patient should first avoid all these foods, and then be subjected to oral challenge with each separately. (The challenge must be avoided, however, if the food being considered may have been the cause of a life-threatening reaction in the past.)

The first phase of the test aims at documenting definite improvement in symptoms following a trial of dietary elimination. All suspected foods should be simultaneously and completely avoided for 1 to 2 weeks. If the symptoms do not improve substantially, either that food is not the offender or additional offending factors were not controlled. If the symptoms definitely improve, the patient should be subjected to oral challenge tests while taking no or minimal symptomatic medications and having no intercurrent illness.

The second phase of the test aims at documenting recurrence of symptoms following exposure to the offending food. Generally, the challenge test should be done under supervision and in a place where facilities exist for the management of any possible severe reaction. We, as well as others (21,22), have witnessed severe reactions, including systemic anaphylaxis, from oral challenge tests in some patients who had had no such reactions before.

The initial challenge dose of food should depend on the anticipated severity of symptoms and on the quantities of the food the patient had been accustomed to eating while symptomatic. Increasing quantities may be administered every 30 min, as long as no reaction appears, until a cumulative quantity is reached that is equivalent to what the patient usually used to eat. On another visit, a challenge with an appropriate placebo should be carried out in the same way as with the suspected food. In addition to documenting all clinical symptoms and signs, the physician should record, whenever applicable, any changes in relevant laboratory findings. In a clinic setting, if no reaction occurs during the challenge procedure (usually 3 to 4 hr), the patient is sent home with instructions to maintain the elimination diet and to report any symptoms. If no symptoms occur by the next day, more of that food may be eaten at home unless the physician prefers not to disclose the nature of the challenge tests until all the challenges are completed.

In infants and young children, where reactions are mostly objective, the challenge may be conducted in an open manner. In older children and adults, however, the test should be conducted in a blind manner, usually single-blind and occasionally double-blind. Difficulties may be encountered in providing a placebo that matches the suspected food in consistency, color, odor, taste, and quantity. Because of this problem, the physician may choose to use open challenge testing first, then verify by a blind test only those foods that cause a reaction. This approach would save much time because a negative result occurs in approximately two-thirds of blind challenge tests (11,12,23,24). A common method of hiding the test food is providing it in a freeze-dried powder in opaque capsules. It can be also disguised in a hypoallergenic formula, an elemental formula, or in another appropriately selected food.

Results of 107 double-blind oral challenges in patients highly suspected to be food allergic, a clinical reaction was noted in 36% (12). The reproduced symptoms were mostly similar to the presenting symptoms. In a few instances, additional symptoms were noted, including systemic anaphylaxis in one. With few exceptions, all positive reactions appeared while the patient was being observed in the clinic. In a few instances the reaction occurred at home within 24 hr after challenge.

Although oral challenge is the most definitive test for identification of the offending food, it has some limitations. It relies on the appearance of clinical symptoms and might miss a subclinical reaction (25,26). It is conducted under controlled conditions that might be different from the usual circumstances of exposure in certain patients, such as food preparation, combination with other foods, association with other contributory factors, or route of exposure. Certain food hypersensitivity reactions, mostly respiratory, are precipitated by inhalation rather than ingestion (1,2). Verification of these reactions requires specially designed bronchial inhalation challenge tests (27).

ACKNOWLEDGMENT

The Oral Challenge Food Test

William H. Wilson, M.D.

Objective

This paper briefly presents the technique for performing the oral challenge food test.

The oral challenge test for determining hypersensitivity to a specific food dates back to the original employment of the concept by Duke [1] in 1923. The reintroduction of a food that had been eliminated from the patient's diet because of a suspected labyrinthine excitation resulted in an episode of acute vertigo.

Rinkel [2] reported the use of a deliberate feeding test in 1934 in diagnosing a gastrointestinal allergy that mimicked a peptic ulcer syndrome. His technique involved total elimination of the suspected food for four full days, with reintroduction on the fifth day. His technique was further refined by Randolph in 1946 by correlation of the clinical response of the test with the changes occasionally noted in the white blood count. This he referred to as the leukopenic index.

Rinkel [3] defined food allergy as "a hypersensitivity to or an intolerance of a food which is demonstrable by the production of clinical manifestations with specific means of testing." The oral challenge food test meets this criterion.

An understanding of the principle of the test awaited recognition of the phenomenon of masking as described by Rinkel, and later referred to by Randolph as the phenomenon of adaptation. Understanding of the cyclic aspect of hypersensitivity to foods brought a realization that it was the elimination of the phenomenon of adaptation during the four

William H. Wilson, M.D., Associate Professor of Otolaryngology, University of Colorado Medical Center, Denver.

days of abstinence that made possible the clinical response upon reintroduction if a specific hypersensitivity existed. This induced phase of acute hypersensitivity actually returns the patient to a state of nonadaptation.

The challenge test may be performed in the physician's office or in the patient's home. Professional observation is most desirable, but a well-instructed patient or parent of moderate intelligence should be able to record clinical signs and symptoms observed upon reintroduction of the food undergoing a test. The physician's office affords a controlled environment, but the home is suitable and can be made acceptable with proper instruction. Warning that exposure to possible inhalant allergens during the test day may produce a false-positive response is essential.

Blood pressure determinations in the hypertensive patient and white blood counts before and after the feeding test are available only in an office setting, but rarely are essential in determining a positive test response.

The greatest source of error in the oral challenge test lies in the possibility that the food being tested inadvertently entered the diet during the four days of elimination. Performing the challenge in the office fails to offer any additional safeguard from this standpoint. The convenience and economy of utilizing the home as the test site not only adds practicality but also materially lessens traffic in a busy medical office.

Verbal detailing of which foods can and cannot be ingested during the four days of total elimination should be supplemented by complete lists tailored to the market in the physician's community. The exact procedure to follow on the day of the test must be written and explained in detail.

The patient is instructed to have an early breakfast on the fifth day, the day the food is reintroduced. The food under consideration is not included in the breakfast and no new food is introduced at that meal. Smoking is prohibited and nothing more is taken by mouth until the test meal 3½ hours later. The status of the patient's allergy is evaluated prior to the late-morning feeding. Should the patient be ill or experiencing an exacerbation that day, the test may be postponed until the 6th, 7th or 8th day.

Only the food undergoing the test is ingested at the test meal. The inclusion of other foods slows absorption and may

result in an equivocal response. An average portion is eaten within a five-minute period. The environment should remain stable. Significant signs and symptoms are noted and recorded. If they are definite, further ingestion of the food is contraindicated.

One hour after the initial ingestion of the test food the patient eats one-half portion more. No other food enters the diet for one hour, and all observations are recorded. The noon meal may follow. All symptoms and signs that occur during the afternoon and evening require recording, and notations are made the next morning as to any occurrences during the night.

The oral challenge test offers an approximate 80% accuracy. If a hypersensitivity to a specific food remains suspect following a negative challenge, the intracutaneous provocative test offers an alternative technique. The oral challenge test also offers an alternative methodology when a highly suspected food fails to produce a positive response by the intracutaneous provocative method.

An adjunctive value of the test lies in the self-instruction it affords the physician as to the nature of allergy to foods as he observes the reported responses of his patients during their specific challenges.

Self-Evaluation Quiz

1. The underlying principle of the oral challenge food test has been described as:
 - a) Elimination of the phenomenon of masking
 - b) Elimination of the phenomenon of adaptation
 - c) Return to nonadaptation
 - d) All of the above
2. Four days of abstinence from an allergenic food induces acute hypersensitivity in an affected individual.

CPT Descriptor: Neuromuscular junction testing (repetitive stimulation, paired stimuli), each nerve, any one method

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 25-year-old woman has noted intermittent ptosis of the eyelids and double vision for 3 months. Physical examination is normal except she develops ptosis of the eyelids after 60 seconds of sustained upgaze. A primary diagnostic consideration is myasthenia gravis. Acetylcholine receptor antibody titers and a Tensilon test are normal. Repetitive nerve stimulation studies of a hand and shoulder muscle are normal. Repetitive nerve stimulation studies of the inferior orbicularis oculi and nasalis muscles innervated by the facial nerve are abnormal, showing a decrement-increment pattern on 2 Hz and 3 Hz stimulation. The abnormal facial repetitive nerve stimulation studies demonstrate abnormal neuromuscular transmission and support the clinical diagnosis of myasthenia gravis.

Description of Pre-Service Work:

Pre-service work involves the examiner determining which nerve-muscle pairs are to be studied based on the referring physician's questions and the available clinical information.

Description of Intra-Service Work:

Intra-service work includes physician performance or supervision of patient preparation, setting the electromyograph's gain setting, time base and filter settings, placement of ground, stimulating and recording surface electrodes, stimulation of nerves and recording of the waveforms of the resulting compound muscle action potentials. If possible, the body part receiving the stimulation is immobilized to minimize motion artifacts that often interfere with reliable data collection. This is much more easily done if a distal limb nerve is stimulated. The compound muscle action potential waveforms are analyzed with respect to amplitude and configuration and, sometimes, area following one or more trains of repetitive nerve stimulation. Different numbers and rates of stimuli are delivered depending on the clinical situation. Test design changes during the course of the study in response to the information obtained.

Description of Post-Service Work:

Post-service work involves calculation of compound muscle action potential amplitude and configuration change during the course of the trains of repetitive nerve stimulation, sometimes calculation of compound muscle action potential area change during the course of the trains of repetitive nerve stimulation, comparison to normal values, summarization of clinical and electrodiagnostic data, physician interpretation, generation of a differential diagnosis and sometimes suggestions for further work-up.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The following table compares the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the surveyed CPT code 95937 to the key reference services used in the survey.

