Mr. Thomas A. Ault
Director, Bureau of Policy Development
Health Care Financing Administration
7500 Security Boulevard, C5-01-17
Baltimore, MD 21244

Dear Mr. Ault:

I am pleased to provide you with the recommendations of the American Medical Association/Specialty Society RVS Update Committee (RUC) for the five-year review of Medicare's resource-based relative value scale (RBRVS). Although the five-year review presented an unprecedented opportunity to improve the accuracy of the physician work component, it also presented a significant challenge to the medical community. The enclosed recommendations reflect evaluation of the work involved in services of every type and those which are provided by virtually every medical specialty, as well as many of the other health professions.

Upon completion of your review, I believe you will agree with me that the RUC has successfully met this challenge. We have held all of the proposed changes in work values to a very high standard of proof, and refrained from recommending increases in values unless a compelling argument was presented. Likewise, we have required specialties to present a compelling argument in order to maintain the current values of services that were identified in comments as being overvalued. Despite the limited number of RUC-recommended changes in values as compared to the number of changes proposed in the comments, assuming that all of the RUC's recommendations are accepted, we believe that the physician work component of the RBRVS as a whole will be significantly more accurate and correct than it is currently. By relying on the RUC for assistance in the five-year review, the Health Care Financing Administration (HCFA) has ensured that the clinical experiences of practicing physicians will be reflected in any changes that are made. As you know, the widespread adoption of the Medicare RBRVS by other third-party payors underscores the need for it to be as accurate as possible in reflecting the realities of clinical practice.

Scope of the Review

During the public comment period from December 8, 1994 until February 6, 1995, HCFA received about 500 comment letters identifying about 1,100 CPT codes for review. Three specialty societies submitted RBRVS studies conducted for them by Abt Associates Inc., which spanned all of the more than 2,000 codes used by physicians in those specialties. The carrier medical directors' review identified about 900 codes. The American Academy of Pediatrics (AAP) submitted comments claiming that the physician work involved in providing 480 services to pediatric patients is different than when these same services are provided to adult patients. After preliminary screening, HCFA referred to the RUC:

Thomas A. Ault
September 28, 1995
Page Two

- public comments on 669 codes;
- carrier medical director (CMD) comments on 387 codes;
- the three special studies by Abt Associates Inc.; and,
- the comments submitted by the American Academy of Pediatrics.

Eliminating some overlap (e.g., both the American Society of Anesthesiologists and the AAP commented on all of the approximately 250 anesthesia codes), the total number of codes referred to the RUC in late February was about 3,500. The entire RBRVS was considered by the profession, but, through their exclusion from the comments submitted, we may infer that the remainder of the codes were felt to have been appropriately ranked.

Review of Abt Studies

The RUC employed a process similar to its annual update process to evaluate the public and CMD comments. This method is further detailed below. The RUC referred the three Abt studies to the Research Subcommittee to evaluate the methodologies used before considering the actual recommended work values. The Research Subcommittee concluded, and the RUC agreed, that the Abt studies for orthopaedics and otolaryngology produced correct rank ordering of codes within the respective specialties, but that additional study would need to be conducted to constitute compelling evidence that the proposed relative values were correct. The Research Subcommittee did not reach any conclusions about the ASA Abt study, but indicated that the specialty was not precluded from demonstrating the validity of its methodology through the workgroup process.

Following this methodological review, the American Academy of Orthopaedic Surgeons (AAOS), with HCFA's concurrence, withdrew its Abt study from consideration and developed a list of 83 codes for which it conducted a survey using standard RUC methodology and submitted individual recommendations on them to the RUC. The American Academy of Otolaryngology - Head and Neck Surgery (AAO-HNS) had already provided detailed comments on about 100 codes to HCFA in addition to submitting its Abt study. The AAO-HNS did not present further validation of its Abt study to the RUC, but evaluated the work of the individually identified codes and made recommendations to the RUC. The ASA conducted further research to validate its Abt study and presented the results to a RUC workgroup and to the full committee.

Pediatric Comments

The comments submitted by the AAP responded to HCFA's question of whether the work involved in treating pediatric patients is different than adult patients. The AAP requested that new codes be added to CPT to describe different age categories of patients, and that relative values be assigned to these codes reflecting the differences in work for patients of different ages.

To consider the AAP comments, the RUC formed a new subcommittee comprised of RUC members and several members of the CPT Editorial Panel. This committee provided guidance to the AAP to refine its proposal and reduce the number of new codes that would need to be added.

The recommendations for this group of comments are expected to be included in the RUC's recommendations for new and revised codes for CPT 1997.

Review of Public and CMD Comments

The RUC's process for evaluating codes included in the five-year review involves the same basic methodology as the annual update process, with some important innovations. First, a modified survey instrument was developed (see Attachment 1). Because the five-year review involves evaluating the work of established codes with established RVUs, "compelling arguments" were needed to support changes. To help gather evidence to support such arguments, in addition to comparing the total work involved in the services under review to key reference services, survey respondents were asked to provide a detailed comparison of the pre-, intra-, and postservice time involved in the key reference services selected. For surgical procedures, postservice time was further divided for this purpose into time on the day of the procedure, time in the intensive care unit, hospital visits, and office or other outpatient visits following discharge.

Questions were also added regarding the other elements of work besides time and the extent to which the service has changed over the last five years. The nontemporal components of work are the physician's mental effort and judgement, technical skill and physical effort, and stress due to the risk of mortality or iatrogenic harm to the patient. Respondents were asked to rate the complexity of each of these components for the services under review and key reference services. If they believe the service has changed over the past five years, they were asked whether: the service represents new technology that has become more familiar; patients requiring the service are more or less complex; and, if the usual site of service has changed.

Visit and consultation codes. The codes addressed by the public comments included many of the CPT codes for evaluation and management services. Since the new codes for these services were introduced simultaneously with the RBRVS in 1992 and they have not been revised during the annual update process, their inclusion in the five-year review presents the first opportunity for the RUC to evaluate their relative physician work. In the public comment letters addressing these services, the major primary care specialty societies stated that the services had become more difficult than they were when the Harvard RBRVS surveys were conducted, due to factors such as decreasing lengths of stay, increasing complexity of patients in inpatient and outpatient settings, documentation and case management requirements, and a better educated patient population that expects more information from physicians. The modified survey instrument was further modified, therefore, to make it more appropriate for surveying the work involved in visits and consultations and addressing the issues raised in the primary care groups' comments.

Multidisciplinary workgroups. In addition to the survey instrument, modifications were also made in the RUC review process. For example, to manage the large number of comments referred and to ensure objective review of potentially overvalued services, the RUC adapted the facilitation committee concept used in valuing new and revised codes to the five-year review. Prior to reviewing the comments, therefore, the RUC members were divided into eight multidisciplinary workgroups of three or four members, each comprised of at least one surgeon, one

primary care physician, and one from another medical specialty, such as radiology (see Attachment 2). The public and CMD comments were then organized into 21 topic areas, and several topics were assigned to each workgroup. The workgroups were responsible for providing assistance to specialties upon request, for example, by reviewing proposed vignettes. After the specialty recommendations were provided to the RUC, the workgroups evaluated the recommendations for the topics assigned to them and made recommendations to the RUC. These recommendations were treated as consent calendars by the full RUC, with other RUC members and specialty societies extracting for discussion any workgroup recommendations with which they disagreed.

Supplemental data. Another innovation was the collection of information besides that which was developed by the specialty societies to facilitate evaluation of the comments. In addition to the specialty recommendation forms, therefore, the AMA assembled data from several sources into a supplemental report on each code, which was provided to the workgroup members and the full RUC (see Attachment 3). First, the tables provided by HCFA summarizing all the public and CMD comments included: 1995 RVUs and their source; the commenter's recommended RVUs; the ratio of the recommended to the 1995 RVUs; the frequency of claims for the service; and, the reference services identified by the commenter. Second, an AMA analysis of Medicare claims data for each service provided: beneficiary age and other characteristics; recent trends in claims frequency and site of service; specialties that provide the service; and, diagnosis codes reported on claims. Third, each code was analyzed to assess any changes in RVUs during the first four years of RBRVS implementation, and how the 1995 Medicare RVUs compare to the final RVUs from Phase III of the Harvard RBRVS study. Finally, all the available data from the Harvard study was assembled for each code, including pre-, intra-, and postservice times, number and type of postservice visits, and the ratio of intraservice work to intraservice time.

Additional Potentially Overvalued Services

As described in Tab 19, in addition to reviewing the referred comments, the RUC also conducted a special analysis to identify additional potentially overvalued services that were not identified in the public or CMD comments. The RUC's evaluation of several of the 33 services so identified has not yet been completed, but, at this time, the RUC is recommending that the relative values for one third of these services be reduced.

Summary of Recommendations

Tabs 1 through 18 present the RUC's recommendations on the comments referred to us, grouped into the topic areas discussed above and listed in Attachment 2. In addition, Tab 19 discusses the 33 additional potentially overvalued services identified by the RUC, and Tab 20 explains those codes that the RUC recommends be considered by the CPT Editorial Panel prior to any further review of their relative values by the RUC. The RUC's recommendations may be summarized as follows:

Thomas A. Ault
September 28, 1995
Page Five

- For 158 codes, the RUC is recommending that the increase proposed by the specialty society or CMD be adopted.
- For 138 codes, the RUC is recommending that the relative value be increased, but by less than the specialty has recommended.
- For 650 codes, the RUC recommends that the current relative value be maintained. The RUC also recommends the current relative values for the anesthesia codes be maintained.
- For 101 codes, the RUC is recommending that the decrease proposed by the specialty society or CMD be accepted.
- For 6 codes, the RUC has developed a recommended decrease to maintain work neutrality with closely related codes.
- The RUC has referred 65 codes to the CPT Editorial Panel to consider coding changes prior to further review by the RUC.

Excluding the issues referred to CPT, the total number of recommendations being submitted at this time is 1,053. All of these recommendations are discussed and explained in the reports contained in each tab. In addition, for codes for which the RUC is recommending an increase and codes for which the commenter recommended a decrease but the RUC is recommending that the current RVUs be maintained, we have included the "summary of recommendation" form provided by the specialty society and the two-page data report containing the Harvard study and Medicare claims data discussed above. Please note that, in most cases, the specialty recommendation forms indicate the increase recommended by the specialty to the RUC, but in many cases the RUC-recommended relative values are lower.

Throughout the review process, the AMA has used the claims data provided by HCFA to assess the impact of the comments and the recommendations. The final RUC-recommended values are a fraction of what was proposed in the comments, particularly considering that many of the comments for high volume services did not specify recommended relative value units. Nevertheless, the overall impact of adopting the RUC's recommendations will be significant. More than 90% of the overall impact is due to the recommended increases in the evaluation and management services, since these services account for about 35% of all Medicare expenditures on the payment schedule, far more than any of the other families of services considered in this five-year review.

We appreciate the opportunity to assist you in this review process and HCFA's confidence in our ability to do so. I have selected several RUC members to attend the November meetings when the CMDs will review the RUC's recommendations to answer further questions that may arise.

Thomas A. Ault
September 28, 1995

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS

IMPORTANT: PLEASE READ THE INSTRUCTIONS BEFORE COMPLETING THE QUESTIONNAIRE

Step 1: Please evaluate the physician work for each service described on the attached questionnaire. Please consider all of the following before providing your estimate:

Definition of Physician Work: Physician work includes four components: (1) the time it takes to perform the service, (2) mental effort and judgement, (3) technical skill and physical effort, and (4) stress associated with the physician's concern about iatrogenic risk. See Appendix A for further details regarding the components of physician work for the services you are rating.

Typical Patient/Service: Your specialty has developed a short description or "vignette" describing the typical patient/service for each service you will be evaluating. Base your estimate on this typical patient/service. Do not allow your rating to be influenced by unusual or atypical patients.

Reference Services: Compare the service described on each questionnaire to the reference services listed in Table 1. For example, if the service involves the same amount of work as a reference service, assign the same work value to the code you are rating. If the service involves twice as much work as the closest reference service, you would assign a work value that was twice that of the reference service value. If you think that the service involves half as much work as the reference service, you would assign a work value that was equal to half the reference service value. These services have been selected by your specialty for use as reference services for this survey because the services and their relative values are sufficiently accurate and stable to compare with other services. Do not change the work relative values (RVUs) for any of the reference services.

Global Period: A service paid on a global basis includes visits and other services provided in addition to the basic procedure during the day preceding the procedure and for a specified number of days after the procedure is provided. The global period listed on the attached questionnaire refers to the number of post-service days of care that are included in the payment for a global surgical package as determined by the Health Care Financing Administration for Medicare payment purposes. There are three categories of global services: 090 (90 days), 010 (10 days), 000 (0 days). Two other global periods may be used: XXX means that a global period does not apply to the code and ZZZ means that you would report this service in addition to the primary procedure and you should rate only the additional intra-service work of the service. Take into account any difference between the global period of the service that you are evaluating and that of the reference service that you are comparing it to.

Step 2: List one or two CPT code(s) from Table 1 that were important reference services in estimating the relative value of physician work for the service described in each questionnaire.

Step 3: Estimate the following service characteristics for the service you are rating and your key reference services:

Average Time (in Minutes): Estimate the average time, in minutes, involved in the pre-service, intra-service, and post-service portion of the service. You must refer to Appendix A for definitions of these time periods.

In considering post-service time for surgical services, please indicate each of the following:

- Time you spend on post-operative care on the day of the procedure;
- Total time you spend with the patient and the number of visits in the ICU after the day of the procedure;
- Total time you spend with the patient and the number of visits in the hospital after the day of the procedure and after any ICU days;
- Total time you spend with the patient and the number of visits in your office after discharge during the global period only.

Complexity/Intensity: For each component of work (see Appendix A for detailed definitions), indicate the level of complexity/intensity for each service on a scale from 1 to 5 (1 = least complex among all of the services you perform, 5 = most complex among all of the services you perform).

Step 4: Indicate if the physician work of performing this service has changed in the past 5 years.

Step 5 Consider whether the typical service/patient provided by your specialty society describes your typical patient.

QUESTIONNAIRE

CPT Code Number: _____

Global Period: _____

CPT Descriptor: _____

Typical Service/Patient: _____

Step 1 Estimate the Relative Value of Physician Work (work RVU): _____

Step 2 List one or two important reference services (Table 1) in estimating physician work for this code (List only the CPT code numbers for the reference services):

1) _____ 2) _____

Step 3 Estimate the following service characteristics for the code that you have rated and your key reference services:

Service Characteristic	CPT code that you have rated in Step 1	Reference Service 1 (from Step 2)	Reference Service 2 (from Step 2)
CPT Code			
TIME IN MINUTES (See Appendix A for detailed definitions of Time Periods)			
Pre-Service Time			
Intra-Service Time			
Post-Service Time:			
Day of Procedure			
ICU (Total Time/Number of Visits)	/	/	/
Other Hospital (Total Time/# of Visits)	/	/	/
Office (Total Time/Number of Visits)	/	/	/
Complexity/Intensity on a scale of 1 to 5 (1=least complex, 5=most complex) (See Appendix A for detailed definitions)			
Mental Effort and Judgment			
Technical Skill & Physical Effort			
Psychological Stress			

Step 4 Has the work of performing this service changed in the past 5 years? ___ Yes ___ No. If yes, complete a - c.

This service represents new technology that has become more familiar (i.e., less work). ___ I agree ___ I do not agree
 Patients requiring this service are now: ___ more complex (more work) ___ less complex (less work) ___ no change
 The usual site-of-service has changed: ___ from outpatient to inpatient ___ from inpatient to outpatient ___ no change

Step 5 Do you agree that the Typical Service/Patient provided above describes your typical patient? Yes ___ No ___

CPT Code	1995 Descriptor	1995 Work RVU	Global Period
Table 1			
4/6/95			
Colon and Rectal Surgery			
American Society of Colon and Rectal Surgeons			
99213	Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.	0.55	XXX
45330	Sigmoidoscopy, flexible; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)	0.96	000
45305	Proctosigmoidoscopy, rigid; with biopsy, single or multiple	1.01	000
99242	Office consultation for a new or established patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; and straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient(s) and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.	1.11	XXX
46050	Incision and drainage, perianal abscess, superficial	1.14	010
45331	Sigmoidoscopy, flexible; with biopsy, single or multiple	1.26	000
46604	Anoscopy; with dilation, any method	1.31	000
46221	Hemorrhoidectomy, by simple ligature (eg. rubber band)	1.38	010
46500	Injection of sclerosing solution, hemorrhoids	1.53	010

Appendix A
Components of Physicians' Total Work
MAJOR SURGERY
(090 Global Period)

In evaluating the work of a service, it is helpful to identify and think about each of the components of a particular service. Focus only on the work that you perform during each of the identified components. The descriptions below are general in nature. Specific components will vary by specialty and specific service. Your specialty may have developed a more specific listing of potential services within each component. Within the broad outlines presented, please think about the specific services that you provide.

Physician work includes the following:

- Time it takes to perform the service.
- Mental effort and judgment necessary with respect to the amount of clinical data that needs to be considered, the fund of knowledge required, the range of possible decisions, the number of factors considered in making a decision, and the degree of complexity of the interaction of these factors.
- Technical skill required with respect to knowledge, training and actual experience necessary to perform the service. Physical effort can be compared by dividing services into tasks and making the direct comparison of tasks. In making the comparison, it is necessary to show that the differences in physical effort are not reflected accurately by differences in the time involved; if they are, considerations of physical effort amount to double counting of physician work in the service.
- Psychological stress - Two kinds of psychological stress are usually associated with physician work. The first is the pressure involved when the outcome is heavily dependent upon skill and judgment and a mistake has serious consequences. The second is related to unpleasant conditions connected with the work that are not affected by skill or judgment. These circumstances would include situations with high rates of mortality or morbidity regardless of the physician's skill or judgment, difficult patients or families, or physician physical discomfort. Of the two forms of stress, only the former is fully accepted as an aspect of work; many consider the latter to be highly variable function of physician personality.

Intensity often varies significantly in the course of furnishing a service. One common mistake is to "anchor" the value of the service to a point of maximum intensity during the service as the basis for comparing services. It is unlikely that the maximum intensity is an accurate reflection of the average intensity of a service; a lengthy procedure that is simple except for a few moments of extreme intensity is probably less work than one of equal length during which a fairly high level of intensity is maintained throughout.

PRE-SERVICE PERIOD Before the Service, <u>May Include</u>	INTRA-SERVICE PERIOD Work <u>During the Service Is</u>	POST-SERVICE PERIOD After the Service, <u>May Include</u>
<p><u>Services provided from the day before the surgery until the time of the procedure:</u></p> <p>Hospital admission work-up.</p> <p>The pre-operative evaluation may include the procedural work-up, review of records, communicating with other professionals, patient and family, and obtaining consent.</p> <p>Other pre-operative work may include dressing, scrubbing, and waiting before surgery, preparing patient and needed equipment for surgery, positioning the patient and other non "skin-to-skin" work in the OR.</p> <p>Excludes:</p> <ul style="list-style-type: none"> • Consultation or evaluation at which the decision to provide the procedure was made (reported with modifier -57). • Distinct evaluation and management services provided in addition to the procedure (reported with modifier -25). 	<p><u>Work while you perform the service</u> - "skin-to-skin" work including all intra-service activity that is normally included as a necessary part of the procedure.</p>	<p><u>Services provided within 90 days of the operation:</u></p> <p><u>Day of Procedure:</u></p> <p>Post-operative care on day of the procedure, includes non "skin-to-skin" work in the OR, communicating with the patient and other professionals (including written and telephone reports and orders), and patient visits.</p> <p>Patient stabilization in the recovery room or special unit.</p> <p><u>Other follow-up care before the patient is discharged, if applicable:</u></p> <p>Post-operative visits, both in-hospital, if applicable, and out-patient office visits within 90 days of the operation</p> <p><u>Excludes:</u> Unrelated evaluation and management service provided during the postoperative period (reported with modifier -24)</p>

Appendix A
Components of Physicians' Total Work
MINOR SURGERY AND ENDOSCOPIES
(000 and 010 Global Period)

In evaluating the work of a service, it is helpful to identify and think about each of the components of a particular service. Focus only on the work that you perform during each of the identified components. The descriptions below are general in nature. Specific components will vary by specialty and specific service. Your specialty may have developed a more specific listing of potential services within each component. Within the broad outlines presented, please think about the specific services that you provide.

Physician work includes the following:

- Time it takes to perform the service.
- Mental effort and judgment necessary with respect to the amount of clinical data that needs to be considered, the fund of knowledge required, the range of possible decisions, the number of factors considered in making a decision, and the degree of complexity of the interaction of these factors.
- Technical skill required with respect to knowledge, training and actual experience necessary to perform the service. Physical effort can be compared by dividing services into tasks and making the direct comparison of tasks. In making the comparison, it is necessary to show that the differences in physical effort are not reflected accurately by differences in the time involved; if they are, considerations of physical effort amount to double counting of physician work in the service.
- Psychological stress - Two kinds of psychological stress are usually associated with physician work. The first is the pressure involved when the outcome is heavily dependent upon skill and judgment and a mistake has serious consequences. The second is related to unpleasant conditions connected with the work that are not affected by skill or judgment. Intensity often varies significantly in the course of furnishing a service. One common mistake is to "anchor" the value of the service to a point of maximum intensity during the service as the basis for comparing services. It is unlikely that the maximum intensity is an accurate reflection of the average intensity of a service; a lengthy procedure that is simple except for a few moments of extreme intensity is probably less work than one of equal length during which a fairly high level of intensity is maintained throughout.

PRE-SERVICE PERIOD Before the Service, <u>May Include</u> .	INTRA-SERVICE PERIOD Work <u>During</u> the Service Is	POST-SERVICE PERIOD After the Service, <u>May Include</u>
<p><u>Services provided from the day before the surgery until the time of the procedure:</u></p> <p>Hospital admission work-up.</p> <p>The pre-operative evaluation may include the procedural work-up, review of records, communicating with other professionals, patient and family, and obtaining consent.</p> <p>Other pre-operative work may include dressing, scrubbing, and waiting before surgery, preparing patient and needed equipment for surgery, positioning the patient and other non "skin-to-skin" work in the OR.</p> <p>Excludes:</p> <ul style="list-style-type: none"> ● Consultation or evaluation at which the decision to provide the procedure was made (reported with modifier -57). ● Distinct evaluation and management services provided in addition to the procedure (reported with modifier -25). 	<p><u>Work while you perform the service</u> -- "skin-to-skin" work including all intra-service activity that is normally included as a necessary part of the procedure.</p>	<p><u>Day of Procedure:</u></p> <p>Post-operative care on day of the procedure, includes non "skin-to-skin" work in the OR, communicating with the patient and other professionals (including written and telephone reports and orders), and patient visits.</p> <p>Patient stabilization in the recovery room or special unit.</p> <p><u>Other follow-up care before the patient is discharged, if applicable:</u></p> <p>Post-procedure visits on the day of the procedure (global period = 000) or within 10 days of the procedure (global period = 010)</p> <p><u>Excludes:</u> Unrelated evaluation & management service provided during the postoperative period (reported with modifier -24)</p>

Appendix A

Components of Physicians' Total Work

EVALUATION AND MANAGEMENT SERVICES

In evaluating the work of a service, it is helpful to identify and think about each of the components of a particular service. Focus only on the work that you perform during each of the identified components. The descriptions below are general in nature. Specific components will vary by specialty and specific service. Your specialty may have developed a more specific listing of potential services within each component. Within the broad outlines presented, please think about the specific services that you provide.

Physician work includes the following:

- Time it takes to perform the service.
- Mental effort and judgment necessary with respect to the amount of clinical data that needs to be considered, the fund of knowledge required, the range of possible decisions, the number of factors considered in making a decision, and the degree of complexity of the interaction of these factors.
- Technical skill required with respect to knowledge, training and actual experience necessary to perform the service. Physical effort can be compared by dividing services into tasks and making the direct comparison of tasks. In making the comparison, it is necessary to show that the differences in physical effort are not reflected accurately by differences in the time involved; if they are, considerations of physical effort amount to double counting of physician work in the service.
- Psychological stress - Two kinds of psychological stress are usually associated with physician work. The first is the pressure involved when the outcome is heavily dependent upon skill and judgment and a mistake has serious consequences. The second is related to unpleasant conditions connected with the work that are not affected by skill or judgment. These circumstances would include situations with high rates of mortality or morbidity regardless of the physician's skill or judgment, difficult patients or families, or physician physical discomfort. Of the two forms of stress, only the former is fully accepted as an aspect of work; many consider the latter to be highly variable function of physician personality.

Intensity often varies significantly in the course of furnishing a service. One common mistake is to "anchor" the value of the service to a point of maximum intensity during the service as the basis for comparing services. It is unlikely that the maximum intensity is an accurate reflection of the average intensity of a service; a lengthy procedure that is simple except for a few moments of extreme intensity is probably less work than one of equal length during which a fairly high level of intensity is maintained throughout.

	PRE-SERVICE PERIOD Before the Service, <u>May</u> Include	INTRA-SERVICE PERIOD Work <u>During</u> the Service Is	POST-SERVICE PERIOD After the Service, <u>May</u> Include
Office	<u>Preparing to see patient.</u> <u>Reviewing records.</u> <u>Communicating with other professionals.</u>	<u>Work while you are with the patient and/or family. This includes the time in which the physician performs such tasks as obtaining a history, performing an examination, and counseling the patient.</u>	<u>Arranging for further services.</u> <u>Reviewing results of studies.</u> <u>Communicating further with patient, family, and other professionals, including written and telephone reports.</u>
Hospital	<u>Work while not present on the patient's hospital unit or floor, including:</u> Communicating further with other professionals and the patient's family. Obtaining and/or reviewing the results of diagnostic and other studies. LABORATORY/IMAGING/OTHER NON-EVALUATION AND MANAGEMENT SERVICES

In evaluating the work of a service, it is helpful to identify and think about each of the components of a particular service. Focus only on the work that you perform during each of the identified components. The descriptions below are general in nature. Specific components will vary by specialty and specific service. Your specialty may have developed a more specific listing of potential services within each component. Within the broad outlines presented, please think about the specific services that you provide.

Physician work includes the following:

- Time it takes to perform the service.
- Mental effort and judgment necessary with respect to the amount of clinical data that needs to be considered, the fund of knowledge required, the range of possible decisions, the number of factors considered in making a decision, and the degree of complexity of the interaction of these factors.
- Technical skill required with respect to knowledge, training and actual experience necessary to perform the service. Physical effort can be compared by dividing services into tasks and making the direct comparison of tasks. In making the comparison, it is necessary to show that the differences in physical effort are not reflected accurately by differences in the time involved; if they are, considerations of physical effort amount to double counting of physician work in the service.
- Psychological stress - Two kinds of psychological stress are usually associated with physician work. The first is the pressure involved when the outcome is heavily dependent upon skill and judgment and a mistake has serious consequences. The second is related to unpleasant conditions connected with the work that are not affected by skill or judgment. These circumstances would include situations with high rates of mortality or morbidity regardless of the physician's skill or judgment, difficult patients or families, or physician physical discomfort. Of the two forms of stress, only the former is fully accepted as an aspect of work; many consider the latter to be highly variable function of physician personality.

Intensity often varies significantly in the course of furnishing a service. One common mistake is to "anchor" the value of the service to a point of maximum intensity during the service as the basis for comparing services. It is unlikely that the maximum intensity is an accurate reflection of the average intensity of a service; a lengthy procedure that is simple except for a few moments of extreme intensity is probably less work than one of equal length during which a fairly high level of intensity is maintained throughout.

PRE-SERVICE PERIOD Before the Service, <u>May</u> Include:	INTRA-SERVICE PERIOD Work During the Service Is	POST-SERVICE PERIOD After the Service, <u>May</u> Include
For these services, the service period is treated as a whole and includes the work from the time you begin the service until you complete it and report your results, if applicable. Consider only the work that you do and not work done by technicians or other professionals. Do not include distinct evaluation and management services provided in addition to procedure in your estimate.

KEY TO THE DATA REPORTS

Behind the specialty recommendation form for each code is a 2-page report assembling the following data for each code:

- Data from the HCFA-supplied tables for all the public and carrier medical director comments, including: 1995 RVUs and their source; the commenter's recommended RVUs; the ratio of the recommended to the 1995 RVUs; the frequency of claims for the service; and, the reference services identified by the commenter. For CMD comments, this report also includes the actual CMD comment.
- An AMA analysis of Medicare claims data provides substantial information about each service, including: beneficiary age and other characteristics; recent trends in claims frequency and site of service; specialties that provide the service; and, diagnosis codes reported on claims.
- Each code was also analyzed to assess: (1) any changes in RVUs for each service during the first four years of RBRVS implementation; (2) how the 1995 Medicare RVUs compare to the final RVUs from Phase IV of the Harvard RBRVS study; and (3) all the available data from the Harvard study on each code, including pre-, intra-, and post-service times, number and type of post-service visits, and the ratio of intra-service work to intra-service time.

Most of this information is labelled in a manner that makes it easy to understand. The last page of this KEY explains the AMA analysis, which is listed in the data reports in the boxes labelled Beneficiary Information, Frequency, Site of Service, Specialty Mix, and Claims-Level Diagnosis Information. The following documentation identifies what the numbers identified as "Source" mean, and what all the labels for the Harvard data mean.

Key to SOURCE for Codes Identified by Public Comments:

- 1 = Harvard
- 2 = HCFA
- 3 = Charge-based
- 4 = Refinement panel, retained published value
- 5 = Refinement panel, increased value
- 6 = Refinement panel, decreased value
- 7 = Other source
- 8 = RUC recommendation, accepted by HCFA
- 9 = RUC recommendation, increased by HCFA
- 10 = RUC recommendation, decreased by HCFA
- 11 = RUC recommendation, no change from published value
- 12 = Specialty society recommendation, accepted by HCFA
- 13 = Specialty society recommendation, increased by HCFA

- 14 = Specialty society recommendation, decreased by HCFA
- 15 = Specialty society recommendation, no change from published value
- 16 = Global period increased
- 17 = Global period decreased

Key to Harvard Data:

The data in the first two boxes of Harvard data summarize the differences in service work between the Harvard study and each of the Medicare Fee Schedules -- 1992 through 1995. In this way, the file provides a record of the evolution of the work RVUs since their initial complete publication. To make this comparison, all the codes are listed in 1995 RVUs. In other words, the effect of the 5.18% reduction for each service due to rescaling for budget neutrality has been eliminated. This allows you to identify services for which the RVUs have changed for reasons other than budget neutrality.

The labels are defined as follows:

modif	CPT two-digit modifier, if any
packhv	Harvard study global surgical package
pack95	MFS 95 global surgical package
desc95	1995 CPT descriptor
Hrvtotwk	Harvard study total work
MFSWK95	MFS 95 total work
ratio5h	ratio MFSWK95 to hrvtotwk
MFSWK92	MFS 95 total work
MFSWK93	MFS 94 total work
MFSWK94	MFS 93 total work
ratio2h	ratio MFSWK92 to hrvtotwk
ratio32	ratio MFSWK93 to MFSWK92
ratio43	ratio MFSWK94 to MFSWK93
ratio54	ratio MFSWK95 to MFSWK94
comm	identity of commenter
recwk	commenter's recommended total work value
amacod	AMA code for comment

Further Information --

- Global Period describes the global service packaging used in the Harvard study and in the MFS.
- Work RVUs are the total work RVUs for the MFS and for the Harvard RBRVS Study. The Harvard study amounts are those reported in the Harvard Phase III Final Report, unless indicated otherwise.
- Ratios describe the ratio of one Work RVU to another. A ratio greater than 1.0 indicates an increase in RVUs, a ratio less than 1.0 indicates a decrease.

The Harvard data in the other three boxes summarizes service work and time estimates for each code under review. The labels are defined as follows:

pack95	MFS 95 global surgical package
desc95	1995 CPT descriptor
hrvtotwk	Harvard study total work
notetw	denotes the service work was measured for the total service
pret	pre-service time, before O.R. entry
svdpre	indicates whether estimate is from a survey or prediction model (* = prediction)
itime	intra-service time
notett	denotes the service time was measured for the total service
imppt	immediate pre-and post operative time
svdimp	indicates whether estimate is from a survey or prediction model (* = prediction)
sdvis	number of later same day post visits
svdsdvis	indicates whether estimate is from a survey or prediction model (* = prediction)
sdvisdur	average duration of same day post visits
hvis	number of follow-up hospital visits after the day of surgery.
svdhvis	indicates whether estimate is from a survey or prediction model (* = prediction)
hvisdur	average duration of post-hospital visits
icuviz	number of follow-up hospital visits after the day of surgery that are in the ICU.
offvis	number of follow-up office visits after the day of surgery w/in global period.
svdoffd	indicates whether estimate is from a survey or prediction model (* = prediction)
offvdur	average duration of post-office visits
low_n	if equal to "j", indicates low number of survey responses for the Harvard estimate (N < 5)
recwk	total work value recommended by commenter
MFSWK95	1995 MFS total work value
sp	Harvard study specialty surveyed
phase	Harvard study phase service was studied in
twput	Harvard estimate of total work per minute (if relevant)
iwput	Harvard estimate of intra work per minute (if relevant)

Further Information:

- Specialty and phase (Source of Data) - The specialty surveyed in the Harvard Study is listed first (2-digit code), followed by an indicator of when the service was studied. An "n" indicates the time and work estimates are from the Harvard Study, with the intra-

service estimates derived from the phase I and II national surveys. A "3" indicates the time and work estimates are derived from the phase III surveys of technical expert panels. An 'xx' listed for specialty indicates two or more specialties were surveyed.

- Total Work - Estimate of total-service work. For the Harvard study estimates, the work values are derived primarily from the Harvard, Phase III results. The exceptions are for services where the global surgical period has been revised since the Harvard Study. For these services, the Harvard total work value has been adjusted to fit the new period. Harvard work values were multiplied by a constant factor to place them on the 1995 MFS scale of work.
- IWPUT - Harvard intra-work per unit time, equals intra work divided by intra time. If work and time were measured for the "total" service, work per unit time is equal to total work divided by total time (which is listed in the intra time column for these services). In these cases, total work per unit time is listed in parentheses under the total work estimate. This IWPUT is unadjusted for changes in work since the Harvard study.
- Pre- Before O.R. entry -- The amount of time (in minutes) spent by the surgeon on the day before and day of a procedure, up to admission to the operating room.
- Intra-Time -- The time spent by the physician performing the service itself (i.e. skin to skin time for incisional services or patient encounter time for office visits). For selected services, total rather than intra time is listed. These services are indicated with a "t" to the right of the time estimate.
- Immediate Pre-Post -- Immediate pre-and post operative time -- For surgical services, the amount of time spent by the surgeon from the admission to the operating room to the skin incision or beginning of the procedure, plus the time from skin closure until the patient leaves the operating room. For evaluation and management services, includes total pre- and post-service time.
- Later Same Day Post -- The amount of time spent by the surgeon after the patient leaves the recovery room on the day of the procedure. These data include the **number** and **duration** of surgeon post-operative visits to the patient during this period. The **Type** of visit is measured by minutes in increments of five.
- Hospital Post-Op -- The amount of time spent by the surgeon for in-hospital post-operative care after the day of the procedure. These data include the **number**, **duration**, and **ICU Visits** of surgeon post-operative visits to the patient during this period. The **Type** of visit is measured by minutes in increments of five.
- Office Post-Op -- The amount of time spent by the surgeon for post-operative care in the office after the day of the procedure. These data will include the **number**, and **duration** of post-operative visits to the patient during this period. The **Type** of visit is measured by minutes in increments of five.
- MFS95 Work -- The Medicare Fee Schedule Work Value for 1995.

AMA Procedure Profiles Analysis

The data reports present several selected types of information for each code under review in the five year review of the RBRVS. This information is intended to provide a "profile" of each code to assist AMA/Specialty Society RVS Update Committee in the evaluation of physician work.

The first box presents information on the characteristics of the beneficiaries that receive each service. The beneficiary characteristics data are from a 5% sample of Medicare physician/supplier claims for the first six months of 1994. These data provide information on a variety of factors which may be associated with health status or utilization. Included are information on the proportion of claims for beneficiaries that are: age 75 and over; age 85 and over; nonwhite; female; disabled only (non-aged, non-ESRD); ESRD only (non-aged, non-disabled), and; aged or disabled with ESRD. Location information is also provided -- in particular, the proportion of claims for the service that are provided in rural localities. (Rural localities are defined as Medicare payment localities that have more than 50% of the population outside of Metropolitan Statistical Areas (MSAs) according to the 1990 census.)

The second and third boxes provide frequency and site of service data from Medicare physician claims for 1992 and for the first half of 1994. These data are from HCFA's procedure summary files which contain information on virtually 100% of claims incurred in a given period. The 1994 frequency data are from the first six months of the year, and have been annualized for comparison with 1992 frequency. The average annual change in frequency and the average change in the hospital inpatient share of frequency are also presented.

The fourth box presents specialty mix information from the HCFA procedure summary file for the first six months of 1994. The specialties were ranked in descending order according to the share of total frequency for each code. The top eight specialties with at least 2% of total frequency for the code are displayed.

The last box presents information on the diagnosis of patients receiving each service. These data are also drawn from the 5% sample of Medicare physician/supplier claims for the first six months of 1994. Medicare physician/supplier claims contain up to four "claim-level" ICD9 diagnosis codes. These (typically five-digit) diagnosis codes have been truncated to three-digit codes. Table 1 reports the three-digit claim-level ICD9 codes most commonly reported for each service. The percentage reported is the number of times a diagnosis code was reported out of the total number of claim-level diagnosis codes possible for a service. (For example, if there are 10 claims for a given service then there are 40 possible claim-level diagnosis codes that could be reported.) Descriptors for the three-digit ICD9 codes are also provided.

Because the summary statistics for the beneficiary characteristics and diagnosis data are based on a sample of claims (rather than virtually 100% of claims as for the frequency, site of service and specialty mix data), these measures will be missing for many low-volume codes. There will also be some sampling error in these estimates, particularly among low-volume codes.

Specialty Society Acronyms

AAAI	American Academy of Allergy & Immunology
AACAP	American Academy of Child & Adolescent Psychiatry
AAD	American Academy of Dermatology

QUESTIONNAIRE

CPT Code Number: _____

Global Period: _____

CPT Descriptor: _____

Typical Service/Patient: _____

Step 1 Estimate the Relative Value of Physician Work (work RVU): _____

Step 2 List one or two important reference services (Table 1) in estimating physician work for this code (List only the CPT code numbers for the reference services):

1) _____ 2) _____

Step 3 Estimate the following service characteristics for the code that you have rated and your key reference services:

Service Characteristic	CPT code that you have rated in Step 1	Reference Service 1 (from Step 2)	Reference Service 2 (from Step 2)
CPT Code			
TIME IN MINUTES (See Appendix A for detailed definitions of Time Periods)			
Pre-Service Time			
Intra-Service Time			
Post-Service Time:			
Day of Procedure			
ICU (Total Time/Number of Visits)	/	/	/
Other Hospital (Total Time/# of Visits)	/	/	/
Office (Total Time/Number of Visits)	/	/	/
Complexity/Intensity on a scale of 1 to 5 (1=least complex, 5=most complex) (See Appendix A for detailed definitions)			
Mental Effort and Judgment			
Technical Skill & Physical Effort			
Psychological Stress			

Step 4 Has the work of performing this service changed in the past 5 years? ___ Yes ___ No. If yes, complete a - c.

a. This service represents new technology that has become more familiar (i.e., less work). ___ I agree ___ I do not agree
 b. Patients requiring this service are now: ___ more complex (more work) ___ less complex (less work) ___ no change
 c. The usual site-of-service has changed: ___ from outpatient to inpatient ___ from inpatient to outpatient ___ no change

Step 5 Do you agree that the Typical Service/Patient provided above describes your typical patient? Yes ___ No ___

CPT Code	1995 Descriptor	1995 Work RVU	Global Period
Table 1			
4/6/95			
Colon and Rectal Surgery			
American Society of Colon and Rectal Surgeons			
99213	Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.	0.55	XXX
45330	Sigmoidoscopy, flexible; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)	0.96	000
45305	Proctosigmoidoscopy, rigid; with biopsy, single or multiple	1.01	000
99242	Office consultation for a new or established patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; and straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient(s) and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.	1.11	XXX
46050	Incision and drainage, perianal abscess, superficial	1.14	010
45331	Sigmoidoscopy, flexible; with biopsy, single or multiple	1.26	000
46604	Anoscopy; with dilation, any method	1.31	000
46221	Hemorrhoidectomy, by simple ligature (eg, rubber band)	1.38	010
46500	Injection of sclerosing solution, hemorrhoids	1.53	010

Appendix A
Components of Physicians' Total Work
MAJOR SURGERY
(090 Global Period)

In evaluating the work of a service, it is helpful to identify and think about each of the components of a particular service. Focus only on the work that you perform during each of the identified components. The descriptions below are general in nature. Specific components will vary by specialty and specific service. Your specialty may have developed a more specific listing of potential services within each component. Within the broad outlines presented, please think about the specific services that you provide.

Physician work includes the following:

- Time it takes to perform the service.
- Mental effort and judgment necessary with respect to the amount of clinical data that needs to be considered, the fund of knowledge required, the range of possible decisions, the number of factors considered in making a decision, and the degree of complexity of the interaction of these factors.
- Technical skill required with respect to knowledge, training and actual experience necessary to perform the service. Physical effort can be compared by dividing services into tasks and making the direct comparison of tasks. In making the comparison, it is necessary to show that the differences in physical effort are not reflected accurately by differences in the time involved; if they are, considerations of physical effort amount to double counting of physician work in the service.
- Psychological stress - Two kinds of psychological stress are usually associated with physician work. The first is the pressure involved when the outcome is heavily dependent upon skill and judgment and a mistake has serious consequences. The second is related to unpleasant conditions connected with the work that are not affected by skill or judgment. These circumstances would include situations with high rates of mortality or morbidity regardless of the physician's skill or judgment, difficult patients or families, or physician physical discomfort. Of the two forms of stress, only the former is fully accepted as an aspect of work; many consider the latter to be highly variable function of physician personality.

Intensity often varies significantly in the course of furnishing a service. One common mistake is to "anchor" the value of the service to a point of maximum intensity during the service as the basis for comparing services. It is unlikely that the maximum intensity is an accurate reflection of the average intensity of a service; a lengthy procedure that is simple except for a few moments of extreme intensity is probably less work than one of equal length during which a fairly high level of intensity is maintained throughout.

PRE-SERVICE PERIOD Before the Service, <u>May Include</u>	INTRA-SERVICE PERIOD Work <u>During</u> the Service Is	POST-SERVICE PERIOD After the Service, <u>May Include</u>
<p><u>Services provided from the day before the surgery until the time of the procedure:</u></p> <p>Hospital admission work-up.</p> <p>The pre-operative evaluation may include the procedural work-up, review of records, communicating with other professionals, patient and family, and obtaining consent.</p> <p>Other pre-operative work may include dressing, scrubbing, and waiting before surgery, preparing patient and needed equipment for surgery, positioning the patient and other non "skin-to-skin" work in the OR.</p> <p><u>Excludes:</u></p> <ul style="list-style-type: none"> • Consultation or evaluation at which the decision to provide the procedure was made (reported with modifier -57). • Distinct evaluation and management services provided in addition to the procedure (reported with modifier -25). 	<p><u>Work while you perform the service -- "skin-to-skin" work</u> including all intra-service activity that is normally included as a necessary part of the procedure.</p>	<p><u>Services provided within 90 days of the operation:</u></p> <p><u>Day of Procedure:</u></p> <p>Post-operative care on day of the procedure, includes non "skin-to-skin" work in the OR, communicating with the patient and other professionals (including written and telephone reports and orders), and patient visits.</p> <p>Patient stabilization in the recovery room or special unit.</p> <p><u>Other follow-up care before the patient is discharged, if applicable:</u></p> <p>Post-operative visits, both in-hospital, if applicable, and out-patient office visits within 90 days of the operation</p> <p><u>Excludes:</u> Unrelated evaluation and management service provided during the postoperative period (reported with modifier -24)</p>

Appendix A
Components of Physicians' Total Work
MINOR SURGERY AND ENDOSCOPIES
(000 and 010 Global Period)

In evaluating the work of a service, it is helpful to identify and think about each of the components of a particular service. Focus only on the work that you perform during each of the identified components. The descriptions below are general in nature. Specific components will vary by specialty and specific service. Your specialty may have developed a more specific listing of potential services within each component. Within the broad outlines presented, please think about the specific services that you provide.

Physician work includes the following:

- Time it takes to perform the service.
- Mental effort and judgment necessary with respect to the amount of clinical data that needs to be considered, the fund of knowledge required, the range of possible decisions, the number of factors considered in making a decision, and the degree of complexity of the interaction of these factors.
- Technical skill required with respect to knowledge, training and actual experience necessary to perform the service. Physical effort can be compared by dividing services into tasks and making the direct comparison of tasks. In making the comparison, it is necessary to show that the differences in physical effort are not reflected accurately by differences in the time involved; if they are, considerations of physical effort amount to double counting of physician work in the service.
- Psychological stress - Two kinds of psychological stress are usually associated with physician work. The first is the pressure involved when the outcome is heavily dependent upon skill and judgment and a mistake has serious consequences. The second is related to unpleasant conditions connected with the work that are not affected by skill or judgment. These circumstances would include situations with high rates of mortality or morbidity regardless of the physician's skill or judgment, difficult patients or families, or physician physical discomfort. Of the two forms of stress, only the former is fully accepted as an aspect of work; many consider the latter to be highly variable function of physician personality.

Intensity often varies significantly in the course of furnishing a service. One common mistake is to "anchor" the value of the service to a point of maximum intensity during the service as the basis for comparing services. It is unlikely that the maximum intensity is an accurate reflection of the average intensity of a service; a lengthy procedure that is simple except for a few moments of extreme intensity is probably less work than one of equal length during which a fairly high level of intensity is maintained throughout.

PRE-SERVICE PERIOD Before the Service, <u>May Include</u>	INTRA-SERVICE PERIOD Work <u>During</u> the Service Is	POST-SERVICE PERIOD After the Service, <u>May Include</u>
<p><u>Services provided from the day before the surgery until the time of the procedure:</u></p> <p>Hospital admission work-up.</p> <p>The pre-operative evaluation may include the procedural work-up, review of records, communicating with other professionals, patient and family, and obtaining consent.</p> <p>Other pre-operative work may include dressing, scrubbing, and waiting before surgery, preparing patient and needed equipment for surgery, positioning the patient and other non "skin-to-skin" work in the OR.</p> <p>Excludes:</p> <ul style="list-style-type: none"> ● Consultation or evaluation at which the decision to provide the procedure was made (reported with modifier -57). ● Distinct evaluation and management services provided in addition to the procedure (reported with modifier -25). 	<p><u>Work while you perform the service</u> - "skin-to-skin" work including all intra-service activity that is normally included as a necessary part of the procedure.</p>	<p><u>Day of Procedure:</u></p> <p>Post-operative care on day of the procedure, includes non "skin-to-skin" work in the OR, communicating with the patient and other professionals (including written and telephone reports and orders), and patient visits.</p> <p>Patient stabilization in the recovery room or special unit.</p> <p><u>Other follow-up care before the patient is discharged, if applicable:</u></p> <p>Post-procedure visits on the day of the procedure (global period = 000) or within 10 days of the procedure (global period = 010)</p> <p><u>Excludes:</u> Unrelated evaluation & management service provided during the postoperative period (reported with modifier -24)</p>

KEY TO THE DATA REPORTS

Behind the specialty recommendation form for each code is a 2-page report assembling the following data for each code:

- Data from the HCFA-supplied tables for all the public and carrier medical director comments, including: 1995 RVUs and their source; the commenter's recommended RVUs; the ratio of the recommended to the 1995 RVUs; the frequency of claims for the service; and, the reference services identified by the commenter. For CMD comments, this report also includes the actual CMD comment.
- An AMA analysis of Medicare claims data provides substantial information about each service, including: beneficiary age and other characteristics; recent trends in claims frequency and site of service; specialties that provide the service; and, diagnosis codes reported on claims.
- Each code was also analyzed to assess: (1) any changes in RVUs for each service during the first four years of RBRVS implementation; (2) how the 1995 Medicare RVUs compare to the final RVUs from Phase IV of the Harvard RBRVS study; and (3) all the available data from the Harvard study on each code, including pre-, intra-, and post-service times, number and type of post-service visits, and the ratio of intra-service work to intra-service time.

Most of this information is labelled in a manner that makes it easy to understand. The last page of this KEY explains the AMA analysis, which is listed in the data reports in the boxes labelled Beneficiary Information, Frequency, Site of Service, Specialty Mix, and Claims-Level Diagnosis Information. The following documentation identifies what the numbers identified as "Source" mean, and what all the labels for the Harvard data mean.

Key to SOURCE for Codes Identified by Public Comments:

- 1=Harvard
- 2=HCFA
- 3=Charge-based
- 4=Refinement panel, retained published value
- 5=Refinement panel, increased value
- 6=Refinement panel, decreased value
- 7=Other source
- 8=RUC recommendation, accepted by HCFA
- 9=RUC recommendation, increased by HCFA
- 10=RUC recommendation, decreased by HCFA
- 11=RUC recommendation, no change from published value
- 12=Specialty society recommendation, accepted by HCFA
- 13=Specialty society recommendation, increased by HCFA

- 14 = Specialty society recommendation, decreased by HCFA
- 15 = Specialty society recommendation, no change from published value
- 16 = Global period increased
- 17 = Global period decreased

Key to Harvard Data:

The data in the first two boxes of Harvard data summarize the differences in service work between the Harvard study and each of the Medicare Fee Schedules -- 1992 through 1995. In this way, the file provides a record of the evolution of the work RVUs since their initial complete publication. To make this comparison, all the codes are listed in 1995 RVUs. In other words, the effect of the 5.18% reduction for each service due to rescaling for budget neutrality has been eliminated. This allows you to identify services for which the RVUs have changed for reasons other than budget neutrality.

The labels are defined as follows:

modif	CPT two-digit modifier, if any
packhv	Harvard study global surgical package
pack95	MFS 95 global surgical package
desc95	1995 CPT descriptor
Hrvtotwk	Harvard study total work
MFSWK95	MFS 95 total work
ratio5h	ratio MFSWK95 to hrvtotwk
MFSWK92	MFS 95 total work
MFSWK93	MFS 94 total work
MFSWK94	MFS 93 total work
ratio2h	ratio MFSWK92 to hrvtotwk
ratio32	ratio MFSWK93 to MFSWK92
ratio43	ratio MFSWK94 to MFSWK93
ratio54	ratio MFSWK95 to MFSWK94
comm	identity of commenter
recwk	commenter's recommended total work value
amacod	AMA code for comment

Further Information --

- Global Period describes the global service packaging used in the Harvard study and in the MFS.
- Work RVUs are the total work RVUs for the MFS and for the Harvard RBRVS Study. The Harvard study amounts are those reported in the Harvard Phase III Final Report, unless indicated otherwise.
- Ratios describe the ratio of one Work RVU to another. A ratio greater than 1.0 indicates an increase in RVUs, a ratio less than 1.0 indicates a decrease.

The Harvard data in the other three boxes summarizes service work and time estimates for each code under review. The labels are defined as follows:

pack95	MFS 95 global surgical package
desc95	1995 CPT descriptor
hrvtotwk	Harvard study total work
notetw	denotes the service work was measured for the total service
pret	pre-service time, before O.R. entry
svdpre	indicates whether estimate is from a survey or prediction model (*=prediction)
itime	intra-service time
notett	denotes the service time was measured for the total service
imppt	immediate pre-and post operative time
svdimp	indicates whether estimate is from a survey or prediction model (*=prediction)
sdvis	number of later same day post visits
svdsdvis	indicates whether estimate is from a survey or prediction model (*=prediction)
sdvisdur	average duration of same day post visits
hvis	number of follow-up hospital visits after the day of surgery.
svdhvis	indicates whether estimate is from a survey or prediction model (*=prediction)
hvisdur	average duration of post-hospital visits
icuis	number of follow-up hospital visits after the day of surgery that are in the ICU.
offvis	number of follow-up office visits after the day of surgery w/in global period.
svdoffd	indicates whether estimate is from a survey or prediction model (*=prediction)
offvdur	average duration of post-office visits
low_n	if equal to "j", indicates low number of survey responses for the Harvard estimate (N < 5)
recwk	total work value recommended by commenter
MFSWK95	1995 MFS total work value
sp	Harvard study specialty surveyed
phase	Harvard study phase service was studied in
twput	Harvard estimate of total work per minute (if relevant)
iwput	Harvard estimate of intra work per minute (if relevant)

Further Information:

- Specialty and phase (Source of Data) - The specialty surveyed in the Harvard Study is listed first (2-digit code), followed by an indicator of when the service was studied. An "n" indicates the time and work estimates are from the Harvard Study, with the intra-

service estimates derived from the phase I and II national surveys. A "3" indicates the time and work estimates are derived from the phase III surveys of technical expert panels. An 'xx' listed for specialty indicates two or more specialties were surveyed.

- Total Work - Estimate of total-service work. For the Harvard study estimates, the work values are derived primarily from the Harvard, Phase III results. The exceptions are for services where the global surgical period has been revised since the Harvard Study. For these services, the Harvard total work value has been adjusted to fit the new period. Harvard work values were multiplied by a constant factor to place them on the 1995 MFS scale of work.
- IWPUT - Harvard intra-work per unit time, equals intra work divided by intra time. If work and time were measured for the "total" service, work per unit time is equal to total work divided by total time (which is listed in the intra time column for these services). In these cases, total work per unit time is listed in parentheses under the total work estimate. This IWPUT is unadjusted for changes in work since the Harvard study.
- Pre- Before O.R. entry -- The amount of time (in minutes) spent by the surgeon on the day before and day of a procedure, up to admission to the operating room.
- Intra-Time -- The time spent by the physician performing the service itself (i.e. skin to skin time for incisional services or patient encounter time for office visits). For selected services, total rather than intra time is listed. These services are indicated with a "t" to the right of the time estimate.
- Immediate Pre-Post -- Immediate pre-and post operative time -- For surgical services, the amount of time spent by the surgeon from the admission to the operating room to the skin incision or beginning of the procedure, plus the time from skin closure until the patient leaves the operating room. For evaluation and management services, includes total pre- and post-service time.
- Later Same Day Post -- The amount of time spent by the surgeon after the patient leaves the recovery room on the day of the procedure. These data include the **number** and **duration** of surgeon post-operative visits to the patient during this period. The **Type** of visit is measured by minutes in increments of five.
- Hospital Post-Op -- The amount of time spent by the surgeon for in-hospital post-operative care after the day of the procedure. These data include the **number**, **duration**, and **ICU Visits** of surgeon post-operative visits to the patient during this period. The **Type** of visit is measured by minutes in increments of five.
- Office Post-Op -- The amount of time spent by the surgeon for post-operative care in the office after the day of the procedure. These data will include the **number**, and **duration** of post-operative visits to the patient during this period. The **Type** of visit is measured by minutes in increments of five.
- MFS95 Work -- The Medicare Fee Schedule Work Value for 1995.

AMA Procedure Profiles Analysis

The data reports present several selected types of information for each code under review in the five year review of the RBRVS. This information is intended to provide a "profile" of each code to assist AMA/Specialty Society RVS Update Committee in the evaluation of physician work.

The first box presents information on the characteristics of the beneficiaries that receive each service. The beneficiary characteristics data are from a 5% sample of Medicare physician/supplier claims for the first six months of 1994. These data provide information on a variety of factors which may be associated with health status or utilization. Included are information on the proportion of claims for beneficiaries that are: age 75 and over; age 85 and over; nonwhite; female; disabled only (non-aged, non-ESRD); ESRD only (non-aged, non-disabled), and; aged or disabled with ESRD. Location information is also provided -- in particular, the proportion of claims for the service that are provided in rural localities. (Rural localities are defined as Medicare payment localities that have more than 50% of the population outside of Metropolitan Statistical Areas (MSAs) according to the 1990 census.)

The second and third boxes provide frequency and site of service data from Medicare physician claims for 1992 and for the first half of 1994. These data are from HCFA's procedure summary files which contain information on virtually 100% of claims incurred in a given period. The 1994 frequency data are from the first six months of the year, and have been annualized for comparison with 1992 frequency. The average annual change in frequency and the average change in the hospital inpatient share of frequency are also presented.

The fourth box presents specialty mix information from the HCFA procedure summary file for the first six months of 1994. The specialties were ranked in descending order according to the share of total frequency for each code. The top eight specialties with at least 2% of total frequency for the code are displayed.

The last box presents information on the diagnosis of patients receiving each service. These data are also drawn from the 5% sample of Medicare physician/supplier claims for the first six months of 1994. Medicare physician/supplier claims contain up to four "claim-level" ICD9 diagnosis codes. These (typically five-digit) diagnosis codes have been truncated to three-digit codes. Table 1 reports the three-digit claim-level ICD9 codes most commonly reported for each service. The percentage reported is the number of times a diagnosis code was reported out of the total number of claim-level diagnosis codes possible for a service. (For example, if there are 10 claims for a given service then there are 40 possible claim-level diagnosis codes that could be reported.) Descriptors for the three-digit ICD9 codes are also provided.

Because the summary statistics for the beneficiary characteristics and diagnosis data are based on a sample of claims (rather than virtually 100% of claims as for the frequency, site of service and specialty mix data), these measures will be missing for many low-volume codes. There will also be some sampling error in these estimates, particularly among low-volume codes.

Specialty Society Acronyms

AAAI	American Academy of Allergy & Immunology
AACAP	American Academy of Child & Adolescent Psychiatry

Evaluation and Management Services

Comments

Comments were submitted by a number of specialty societies representing primary care physicians recommending that the CPT codes for evaluation and management services (E/M) be included in the five-year review of the RBRVS. Comments from the American Society of Internal Medicine (ASIM) and the American College of Physicians (ACP) were referred to the RUC, focusing particularly on the need to review the relative values for office visits, hospital visits, and consultations. The American Academy of Family Physicians (AAFP) had submitted similar comments, but this comment letter was not referred to the RUC. To prepare for the five-year review, the AAFP and ASIM had conducted large surveys of their membership in late 1994 to determine which codes should be included and why. Their comments offered three major reasons for including E/M services in the review:

- **The physician work involved in the services has increased since the time that the Harvard RBRVS study was conducted. Sweeping changes in the delivery of health care have had a major impact on primary care services. The growth of managed care and pressure to contain costs have created a great deal of pressure to keep patients out of hospitals and emergency rooms and, if they are hospitalized, to discharge them as quickly as possible. As a result, the typical patient seen in both the office and the hospital is more complex than in the mid-1980s. In addition, a larger proportion of the frail elderly population is living in the community and, therefore, being seen by physicians in the office rather than being cared for in an institutional setting. Hospitalized patients are likely to be hospitalized for a very short period, so subsequent hospital visits are more likely to occur on the second or third hospital day than the sixth or seventh. During office visits and subsequent hospital visits, physicians must make diagnostic and treatment decisions within a shorter time frame and based more on history, examination, and test results, rather than observation over several days or a week. Changes in the delivery system have had an even greater impact on postservice work. Relative to the mid-1980s, much more time and effort is required to:**
 - document care and respond to questions regarding medical necessity and adherence to quality standards;
 - obtain or provide authorizations for tests and referrals;
 - coordinate care with other health professionals and family members, particularly for elderly patients; and
 - provide education regarding issues such as fall prevention and adverse drug reactions, and respond to questions from an increasingly well-informed patient population.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU developed by facilitation committee; 5 = Adopt decreased RVU to maintain neutrality

The amount of work involved in documenting services in the medical record, for example, has increased dramatically. The emphasis of Medicare and other insurers on medical necessity has been greatly heightened, and physicians are required to document both (1) that they did what they claim they did and (2) that what they did was medically necessary. Demands by Medicare for better documentation of the services actually provided to patients in visits and consultations were, in fact, among the major reasons for developing the new E/M coding system.

- **These services are undervalued relative to most of the other services on the RBRVS.** It would be difficult to find a non-E/M service on the RBRVS which involves 25 minutes of intraservice time and is valued below the 0.94 RVUs of a 99214 (office visit, established patient). For virtually every service on the RBRVS, the ratio of total work RVUs to total minutes of service is 0.05. For 99214, with 35 minutes total time assumed in the Harvard study, the ratio is only 0.027. By definition, the highest level E/M services involve a "comprehensive examination" and "medical decision making of high complexity," yet the RVUs are lower than procedures that require less time, less mental effort and judgement, and less technical skill and physical effort. Code 12002 [*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm*], for example, involves 22 minutes of intrawork and 44 minutes of total time and has 1.81 RVUs, compared with 99215 [*Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a comprehensive history; a comprehensive examination; medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs.*], which involves 40 minutes of intrawork, 55 minutes of total work, and has 1.51 RVUs. Code 45378 [*Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)*] involves 39 minutes of intrawork and 93 minutes of total time and has 3.70 RVUs, compared with 99205, which involves 60 minutes of intrawork and 83 minutes of total work, but only has 2.28 RVUs. The ACP's comments stated that an intrawork per unit time (IWPUT) analysis by the College of most of the services on the RBRVS found that the E/M services are currently at the 3.5 percentile, meaning that 96% of the services on the RBRVS are rated as being more difficult than E/M. Those commenting believe that the current relationships between the E/M services they provide and the non-E/M services provided by these same physicians are not correct.
- **The current CPT-coded services were never directly surveyed or studied in the Harvard RBRVS study.** Harvard conducted its national surveys from 1986 through 1988, so they were completed four years prior to publication of the current E/M codes in CPT and their use in the Medicare RBRVS payment system. At the time that the Harvard study was conducted, E/M services were not defined based on the level of history, examination, and medical decision making. The vignettes used in this study were never intended to distinguish physician services based on these factors; they provided a brief description of the patient's chief complaint, presenting medical problem, or diagnosis, but did not provide information about the physician service being provided. The data from these surveys could not be directly used to establish RVUs for the new codes. Instead, a "crosswalk" was estimated from the old to the new coding system. Pre- and postwork was not directly surveyed, nor had the postservice period been defined at the time the codes and relative values were implemented, so the Harvard study made no attempt to measure the physician work that occurs from the day following the visit until the next face-to-face encounter occurs. Whatever telephone calls and other physician services are provided in this period are considered to be "bundled" into the RVUs for the visit, yet this bundle was never defined. In addition, as noted above, documentation requirements have greatly increased so, for example, physicians must document

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU developed by facilitation committee; 5 = Adopt decreased RVU to maintain neutrality

that each element of the service definition has actually been provided. For example, to document a "comprehensive" examination, the physician must record what organs have been examined to support that a single-system or multisystem exam has been done.

Comments submitted by the American Medical Directors Association (AMDA) and the American Association of Homecare Physicians (AAHP) were also referred to the RUC for review. These comments suggested that the relative values assigned to nursing home and home visits should also be included in the five-year review.

The CMDs submitted comments on the ophthalmology codes for eye examinations, comparing them to the relative values for office visits. The RUC considered these codes along with the office visit codes.

RUC Review

The RUC agreed with all the commenters that an in-depth review of the work involved in office and hospital visits and consultations was warranted. The RUC has previously revisited the established relative values for many families of services within CPT and for virtually all specialties; however, the five-year review is the first opportunity to review the relative values assigned to the E/M codes introduced in 1992.

The RUC had developed a modified survey instrument for use in the five-year review. To address the E/M codes, the questionnaire was further modified (1) to make it more relevant to E/M services and (2) to address some of the specific points made in the comments:

- For procedural services, surveyed physicians were asked about four components of postoperative care: postwork on the day of the procedure, ICU visits, other inpatient visits, and office visits after discharge. To obtain data on the postservice work for E/M services, surveyed physicians were asked about five components of work following the face-to-face encounter: documentation of the service provided; arranging for further services; reviewing results of studies; communicating further with the patient, family, and other professionals; and, providing written or telephone reports to Medicare or other third party payors.
- To assess the relationship between E/M services and procedural services, the services on the reference list for each survey were divided into Category A and Category B. Category A was comprised of reference services that were other E/M services that were not being surveyed as part of the joint study; Category B was comprised of procedural reference services. In choosing the two reference services to use as comparisons for each service being rated, respondents were asked to choose one from Category A and one from Category B.
- The questionnaire for other services in the five-year review asked whether the work involved in the service had changed in the last five years and, if so, how. In the E/M questionnaire, these questions were modified. Physicians responding "Yes" to the question of whether the work had changed were then asked whether the typical complexity of patient problems in the relevant setting, the typical complexity of patients in the inpatient setting, and the work associated with coordination and documentation has increased, decreased, or stayed the same in that period.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU developed by facilitation committee; 5 = Adopt decreased RVU to maintain neutrality

Standard RUC procedures allow all the specialty societies expressing interest in developing data on a code that is under review to participate in the survey process. In addition to the AAFP, ASIM, and ACP, as many as 8 other groups participated in developing data for each code, including pediatricians, osteopathic physicians, geriatricians, nurses, physician assistants, and physicians specializing in rheumatology, cardiology, and neurology. To ensure that the survey results would be as valid as possible, specialty representatives agreed on the following survey procedures before the survey was conducted:

- The clinical vignettes used in the surveys were those that had been validated by the CPT Editorial Panel and included in either the main CPT book or the clinical examples supplement (Appendix D). The RUC survey, therefore, used clinical vignettes that had been empirically demonstrated to be appropriate for the CPT codes being reviewed.
- A standard set of reference services was chosen for use in the surveys. To avoid the problem of comparing the services being surveyed to other E/M services that would themselves be moving targets, the Category A services selected were those that the surveying specialties considered to be appropriately valued in the current RBRVS: preventive medicine (99381-99397), observation care (99217-99219), emergency room visits (99281-99283), and critical care (99291-99292).
- The issue of whether the IWPUT is the same or different for all levels of service within an E/M family was addressed by HCFA in 1992. HCFA concluded at that time that IWPUT is constant within a family from the lowest to highest level of service. The group agreed not to revisit this question, but to instead survey one or two codes within each family and then extrapolate to the other codes based on the IWPUT of the surveyed codes, maintaining a constant IWPUT for each level of service. This decision also meant that each survey respondent could be asked to rate the work of fewer codes, which seemed likely to increase the response rate for the survey.

The joint efforts of these societies resulted in about 150 completed surveys for each surveyed code. A median value was calculated for each specialty, and these values were weighted to develop the recommended RVUs. This weighting process took into account the percentage of the services that are provided by each specialty, the number of respondents from the specialty, and other factors affecting the validity of each specialty's survey process.

RUC Recommendations and Rationale

Office and Hospital Visits

The RUC found the arguments made by the specialties and the results of the survey very compelling and recommends increases in the RVUs for office visits for new and established patients, subsequent hospital visits, and inpatient and outpatient consultations. In particular, the RUC found that the surveyed RVUs produced a more reasonable relationship between E/M and non-E/M services on the RBRVS, with the ratio of total work to total time moving closer to the level that has been consistently identified for all other services. For instance, in the example above comparing 99215 and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU developed by facilitation committee; 5 = Adopt decreased RVU to maintain neutrality

12002, the RVUs for 99215 would be increased from 1.51 to 1.90, which is slightly more than 12002 and reflects the greater time and mental effort and judgement involved in the E/M service, as well as the increased complexity of postwork since the service was originally valued.

In addition to the survey results, the RUC's recommendations are also based on rigorous multidisciplinary review by surgeons and other specialists who share the primary care groups' views regarding the increase in the work of E/M services in the last five years and the failure of the current RVUs to appropriately recognize the time and effort involved in both intra- and postservice work. Although primary care physicians are a minority of the RUC members, the RUC's votes on adoption of the recommendations for these services were nearly unanimous.

Objective data on trends in the delivery of care confirms the statements made by the primary care societies and RUC members. Attachment 1 shows a clear shift in care from inpatient to outpatient settings. Attachment 2 graphically depicts the RUC recommended RVUs for many of the E/M code families so that their values may be seen in relation to one another.

The RUC's evaluation of these recommendations focused principally on the work involved in them, how that work has changed over time, and how the service work is related to the work of other E/M and non-E/M services. The survey respondents' ratings of work appeared to be accurate. Some problems were noted in the survey results for postservice time, however. Within the questionnaire, the splitting of reported postservice time into documentation, arranging for further studies, reviewing study results, communicating with the patient, family, and other professionals, and providing reports to insurers, seems to have led to overestimates of total postservice time. This may be due either to rounding, to overlap within categories, or just to the tendency of survey respondents to want to fill in all the boxes on a questionnaire. The RUC concluded, therefore, that although postservice time is underestimated in the Harvard data considering what is involved in these services in 1995, it is likely overestimated in the RUC survey data. The correct estimate of postservice time is likely somewhere between these two estimates. The time estimates for hospital services were more problematic than the estimates for office services, because the intraservice period is defined as time on the patient's floor. Many services, such as arranging for further studies and reviewing results, could take place either on the patient's floor, elsewhere in the hospital, or in the physician's office, thus making precise estimates difficult to obtain.

The uncertainty surrounding the postservice time estimates did not affect the extrapolation from surveyed to nonsurveyed services within a family, however. Extrapolation was based on work per unit time, and this remains constant within each family whether the surveyed postservice times are used as is or are reduced by some percentage. The typical times listed in the CPT descriptors were used for this purpose.

Consultations and Home Visits

Another problem in the survey results was that, although generalists were well-represented in the survey, subspecialists were not as well represented. As indicated above, survey medians were weighted to ensure that responses from those who provide the services most frequently were weighted most heavily in the recommendations. Most office and hospital visits are provided by primary care physicians, but office and hospital consultations are provided more by internal medicine subspecialists. Two of the three home visits that were surveyed are provided mostly by podiatrists, and other home visit services are provided by special groups of physicians, such as the members of the AAHP, in addition to the major groups surveyed. This

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU developed by facilitation committee; 5 = Adopt decreased RVU to maintain neutrality

made the weighting process more problematic, so the consultation codes were referred to a multidisciplinary facilitation committee of the RUC. The decisions made by the facilitation committee and adopted by the RUC are discussed in the table below. (Note that the "Key" for these services is somewhat different as a "4" indicates the recommendations were developed by this facilitation committee, instead of indicating that the RVUs are lower than those recommended by the specialty societies.)

Podiatrists were not included in the survey of home visit services and there were relatively few responses from the AGS and the AAHP compared to the large primary care societies. In retrospect, it also seemed that all the home visit codes may need to be surveyed, rather than the sample selected. The RUC is recommending on an interim basis, therefore, that the current RVUs be maintained, but will review new and more comprehensive survey data at its next meeting.

Emergency Room Visits and Critical Care

Comments submitted by the American College of Emergency Room Physicians (ACEP), the National Association of Medical Directors of Respiratory Care (NAMDRC), the American College of Cardiology (ACC), and the Society of Critical Care Medicine (SCCM) for the RVUs of emergency room and critical care codes were also referred to the RUC by HCFA. In general, the comments stated the physician work is intense, often involving integrating care for several patients each with urgent problems.

ACEP conducted a survey of the two highest level emergency room visit codes. This was separate from the survey of other E/M codes discussed above, and 44 responses were obtained. The RUC did not believe that the arguments and survey data presented by ACEP were sufficiently compelling to justify the recommended increases in these services.

The SCCM recommendations are based on survey responses from nearly 100 intensivists, emergency room physicians, and pulmonologists. Although code 99291 may be reported for 31-74 minutes of critical care, the median surveyed time was 60 minutes, and the service was considered to require more work than the key reference services, including cardiopulmonary resuscitation (code 92950, 3.80 RVUs). The RUC recommends that the RVUs be increased from 3.64 to 4.00 for code 99291 and from 1.84 to 2.00 for code 99292.

Ophthalmology Visits

The CMDs compared 92002 [*Eye exam new patient*], 92004 [*Eye exam new patient*], 92012 [*Eye exam established patient*], and 92014 [*Eye exam and treatment*] to E/M office visit codes. The RUC agrees with the comparisons made by the CMDs, and recommends that a permanent link be established between ophthalmology eye exam codes and the E/M codes. Code 92002 should be equal to 99202 [*Office/outpatient visit, new*], 92004 should equal the average of 99203 [*Office/outpatient visit, new*] and 99204 [*Office/outpatient visit, new*], 92012 should be equal to 99213 [*Office/outpatient visit, established*], and 92014 should be equal to 99214 [*Office/outpatient visit, established*]. The RUC-recommended RVUs for the eye exam codes reflect the recommended increases in the RVUs for codes 99202, 99203, 99204, 99213 and 99214; however, for all the codes except 92014, the RUC recommended RVUs represent a reduction from the 1995 RVUs for eye exam codes.