<u>Reference Service</u>	<u>RVW</u>	<u>MEDIANS</u>			<u>AVERAGES</u>		
		<u>Pre Time</u>	<u>Intra Time</u>	<u>Post Time</u>	<u>Mental Effort/ Judgment</u>	<u>Technical Skill/ Physical Effort</u>	<u>Psychological Stress</u>
95900	0.42	5.0	5.0	2.0	2.1	2.2	1.9
95935	0.59	5.0	10.0	4.0	2.7	3.0	2.6
95933	0.59	4.0	9.0	4.0	3.0	2.9	2.4
<u>Survey Code</u>	<u>Proposed RVW</u>						
95937	0.65	5.0	12.0	5.0	3.4	3.7	2.9

As can be seen in the above table, pre-service time for code 95937 was equal to or greater than pre-service time for the reference services. Intra-service and post-service times were greater for code 95937 than the three reference services. The degree of mental effort and judgement; technical skill & physical effort; and psychological stress associated with code 95937 was greater than that of any of the reference services. The ratio of the proposed RVW for code 95937 (0.65) to that of reference services 95935 and 95933 (0.59) is 1.10. The ratio of intra-service time for code 95937 (12 min) to that of the average intra-service time for reference services 95935 and 95933 ($\{(9 + 10) / 2\} = 9.5$) is even greater, at 1.26.

Comparison of the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the surveyed CPT code 95937 to the key reference services supports the recommendation that the RVW for 95937 should be higher than the RVWs for any of the reference services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Pre-Service Work (5 minutes):

Pre-service work involves the examiner determining which nerve-muscle pairs are to be studied based on the referring physician's questions and the available clinical information. Level of technical skill & physical effort; mental effort and judgement; and stress is that required to perform a medical history and physical examination and to understand the role of code 95937 in the diagnostic process of neuromuscular diseases.

Intra-Service Work (12 minutes):

Intra-service work includes physician performance or supervision of patient preparation, setting the electromyograph's gain setting, time base and filter settings, placement of ground, stimulating and recording surface electrodes, stimulation of nerves and recording of the waveforms of the resulting compound muscle action potentials. If possible, the body part receiving the stimulation is immobilized to minimize motion artifacts that often interfere with reliable data collection. This is much more easily done if a distal limb nerve is stimulated. The compound muscle action potential waveforms are analyzed with respect to amplitude and configuration and, sometimes, area following one or more trains of repetitive nerve stimulation. Different numbers and rates of stimuli are delivered depending on the clinical situation. Test design changes during the course of the study in response to the information obtained. Level of technical skill & physical effort; mental effort and judgement; and stress is that required to perform electrodiagnostic testing,, as described above, and to interpret the results obtained during the course of the study within the clinical context, so that further studies, if necessary, can be done in order to maximize the chance of arriving at a proper diagnosis while minimizing patient inconvenience and discomfort.

Description of Post-Service Work (5 minutes):

Post-service work involves calculation of compound muscle action potential amplitude and configuration change during the course of the trains of repetitive nerve stimulation, sometimes calculation of compound muscle action potential area change during the course of the trains of repetitive nerve stimulation, comparison to normal values, summarization of clinical and electrodiagnostic data, physician interpretation, generation of a differential diagnosis and sometimes suggestions for further work-up. Level of technical skill & physical effort; mental effort and judgement; and stress is that required to correctly analyze and interpret the results of the electrodiagnostic testing, and to place them in a clinical context so that the report is meaningful to the referring physician in terms of a reasonable differential diagnosis and sometimes suggestions for treatment or further evaluation.

Change in the Work of Performing the Service Over the Past Five Years:

The work of performing the service has changed little over the past five years. Only 1 of the survey respondents stated that the site of service has changed from in-patient to out-patient. Only 1 of the survey respondents stated that this service represents new technology that has become more familiar (less work). Only 2 of the survey respondents stated patients requiring this service are more complex (more work).

Objective Data Supporting the Rationale:

On June 8, 1995 the AMA sent the AAEM three relevant documents:

1. *Medicare Part B Data for Reference Codes and Codes under Review*
2. *Summary of Work and Time Estimates for Services Undergoing Investigation for the Five-Year-Review*
3. *Comparison of Work RVUs – 1995 MFS versus the Harvard RBRVS Study for Services Undergoing Investigation for the Five-Year-Review*

Each of these documents, in its own way, supports assigning an RVW for code 95937 that is higher than the current value.

Medicare Part B Data for Reference Codes and Codes under Review shows that the frequency of performance of code 95937 has increased from 13,698 in 1992 to 65,134 in 1994, an increase of 118.1%. During the same period, the frequency of performance of reference service 95900 increased only 9.5% and the frequency of performance of reference service 95935 increased only 36%. Information on reference service 95933 is not available.

The proportion of the specialty mix of those physicians reporting reference code 95900 who would be expected to have specialized training in electrodiagnostic studies (neurologists and physiatrists) was 69.6% in 1994. The proportion of the specialty mix of those physicians reporting reference code 95935 who would be expected to have specialized training in electrodiagnostic studies (neurologists and physiatrists) was 50.0% in 1994. However, the proportion of the specialty mix of those physicians reporting reference code 95937 who would be expected to have specialized training in electrodiagnostic studies (neurologists and physiatrists) was only 26.1% in 1994. The AAEM would expect that the patient populations in which the reference services and survey code 95937 would be performed would be similar and that the clinical skills involved in performing the reference services and survey code 95937 would be similar.

Although the AAEM would expect that the usual indications for code 95937 would be the symptom of muscle weakness (ICD-9 code 728.9) or neuromuscular junction disorders (botulism: 005.1, tetanus: 037, myasthenia gravis: 358.0, myasthenic syndromes: 358.1), the ICD-9 codes actually reported with performance of CPT code 95937 are listed below in order of frequency (highest to lowest):

- 355 Mononeuritis lower limb
- 356 Hereditary and idiopathic peripheral neuropathy
- 786 Symptoms involving respiratory system and other chest symptoms
- 724 Other and unspecified disorder of the back
- 729 Other disorders of soft tissues
- 354 Mononeuritis of upper limb and mononeuritis multiplex
- 723 Other disorders of cervical region
- 780 General symptoms

It is difficult for the AAEM to understand the justification for performing neuromuscular junction testing (code 95937) in large numbers of patients with the above diagnoses, although this procedure could be indicated in certain patients with these illnesses and symptoms.

The above Medicare data suggests that the increased utilization of code 95937 from 1992 to 1994 may not be justifiable on clinical grounds. Furthermore, the data suggests that a different population of practitioners are reporting code 95937 than those reporting some other similar electrodiagnostic codes. Perhaps many of the practitioners reporting code 95937 do not understand the true definition of this code.

The AAEM is of the opinion that the optimal remedy for overutilization of a given electrodiagnostic code is peer review of questionable cases and/or development of and adherence to practice parameters regarding electrodiagnostic testing. A decrease in the RVW of code 95937 is not justifiable on the basis of our survey results and the above supporting data and such a decrease would unfairly penalize those practitioners who perform this procedure under the correct clinical circumstances.

Summary of Work and Time Estimates for Services Undergoing Investigation for the Five-Year-Review lists an intratest time for code 95937 at 29 minutes. The intratest time for code 95867, which is also under review (and therefore was not used as a reference service in the survey for code 95937), is listed as 23 minutes, yet the Carrier Medical Directors' recommended RVW for code 95867 is 0.79!

Comparison of Work RVUs – 1995 MFS versus the Harvard RBRVS Study for Services Undergoing Investigation for the Five-Year-Review states that the recommended RVW for code 95937 from the original Harvard RBRVS study was 0.77.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 95951 Global Period: XXX Current RVW: 3.8 Recommended RVW: 6.0

CPT Descriptor: Monitoring for identification and lateralization of cerebral seizure focus, combined electroencephalographic (EEG) and video recording and interpretation, each 24 hours

Source and Summary of Comment to HCFA on this service: The American Academy of Neurology (AAN) was the source of public comment to HCFA regarding the refinement of physician work RVU's associated with CPT 95951. It was the opinion of the AAN that the initial Harvard Study value (1.79 RVUs) was gross underestimation of the actual time and intensity of the physician work involved and the current RVU in the MFS (3.8) still represents a highly undervalued value. The complexity of the patients and work associated with this service has increased significantly.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25 year-old woman has a 15 year history of partial and grand mal seizures which are still poorly controlled despite all medication regimens tried. Her seizures, occurring 2-3 times per week, have made her unable to work. The MRI and exam are normal. She is referred for long-term video-EEG monitoring. Patient is monitored for four days, during which time eight partial complex seizures were recorded. After cortical resection at the seizure focus, identified by the video-EEG monitoring, the patient is seizure free and eventually stops all medication and returns to work.

Description of Pre-Service Work: Explaining to patient the risks of withdrawing medication, grand mal status, restrictions on behavior, the procedure itself, outcomes, and why it has been recommended for the patient. Instruct technicians as to specific monitoring techniques that should be used for the patient.

Description of Intra-Service Work: For each seizure during a 24 hour period (typically several), a review of the nursing notes and review and interpretation of both the video and EEG recordings from before, during and after seizure. For each 24 hour period a note is written of the behavioral and EEG findings for seizures that day.