Code	Descriptor	95 RVU	RUC Rec RVU	Intra-Time	IWPUT	RUC Rationale	Key
OFFICE VISITS							
99201	Office or other outpatient visit for the evaluation and management of a new patient, which requires these three key components: a problem focused history; a problem focused examination; and straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problems are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.	0.38	0.39	10	0.022	Codes 99203, 99205, 99213, and 99215 were surveyed by the specialty societies using the survey instrument described above. The survey indicated that the new patient office visit codes are currently undervalued by 5-6%, but that the established patient office visits are undervalued by about a third. Changes in the delivery of health care, such as the need to manage more complex patient problems in the office and the need to manage the chronic diseases and multiple comorbidities of elderly patients, have had a particularly significant impact on the physician work involved in providing office services to established patients. In addition, postservice work, such as arranging for further studies and communicating further with the patient, family, and other professionals, is a greater proportion of total work than it used to be and than is suggested by the Harvard study.	1
99202	Office/outpatient visit, new ... expanded problem focused history; expanded problem focused examination; straightforward medical decision making.	0.75	0.79	20	0.022

Code	Descriptor	95 RVU	RUC Rec RVU	Intra- Time	IWPUT	RUC Rationale	Key
HOSPITAL VISITS AND FOLLOW-UP CONSULTATIONS							
99221	Initial hospital care, per day, for the evaluation and management of a patient which requires these three key components: a detailed or comprehensive history; a detailed or comprehensive examination; and medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of low severity. Physicians typically spend 30 minutes at the bedside and on the patient's hospital floor or unit.	1.06	1.06	30	0.024	The specialty surveys did not find that the work of initial hospital care, which is essentially the hospital admission service, had increased sufficiently to justify an increase in the RVUs. There has been a clear trend in claims for these services of the highest level service being reported more frequently and the first and second level of service being reported less frequently, suggesting that coding is accounting for some increased patient complexity. In addition, increases in preservice work may be showing up in the office visits as physicians try to avoid hospital admissions, and increases in postservice work may be reflected in subsequent hospital visits and discharge day services.	2
99222	Initial hospital care ... comprehensive history; comprehensive examination; medical decision making of moderate complexity.	1.84	1.84	50	0.024		
99223	Initial hospital care ... comprehensive history; comprehensive examination; medical decision making of high complexity.	2.57	2.57	70	0.024

Code	Descriptor	95 RVU	RUC Rec RVU	Intra-Time	IWPUT	RUC Rationale	Key
INPATIENT AND OUTPATIENT CONSULTATIONS							
99251	Initial inpatient consultation for a new or established patient, which requires these three key components: a problem focused history; a problem focused examination; and straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 20 minutes at the bedside and on the patient's hospital floor or unit.	0.54	0.63	20	0.023	The RUC reviewed the office consultation and initial inpatient consultation codes and survey data on them and concluded that the RVUs for the two families of services should be equivalent at all levels except the highest. This preserves the same relationship that exists in the current RVUs for these services, but recognizes that the work of the services has increased over time and that they are undervalued compared to key reference services. The RUC concluded that there is little difference, in either CPT definition of the service or physician work involved, between an office/outpatient consultation and an inpatient consultation. The RVUs were increased to the values supported by survey data. These data were weighted more heavily toward the responses from internal medicine subspecialists since they are the most frequent providers of the services.	4
99252	Initial inpatient consultation, new or established ... expanded problem focused history; expanded problem focused examination; straightforward medical decision making.	1.13	1.25	40	0.022		
99253	Initial inpatient consultation, new or established ... detailed history; detailed examination; medical decision making of low complexity.	1.56	1.90	55	0.023		
99254	Initial inpatient consultation, new or established ... comprehensive history; comprehensive examination; medical decision making of moderate complexity.	2.27	2.50	80	0.022

Code	Descriptor	95 RVU	RUC Rec RVU	RUC Rationale	Key
HOME VISITS					
99341	Home visit for the evaluation and management of a new patient, which requires these three key components: a problem focused history; a problem focused examination; and medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity.	1.12	1.12	Two of the three home visit codes that were surveyed are provided mostly by podiatrists. Podiatrists were not included in the survey of home visit services and there were relatively few responses from the AGS and the AAHP compared to the large primary care societies. In retrospect, it also seemed that all the home visit codes may need to be surveyed, rather than the sample selected. The RUC is recommending on an interim basis, therefore, that the current RVUs be maintained, but will review new and more comprehensive survey data at its next meeting.	2
99342	Home visit, new ... expanded problem focused history; expanded problem focused examination; medical decision making of moderate complexity.	1.58	1.58		
99343	Home visit, new ... detailed history; detailed examination; medical decision making of high complexity	2.09	2.09		
99351	Home visit for the evaluation and management of an established patient, which requires at least two of these three key components: a problem focused interval history; a problem focused examination; medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving.	0.83	0.83

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU developed by facilitation committee; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC Rec RVU	RUC Rationale	Key
99352	Home visit, established ... expanded problem focused interval history; expanded problem focused examination; medical decision making of moderate complexity.	1.12	1.12	See previous page.	2
99353	Home visit, established ... detailed interval history; detailed examination; medical decision making of high complexity.	1.48	1.48		
EMERGENCY ROOM VISITS					
99284	Emergency department visit for the evaluation and management of a patient, which requires these three key components: a detailed history; a detailed examination; and medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of high severity, and require urgent evaluation by the physician but do not pose an immediate significant threat to life or physiologic function.	1.68	1.68	ACEP argued that emergency medicine is unique in the E/M codes since emergency care is unscheduled. Because of this, time is not a reliable predictor of the work that is performed by emergency room physicians. The College also stated that problems in patient access to office-based primary care physicians have led to emergency department patients being sicker and more complex, and they noted that the physician documentation requirements have increased significantly for quality assessments and the encouragement of outpatient management modalities. The specialty recommended an RVU of 2.25 for 99284 and 3.23 for 99285 both of which represent the survey medians. The RUC questioned why, if these contentions were true, they would only affect the highest level codes. The RUC concluded that sufficient evidence had not been presented to support the argument that the work has increased, and recommends that the current RVUs be maintained.	2
99285	Emergency department visit... which requires these three key components within the constraints imposed by the urgency of the patient's clinical condition and mental status: comprehensive history; comprehensive examination; medical decision making of high complexity.	2.63	2.63

Code	Descriptor	95 RVU	RUC Rec RVU	RUC-Rationale	Key
CRITICAL CARE					
99291	Critical care, evaluation and management of the critically ill or critically injured patient, requiring the constant attendance of the physician; first hour	3.64	4.00	92% of the survey respondents stated that the patients are more complex. SCCM selected as one of the key reference services CPT code 92950 - cardiopulmonary resuscitation (3.80), noting that in performing CPR, the physician analyzes the patients heart rhythm, blood pressure, pulse, and blood gases. In judging the magnitude of the cardiorespiratory failure and implementing the treatment, the physician focuses on cardiorespiratory function. The procedure takes 20-30 minutes, but no longer than 30 minutes. In contrast, when providing critical care the physician analyzes the indicators used in providing CPR, plus additional factors, including brain protection and metabolic function, and often treats multiple organ failure. SCCM contends that the provision of critical care takes at minimum 31 minutes, and often lasts as long as 74 minutes. SCCM recommends that the RVUs of 99291 and 99292 be increased to 4.00 and 2.00 RVUs respectively. These higher values also represent the survey medians.	1
99292	Critical care, evaluation and management of the critically ill or critically injured patient, requiring the constant attendance of the physician; each additional 30 minutes	1.84	2.00

OPHTHALMOLOGY VISITS				CMD Comments	
92002	Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; intermediate, new patient	1.01	0.79	A national coding organization (Med Index) lists the following services necessary for 92002: History, general medical observation, external ocular and adnexal examination, other diagnostic procedures as indicated, and mydriasis (optional). There are almost no "other diagnostic procedures" for which the ophthalmologist/optometrist does not bill separately. Hence, all of the other issues are equivalent to what a physician does for 99202.	3
92004	Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, one or more visits	1.61	1.50	This same coding organization lists the following services for a "comprehensive level of service": History, general medical observation, external and ophthalmoscopic examination, gross visual fields, basic sensory motor examination. Often includes microscopy, dilation, tonometry. It appears that this is no different than what a provider does for the average of 99204 and 99203.	3
92012	Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; intermediate, established patient	0.82	0.80	The services included in 92012 are listed under 92002. This level of service is no different than what a physician provides for 99213.	3
92014	Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; comprehensive, established patient, one or more visits	1.06	1.27	The services required for 92014 are listed under 92004. These services are no more than a physician provides for 99214 visit.	1

Attachment 1

The data on these graphs represent a time series comparison of inpatient days and outpatient visits. The American Hospital Association defines inpatient days as the "number of adult and pediatric days of care, excluding newborn days of care, rendered during the entire reporting period (one year)".¹ Outpatient visits are defined as those provided to individuals who are not lodged in the hospital while receiving hospital services. Further breakdown of the data is into General Short-term nongovernment not-for-profit and General Short-term nongovernment investor-owned (for profit). The definition of a general hospital is very broad in that it includes other specialty hospitals, such as obstetrics and gynecology; eye, ear, nose and throat; rehabilitation; and orthopaedic, whose facilities are open to the public. Short term is defined by the AHA as a hospital in which the average length of stay is less than 30 days.² The other characteristics of the two hospital types are self explanatory.

The data show a gradual decline in inpatient days and a dramatic increase in outpatient visits. From 1988 to 1993, the most recent year for which data are available, in the not-for-profit sector inpatient days saw a 5% decline while outpatient visits saw a 38% increase. Over this same period in the for profit sector inpatient days dropped by 4% and outpatient visits increased 34%. This data shows a distinct trend toward moving patients away from an inpatient setting to providing services on an outpatient basis. This changing patient distribution has had profound effects on the delivery of E/M services.

Attachment 2

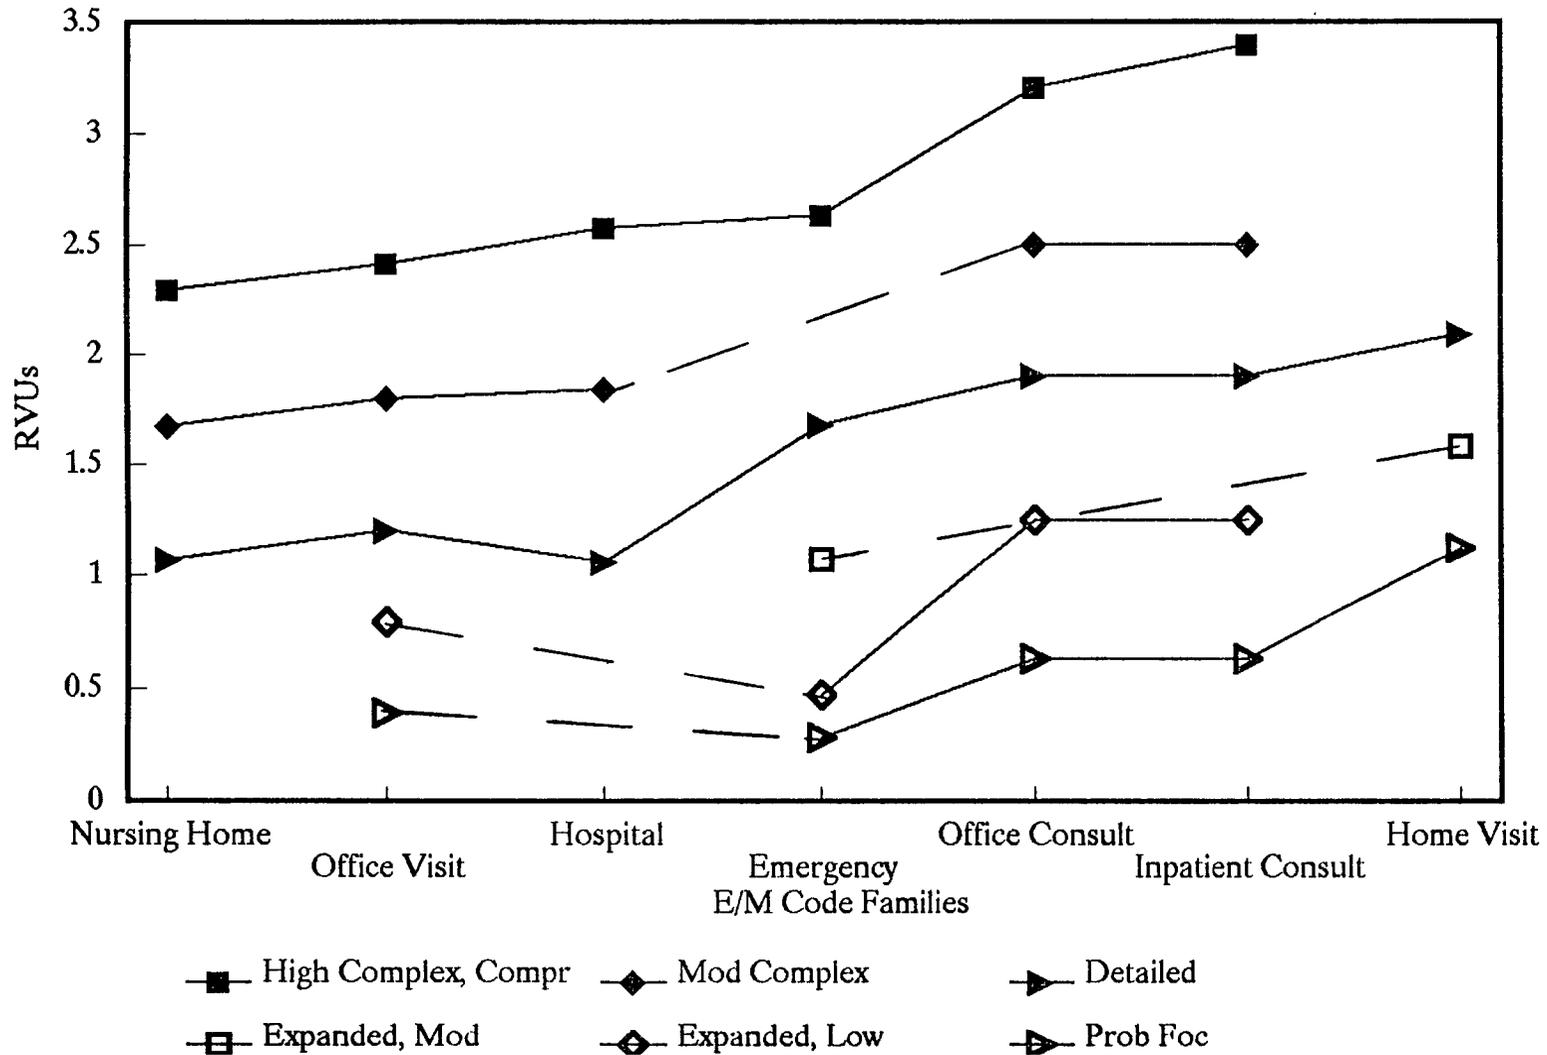

These two charts plot RUC proposed RVUs for families of E/M codes involving new patients and established patients. The charts' vertical axis represents the work RVUs proposed by the RUC. The horizontal axis describes the different families of E/M services: Nursing Home Visits, Office Visits, Hospital Services, Emergency Room Visits, Office Consultations, Inpatient Consultations and Home Visits. Across the chart, codes with similar CPT descriptors and level of complexity are connected to show the relationship of work RVUs across different settings. The trend or direction of the connecting lines help visualize the relationships among families of E/M services. To this end, the RUC reviewed the charts as a means of understanding the pattern and relationship of work RVUs among codes established by the RUC recommended values.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99201 Global Period: XXX Current RVW: 0.38 Recommended RVW: 0.39

CPT Descriptor: Office or other outpatient visit for the evaluation and management of a new patient, which requires these three key components: a problem focused history; a problem focused examination and straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problems are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

CPT Code: 99202 Global Period: XXX Current RVW: 0.75 Recommended RVW: 0.79

CPT Descriptor: Office or other outpatient visit for the evaluation and management of a new patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; and straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 20 minutes face-to-face with the patient and/or family.

CPT Code: 99204 Global Period: XXX Current RVW: 1.71 Recommended RVW: 1.80

CPT Descriptor: Office or other outpatient visit for the evaluation and management of a new patient, which requires these three key components: a comprehensive history; a comprehensive examination and medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: AAP, ACP and others.

Increased complexity of patients due to shift from inpatient to outpatient setting over the last 5 - 7 years; increased post service work over the past 5 - 7 years due to the increased complexity of the patients and prevalence of managed care arrangements, E/M codes thought to be undervalued in general, and especially as compared to non E/M services, and low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The RVWs for these codes were extrapolated from the surveyed codes within this family of services, 99203 and 99205. In extrapolating, we assumed linear relationships within the family of services. The ratios of pre-service plus post-service time to intra-service time and the calculated intra-service intensities of 99203 and 99205 were used to perform the extrapolation. The intra-service intensities for 99203 and 99205 were calculated using the following formula:

$$\{RVW/[(pre-service + post-service time/CPT intra-service time) + 1] \} / CPT intra-service time.$$

Because of an inconsistency in the survey instrument for the hospital admit, follow-up, and consult codes, the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the office/outpatient visit and consult codes.

Based on the median of the ratios of pre-service plus post-service time to intra-service time and the calculated intra-service intensities of 99203 and 99205, the ratio of pre-service plus post-service time to intra-service time and intra-service intensity were extrapolated to 99201, 99202, and 99204. Once these numbers were available, the RVW was calculated using the above formula.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

Code: 99203 Global Period: XXX Current RVW: 1.14 Recommended RVW: 1.20

EPT Descriptor: Office or other outpatient visit for the evaluation and management of a new patient, which requires these three key components: a detailed history; a detailed examination; and medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: AAP, ACP and others.

Increased complexity of patients due to shift from inpatient to outpatient setting over the last 5 - 7 years; increased post-service work over the past 5 - 7 years due to the increased complexity of the patients and prevalence of managed care arrangements, E/M codes thought to be undervalued in general, and especially as compared to non E/M services, and low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

CLINICAL DESCRIPTION OF SERVICE:

Vignettes Used in Survey:

AAP/ANA/AOA: Initial office visit for a 50 year-old female with dyspepsia and nausea. Detailed history including gastrointestinal system, food character of discomfort, and bowel habits. Detailed exam including chest and abdomen, and a rectal with hemoccult. Medical decision making of low complexity and discussion of diet, medication, diagnostic tests and follow-up with the patient.

AAP/AOA: Initial office visit for a new patient, a 6 year old male with a two day history of lower abdominal pain with occasional vomiting. Detailed history including gastrointestinal system, fever, appetite, and characteristics of pain and bowel movements. Detailed examination of chest and abdomen including rectal examination. Medical decision making of low complexity and ordering of laboratory studies and initiation of plans for surgical consultation.

ACC: Initial office visit for a 67 year old diabetic man complaining of exertional chest discomfort. The physician performs a detailed history and detailed physical examination including the vascular system in the neck and extremities, fundi, heart, lungs and abdomen. Medical decision making is of low complexity and involves ordering electrocardiogram, exercise stress test, lab work to check lipid profile, electrolytes and glucose, and initiating medical therapy. Alternative approaches to diagnosis and therapy are explained to the patient including the possibility of hospitalization for coronary arteriography.

ACP/AOA/ASIM: Initial office visit for evaluation, diagnosis and management of painless gross hematuria in new patient, without cystoscopy. Detailed history including genitourinary system and bleeding disorders. Detailed examination including abdomen, genitalia, back and skin for evidence of coagulopathy. Medical decision making of low complexity including discussion with patient about diagnostic testing and follow-up.

ACRb: Initial office visit for a 15 year old male, basketball player, with episodic knee swelling following activity.

Description of Pre-Service Work: Preparing to see the patient, reviewing records, and communicating with other professionals as appropriate.

Description of Intra-Service Work: A detailed history, detailed examination, and medical decision making of low complexity.

Description of Post-Service Work: All coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients).

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
	Emergency department visit for the evaluation and management of a patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; and medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity.	1.07
12002*	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm	1.81

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

are the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) service you are rating to the key reference services listed above.

Compared to reference service 99283, the pre-, intra-, and post-service time of 99203 are greater due to the detailed vs. expanded problem focused history and examination. The mental effort and technical skill are greater for 99203, again due to the extent of the history and examination, while the psychological stress is greater for 99283 because of the intensity of patient care in the emergency situation. This would suggest that the RVW for 99203 be somewhat higher than for 99283. Compared to reference service 12002, the pre, intra, and post service of 99203 are similar or slightly higher. The mental effort of 99203 and 12002 is similar while the increased technical skill and psychological stress are higher for 12002 because of the training and experience needed to repair the wound, and with a wound of this size there is an increased risk for prolonged scarring. This would suggest that the RVW for 99203 be less than the RVW for 12002.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The median surveyed RVW of 1.35, which would be an 18% increase over the current RVW of 1.14 seemed difficult to justify, especially due to the range of median surveyed RVWs by the specialty societies (1.08 - 2.00), and only 54% of respondents indicating that the work of this service has changed over the last 5 years. According to AMA trends analysis, 15.3% of Medicare billing for 99203 were from general/family practice while 10.8% were from internal medicine. In addition, AAFP, ACP, and ASIM had a much smaller spread in surveyed median RVWs (1.37, 1.14, and 1.00 respectively). Therefore, it was felt by the group that a strong argument could be made to increase the RVW to 1.20, which gives more weight to the survey data of AAFP, ACP, and ASIM, and a 5% increase over the current RVW. The rationale for this increase is that pre- and post-service time has increased from the 12 minutes extrapolated by Hsiao to the 29 minutes identified by the survey respondents. An explanation for this may be that Hsiao's extrapolated values do not take into account the extent of post-service work between face-to-face encounters. In addition, over the last 5 years, there has been an increase in the pre and/or post service work due to: increased documentation requirements; increased case management and telephone calls in between face-to-face encounters; and fewer follow-up visits for the same problem. The increased RVW to 1.20 and the increased pre- and post-service time lead to an intra-service intensity of 226 for 99203.

Due to an inconsistency in the survey instrument for the hospital admit, follow-up, and consult codes, the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the office/outpatient visit and consult codes.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 99205 Global Period: XXX Current RVW: 2.28 Recommended RVW: 2.41

CPT Descriptor: Office or other outpatient visit for the evaluation and management of a new patient, which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: AAP, ACP and others.

Increased complexity of patients due to shift from inpatient to outpatient setting over the last 5 - 7 years; increased post-service work over the past 5 - 7 years due to the increased complexity of the patients and prevalence of managed care arrangements, E/M codes thought to be undervalued in general, and especially as compared to non E/M services, and low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

CLINICAL DESCRIPTION OF SERVICE:

Vignettes Used in Survey:

AAP/ACP/AOA/ASIM: Initial outpatient evaluation of a 69 year-old male with severe chronic obstructive pulmonary disease, congestive heart failure, and hypertension. Comprehensive history including extensive as to prior treatment, tests and details needed to seek old records. Comprehensive examination including neurologic exam. Lengthy problem list with plans for new diagnostic testing. Medical decision making of high complexity. Lengthy discussion with patient about multisystem illness severity, prognosis without adequate treatment and follow-up. Counseling including smoking, diet, and medication compliance.

AAP/AOA: Initial office visit for a 5 year old child with a history of a motor vehicle accident at 18 months of age with massive head injury resulting in neurological damage without seizures. A comprehensive history including neurological system, social interaction, and response to previous therapies. A comprehensive examination reveals neurologic deficits. Medical decision making of high complexity and discussion of plans for ongoing management with the family, referrals are made to appropriate community resources, and prescriptions for medications are telephoned to local pharmacists.

ACC: Initial office evaluation of a 65 year-old woman with exertional chest pain, intermittent claudication, syncope and a murmur of aortic stenosis. The physician performs a comprehensive history and comprehensive physical examination including supine and upright blood pressures, vascular system in neck and extremities, heart, neurological system. Medical decision making is of high complexity and involves ordering appropriate diagnostic procedures (electrocardiogram, 2-D and Doppler echocardiography for estimated degree of stenosis and function of ventricle, chest x-ray to check for cardiac hypertrophy and valvular and/or aortic root calcification) and decision regarding hospitalization for cardiac catheterization and coronary angiography and possible head-up tilt table testing. Alternative approaches to diagnosis and therapy are explained to the patient.

ACRb: Initial office evaluation, patient with systemic lupus erythematosus, fever, seizures, and profound thrombocytopenia.

Description of Pre-Service Work: Preparing to see the patient, reviewing records, and communicating with other professionals as appropriate.

Description of Intra-Service Work: A comprehensive history, a comprehensive examination, and medical decision making of high complexity.

Description of Post-Service Work: All coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding call plan oversight of more than 30 minutes per month for home health and hospice patients).

SURVEY DATA:

Specialty: AAFP (50 respondents), AAP (39), ACC (9), ACP (15 general internists, 1 cardiologist, 1 hematologist, and 1 pulmonologist), ACRh (8), AOA (5), ASIM (11 general internists, 3 pulmonologists, 3 gastroenterologists, 2 endocrinologists, 2 allergists, 2 rheumatologists, 1 oncologist, and 1 geriatrician)

Sample Size: 913 Response Rate (%): 14% Median RVW: 2.41

25th Percentile RVW: 2.06 75th Percentile RVW: 2.80 Low: 0.47 High: 6.00

Median Pre-Service Time: 10 min Median Intra-Service Time: 45 min

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

As compared to 99220, the pre-, intra-, and post-service times are higher for 99205 because of the required elements of history and examination. The mental effort is greater for 99205 because of expanded differential diagnosis and medical decision making of high complexity, reviewing extended options, extended data and, by definition, the high risk of the procedure. Technical skill and psychological stress are similar for 99220 and 99205. Thus, the RVW for 99205 should be similar to 99220. As compared to 43235, the pre-, intra-, and post-service time are higher for 99205. The mental effort is so greater for 99205. The psychological stress is comparable for 43235 and 99205, while the technical skill is greater for 43235 because of the training, experience and hand-eye coordination needed to provide the procedure. Thus, the RVWs should be similar for 43235 and 99205, with the RVW for 99205 being slightly higher than for 43235.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

There was considerable consistency in the surveyed median RVWs for all specialty societies (2.23 - 2.63) except for Rh (3.25), especially for internal medicine and family physicians (AAFP - 2.32, ACP - 2.63, and ASIM - 2.41) who provide approximately 43% of all of these services to Medicare patients according to AMA trends analysis data. In addition, 77% of respondents identified that this service has changed over the last 5 years. Thus, it was felt that the surveyed median RVW of 2.41 was appropriate for this code. The recommended RVW of 2.41 is a 6% increase over the current RVW of 2.28. The rationale for this increase is that pre- and post-service time has increased from the 23 minutes extrapolated by Hsiao to the 65 minutes identified by the survey respondents. An explanation for this may be that Hsiao's extrapolated values did not take into account the extent of post-service work between face-to-face encounters. In addition, over the last 5 to 7 years, there has been an increase in the pre and/or post service work due to: increased documentation requirements; increased case management and telephone calls in between face-to-face encounters; increased complexity of patients that are seen in the office that would have in the past been seen in the hospital or other facility; and fewer follow-up visits for the same problem. In addition, there is an increase in the complexity and severity of illness of patients seen in the office today as compared to 5 years ago due to a fewer admissions to the hospital and shorter lengths of stay. The greater number of choice and complexity of treatment alternatives, and patients becoming more informed and discerning consumers of health care have increased the physician work involved in office and outpatient settings as well. The increased RVW of 2.41 and increased pre- and post-service time lead to an intra-service intensity of 0.0219 for 99205.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 99211 Global Period: XXX Current RVW: 0.17 Recommended RVW: 0.25

CPT Descriptor: Office or other outpatient visit for the evaluation and management of an established patient, that may not require the presence of a physician. Usually, the presenting problem(s) are minimal. Typically, 5 minutes are spent performing or supervising these services.

CPT Code: 99212 Global Period: XXX Current RVW: 0.38 Recommended RVW: 0.50

CPT Descriptor: Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a problem focused history; a problem focused examination; straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

CPT Code: 99214 Global Period: XXX Current RVW: 0.94 Recommended RVW: 1.27

CPT Descriptor: Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

Force and Summary of Comment to HCFA on this service: AAFP, AAP, ACP and others.

Increased complexity of patients due to shift from inpatient to outpatient setting over the last 5 - 7 years; increased post-service work over the past 5 - 7 years due to the increased complexity of the patients and prevalence of managed care arrangements, E/M codes thought to be undervalued in general, and especially as compared to non E/M services, and low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The RVWs for these codes were extrapolated from the surveyed codes within this family of services, 99213 and 99215. In extrapolating, we assumed linear relationships within the family of services. The ratios of pre-service plus post-service time to intra-service time and the calculated intra-service intensities of 99213 and 99215 were used to perform the extrapolation. The intra-service intensities for 99213 and 99215 were calculated using the following formula:

$$\{RVW/[(pre-service + post-service\ time/CPT\ intra-service\ time) + 1]}/CPT\ intra-service\ time.$$

Because of an inconsistency in the survey instrument for the hospital admit, follow-up, and consult codes, the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the office/outpatient visit and consult codes.

Based on the median of the ratios of pre-service plus post-service time to intra-service time and the calculated intra-service intensities of 99213 and 99215, the ratio of pre-service plus post-service time to intra-service time and intra-service intensity were extrapolated to 99211, 99212, and 99214. Once these numbers were available, the RVW was calculated using the above formula.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

PT #: 99213 Global Period: XXX Current RVW: 0.55 Recommended RVW: 0.80

PT Descriptor: Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: an expanded problem focused history; an expanded problem focused examination; medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: AAFP, AAP, ACP and others.

Increased complexity of patients due to shift from inpatient to outpatient setting over the last 5 - 7 years; increased post-service work over the past 5 - 7 years due to the increased complexity of the patients and prevalence of managed care arrangements, E/M codes thought to be undervalued in general, and especially as compared to non-E/M services, and low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

CLINICAL DESCRIPTION OF SERVICE:

Vignettes Used in Survey:

AAFP/AAPA/ACP/ANA/AOA/ASIM: Office visit with 55 year-old male, established patient, for management of hypertension, mild fatigue, on beta blocker/thiazide regimen. Expanded problem focused history including compliance, diet, stress issues. Expanded problem focused exam including vital signs, chest and heart exam; check for edema. Medical decision making of low complexity including counseling about medication and alternatives, appropriate lab work, and a review of possible medication side effects.

AAFP: Office visit for an established 3 year old female patient with a two day history of ear pain, fever, cough, and inability to sleep at night. Expanded problem focused history including labored breathing, characteristics of pain, respiratory system. Expanded problem focused examination including ears, nose, throat, chest, and hydration status. Medical decision making of low complexity and discussions regarding tonsillectomy and adenoidectomy and a follow-up visit with her mother. Antibiotics are prescribed.

AAPM: Office visit for reassessment and reassurance/counseling of a 40 year old female, established patient, who is experiencing increased symptoms while on a pain management treatment program. Physician performs an expanded problem focused history and problem focused physical examination of new or increased symptoms. Medical decision making is of low complexity in determining if additional somatic pain management, pharmacologic interventions/adjustment, behavioral pain management strategies, or physical therapy and rehabilitation interventions are needed. Reassurance and counseling is higher intensity in patients with pain due to the frequent occurrence of severe distress, confrontational attitudes, and litigious nature of the initial injury or failed responses to treatment.

ACC: Office visit for a 56 year-old man, established patient, with stable exertional angina who complains of new onset calf pain while walking. The physician performs an expanded problem focused history and expanded problem focused physical examination including the entire vascular system, especially the appearance of the legs supine and when dependent. Medical decision making is of low complexity and involves ordering Doppler test of legs and initiating appropriate medical therapy. Alternative approaches to diagnosis and therapy are explained to the patient.

ACRn: Follow-up visit with 80 year old female established patient for follow-up osteoporosis, status-post compression fractures.

Description of Pre-Service Work: Preparing to see the patient, reviewing records, and communicating with other professionals as appropriate.

Description of Intra-Service Work: An expanded problem focused history, an expanded problem focused examination, and medical decision making of low complexity.

Description of Post-Service Work: All coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients).

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	9282*	Emergency department visit for the evaluation and management of a patient, which requires these three key components: an expanded problem focused history; an expanded problem focused examination; and medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity.	0.47
2)	45330*	Sigmoidoscopy, flexible; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)	0.70

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Compared to 99282, pre-, intra-, and post-service times and mental effort are higher for 99213 because the history, examination and medical decision making are all at a higher level of complexity. Technical skill is equivalent for 99213 and 99283, while 99283 involves more psychological stress because of the acuteness of the emergency department patient. This suggests that the RVW for 99213 should be significantly greater than that of 99282. As compared to 45330, 99213 requires more mental effort, psychological stress, and time, while 45330 involves more psychological stress due to the complexity of the procedure and the small, but real risk of perforation. This suggests that the RVW for 99213 should be similar, but somewhat higher than the RVW for 45330.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The median surveyed RVW of 1.00, which would be an 81% increase over the current RVW of 0.55, seemed difficult to justify, especially due to the range of median surveyed RVWs by the specialty societies (0.47 - 1.50), and only 56% of respondents indicating that the work of this service has changed over the last 5 years. According to AMA trends analysis, 29.7% of Medicare billing for 99213 were from general/family practice while 30.3% were from internal medicine. In addition, AAFP, ACP, and ASIM had a much smaller spread in surveyed median RVWs (1.00, 1.00, and 0.53 respectively). Therefore, it was felt by the group that a strong argument could be made to increase the RVW to 0.80, which gives more weight to the survey data of AAFP, ACP, and ASIM, and a 45% increase over the current RVW. The rationale for this increase is that pre- and post-service time has increased from the 6 minutes extrapolated by Hsiao to the 21 minutes identified by the survey respondents. An explanation for this may be that Hsiao's extrapolated values did not take into account the extent of post-service work between face-to-face encounters. In addition, over the last 5 to 7 years, there has been an increase in the pre and/or post service work due to: increased documentation requirements; increased case management and telephone calls in between face-to-face encounters; and fewer follow-up visits for the same problem. In addition, there is an increase in the complexity and severity of illness for patients seen in the office today as compared to 5 years ago due to a fewer admissions to the hospital and shorter lengths of stay. The greater number of choice and complexity of treatment alternatives, and patients becoming more informed and discerning consumers of health care have increased the physician work involved in office and outpatient services as well. and telephone calls in between face-to-face encounters; and fewer follow-up visits for the same problem. The increased RVW of .80 and increased pre- and post-service time lead to an intra-service intensity of 0.0222 for 99213.

SURVEY DATA:

per AAFP (50 respondents), AAP (26), AAPA (25), AAPM (21), ACC (9), ACP (10 general internists and 3
pediatric logists), ACRh (10), ANA (26), AOA (2), ASIM (11 general internists, 3 pulmonologists, 3 gastroenterologists,
endocrinologists, 2 allergists, 2 rheumatologists, 1 oncologist, and 1 geriatrician)

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

PT # [redacted] File: 99215 Global Period: XXX Current RVW: 1.51 Recommended RVW: 1.90

PT Descriptor: Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a comprehensive history; a comprehensive examination; medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: AAFP, AAP, ACP, ASIM and others.

Increased complexity of patients due to shift from inpatient to outpatient setting over the last 5 - 7 years; increased post-service work over the past 5 - 7 years due to the increased complexity of the patients and prevalence of managed care arrangements, E/M codes thought to be undervalued in general, and especially as compared to non E/M services, and low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

CLINICAL DESCRIPTION OF SERVICE:

Cigarettes Used in Survey:

AAFP/ACP/AOA/ASIM: Office visit with 30 year old male, established patient for 3 month history of fatigue, weight loss, intermittent fever, and presenting with diffuse adenopathy and splenomegaly. Comprehensive history including complaints and possible exposure such as sexual, travels abroad, etc. Comprehensive exam including lymphatic and abdominal. Medical decision making of high complexity including discussion of possible diagnosis, possible diagnostic test needed and importance of follow-up.

AAFP: An 8 year old established patient is seen for a history of continued fighting in school. Comprehensive interval history including physical performance, peer relationships, family interactions, and family history of ADHD. A comprehensive physical examination reveals only soft neurological signs. Medical decision making of high complexity and discussion on behavior modification and Connors questionnaires are undertaken with parents. A return visit is scheduled.

AAFP: Office visit for an established patient having acute migraine with new onset neurological symptoms and whose headaches are unresponsive to previous attempts at management with a combination of preventive and abortive medication. Physician performs a comprehensive history and a comprehensive physical examination, as well as a complete neurological exam. Examination of the head and neck is accomplished to detect extracranial sources of myofascial or neurogenic pain. Medical decision making is of high complexity and involves ordering new imaging studies. A new treatment plan is formulated with pharmacologic adjustments and behavioral pain management strategies.

AAFP: Office visit for a 68 year-old man with previous prosthetic valve replacement, diabetes and morbid obesity who now presents with new onset dyspnea and fluid retention. The physician performs a comprehensive history and comprehensive physical examination including heart, lungs and abdomen, venous system in neck and legs while lying, sitting and standing, skin and soft tissue of legs. Fluid restriction, diet and therapeutic goals are discussed with the patient. Medical decision making is of high complexity and involves ordering chest x-ray and echocardiogram to assess valvular function, lab work to evaluate control of diabetes and renal function, and initiating appropriate medical therapy.

AAFP: Follow-up visit, 40 year old mother of three, established patient, with acute rheumatoid arthritis, anatomical Stage 3, ARA function Class 3 rheumatoid arthritis, and deteriorating function.

Description of Pre-Service Work: Preparing to see the patient, reviewing records, and communicating with other professionals as appropriate.

Description of Intra-Service Work: A comprehensive history, a comprehensive examination, and medical decision making of high complexity.

Description of Post-Service Work: All coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients).

SURVEY DATA:

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
99220	Initial observation care, per day, for the evaluation and management of a patient, which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission to "observation status" are of high severity.	2.41
12002*	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm	1.81

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

As compared to 99220, pre-, intra-, and post-service times and mental effort are similar for 99215 due to the increased requirement for counseling and coordination of care in the office as compared to the observation area. 99215 involves similar technical skill and psychological stress as 99220. The RVW for 99215 should be lower than for 99220. As compared to 12002, 99215 requires more mental effort and time, but less psychological stress than 12002 due to the nature of the wound and the potential for poor outcome with inappropriate technique. The technical skill for these services is similar. Thus the RVW for 99215 should be similar to but higher than the RVW for 12002.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The median surveyed RVW of 2.00, which would be a 32% increase over the current RVW of 1.51, seemed difficult to justify, especially due to the range of median surveyed RVWs by the specialty societies (1.83 - 2.40). According to the AMA trends analysis, 19.5 % of Medicare billing for 99215 were from general/family practice while 36% were from internal medicine. In addition, AAFP, ACP, and ASIM had a much smaller spread in surveyed median RVWs (1.80, 2.00, and 2.10 respectively). Therefore, it was felt by the group that a strong argument could be made to increase the RVW to 1.90; which gives more weight to the survey data of AAFP, ACP, and ASIM, and a 26% increase over the current RVW. The rationale for this increase is that pre- and post-service time has increased substantially from the 15 minutes extrapolated by Hsiao to the 47 minutes identified by the survey respondents. An explanation for this may be that Hsiao's extrapolated values did not take into account the extent of post-service work between face-to-face encounters. In addition, over the last 5 to 7 years, there has been an increase in the pre and/or post service work due to: increased documentation requirements; increased case management and telephone calls in between face-to-face encounters; and fewer follow-up visits for the same problem. In addition, there is an increase in the complexity and severity of illness for patients seen in the office today as compared to 5 years ago due to a fewer admissions to the hospital and shorter lengths of stay. The greater number of choice and complexity of treatment alternatives, and patients becoming more informed and discerning consumers of health care have increased the physician work involved in office and outpatient services as well, and telephone calls in between face-to-face encounters; and fewer follow-up visits for the same problem. The increased RVW and increased pre- and post-service time lead to an intra-service intensity of 0.0231 for 99215.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99231 Global Period: XXX Current RVW: 0.51 Workgroup Recommended RVW: 0.60

CPT Descriptor: Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least two of these three key components:

1. a problem focused interval history;
2. a problem focused examination; and
3. medical decision making that is straightforward or of low complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Physicians typically spend 15 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Subsequent hospital visit for a 50 year old male with uncomplicated myocardial infarction who is clinically stable and without chest pain. (ASIM/ACP/AQA/ACC)

Subsequent hospital visit for a 4 year old female, admitted for acute gastroenteritis and dehydration, requiring IV hydration; now stable. (AAFP/AQA/AAPA)

Subsequent hospital visit for a 10 year old male admitted with right upper lobe pneumonia, vomiting and 8 percent dehydration. (AAP/AQA)

Subsequent hospital visit for a 55 year old male with rheumatoid arthritis, two days following an uncomplicated joint replacement. (ACR)

Description of Pre-Service Work:

Pre-service work includes preparing to see the patient, reviewing records, and communicating with other professionals, as appropriate. (ALL)

Description of Intra-Service Work:

Problem focused interval history including cardiopulmonary systems and extremities. Problem focused examination including evaluation for congestive heart failure and arrhythmias. (ASIM/ACP/AQA)

The physician performs a problem focused interval history and problem focused physical examination including history of chest discomfort, dyspnea and present energy level. Medical decision making is of moderate complexity including instruction on increased activity and return to work and titrating medications to optimal doses and ordering or evaluating the results of functional testing. (ACC)

Problem focused interval history including P.O. intake, total input and output, and bowel habits since admission. Problem focused exam including abdomen and skin turgor. Medical decision making of low complexity including discussion of progress and plans with patient and responsible caregiver. (AAFP/AQA/AAPA)

He continues on intravenous fluids, begins to deconvalesce, and begins to tolerate oral fluids. Examination reveals improved hydration, less work of breathing, decreasing rales and rhonchi in the right lung field, and a more interactive patient. His blood culture is checked and continues without growth. His condition is discussed with his family and the bedside nurse. Discharge is anticipated the following day if oral intake improves. (AAP/AQA)

Intake and output are checked and laboratory values are reviewed. Orders from the orthopedist are reviewed for accuracy and appropriateness. Medications are reviewed and appropriate medications are resumed. A focused examination of the heart and lungs is performed. A brief assessment of range of motion is also performed. (ACR)

Post-service work includes all coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals, associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients). (ALL)

KEY REFERENCE SERVICE(S):

CPT Code 99231

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99282	Emergency Dept Visit	0.47
2)	20610	Drain/Inject Joint/Bursa	0.79

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

According to the survey results, mental effort, technical skill and psychological stress were rated about the same for 99282 and 99231. Pre- and post time for 99231 were estimated to be somewhat higher. This is because the typical less-complex emergency department patient is similar to a "stable" (lowest level) subsequent hospital visit patient. However, the post service time involved with the hospital patient is higher because the hospital patient will have more tests results to be reviewed, and more coordination and follow-up of care is required. Pre-time for the subsequent hospital visit is higher because the physician has seen the previously and the chart will be reviewed whereas the typical emergency department patient does not involve much if any pre-service work.

Compared to 20610, 99231 was rated by survey respondents as slightly higher in mental effort, psychological stress, intra time and post time, but slightly lower in technical skill and pre time. The technical skill of properly draining or injecting a joint or a bursa may be slightly higher than the lowest level subsequent hospital visit, but as the survey respondents indicated, the mental effort of assessing the hospital patient's status, the stress involved with making treatment decisions and the time on the hospital unit are higher than for a joint injection. There isn't much post service time involved with the procedure whereas there is significant post-service time involved with the hospital visit as hospital care must be coordinated, and as reports must be documented and communicated.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The surveying organizations recommend an increase in RVWs to 0.75, even though the median of the combined survey results was much higher (1.0 RVWs). The combined survey median "total time estimate" of 36 minutes is substantially higher than the current 18 minutes of total time assumed for this code. The intra-service combined median time of 10 minutes is slightly below the current intra-service time of 15 minutes and post-service time is substantially higher than the 3 minutes that is currently assumed in the RVWs. If some of the post-service time was shifted to intra-time to correct for the inconsistency in the survey instrument, the result would be an intra-service time that is the same or higher than is currently assumed, and post-service time would still be substantially higher.

In regard to the clinical example and vignette used by ASIM, ACP, and AOA, the typical post-MI patient care is accelerated as compared to the same patient five years ago. The amount of physician work is compressed into a shorter patient hospital stay. Instead of rest and gradual activity for the stable hospital patient, frequent interventions are common. Today, more information and treatment options are integrated by the physician into the treatment plan. Discussion with the patient and family are typically more complex than five years ago as issues of diet and cholesterol management and the use of various medications are discussed with the patient and family. All different factors require complex coordination of care by the physician on behalf of the patient.

An increase in post-service time and work has taken place over the past five years due to a compression of hospital stays and more education of patients and family members provided during each hospital visit. The hospital stay now requires that more data be analyzed and pursued during each visit. Less ill patients are also likely to already have been discharged, meaning that the patients that are being seen under this code are sicker.

These patients also on average have more co-morbidities than was the case in the past. Data gathered from the HCFA *Health Care Financing Review* indicates that hospital length of stay has decreased 10.1 percent for Medicare beneficiaries during the five year period of 1988 to 1993 (from 8.9 to 8.0). The hospital discharge rate

has decreased 1.6 percent during the same period (from 316 per 1000 enrollees to 311).

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99232 Global Period: XXX Current RVW: 0.88 Workgroup Recommended RVW: 1.10

CPT Descriptor: Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least two of these three key components:

1. an expanded problem focused interval history;
2. an expanded problem focused examination; and
3. medical decision making of moderate complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 25 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Subsequent hospital visit for a 54 year old female, post myocardial infarction, who is out of the critical care unit, but is now having frequent premature ventricular contractions on telemetry. (ASIM/ACPI/AOA)

Subsequent hospital visit for a 54 year old female admitted for myocardial infarction, but who now having frequent premature ventricular contractions. (AAFP/AOA)

Subsequent hospital visit for a 17 year old female admitted with fever and pharyngitis with airway obstruction. (AAP/AOA)

Follow-up hospital visit for a 54-year-old patient, post-myocardial infarction who is out of the coronary care unit, but now having recurring chest pain. (ACC)

Subsequent hospital visit for a 65 year old female with rheumatoid arthritis, anatomical stage 3, ARA function class 3 rheumatoid arthritis, admitted for trosepsis. On the third hospital day, chest pain, dyspnea, and fever develop. (ACR)

Description of Pre-Service Work:

Pre-service work includes preparing to see the patient, reviewing records, and communicating with other professionals, as appropriate. (ALL)

Description of Intra-Service Work:

Expanded problem focused interval history, including review of events since admission, focused on cardiopulmonary systems. Expanded problem focused interval exam including heart, lungs, extremities. Medical decision making of moderate complexity including review of all test results, x-rays, rhythm strips, medication adjustments and a plan for more extensive cardiovascular work-up. (ASIM/ACPI/AAFP/AOA)

Her fever is now decreasing after 48 hours of antibiotics. However she has developed a generalized maculopapular eruption preeminently on her trunk. She had been maintained on intravenous antibiotics and is now ready for oral liquids. Review of laboratory data reveals a positive group A beta hemolytic streptococcus on throat culture and a leukocytosis. Her condition is discussed with her parents and a bedside nurse. (AAP/AOA)

The physician performs an expanded problem focused interval history and expanded problem focused physical examination including heart, lungs, blood pressure and cardi-rhythm. Alternative approaches to diagnosis and therapy are explained to the patient. Medical decision making is of moderate complexity and involves decision regard stress testing, cardiac catheterization and possible angioplasty, ordering lab work to assess recurrent infarction, and reviewing current medications. (ACC)

A detailed history of the hospital course is obtained through interviews and review of the hospital record. Careful examination of the heart, lung, and extremities is performed. A ventilation/perfusion study and EKG are reviewed and a treatment course is instituted. (ACR)

Post-service work includes all coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals, associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients). (ALL)

Handwritten notes: 20, 35, 7, 62

KEY REFERENCE SERVICE(S):

CPT Code 99232

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99283	Emergency Dept Visit	1.07
2)	62270	Spinal Fluid Tap, Diagnostic	1.13

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Compared to reference service 99283 (ER visit, moderate severity), CPT 99232 has similar mental effort, technical skill and stress and pre-time and intra-time, but a higher post time. This would argue for a substantial increase in the RVWs for CPT 99232. The survey respondents compared these services in that manner because the MI patient with potentially unstable arrhythmia will need much more after-visit followup to check on test results and to modify treatment than the typical ER visit patient.

CPT 62270 and 99232 were rated by survey respondents to have comparable mental effort, technical skill and stress. Pre- and intra-time are also comparable, and post-time is substantially higher for CPT 99232. The MI patient requires similar effort and skill to sort through the problem and causes a similar amount of stress as the spinal tap, but the MI patient with potentially unstable arrhythmia will need much more after-visit followup to check on test results and to modify treatment than the spinal tap patient.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale including materials you received from the AMA or your own research.

The surveying organizations recommend an increase in the RVWs to 1.30. The survey data supports an even larger increase—the combined median RVW is much higher (1.5). Total time reported by all specialties is significantly higher than the 29 minutes total time assumed in the current RVWs—the median combined total time is 62 minutes. Increased coordination of care, increased communication with family members and the compression of patients' hospital stays support the view the post-service time is significantly higher than accounted for in the current RVWs.

In regard to the clinical example and vignette used by ASIM, ACP, AAFP, and AOA, physicians are more aggressive in their treatment of coronary disease, and the decision making required to decide when and how to intervene on a PVC patient is much more complex than five years ago. This is because there is a greater variety of treatment options, such as IV infusions, newer-more toxic drugs. This requires more time to assess the patient, to discuss treatment options with the patient and her family, to coordinate with the consultant (if there is one), and to plan further treatment.

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99233 Global Period: XXX Current RVW: 1.25 Workgroup Recommended RVW: 1.56

CPT Descriptor: Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least two of these three key components:

1. a detailed interval history;
2. a detailed examination; and
3. medical decision making of high complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This service was not surveyed directly for the five year review. Our recommendation for this service is based upon the intra-service intensity that was found for the other two codes in this family of service (99231 and 99232).

The surveying organizations recommend an increase in the RVWs to 1.75. Based upon the survey results for the other two services in this family, we believe that the total time associated with this service has increased. Increased coordination of care, increased communication with family members and the compression of patients' hospital stays support the view the post-service time is significantly higher than accounted for in the current RVWs.

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

Specialty: Calculated data: American Society of Internal Medicine, American College of Physicians, American Academy of Family Physicians, American Academy of Pediatrics, American Osteopathic Association, American College of Cardiology, American College of Rheumatology, American Academy of Neurology, American Academy of Pain Medicine, American Geriatrics Society, American Nurses Association, and American Academy of Physician Assistants

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
99396	Periodic preventive medicine reevaluation and management of an individual including a comprehensive history, comprehensive examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of appropriate laboratory/diagnostic procedures, established patient; 40-64 years	1.53
12002*	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm.	1.81

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

As compared to 99396, pre-, intra-, and post-service time is similar for 99243. Technical skill is similar for both services; while mental effort is slightly greater for 99396 while psychological stress is slightly greater for 99243. Thus, the RVW for 99243 should be similar to that of 99396. As compared to 12002, pre-, intra-, and post-service time is higher for 99243. 99243 requires more mental effort than 12002, similar technical skill, but less psychological stress. Thus the RVW should be similar to the RVW for 12002.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The weighted median surveyed RVW is 1.91 and the weighted median surveyed total time is 70 minutes. The RVW and total time were derived by weighting the surveyed median RVWs and total times for AAN, ACC, and ASIM more heavily since their members provide this service to Medicare patients more frequently. Also, since 77% of these services are provided by specialties that did not survey these codes, the specialty societies felt it would be appropriate to resurvey these codes. Pre- and post-service time has increased from the 15 minutes extrapolated by Hsiao to the 36 minutes identified by the survey respondents. An explanation for this may be that Hsiao's extrapolated values did not take into account the extent of post-service work between face-to-face encounters. In addition, over the last 5 to 7 years, there has been an increase in the pre and/or post service work due to: increased documentation requirements; increased case management and telephone calls in between face-to-face encounters; increased coordination of care between all treating physicians; increased work of obtaining and documenting referrals; and fewer follow-up visits for the same problem. Because pre- and post-service work increased, the intra-service intensity was recalculated using this data. The revised intra-service intensity for 99243 is 0.027.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient(s) and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

CPT Code: 99244 Global Period: XXX Current RVW: 2.23 Recommended RVW: 2.50

CPT Descriptor: Office consultation for a new or established patient, which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: ACP and others

Low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the performance of the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The RVWs for these codes were extrapolated from the surveyed codes within this family of services, 99243 and 99245. In extrapolating, we assumed linear relationships within the family of services. The ratios of pre-service plus post-service time to intra-service time and the calculated intra-service intensities of 99243 and 99245 were used to perform the extrapolation. The intra-service intensities for 99213 and 99215 were calculated using the following formula:

$$RVW / [(pre\text{-}service + post\text{-}service\ time / CPT\ intra\text{-}service\ time) + 1] / CPT\ intra\text{-}service\ time.$$

Because of an inconsistency in the survey instrument for the hospital admit, follow-up, and consult codes, the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the office/outpatient visit and consult codes.

Based on the median of the ratios of pre-service plus post-service time to intra-service time and the calculated intra-service intensities of 99243 and 99245, the ratio of pre-service plus post-service time to intra-service time and intra-service intensity were extrapolated to 99241, 99242, and 99244. Once these numbers were available, the RVW was calculated using the above formula.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

Number: 99243 Global Period: XXX Current RVW: 1.47 Recommended RVW: 1.91

E/M Descriptor: Office consultation for a new or established patient, which requires these three key components: a detailed history; a detailed examination; and medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: ACP and others

Low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

CLINICAL DESCRIPTION OF SERVICE:

Vignettes Used in Survey:

AAFP/AOA: Outpatient consultation for a 55 year old female with positive mammography sent for a pre-operative evaluation by a surgeon. Detailed history including any changes in self breast exams, gynecological system, weight changes, and prior complications with anesthesia. Detailed exam including breast exam and gynecological system. Medical decision making of low complexity including discussion with the patient about the procedure and possible outcomes and necessity for follow-up.

AAN: A 29 year-old male meat cutter referred for an office consultation for progressive symptoms of paresthesias in the right hand awakening him from sleep and while driving. Examination is normal except for mild thenar wasting and weakness on the right and subjective median sensory loss.

A: Office consultation for a 10 year old with chronic cough treated with repetitive courses of antibiotics. Detailed history including respiratory history, fever, labored breathing, characteristics of pain, allergies, and appetite. A detailed examination including ear, nose, and throat, respiratory, and immunologic. Medical decision making of low complexity and a discussion of asthma and treatment plans are initiated with the family.

ACC: Office consultation for a 31 year-old woman complaining of palpitations and chest pains. Her internist described a mid-systolic click. The physician performs a detailed history, encouraging patient to describe her pain and palpitations as it relates to stress and any recent-life changes. A detailed physical examination is conducted including cardiac examination standing and lying-down. Medical decision making is of low complexity and includes explanation of symptoms as a function of autonomic nervous system reactivity, and life style modification to alleviate symptoms.

ACRn: Initial office consultation for a 45 year old female with diabetes mellitus, hypertension, diffuse psoriasis, and arthritis unresponsive to anti-inflammatory medications.

AOA/ASIM: 74 year old female with previously known cirrhosis who has recently developed moderate ascites without other complication.

Description of Pre-Service Work: Preparing to see the patient, reviewing records, and communicating with other professionals as appropriate.

Description of Intra-Service Work: A detailed history, a detailed examination, and medical decision making of low complexity.

Description of Post-Service Work: All coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients).

KEY DATA:

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

File: 99245 Global Period: XXX Current RVW: 2.96 Recommended RVW: 3.21

PT Descriptor: Office consultation for a new or established patient, which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 80 minutes face-to-face with the patient and/or family.

Source and Summary of Comment to HCFA on this service: ACP and others

Low intra-service intensity of E/M codes as compared to all services studied by Hsiao.

CLINICAL DESCRIPTION OF SERVICE:

Cigarettes Used in Survey:

AFP/AOA: Outpatient consultation for 74 year old male with a history of coronary artery disease and diabetes undergoing a pre-operative evaluation for elective hip replacement. Comprehensive history including cardiopulmonary system, blood sugar control, medications, prior complication with anesthesia. Comprehensive exam including heart, lungs, extremities and skin. Medical decision making of high complexity including recommendations for pre-op lab and medications and possible post-op complications, discussion with the patient about nutrition and blood sugar control and importance of compliance and follow-up.

AN: A 50 year-old female is referred for an office consultation for 3 month history of weakness and atrophy of the right arm and gait deterioration. Examination shows loss of reflexes atrophy and weakness in the right arm and a spastic paraparesis with bilateral upper extremity and trunk muscle atrophy.

AN: Office consultation for 16 year old referred for evaluation of drug use. Comprehensive history including school performance, sexual activity, alcohol and substance abuse, peer and family relationships. Comprehensive examination including psychological and neurological examinations. Medical decision making of high complexity and detailed discussion with the patient and her parents is undertaken with appropriate referral for laboratory studies, medical and psychological care.

APM: Initial office consultation for a 36 year old male, one year status post occupational herniated cervical disk treated by laminectomy, requiring management of multiple sites of intractable pain, depression, and narcotic dependence. Physician performs a comprehensive history and a comprehensive physical and neurological examination. Medical decision making is of high complexity due to operative intervention, depression, and narcotic dependence. Imaging, electrodiagnostic, and psychometric tests are ordered, and a diagnosis formulated. A coordinated treatment plan with pharmacologic/interventions, behavioral pain management strategies and physical therapy/rehabilitation is instituted.

CC: Office consultation for a 58 year-old man with history of MI and CHF who complains of the recent onset of rest angina and shortness of breath. The patient has a systolic blood pressure of 90mmHG and is in Class IV heart failure. The physician performs a comprehensive history including review of salt intake, appropriateness of and compliance with medications. A comprehensive physical examination is conducted including heart, lungs, abdomen, legs, vascular system in neck and extremities. Alternative approaches to diagnosis and therapy are discussed with the patient. Medical decision making is of high complexity and involves consideration of hospitalization, therapy for angina and dyspnea, lab work to confirm or deny new myocardial infarction, and possible diagnostic procedures including echocardiography and/or cardiac catheterization.

CRh: Office consultation for 6 year old male for evaluation of severe muscle and joint pain and a diffuse rash. Well until 4 - 6 weeks earlier when he developed arthralgia, myalgias, and a fever of 102 for 1 week.

OA/ASIM: Outpatient consultation for 74 year old male with a history of coronary artery disease and diabetes undergoing a pre-operative evaluation for elective hip replacement.

Description of Pre-Service Work: Preparing to see the patient, reviewing records, and communicating with other professionals as appropriate.

Description of Intra-Service Work: A comprehensive history, a comprehensive examination, and medical decision making of high complexity.

Description of Post-Service Work: All coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients).

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
99220	Initial observation care, per day, for the evaluation and management of a patient, which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission to "observation status" are of high severity.	2.41
12002*	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm	1.81

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

As compared to 99220, pre-, intra-, and post-service time are higher for 99245. Mental effort and technical skill are similar, while psychological stress is higher for 99245. The RVW for 99245 should be higher than the RVW for 99220. As compared to 12002, 99245 requires more mental effort, technical skill, and time than 12002, but less psychological stress. Thus the RVW for 99245 should be significantly greater than the RVW for 12002.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The weighted median surveyed RVW is 3.21 and the median total time is 107.5 minutes. The RVW and total time were derived by weighting the surveyed median RVWs and total times for AAN, ACC, and ASIM more heavily since their members provide this service to Medicare patients more frequently. Also, since 59% of these services are provided by specialties that did not survey these codes, the specialty societies felt it would be appropriate to resurvey these codes. Pre- and post-service time has increased from the 29 minutes extrapolated by Hsiao to the 60 minutes identified by the survey respondents. An explanation for this may be that Hsiao's extrapolated values did not take into account the extent of post-service work between face-to-face encounters. In addition, over the last 5 to 7 years, there has been an increase in the pre and/or post service work due to: increased documentation requirements; increased case management and telephone calls in between face-to-face encounters; increased coordination of care between all treating physicians; increased work of obtaining and documenting referrals; and fewer follow-up visits for the same problem. Because pre-service work increased, the intra-service intensity was recalculated using this data. The revised intra-service intensity for 99245 is 0.0279.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99251 Global Period: XXX Current RVW: 0.54 Workgroup Recommended RVW: 0.54

CPT Descriptor: Initial inpatient consultation for a new or established patient, which requires these three key components:

1. a problem focused history;
2. a problem focused examination; and
3. Straightforward medical decision making.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 20 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CPT Code: 99252 Global Period: XXX Current RVW: 1.13 Workgroup Recommended RVW: 1.13

CPT Descriptor: Initial inpatient consultation for a new or established patient, which requires these three key components:

1. an expanded problem focused history;
2. an expanded problem focused examination; and
3. straightforward medical decision making.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 40 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CPT Code: 99254 Global Period: XXX Current RVW: 2.27 Workgroup Recommended RVW: 2.27

CPT Descriptor: Initial inpatient consultation for a new or established patient, which requires these three key components:

1. a comprehensive history;
2. a comprehensive examination; and
3. medical decision making of moderate complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 80 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

These services were not surveyed directly for the five year review. Our recommendations for these services are based upon the intra-service intensity that was found for the other two codes in this family of service (99253 and 99255).

Based on the survey results, consensus recommendations and intra-service intensities, for other services within this family of codes that were directly surveyed, the organizations surveying evaluation and management codes recommend that the RVW for 99251 be increased to 0.63, the RVW for 99252 be increased to 1.25, and the RVW for 99254 be increased to 2.5.

Post-service time has increased substantially in recent years because of the increase in documentation; more time spent tracking down information while the patient is in the hospital; more time spent discussing treatment options with the patient, family, and the primary care physician; because physicians are working with frailer patients than five years ago and because of the compression of the hospital stay.

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

Description of Post-Service Work:

CPT Code 99253

Post-service work includes all coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals, associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients). (ALL)

SURVEY DATA:

Specialty: Combined data: American Society of Internal Medicine, American Academy of Family Physicians, American Academy of Pediatrics, American Osteopathic Association, American College of Cardiology, American College of Rheumatology, and American Academy of Neurology

Sample Size: 155/902 Response Rate (%): 17% Weighted Median RVW: 1.9

25th Percentile RVW: 1.4 75th Percentile RVW: 2.1 Low: 0.47 High: 4.0

Median Pre-Service Time: 10 minutes Median Intra-Service Time: 30 minutes

25th Percentile Intra-Svc Time: 20 minutes 75th Percentile Intra-Svc Time: 40 minutes

Low Intra-Svc Time: 10 minutes High Intra-Svc Time: 60 minutes

Median Post-Service Time: 35 minutes

Elements of Post Time:

Median time for documentation of the service provided: 10 minutes

Median time for arranging for further services: 5 minutes

Median time for reviewing results of studies: 5 minutes

Median time for communicating further with patient, family, and other professionals including reports: 10 minutes

Median time for providing written or telephone reports to Medicare or other third party payers: 5 minutes

Median time for providing care plan oversight services less than 30 minutes per month: X minutes

* Care plan oversight was not included on most survey reporting forms.

Work Changed?: Complexity: Increased: 75.8% Decreased: 3.2% Same: 21%

Oversight: Increased: 82.5% Decreased: 2.1% Same: 15.4%

Documentation: Increased: 88.2% Decreased: 0% Same: 11.8%

Vignette Typical: Yes: 88.4% No: 11.6%

Demographics (who responded):

General internists: 25 Family physicians: 47 Pediatricians: 26

Urologists: 26 Internal Medicine Subspecialists: 31

Breakdown by Subspecialty: Cardiology 9, Rheumatology 10, Endocrinology 2, Pulmonology 2, Allergy 2, Gastroenterology 2, Nephrology 3, Infectious Disease 1.

KEY REFERENCE SERVICE(S):

CPT Code 99253

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99219	Observation Care	1.75
2)	99218	Observation Care	1.08
3)	45235	Upper GI Endoscopy, Diagnostic	2.39

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The elements of work (mental effort, technical skill and psychological stress) and pre and intra time were measured by the survey instrument to be similar to 45235, but the post-service time was measured to be slightly higher than 43235. Interestingly, the RVW for the reference service is much higher (2.39) than the current RVW for 99253.

The respondents also rated the service to be similar to 99219. The survey respondents rated the mental effort higher for 99253 than 99219 and judged the technical skill and stress to be similar. The respondents also rated the pre and intra times for 99253 and 99219 to be the same, but the post times for 99253 to be slightly higher. Compared to 99218, mental effort, technical skill and psychological stress were all rated higher for 99253, pre and intra time were rated as being similar and post-service time was rated higher for 99253. This is because a mid-level consultation typically requires more data to review and process than for a mid-level observation patient. These days, the consultant doesn't just dispense advice, but typically initiates management of the problem on hand.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The surveying organizations recommend that the RVW be increased to 1.9. The combined median RVW for this service was 1.8, however weighted median RVWs for the groups that provide this service the most often (internists and cardiologists) is 1.9. According to 1994 Medicare Part B data, internists and cardiologists account for 27.7% of all billings for this service. These two specialties bill this service more than any other specialty. The next highest specialty, that surveyed this code, was neurology at 4.4%.

The total time estimates for this service are much higher than the current assumption of 55 minutes (the median total time is 75 minutes). The median total time for internists and cardiologists is 83 minutes (which was the figure used in the intra-service intensity calculation). The median combined pre/post time estimate is 4.5 times higher than the current assumption of 10 minutes. Post-service time has increased substantially in recent years because of the increase in documentation; more time spent tracking down information while the patient is in the hospital; more time spent discussing treatment options with the patient, family, and the primary care physician; and because of the compression of the hospital stay. The intra-service time estimates were lower than the current assumption of 45 minutes, but some of the post-service time could be attributed to the intra-service time, per the discussion on 99223.

In regard to the clinical example and vignette used by ASIM, ACP, AAFP, and AOA, five years ago the consultant would be treating a patient with a lower fever threshold than today. Today, consultants are typically called in only when standard tests and antibiotics haven't resolved the problem or point to potentially serious complications, such as antibiotic resistance, occult deep infection, or fungal sepsis. The typical hospital patient having surgery is more complex than five years ago because the less complex patients are being treated on an outpatient basis.

CPT Code 99253

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99253 Global Period: XXX Current RVW: 1.56 Recommended RVW: 1.9

CPT Descriptor: Initial inpatient consultation for a new or established patient, which requires these three key components:

1. a detailed history;
2. a detailed examination; and
3. medical decision making of low complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 55 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Initial inpatient consultation for diagnosis/management of fever following abdominal surgery. (ASIM/ACP/AAFP/AOA)

Initial hospital consultation for a 8 year old female, 48 hours post appendectomy, who develops a fever of 104 degrees with abdominal pain and vomiting. (AAP/AOA)

Initial inpatient preoperative consultation for a 58 year old woman with cholecystitis and poorly controlled hypertension. (ACC)

Initial hospital consultation for a 50 year old female with incapacitating knee pain due to generalized rheumatoid arthritis. (ACR)

Initial hospital consultation for a 39 year old male with left hand weakness and paresthesia of the fourth and fifth fingers following left inguinal hernia surgery four days ago, but now improving. Examination reveals mild weakness of ulnar innervated muscles and patchy sensory loss over fifth and medial fourth finger, without other weakness or reflex changes. (AAN)

Description of Pre-Service Work:

Pre-service work includes preparing to see the patient, reviewing records, and communicating with other professionals, as appropriate. (ALL)

Description of Intra-Service Work:

Detailed history including infection sources and risk factors. Detailed exam including rectal (and bimanual pelvic in female). Medical decision making of low complexity including review of lab, scan results with discussion with surgeon, radiologist. Counseling regarding diagnosis and treatment plans. (ASIM/ACP/AAFP/AOA)

Examination reveals a right lower lobe pneumonia. Appropriate confirmatory laboratory and x-rays studies and intravenous antibiotics are ordered and reviewed. No evidence of peritonitis or wound infection is found. (AAP/AOA)

The physician performs a detailed history and detailed physical examination including confirmation of blood pressure, appropriateness and compliance with home medication, physical examination of abdomen. Medical decision making of low complexity and involves ordering lab work to check liver and kidney function, and electrolyte balance, abdominal ultrasound, decision regarding antibiotics and possible postponement of surgery. (ACC)

The history, x-rays, and an MRI are reviewed. A detailed examination of the extremities is undertaken, with particular attention to the knees. Therapy is recommended. (ACR)

Includes a detailed history, detailed examination, and medical decisionmaking of low complexity. (AAN)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99255 Global Period: XXX Current RVW: 3.14 Recommended RVW: 3.4

CPT Descriptor: Initial inpatient consultation for a new or established patient, which requires these three key components:

1. a comprehensive history;
2. a comprehensive examination; and
3. medical decision making of high complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 110 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Initial hospital consultation for a 66 year-old female, two days post-abdominal aneurysm repair, with oliguria and hypertension of one day duration. (ASIM/ACP/AAFP/AOA)

Initial inpatient consultation for a 16 year old female hospitalized with abdominal pain and vomiting, who is found to be pregnant. (AAP/AOA)

Initial hospital consultation for a 50 year old man with a history of previous myocardial infarction, who now presents with acute pulmonary edema and hypotension. (ACC)

Initial inpatient consultation for a 36 year old male admitted with hemoptysis whose radiographic studies show widespread interstitial pulmonary changes. (ACR)

Initial hospital consultation for a 62 year old male having suffered an in-hospital cardiac arrest. Following examination findings including absent brainstem activity and a negative apnea test, the family members present request explanation of findings. (AAN)

Initial hospital consultation for a 45 year old female with widely metastatic lung carcinoma, intractable back pain, and a history that includes substance dependence, NSAID allergy, and two prior laminectomies with fusion for low back pain. (AAPM)

Description of Pre-Service Work:

Pre-service work includes preparing to see the patient, reviewing records, and communicating with other professionals, as appropriate. (ALL)

Description of Intra-Service Work:

Comprehensive history, including review of actual location and complexity of surgical repair, review of all events since admission, urinary and renal systems, cardiovascular system, review of all lab tests and all input/output. Comprehensive exam, including cardiovascular system, urinary/renal system, abdomen and incisional area. Medical decision making of high complexity, including discussion of necessary diagnostic tests/procedures with patient, family, and current care team. (ASIM/ACP/AAFP)

Comprehensive examination reveals signs of resolving dehydration as well as evidence of substance abuse. Appropriate confirmatory laboratory studies are ordered and reviewed. Discussion with patient and family regarding the implications of her pregnancy are undertaken. Obstetrical and psychiatric referrals are made. (AAP)

The physician performs a comprehensive history and comprehensive physical examination including heart, lungs, extremities and confirmation of blood pressure. Alternative approaches to diagnosis and therapy, as well as prognosis are discussed with the patient. Medical decision making is of high complexity and involves ordering lab work to assess renal function and to confirm or rule out recurrent myocardial infarction, considering of Swan-Ganz catheterization or use of intra-aortic balloon pump, initiation of appropriate medical therapy to increase blood pressure and relieve pulmonary edema and planning for follow up treatment for heart and blood pressure based on initial findings. (ACC)

Further history is elicited from family members. A comprehensive exam of the heart, lungs, abdomen, joints, and integument is performed. A wide range of laboratory studies are ordered and emergency imaging studies are arranged. Presumptive disease modifying treatment is initiated. (ACR)

Includes a comprehensive history, comprehensive examination, and medical decisionmaking of high complexity. (AAN)

CPT Code 99255

Physician performs a comprehensive history and a comprehensive physical and neurological examination to assess the etiology of the intractable back pain and metastatic spread of disease. Medical decision making is of high complexity due to the prior operative interventions, metastatic spread of disease, substance dependence and psychosocial impact of malignant disease. Imaging electrodiagnostic and psychometric tests are ordered. A diagnosis is formulated and a coordinated treatment plan with somatic/pharmacologic/radiation diagnostic interventions, behavioral counseling and pain management strategies, and physician therapy/rehabilitation is instituted. Treatment planning and counseling of a patient with pain of malignant origin requires a longer duration of time and higher intensity due to the severe psychosocial impact of malignant disease. (AAPM)

Description of Post-Service Work:

Post-service work includes all coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals, associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients). (ALL)

SURVEY DATA:

Specialty: Combined data: American Society of Internal Medicine, American Academy of Family Physicians, American Academy of Pediatrics, American Osteopathic Association, American College of Cardiology, American College of Rheumatology, American Academy of Neurology, and American Academy of Pain Medicine

Sample Size: 182/955 Response Rate (%): 19% Weighted Median RVW: 3.4

25th Percentile RVW: 2.41 75th Percentile RVW: 3.6 Low: 0.5 High: 8.0

Median Pre-Service Time: 15 minutes Median Intra-Service Time: 45 minutes

25th Percentile Intra-Svc Time: 30 minutes 75th Percentile Intra-Svc Time: 70 minutes

Low Intra-Svc Time: 10 minutes High Intra-Svc Time: 120 minutes

Median Post-Service Time: 57 minutes

Elements of Post Time:

Median time for documentation of the service provided: 15 minutes

Median time for arranging for further services: 15 minutes

Median time for reviewing results of studies: 10 minutes

Median time for communicating further with patient, family, and other professionals including reports: 15 minutes

Median time for providing written or telephone reports to Medicare or other third party payers: 10 minutes

Median time for providing care plan oversight services less than 30 minutes per month: X minutes*

* Care plan oversight was not included on most survey reporting forms.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99220	Observation Care	2.41
2)	45378	Diagnostic Colonoscopy	3.7

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

99255 was rated by survey respondents as higher across the board than 99220 (mental effort, technical skill, psychological stress, pre time, intra time, and post time). This is because level five hospital consult patients are typically more ill than observation unit patients, the hospital patients often have multisystem problems requiring complex treatments, more testing options and greater risk of deterioration. Pre time is very much more involved for the level five hospital consult patient because the chart and previous tests must be reviewed and the consultant often must discuss the patient with the referring physician. Similarly, post time is also more involved due to development of the care plan and coordination of care with the referring physician and/or other providers, such as physical therapists.

Similarly, 99255 was rated higher than 45378 in each category, except for technical skill. Technical skill is higher for endoscopy. However, mental effort of the thought process and the psychological stress are greater because of the potential complications if the treatment plan is incorrect or inadequate. Intra-service time is longer for the consult—the endoscopy shouldn't take more than 30 minutes whereas the consultant spends almost two hours (CPT typical time 110 minutes) on the patients hospital unit. Pre time are very much more involved for the level five hospital consult patient because the chart and previous tests must be reviewed and the consultant often must discuss the patient with the referring physician. Similarly, post time is also more involved due to development of the care plan and coordination of care with the referring physician and/or other providers, such as physical therapists.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The organizations surveying evaluation and management codes recommend that the RVW be increased to 3.4. Although the combined median RVW is 3.0, the median RVW is higher among the specialties that bill this service more frequently (3.4 to 3.64). The weighted median recommendation of 3.4 is supported by 1994 Medicare Part B billing data that indicates that cardiologists, internists, and neurologists account for 45.3% of all billings for this service. These three specialties bill this service more frequently than any other specialty. All the other specialties that surveyed this code account for less than 4% of billings for this service.

CPT Code 99255

The combined median total time estimate of 117 minutes for this service is slightly higher than the current assumption of 110 minutes. Again, the median total times for the specialties that bill this service most often were much higher (145 minutes) – the later time estimate was used in determining intra-service intensity. The combined pre/post time estimate of 72 minutes is 3.3 times higher than the current assumption of 22 minutes. Post-service time has increased substantially in recent years because of the increase in documentation; more time spent tracking down information while the patient is in the hospital; more time spent discussing treatment options with the patient, family, and the primary care physician; because physicians are working with frailer patients than five years ago and because of the compression of the hospital stay. The intra-service time estimate was much lower than the current assumption, but some of the post-service time could be attributed to the intra-service time, per the discussion regarding the recommendation for 99223.

Less ill patients are likely to be treated on the outpatient basis, meaning that the complexity of patients has increased, particularly for the more complex levels of patients, as data gathered from the HCFA *Health Care Financing Review* indicates. Hospital length of stay has decreased 10.1 percent for Medicare beneficiaries during the five year period of 1988 to 1993 (from 8.9 to 8.0). The hospital discharge rate has decreased 1.6 percent during the same period (from 316 per 1000 enrollees to 311). This means that more data has to be gathered, more difficult judgements made, and more risk is involved with the decision making when the consultation is made on the typical level five consultation patient who will be in the hospital for a shorter period of time than he/she would have five years ago.

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99261 Global Period: XXX Current RVW: 0.36 Recommended RVW: 0.65

CPT Descriptor: Follow-up inpatient consultation for an established patient which requires at least two of these three key components:

1. a problem focused interval history;
2. a problem focused examination; and
3. medical decision making that is straightforward or of low complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Physicians typically spend 10 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CPT Code: 99263 Global Period: XXX Current RVW: 1.16 Recommended RVW: 1.95

CPT Descriptor: Follow-up inpatient consultation for an established patient which requires at least two of these three key components:

1. a detailed interval history;
2. a detailed examination; and
3. medical decision making of high complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 30 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and risk. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

(14)

CPT Codes 99261 and 99263

These services were not surveyed directly for the five year review. Our recommendations for these services are based upon the intra-service intensity that was found for the other code in this family of service (99262).

Based on the survey responses, consensus recommendations and intra-service intensity for the surveyed codes, the organizations surveying evaluation and management (E/M) codes recommend that the RVW for 99261 be increased to 0.65 and the RVW for 99263 be increased to 1.95. These RVW recommendations fall in-line with the recommendation for 99262.

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 99262 Global Period: XXX Current RVW: 0.74 Recommended RVW: 1.3

CPT Descriptor: Follow-up inpatient consultation for an established patient which requires at least two of these three key components:

1. an expanded problem focused interval history;
2. an expanded problem focused examination; and
3. medical decision making of moderate complexity.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 20 minutes at the bedside and on the patient's hospital floor or unit.