Description of Post-Service Work: For each admission (typically several days to a week), dictation of a summary of the video behavior and EEG information recorded with the seizures. Analysis, including comparing and contrasting, the separate types of seizures which were found. Determination of the patient's suitability for surgery, which part of the brain to resect and what risks are involved. Review findings with surgeon and discussion of test results with referring physician, patient, and/or family.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	95819	Electroencephalogram (EEG) including recording awake and asleep, with hyperventilation and/or phonic stimulation	1.08
2)	99244	Office consultation for a new or established patient, which requires a comprehensive history; a comprehensive examination; and medical decision making of moderate complexity.	2.23

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

<u>Time Comparison (Medians)</u>	<u>Reference Services</u>		
	<u>95951</u>	<u>95819</u>	<u>99244</u>
Pre-Service	30	5	10
Intra-Service	60	15	60
Post-Service	60	5	10
<u>Intensity Comparison (Medians)</u>			
Mental Effort & Judgement	5	2	4
Technical Skill & Physical Effort	5	2	3
Psychological Stress	4	2	3

It is obvious from the above comparison of pre, intra, and post service times and complexity/intensity of physician work that CPT 95951 was rated much greater in all aspects than the two primary reference services. The total time associated with CPT 95951 (150 min.) is six times that of the time associated with CPT 95819 (25 min.) and close to twice the time for CPT 99244 (80 min.). The ratio of median intensity factors for CPT 95951 compared to CPT 95819 is 2.0 - 2.5 and the ratio to the intensity values for CPT 99244 ranges from approximately 1.3 - 1.7.

Based on time comparison alone to the reference services the RVW for CPT 95951 would range from 4.18 (1.875 x 2.23) to 6.48 (6 x 1.08). An RVW value of 6.27 based on both time and intensity can be arrived at by multiplying 4.18 (the lowest RVW based only on time) by a conservative intensity factor of 1.5. The AAN is recommending the median RVW value of 6.00 from the survey which represents a very appropriate value when compared to the RVWs associated with the reference services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

(Please See The Following Pages)

RATIONALE - RUC RECOMMENDATION
CPT 95951

DESCRIPTION OF SERVICE

Video monitoring is precisely coordinated with EEG recordings in order to correlate behavioral observations with EEG changes. Video EEG monitoring is critical to the evaluation of intractable epilepsy patients, especially epilepsy surgery candidates and to the differential diagnosis of seizure type. Clinical symptoms such as aphasia, focal clonus, aversive posturing and behavioral changes provide information that is not available with routine EEG (95819), ambulatory EEG (95950) or computerized EEG (95953). The combining of EEG with video provides more localizing information than would the sum of the two studies performed separately. The physician time and skill in recording and interpreting information related to CPT 95951 is considerably greater than most other EEG services.

PHYSICIAN WORK

Time

Patients undergoing a comprehensive epilepsy evaluation are most often monitored continuously. This typically requires an inpatient hospital stay since antiepileptic drugs are reduced or discontinued to increase the likelihood of seizures and decrease the length of hospital stay. Under these conditions, it would be unsafe to allow the patient to leave the hospital for fear of precipitating status epilepticus. Patients must understand the rationale for medication reduction, the risks involved, and the importance of being confined and remaining on camera throughout the procedure despite the loss of personal privacy. In order to explain these details, pre-service time with the patient is significantly more than for other similar EEG procedures such as 8 channel ambulatory EEG or 16 channel ambulatory EEG monitoring as an outpatient.

Analysis and interpretation of each seizure can take 15 to 45 minutes depending on localization, duration and case complexity. All of the seizures must be compared and described in detail. The EEG correlation with clinical activity must be done on a second to second basis. Analysis of EEG data recorded over a 24 hour period, review of video recordings, and synthesis of the EEG data with the video information and other clinical findings and observations takes an average of 60-90 minutes. This estimate does not include the extensive amount of time spent with the patient over the 24-hour period such as interviewing the patient before and after seizures and dealing with agitated and sometimes psychotic patients following seizures. Time spent with the patient is billed and separately reimbursed through hospital visit codes or other evaluation and management procedures.

Intensity

If EEG localization conflicts with reliable clinical signs, extreme caution is needed prior to surgery to prevent the possibility of performing incorrect procedures. It is usually necessary to videotape several of the patient's habitual seizures to assure that they are consistent with the type of seizure usually experienced and to fully understand the details of the seizure semiology. The family is usually shown videotaped seizures to determine if the patient's habitual seizure has been recorded. If the patient experiences multiple types of seizures, it is extremely important to capture this information as it may indicate a different type of surgical intervention.

It is very psychologically stressful and requires a great deal of mental effort and judgment for the physician to use these data to make a determination about the region of the brain to be removed at neurosurgery. In the manner in which this test is usually used, i.e. a medically refractory epilepsy patient seeking neurosurgical cure, this test represents the sole or most important test in determining the site for resection. If done correctly, the patient can be permanently cured of his or her epilepsy. If done incorrectly, this procedure will point the neurosurgeon to the incorrect location for removal, resulting in a patient who continues to have medically refractory epileptic seizures at an even increased rate of severity and frequency, as well as permanent brain damage from removal of normal brain.

Patients receiving incorrect surgery are often left permanently totally disabled, sometimes with inability to remember any new information for the rest of their life. The profound importance of this test, and potential catastrophic effect of error here, weigh heavily on physicians performing this CPT 95951, and this grave stress needs to be taken into account.

Most patients admitted for a comprehensive epilepsy evaluation will have 1-2 seizures per day, but this code must accommodate a broad variation in patients, including some who will have more than 100 seizures per day. Patients may become violent, throw objects, and even run out of the monitoring room during seizures. The physician must always be available to deal with potentially dangerous situations. Psychotic patients are particularly distressing since they have the potential to harm themselves and others.

The greater the number of seizures generally means a larger amount of data and time spent analyzing it. Even on days when there are no seizures recorded, the physician is often analyzing EEG recordings for subclinical seizures spikes, or slowing. While rudimentary computer programs exist for detection of seizures and spikes, the physician must make the final decision regarding a particular event even with the help of computers.

RVW JUSTIFICATION

Survey Results

The American Academy of Neurology has recommended to the RUC a physician work RVW value of 6.00 for CPT 95951-video EEG monitoring, each 24 hours. This value is based on a survey of sixty (60) epilepsy center physicians across the country, who represent the leading neurologists performing this procedure. According to Medical Part B Data, neurology accounts for 93.2% of this procedure and as such is the only specialty appropriate to judge accurately the time and intensity of the work involved.

As described above and supported by our survey data, it is clear that the components of physician time (pre, intra, and post service) and intensity (mental effort and judgment, technical skill and physical effort, and psychological stress) are much greater and more complex for CPT 95951 than for the primary reference services used in this survey, CPT 95819 and 99244. The AAN survey used those reference codes because they are familiar to and frequently used by neurologists who were asked to complete our survey, and they were among the AMA RUC reference services. We were instructed to use the designated neurology services which were on the reference list, and we have followed those instructions.

Our survey showed that the physician work involved in providing CPT 95951 is approximately 5-6 times greater than CPT 95819 (physician work RVW value of 1.08) as well as 2-3 times that of CPT 99244 (physician work RVW value of 2.23).

Comparison to Additional Reference Services

Several CPT codes could have been chosen for comparison in our survey. Other neurodiagnostic CPT codes are more directly relevant for assessing physician work RVW values for CPT 95951. In comparison to CPT 95810, polysomnography (physician work RVW value of 3.53), CPT 95951 is greater in all aspects, i.e. requires more physician time, requires a greater degree of mental effort and judgment, and exacts a much greater amount of psychological stress. For example, polysomnography, if interpreted incorrectly will lead to prescription of incorrect medications or the use of nocturnal sleep aid devices not appropriate for that patient. This may have substantial social implications such as automobile accidents from persistent excessive daytime sleepiness.

On the other hand, CPT 95951 is used to determine which part of a patient's brain to remove in a patient with medically refractory epileptic seizure whose MRI and CT are normal. Procedure 95951 directs the physician to choose which lobe of the brain to remove. If 95951 is interpreted incorrectly, the patient would be sent to surgery to have the wrong part of the brain removed. In that case, the patient would continue to have medically refractory epileptic seizures, plus suffer substantial additional brain damage from inappropriate surgery. The effects of the incorrect surgery cannot be undone. If 95951 is read correctly, the patient can undergo surgery which will cure his or her epileptic seizures permanently. A decision about where to operate is based often solely on the 95951 results, so the intensity and psychological stress of interpreting these correctly is very great.

In comparison to CPT 95958, intracarotid amytal testing (physician work RVW value of 4.25), the work of CPT 95951 is higher in all aspects, i.e. requires more physician time, and a greater degree of mental effort and judgment as well as greater psychological stress. CPT 95958 is a test which can prevent

inappropriate or incorrect surgery from being performed to remove a part of the brain which is necessary for memory. However, it is usually answered in a *yes* versus *no* manner. This is less complex than the decision making needed in CPT 95951 to draw a dotted line on a map of the human brain, indicating which parts of the brain to remove.

In comparison to CPT 95829, electrocorticography (physician work RVW value of 6.21), the two procedures are somewhat similar. They are similar in terms of the time required, mental effort, psychological stress and other factors. Both are similar in that they are procedures in which the physician must evaluate a human brain and make a decision as to which part should be surgically removed, both are generally carried out in patients who have a normal CT or MRI. Both are based on electrophysiological recordings of brain waves, and the need to identify subtle signs indicating which regions ought to be removed. Both require a very great amount of experience and training in order to carry out the procedure.