Source and Summary of Comment to HCFA on this service: ASIM, ACP, AAFP, AAP and others on hospital evaluation and management services in general. Patients' hospital stay has decreased and they are being discharged from the hospital in a more unstable condition than five years ago. Consequently, intensity of physician work in the hospital has increased over the past five years. Post-service work has also increased over the past five years. Finally, current intra-service intensities are much lower for evaluation and management codes than other services.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Follow-up inpatient consultation with 51 year old male for evaluation and determination of the etiology of postoperative hyponatremia following TURP. (ASIM/ACP/AAFP/AOA)

Follow-up inpatient consultation for an 8 year old male who develops a maculopapular skin rash 48 hours after initiation of an antibiotic therapy for pneumonia and dehydration. (AAP/AOA)

Follow up inpatient consultation for a 65 year old man with a history of hypertension and MI who is five days post uncomplicated GI procedure with a [heretofore] unremarkable postoperative recovery. He has just been resuscitated from a cardiopulmonary arrest. (ACC)

Follow-up inpatient consultation for a 22 year old female, established patient, with steroid-dependent systemic lupus erythematosus, arthritis, and glomerulonephritis. (ACR)

Follow-up hospital consultation for a 71 year old male with progressive dementia to review requested studies which reveal no treatable cause of dementia and to have brief initial discussion with the patient and family present concerning Alzheimer's disease. (AAN)

Follow-up inpatient consultation for a 30 year old established patient, with intractable neck and low back pain, who is excessively sedated after institution of methadone therapy. (AAPM)

Description of Pre-Service Work:

Pre-service work includes preparing to see the patient, reviewing records, and communicating with other professionals, as appropriate. (ALL)

Description of Intra-Service Work:

Expanded problem focused interval history, including review of lab results. Expanded problem focused exam, including fluid status and mentation. Medical decision making of moderate complexity, including revision of treatment plan and discussion with urologist. (ASIM/ACP/AAFP/AOA)

Examination reveals exanthem typical of roseola. Laboratory work and radiological studies are ordered and reviewed. (AAP/AOA)

The physician performs an expanded problem focused interval history and expanded problem focused physician examination including abdomen flanks, heart, lungs and extremities; and neurologic system including cerebral function. Prognosis and alternative approaches to diagnosis and therapy are discussed with the family, and if possible, the patient. Medical decision making is of high complexity and involves ordering ventilation perfusion study to confirm or rule out pulmonary embolus, possible Doppler exam of legs to assess thrombophlebitis, decision regarding thrombolytics, anticoagulants, or other appropriate medical therapy. (ACC)

The patient's recent hospital course and lab studies are reviewed. An expanded problem focused examination is performed and MRI, EKG, and V/Q scan are ordered. A conference is held with other attending physicians. (ACR)

CPT Code 99262

Includes an expanded problem focused interval history, expanded problem focused examination, and medical decisionmaking of moderate complexity. (AAN)

Physician performs an expanded problem focused interval history (may include discussions with family) and an expanded problem focused physical and neurological examination to detect any changes from intractable pain baseline status. Medical decisionmaking is of moderate complexity due to excessive sensation. Pharmacologic adjustments are made using many different classes of pharmacologic agents. (AAPM)

Description of Post-Service Work:

Post-service work includes all coordination of care, documentation, and telephone calls with the patient, family members, or other health professionals, associated with the delivery of care to this patient until the next face-to-face E/M service is provided (excluding care plan oversight of more than 30 minutes per month for home health and hospice patients). 3)	62270	Spinal Fluid Tap, Diagnostic	1.13
4)	12002	Repair Superficial Wounds	1.81

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the services you are rating to the key reference services listed above.

According to the survey respondents, mental effort is higher for 99262, lower for technical skill, and about the same for psychological stress, when compared to 12002. Pre time and post time are both higher for 99262, but the intra time was rated about the same as 12002. It is true that the technical skill involved with laceration repair is more complex than the followup consult, but the consult requires more mental effort and pre and post-service time than for such a simple procedure. The followup consultation requires that lab results be checked, more documentation, communication with the patient and patient's family, and communication with the referring physician.

The components of work and time were measured to be very similar to 62270 (1.13 RVWs), except for mental effort and post-service time, which were higher for 99262. The major mental effort involved with a spinal tap is the decision to perform the tap, not the act of performing the tap itself, hence mental effort for a followup consultation is much higher. Post-service time for the consultation followup is also much higher than a bedside procedure, both require checking lab results, but documentation, communication with the patient and patient's family, and communication with the referring physician are more extensive for the consultation followup.

The survey respondents rated 99262 similar to 99283 emergency room visit, except that the mental effort and post-service time is higher for 99262. Compared to 99282, 99262 is rated higher across the board, except for psychological stress, which is slightly lower. The greater complexity of a patient warranting a consultation followup is what confers the additional work as compared to an emergency room visit, whether it is at the second or third level.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The organizations surveying evaluation and management (E/M) codes recommend that the RVW be increased from the current level to 1.3. The combined median RVW was 1.25, but a weighted median of 1.3 based upon the RVW estimates of specialties that perform the service most often (see comments on codes 99253 and 99255) and because of the time estimates, a slightly higher RVW was justified to bring intra-service intensities in line with the RVW recommendations of other E/M services.

CPT Code 99262

The combined median total time estimates for this service (60 minutes) is more than double the current assumed time of 24 minutes. The combined median post time estimate of 30 minutes is nearly eight times higher than the current estimate of 4 minutes. Post-service time has increased substantially in recent years because of the increase in documentation; more time spent tracking down information while the patient is in the hospital; more time spent discussing treatment options with the patient, family, and the primary care physician; because physicians are working with frailer patients than five years ago and because of the compression of the hospital stay. The intra-service time estimates were very similar to the current assumption of 20 minutes.

Like other consultative services in the hospital, the average hospitalized patient has more problems, some of which maybe unstable, requiring more complex evaluations and procedures to be performed. Consultations are not requested as often as they were five years ago because of the implementation and changes in utilization review criteria. Thus, when a followup consultation is requested, the work involved is greater than five years ago.

Because of the inconsistency in the survey instrument (see "rationale" of CPT Code 99223), the definition of intra-service time may have been unclear to the survey respondents. Therefore, CPT intra-service time was utilized to more accurately redistribute the median surveyed pre-, intra-, and post-service time in order to calculate intra-service intensity. In order to maintain consistency in the calculations of intra-service intensity, the CPT intra-service time was subtracted from the sum of the surveyed median pre-, intra-, and post-service times to determine the consensus pre- and post-service time that were used in the intra-service intensity calculations. This rationale applies to all of the hospital visit and consult codes.

Code: 99262

1995 RVUs: 0.74

Recommended RVUs: Inc

Ratio:

Long Descriptor: Follow-up inpatient consultation for an established patient which requires at least two of these three key components: an expanded problem focused interval history; an expanded problem focused examination; medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 20 minutes at the bedside and on the patient's hospital floor or unit.

Society of Critical Care Medicine

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 99291 Global Period: 0 Current RVW: 3.64 Recommended RVW: 4.00

CPT Descriptor: Critical care, evaluation and management of the critically ill or critically injured patient, requiring the constant attendance of the physician; first hour.

Source and Summary of Comment to HCFA on this service: Survey of critical care physician members of the Society of Critical Care Medicine, American College of Emergency Physicians, American Thoracic Society and American College of Chest Physicians.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: First hour of critical care of a 65-year old woman who, following a hysterectomy, suffered a cardiac arrest associated with a pulmonary embolus.

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Critical care is the care of critically ill and unstable patients who require constant physician attention due to the patient's acute circumstances. Care of these patients involves decision making of high complexity and extensive interpretation of multiple databases to prevent or combat single or multiple organ system failure. Critical care services are provided to critically ill and unstable patients who include, but are not limited to, patients with central nervous system failure, circulatory failure, shock-like conditions, renal or respiratory failure, postoperative complications or overwhelming infection. The acute, unstable nature of the patient is the focus of the physician's efforts as he/she works quickly to develop a patient history/physical assessment and diagnostic data for interpretation. The physician quickly stabilizes the patient and conducts a number of invasive and non-invasive procedures, including CPR; fluid resuscitation; antibiotic therapy; interpretation of cardiac output measurements; chest x-rays; blood gases and information data stored in computers (eg blood pressures, hematologic data; gastric intubation; temporary transcutaneous pacing; ventilator management; and vascular access procedures. The physician coordinates all diagnostic procedures and the efforts of appropriate consultants, when the patient's condition necessitates their involvement.

Description of Post-Service Work: N/A

1)	92950	Cardiopulmonary resuscitation (eg, in cardiac arrest)	3.80
2)	99255	Inpatient consultation for a new or established patient which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of moderate to high severity. Physicians typically spend 110 minutes at the bedside and on the patient's hospital floor or unit.	3.14
3)	99285	Emergency department visit for the evaluation and management of a patient, which requires these three components within the constraints imposed by the urgency of the patient's clinical condition and mental status: a comprehensive history; a comprehensive examination; and medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) are of high severity and pose an immediate significant threat to life or physiologic function.	2.63

4)

Society of Critical Care Medicine

CPT Code: 99291

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Please see attached information.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Please see attached information.

Society of Critical Care Medicine

CPT Code 99291

Key Reference Services:

		RVW
92950	Cardiopulmonary resuscitation	3.80
99255	Initial inpatient consultation	3.14
99285	Emergency department visit	2.63

Relationship of code being reviewed to key reference services:

Results of the survey demonstrated a very high intensity level for critical care, with average scores for mental effort and judgment; technical skill and physician effort; and psychological stress being 4.8; 4.4267; and 4.6 respectively. The respondents believed that critical care services were more intense than the reference services. The scores for CPR, by far the most frequently mentioned reference service, for the above-mentioned categories were 4.1; 4.1; and 4.568; for initial inpatient consultation the scores were 3.533; 3.429; and 3.267; for the emergency department visit the scores were 4.375; 3.75; and 4.0.

Median intra-service time for critical care (60 minutes) also was greater than that for all the reference services above, including double the median intra-service time for CPR and the emergency department visit, both of which had median times of 30 minutes. The median intra-service time for the initial inpatient consultation was 52.5 minutes. This is close to the median intra-service time for critical care. However, it should be noted that the intensity measurements for the inpatient consultation were far lower than those for critical care. Critical care is defined as a "hands on" code. Therefore, comparisons of pre- and post-service times are not applicable.

Rationale:

Members of the four different specialty societies participated in the survey process for critical care services — the Society of Critical Care Medicine, the American College of Chest Physicians, the American College of Emergency Physicians and the American Thoracic Society. The number of respondents (77) reflects a significant consensus of opinion among the societies that the physician work for the initial hour of critical care services per day should be valued at 4.0 for physician work.

A large majority of the respondents felt that 4.0 was an appropriate RVW for critical care, as evidenced by the median RVW being 4.00, the 25th percentile RVW being 4.00, and the 75th percentile being 4.20. In addition, the most frequently used reference service, 92950, which appears on HCFA's multispecialty reference list, has an RVW of 3.8. As has been discussed above, the survey results confirm that critical care is a more intense service than 94950 and requires more than twice the time, on average. The other reference services — 99255 and 99285 — are also on HCFA's multispecialty reference list.

A vast majority of the respondents believe that care for the typical patient has changed and that the patient has become more complex.

Of those choosing to answer the questions regarding whether the patients requiring critical care services are more complex, 92% believe that the patients are more complex, 8% believe there has been no change. No one responded that the patients are less complex.

Society of Critical Care Medicine

CPT Code 99292

Key Reference Services:

		RVW
31500	Insertion emergency airway	2.33
36625	Insertion, catheter, artery	2.11
99291	Critical care, initial hour	4.00*

*Recommended RVW

Relationship of code being surveyed to key reference services

The key reference service is 99291, critical care, initial hour. Survey respondents scored the mental effort and judgment; technical skill and physician effort; and psychological stress almost identical to those factors for 99291. The average scores for 99292 were 4.7; 4.42; and 4.57 respectively. Since 99292 is used only when critical care services are required for more than 74 minutes, one would expect the intensity for the two services to be about the same. The median intra-service time for 99292 was 30 minutes as compared to 60 minutes for 99291.

Rationale:

Members of the four different specialty societies participated in the survey process for critical care services — the Society of Critical Care Medicine, the American College of Chest Physicians, the American College of Emergency Physicians and the American Thoracic Society. The number of responses (76) reflects a significant consensus of opinion among the societies that the subsequent half-hour segments of critical care services per day should be valued at 2.0 for physician work.

A large majority of the respondents felt that 2.0 was an appropriate RVW for critical care, as evidenced by the median RVW being 2.00, the 25th percentile being 2.00 and the 75th percentile being 2.38. The other reference services mentioned frequently on the survey responses — other than 99291 — have values close to 2.00.

A vast majority of respondents believe that care for the typical patient has changed and that the care for the critically ill or injured patient has become more complex.

Of those choosing to answer the questions regarding whether the patients requiring critical care services are more complex, 91.3% believe that the patients are more complex, 8.79% believe there has been no change. No one responded that the patients are less complex.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 92014 Global Period: XXX Current RVW: 1.06 Recommended RVW: 1.27

CPT Descriptor: Ophthalmological services; medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; comprehensive, established patient, one or more visits

Source and Summary of Comment to HCFA on this service:

CMD Comments:

Recommended RVUs: 0.94

Reference Codes: 99214

Rationale for Change: The services required for 92014 are listed under 92004. These services are no more than a physician provides for 99214 visit.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: "A 64 year old with a recent onset of decreased vision and a past history of cataracts and macular drusen."

Description of Pre-Service Work: Inclusion of history of the previous records. Review of correspondence by other medical providers regarding the individual case.

Description of Intra-Service Work: Examine and evaluate eye and ocular adnexa to include comprehensive history, both medical and ocular, external examination of the eye, ophthalmoscopy, and biomicroscopy. Gross visual fields and neurological evaluation. Often may include dilated fundoscopic evaluation. Initiation of a diagnostic and treatment plan which may include other special ophthalmological testing, consultations, laboratory and radiological services; prescription of medication and/or corrective lenses would be included. Counseling of the patient and detailed instructions on treatment plan.

Description of Post-Service Work: Completion of medical record; transmittal of information to the patient's general practitioner or others as indicated.

SURVEY DATA:Specialty: American Academy of OphthalmologySample Size: 103 Response Rate (%): 34 Median RVW: 1.4725th Percentile RVW: 1.10 75th Percentile RVW: 1.70 Low: 0.55 High: 3.80Median Pre-Service Time: 5 Median Intra-Service Time: 2425th Percentile Intra-Svc Time: 15 75th Percentile Intra-Svc Time: 3 Low: 0 High: 60

Median Post-Service Time:

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>Short Descriptor</u>	<u>RVW</u>
1)	99213	Office/outpatient visit, est	0.55
2)	99215	Office/outpatient visit, est	1.51
3)	99203	Office/outpatient visit, new	1.14
4)	99214	Office/outpatient visit, est	0.94

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

99213 – the 92014 contains all services described in 99214 and sometimes could even reflect a 99215 visit. In the measurement of technical skill, mental effort and psychological stress involved 92014 represents at least an increase of two and one-half times the 99213 level. All respondents referenced 99213 because it was the closest accepted reference set; however, the services are vastly different.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The AAO and AOA originally recommended linking the value of this procedure to the 1995 value of 99215 (1.51 RVWs). The surveyed intra-service time for these procedures did not support our assertion (92014 – 27 minutes and 99215 – 35 minutes). The CMD's suggested that this procedure is no more work than a 99214 and that 92014 be valued identically. We now accept that linkage while noting that the RUC's multi-disciplinary workgroup 5 has agreed to recommend an RVW of 1.27 for 99214. Therefore, we recommend an increase in the value of 92014 from 1.06 to 1.27 RVWs.

The RVWs per surveyed minute of intra-service time for 92014 are 0.47 (1.27/27). This is lower than the ratios for the other surveyed evaluation and management procedures (see Table 1 on the recommendation form for 92002).

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Psychiatry

The RUC considered comments submitted to HCFA by the American Psychiatric Association (APA) and the American Academy of Child and Adolescent Psychiatry (AACAP) on psychiatric services. Both societies commented that the current RBRVS Medicare Fee Schedule has not preserved the original work value relationships developed by Harvard. It was noted that according to Harvard methodology, it is important to preserve the ratio of relative work between the service designated as the standard service and the other services on the specialty-specific scale. Therefore, if the relative value of the standard service is changed, all other values should be changed to preserve the original ratio of the standard to other services. In particular the societies noted that since the implementation of the fee schedule, HCFA has disregarded this relationship by changing the relative values of some psychiatry codes but not others, which has resulted in the failure to preserve the fundamental relationships to the standard code. The societies contend that this HCFA's failure to maintain the relative relationship among the psychiatric codes that were surveyed by Harvard has resulted in the undervaluation of the entire scale of psychiatric service relative work values. In addition the comment made about HCFA's departure from the Harvard methodology, the APA made five other specific comments: 1) psychotherapy services 90842, 90843, and 90844 represent three bundled services (continuing medical evaluation, medication management, and psychotherapy), 2) psychotherapy codes which are time dependent, especially 98044 have inappropriately low work values due to undervaluing of time as a dimension of work, 3) the nature of psychotherapy services has become more intensive since the development of the existing work values, 4) the pre and post work for psychiatric services is undervalued, and 5) CPT code 90844 is inappropriately linked to CPT code 99204. The APA argued in their comments that CPT code 90844 requires that the physician spend 45-50 minutes of face-to-face time with a patient. In contrast 99204 can routinely last less than 45 minutes.

Based on a combined survey of 250 physicians, clinical psychologists, and nurses, recommendations were presented on eighteen psychiatric codes.

In their comments to HCFA and during their presentation to the RUC, the APA used the following as compelling evidence to increase the RVUs of the psychiatric codes:

1) Patient type and mix has changed dramatically during the past five years. APA reported that prior to 1990 for the most part "stable" patients were seen in an office outpatient setting. Patients that were considered unstable, and otherwise hard to manage were treated as inpatients, allowing the physician to

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1= adopt specialty/CMD recommended increase; 2= Maintain current value; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain budget neutrality)

add= The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

coordinate with the hospital staff if necessary. In the past patients tended to seek treatment earlier and physicians were able to make referrals to psychiatrists earlier. The onset of managed care has increased the likelihood that many patients are referred to non-physician mental health providers, which has translated into psychiatrists treating only the severely ill patient.

2) Decreasing inpatient hospital has resulted in increased patient morbidity. Again APA noted that shifting insurance industry patterns have played a significant role in this. Although many insurance policies offer mental health coverage, the coverage is often very restrictive. For example, most policies have strict limits on the number of inpatient hospital days. Many managed care policies have shifted away from long term psychotherapy in favor of short intermittent treatment therapies.

3) Since many more patients are seen at an outpatient basis there is an increasing amount of coordination of care with other providers. The APA noted that the time spent dealing with coordination of care issues has resulted in an increase of physician pre and post service work.

4) During the past five years there has been the introduction of new, highly sophisticated neuroleptic and antidepressant medications. The APA noted that because of the advances in psychopharmacology, a greater number of individual psychotherapy patients will likely utilize such medications, which was not the case five years ago. The greater reliance on such medications has increased the complexity of the medical decision making during an individual psychotherapy visit. Many of these new drugs require constant monitoring, such as weekly blood monitoring in the case of Clorazil. The failure to appropriately monitor these drugs could result in adverse side effects and possibly death.

5) The psychotherapy codes have specific times incorporated into the CPT descriptor which do not accurately reflect the current practice of psychiatry. The APA noted that the practice of psychiatry has changed significantly since the psychotherapy codes were surveyed during the Harvard study therefore, the current RVUs should be increased to reflect this change.

For those codes for which an increase is recommended, the RUC believes that these five points provide a compelling argument for increasing the RVUs from their current levels. The RUC also concluded that the survey vignettes that the specialty society used describe the "typical patient" in 1995. In two instances the CMDs recommended lowering the current RVUs of psychiatric services, in both instances the RUC concluded that the specialty society has provided compelling evidence to maintain the current value of those codes.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1= adopt specialty/CMD recommended increase; 2= Maintain current value; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain budget neutrality)

add= The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	Rec RVU	RUC/Rationale	Key
90801	Psychiatric interview	2.19	2.80	The APA noted that the patient mix is more difficult as easier patients are being seen in different venues and because patients who were formally hospitalized are being seen as outpatients. In terms of reference services CPT code 90801[Psychiatric diagnostic interview examination including history, mental status, or disposition (may include communication with family or other sources, ordering and medical interpretation of laboratory or other medical diagnostic studies. In certain circumstances their informants will be seen in lieu of the patient)] is similar to the office consultation codes 99244[Office consultation for a new or established patient, which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of moderate complexity] and 99245[Office consultation for a new or established patient, which requires these three key components: a comprehensive history; a comprehensive examination; and medical decision making of high complexity]. It was noted that in terms of time, 90801 is most similar to 99244 however 90801, requires more post-service time. The APA also noted that unlike the Evaluation and Management codes, there is not a higher level psychiatric interview code. The APA-HCPAC noted that 90801 is the only consultation code available to them since they cannot report E/M codes. In current practice many patients are referred by a physician or referring agency, and the physician must provide a written report and treatment plan to the referring physician or agency. The RUC believed that compelling evidence was presented to increase the current value of this service.	1
90820	Diagnostic interview	2.25	2.25	90820 is reported primarily by child and adolescent psychiatrists, in circumstances which the patient cannot communicate to the therapist by talking and instead uses toys or other objects to "interact". Although, this service is sometimes referred to as "play therapy", this code is a diagnostic service also reported for adults that cannot communicate with their physician. AACAP noted that this patient is typically stable. The RUC noted that although, child and adolescent psychiatrists report this code most often, this group did not survey the code. It was the consensus of the RUC that the current RVU of 2.25 be maintained on an interim basis until the AACAP completes a survey of this code.	2
90825	Evaluation of tests/records	0.97	0.97	The specialty society provided no compelling evidence to support their comment, so the RUC recommends that the current RVUs be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = adopt specialty/CMD recommended increase; 2 = Maintain current value; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain budget neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	Rec RVU	RUC/Rationale	Key
90835	Special interview	2.82	2.82	The specialty society provided no compelling evidence to support their comment, so the RUC recommends that the current RVUs be maintained.	2
90842	Psychotherapy, 75-80 min	2.74	2.74	This code was added to CPT and reviewed by the RUC during the 1994 RUC cycle. The RUC recommendation was accepted by HCFA at that time. Therefore, the RUC recommended maintaining the current value of this procedure.	2
90843	Psychotherapy, 20-30 min	1.10	1.47	The APA reported that the Harvard study showed that the 30 minute psychotherapy visit was more intense per unit time than the 50 minute visit. This intensity results from the fact that the physician is providing the same services as in the 50 minute visit (90844) but within a shortened timeframe. This code has also been affected by the proliferation of managed care, in that the carriers view the 90843 as more cost effective than 90844 which has resulted in more physicians reporting 90843. The RUC agreed with the rationale presented by the specialty society to increase the current value.	1
90844	Psychotherapy 45-50 min	1.72	2.00	The APA reported that this service represents the common 50 minute psychotherapy visit. The specialty society noted that a higher work value for 90844 is supported by 80% of their survey respondents who reported that the work of associated with this service has changed over the past five years. Of these, over 75% of the survey respondents reported that the complexity of patient problems being seen in the office had the hospital has increased. Slightly over one-half of all respondents report that the usual site of service has shifted from the inpatient to the outpatient setting. The Medicare data supports this shift. The RUC agreed with the rationale presented by the specialty society to increase the current value.	1
90845	Medical psychoanalysis	1.78	1.78	The specialty society survey results supported maintaining the current RVU for 90845[Medical psychoanalysis]. The median RVU of the survey was 1.71 which is close to the current value of this procedure, and almost two-thirds of the survey respondents report that the work associated with this service has remained the same during the past five years. The RUC agreed with the rationale of the specialty society and supported maintaining the current value.	2
90846	Special family therapy	1.82	1.82	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVU be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = adopt specialty/CMD recommended increase; 2 = Maintain current value; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain budget neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	Rec RVU	RUC/Rationale	Key
90847	Special family therapy	2.19	2.19	<p>The specialty society recommended a value of 2.10 which is 4% lower than the current RVU and also represents the survey median for psychiatrists. The APA-HCPAC noted that they support maintaining the current value of 90847.</p> <p>In light of the survey results that were presented by APA, and the fact that HCFA felt that a 4% decrease in the value of this code would be too small to make. The RUC consensus was to maintain the current value.</p>	2
90853	Special group therapy	0.43	0.59	<p>The median survey result of 1.74 indicated that some of the survey respondents misunderstood that the rating should be based on the individual group member not the entire group. Because of this misunderstanding the survey results revealed a bi-modal distribution. To arrive at the recommended value of 0.59 the specialty society assumed that all respondents rating 90853 above 1.0 were rating the entire group and divided these values by the number of persons in the group (6 or 8 depending on the vignette) the new median would be 0.59. The specialty society also noted that 90849[Multiple-family group medical psychotherapy by a physician, with continuing medical diagnostic drug evaluation, and drug management when indicated] which was a reference service for this code has an RVU of 0.59 which was recently adopted by the RUC. The RUC agreed with the specialty society rationale to increase the current value of the code.</p>	1
90855	Individual psychotherapy	1.81	2.15	<p>The specialty societies noted that the recommendation of 2.15 was 4% lower than the survey median which was 2.23. The specialty societies also noted that most of the survey respondents agreed that the work of 90855 fell between the key reference service codes of 99244(2.23) and 99404(1.95). The RUC agreed with the specialty society rationale and accepted the recommendation to increase the value of 90855.</p>	1
90857	Special group therapy	0.43	0.43	<p>The specialty society noted that the median survey result of 2.00 indicated that some of the survey respondents misunderstood that the rating should be based on the individual group member not the entire group. Therefore the specialty society is recommending an RVU of 0.59 for this service in order to preserve the current relationship between 90853 and 90857. This increased work value was also supported by the majority of the survey respondents who reported that the work of this service has increased during the past five years. The RUC did not think that there was compelling evidence to raise the current RVU for this service.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1 = adopt specialty/CMD recommended increase; 2 = Maintain current value; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain budget neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	Rec RVU	RUC/Rationale	Key
90862	Medication management	0.95	0.95	<p>This code is reported when the physician is providing medication management only. Another physician or mental health provider is usually responsible for patient psychotherapy. The APA noted that provision of this service represents the most significant change in psychiatric practice, due to the new generation of available medications. The APA also noted that the median intra-service time from the survey of 25 minutes was close to the Harvard intra-service time which is 28 minutes.</p> <p>The RUC did not think that there was compelling evidence to raise the value of this code. However, they disagreed with the CMD recommendation to lower the value and also noted that the RUC is not the correct forum to deal with issues of Medicare fraud and abuse.</p>	2
90870	Electroconvulsive therapy	1.88	1.88	<p>The specialty society reported that their survey results for these codes were unreliable based upon : 1) low response rate, 2) wide variation in values, and 3) the inability of the respondent to select a reference service. The specialty society recommended a value of 2.19 for this 90870 code in order to preserve its relationship to 90844 because the Harvard study used 98044 as the anchor for the development of the relative values for the psychiatric codes. For code 98071 the specialty society recommended an RVU of 3.17, in order to preserve its current relationship to 98071. The RUC was not convinced that the work changed or was out of line with the relative values for this family of codes. Therefore, the RUC recommended maintaining the current RVUs of 90870 and 90871.</p>	2
90871	Electroconvulsive therapy	2.72	2.72		2
90880	Medical hypnotherapy	2.19	2.19	<p>Hypnotherapy is the application of hypnotic technique in the context of psychotherapy for the treatment of mental/behavioral disorders, and is also utilized for the control of pain and psychosocial disorders.</p> <p>Although APA commented to HCFA that they felt 90880 was overvalued, the survey results support maintaining the current value of 2.19 for this service. The survey median of 2.23 is almost the same as the current value and the data does not support the assertion that the service is overvalued. APA also noted that 63% of the survey respondents report that the work of this service has increased during the past 5 years due to the complexity of the patient. The volume of this procedure is very low, with a frequency of 11,166 in 1994, as this procedure is typically not reimbursed by HCFA. The RUC recommended maintaining the current value of this service.</p>	2

Key (1= adopt specialty/CMD recommended increase; 2= Maintain current value; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain budget neutrality)

add= The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	Rec RVU	RUC/Rationale	Key
90887	Consultation with family	1.48	1.48	<p>The CMDs commented that CPT code 99214[Office or other outpatient visit for the evaluation and management of an established patient, which requires at least two of these three key components: a detailed history; a detailed examination; medical decision making of moderate complexity], which takes on average 25 minutes, if spent counseling a family member or a patient, would have an RVU of 0.94. The CMDs do not believe that the work of 90887 is greater.</p> <p>The specialty societies noted that their recommendation was the same as the survey median of 2.00, which reflects the higher intensity of this service when compared to that of 99204(1.95). HCFA commented that although a better reference service for this code is an established office visit, in terms of time, the current value of this procedure 1.48 is appropriate.</p> <p>The RUC believes that the current value of this service is in line with the Harvard value for this code of 1.48 and the Harvard intra-service time of 65 minutes. The RUC also noted that the Harvard data on time for this code, refute the CMD assertion that this service would take 25 minutes. The RUC recommends maintaining the current RVU for this code.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Key (1= adopt specialty/CMD recommended increase; 2= Maintain current value; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain budget neutrality)

add= The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

CHANGES IN PSYCHIATRIC PRACTICE

A Five Year Review

The cost containment strategies adopted by public and private insurers in recent years (e.g., prospective payment and managed care) have significantly influenced the delivery of mental health services. These changes have led to an increase in the average severity level of patients treated. The following identifies major trends in psychiatric practice and their resulting impact on patient severity:

- **Decreasing inpatient admissions.** The cost containment efforts of many payers have focused on reducing utilization of inpatient services. Capitated payment methods and utilization review procedures have sought to ensure that only the most severely ill patients are hospitalized. This shift of moderately ill patients to outpatient settings has served to increase the severity of both the average inpatient and the average outpatient.
- An analysis of the Medicare Part B Analytic Dataset (BMAD) supports the finding that inpatient services represent a decreasing proportion of all psychiatric services (Lewin-VHI, 1995a). As shown in Exhibit 1, approximately 44 percent of all psychiatric services delivered to Medicare patients took place in an inpatient setting in 1988. By 1994 only 18 percent of services were inpatient-based. Between 1988 and 1993, utilization of inpatient psychiatric services increased by only 23 percent, while utilization of outpatient psychiatric services increased by over 250 percent.
- An analysis of private insurance claims reveals that this reliance on outpatient service settings is even more pronounced in aggressively managed insurance plans. In one representative managed care plan, only 4 percent of all psychiatric services were delivered in inpatient settings in 1994 (Lewin-VHI, 1995b).
- Research supports the hypothesis that this shift in treatment setting has resulted in an increase in the severity of the average inpatient. Carter, Newhouse, and Relles (1991) document that the average PPS-paid patient is getting "sicker" in terms of case mix as measured by DRG. Russell and Manning (1993) also present evidence that the average hospital patient actually got sicker after PPS, as less severely ill patients were shifted to outpatient care.

- **Decreasing average lengths of stay.** Despite the increasing severity of patients admitted to inpatient care settings, the average length of a hospital stay has decreased dramatically since PPS was instituted (Coulam and Gaumer, 1991; Gold et al, 1993).
 - Freiman, Ellis, and McGuire (1989) found that the shift to PPS reduced ALOS for psychiatric patients in Medicare about 15 percent.
 - Frank and Lave (1989) and Ellis and McGuire (1994) estimated a similar reduction in ALOS for psychiatric patients insured through state Medicaid programs.

Reductions in average length of stay have augmented the shift of moderately severe patients to outpatient care settings. As inpatient stays are shortened, more severely ill patients are discharged to ambulatory treatment settings sooner, increasing the severity level of the average outpatient.

- **Increasing utilization of non-physician providers and non-psychiatric physicians.** As patients are shifted from inpatient to outpatient settings, the utilization of providers who are not psychiatrists has increased.
 - In 1988, 87 percent of psychiatric services utilized by Medicare patients were provided by psychiatrists, as shown in Exhibit 2. By 1994, only 66 percent of these services were delivered by psychiatrists (Lewin VHI, 1995a).
 - During that six year period, utilization of psychiatrist-provided services rose by 84 percent, while utilization of psychologist-provided services grew over twice that amount, increasing nearly 170 percent (Lewin-VHI, 1995a).
 - An analysis of private insurance claims reveals that this reliance on non-physician providers is even more pronounced in aggressively managed insurance plans. In one representative managed care plan, psychiatrists delivered only 18 percent of all psychiatric services in 1994 (Lewin-VHI, 1995b).

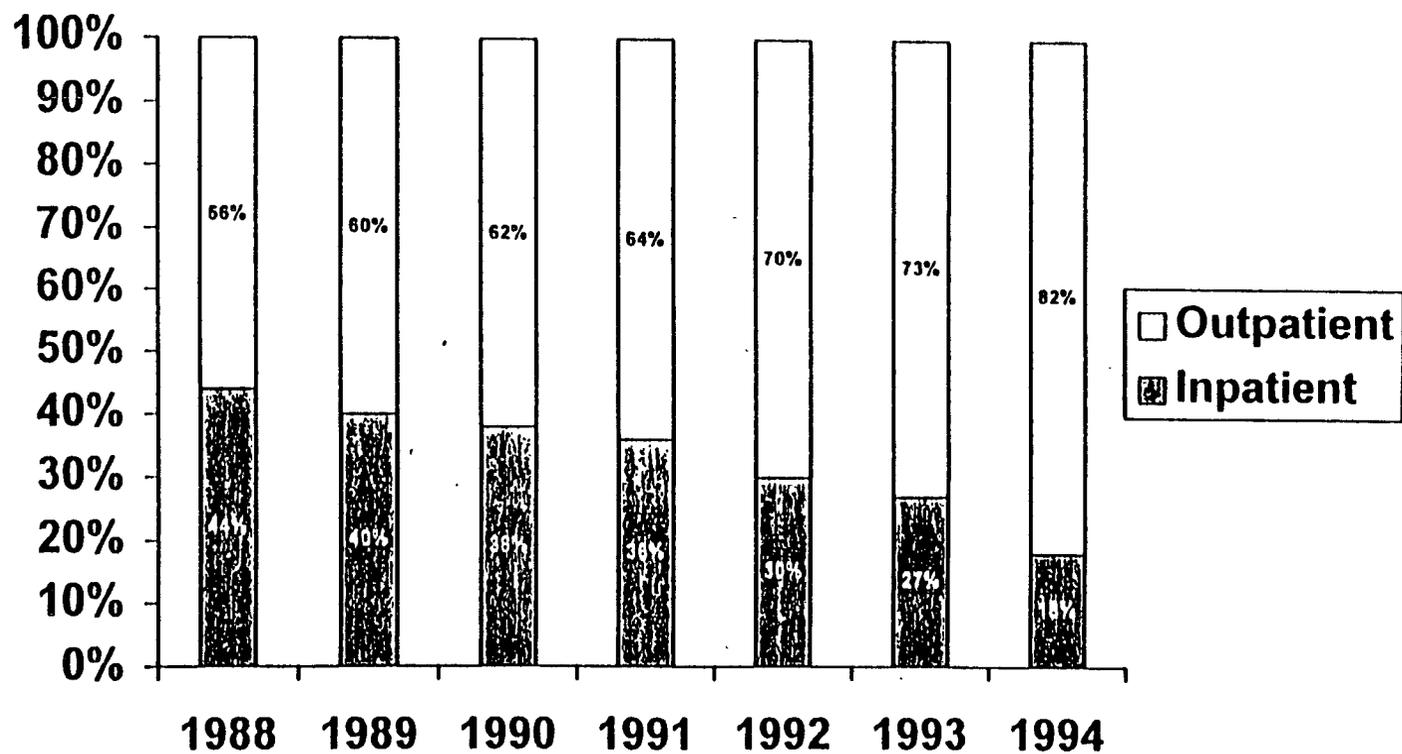

Although there has been an increasing reliance on non-physician providers of psychiatric services and non-psychiatric physicians, the bulk of the psychiatric services paid under the Medicare fee schedule are provided by psychiatrists. Thus, information about the complexity of the patients typically seen by psychiatrists is relevant to the development of appropriate work values for these services.

- Rodgers, et al (1993) found that the psychological sickness of patients of psychiatrists was approximately twice that of patients of psychologists/therapists or general medical clinicians.
- Wells et al (1995) also found that patients of psychiatrists tended to be the most psychologically sick.
- Psychiatrists continue to serve the vast majority of Medicare inpatients. In 1988, 90 percent of inpatient psychiatric services were provided by psychiatrists. By 1993, psychiatrists were still providing 80 percent of such services. As inpatients are likely the most severely ill psychiatric patients, on average the patients of psychiatrists are likely to be more severely ill than the patients of other providers (Lewin-VHI, 1995a).
- Despite the dramatic overall shift of patients from inpatient to outpatient treatment settings, psychiatrists only experienced a 30 percent decline in the proportion of Medicare services delivered in an inpatient setting, as shown in Exhibit 3. In contrast, psychologists experienced a 48 percent decrease in inpatient-based treatment delivery (Lewin-VHI, 1995a).

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 90801 Global Period: _____ Current RVW: 2.19 Recommended RVW: 2.80

CPT Descriptor:

Psychiatric diagnostic interview examination including history, mental status, or disposition (may include communication with family or other sources, ordering and medical interpretation of laboratory or other medical diagnostic studies. In certain circumstances other informants will be seen in lieu of the patient.)

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ Evaluation session in office for 24 year old male who says he heard voices coming out of wall and was threatening to harm the neighbors.

Vignette 2

- ◆ The parents of a 15 year old boy ask for an evaluation for their son who was brought home by police after violating curfew and perhaps breaking and entering. They tell you he has a history of Attention Deficit and Hyperactivity Disorder (ADHD), has been suspended from school and has refused to take medicine for the past 6 months.

Description of Pre-Service Work:

Depends on how patient was referred. At a minimum requires phone discussion with person who initiated referral, e.g. physician, family, law enforcement, employer. Probably involves review of records from referral source and lab or consultation reports.

Description of Intra-Service Work:

Complete psychiatric history, including present illness, past history, family history, complete mental status examination, selected physical examination, making arrangements for laboratory tests. Establishing a definitive diagnosis or at least a narrow enough differential to warrant a treatment plan. Decision making concerning need for degree of supervision (e.g. hospitalization). Counseling with patient concerning diagnosis and options for treatment and proposed options.

Description of Post-Service Work:

Arrangement for further studies and further care. Report or discussion with referral source. Arrangement for getting additional information. Dictating results of examination. Frequently involves additional communication with patient and/or family after results of studies are known or to deal with side effects of instituted treatment. Would probably require information from collateral source regarding patient's compliance, accuracy of prediction that patient might remain on out-patient status, etc. Report and consultation with third party utilization manager to arrange for payment and funding for proposed treatment.

SURVEY DATA:

Specialty: Psychiatry (APA and AACAP), Psychology, Nursing

Sample Size: 523¹ Response Rate (%): 35%(184) Median RVW: 2.80

1)	99245	Office consultation, moderate to high severity (80 minutes)	2.96
2)	99244	Office consultation, moderate to high severity (60 minutes)	2.23
3)			
4)			

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

90801

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90801	10	60	55	4	4	4
99245	10	80	60	4	4	4
99244	10	60	45	4	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 2.80 is supported by the survey results. Moreover, the relationship of 90801 to the two most common reference services in terms of time and intensity also supports the value. Survey respondents find that 90801 takes more time than 99244 but less time than 99245. It is also of higher intensity than 99244 with a work value of 2.23 and of equal intensity to 99245 with a work value of 2.96. Given the survey results of 90801 in relationship to the two reference services, a value of 2.80 is appropriate. It is important to note that our reference services are EM codes that are subject to review. To the extent that the values of either of these reference services changes as part of the five year review, consideration should be given to altering the psychiatric values that were derived from those reference values.

The work entailed in conducting a diagnostic interview has increased significantly over the past five years. Patients being seen for a diagnostic interview are usually referred from other providers for a psychiatric evaluation. These patients often do not want to be seen by a mental health professional and the provider has only the time with the patient to render a diagnosis and prepare a treatment plan. Five years ago, many of these patients were hospitalized and the provider had a longer period of time to make a diagnosis. Today, most of these services occur in the provider's office and the time and intensity of performing the service has increased.

A higher work value for 90801 is also supported by 91 percent of survey respondents who report that the work associated with the service has changed over the past 5 years. Of these, 85 percent report that the complexity of patient problems being seen in the office and in the hospital has increased. About 60 percent report that the usual site of service for this code has changed from the inpatient to outpatient setting. Medicare data support the shift from inpatient to outpatient care for this code. From 1988 to 1994 the proportion of this service being done in the inpatient setting declined by 50 percent, while the proportion of the service being performed in an outpatient setting increased from 56 percent to 80 percent. Finally, an overwhelming proportion of survey respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (82 percent), documenting services (94 percent), and communicating with third-party payers (98 percent).

The majority (81 percent) of survey respondents consider the vignettes to be representative of their typical patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90843 Global Period: _____ Current RVW: 1.10 Recommended RVW: 1.47

CPT Descriptor:

Individual medical psychotherapy by a physician, with continuing medical diagnostic evaluation, and drug management when indicated, including insight oriented, behavior modifying or supportive psychotherapy approximately 20 to 30 minutes.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

- ◆ Obsessive compulsive 29 year old female on chlomipramine who begins to uncontrollably pull her hair out after she gets fired from her job. Last seen six weeks ago.

Description of Pre-Service Work:

Preparing to see patient. Review of records. Telephone call to mother to get collateral information on patient. Telephone call to managed care to arrange for coverage of visit.

Description of Intra-Service Work:

History of present illness and relation of changes in patient's situation to patient's past history. Mental status examination with follow up on changes since last mental status examination. Psychotherapy addressing patient's obsessive compulsive disorder, hairpulling behavior, and employment difficulties. Brief physical examination (examination of pupils, blood pressure) to determine if patient is taking medication appropriately. Arrangement for blood test. Regulation of medicine. Counseling about side effects, counseling about significant environmental factors contributing to evaluation of anxiety, interpretation of connection between present and past events.

Description of Post-Service Work:

Arranging next visit. Obtaining and reviewing lab results and communicating with patient. Communicating with family. Calling in new prescription. Dictating record. Three telephone calls to managed care firm to arrange for additional outpatient visits. If provided by a non-physician, it also includes consulting with a physician.

SURVEY DATA:Specialty: Psychiatry (APA), Psychology, NursingSample Size: 483¹ Response Rate (%): 26%(127) Median RVW: 1.4725th Percentile RVW: 1.14 75th Percentile RVW: 1.71 Low: .90 High: 5.92Median Pre-Service Time: 5 Median Intra-Service Time: 30 Min.25th Percentile Intra-Svc Time: 25 75th Percentile Intra-Svc Time: 30 Low: 20 High: 180

1)	99243	Office consultation (30 minutes)	1.47
2)	99203	Office visit (30 minutes)	1.14
3)	99244	Office consultation, moderate to high severity (60 minutes)	2.23
4)			

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental Effort	Technical Skill and Physical Effort	Psychological Stress
90843	5	30	20	3	3	3
99243	5	30	16	3	3	3
99203	5	30	26	3	3	2.5
99244	5	50	75	4	4	3.5

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 1.47 is supported by the survey results and the relationship of 90843 to the reference services used to develop the RVU value. One-third of all respondents identified 99243 (RVU 1.47) as the reference service for 90843 and the survey results rated the two services as nearly identical in terms of time and intensity. The two other most common reference services used were 99203 (RVU 1.14) and 99244 (RVU 2.23). Respondents rated 90843 about the same time but higher intensity as 99203 and lower time and intensity than 99244. Based on the relationship of 90843 to the reference services, a value of 1.47 is appropriate. It was the median value of all the survey values and is below the mean value of the three reference services used to develop the RVU. It is important to note that our reference services are EM codes that are subject to change under the five year review. To the extent that the values of any of these reference services change as part of the five year review, consideration should be given to changing 90843 accordingly.

A higher work value for 90843 is also supported by the 78 percent of respondents who reported that the work associated with this service has changed over the past five years. Of these, three-quarters report that the complexity of patient problems being seen in the office has increased, while 78 percent report that the complexity of patient problems being seen in the hospital has increased. One-half of all respondents report that the usual site of service has shifted from the inpatient to the outpatient setting. Medicare data support this shift from inpatient to outpatient care for this code. In 1988, 45 percent of this service was performed in the inpatient setting and by 1994 this proportion has declined to 23 percent. Finally, an overwhelming proportion of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (74 percent); documenting services (90 percent); and communicating with third-party payers (95 percent).

The vast majority (80 percent) of respondents consider the vignette to be representative of their typical patients.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90844 Global Period: _____ Current RVW: 1.72 Recommended RVW: 2.00

CPT Descriptor:

Individual medical psychotherapy by a physician, with continuing medical diagnostic evaluation, and drug management when indicated, including insight oriented, behavior modifying or supportive psychotherapy; Approximately 45 to 50 minutes.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ Office psychotherapy, 20th session, for 52 year old depressed female with recurring suicidal ideation who took an overdose seven months ago but who has been stable on anti-depressants for four months.

Vignette 2

- ◆ Office psychotherapy for a 12 year old boy with post traumatic stress disorder secondary to abuse.

Description of Pre-Service Work:

Preparing to see patient. Review of records. Review of assignments for cognitive therapy.

Description of Intra-Service Work:

Mental status examination with special focus on suicidal ideas and related factors. History of present events with emphasis on distorted thinking and conscious efforts to change thinking patterns. Interpreting present behavior to past patterns of behavior. Physical examinations related to medicine. Counseling concerning side effects of medicine.

Description of Post-Service Work:

Arranging next visit. Dictating report. Whatever contact is necessary with managed care to enable service to be paid. Occasionally requires telephone conversation with collateral informant or primary care physician, e.g. if recurrence of suicidal thoughts is suspected. Reviewing and communicating results of lab studies if done at this visit.

4)	99243	Office consultation (40 minutes)	1.47

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90844	5	50	18	3.0	4.0	3.0
99244	5	50	28	4.0	3.75	3.0
99404	5	60	13	3.0	3.0	2.0
99204	5	45	20	3.0	3.0	2.0
99243	5	45	17	2.5	3.0	3.0

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 2.00 is supported by the survey results and the relationship of 90844 to the reference services used to develop the RVU value. Over one-quarter of all respondents used 99244 (RVU 2.23) as the reference service for 90844 and the survey results rated the two services as nearly identical in terms of time and intensity (although 99244 was viewed as slightly longer and requiring higher mental effort). After 99244, three other common references were 99404 (RVU 1.95), 99204 (RVU 1.71), and 99243 (RVU 1.47). Respondents viewed each of these services as either requiring less time or being less intense than 90844. For example, 99404 which has an RVU of 1.95 was viewed as requiring about the same amount of time as 90844 but requiring less psychological stress. Given the relationship of 90844 to the reference services, we believe that an RVU value of 2.00 is appropriate for 90844. It is important to note that our reference services are EM codes that are subject to change under the five year review. To the extent that the values of any of these reference services change as part of the five year review, consideration should be given to adjusting 90844 accordingly.

A higher work value for 90844 is also supported by 80 percent of all respondents who reported that the work associated with this service has changed over the past five years. Of these, over 75 percent report that the complexity of patient problems being seen in the office and in the hospital has increased. Slightly over one-half of all respondents report that the usual site of service has shifted from the inpatient to the outpatient setting. Medicare data support this shift. In 1988, 51 percent of this service was performed in the inpatient setting and by 1994 this proportion had declined to 15 percent. Finally, a large proportion of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (67 percent); documenting services (90 percent); and communicating with third party payers (98 percent).

The vast majority (95 percent) of respondents consider the vignettes to be representative of their typical patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90853 Global Period: _____ Current RVW: .43 Recommended RVW: .59

CPT Descriptor:

Group medical psychotherapy (other than of a multiple-family group) by a physician, with continuing medical diagnostic evaluation and drug management when indicated.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ Office group psychotherapy with eight men and women with dual diagnosis substance abuse and personality disorders.

Description of Pre-Service Work:

Preparing to see patient. Review of record of patient, including review of medication and lab studies. Consultation with collateral source from half of the patients.

Description of Intra-Service Work:

Observed mental status of each patient. Observation and interpretation of patterns of interaction among patients in group. Interpretation of effects of personality patterns and substance abuse behavior on group interactions and on reported behavior outside the group.

Description of Post-Service Work:

Dictation of records. Arrangement for next group service and for other individual services this patient requires. Communication with third party for coverage. Arrangement for follow up, including drug screening, appropriate lab studies for medication, follow up individual psychiatric and other medical services. May include coordinating and/or supervision of co-therapist. Reports to employee assistant managers, law enforcement agencies. Telephone communication with family is much greater in this type of group.

Vignette 2

- ◆ Group psychotherapy in residential treatment facility for six adolescent females. Diagnosis unspecified.

Description of Pre-Service Work:

Communicating with houseparents, nursing staff, and parents concerning the patient. Review of records and results of studies since last session. Review of chart.

Description of Intra-Service Work:

Seeing the patient. Making observations and assessing mental status within the group setting. Interpreting interactions and behavioral manifestations of illnesses present.

Description of Post-Service Work:

As opposed to usual hospital setting, writing notes and communicating with other professionals, third parties, and family is done after the session. Obtaining and reviewing results of studies. Reports and communications with other third parties, e.g. school. Documentation of services is done afterwards.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	90849	Multiple Family Group Medical Psychotherapy	.59
2)	99244	Office consultation (60 minutes)	2.23
3)	99231	Subsequent hospital care, per day (15 minutes)	.51

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90853	5	80	44	4	4	4
90849	10	60	26	3.5	4	3.5
99244	10	60	45	4	3	3
99231	5	15	5	3	3	2

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A value of .59 for 90853 is more appropriate than the median RVU of 1.74 indicated by the survey results. It appears that while the majority of respondents understood that the rating should be based on an individual member in the group, others rated the service based on the entire group. Thus the survey results revealed a bi-modal distribution. The reference service used by 60 percent of respondents to value this code was 90849 with a value of .59. About 10 percent of survey respondents used 99244 (RVU 2.23) and 99231 (RVU .51) as reference services. The survey respondents believe that the relationship between the codes is similar, with 90853 believed to have more intra-service time. Moreover, if we assume that all respondents who rated 90853 above 1.0 actually gave a value for the entire group (a conservative assumption) and we divided these values by the number of persons in the group (6 or 8 depending on the vignette) the new median would be .59.

A higher work value for 90853 is also supported by the two-thirds of survey respondents who report that the work associated with performing this service has increased over the past five years. Of these, almost 80 percent report that the complexity of patient problems being seen in the office and in the hospital has increased. Respondents also report that the work associated with this service has increased: 62 percent find that the work associated with coordinating with other professionals has increased; 88 percent of respondents report that the work in documenting services has increased; and 97 percent report that the work in communicating with third party payers has increased.

The majority (71 percent) of respondents consider the vignette to be representative of their typical patients.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 90855 Global Period: _____ Current RVW: 1.81 Recommended RVW: 2.15

CPT Descriptor:

Interactive individual medical psychotherapy.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

- ♦ An 8 year old with a history of separation anxiety disorder and generalized anxiety disorder, previously seen for monthly medication management and short-term psychotherapy, presents for assistance planning for a scheduled surgical procedure. She requires fact-to-face time using play materials to enact the hospital admission and surgical procedure.

Description of Pre-Service Work:

Review the record of previous treatment and medications. Talk with the surgeon about the planned surgery, including planned procedures and prognosis. Talk with the parents about their observations of the child's response to past and planned medical/surgical interventions.

Description of Intra-Service Work:

Using play equipment, re-enactment with the child of the anticipation, surgery and recovery periods, exploring his fears, anxieties, and potential coping strategies.

Description of Post-Service Work:

Talk with the parents, nursing staff where the surgery will occur, and the surgeon or his/her office staff about their observations of the patient's vulnerabilities and ways they can modify their procedures to support the child and minimize his stress.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	<u>Pre</u>	<u>Intra</u>	<u>Post</u>	<u>Mental</u>	<u>Technical Skill and Physical Effort</u>	<u>Psychological Stress</u>
90855	10	50	42	4	4	3
99244	8	60	25	4	4	3
99404	0	50	10	2	2	1

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 2.15 is supported by the survey results and the relationship of 90855 to the reference service used to develop the RVU value. The recommended value is about 4 percent lower than the survey median. About 30 percent of the respondents used 99244 (RVU 2.23) as the reference service for 90855 and the survey results indicate that 99244 requires more time and more psychological stress than 90855. Thus, the RVU for 90855 should be less than 99244. Moreover, survey respondents consider 90855 to be of longer duration, particularly in post-service time, and of higher intensity than 90844 with a recommended RVU of 2.00. It is important to note that our reference service is an EM code that is subject to change under the five year review. To the extent that the values of any of these reference services change as part of the five year review, consideration should be given to adjusting 90855 accordingly.

A higher work value for 90855 is also supported by the 80 percent of survey respondents who reported that the work associated with this service has changed over the past five years. Two-thirds of respondents report that the complexity of patient problems being seen in the office and in the hospital has increased, which is a particularly high result given that the code is a new code. Finally, a large proportion of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (70 percent); documenting services (86 percent); and communicating with third party payers (94 percent).

The majority (68 percent) of respondents consider the vignettes to be representative of their typical patients. It is important to note that 95 percent of child psychiatrists and 80 percent of psychiatrists consider the vignette to be typical of their patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90862 Global Period: _____ Current RVW: .95 Recommended RVW: 1.30

CPT Descriptor:

Pharmacologic management, including prescription, use, and review of medication with no more than minimal medical psychotherapy.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ 72 year old man with bipolar disorder, or lithium with familial benign tremor, comes in for treatment because his tremor has suddenly become worse.

Vignette 2

- ◆ An 8 year old boy on ritalin for Attention Deficit and Hyperactivity Disorder (ADHD) is developing tics and comes in for medication management.

Description of Pre-Service Work:

Preparing to see the patient. Review of records. Ordering laboratory services. Reviewing the results of lab tests. Communicating with neurologist concerning patient's tremor. Telephone call to wife/family.

Description of Intra-Service Work:

Mental status examination with especial assessment of mood disorder and cognitive examination. History of present illness. Review of history of taking medication. Examination of tremor, including brief neurological assessment. Regulation of medication.

Description of Post-Service Work:

Arranging for follow up visit. Arrangement for lab studies after medicine change. Communicating with neurological consultant. Documentation of services and providing reports to third party. Telephone call to wife to assure patient's adequate hydration.

4)	99232	Subsequent hospital care (25 minutes)	.88

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90862	5	25	23	4	4	3
99243	5	28	25	3	3	3
99203	5	30	16	3	3	2
99262	0	20	10	3	3	3
99232	0	25	10	3	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU of 1.3 is supported by the survey results and the relationship of 90862 to the reference services used to develop the RVU. The time and intensity involved in performing 90862 was viewed as less than 99203 (RVU 1.47), more than 99262 (RVU .75) and about the same time but greater intensity than 99243 (RVU 1.14). It is important to note that our reference services are EM codes that are subject to review. To the extent that the values of either of these reference services changes as part of the five year review, consideration should be given to altering the psychiatric values that were derived from those reference values.

A higher work value for 90862 is also supported by the 81 percent of respondents who reported that the work associated with this service has changed over the past five years. Of these, 80 percent of all respondents report that the complexity of patient problems being seen in the office has increased, while 76 percent of respondents report that the complexity of patient problems seen in the hospital has increased. The majority of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (75 percent); documenting services (90 percent); and communicating with third party payers (96 percent).

The work involved in 90862 has changed significantly since the original work value was developed. First, simple medication follow-up is done by primary care physicians. Psychiatrists' services are now sought, as the vignette indicates, when there are some complications which call for specialized psychiatric services. Second, the patients, especially in managed care settings, are seen for psychotherapy by non-physician practitioners. When there is indication for pharmacologic management, the patient is referred to the physician whose service under this code resembles, but is not identical to, 99243, consultation. The psychiatrist performing 90862 must do an evaluation and examination to grasp changes in clinical state since the previous examination, then utilize medical decision-making to deal with possible alterations of psychiatric medicine while weighing other medical conditions and other medications. Patients are frequently on several medications for other medical conditions requiring careful management.

For example, in the first vignette, pre-service calls had to be made to the neurologist who follows his tremor and to the primary care physician who medicates his hypertension. The degree of hypomanic behavior has to be assessed and a focused neurologic examination had to be done to differentiate the benign tumor from lithium tremor and from senile or extrapyramidal tremor or tremor of other etiology before medication management was possible.

The vast majority (92 percent) of respondents consider the vignettes to be representative of their typical patients.

CMD Comment:

90862 is comparable to 99213. Standard of practice for this service is for 15 minutes of face to face time with a low level of stress and intensity. This code is abused because of its relatively high payment and low work requirement.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90887 Global Period: _____ Current RVW: 1.48 Recommended RVW: 2.00

CPT Descriptor:

Interpretation or examination of results of psychiatric, other medical examinations and procedures, or other accumulated data to family or other responsible persons, or advising them how to assist patient.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

The father and stepmother of a 7 year old girl request an explanation of findings on their daughter whom the biological mother brought for evaluation. The biological parents share custody. The patient has been distractible, unable to learn to read, and has no friends. The father is financially responsible for medical treatment and wants to know why medication AND behavioral management are recommended.

Description of Pre-Service Work:

Review of the history, findings, and laboratory to present to the father and stepmother.

Description of Intra-Service Work:

Presentation of the findings and treatment recommendation, as well as review of the custody arrangement, the financial obligation of the father, and the rationale for the combination of medication and behavioral management.

Description of Post-Service Work:

Contact the biological mother to inform her of the process; perhaps contact the attorney.

Median Post-Service Time:

Total TimeDocumentation of the service provided 8Arranging for further services 3Reviewing results of studies 2Communicating further with patient, family, and
other professionals including reports 10Providing written or telephone reports to
Medicare or other third party payors 5**KEY REFERENCE SERVICE(S):**

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99404	Counseling and/or risk reduction interventions (60 minutes)	1.95
2)	99244	Office consultation (60 minutes)	2.23
3)	99386	Initial evaluation of healthy individual	1.88
4)	99204	Office visit (45 minutes)	1.71

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90887	10	50	28	4	4	3
99404	5	60	25	3	3	3
99244	5	60	37	4	4	3
99386	10	45	37	3	3	3
99204	10	45	38	3	3	3

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 2.00 is supported by the survey results. This service was viewed as identical to 99404 (1.95) in terms of time but of higher intensity, thus 90887 should have a higher value than 99404. Similarly, this service is considered to be more time and higher intensity than both 99204 (RVU 1.71) and 99386 (1.88), although it is viewed as less time and intensity than 99244 (RVU 2.23). Given the relationship of 90887 to the reference services, a value of 2.00 is appropriate.

A higher work value for 90887 is also supported by the 64 percent of respondents who reported that the work associated with this service has changed over the past five years. Of these, three-quarters of respondents report that the complexity of patient problems being seen in the office has increased, while 61 percent report that the complexity of patient problems being seen in the hospital has increased. An analysis of Medicare data suggest that the usual site of service has shifted from the inpatient to outpatient setting. In 1988 51 percent of services for this code were performed in the inpatient setting. By 1994 this proportion declined to 25 percent. Finally, a large proportion of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (67 percent); documenting services (84 percent); and communicating with third party payers (93 percent).

The vast majority (81 percent) of respondents consider the vignettes to be representative of their typical patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90845 Global Period: _____ Current RVW: 1.78 Recommended RVW: 1.78

CPT Descriptor:

Medical psychoanalysis.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ A 37-year-old man with dysthymia and narcissistic personality disorder manifested by entitlement, inability to be intimate, and extreme variability of self esteem is seen in the second year of psychoanalysis, just prior to going on a business trip. Argumentative and easily offended, he accuses the analyst of being insensitive and detached, and angrily rejects any effort to explore the basis of his mood or behavior.

Vignette 2

- ◆ A 17-year-old girl with generalized anxiety and an eating disorder in the sixth month of psychoanalysis with a female analyst reveals for the first time that she experiences her father's behavior as seductive and her mother as remote and hostile, unable to help her manage her feelings. She desperately wants to be held and comforted by the analyst and worries that she won't be able to leave when the session is over.

Description of Pre-Service Work:

Reviewing notes, arranging clinical setting, telephone work related to appointments. 3-10 minutes.

Description of Intra-Service Work:

Establishment and maintenance of working relationship. Intense observation, listening, and analysis of patient behavior, emotion, and verbal productions, as well as assessing contributory general medical problems. Expert self-observation for reactions to patient and assessment of relevance to understanding of patient. Formulation of working hypotheses regarding patient's mental processes and experiences. Development of responses to patient to 1) elicit further information, 2) facilitate further exploration and awareness by patient, 3) aid patient in clarifying self-observations, 4) assist patient in understanding and modulating regression during this session and as part of the ongoing treatment, 5) facilitate patient's integrated, in-depth understanding (insight), and 6) assist patient in working through barriers (resistance) to adaptive change of mental status and behavior. Ongoing monitoring and reassessment of need for psychotropic medications and/or ongoing assessment of impact of medication on the patient and the treatment process. 45-50 minutes.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90845	5	45	11	4	4	4
99243	5	45	10	3	4	2
99244	5	60	25	4.5	4	3.5
99404	0	50	10	2	2	1
99204	5	50	40	2	2	1

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The survey results support maintaining the current RVU value for 90845. The median RVU is almost the same as the current value and almost two thirds of survey respondents report that the work associated with this service has remained the same over the past five years. In addition, Medicare data does not suggest a shift in the site of care or in the distribution of providers performing this service. Survey results indicate that 85 percent of respondents consider the vignette typical of their patients. It is important to note that our reference services are EM codes that are subject to change under the five-year review. To the extent that the values of any of these reference services change as part of the five-year review, consideration should be given to adjusting 90845 accordingly.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90847 Global Period: _____ Current RVW: 2.19 Recommended RVW: 2.10

CPT Descriptor:

Family medical psychotherapy (conjoint psychotherapy) by a physician, with continuing medical diagnostic evaluation, and drug management when indicated.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ Conjoint psychotherapy in the office, eighth weekly session, for a married couple in their early 40s, for marital problems. The woman is having moderate depression with vegetative signs and is gradually improving with antidepressant medication.

Vignette 2

- ◆ Parents require therapy due to their disagreement about how to handle a 14 year old gifted child who is failing in school and violating curfew.

Description of Pre-Service Work:

Preparing to see patient. Review of records. Occasionally communicating with other providers who may be managing the woman's depression.

Description of Intra-Service Work:

Observation and interpretation of interactive patterns of communication and behavior of this couple with each other. Interpreting relation of these patterns to past patterns of behavior. Mental status examination of depressed wife with special emphasis on changes in vegetative signs since last examination. Decision making concerning course of depression and further course of treatment. Discussion of side effects of medication and whatever physical examination is appropriate to medicine.

Description of Post-Service Work:

Arranging for next service, including prorated time to communicate with third party for coverage. Dictating record.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	<u>Pre</u>	<u>Intra</u>	<u>Post</u>	<u>Mental</u>	<u>Technical Skill and Physical Effort</u>	<u>Psychological Stress</u>
90847	5	50	21	3	3	3
99244	5	60	25	4	4	3
99243	5	45	20	3	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 2.10 is 4 percent lower than the current value and reflects the survey median for psychiatrists. Although the consolidated median was 2.00, psychiatrists represent three-quarters of all respondents and rated the service a 2.11 RVU. Moreover, psychiatrists rated this service higher in intensity than 90844 which received a work RVU of 2.00. It is important to note that our reference services are EM codes that are subject to change under the five-year review. To the extent that the values of any of these reference services change as part of the five-year review, consideration should be given to adjusting 90847 accordingly.

The vast majority (90 percent) of respondents consider the vignettes to be representative of their typical patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90853 Global Period: _____ Current RVW: .43 Recommended RVW: .59

CPT Descriptor:

Group medical psychotherapy (other than of a multiple-family group) by a physician, with continuing medical diagnostic evaluation and drug management when indicated.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ Office group psychotherapy with eight men and women with dual diagnosis substance abuse and personality disorders.

Description of Pre-Service Work:

Preparing to see patient. Review of record of patient, including review of medication and lab studies. Consultation with collateral source from half of the patients.

Description of Intra-Service Work:

Observed mental status of each patient. Observation and interpretation of patterns of interaction among patients in group. Interpretation of effects of personality patterns and substance abuse behavior on group interactions and on reported behavior outside the group.

Description of Post-Service Work:

Dictation of records. Arrangement for next group service and for other individual services this patient requires. Communication with third party for coverage. Arrangement for follow up, including drug screening, appropriate lab studies for medication, follow up individual psychiatric and other medical services. May include coordinating and/or supervision of co-therapist. Reports to employee assistant managers, law enforcement agencies. Telephone communication with family is much greater in this type of group.

Vignette 2

- ◆ Group psychotherapy in residential treatment facility for six adolescent females. Diagnosis unspecified.

Description of Pre-Service Work:

Communicating with houseparents, nursing staff, and parents concerning the patient. Review of records and results of studies since last session. Review of chart.

Description of Intra-Service Work:

Seeing the patient. Making observations and assessing mental status within the group setting. Interpreting interactions and behavioral manifestations of illnesses present.

Description of Post-Service Work:

As opposed to usual hospital setting, writing notes and communicating with other professionals, third parties, and family is done after the session. Obtaining and reviewing results of studies. Reports and communications with other third parties, e.g. school. Documentation of services is done afterwards.

SURVEY DATA:

99244	10	60	45	4	3	3
99231	5	15	5	3	3	2

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A value of .59 for 90853 is more appropriate than the median RVU of 1.74 indicated by the survey results. It appears that while the majority of respondents understood that the rating should be based on an individual member in the group, others rated the service based on the entire group. Thus the survey results revealed a bi-modal distribution. The reference service used by 60 percent of respondents to value this code was 90849 with a value of .59. About 10 percent of survey respondents used 99244 (RVU 2.23) and 99231 (RVU .51) as reference services. The survey respondents believe that the relationship between the codes is similar, with 90853 believed to have more intra-service time. Moreover, if we assume that all respondents who rated 90853 above 1.0 actually gave a value for the entire group (a conservative assumption) and we divided these values by the number of persons in the group (6 or 8 depending on the vignette) the new median would be .59.

A higher work value for 90853 is also supported by the two-thirds of survey respondents who report that the work associated with performing this service has increased over the past five years. Of these, almost 80 percent report that the complexity of patient problems being seen in the office and in the hospital has increased. Respondents also report that the work associated with this service has increased: 62 percent find that the work associated with coordinating with other professionals has increased; 88 percent of respondents report that the work in documenting services has increased; and 97 percent report that the work in communicating with third party payers has increased.

The majority (71 percent) of respondents consider the vignette to be representative of their typical patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90855 Global Period: _____ Current RVW: 1.81 Recommended RVW: 2.15

CPT Descriptor:

Interactive individual medical psychotherapy.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

- ◆ An 8 year old with a history of separation anxiety disorder and generalized anxiety disorder, previously seen for monthly medication management and short-term psychotherapy, presents for assistance planning for a scheduled surgical procedure. She requires fact-to-face time using play materials to enact the hospital admission and surgical procedure.

Description of Pre-Service Work:

Review the record of previous treatment and medications. Talk with the surgeon about the planned surgery, including planned procedures and prognosis. Talk with the parents about their observations of the child's response to past and planned medical/surgical interventions.

Description of Intra-Service Work:

Using play equipment, re-enactment with the child of the anticipation, surgery and recovery periods, exploring his fears, anxieties, and potential coping strategies.

Description of Post-Service Work:

Talk with the parents, nursing staff where the surgery will occur, and the surgeon or his/her office staff about their observations of the patient's vulnerabilities and ways they can modify their procedures to support the child and minimize his stress.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	<u>Pre</u>	<u>Intra</u>	<u>Post</u>	<u>Mental</u>	<u>Technical Skill and Physical Effort</u>	<u>Psychological Stress</u>
90855	10	50	42	4	4	3
99244	8	60	25	4	4	3
99404	0	50	10	2	2	1

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 2.15 is supported by the survey results and the relationship of 90855 to the reference service used to develop the RVU value. The recommended value is about 4 percent lower than the survey median. About 30 percent of the respondents used 99244 (RVU 2.23) as the reference service for 90855 and the survey results indicate that 99244 requires more time and more psychological stress than 90855. Thus, the RVU for 90855 should be less than 99744. Moreover, survey respondents consider 90855 to be of longer duration, particularly in post-service time, and of higher intensity than 90844 with a recommended RVU of 2.00. It is important to note that our reference service is an EM code that is subject to change under the five year review. To the extent that the values of any of these reference services change as part of the five year review, consideration should be given to adjusting 90855 accordingly.

A higher work value for 90855 is also supported by the 80 percent of survey respondents who reported that the work associated with this service has changed over the past five years. Two-thirds of respondents report that the complexity of patient problems being seen in the office and in the hospital has increased, which is a particularly high result given that the code is a new code. Finally, a large proportion of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (70 percent); documenting services (86 percent); and communicating with third party payers (94 percent).

The majority (68 percent) of respondents consider the vignettes to be representative of their typical patients. It is important to note that 95 percent of child psychiatrists and 80 percent of psychiatrists consider the vignette to be typical of their patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90857 Global Period: _____ Current RVW: .43 Recommended RVW: .59

CPT Descriptor:

Interactive group medical psychotherapy by a physician, with continuing medical diagnostic evaluation and drug management when indicated.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Pre-schoolers develop sleep problems, decreased appetite, and increased irritability after the sudden drowning death of a peer. They meet with a therapist and use play (interactive) techniques to work through the loss.

Description of Pre-Service Work:

Preparing to see patient. Review of record of patient. Consultation with collateral source from half of the patients.

Description of Intra-Service Work:

Seeing the patient. Making observations and assessing mental status within the group setting. Interpreting interactions and behavioral manifestations of illnesses present.

Description of Post-Service Work:

Dictation of records. Arrangement for next group service and for other individual services this patient requires. Communication with third party for coverage. Arrangement for follow up, follow up individual psychiatric and other medical services. May include coordinating and/or supervision of co-therapist. Reports to school. Telephone communication with family is much greater in this type of group.

1)	90849	Multiple Family Group Medical Psychotherapy	.59
2)	99244	Office consultation (60 minutes)	2.23
3)			

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90857	15	50	57.5	4	4	4
90849	10	60	26	3.5	4	3.5
99244	10	60	45	4	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A value of .59 for 90857 is more appropriate than the median RVU of 2.00 indicated by the survey results. It appears that while the majority of respondents understood that the rating should be based on an individual member in the group, others rated the service based on the entire group. Thus the survey results revealed a bi-modal distribution. A value of .59 for 90857 is more appropriate in order to preserve the current relationship between 90853 and 90857.

A higher work value for 90853 is also supported by the majority of respondents who report that work has increased over the past five years. One-half find that the work associated with coordinating with other professionals has increased; three-quarters of respondents report that the work in documenting services has increased; and 86 percent report that the work in communicating with third party payers has increased.

Less than half (40 percent) of respondents consider the vignette to be representative of their typical patients. However, three-quarters of psychiatrists consider the vignette to be typical. This result may have occurred because the vignette was prepared by the psychiatrists.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90862 Global Period: _____ Current RVW: .95 Recommended RVW: 1.30

CPT Descriptor:

Pharmacologic management, including prescription, use, and review of medication with no more than minimal medical psychotherapy.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Vignette 1

- ◆ 72 year old man with bipolar disorder, on lithium with familial benign tremor, comes in for treatment because his tremor has suddenly become worse.

Vignette 2

- ◆ An 8 year old boy on ritalin for Attention Deficit and Hyperactivity Disorder (ADHD) is developing tics and comes in for medication management.

Description of Pre-Service Work:

Preparing to see the patient. Review of records. Ordering laboratory services. Reviewing the results of lab tests. Communicating with neurologist concerning patient's tremor. Telephone call to wife/family.

Description of Intra-Service Work:

Mental status examination with especial assessment of mood disorder and cognitive examination. History of present illness. Review of history of taking medication. Examination of tremor, including brief neurological assessment. Regulation of medication.

Description of Post-Service Work:

Arranging for follow up visit. Arrangement for lab studies after medicine change. Communicating with neurological consultant. Documentation of services and providing reports to third party. Telephone call to wife to assure patient's adequate hydration.

other professionals including reports 5Providing written or telephone reports to
Medicare or other third party payors 5**KEY REFERENCE SERVICE(S):**

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99243	Office consultation (40 minutes)	1.14
2)	99203	Office visit (30 minutes)	1.47
3)	99262	Follow-up inpatient consultation (20 minutes)	.75
4)	99232	Subsequent hospital care (25 minutes)	.88

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	<u>Pre</u>	<u>Intra</u>	<u>Post</u>	<u>Mental</u>	<u>Technical Skill and Physical Effort</u>	<u>Psychological Stress</u>
90862	5	25	23	4	4	3
99243	5	28	25	3	3	3
99203	5	30	16	3	3	2
99262	0	20	10	3	3	3
99232	0	25	10	3	3	3

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU of 1.3 is supported by the survey results and the relationship of 90862 to the reference services used to develop the RVU. The time and intensity involved in performing 90862 was viewed as less than 99203 (RVU 1.47), more than 99262 (RVU .75) and about the same time but greater intensity than 99243 (RVU 1.14). It is important to note that our reference services are EM codes that are subject to review. To the extent that the values of either of these reference services changes as part of the five year review, consideration should be given to altering the psychiatric values that were derived from those reference values.

A higher work value for 90862 is also supported by the 81 percent of respondents who reported that the work associated with this service has changed over the past five years. Of these, 80 percent of all respondents report that the complexity of patient problems being seen in the office has increased, while 76 percent of respondents report that the complexity of patient problems seen in the hospital has increased. The majority of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (75 percent); documenting services (90 percent); and communicating with third party payers (96 percent).

The work involved in 90862 has changed significantly since the original work value was developed. First, simple medication follow-up is done by primary care physicians. Psychiatrists' services are now sought, as the vignette indicates, when there are some complications which call for specialized psychiatric services. Second, the patients, especially in managed care settings, are seen for psychotherapy by non-physician practitioners. When there is indication for pharmacologic management, the patient is referred to the physician whose service under this code resembles, but is not identical to, 99243, consultation. The psychiatrist performing 90862 must do an evaluation and examination to grasp changes in clinical state since the previous examination, then utilize medical decision-making to deal with possible alterations of psychiatric medicine while weighing other medical conditions and other medications. Patients are frequently on several medications for other medical conditions requiring careful management.

For example, in the first vignette, pre-service calls had to be made to the neurologist who follows his tremor and to the primary care physician who medicates his hypertension. The degree of hypomanic behavior has to be assessed and a focused neurologic examination had to be done to differentiate the benign tumor from lithium tremor and from senile or extrapyramidal tremor or tremor of other etiology before medication management was possible.

The vast majority (92 percent) of respondents consider the vignettes to be representative of their typical patients.

	99213 OFFICE/OUTPATIENT VISIT, EST	0.55	XXX

CMD Comment:

90862 is comparable to 99213. Standard of practice for this service is for 15 minutes of face to face time with a low level of stress and intensity. This code is abused because of its relatively high payment and low work requirement.

1)			
2)			
3)			
4)			

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Given the unreliable survey results based upon: (1) low response rate; (2) wide variation in values; and (3) respondent inability to select a reference service, we have not based our recommendation on the survey results.