In comparison to CPT 95950, ambulatory EEG (physician work RVW value of 1.51), the work of CPT 95951 is very substantially greater in time, intensity, mental effort and judgment, and psychological stress. CPT 95950 is for an ambulatory EEG monitor worn by the patient, similar to a cardiac Holter monitor. This small belt pack or purse records 8 channel EEG for 24 hours. It is subsequently reviewed to see whether or not the patient is having seizures including non-convulsive or subclinical seizures such as brief petit mal attacks during school hours. The technique of ambulatory EEG, CPT 95950, resembles Holter in the recording, but uses 8 separate channels of EEG and has no automated microprocessor identification of arrhythmic events. As such, ambulatory EEG requires more work by the physician to review 8-fold more data and to do the screening of the EEG without the advantage of a microprocessor to identify salient events. The goal of 95950 is to find, count, lateralize and subtype seizures occurring during one day. This leads to proper medication therapy. In contrast, video-EEG epilepsy monitoring, CPT 95951, is a substantially different clinical goal. CPT 95951 is meant to exactly localize an epileptic focus for surgical therapy, rather than just identify, count, subtype and lateralize the nature of seizures as is done for CPT 95950. The CPT code book gives a superficially similar description to CPT 95950 and 95951, whereas the clinical community uses them for very different purposes.

Change in Work

As indicated by 87% of the survey respondents, the amount of work for CPT 95951 has substantially increased in the past five years. First, with the advent of medical marketplace forces, the duration of stay on inpatient epilepsy monitoring units has been considerably reduced. The inpatient work that used to be done in 7-30 days is now done in 4-10 days. For an individual patient, the length of stay has been reduced by several-fold. However, the need to obtain a sufficient number of seizures has not changed. As such, clinically the patients are much more abruptly withdrawn from their anti-epileptic medication and sleep deprived, so as to provoke epileptic seizures to occur much more frequently. As a result, instead of capturing one seizure per day, the procedure now captures several seizures per day. The amount of work to review several seizures is several-fold more than the amount of work to review one seizure. therefore, the amount of work has increased.

The second reason the procedure is now more complicated is that more complex, sicker patients are also receiving video-EEG monitoring, compared to five years ago. Some patients have several seizures per hour, so that the entire monitoring can be accomplished in one day instead of several. Patients who have 20-40 brief atonic or partial seizures in one day will require the review of this entire collection of brief partial events individually seizure by seizure. The amount of work to review 20-40 brief partial seizures is immensely more than the work to review the traditional one complex partial seizure, with possible secondary generalization, as was typical of this procedure five years ago.

The third reason 95951 now is more complicated has to do with the available technology. Five years ago it was common to record just 16 channels on most patients, whereas now a much greater number of EEG channels is available technologically. The physician is therefore faced with 32-128 channels of data to review, rather than just 16 in many patients. As such, the procedure has evolved over the past five years to require substantially more physician work, because of medical marketplace forces compressing the time

to capture seizures, the evaluation of sicker patients and a logical expansion of the amount of data stored and reviewed. (The good news is that 70-90% of these surgical epilepsy cases are successfully treated by surgery, including patients with 20-40 brief atonic drop attacks and brief partial seizures per day who can be surgically cured of their catastrophic epilepsy).

SUMMARY

Overall, the RVW value of 6.00 for CPT 95951 represents a true estimate of the actual physician time and intensity involved in performing video-EEG epilepsy monitoring services. A value of 6.00 is determined to be reasonable, both based in comparison to the reference CPT codes on which our survey was necessarily based, as well as in comparison to other neurodiagnostic CPT codes such as 95810, 95829, 95950 and 95958. The procedure has enormous potential for positive value to the patient when it can cure epilepsy permanently, but enormous threat of permanent substantial harm to the patient if done incorrectly. The work has increased over five years due to medical marketplace forces, use in more complex sicker patients and technologically driven expanded data collection. It is of the utmost importance that the complexity and duration of physician work be recognized appropriately in the Resource-Based Relative Value Scale.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Anesthesiology

Comments

During the comment period for the five-year review, the American Society of Anesthesiologists (ASA) submitted the report of a study conducted by Abt Associates covering all the codes for anesthesiology services in CPT. The study was conducted to try to assess the work of anesthesia services in a way that does not rely on the current anesthesia conversion factor. The average times for anesthesia services that were published in the December 8 Federal Register were accepted with no modifications.

Medicare payments for anesthesiology services are based on the ASA Relative Value Guide (RVG). The RVG assigns a base unit to each code. Anesthesiologists then report their time for each procedure, and the time is added to the base units. This sum is then multiplied by the anesthesiology conversion factor. Although the relative values for each service are not based on the Harvard RBRVS study, the Harvard study was used to determine what the anesthesiology conversion factor should be. As with other specialties, Harvard first conducted a survey of anesthesiologists of the work involved in a number of anesthesiology services, two non-anesthesiology procedures (Swan-Ganz catheter and epidural injection of an anesthetic substance), and two visit services. Then, cross-specialty links were selected and the anesthesia services were placed on the common scale with other specialties. HCFA's use of these results produced a 40% reduction in the work RVUs for anesthesiology, which was a 27% reduction in the anesthesia conversion factor.

In its comment, the ASA claims that the Harvard cross-specialty process produced flawed results, and this is the reason for the Abt study. The study involved convening a multidisciplinary panel of 12 physicians. The average anesthesia times for 15 surgical procedures selected for in-depth study were accepted as correct. The panel separated the anesthesia time for each service into five components: prework, induction, procedure, emergence, postwork. The sum of induction, procedure, and emergence are equal to the HCFA supplied intra-service times.

For each component of these reference services, the panel rated the intensity (defined as intrawork per minute, or IWPUT) of the work effort. Four key procedures were selected as the key levels of intensity for use in this comparison:

99204 Office visit, new patient, .027 IWPUT
62279 Injection of anesthetic substance; epidural, lumbar or caudal, continuous, .044 IWPUT
99291 Critical care, 0.061 IWPUT
33405 Replacement, aortic valve, with bypass; with prosthetic valve, .090 IWPUT

The intensity values were then multiplied by the time for each component to produce recommended RVUs on the same scale as other services in the Medicare payment schedule. The 15 studied services represent 45.6% of total Medicare payments for anesthesia services. A regression analysis was done

to extrapolate from the 15 to the other anesthesia services in CPT. Based on the results, the ASA recommends that the work RVUs for all anesthesia services be increased by 40% through an increase of about 27% in the anesthesia conversion factor.

RUC Evaluation

The RUC's evaluation of the ASA comment focused initially on the methodology employed by Abt, particularly the use of assigned intensity levels rather than measures of physician work, through an evaluation by the RUC's Research Subcommittee. The Research Subcommittee was informed that previous efforts to measure intensity had not been successful. They suggested to the ASA that, because many anesthesiologists have experience in other specialties, a study could be conducted of double-boarded anesthesiologists in which physicians could assess the work involved in reference services compared to the work involved in both anesthesia and non-anesthesia services. Such a study could provide a means for validating the approach of assigning intensity levels to the discrete time periods. In addition to its discomfort with assigning intensity levels, in its initial evaluation of the study the RUC also expressed concern about the particular levels of intensity selected, especially the use of the IWPUT of 99204 as the lowest value for any anesthesiology work, which is used for the period when the surgeon is performing the operation. They did note that the regression analysis used to expand the study from the 15 services directly studied to the 250 anesthesiology codes in CPT appeared to work well.

Subsequently, the ASA did conduct a study of double-boarded anesthesiologists. This survey, however, produced even higher RVUs than the panel. The ASA also reconvened the panel to review the survey results and to discuss the levels of intensity assigned to the codes. The panel used the survey results to refine its previous estimates, but did not adopt the survey results as a substitute for its previous approach. The panel also confirmed its view that the intensity levels selected are correct.

The RUC workgroup which evaluated the ASA recommendation asked for a better explanation of the intensity levels selected, particularly the use of 0.027, the IWPUT for evaluation and management services (E/M), as the reference service for that period of time when the surgeon is doing the procedure and the patient is anesthetized. The ASA advisor explained that during this period the anesthesiologist is continuously monitoring the patient, integrating the anesthesia care with what the surgeon is doing, integrating data, making decisions, and doing whatever has to be done for the patient. This was considered by the panel to be equivalent to face-to-face E/M work.

The workgroup concluded, however, and the RUC agreed, that although this period of time clearly involved two of the components of physician work, time and stress due to the risk of harm to the patient, this part of each procedure does not involve the same mental effort and judgement and technical skill and physical effort as an E/M encounter. A suggestion was made that the intensity might be more comparable to postoperative E/M services, at 0.013 per minute, than face-to-face E/M intrawork at 0.027.

This workgroup also analyzed the results of the analysis of the 15 services by calculating: (1) recommended total work RVUs/intraservice time, and (2) recommended total work RVUs/total time. Comparisons were also made by the workgroup and the full RUC between several of the anesthesia services and services on the MPC, as well as between the anesthesia work on the day of a procedure and the surgeon's work on that day.

- The anesthesia work involved in code 32480 [*Removal of lung, other than total pneumonectomy; single lobe (lobectomy)*], 10.90 RVUs recommended for anesthesia] was compared to the surgeon's work for code 66984 [*Extracapsular cataract removal with insertion of intraocular lens prosthesis (one stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification)*], 9.89 RVUs]. The RUC also compared the total anesthesia work for 32480 (10.90 recommended) to the surgeon's intrawork for 32480 (9.58 RVUs).
- Similar comparisons were made between the surgeon's intrawork for code 44140 [*Colectomy, partial; with anastomosis*], 16.97 RVUs, 8.59 intrawork RVUs] and the recommended anesthesia intrawork for 44140, at 4.51 RVUs (5.25 total anesthesia RVUs).
- Similar comparisons were made for codes 44152 [*Colectomy, partial; with rectal mucosectomy, ileoanal anastomosis, with or without loop ileostomy*], 12.69 surgical intrawork, 12.6 anesthesia intrawork], and for the comparison between 58150 [*Total abdominal hysterectomy (corpus and cervix), with or without removal of tube(s), with or without removal of ovary(s)*], 9.26 surgical intrawork] and the anesthesia work for 59515 [*Cesarean delivery; including postpartum care*], 4.18 anesthesia intrawork and 5.71 total anesthesia work recommended].