Instead, we recommend an RVU value of 2.19 for 90870 in order to preserve its relationship to 90844. The original Harvard study used 90844 as the anchor for the development of the relative values for the psychiatric codes. We recommend preserving this relationship and valuing 90870 at 2.19.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90880 Global Period: _____ Current RVW: 2.19 Recommended RVW: 2.19

CPT Descriptor: Medical Hypnotherapy

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service was felt to be overvalued. The American Psychological Association supports the American Psychiatric Association's assertion that the nature of psychiatric services has become more intensive over the past 5 years and believed it appropriate to develop survey data to determine the Relative Work Value of 90880. The present work value of 2.19 was assigned by HCFA in 1992.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

- #1: Referred by his neurologist, a 45-year-old man presented with chronic intractable pain that has not responded to medical intervention.
- #2: A 10-year-old girl was hit by a car eight months before. In the past six months, she has become afraid to cross any street and has to be carried or dragged by an adult. In the initial evaluation, she reported a number of symptoms of PTSD that had been worsening.

Description of Pre-Service Work:

Preparing to see patient and review of records. Communication with other providers as appropriate.

Description of Intra-Service Work:

History of problem and symptoms since last office visit and assessment of present mental status. Assessment of treatment efficacy since last visit and review of assignments with patient (or parents and patient when patient is a child). Hypnotic induction with patient and assessment of depth of trance state. Monitoring and management of patient response to hypnotherapy. Hypnotherapeutic work with special emphasis on suggestions to provide symptom reduction and symptom management (eg, pain control; anxiety management) with interpretation of present behavior and symptoms in context of their etiology and the patient's ability to change and control symptoms. Discussion of intersession assignments regarding behavior change with patient, and parents, if child.

Description of Post-Service Work:

Arranging next visit. Documentation of services including dictating report. Communication with third party payors as necessary. Periodic telephonic consultation with referring physician, other professionals, and family for continuity of care. Review of new medical or lab studies when relevant.

SURVEY DATA:Specialty: American Psychological AssociationSample Size: 120¹ Response Rate (%): 29%(35) Median RVW: 2.2325th Percentile RVW: 1.80 75th Percentile RVW: 2.31 Low: 1.35 High: 3.00Median Pre-Service Time: 8 Min. Median Intra-Service Time: 50 Min.25th Percentile Intra-Svc Time: 50 Min. 75th Percentile Intra-Svc Time: 60 Min. Low: 40 High: 90

Median Post-Service Time:	<u>Total Time</u>
Documentation of service provided	<u>10</u>
Arranging for further services	<u>5</u>
Reviewing results of studies	<u>5</u>
Communication further with patient, family, and other professionals including reports	<u>10</u>
Providing written or telephone reports to Medicare or other third party payors	<u>10</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99204	Office visit, moderate to high severity (45 minutes)	1.71
2)	99244	Office consultation, moderate to high severity (60 min)	2.23

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	Pre	Intra	Post	Mental	Technical Skill and Physical Effort	Psychological Stress
90880	8	50	40	4	4	3
99204	5	50	24	3	3	2.5
99244	5	52.5	25	3	3	3

¹The American Psychological Association sampled a total of 546 psychologists, of which 120 were targeted to this code.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The survey results support maintaining the current RVW value of 2.19 for 90880. The survey median RVW (2.23) is almost the same as the current value and the data does not support the assertion that the service is over-valued. The volume of this procedure is very low, with a frequency of 11,166 in 1994, as this procedure is not typically reimbursed by HCFA. However, payment policy does not change the relative work of providing the service. The American Psychiatric Association proposed a reduction in this value to 1.76 in their February 6, 1995 comment letter to HCFA, while proposing relative value increases of almost all other psychiatric procedures, citing a shift toward increased intensity and complexity of outpatient services over the past 5 years. This shift and complexity is not different for patients treated with 90880, medical hypnotherapy, which is rated as a more complex and intensive procedure than 90844, 45 - 50 minutes individual psychotherapy, (proposed RVW of 2.00) by psychologists.

Hypnotherapy is the application of hypnotic technique in the context of psychotherapy for treatment of mental/behavioral disorders, and is utilized in behavioral medicine for the control of pain, psychophysiological disorders, and behavioral disorders. Seventy-seven percent of our survey respondents report that the work of performing 90880 has changed in the past 5 years, with 63% of the sample reporting an increase in the complexity of the typical patient seen in the office. 100% of the sample reported that communication with third party payors has increased the work of providing this service, and 90% of the sample rated the vignette of the service as typical of their patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 90887 Global Period: _____ Current RVW: 1.48 Recommended RVW: 2.00

CPT Descriptor:

Interpretation or examination of results of psychiatric, other medical examinations and procedures, or other accumulated data to family or other responsible persons, or advising them how to assist patient.

Source and Summary of Comment to HCFA on this service:

The American Psychiatric Association's February 6 comments to HCFA indicated that this service is undervalued as the nature of psychiatric services has become more intensive since the development of existing work values. Also, HCFA failed to maintain the relative relationship among the psychiatric codes that was developed by Harvard.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

The father and stepmother of a 7 year old girl request an explanation of findings on their daughter whom the biological mother brought for evaluation. The biological parents share custody. The patient has been distractible, unable to learn to read, and has no friends. The father is financially responsible for medical treatment and wants to know why medication AND behavioral management are recommended.

Description of Pre-Service Work:

Review of the history, findings, and laboratory to present to the father and stepmother.

Description of Intra-Service Work:

Presentation of the findings and treatment recommendation, as well as review of the custody arrangement, the financial obligation of the father, and the rationale for the combination of medication and behavioral management.

Description of Post-Service Work:

Contact the biological mother to inform her of the process; perhaps contact the attorney.

SURVEY DATA:Specialty: Psychiatry (APA, AACAP), Psychology, NursingSample Size: 523¹ Response Rate (%): 23%(122) Median RVW: 2.025th Percentile RVW: 1.71 75th Percentile RVW: 2.25 Low: .5 High: 7.25Median Pre-Service Time: 10 Median Intra-Service Time: 50 Min.25th Percentile Intra-Svc Time: 45 75th Percentile Intra-Svc Time: 60 Low: 15 High: 100

Median Post-Service Time:

Total TimeDocumentation of the service provided 8Arranging for further services 3Reviewing results of studies 2Communicating further with patient, family, and
other professionals including reports 10Providing written or telephone reports to
Medicare or other third party payors 5**KEY REFERENCE SERVICE(S):**

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	99404	Counseling and/or risk reduction interventions (60 minutes)	1.95
2)	99244	Office consultation (60 minutes)	2.23
3)	99386	Initial evaluation of healthy individual	1.88
4)	99204	Office visit (45 minutes)	1.71

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

	<u>Pre</u>	<u>Intra</u>	<u>Post</u>	<u>Mental</u>	<u>Technical Skill and Physical Effort</u>	<u>Psychological Stress</u>
90887	10	50	28	4	4	3
99404	5	60	25	3	3	3
99244	5	60	37	4	4	3
99386	10	45	37	3	3	3
99204	10	45	38	3	3	3

¹ The American Psychological Association sampled a total of 546 psychologists, of which 186 were targeted to this code.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A recommended RVU value of 2.00 is supported by the survey results. This service was viewed as identical to 99404 (1.95) in terms of time but of higher intensity, thus 90887 should have a higher value than 99404. Similarly, this service is considered to be more time and higher intensity than both 99204 (RVU 1.71) and 99386 (1.88), although it is viewed as less time and intensity than 99244 (RVU 2.23). Given the relationship of 90887 to the reference services, a value of 2.00 is appropriate.

A higher work value for 90887 is also supported by the 64 percent of respondents who reported that the work associated with this service has changed over the past five years. Of these, three-quarters of respondents report that the complexity of patient problems being seen in the office has increased, while 61 percent report that the complexity of patient problems being seen in the hospital has increased. An analysis of Medicare data suggest that the usual site of service has shifted from the inpatient to outpatient setting. In 1988 51 percent of services for this code were performed in the inpatient setting. By 1994 this proportion declined to 25 percent. Finally, a large proportion of respondents report that the work of performing this service has increased in terms of coordinating with other health professionals (67 percent); documenting services (84 percent); and communicating with third party payers (93 percent).

The vast majority (81 percent) of respondents consider the vignettes to be representative of their typical patients.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Integumentary

The codes in this section have been surveyed and commented on by numerous specialty societies. These societies wrote public comments on codes they believed were undervalued or overvalued. In several instances specialty societies were responding to reductions proposed by the Carrier Medical Directors.

Recommendations given by specialty societies were generally supported with survey data and arguments that were based on changes in the patient population, changes in technology, erroneous assumptions about the similarities between two codes and rank order anomalies. Survey sample sizes were generally of sufficient size to validate the results. Additionally, specialty societies made cross specialty comparisons to similar procedures. These gave support to arguments and survey data.

Generally the RUC found the data, comparisons and arguments convincing. The threshold for the RUC was to show compelling evidence that the procedure changed, the patient population changed, or that the code had been originally undervalued or overvalued. When the RUC recommended a different RVU, it typically attempted to rectify new survey data and rationale with Harvard data, producing final recommended RVU increases below those recommended by the specialty society. In all; 6 codes were reduced in value, 15 codes were increased in value, and for 35 codes the RUC recommended to retain the current value.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
10040	Acne surgery	1.34	0.80	CMD: Reduce RVU to .80. This is a low intensity service that can be performed by a nurse under a physician's supervision. The HCFA data indicate an intra-operative time of 14 minutes. The intra-operative time of reference code 10060, <i>I&D of a simple abscess</i> , is 19 minutes. The average number of office visits in the follow-up period of acne surgery is 0.4 while it is 1.0 for the I&D of an abscess. Therefore, the RVUs for 10040 should be reduced to 0.8 which would place it at a level below the RVUs assigned to 10060 (1.12).	The RUC recommends that the CMD recommendation for a reduction be accepted.	3
10061	Drainage of skin abscess	2.48	2.24	Code 10061 is over valued by 10%. Comparable to 11603, <i>excision malignant lesion</i> , which is valued at 2.30.	The RUC recommends that the specialty societies recommendation for a reduction be accepted.	3
10080	Drainage of pilonidal cyst	1.62	1.12	CMD: Reduce RVU to 1.12. Service times are either equal or less than 10060, <i>I&D of a simple abscess</i> . The work involved in the I&D of a simple pilonidal cyst is comparable to the work involved in the I&D of an abscess yet the RVUs are significantly higher. The HCFA data indicate 15 minutes of intra-operative time for 10080 which is less than the intra-operative time for 10060 (19 minutes.) The intensity of the services is comparable. The RVUs for 10080 should be equivalent to the level of 10060 (1.12).	The RUC recommends that the CMD recommendation for a reduction be accepted.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
10140	Drainage of hematoma/fluid	1.48	1.48	An individual commented that this code is over valued compared to 10160, Puncture drainage of lesion.	The argument is not compelling. No further evidence in the form of survey data or additional comparisons. The RUC recommends that the current value be maintained.	2
11000	Surgical cleansing of skin	0.91	0.60	CMD: Reduce to 0.45. This code is overvalued relative to code 11040, <i>debridement of the skin, partial thickness</i> . HCFA data indicates an intra-operative time of 73 minutes for code 11000. This is far too high since it is a very superficial debridement of eczematous skin of up to 10% of the body service. This takes simple cleansing of the skin with very little surgical debridement done, and certainly would not require 73 minutes. The operative time would compare more closely to code 11040, which has an operative time of 25 minutes, but it is not nearly as difficult as this. Therefore, the RVUs should be reduced to 0.45 which would be slightly below the RVUs (0.50) assigned to code 11040.	Surveys indicated a median intra-service time of 10 min. and a median RVU of 0.75 for 11000. 11040 has an intra-service time of 25 min. The RUC feels that the code is overvalued and should be reduced. The recommend RVU for 11000 is the average of the survey median RVU and the CMD recommended RVU. Payment policy 50% rule is applied to 11001.	3
11001	Additional cleansing of skin	0.45	0.30			3
11101	Biopsy, each added Lesion	0.41	0.41	Code is identical in work and intensity to 11100, <i>biopsy of skin</i> , which has an RVU of 0.81. 11101 should not fall under 50% rule for multiple surgical reductions.	Survey data show median intra-service time of 10 min. and a median RVU of 0.63. The description of this code as: each added lesion, indicates that it is intended to fall under 50% rule. The RUC recommends that the current RVU be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
11300	Shave skin lesion	0.51	0.51	CMD: All shaving for lesion codes RVUs should be reduced. The shaving of an epidermal or dermal lesion is overvalued compared to the excision of a benign lesion of the same size in the same location. It should be valued at 50% of the reference code because it requires less technical skill and physical effort, the mental effort and judgment are less, it takes less time and the stress is lower. Further, closure is not required and the global period is zero compared to the reference code with a global period of 10 days.	The whole family of shave excision codes were previously reviewed by the RUC and the results appeared in HCFA's December 2, 1993 final rule. At this time HCFA decided that the shave excision codes should be valued at 60% of the other excision codes, the 11400 series. The original RUC recommendation to HCFA suggested that the shave excision codes should be valued at 80% of the other excision codes. The current values are already below what the RUC recommended. Therefore, the current values should be maintained.	2
11301	Shave skin lesion	0.85	0.85			
11302	Shave skin lesion	1.05	1.05			
11303	Shave skin lesion	1.24	1.24			
11305	Shave skin lesion	0.67	0.67			
11306	Shave skin lesion	0.99	0.99			
11307	Shave skin lesion	1.14	1.14			
11308	Shave skin lesion	1.41	1.41			
11310	Shave skin lesion	0.73	0.73			
11311	Shave skin lesion	1.05	1.05			
11312	Shave skin lesion	1.20	1.20			
11313	Shave skin lesion	1.62	1.62			
11441	Removal of skin lesion	1.56	1.56	An individual commented that the charges for this procedure were excessive. The application of liquid nitrogen is not time consuming and is an insignificant cost. The physician work involved is minimal and does not require great skill.	The intention of the RUC and the 5-year review is to examine work values. The comment is based on charges which are not directly related to mission of the RUC. The RUC recommends that the current values be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
11731	Removal of second nail plate	0.55	0.57	Since the RVU for 11730, <i>removal nail plate</i> , is 1.13, the payment policy 50% adjustment for multiple procedures would increase the values for both codes.	The RUC recommends increasing the RVUs. The RVUs for both codes are increased to adjust the codes to 50% of the base code, 11730.	1
11732	Remove additional nail plate	0.38	0.57			1
11750	Removal nail bed	1.66	1.66	The RVU for 11752 should be greater than 28108, <i>Removal of toe lesions</i> , because not only is the tuft of the distal phalanx amputated, but the nail and nail matrix are also removed. APMA was not surveyed in original data collection conducted by Harvard, and yet podiatry performs the vast majority of services.	Survey data show median intra-service times of 15 and 25 min. and median RVUs of 2.50 and 3.40. Arguments for an increase are not compelling and survey results do not demonstrate need to raise RVUs. For 11752 Harvard's data collection showed 36 min. intra-service time which is longer than the survey results. The RUC recommends that the current values be maintained.	2 Add
11752	Remove nail bed/finger tip	2.37	2.37			2
11762	Reconstruction of nail bed	2.84	2.84	Correct value is 4.73 RVUs. Same elements of work as associated with 11750, <i>excision of nail and nail matrix</i> , and 15050, <i>pinch graft</i> . Should be greater than 15050 (3.90) because not only is the graphing procedure performed, but the nail and nail matrix are also removed. Feel that 100% of 3.90 should be added to 50% of 1.66.	Arguments for an increase are not compelling. The code was not surveyed. The RUC recommends that the current value be maintained.	2
11901	Added skin lesion injections	0.8	0.8	The RVU should be 1.34, the same as 10040, <i>acne surgery</i> . This procedure requires multiple injections into spots of 1 cm or larger. As a result, the procedure is more time intensive than the current RVU suggests.	Arguments for an increase are not compelling. The code was not surveyed. The RUC recommends that the current value be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
11960	Insert tissue expander(s)	6.04	8.00	Code should be increased to 9.37 RVUs. 11960 is comparable to 19357, <i>breast reconstruction</i> , at 16.72 RVUs. The only difference is that 19357 is normally more intense, except when tissue expansion occurs in the neck, face or scalp. The major change from the original RVU is that the Harvard survey only allowed for 3 post operation visits and the current number is 8.	Survey data show median intra-service time of 78 min. and a median RVU of 9.37. The argument rests on the increase in post service visits shown in survey results. The RUC recommends that the RVU be increased to 8.0 to accommodate the increase in post service time.	4
13132	Repair of wound or lesion	4.21	5.75	CMD: Increase RVU to 4.32; Code 13132 describes the complex repair of a 2.6 - 7.5 cm wound of the face. It is valued lower than the comparable repair of the scalp. This rank order is in conflict with the rank ordering of the codes for repairs of shorter wounds where the RVUs for the scalp procedure (code 13120, RVU = 3.25) are less than the RVUs for the face procedure (code 13131, RVU = 3.74). Compared to 13120 and 13121, the estimated work for 13132 should be higher than 13121, not less, since the face area is more complex and riskier.	Survey data show median intra-service time of 30 min. and a median RVU of 5.99. When repairing wound anatomy makes a difference. To correct rank order anomaly, the RUC recommends that the code should be valued in proportion to 13120 and 13121.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
13131	Repair of wound or lesion	3.74	3.74	An individual commented that the whole series of complex laceration codes, 13131-13300, are undervalued. They felt that emergency room physicians were using these codes inappropriately since a specialist is usually called in for the truly complex procedures. Compare to scleral buckle for retinal detachment.	Arguments for an increase are not compelling. The specialty provided no evidence to support this comment. The RUC recommends that the current value be maintained.	2
13150	Repair of wound or lesion	3.76	3.76			
13151	Repair of wound or lesion	4.40	4.40			
13160	Late closure of wound	9.53	9.53			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
15570	Form skin pedicle flap	3.75	8.39	All of these codes are undervalued. When compared to the corresponding adjacent flap codes, 14001 at 7.78, 14021 at 9.37 and 14040 at 7.18, the need for increased RVUs is apparent.	Situation in which old codes, 15500-15515, which were valued by Harvard, were deleted in 1992 and replaced with 15570-15576. The new codes are misvalued and no explanation has been received describing how the valuation of these codes was arrived at. The survey results show: a median RVU of 9.85 and a median intra-service time of 105 min for 15570; a median RVU of 9.63 and a median intra-service time of 90 min for 15572; a median RVU of 10.50 and a median intra-service time of 120 min for 15574; and a median RVU of 8.50 and a median intra-service time of 90 min for 15576. These results agree with the Harvard data for the original codes, 15500-15515. The survey results and lack of rationale for current RVUs supports the need for new RVUs. The RUC recommends that the codes should be valued at the same level established by Harvard for the original deleted codes.	4
15572	Form skin pedicle flap	3.80	8.59			
15574	Form skin pedicle flap	3.85	8.79			
15576	Form skin pedicle flap	4.27	7.85

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
15580	Attach skin pedicle graft	3.30	9.00	This code is undervalued. It does not account for the intra-service time and work involved in harvesting and applying the skin graft. Compare to 15240, <i>skin full graft procedure</i> , and 15100, <i>skin split graft procedure</i> .	This code is now used for major reconstruction of the forehead. The current value does not include harvesting of the graft. Survey data show median intra-service time of 90 min. and a median RVU of 9.00. Survey results, rationale and comparisons provide compelling evidence to change the RVU. The RUC recommends that the RVU be increased.	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
15732	Muscle-skin graft, head/neck	12.10	16.52	A review of work involved and of service time data indicate that 15734 at 16.52 is the most difficult procedure of the family. 15732 and 15738 fall somewhere between 15734 and 15736. 15734 should be used as an anchor with the highest RVU followed by 15738, 15732, and 15736.	The entire family of codes are not aligned properly. CMD comments submitted to the February RUC meeting indicated that 15738 was "inconsistent with the other muscle flaps in this family" and should be increased to 15.26. This statement prompted the society to survey 15732, 15736 and 15738. Code 15734 is an accepted value on the MPC and is used as an anchor for all the codes. Compare the entire family of codes to 27165, <i>Incision/fixation of femur</i> , (16.38 RVUs and 147 min intra-service time) and to 42415, <i>Excise parotid gland/lesion</i> , (16.12 RVUs and 156 min intra-service time). 15732 and 15738 are similar in time and intensity to 15734. This assessment is supported by survey data. The survey data and comparisons are compelling. The RUC recommends that 15732 and 15738 should have their RVUs increased, while 15736 should remain at the current RVU.	4
15736	Muscle-skin graft, arm	15.26	15.26			2
15738	Muscle-skin graft, leg	10.07	16.52			4
15958	Remove thigh pressure sore	13.89	13.89	15958, <i>Remove thigh pressure sore with ostectomy</i> , is valued .04 RVUs lower than 15956, <i>Remove thigh pressure sore</i> , which does not specify ostectomy. The RVU of 15958 should be raised to account for the ostectomy.	Argument is not compelling. No further evidence is offered in the form of survey data or additional comparisons. The RUC recommends that the current value be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
16000	Initial treatment of burn(s)	0.89	0.89	An individual commented that this code is overvalued compared to 16020, <i>treatment of burns</i> .	The current relationship between 16000 and 16020 is acceptable. No further evidence is offered in the form of survey data or additional comparisons. The RUC recommends that the current value be maintained.	2
16035	Incision of burn scab	4.53	4.53	Global period of 90 days is incorrect. This should be deleted and the RVU should remain at 4.53.	The RUC recommends that the current value be maintained. The intention of the 5-year review is to consider changes in work. No compelling argument for change.	2
17000	Destroy benign/premal lesion	0.64	0.64	An individual commented that the charges for these procedures were excessive. The application of liquid nitrogen is not time consuming and is an insignificant cost. The physician work involved is minimal and does not require great skill. The society recommends that these codes maintain their current value.	The intention of the RUC and the 5-year review is to examine work values. The comment is based on charges which is not directly related to mission of the RUC. The current values should be maintained.	2
17001	Destruction of add'l lesions	0.19	0.19			2
17002	Destruction of add'l lesions	0.19	0.19			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
17106	Destruction of skin lesions	4.54	4.54	CMD: reduce RVUs to 2.27, 5.06 and 7.10; When pre and post-service work are accounted for, the intra-service work is valued at over five times the intensity of the reference procedures. The reduction lowers the intensity to twice that of the reference procedures. Compares to 17000, <i>destroy benign lesion</i> , and 17100, <i>destruction of skin lesion</i> .	Survey results show median RVUs of 4.54, 9.06 and 13.10 and median intra-service times of 20 min, 30 min and 45 min. Work times and median RVU are comparable to current data. It is acceptable that the work and intensity is greater for lasers than for excisional procedures referenced by the CMDs. Survey results and rational substantiate maintaining the current values	2
17107	Destruction of skin lesions	9.06	9.06			2
17108	Destruction of skin lesions	13.10	13.10			2
19120	Removal of breast lesion	4.84	5.35	Code is undervalued by 17%. Code 19120 is comparable to 55530, <i>Revise spermatic cord veins</i> , which is valued at 5.45 RVUs.	Survey data show median intra-service time of 45 min. and a median RVU of 5.00. More frequent use of new technology diagnostic procedure, stereotactic needle biopsy, means that patients who under go this procedure are more likely to have cancer. Thus, the work intensity has increased. Survey and rational are compelling. However, the RUC recommends that the code only be increase in proportion to the 10 min. increase in intensity.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
19140	Removal of breast tissue	4.90	4.85	Code 19140 is overvalued by 1%. Compare to 54520, <i>orchiectomy, simple</i> .	The requested decrease is less than 10% of the current RVUs for the service. The RUC did not believe its survey instrument to be sufficiently precise to detect such small changes, and recommends that the decrease be accepted.	3
19160	Removal of breast tissue	6.65	5.75	Code 19160 is overvalued by 14%. Compare to 43260, <i>ERCP</i> .		
19180	Removal of breast	8.15	8.09	Code 19180 is overvalued by 1%. Compare to 14060, <i>adjacent tissue transfer</i> .		
19318	Reduction of large breast	11.08	15.00	An individual commented that code 19318 is undervalued. Procedure is most commonly done as a bilateral procedure. Compare to 27130, <i>Hip reconstruction</i> , valued at 18.68, 35102, <i>Abdominal aortic aneurysm repair</i> , valued at 23.44, 55845, <i>Prostatectomy and lymphadenectomy</i> , valued at 26.73, and 63075, <i>Neurosurgical spinal cord discectomy</i> , valued at 19.77. In each of these cases the pre-, intra-, and post-service times are comparable with 19318.	Survey data show median intra-service time of 150 min. and a median RVU of 16.90. Greater intensity in that procedure requires that not only material be removed but also that the breast be reconstructed; skin and nipple. There is no Harvard data for this code and no basis for the current RVU. These survey results are the only data on this code and as a result the RUC recommends that the RVU be increased to the level of the survey median. Survey results and the lack of any basis for the current value are compelling reasons to change the RVU. However, the society recommended increase is too large.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC Rec RVU	Comments	RUC Rationale	Key*
19325	Enlarge breast with implant	8.05	8.05	Code 19325 is undervalued. This code should be made comparable to 19342, <i>Delayed breast prosthesis</i> , at 10.64	Survey data show median intra-service time of 90 min. and a median RVU of 8.5. The specialty recommended that the code should be increased to level of the survey median. However, the recommended increase is not significant. The RUC recommends that the current value be maintained.	2
19350	Breast reconstruction	8.21	8.52	Code 19350 is undervalued. The procedure should be valued as follows. 15200, <i>Full thickness skin graft</i> , valued at 7.46 and a small flap for the nipple reconstruction, 14000 (<i>skin tissue rearrangement</i>) at 5.43, would yield 10.16 after the 50% rule was applied to 14000.	Survey data show median intra-service time of 90 min. and a median RVU of 10.00. The code is a combination of 14040, <i>skin tissue rearrangement</i> , and 15200, <i>skin full graft procedure</i> . Such a combination with a normal 50% reduction would produce a an RVU of 11.00. Since the Survey validates the Harvard data, this original Harvard derived value is recommended by the RUC.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

*Key (1= Adopt specialty/CMD recommended increase; 2= Maintain current RVU; 3= Adopt specialty/CMD recommended decrease; 4= Adopt increased RVU, but lower than specialty recommended; 5= Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 11000 Global Period: 000 Current RVW: 0.91

Recommended RVW: 0.75

CPT Descriptor:

Debridement of extensive eczematous or infected skin; up to 10% of body surface

Source and Summary of Comment to HCFA on this service:

The Medicare Carrier Medical Directors recommended a decrease in RVW from 0.91 to 0.45. APMA agrees that 11000 is overvalued, but that RVW should be decreased to 0.75.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 65 year-old female undergoes the debridement of infected skin from the 4th digital interspace right foot, in office.

Description of Pre-Service Work:

Review of chart with general medical history update including current medications and any allergies. Physical examination includes evaluating the neurological and vascular status of the patient, along with a dermatologic examination. The procedural work is explained to the patient and the instruments used in treatment are removed from the sterilizer. A culture and sensitivity may be taken from the infected skin. The patient's vital signs are taken. The patient is placed in the supine position and the foot is prepped in an aseptic manner. Suitable local anesthesia may be administered.

Description of Intra-Service Work:

In a sterile field, using both sharp and blunt dissection the infected skin is debrided with care being taken to identify and to retract away any vital structures. The area is flushed with copious amounts of sterile saline. A sterile dressing is applied.

Description of Post-Service Work:

A surgical shoe may be fitted on the patient. The patient is instructed on the care of the wound. Homecare instructions are given and explained to the patient. Appropriate antibiotic prescriptions are given to the patient. The doctor discusses future management and follow-up as necessary, including analyzing laboratory results. The medical record is completed. Also, a note to the referring physician is dictated as to the course and outcome of treatment and future management.

SURVEY DATA:

Specialty: Podiatric Medicine

Sample Size: 87/88 Response Rate (%): 100 Median RVW: 0.75

25th Percentile RVW: 0.5 75th Percentile RVW: 1.1 Low: 0.35 High: 9.5

Median Pre-Service Time: 5 Median Intra-Service Time: 10

25th Percentile Intra-Svc Time: 10 75th Percentile Intra-Svc Time: 15

Low: 2 High: 45

<u>Median Post-Service Time:</u>	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	5	
ICU:	NA	NA
Other Hospital:	NA	NA
Office:	NA	NA

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	11040	Debridement; skin, partial thickness	0.50
2)	10060	Incision and drainage of abscess (eg carbuncle, suppurative hidradenitis, cutaneous or sub-cutaneous abscess, cyst, furuncle, or paronychia); simple or single	1.12

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The surveys indicated that the pre-, intra-, and post-service time and intensity of 10060 was approximately 30% greater than 11000. Most of the difference was due to the post-service time included in the 10060 ten day global period. The cumulative pre-, intra-, and post-service time and intensity of 11040 was approximately 20% less than 11000.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The correct RVW for 11000 should be 0.75 and not the current value 0.91 or the 0.45 recommended by the CMDs. The pre-, intra-, and post-service time and intensity of 11000 is the same as reference procedure 10060 (RVW 1.12) except for the increased time included in the 10 day global period which accounted for the 30% greater values obtained from the survey. Additionally, reference procedure 11040 (RVW 0.50) was valued 20% less than 11000. This is probably due to the fact that there is greater intensity and effort in treating infected skin.

CMD Comments

30-Jun-95

Code: 11000

1995 RVUs: 0.91

Recommended RVUs: 0.45

Ratio: -0.51

Reference Set (y/n): N **Global Period:** 000 **Frequency:** 495,028 **Impact:** -227712.88

Source: 4 **Year:** 94 **Public Comment Letter:**

Reference Services:

	Short Descriptor	RVU	Global
11000			
	11040 SURGICAL CLEANSING, ABRASION	0.50	000

CMD Comment:

This code is overvalued relative to code 11040 (debridement of the skin, partial thickness). HCFA data indicates an intra-operative time of 73 minutes for code 11000. This is far too high since it is a very superficial debridement of eczematous skin of up to 10% of the body service. This takes simple cleansing of the skin with very little surgical debridement done, and certainly would not require 73 minutes. The operative time would compare more closely to code 11040, which has an operative time of 25 minutes, but it is not nearly as difficult as this. Therefore, the RVUs should be reduced to 0.45 which would be slightly below the RVUs (0.50) assigned to code 11040.

	11000 SURGICAL CLEANSING OF SKIN	0.91	000

CMD Comment:

Much of the work in 11000 is in preparation, so 11001 adds relatively little work, probably no more than 5 minutes of simple cleansing with little actual surgical debridement. This code is currently valued at 1/2 the value of 11000. This value represents intra-operative work only and the code is not subject to multiple surgical reductions. To maintain the correct relationship to code 11000, the recommended value is 1/2 of the recommended value for 11000.

11731 Avulsion of nail plate, partial or complete, simple; second nail plate

The fee schedule assigned 1.13 as the RVW for 11730 (Avulsion of nail plate, partial or complete, simple; single). The correct RVW for 11731 should be 0.57. We agree with the concept of reduced payment levels for multiple surgeries, but we feel that to be consistent with the established scale of 50% reduction for a second procedure that the RVW for 11731 should be 50% of 1.13 (0.57) and not 0.55.

11732 Avulsion of nail plate, partial or complete, simple; each additional nail plate

As with procedure 11731, the RVW established by the fee schedule is 1.13 for 11730. The correct RVW for 11732 should be 0.57 and not 0.38. We strongly feel that multiple surgery performed on the extremities, and in particular the digits, is generally substantially different than multiple operations performed in other parts of the body. When 11732 is performed in addition to 11730 and 11731 it may require separate administration of local anesthesia (these procedures are typically performed under local anesthesia, frequently through digital blocks); separate incisions are required for each digit; the identical intraoperative work is performed as for 11730; each digit requires individual postoperative dressings; the time required to perform each nail avulsion is the same as 11730; the mental effort and judgment, technical skill and physical effort, and psychological stress are at least the same as 11730, but probably greater due to the increased risk to the patient of infection, vascular compromise and disability; postoperative visits for multiple digital procedures usually requires more time for each visit as well as an increased number of visits.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 11960 **Global Period:** 090 **1995 RVW:** 6.04 **Recommended RVW:** 9.37

CPT Descriptor: Insertion of tissue expander(s) for other than breast, including subsequent expansion.

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 11960 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 67-year old man underwent a complete rhinectomy by the Moh's technique for invasive basal cell carcinoma. The wound is healed well. Complete physical examination indicates no evidence of metastatic disease. The nasal reconstruction was planned, utilizing expanded forehead skin. At operation, an incision was made in the right temple and scalp and the forehead was completely undermined at the level of the gales. An appropriately sized and shaped tissue expander is placed in the pocket and the filling port was placed in a random spot. This wound is closed in layers in the usual fashion. Post-operatively, the patient is seen at 4-7 day intervals for a total of 6-10 visits to add saline to the tissue expander until it reaches requisite capacity.

Description of Pre-Service Work:

After the decision to operate is made, pre-service work begins on the day before surgery and continues until the time of the procedure. This work includes obtaining and reviewing pre-procedural laboratory, pathology, and imaging studies; and communicating with the patient (and/or the patient's family) to review the operative risks and benefits, and to obtain informed consent. Other preoperative services include personal and patient preparation; and monitoring of the induction of anesthesia; supervision of the positioning, preparing and draping of the patient; and ensuring that the appropriate surgical instruments and supplies are available, including the prosthesis.

Description of Intra-Service Work:

After anesthesia is satisfactorily established, the appropriate operative plan is transferred to the forehead. The incision is made in the forehead or scalp and carried down to the level of the galea. A sufficient pocket is created by undermining at this level to accommodate the expander and a distant filling port if used. The tissue expander is checked for integrity with pressure under saline and then placed in the prepared pocket. The wound is closed in layers. A dry sterile dressing is applied and the patient monitored during emergence from anesthesia.

Description of Post-Service Work:

Post-service work begins with communication of the operative procedure to the patient's family and other health care professionals as appropriate. A surgical report is prepared for the chart and dictated to the medical record. Post-operative orders are written. Discharge planning is supervised and instructions given.

Post-operative office visits allow monitoring of the skin closure until sufficient healing has occurred to allow initiation of tissue expansion. Expansion is accomplished by percutaneous introduction of normal saline into the distant filler port. The volume of expansion is determined at the time of each visit relative to the clinical situation. The number of expansion procedures and the volume of saline injected is determined by the goals of the reconstruction. This sequence of expansion typically takes approximately ten office visits, which occur on a weekly basis.

KEY REFERENCE SERVICE(S):

1995 RVW Global CPT Descriptor

16.72 090 19357 Breast reconstruction, immediate or delayed, with tissue expander, including subsequent expansion

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The work of 11960 is comparable, but may not be more intense than the work of CPT 19357 as the operative design and execution is usually more complex and, therefore, the planning requires more intensity and planning. Examples where 11960 has a higher intensity than 19357 include procedures for the expansion of the neck for reconstruction of the face, or expansion of the scalp in a child for reconstruction after excision of a congenital nevus.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This procedure has allowed reconstructive efforts to replace unique tissue losses with "like" tissue. As mentioned above, this procedure entails detailed planning and is patient-specific but is not as intense as 19357.

The work of performing this service has not changed in the last five years and is felt to be of moderate intensity by almost all who participated in the survey.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 13132 **Global Period:** 010 **1995 RVW:** 4.21 **Recommended RVW:** 5.99

CPT Descriptor: Repair, complex, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; 2.6 cm to 7.5 cm

Source and Summary of Comment to HCFA on this service: 13132 was found to be undervalued by the Medicare Carrier Medical Directors.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 27 year old female presents to the emergency room with a 3.5 cm curvilinear jagged laceration of the cheek, as well as other abrasions, following a rollerblading accident. She had no loss of consciousness and no other maxillofacial or skeletal injuries. Services of a specialized surgeon were requested.

Description of Pre-Service Work:

This service is typically rendered in the emergency department. A physician must assess the patient and review the existing emergency department evaluation. Once the decision to render care has been made, the pre-service work then begins.

The typical patient is informed of the treatment to be rendered, the manner in which it is to be rendered, and this information is communicated to the patient's family, if appropriate, and other health care professionals.

Description of Intra-Service Work:

Intra-service work, in this instance, includes the introduction of local anesthesia, preparation of the skin, and appropriate drape. Routine debridement of the skin edges to remove ragged tissue and embedded dirt and foreign material precedes layered closure.

Appropriate topical antibiotics and dry sterile dressings are applied.

Description of Post-Service Work:

Post-service work includes post-operative instructions regarding wound care, arrangement for follow-up visit, and communication of operative findings with the patient, the family, and appropriate health professionals. Written reports are prepared.

Although typically two or three post-operative visits are required for wound care and suture removal, all routine services performed within the 90-day global period are included. Frequently, the location and nature of the scar requires a follow-up office visit at 3 to 4 months.

CMD Comments

30-Jun-95

Code: 13132

1995 RVUs: 4.21

Recommended RVUs: 4.32

Ratio: 0.03

Long Descriptor: Repair, complex, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; 2.6 cm to 7.5 cm

Reference Set (y/n): N **Global Period:** 010 **Frequency:** 33,787 **Impact:** 3716.57

Source: 4 **Year:** 93 **Public Comment Letter:**

Reference Services:

	Short Descriptor	RVU	Global
13132			
13120	REPAIR OF WOUND OR LESION	3.25	010
13121	REPAIR OF WOUND OR LESION	4.28	010

CMD Comment:

Code 13132 describes the complex repair of a 2.6 - 7.5 cm wound of the face. It is valued lower than the comparable repair of the scalp. This rank order is in conflict with the rank ordering of the codes for repairs of shorter wounds where the RVUs for the scalp procedure (code 13120, RVU = 3.25) are less than the RVUs for the face procedure (code 13131, RVU = 3.74). Compared to 13120 and 13121, the estimated work for 13132 should be higher than 13121, not less, since the face area is more complex and riskier.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 15570 **Global Period:** 090 **1995 RVW:** 3.75 **Recommended RVW:** 9.85

CPT Descriptor: Formation of direct or tubed pedicle, with or without transfer, trunk

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 15570 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

Patient has a large thoraco-abdominal tumor which will require a full thickness chest wall resection and subsequent reconstruction. The ipsilateral latissimus dorsi muscle is unavailable due to a previous thorotomy and a thoraco-epigastric tubed pedicle is chosen for reconstruction. At operation, the abdominal skin is appropriately measured. The dimensions are taken and the skin is elevated and tubed. The thoraco-abdominal skin beneath the tube is then advanced for primary closure.

Description of Pre-Service Work:

Pre-service work begins the day before the surgery and continues until the time of the procedure. This includes obtaining and reviewing pre-procedural pathology, laboratory, and imaging studies; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal and patient preparation; supervision of the positioning, prepping, and draping of the patient; and ensuring that appropriate surgical instruments are necessary are present.

Description of Intra-Service Work:

At operation, the plan design is re-evaluated, and the design transferred to the abdominal skin. After anesthesia is achieved, the skin is incised and dissection is carried down to the superficial fascia on both sides of the proposed tube. The tube pedicle is formed and that incision is closed. The donor defect then created is closed by abdominal wall tissue advancement. Appropriate dressings designed to protect the tube pedicle and allow primary wound healing.

Description of Post-Service Work:

Post-service work begins with communication with the family and other health care professionals (including written and oral reports and orders). All hospital visits and services performed by the surgeon; such as monitoring and care of the incision; and antibiotic and pain medication management. Discharge management includes the surgeon's instructions for continuing care, and preparation of discharge records. All post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure including removal of sutures.

*Codes 15500-15515 were deleted in 1992 and replaced with codes 15570-15576.

(P3) denotes Harvard Phase 3

(P4) denotes Harvard Phase 4, refinement

Codes 15500, 15505, 15510, and 15515 were studied as part of the Harvard Phase 3. The results of the study are presented in the table above. The cross-specialty crosswalk work values for these four codes equated to the 1995-scaled RVWs presented under Key References above. In 1992 these codes were deleted and replaced by 15570-15576, however, the published RVWs were reduced **significantly** from the Harvard study values. The survey data for 15570-15576 confirms the time information gathered in the Harvard Study and emphasizes the undervaluation of these codes.

In addition, the work of 15570, 15572, 15574, and 15576 is comparable to the corresponding adjacent flap codes in the range 14001-14060 (see tables above). These codes, also, have significantly higher RVWs than 15570-15576.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The discussion presented above, that compares the RVWs for 15570, 15572, 15574, and 15576 with the RVWs for similar key reference services, emphasizes the undervaluation of these codes based on time alone. The following RVWs are recommended: [15570; RVW=9.85]; [15572; RVW=9.63]; [15774; RVW=10.50]; [15776; RVW=8.50].

As noted above, with the CPT realignment the values have been arbitrarily reduced. Because of this action, ASPRS has resurveyed these four codes and presents this information. It is acknowledged that the numbers of respondents are less than 30, but the RUC should be aware that this family of codes are rarely used and finding ASPRS members who have performed this procedure within the last 12 months was difficult. Review of the survey data with knowledgeable plastic surgeons confirms the relativity of these submitted work values.

The intensity, work and visits of this code have not changed in the last five years.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 15572 **Global Period:** 090 **1995 RVW:** 3.80 **Recommended RVW:** 9.63

CPT Descriptor: Formation of direct or tubed pedicle, with or without transfer; scalp, arms or legs

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 15572 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 23-year old female who sustained full thickness burns of her scalp was reconstructed primarily with a split thickness skin graft. The defect has been reconstructed with tissue expansion of hair bearing scalp and the patient has now had full expansion. At operation, the incision is made. The tissue expander is removed (separate CPT code, #11971). The residual scalp skin after expansion is designed and tailored to fit the previous skin graft. This skin graft is removed. The flap is usually rotated and/or advanced into position and wound closure is accomplished.

Description of Pre-Service Work:

Pre-service work begins the day before the surgery and continues until the time of the procedure. This includes obtaining and reviewing pre-procedural pathology, laboratory, and imaging studies; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal and patient preparation; supervision of the positioning, prepping, and draping of the patient; and ensuring that appropriate surgical instruments are necessary are present.

Description of Intra-Service Work:

After anesthesia is induced, the tissue expander is exposed and removed (11971). The expanded tissue is formed into a flap and inset into the defect, and secure in place. A dry sterile dressing is applied.

Description of Post-Service Work:

Post-service work begins with communication with the family and other health care professionals (including written and oral reports and orders). All hospital visits and services performed by the surgeon, including monitoring and care of the incision, and antibiotic and pain medication management. Discharge management includes the surgeon's examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure.

*Codes 15500-15515 were deleted in 1992 and replaced with codes 15570-15576.

(P3) denotes Harvard Phase 3

(P4) denotes Harvard Phase 4, refinement

Codes 15500, 15505, 15510, and 15515 were studied as part of the Harvard Phase 3. The results of the study are presented in the table above. The cross-specialty crosswalk work values for these four codes equated to the 1995-scaled RVWs presented under Key References above. In 1992 these codes were deleted and replaced by 15570-15576, however, the published RVWs were reduced **significantly** from the Harvard study values. The survey data for 15570-15576 confirms the time information gathered in the Harvard Study and emphasizes the undervaluation of these codes.

In addition, the work of 15570, 15572, 15574, and 15576 is comparable to the corresponding adjacent flap codes in the range 14001-14060 (see tables above). These codes, also, have significantly higher RVWs than 15570-15576.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The discussion presented above, that compares the RVWs for 15570, 15572, 15574, and 15576 with the RVWs for similar key reference services, emphasizes the undervaluation of these codes based on time alone. The following RVWs are recommended: [15570; RVW=9.85]; [15572; RVW=9.63]; [15774; RVW=10.50]; [15776; RVW=8.50].

As noted above, with the CPT realignment the values have been arbitrarily reduced. Because of this action, ASPRS has resurveyed these four codes and presents this information. While the numbers of respondents was 30, the RUC should be aware that this family of codes are rarely used and finding ASPRS members who have performed this procedure within the last 12 months was difficult. Review of the survey data with knowledgeable plastic surgeons confirms the relativity of these submitted work values.

The intensity, work and visits of this code have not changed in the last five years.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 15574 **Global Period:** 090 **1995 RVW:** 3.85 **Recommended RVW:** 10.50

CPT Descriptor: Formation of direct or tubed pedicle, with or without transfer, forehead, cheeks, chin, mouth, neck, axilla, genitalia, hands or feet.

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 15574 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 56-year old hunter sustains a gun shot injury to his left hand. He is brought to the hospital and initial debridement, fracture stabilization and temporary wound cover is accomplished with dressing changes. A tailored groin flap is planned for coverage of the dorsal defect. At operation, a random patterned groin flap is elevated. The hand is, again, thoroughly debrided and lavaged, and the groin flap is placed. The abdominal wound is closed by primary advancement of the abdominal skin. The post-operative care is routine until either further delay or separation occurs.

Description of Pre-Service Work:

Pre-service work begins with assessing the patient in the emergency department; taking a history as to the incident; obtaining and reviewing emergency department admission imaging and laboratory studies; communicating with other health care professionals; ordering preoperative antibiotics; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal and patient preparation and ensuring that surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

At surgery, anesthesia is induced prior to any patient preparation. Therefore, "prepping and draping" occurs as part of the intra-operative work. After intra-operative assessment of the cleanliness of the wound is made and suitability of the wound for coverage established, the dimension of the skin defect are measured and transferred to the ipsilateral groin.

The flap is then incised and elevated at the superficial fascial level. The flap is inset into the defect and sutured into place. Usually, the abdominal wall donor defect can be closed by advancement of local tissue. Occasionally, the defect requires a split-thickness skin graft to close the donor site and this portion of the procedure (CPT 15100) is accomplished prior to inset and suture of the flap. Appropriate antibiotic and antibacterial agents are applied topically and then a specially created dressing is created which maintains the relative positions of the hand, the flap, and the abdominal wall.

Description of Post-Service Work:

Post-service work begins with monitoring patient stabilization and the dressing integrity; communication with the family and other health care professionals (including written and oral reports and orders). Hospital visits and services performed by the surgeon, including monitoring and care of the incision; and the critical positioning and antibiotic and pain medication management. Hospitalization usually requires daily direct examination of the hand and flap for 17 to 21 days until detachment and inset of the flap occurs. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay,

instructions for continuing care, and preparation of discharge records. All post-discharge office visits after detachment are included in the global period for that procedure.

*Codes 15500-15515 were deleted in 1992 and replaced with codes 15570-15576.

(P3) denotes Harvard Phase 3

(P4) denotes Harvard Phase 4, refinement

Codes 15500, 15505, 15510, and 15515 were studied as part of the Harvard Phase 3. The results of the study are presented in the table above. The cross-specialty crosswalk work values for these four codes equated to the 1995-scaled RVWs presented under Key References above. In 1992 these codes were deleted and replaced by 15570-15576, however, the published RVWs were reduced **significantly** from the Harvard study values. The survey data for 15570-15576 confirms the time information gathered in the Harvard Study and emphasizes the undervaluation of these codes.

In addition, the work of 15570, 15572, 15574, and 15576 is comparable to the corresponding adjacent flap codes in the range 14001-14060 (see tables above). These codes, also, have significantly higher RVWs than 15570-15576.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The discussion presented above, that compares the RVWs for 15570, 15572, 15574, and 15576 with the RVWs for similar key reference services, emphasizes the undervaluation of these codes based on time alone. The following RVWs are recommended: [15570; RVW=9.85]; [15572; RVW=9.63]; [15774; RVW=10.50]; [15776; RVW=8.50].

For this code, as for other codes which deal with the formation, movement and application of tubed pedicles, the post-service work is more intense in time commitment because of the prolonged hospital stay until detachment and inset can occur.

As noted above, with the CPT realignment the values have been arbitrarily reduced. Because of this action, ASPRS has resurveyed these four codes and presents this information. It is acknowledged that the numbers of respondents are less than 30, but the RUC should be aware that this family of codes are rarely used and finding ASPRS members who have performed this procedure within the last 12 months was difficult. Review of the survey data with knowledgeable plastic surgeons confirms the relativity of these submitted work values.

The intensity, work and visits of this code have not changed in the last five years.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 15576 **Global Period:** 090 **1995 RVW:** 4.27 **Recommended RVW:** 8.50

CPT Descriptor: Formation of direct or tubed pedicle, with or without transfer, eyelids, nose, ears, lips or intra-oral

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 15576 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 25-year old male sustains a motorcycle accident with loss of the superior and lateral margins of the helical rim of the left ear. The patient is brought to the operating room and the wound is debrided. Dressing care is accomplished with normal saline dressings. At the second operation, a post auricular tube is formed for transfer and reconstruction to the auricle. At operation, a 1.5 cm tubed pedicle is developed in post-auricular skin. The defect from the tube is reconstructed by primary advancement of the post-auricular skin. Post-operative wound care is routine until further delay or transfer of the tubed pedicle.

Description of Pre-Service Work:

Pre-service work begins with assessment of the patient in the emergency department; taking a history as to the incident; obtaining and reviewing emergency department admission imaging and laboratory studies; communicating with other health care professionals; ordering preoperative antibiotics; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal and patient preparation; supervision of the positioning, prepping, and draping of the patient; and ensuring that surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

After satisfactory anesthetic levels are achieved (this procedure can be done under local infiltrative anesthesia or general anesthesia, the wound is again debrided and its suitability for coverage confirmed.

The dimensions of the defect are measured and transferred to the post-auricular skin. The tube is elevated and local skin undermined at the level of the mastoid fascia to provide primary closure of the donor site. The pedicle is then transferred to the defect, inset, and sutured into place. A dry sterile dressing is applied and held in place with a head wrap bandage.

Description of Post-Service Work:

Post-service work begins with monitoring patient stabilization; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incision; and antibiotic and pain medication management. Discharge management includes instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging, pathology, and laboratory reports, if needed; and antibiotic and pain medication adjustments. The post-operative period does not, however, include division and further inset of the proximal end of the flap, if required.

15572	ASPRS 5-Yr	43	105	60	60
15574	ASPRS 5-Yr	60	120	90	53
15576	ASPRS 5-Yr	45	90	45	60

*Codes 15500-15515 were deleted in 1992 and replaced with codes 15570-15576.

(P3) denotes Harvard Phase 3

(P4) denotes Harvard Phase 4, refinement

Codes 15500, 15505, 15510, and 15515 were studied as part of the Harvard Phase 3. The results of the study are presented in the table above. The cross-specialty crosswalk work values for these four codes equated to the 1995-scaled RVWs presented under Key References above. In 1992 these codes were deleted and replaced by 15570-15576, however, the published RVWs were reduced **significantly** from the Harvard study values. The survey data for 15570-15576 confirms the time information gathered in the Harvard Study and emphasizes the undervaluation of these codes.

In addition, the work of 15570, 15572, 15574, and 15576 is comparable to the corresponding adjacent flap codes in the range 14001-14060 (see tables above). These codes, also, have significantly higher RVWs than 15570-15576.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The discussion presented above, that compares the RVWs for 15570, 15572, 15574, and 15576 with the RVWs for similar key reference services, emphasizes the undervaluation of these codes based on time alone. The following RVWs are recommended: [15570; RVW=9.85]; [15572; RVW=9.63]; [15774; RVW=10.50]; [15776; RVW=8.50].

As noted above, with the CPT realignment the values have been arbitrarily reduced. Because of this action, ASPRS has resurveyed these four codes and presents this information. While the number of respondents is 31, the RUC should be aware that this family of codes are rarely used and finding ASPRS members who have performed any of these procedures within the last 12 months was difficult. Review of the survey data with knowledgeable plastic surgeons confirms the relativity of these submitted work values.

The intensity, work and value of these codes have not changed in the last five years.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 15580 **Global Period:** 090 **1995 RVW:** 3.30 **Recommended RVW:** 9.0

CPT Descriptor: Cross finger flap, including free graft to donor site

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 15580 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 36-year old laborer sustains an avulsion injury of the volar aspect of the middle phalanx of the left index finger in a grinding machine. The profundus tendon is intact and the neurovascular bundles are intact. At operation, a cross finger pedicle flap from the dorsum of the adjacent left middle phalanx is elevated and rotated downward and placed on the volar aspect of the adjacent finger. The donor site defect was reconstructed with a full thickness skin graft harvested from the left groin. Both the pedicle and the skin graft were sewn in place. The post-operative care is routine for that of a split thickness skin graft.

Description of Pre-Service Work:

Pre-service work begins with assessment of the patient in the emergency department; taking a history as to the incident; obtaining and reviewing emergency department admission imaging and laboratory studies; communicating with other health care professionals; ordering preoperative antibiotics; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include dressing, scrubbing, and waiting for surgery; supervision of the positioning, prepping, and draping of the patient; and ensuring that appropriate surgical instruments and supplies are present.

Appropriate anesthesia is initiated. This may be local anesthesia, administered by the surgeon and included in the relative work or; on occasion, general anesthesia may be required.

Description of Intra-Service Work:

At operation after thorough debridement and definition of the wound edges, the injured finger and the appropriate adjacent digit are positioned and the flap designed. The flap is elevated at the level of the paratenon and the dorsal draining veins ligated. The dissection is carried to the mid-axial line adjacent to the injured finger, and the cutaneous restraining ligaments divided. The donor site defect is resurfaced with either a split-thickness or full-thickness skin graft, harvested from an appropriately chosen site and applied and immobilized. The flap is inset and sutured in place. Topical antibiotics and sterile dressings are applied to the fingers and to the donor site. The fingers are immobilized in a specially constructed dressing to remove tension from the flap by preventing motion.

Description of Post-Service Work:

Post-service work begins after skin closure. It includes communication with the patient and the family and other health care professionals (including written and oral reports and orders). Discharge management includes instructions for continuing care, and preparation of discharge records. Unique to this service is the care of the skin graft on the donor site for the flap and the donor site for the graft. At approximately 17 days, the patient is returned to the operating room to provide for detachment of the pedicle and inset (CPT Code 13132). Further follow-up falls in the global period of the second operation.

7.18	090	14040	Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less
8.30	090	15240	Full thickness graft, free, including direct closure of donor site, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands, and/or feet; 20 sq cm or less
3.30	090	15580	Cross finger flap, including free graft to donor site

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT	Data Source (Harvard / 5-Yr)	Time in Minutes			
		Pre-service	Intra-service	Post-service (hospital)	Post-service (office)
14040	Harvard (P4)	45	92	45	63
15240	Harvard (P3)	44	99	51	65
15580	Harvard (P3)	51	106	76	67
15580	ASPRS 5-Yr	45	90	45	60

(P3) denotes Harvard Phase 3

(P4) denotes Harvard Phase 4, refinement

CPT 15580 is essentially a combined flap and graft procedure. CPT 14040 and 15240 represent comparable flap and graft procedures in terms of time and intensity.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This code has been typically undervalued as it has failed to take into account the intra-operative service of harvesting and applying a split-thickness skin graft 15240 or 15100 and the ongoing post-operative care of the skin graft and its donor site. In the case of 15240, a separate surgical incision has been made for the harvest of the full-thickness graft. In the case of 15100, management of the split-thickness donor site requires even more work.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 15732 **Global Period:** 090 **1995 RVW:** 12.10 **Recommended RVW:** 16.55

CPT Descriptor: Muscle, myocutaneous, or fasciocutaneous flap of head and neck

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 15732 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 77-year old smoker develops a carcinoma of the palate which is resected, with loss of approximately one-half of the soft and hard palate. This defect is then reconstructed with a temporalis muscle flap. A separate operative approach must be made to harvest the temporalis muscle. A scalp incision is made and the muscle separated from its origins in the temporal fossa. A dissection of the deep temporal artery is made and this vascular pedicle must carefully be preserved. The muscle is then tunneled deep to the zygomatic arch into the oral cavity. The donor site is closed primarily. The muscle flap is inset into the palatal defect, reconstructing the palate unilaterally.

Description of Pre-Service Work:

Pre-service work begins on the day before surgery and includes obtaining and reviewing pre-procedural laboratory and imaging studies; reviewing findings at the prior operation; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include dressing, scrubbing, and waiting for surgery; supervision of the positioning, prepping, and draping of the patient; and ensuring that surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

After the ablative part of the procedure has been completed, appropriate measurements of the defect are obtained and planning for the size of the flap is done. An incision is made over the ipsilateral temporalis muscle. Dissection is carried down to the temporal fascia, which is opened widely and the appropriate amount of muscle dissected from the temporal fossa. This muscle is then isolated on the deep temporal artery and its accompanying vein and the surrounding anatomic relationships assessed.

A tunnel is created deep to the zygomatic arch with care not to disturb existing intact arteries and nerves. This tunnel is opened into the oral cavity and enlarged to accommodate the muscle flap. The flap is transposed and the vascular pedicle re-assessed. The flap is inset into the palatal defect and sutured in place.

Because of its anatomic setting, no dressings are appropriate.

Description of Post-Service Work:

Post-service work begins with communication with the family and other health care professionals (including written and oral reports and orders). All hospital visits and services are performed by the surgeon, including monitoring and care of the incision; monitoring, care, and removal of drains, if used; and antibiotic and pain medication management. Discharge day management includes the surgeon's final

examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging, pathology, and laboratory reports, if needed; and antibiotic and pain medication adjustments.

*Predicted time, not surveyed.

(P3) denotes Harvard Phase 3; (P4) denotes Harvard Phase 4, refinement

Based on available service time data and the judgment of the advisory panel, codes 15732-15738 represent an anomaly in the current Medicare fee schedule.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Muscle-skin graft codes 15732, 15736, 15738

When initially reviewing plastic surgery procedures for the 5-year review, the ASPRS identified a rank order problem in the family of muscle-skin graft codes. The 1995 RVWs for these codes are as follows: 15732 (head)=12.10, 15734 (trunk)=16.52, 15736 (arm)=15.26, and 15738 (leg)=10.07.

The ASPRS advisory panel determined that CPT 15734 (Muscle skin-graft, trunk) was appropriately valued on the RUC's Multispecialty Points of Comparison (MPC) table at 16.52 RVW. (Published in the 1995 *Final Rule as "Addendum G -- Reference Set with 1995 Work RVUs."*) CPT 15734 was initially felt to be the most difficult procedure in the family by the panel.

ASPRS felt that CPT 15736 (arm) represented the least difficult procedure, and that 15732 (head) and 15738 (leg) were generally undervalued. Initial Harvard data on service time (predicted in the Harvard study) supported this ranking.

This comparison shows that codes 15732 and 15738, neither of which have ever been refined by HCFA, are undervalued in this family according to original Harvard data. Scaling of Harvard work values to the 1995 MFS for CPT codes 15732 and 15738 produces values of 14.96 RVW and 15.83 RVW respectively. These two codes are consequently undervalued by -19.0% and -36.0% when compared to the current 1995 RVWs of 12.10 for 15732 and 10.07 for 15738. The other two codes in the family have scaled values much closer to the Harvard study data, with percentage differences of only -1.0% for CPT 15734 and -4.0% for CPT 15736. Therefore, a clear rank order problem exists for CPT 15732 and 15738.

Most importantly, CMD comments, distributed to the RUC last February, stated that for CPT 15738; "RVUs for this code are inconsistent with other muscle flaps in this family." The CMDs proposed an RVU of 15.26, and stated that "intra-service intensities for all these codes should be comparable." This comment, obviously, prompted the need for a survey.

To support the CMD comment and establish a valid rank order, ASPRS surveyed 15732, 15736, and 15738. ASPRS used 15734 as an anchor, as it was accepted on the RUC's MPC. Median survey values were as follows: 15732=16.55 RVW, 15736=16.00 RVW, 15738=19.40. After facilitation with RUC Workgroup 6 in July, the following values were proposed: 15732=16.52 RVW, 15736=16.00 RVW, and 15738=16.52 RVW. This final rank order was supported by ASPRS with only 15736 requiring slightly less work.

Note: The value of 12.50 RVW for CPT 15736 (arm) originated from the initial ASPRS public comments only, and should have been removed from the consent calendar at the April RUC meeting since a survey was being conducted. This staff error and other transcription errors in this family's rationale (due to the short time frame between the ASPRS Advisory Panel meeting and the RUC recommendation deadline) have caused undue confusion when discussing these codes within the RUC process. In addition, workgroup reports distributed to the full RUC in August could not provide sufficient detail on the workgroup's facilitation for this family of codes.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 15738 **Global Period:** 090 **1995 RVW:** 10.07 **Recommended RVW:** 19.40

CPT Descriptor: Muscle, myocutaneous, or fascio-cutaneous flap; lower extremity

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 15738 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year old construction worker sustains a crush injury of the lower leg, resulting in an open fracture of the middle 1/3 of the tibia and external soft tissue loss. The patient is seen in the operating room after the orthopedic surgeon has performed an open reduction and internal fixation of the tibia with compression plates and screws. The defect, as visualized, includes not only the fractured tibia without periosteal cover, but also the exposed plates and screws. A muscle flap is chosen for coverage. The incision created by the orthopedic surgeon is extended in order to allow harvesting of the medial soleus muscle flap. This is detached from the Achilles tendon to free its insertion and then dissected up the midline of the pared muscle. The muscle is then transposed into position to provide coverage for the bone and the hardware. The external surface of the muscle where it satisfies the open soft tissue defect is closed with a split thickness skin graft (separate procedure).

Description of Pre-Service Work: Pre-service work on the day prior to surgery. This preparation includes obtaining and reviewing pre-procedural laboratory and imaging studies; communicating with other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal and patient preparation; supervision of the positioning, prepping, and draping of the patient; and ensuring that surgical instruments and supplies that are necessary are present and available in the operative suite. It also includes consulting with the orthopaedic surgeon regarding incisions and being available while the appliances are placed.

Description of Intra-Service Work: The incision created by the orthopedic surgeon is extended in order to allow harvesting of the medial soleus muscle as a flap. This is detached from the Achilles tendon to free its insertion and then dissected up the midline of the paired muscle. The muscle is then transposed into position, inset and sutured in place to provide coverage for the bone and the hardware. The external surface of the muscle is covered with a split thickness skin graft (separate procedure -- CPT Code 15100). An appropriate dressing is applied.

Description of Post-Service Work: Post-service work begins with monitoring patient stabilization; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incision; monitoring, care, and removal of drains, if used; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging, pathology, and laboratory reports, if needed; and antibiotic and pain medication adjustments.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 17106 Global Period: 090 Current RVW: 4.54 Recommended RVW: 4.54

CPT Descriptor: Destruction of cutaneous vascular proliferative lesions (eg, laser technique); less than 10 sq cm

Source and Summary of Comment to HCFA on this service: CMD recommends 2.27 RVUs, using CPT 17000, 17100 as reference codes. Their rationale for change states, when pre and post-service work are accounted for, the twenty minutes of intra-service work is valued at over 3.5 RVUs, over five times the intensity of the reference procedures. The reduction lowers the intensity to twice that of the reference procedures.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 3 month old baby presents with a rapidly growing, 2.0 x 3.0cm, bright red plaque on the left lower eyelid and cheek. The strawberry hemangioma is beginning to obstruct vision.

Description of Pre-Service Work:

- *Procedural preparation to include preparation of supplies and equipment, such as use of appropriate surgical tray and laser calibration
- *Obtain protective shields and check for shields on patient and staff
- *Necessary instructions to patient and staff
- *Obtain informed consent

Description of Intra-Service Work:

- *Inspect and palpate lesions for size, location, functional risks, depth
- *Administer sterile prep, when appropriate
- *Administer appropriate anesthesia or sedation
- *Laser set to 6.5 J/cm² at a 5.0mm spot at 585 nm and a total of 45 pulses to photocoagulate the entire lesion
- *Monitoring of patient throughout procedure with appropriate equipment

Description of Post-Service Work:

- *Eye protection removed
 - *Monitors immediate post-procedure recovery
 - *Dressing is applied or instructions provided to staff on dressing application
 - *Instruct parent(s) on wound care, functional risks, risk of recurrence, and follow-up
 - *Completion of medical record charting, including dictation of operative report and, if appropriate, communication to referring physician
-

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	11446	Excision, other benign lesion (unless listed elsewhere), face, ears, eyelids, nose, lips, mucous membrane; lesion diameter over 4.0cm	4.44
2)	11644	Excision, malignant lesion, face, ears, eyelids, nose, lips; lesion diameter 3.1 to 4.0cm	4.50
3)	14040	Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less	7.18
4)	17107	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); 10.0 - 50.0 sq cm	9.06

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

code	pre-svc	intra-svc	post-svc	me/j	ts/pe	ps
17106	20	20	15	3	4	4
11446	20	30	15	3	4	4
11644	20	25	15	3	4	4

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The survey substantiates our belief that the work value for this code is appropriately valued. The time is appropriately documented. The technical skill is substantial as physicians need to be trained in laser physics and safety as well as calibrate and utilize expensive technology. The judgement and mental effort would be greater for laser than for the excisional procedures. The physician must judge the blood flow through the hemangioma, the density of blood vessels, dermal thickness and location of the lesion, the power settings and wave length of the laser. Stress is substantial because often these patients are children where a cosmetic deformity and scar from poor results of treatment could cause significant emotional distress and affect the child's interactions with schoolmates. Also, a child is often sedated and the physician monitors the patient's vital signs during the procedure while the patient is under sedation. The procedure has not changed substantially over the past five years with the exception of attempts to decrease cost by performing the procedure in a clinic setting. This actually increases the work for the physician since outpatient treatment of hemangiomas may require sedation anesthesia and monitoring which would not be paid under separate code if performed in an office. The low reimbursement for 17000, destruction of benign lesions including laser, does not accurately reflect the work involved in laser treatment of benign vascular proliferative lesions compared with cryosurgery or electrosurgery, the main therapies for this code. The American Academy of Dermatology, the American Society for Dermatologic Surgery, and the Society for Investigative Dermatology have on several occasions tried to remedy this aberrancy in CPT without success.

The CMDs choice of the 17000/17100 CPT codes as reference services for the 17106-8 series does not take into consideration that the physician work of providing the 17106-8 procedures is greater than 5 times that of the 17000/17100 codes with an intensity greater than 1.5 times that of CPT 17000/17100, because of the complexity of calibrating the laser, the interpretation of amount of target chromophore in the lesion and the proximity to adjacent functional structures. Typically, vascular lesions treated with the laser are on the head and neck and a high percentage of cases involve structures of vital function, such as the eyelid, nose and mouth. During the procedure, the physician must not only treat the patient but assures that radiation from the laser does not cause damage to structures of vital function or accidental injury to the physician and his/her staff. The patient is typically sedated, which is not the case with the CMDs chosen reference codes of 17000/17100. Typically the 17106-8 procedures are performed in an office setting; therefore, delivery of anesthesia and monitoring of the patient's vital signs is the responsibility of the treating physician. These procedure codes are typically used for a pediatric population and the infant/child is normally less receptive to the stress of the medical therapy and therefore in need of sedation. Note that the dermatologists did not select these codes as reference services for the procedure codes in question and the global periods are 010 days for the 17000/17100 codes and 090 for the 17106-8 series of codes.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 17107 Global Period: 090 Current RVW: 9.06 Recommended RVW: 9.06

CPT Descriptor: Destruction of cutaneous vascular proliferative lesions (eg, laser technique); 10.0 - 50.0 sq cm

Source and Summary of Comment to HCFA on this service: CMD recommends 5.06 RVUs, using 17000 and 17100 as reference codes. Their rationale for change states, when pre and post-service work are accounted for, the sixty minutes of intra-service work is valued at over 8 RVUs, over four times the intensity of the reference procedures. The reduction lowers the intensity to twice that of the reference procedures.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey A 3 year-old child presents with a 5.0 x 3.0cm portwine stain-type hemangioma on the left forehead/upper and lower eyelid area. The patient's parents would like this treated nonsurgically and prior to admission in school because it bleeds and becomes infected.:

Description of Pre-Service Work: (see 17106 example)

Description of Intra-Service Work: (see 17106 example) and

*Flashlamp dye laser set at 585 nm with a 5.0mm spot at 7.25 J/cm²
for a total of 130 pulses

Description of Post-Service Work: (see 17106 example)

SURVEY DATA:

Specialty: Dermatology

Sample Size: 158 Response Rate (%): 20% (32) Median RVW: 9.06

Median Post-Service Time: Total Time Number of Visits

Office: 20 2

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RWV</u>
1)	15260	Full thickness graft, free, including direct closure of donor site, nose, ears, eyelids, and/or lips; 20 sq cm or less	9.56
2)	14060	Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less	8.05
3)	17106	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); less than 10 sq cm	4.54
4)	14040	Adjacent tissue transfer or rearrangement, forehead, cheeks chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less	7.18

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

code	pre-svc	intra-svc	post-svc	me/j	ts/pe	ps
17107	20	30	20	4	4	4
15260	15	55	20	4	5	4
14060	15	40	15	3	4	4

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The rationale for this code is the same as for 17106, however, the lesion size is greater therefore the duration of treatment is longer. Lesions measuring 10 to 50 sq cm may take several times what it takes for smaller lesions to treat. In fact, at one extreme for a lesion coded with 17106 that might be 2 to 4 sq cm in diameter compared with a 50 sq cm lesion coded with 17107, the time for treatment may be as much as 10 times greater. Therefore, using averages and only doubling the value of the work is reasonable. Alternative treatments for hemangioma including excision with full thickness skin grafts or adjacent tissue transfer has been performed in the past but is not considered standard care today yet are valued at higher amounts in many cases.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 17108 Global Period: 090 Current RVW: 13.10 Recommended RVW: 13.10

CPT Descriptor: Destruction of cutaneous vascular proliferative lesions (eg, laser technique); over 50.0 sq cm

Source and Summary of Comment to HCFA on this service: CMD recommends 7.10 RVUs, using 17000 and 17100 as reference codes. Their rationale for change states, when pre and post-service work are accounted for, the ninety minutes of intra-service work is valued at over 12 RVUs, over four times the intensity of the reference procedures. The reduction lowers the intensity to twice that of the reference procedures.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 13 year-old white female with a large portwine stain on her left thigh measuring 10.0 x 15.0 cm presents for evaluation of Klippel-Trenaunay-Weber syndrome and treatment of the hemangioma. The hemangioma occasionally swells and bleeds and is unsightly.

Description of Pre-Service Work: (see 17106 example)

Description of Intra-Service Work: (see 17106 example) and
*Flashlamp dye laser set at 585 nm with a 7.0 mm spot at 8.25 J/cm²
for a total of 460 pulses

Description of Post-Service Work: (see 17106 example)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

code	pre-svc	intra-svc	post-svc	me/j	ts/pe	ps
17108	20	45	20	4	4	4
15260	15	60	20	4	4	4
14060	15	40	15	4	4	4

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Rationale essentially the same as 17106 again with the issue of size. A work value of 13.10 is approximately three times that of the smallest lesion. However, these lesions can sometimes involve entire extremities or in rare cases involve 60 to 90% of the body surface area. In some cases, the RVW of 13.10 would be substantially low if lesions of this size were treated. There is no good comparison or reference code for lesions of this size since excision and grafting or excision with flaps would be untenable. Excisions of that size would likely put in jeopardy the patient's life.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 19120 **Global Period:** 090 **1995 RVW:** 4.84 **Recommended RVW:** 5.66

CPT Descriptor: Excision of cyst, fibroadenoma, or other benign or malignant tumor aberrant breast tissue, duct lesion or nipple lesion (except 19140), male or female, one or more lesions

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 14 general surgeons, with the assistance of Abt Associates, Inc., designed a study that included a survey instrument to effectively measure all aspects of physician work for commonly performed general surgery services. The results of this study found code 19120 to be undervalued at the present time.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

55-year-old female with 0.75 cm stellate density in the upper outer quadrant of the right breast containing microcalcification by mammography. On physical examination, this is palpable 1 cm superior and lateral to the areola. She is taken to the operating room the following day and, under local anesthesia, undergoes excision of this lesion. Frozen section diagnosis is consistent with infiltrating ductal carcinoma.

Description of Pre-Service Work:

Pre-service work begins after the decision to operate is made until the time of the procedure. This activity includes obtaining and reviewing previous laboratory and imaging studies, with special attention to mammograms and ultrasounds of the breast and communicating with the patient (and/or the patient's family) to explain the operative risks and benefits and to obtain informed consent. Other preoperative services include dressing, scrubbing, and waiting to begin the operation; supervising the positioning, prepping, and draping of the patient; and ensuring that the necessary surgical instruments and supplies are present and available in the operative suite.

Description of Intra-Service Work:

The incisional site is identified and injected with local anesthetic, with the injection of additional anesthesia as needed during the operation. The skin is incised. The lesion is identified and dissected with instruments and electrocautery. The biopsy specimen is removed, and the surgeon ensures that the proper history is transmitted to the pathologist, along with the specimen. Intra-operative consultation with the pathologist is accomplished, and further excision is performed, as needed. Drains are placed, as appropriate, and the wound is closed in layers.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes the application of sterile dressings; monitoring the patient's stability; communicating with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incision; monitoring, maintenance, and removal of all drains, if used; and antibiotic and pain medication management. Discharge management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure including removal of sutures; ordering and evaluating periodic mammographic, imaging, pathology, and laboratory reports, as needed; and antibiotic and pain medication adjustments.

SURVEY DATA:

Specialty: American College of Surgeons

Sample Size: 175 Response Rate (%): 49 (28%)

	Median	Low	25th pctl	75th pctl	High
RVW:	5.00	3.00	4.00	6.00	10.00

Office - total time / # of visits	20	2			

KEY REFERENCE SERVICE(S):

1995 RVW	Global	CPT	Descriptor
6.17	090	49505	Repair initial inguinal hernia, age 5 years or over; reducible

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill and physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT	Study	Pre-Service Time	Intra-Service Time	Post-Service Hospital Time	Post-Service Office Time
49505	Harvard 1,2	37	48	34	25
	Harvard 4	30	48	15	20
19120	5-Year Review Survey	32	45	20	40

Both 19120 and 49505 are performed primarily as outpatient procedures under local anesthesia. 19120 often requires immediate preoperative radiographic review. 19120 requires less intra-service time than 49505; however, considerably more face-to-face counseling is necessary for 19120, increasing the post-service office time.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in the RVW (from 4.84 to 5.66) for code 19120 is based on the fact that the patients presenting for this procedure are more complex due to the availability and more frequent use of stereotactic needle biopsies, a new technology that has been developed in the last five years. This technology identifies patients with a higher percentage of malignant diagnoses (60 percent) compared with previous ratios (20 percent). Biopsy-proven malignant lesions require more extensive excision of tissue, which involves more time and work on the part of the surgeon. The decrease in frequency for this procedure between 1992 and 1994 most likely reflects the fact that surgeons are doing fewer "simple" biopsies and instead are seeing primarily those patients having a high risk of malignancy that have been identified through the new stereotactic needle biopsy technology.

The response to survey question 4b indicated that patients requiring this service are "more complex (more work)." In this context, "more complex" refers to the fact that the patients require: (1) more pre-service time (to discuss the risks of the procedure and the options that are available to the patient); (2) more intra-service time (waiting for pathology reports, excising more tissue), and (3) post-service time (counseling the patient and family). Moreover, this service may represent only the first stage of the procedure for those patients requiring a second operation. In these cases, the post-service time for counseling is considerably longer than when the diagnosis is benign. Due to the fact that most of the patients who are seen by surgeons today are those who have a biopsy-proven malignancy and that these patients require more work on the part of the surgeon, the RVW that is recommended for this code is greater than the median that was derived from the survey.

The recommendation to increase the RVW for code 19120 to 5.66 also is based on an analysis of the vertical relationship within the family of breast surgery codes (19120 through 19180). In order to achieve a better relationship within this family of codes, reductions in the RVWs for codes 19140, 19160, and 19180 were recommended. These reductions were placed on the five-year review consent calendar.

<u>CPT/Descriptor</u>	<u>1995 RVW</u>	<u>Rec. RVW</u>
19120 Removal of breast lesion	4.84	5.66
19140 Removal of breast tissue-for gynecomastia	4.90	4.85
19160 