Following this review, the ASA made some adjustments to its Phase II recommendations by reducing the IWPUT for the period of time considered to be equivalent to E/M services from 0.027 to 0.025. They also shortened the number of minutes to which the two highest intensity levels were assigned. An exhibit displaying the final ASA-recommended numbers for the 15 studied services is appended to this recommendation.

RUC Recommendation

Based on this review, the RUC did not find the anesthesia study sufficiently compelling to justify changing the work RVUs by increasing the conversion factor and, therefore, recommends that the current values be maintained. The approach used by the ASA to value these services is reasonable. The results of the ASA method showed that dividing the periods into induction, procedure, and emergence and valuing each component based on its IWPUT is a reasonable way to validate anesthesia services and produces results that are comparable to services provided by other specialists. This methodology produced a reasonable rank order for anesthesia services. The RUC is concerned, however, that the specific levels of intensity used in the analysis may be too high.

AMA/Specialty Society RVS Update Committee
RBRVS Five-Year Review Recommendations

19

Special List of Potentially Overvalued Services

When the RUC Subcommittee on the Five-Year Review was developing its initial proposals for how services should be identified for inclusion in the review, it determined that structured analyses of available data on work per unit time and changes in work over time should be conducted to identify potentially overvalued services. Those services identified as outliers through this type of analysis would be considered good candidates for review. Although the same approach could have been used to identify potentially undervalued services, it seemed likely that the specialty societies would identify the most important undervalued services during the public comment period. Several groups, including the Physician Payment Review Commission, underscored the need to focus considerable attention on identifying potentially overvalued services. It was difficult for the RUC to select the best method to identify all the misvalued services that should be included in the review. Many undervalued services and some overvalued services were identified in the public comments, and the CMDs identified a large number of potentially overvalued services. The RUC also conducted its own analyses, described below, and by June, the RUC had made a comprehensive search for additional potentially overvalued codes, using all the possible screens and individual codes suggested by the RUC members and others.

An initial analysis of work per unit time and other service characteristics was developed by HCFA staff and provided to the CMDs to assist them in developing misvalued services. Daniel Dunn, PhD, who served as a consultant to the RUC throughout the five-year review, noted several problems in the way the analysis was conducted, however, which produced some irrational results, such as negative work per unit time for some services. In addition, the analysis did not encompass potential changes in work over time, and, from the rationales provided for their comments, it appeared that the CMDs relied more on their own impressions about the proper relationships between codes than on the analysis provided to them by HCFA. To ensure that the five-year review included all the potentially overvalued services that it should include, the RUC subcommittee had several additional analyses conducted and used the results to identify additional potentially overvalued services:

1. HCFA provided the AMA with the most current available data on Medicare utilization, site-of-service, and provider of service. Using these data, the AMA identified trends in service frequency and site from 1989-1994 and from 1992-1994. The RUC took the view that a combination of a high rate of increase in annual frequency combined with a shift from inpatient to outpatient site-of-service could be an indicator that services were becoming more commonly or routinely provided, and that the work involved each time the service was done may be less than the current RVUs imply.
2. Dr. Dunn did an alternative analysis of intrawork per unit of time (IWPUT) for each service which corrected for the problems he had identified in the HCFA analysis. Codes were divided into clinical groupings and then the mean IWPUT for the group was identified. All the codes in the group were then assessed according to their level of deviation from the mean. Potentially overvalued codes were indicated as either being above the mean or being 3, 4, or 5 standard deviations above the mean.
3. Individual members of the RUC had reviewed both data on the codes on the Multispecialty Points of Comparison (MPC) and the initial results of the AMA analysis of trends in Medicare claims. They suggested about 80 codes that might warrant closer scrutiny. Dr. Dunn reviewed these codes to determine how the final Harvard work values compared to the current RVUs for the codes. If the final Harvard value was more than 20% below the current RVUs, the code was considered potentially overvalued. (Dr. Dunn also analyzed all codes comparing the final Harvard

RVUs to the current RVUs and identified those for which the Harvard RVUs were 20% below the Medicare RVUs, but the RUC believed there were too many possible explanations for these differences and did not make further use of the results except as described.)

The RUC decided to include the following categories of codes in the five-year review based on these analyses:

1. From the "Trends" analysis: from 1992 through 1994, the frequency of Medicare claims submitted for the service increased by an average of more than 25% per year, the percentage of times the service was provided in an inpatient setting decreased by more than 5% per year, and there were more than 1,000 Medicare claims for the service in 1992 and 1994.
2. From the "Outlier IWPUT" analysis: services identified as 3 or more standard deviations above the mean in the analysis of intraservice work per unit of intraservice time for clinical groups.
3. From the "RUC + Harvard" analysis: services identified for review by one or more members of the RUC or by the Five-Year Review Subcommittee for which the final Harvard RVUs are significantly lower than the 1995 Medicare RVUs.

After eliminating from these three categories those codes that were already included in the five-year review because of the comment process, the RUC asked HCFA if 33 of these potentially overvalued codes could be included in the five-year review. Since the codes were not identified until June 1995, the RUC also asked if it could take more time if necessary to complete review of these codes. HCFA agreed to add the codes and to allow more time if necessary to review them.

The RUC disseminated the list to all the specialty societies on the Advisory Committee and, as with the codes identified through the comment process, asked them to indicate whether they wished to be involved in developing the primary recommendation to the RUC for each code. Those specialties that responded affirmatively were asked to take one of the following four actions:

1. recommend a lower relative value for the code;
2. demonstrate, if the code was identified by Dr. Dunn's analysis of the Harvard data, that it is appropriate that the service have a higher IWPUT than other clinically related codes or that the current Medicare RVUs are more appropriate than the Harvard RVUs;
3. demonstrate, if the code was identified by the AMA trends analysis, that the service work has not decreased over time; or
4. show why the code was identified for review in error.

For 11 of the 33 codes, the specialties recommended that the RVUs be reduced, and the RUC concurs with these recommendations. Five of them were found to have been identified in error because of problems in the BMAD data or because previous coding changes were responsible for the

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

trend changes. For an additional 12 services, the RUC has reviewed the services and recommends that the current RVUs be maintained. Review of five services has been deferred until the February 1996 RUC meeting. The primary review of most of these services was done by the full RUC, not by one of the workgroups.

The table below shows the codes included in the list, their 1995 RVUs, the RUC-recommended RVUs, the basis for including the code in the list (e.g., "Trends"), and the rationale for the RUC's recommendation. Attachments provide data on the codes from the AMA's and Dr. Dunn's analysis, and any explanatory material provided in writing by the specialty societies.

Code	Descriptor	1995 RVUs	Recommended RVUs	Reason for Review	RUC Rationale	Key
17304	Chemosurgery (Mohs' micrographic technique), including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and complete histopathologic preparation; first stage, fresh tissue technique, up to 5 specimens	7.60	7.60	Outlier IWPUT	The RUC accepted the AAD explanation that the RVUs for code 17304 were appropriately increased by a HCFA refinement panel for the 1993 RBRVS. The information provided to the refinement panel and the RUC explain the difference between the IWPUT of the Medicare RVUs and the original Harvard RVUs. The RUC recommends the current RVUs be maintained.	2
21015	Radical resection of tumor (eg, malignant neoplasm), soft tissue of face or scalp	4.94	4.94	Trends	The RUC accepted the AAO-HNS explanation that code 21015 is still appropriately valued, particularly in comparison to codes 30520 [<i>Nasal septoplasty</i> , 5.55 RVUs], 31030 [<i>Caldwell-Luc</i> , 5.60 RVUs], and 42440 [<i>Excision of submaxillary gland</i> , 6.61 RVUs].	2

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	1995 RVUs	Recommended RVUs	Reason for Review	RUC Rationale	Key
27550	Closed treatment of knee dislocation; without anesthesia	5.53	5.53	Outlier IWPUP	The RUC accepted the explanation provided by the AAOS that the higher IWPUP of code 27550 is justified in comparison to other dislocations because the service involves limb threatening emergencies, with amputation as a sequelae reported in up to 35% of cases. The AAOS noted that the clinical grouping used to identify this code was "treatment of closed fractures and dislocations in an office," whereas this service is generally provided in either an inpatient hospital setting or in the emergency room.	2
28010	Tenotomy, subcutaneous, toe; single	2.97	Defer	Outlier IWPUP	Deferred until the February 1996 RUC meeting.	NA
31520	Laryngoscopy direct, with or without tracheoscopy; diagnostic, newborn	2.56	2.56	Outlier IWPUP	The RUC accepted the explanation provided by the AAO-HNS that code 31520 is appropriately high in IWPUP, particularly because it involves life-threatening airway obstruction in newborns which may be further precipitated by the procedure, and is, therefore, significantly more intense per minute than other codes which were included in the same clinical grouping, such as diagnostic colonoscopy, proctosigmoidoscopy, and diagnostic esophagoscopy.	2
33970	Insertion of intra-aortic balloon assist device through the femoral artery, open approach	8.05	Defer	Outlier IWPUP	Deferred until the February 1996 RUC meeting.	NA
36010	Introduction of catheter, superior or inferior vena cava	2.43	2.43	RUC + Harvard	The RUC accepted the SCVIR explanation of the work involved in this service and concluded that the current RVUs are appropriate.	2

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	1995 RVUs	Recommended RVUs	Reason for Review	RUC Rationale	Key
36821	Arteriovenous anastomosis, direct, any site (eg, Cimino type) (separate procedure)	8.39	8.39	Trends	The RVUs for code 36821 were already reduced in 1993 as a result of the deletion of code 36820. Code 36821 is now being used to describe procedures previously reported as either 36820 or 36821, which explains the increase in claims in 1994. The RUC agreed with the SVS that no further reduction is warranted.	2
37201	Transcatheter therapy, infusion for thrombolysis other than coronary	7.25	7.25	Trends	The RUC agreed with the SCVIR that the frequency of claims for this code is growing because thrombolytic infusion is proving to be an effective therapy for thrombosed arteries and grafts, allowing physicians to save patient limbs. The service is still a relatively new technology and the RUC believes it is currently appropriately valued.	2
41010	Incision of lingual frenum (frenotomy)	1.19	1.01	Outlier IWPUT	The RUC accepted the recommendation from AAO-HNS that code 41010 be valued at 60% of the work of code 41115 [<i>Excision of lingual frenum (frenectomy)</i>].	3
49605	Repair of large omphalocele or gastroschisis; with or without prosthesis	21.92	21.92	Outlier IWPUT	The RUC accepted the explanation provided by the APSA that the higher IWPUT is justified for these two services provided to neonates, particularly due to the high level of clinical judgement required to prevent patient demise or severe morbidity. The pathophysiologic sequelae are the results of the absence of the hollow and solid viscera within the abdomen during fetal life as well as the impact of associated anomalies. The two procedures are described as among the most difficult to teach to postgraduate trainees.	2
49606	Repair of large omphalocele or gastroschisis; with removal of prosthesis, final reduction and closure, in operating room	17.93	17.93	Outlier IWPUT		2

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	1995 RVUs	Recommended RVUs	Reason for Review	RUC Rationale	Key
62275	Injection of anesthetic substance (including narcotics), diagnostic or therapeutic; epidural, cervical or thoracic, single	1.79	1.79	Trends	The RUC accepted the argument made by the ASA that the increasing use of this code is due to improved recognition of the value of thoracic and cervical epidurals in treating pain and increased use of nerve blocks in the treatment of thoracic and cervical back pain and radiculopathy, but that the service work has not decreased, particularly relative to reference procedures including 62289 and 62298 [<i>Epidural injection, non-anesthetic, lumbar and thoracic</i> , 1.64 and 2.20 RVUs].	2
64623	Destruction by neurolytic agent; paravertebral facet joint nerve, lumbar, each additional level	0.99	0.99	Trends	The RUC accepted the argument made by the ASA that the increasing use of code 64623 is due to improved recognition of facet joint dysfunction in the etiology of the mechanical low back syndrome and availability of C-arm fluoroscopy. The RUC also agreed that the service is appropriately valued since it involves about one third more work than code 64622 [<i>Destruction by neurolytic agent; paravertebral facet joint nerve, lumbar, single level</i> , 2.95 RVUs].	2

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	1995 RVUs	Recommended RVUs	Reason for Review	RUC Rationale	Key
67210	Destruction of localized lesion of retina (eg, maculopathy, choroidopathy, small tumors), one or more sessions; photocoagulation (laser or xenon arc)	9.48	Defer	Outlier IWP/UT	<p>Like code 17304 (above), the RVUs for this service were increased by a HCFA refinement panel for the 1993 RBRVS to reflect the complexity of the service and the frequency of surgical retreatments provided <u>during</u> the 90-day global period. These retreatments are done during the postservice period, so they are not reflected in the analysis of IWP/UT. In addition, the IWP/UT is appropriately high because the procedure subjects every treated patient to an immediate and substantial risk of vision loss or blindness.</p> <p>Another problem in assessing the appropriate RVUs for this code, however, is that survey responses obtained by the AAO reflect a bimodal distribution: the work involved in treatment of acute macular degeneration is greater than the work involved in treating diabetic retinopathy. The RUC recommends, therefore, that the code be referred to the CPT Editorial Panel for review prior to further consideration by the RUC.</p>	NA
74360	Intraluminal dilation of strictures and/or obstructions (eg, esophagus), radiological supervision and interpretation	0.54	0.54	Trends	The RUC accepted the ACR's explanation that code 74360 has increased in frequency because balloon dilation represents an improvement in medical practice and because its use has expanded beyond the esophagus to other areas of the body, such as the small bowel, colon, and duodenum. The work involved in the service has not decreased, and 74360 shares many of the same elements as angioplasty [see code 75962, 0.54 RVUs], including placement of guidewires, fluoroscopy, supervising staff, interpretation, and a written report.	2

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	1995 RVUs	Recommended RVUs	Reason for Review	RUC Rationale	Key
77420	Weekly radiation therapy management; simple	1.61	Defer	RUC + Harvard	Due to methodological flaws in the initial survey of these radiation therapy codes, the RUC agreed with the ACR to defer review until the February 1996 RUC meeting.	NA
77425	Weekly radiation therapy management; intermediate	2.44		RUC + Harvard		
77430	Weekly radiation therapy management; complex	3.60		RUC + Harvard		
77761	Intracavitary radioelement application; simple	3.56	3.56	Trends	The ACR suggested and further review of the BMAD data by the AMA confirmed that code 77761 was identified for review in error. Frequency of claims by radiologists for the service <u>decreased</u> by 3.9% annually. A number of <u>anesthesiology</u> claims for the service were reported by one carrier (Pennsylvania), which caused the service to appear in the trends analysis. There is no reasonable explanation for the anesthesiology claims.	2
78803	Radiopharmaceutical localization of tumor; tomographic (SPECT)	1.09	1.09	Trends	The RUC agreed with the ACR that the current RVUs for 78803 should be maintained. The frequency of claims has increased because the service has more clinical applications and because new radiopharmaceuticals have been introduced. This increased reliance on the service in treatment planning, however, requires obtaining more tomographic cuts/slices each time the service is done, so the increased frequency has not diminished the physician work involved.	2
93510	Left heart catheterization, retrograde, from the brachial artery, axillary artery or femoral artery; percutaneous	4.33	4.33	Trends	The RUC accepted the explanation provided by the ACC that the recent increase in frequency of claims for these codes is due to the major coding revision that took place for 1994, which means that the codes are being reported differently than they were before. The time and work involved in the services has not been reduced.	2
93526	Combined right heart catheterization and retrograde left heart catheterization	5.99	5.99	Trends		2

CPT five-digit codes, two-digit modifiers, and descriptions are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	1995 RVUs	Recommended RVUs	Reason for Review	RUC Rationale	Key
94400	Breathing response to CO2 (CO2 response curve)	0.40	0.40	Trends	The ATS suggested and further review of the BMAD data by the AMA confirmed that code 94400 had been identified for review in error. The pulmonologists reported that the service is rarely provided anymore because of the risks associated with the CO2, and in 1994 fewer than 400 claims were submitted by pulmonologists. The vast majority of claims (86% of the 5,864) were submitted by providers coded as "independent physiological labs" in two Los Angeles localities.	2

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

ISSUES REFERRED TO THE CPT EDITORIAL PANEL

For CPT 1997, the AMA placed a moratorium on specialty requests for coding changes in order to prevent a large number of new codes from being implemented at the same time as the changes in the RBRVS due to the five-year review. The only coding change requests being considered are those for new technologies that cannot currently be reported with other codes in CPT and those for codes that are not on the RBRVS (e.g., clinical laboratory services). The RUC and the CPT Editorial Panel had also anticipated, however, that a small percentage of the issues included in the five-year review would require review by CPT before they could be considered by the RUC, because it appeared likely that some comments on misvalued codes would actually be due to the codes' nomenclature.

After reviewing the comments referred for inclusion in the five-year review, the RUC identified 25 issues that it recommends be considered by CPT prior to further review by the RUC. The specialty societies submitting the comments have been informed of this decision, and have been asked to submit proposals to CPT in time for any coding changes to be reviewed by the RUC and reflected in CPT 1997 and the 1997 RBRVS, simultaneous with the other changes due to the five-year review. These issues are discussed in the table which follows.

In addition to those requiring further review by CPT, four issues were addressed in five-year review comments which were already addressed by the CPT Editorial Panel and the RUC as part of the updates for CPT 1996. These issues are also discussed in the table.

The American Academy of Pediatrics (AAP) submitted a public comment requesting that 480 CPT codes each be divided into several codes for different age categories, and that about 20 new codes be added for pediatric services that are not currently described in CPT. To address these issues, a Pediatrics Committee was formed comprised of RUC members and two members of the CPT Editorial Panel. This committee has made several recommendations to the AAP about how to best confront the issues raised in its comments. Proposals addressing these recommendations will also be submitted to the CPT Editorial Panel in time for them to be considered for CPT 1997.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
11043	Debridement; skin, subcutaneous tissue, and muscle	1.83	AAOS	A CMD commented that 11040 involves substantially more time than 11043 and recommends that the RVU be 2.60.	The AAOS survey for these services resulted in significant differences with Harvard data. It appears that the services that orthopaedic surgeons are performing while utilizing these codes is different than other providers who also use these codes. The RUC recommends that the CPT Editorial Panel review this issue and determine if separate codes are appropriate.
11044	Debridement; skin, subcutaneous tissue, muscle, and bone	2.28	AAOS/CMD		
11710	Debridement of nails, electric grinder; five or less	0.32	CMD	A CMD commented that grinding requires less time than manual scraping and the relationship to 11700 <i>Debridement of nails, manual; five or less</i> (0.32) should be the same as 11711 <i>Debridement of nails, electric grinder; each additional, five or less</i> (0.20) to 11701 <i>Debridement of nails, manual; each additional, five or less</i> (0.23)	The terminology in these codes is confusion (i.e., five or less and each additional, five or less). CPT should consider collapsing these codes and not specify the method of debridement.
11711	Debridement of nails, electric grinder; each additional, five or less	0.20	APMA	11711 should be valued equal to 11700 to be consistent with the relationship between 11700 and 11710.	
11971	Removal of tissue expander(s) without insertion of prosthesis	1.51	CMD	A CMD commented that this code is roughly two times the difference in intraservice work of 11970 <i>Replacement of tissue expander with permanent prosthesis</i> (6.65), plus follow-up visits in the global period and recommended an RVU of 3.60.	The CPT code needs to be clarified. A number of different specialties are using the code, some inappropriately. The Editorial Panel needs to address how the repair should be reported.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
13300	Repair, unusual, complicated, over 7.5 cm, any area	5.11	ASPRS/IND	An individual commented that Code 13300 is undervalued and raised concern regarding potential abuse of this code. ASPRS also commented that these codes are extremely variable and indistinct.	CPT should clarify these codes to minimize potential abuse.
14300	Adjacent tissue transfer or rearrangement, more than 30 sq cm, unusual or complicated, any area	10.76	ASPRS		
15000	Excisional preparation or creation of recipient site by excision of essentially intact skin (including subcutaneous tissue), scar, or other lesion prior to repair with free skin graft (list as separate service in addition to skin graft)	1.85	ASPRS	ASPRS expressed concern that many varying sizes of wounds fall under this one code and that the preparation of this is externally inconsistent.	All these codes are highly variable in time, intensity, work and morbidity. These codes are used in conjunction with other codes. The ASPRS requested, and the RUC agrees, that CPT review the issue of add-on codes.
15101	Split graft, trunk, scalp, arms, legs, hands, and/or feet (except multiple digits); each additional 100 sq cm, or each one percent of body area of infants and children, or part thereof	1.72	ASPRS	The ASPRS commented that these "add on" codes, for each additional 100 sq cm of split graft or 20 sq cm of full thickness graft, were undervalued in terms of time and intensity and recommended that they should be increased to reflect one third of the RVU of the primary procedure.	
15121	Split graft, face, eyelids, mouth, neck, ears, orbits, genitalia, and/or multiple digits; each additional 100 sq cm, or each one percent of body area of infants and children, or part thereof	2.67	ASPRS		
15201	Full thickness graft, free, including direct closure of donor site, trunk; each additional 20 sq cm	1.32	ASPRS		

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
15221	Full thickness graft, free, including direct closure of donor site, scalp, arms, and/or legs; each additional 20 sq cm	1.19	ASPRS	The ASPRS commented that these "add on" codes, for each additional 100 sq cm of split graft or 20 sq cm of full thickness graft, were undervalued in terms of time and intensity and recommended that they should be increased to reflect one third of the RVU of the primary procedure.	All these codes are highly variable in time, intensity, work and morbidity. These codes are used in conjunction with other codes. The ASPRS requested, and the RUC agrees, that CPT review the issue of add-on codes.
15241	Full thickness graft, free, including direct closure of donor site, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands, and/or feet; each additional 20 sq cm	1.86	ASPRS		
15261	Full thickness graft, free, including direct closure of donor site, nose, ears, eyelids, and/or lips; each additional 20 sq cm	2.23	ASPRS		
15755	Free flap (microvascular transfer)	28.33	ASPRS	This service is undervalued in comparison to microvascular flap procedures, specifically, 20970 <i>Free osteocutaneous flap with microvascular anastomosis; iliac crest</i> (41.22).	The current descriptor describes a variety of procedures and needs to be clarified.
22151	Reconstruction of spine with prefabricated prosthetic replacement following resection of one or more vertebral bodies; thoracic	22.15	AANS	AANS and AAOS submitted comments, based on their earlier studies, that a number of the spinal procedures appear to be misvalued.	These codes were recently revised for <u>CPT 1996</u> . The RUC submitted RVU recommendations for these services to HCFA in May 1995.
22210	Osteotomy of spine, posterior approach, single segment; cervical	22.51	AANS		

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
22315	Closed treatment of vertebral fracture and/or dislocation requiring casting or bracing, with or without anesthesia, by manipulation or traction, each	8.36	AANS	AANS and AAOS submitted comments, based on their earlier studies, that a number of the spinal procedures appear to be misvalued.	These codes were recently revised for <u>CPT 1996</u> . The RUC submitted RVU recommendations for these services to HCFA in May 1995.
22327	Open treatment of vertebral fracture and/or dislocation; thoracic, each	17.56	AAOS		
22554	Arthrodesis, anterior interbody technique; cervical below C2, with bone graft	18.14	AANS/AAOS		
22558	Arthrodesis, anterior interbody technique; lumbar with bone graft	22.12	AAOS		
22610	Arthrodesis, posterior or posterolateral technique, with local bone or bone allograft and/or internal fixation; thoracic	15.11	AANS		
22612	Arthrodesis, posterior or posterolateral technique, with local bone or bone allograft and/or internal fixation; lumbar	22.25	AANS/AAOS		
22800	Arthrodesis, posterior, for spinal deformity, with or without cast, with bone graft; 6 or less vertebrae	16.92	AANS		

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
22802	Arthrodesis, posterior, for spinal deformity, with or without cast, with bone graft; 7 or more vertebrae	31.31	AAOS	AANS and AAOS submitted comments, based on their earlier studies, that a number of the spinal procedures appear to be misvalued.	These codes were recently revised for <u>CPT 1996</u> . The RUC submitted RVU recommendations for these services to HCFA in May 1995.
22812	Arthrodesis, anterior, for spinal deformity, with or without cast, with bone graft; 8 or more vertebrae	27.20	AANS		
22840	Posterior instrumentation; without segmental fixation (eg, single Harrington rod technique)	12.54	AANS		
22842	Posterior instrumentation; segmental fixation (eg, pedicle fixation, dual rods with multiple hooks and sublaminar wires)	14.42	AAOS		
22845	Anterior instrumentation	12.48	AANS		
31090	Sinusotomy combined, three or more sinuses	8.65	AAO-HNS	This service involves an open procedure to remove disease in three or more sinuses and is similar to codes 31075 <i>Sinusotomy frontal; transorbital, unilateral (for mucocele or osteoma, Lynch type)</i> (work RVU = 8.57) and 31255 <i>Nasal/sinus endoscopy, surgical; with ethmoidectomy, total (anterior and posterior)</i> (work RVU = 6.96) combined. It appears that code 31090 has been confused with the endoscopic procedures.	This code should be clarified with a change in the CPT descriptor. The code should reflect that the service is an open procedure, unilateral, and specify the three sinuses.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
42880	Excision nasopharyngeal lesion (eg, fibroma)	6.01	AAO-HNS	AAO-HNS believes the current CPT descriptor may be misleading with the example fibroma in the nomenclature. This service is almost always performed for juvenile nasal pharyngeal angiofibroma.	The RUC recommends that the CPT Editorial Panel review this issue and consider changing the example for this code to juvenile nasal pharyngeal angiofibroma to reflect the actual typical patient.
46900	Destruction of lesion(s) anus (eg, condyloma, papilloma, mulluscum contagiosum, herpetic vesicle), simple; chemical	1.81	CMD	The CMDs commented that code 46900 for destruction of anal lesion is overvalued because it involves the simple application of podophyllin to an anal or perianal lesion.	Colon and rectal surgeons report code 46900 when using anoscopy to treat lesions extending past the innersphincteric groove cephalad through the dentate line into the anal canal. There is also a follow-up appointment within the 10-day global period to evaluate the anoderm and repeat the anoscopy. Claims data indicate that colon and rectal and general surgeons provide 58% of these services. Dermatologists provide 17% of the services, however, and the RUC concluded that the service may then involve simple application of podophyllin to an anal or perianal lesion as described in the CMD comment. The RUC recommends that this issue be referred to CPT to consider revising the terminology to specify that the service involves treatment through anoscopy and/or add a new code for the more superficial procedure.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
49020	Drainage of peritoneal abscess or localized peritonitis, exclusive of appendiceal abscess, transabdominal	9.06	ACS	ACS identified this code as misvalued through a study conducted by Abt Associates Inc.	It was clear from the Medicare claims data that the deletion of code 75990 for percutaneous drainage in 1992 has greatly affected the use of code 49020 for drainage of peritoneal abscess. Only the most complex patients with extensive nonlocalized peritonitis require surgical drainage rather than the percutaneous drainage done by interventional radiologists. Medicare data show that 49% of claims for 49020 are submitted by radiologists and 40% by general surgeons. The RUC recommends that this issue be referred to CPT to consider establishing a separate code for percutaneous drainage so that surgical drainage can be appropriately described and valued.
52340	Cystourethroscopy with incision, fulguration, or resection of bladder neck and/or posterior urethra (congenital valves, obstructive hypertrophic mucosal folds)	7.76	CMD	A CMD commented that the RVU should be reduced to 5.44 as this service is similar to 52277 <i>Cystourethroscopy, with resection of external sphincter (sphincterotomy)</i> (CMD recommended reduction to 3.44) with 2.00 RVUs are added for the global period.	The AUA presented an argument that 52340 is for pediatric patients who are more complex and difficult; miss-billing occurs with 52500 <i>Transurethral resection of bladder neck (separate procedure)</i> (7.82) because identical language is used and 52340 does not specify congenital cases Agrees that descriptors of 52340 and 52500 are essentially the same. As a result, 52340 should be referred to CPT for clarification of congenital cases and 52500 should remain unchanged.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
53600	Dilation of urethral stricture by passage of sound or urethral dilator, male; initial	1.21	AUA	AUA commented that these services are undervalued in comparison to 93503 <i>Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes (rvu = 2.43) and 51010 Aspiration of bladder; with insertion of supra-pubic catheter (rvu = 2.54).</i>	RUC recommends that these services are essentially the same and should be collapsed into one code.
53620	Dilation of urethral stricture by passage of filiform and follower, male; initial	1.62	AUA		
53640	Passage of filiform and follower for acute vesical retention, male	1.59	AUA		
54100	Biopsy of penis; cutaneous (separate procedure)	1.90	CMD	CMD recommended a decrease to 0.86 and compared this service to 11100 <i>Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed (separate procedure); single lesion (rvu = 0.81) and 56605 Biopsy of vulva or perineum (separate procedure); one lesion (rvu = 0.86).</i>	The RUC recommends that CPT review the biopsy codes and determine if site specific codes are necessary.
56300	Laparoscopy, diagnostic (separate procedure)	3.58	ACOG	Code 56300 is the same procedure as 56360 <i>Peritoneoscopy; without biopsy (rvu = 4.04)</i> and should be assigned the same work RVU.	These two procedures are almost identical and ACOG has attempted in the past to have the CPT panel collapse the two codes. The RUC recommends that these codes be collapsed into one code.
56305	Laparoscopy, surgical; with biopsy of peritoneal surface(s); single or multiple	3.80	ACOG	Code 56305 is the same procedure as 56361 <i>Peritoneoscopy; with biopsy (rvu = 4.32)</i> and should be assigned the same work RVU.	

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
65105	Enucleation of eye; with implant, muscles attached to implant	7.82	AAO	This code requires similar work as 67107 <i>Repair of retinal detachment, one or more sessions; scleral buckling (such as lamellar excision, imbrication or encircling procedure), with or without implant, may include procedures 67101, 67105 (rvu = 13.99).</i>	This code was recently revised for <u>CPT 1996</u> . The RUC submitted an RVU recommendation for this services to HCFA in May 1995.
67210	Destruction of localized lesion of retina (eg, maculopathy, choroidopathy, small tumor(s), one or more sessions; photocoagulation (laser or xenon arc)	9.48	Outlier IWPUP	This code was identified by the RUC as having an outlier IWPUP.	The IWPUP analysis and the original HCFA value failed to take into account the re-treatments and the fact that these re-treatments are bundled into the 90 day global period and cannot be billed separately. There is a bimodal distribution of patients treated within this code. The code currently includes treatment of acute macular degeneration and diabetic retinopathy. A code should be added for treatment of the less complex retinal lesions.
68825	Probing of nasolacrimal duct, with or without irrigation, unilateral or bilateral	1.53	AAO	AAO commented that the descriptor for the code would be revised to delete the "unilateral or bilateral" terminology. Additionally, the work value should be modified to reflect a pediatric patient.	This code was recently revised for <u>CPT 1997</u> . The RUC will review an RVU recommendation for this service at the February 1996 meeting.
78480	Myocardial perfusion study with ejection fraction (list separately in addition to code for primary procedure) (Use only for codes 78460, 78461, 78464, 78465)	0.62	ACC	ACC has submitted a coding proposal to specify this code as an add-on procedure. If the code is structured as an add-on code, it may need to be re-evaluated.	RUC agrees that this service should be referred to CPT for further review. The code needs to be properly identified as an add-on code.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
92225	Ophthalmoscopy, extended, with retinal drawing (eg, for retinal detachment, melanoma), with medical diagnostic evaluation; initial	0.58	AAO/CMD	A CMD recommends decreases for these codes as there is no evidence that more diligence or attentiveness is required in this drawing than what any physician draws when describing a physical finding.	The RUC is concerned that these codes are currently subject to abuse and submitted often as part of a routine exam. CPT should clarify the nomenclature to minimize miscoding. <i>Note: CPT did revise these codes to delete " with medical diagnostic evaluation" and add "with interpretation and report" for CPT 1996.</i>
92226	Ophthalmoscopy, extended, with retinal drawing (eg, for retinal detachment, melanoma), with medical diagnostic evaluation; subsequent	0.50	CMD	The AAO commented that this service is undervalued because the procedure often takes 45 minutes to an hour to completely evaluate the peripheral retina with scleral depression.	
92260	Ophthalmodynamometry	0.50	CMD	A CMD commented that ophthalmodynamometry gives an approximate measurement of the relative pressures in the central retinal arteries and is an indirect means of assessing carotid artery flow on either side. The test consists of exerting pressure on the sclera with a spring plunger while observing with an ophthalmoscope the vessels emerging from the optic disks. This is similar in work to 93875 <i>Noninvasive physiologic studies of extracranial arteries, complete bilateral study (eg, periorbital flow direction with arterial compression, ocular pneumoplethysmography, Doppler ultrasound spectral analysis)</i> (rvu = 0.16).	This service is rarely performed and may be an obsolete procedure. CPT should consider deleting this code.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
93621	Comprehensive electrophysiologic evaluation with right atrial pacing and recording, right ventricular pacing and recording, His bundle recording, including insertion and repositioning of multiple electrode catheters; with left atrial recordings from coronary sinus or left atrium, with or without pacing	12.66	ACC	This medical complexity of this service has increased considerable since the code was first developed. Recent medical practice frequently involves a more technically difficult and risky service utilizing a transeptal approach to the left atrium. This code should be split into two distinct codes and appropriately valued.	The RUC agreed to refer this code to CPT based on the changing technology of this procedure. The Editorial Panel should consider splitting the code into several codes.
94150	Vital capacity, total (separate procedure)	0.11	CMD	The CMD commented that the work for this service is the same as 94690 <i>Oxygen uptake, expired gas analysis; rest, indirect (separate procedure)</i> (rvu = 0.07). The technical skill for this procedure is minimal. The time involved is no more than 2-3 minutes. This is a simple test, most commonly done with a hand-held instrument, which provides limited information for interpretation.	The specialty society recommends that 94150 and 94160 be combined into one code. The RUC referred this issue to CPT for deletion of this code.
95872	Needle electromyography, single fiber, any technique	1.50	AAEM	AAEM commented that this service is similar in work to 95864 <i>Needle electromyography, four extremities and related paraspinal areas</i> (rvu = 1.99).	This code were recently revised for <u>CPT 1996</u> . The RUC submitted RVU recommendations for this service to HCFA in May 1995.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
97250	Myofascial release/soft tissue mobilization, one or more regions	0.45	AOA/ CMD	<p>A CMD commented that the work for myofascial release is no different than the work for regional manipulation. Carrier data also show that 97250 is often billed with E/M codes. If this is national experience, the time built into 97250 for pre- and post-service time should be excluded. The intra-service time of 45 minutes appears high based on anecdotal patient data.</p> <p>The AOA commented that this service appears to be overvalued in comparison to OMT.</p>	The RUC recommends that a workgroup (physical therapists, osteopaths, chiropractors, and any other interested providers) be formed to develop a CPT proposal for manipulation services.
97260	Manipulation (cervical, thoracic, lumbosacral, sacroiliac, hand, wrist) (separate procedure), performed by physician; one area	0.19	AOA	The values for these codes represent anomalies with the value for 27250.	
97261	Manipulation (cervical, thoracic, lumbosacral, sacroiliac, hand, wrist) (separate procedure), performed by physician; one or more areas	0.12	AOA		
A2000	Chiropractor manipulation of spine	0.45	ACA/ State	<p>The Colorado Chiropractic Association recommends that this code be valued similar to the mid-level OMT code, 98927.</p> <p>The ACA recommends that either the relative value for this code should be increased to be similar to the OMT codes or all providers should be allowed to report the OMT codes.</p>	The RUC recommends that a workgroup (physical therapists, osteopaths, chiropractors, and any other interested providers) be formed to develop a CPT proposal for manipulation services.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
97500	Orthotics training (dynamic bracing, splinting), upper and/or lower extremities; initial 30 minutes, each visit	0.31	AOTA	The AOTA commented that these are the only codes in the physical medicine section that need to be reviewed by CPT and surveyed for correct relative values.	The RUC recommends that CPT review these codes to be consistent with the recent changes to the Physical Medicine section.
97501	Orthotics training (dynamic bracing, splinting), upper and/or lower extremities; each additional 15 minutes	0.17	AOTA		
97520	Prosthetic training; initial 30 minutes, each visit	0.37	AOTA		
97521	Prosthetic training; each additional 15 minutes	0.22	AOTA		
99238	Hospital discharge day management	1.06	ASIM/ASCO	ASCO and ASIM both commented that this service is currently undervalued.	This code were recently revised for <u>CPT 1996</u> . The RUC submitted RVU recommendations for this service to HCFA in May 1995.

CPT Code	Descriptor - CPT 1995	95 RVU	COMMENTER	COMMENT	RATIONALE
99301	Nursing facility care	1.07	AMDA	Comments submitted by the American Medical Directors Association on the RVUs for nursing home visits were referred to the RUC by HCFA. Similar to the American Society of Internal Medicine comments on the other evaluation and management services, the comments stated that these patients are sicker, more complex, and that physicians must interact more with family members and coordinate care with other providers.	Six medical specialty societies and the American Nurses Association conducted surveys of the work involved in these codes. The survey process identified significant differences in the way the services are provided by different practitioners, particularly in whether or not a comprehensive geriatric assessment is done. Also, no guidelines on time are provided in CPT for these services, so it was difficult to apply the same extrapolation method from surveyed to nonsurveyed services as had been used in other families of codes.
99302	Nursing facility care	1.67	AMDA		
99303	Nursing facility care	2.29	AMDA		
99311	Nursing facility care, subsequent	0.54	AMDA		
99312	Nursing facility care, subsequent	0.89	AMDA		
99313	Nursing facility care, subsequent	1.19	AMDA		Because of these problems, the RUC recommends that the codes be referred to CPT to consider revising them to address the geriatric assessment and other issues.
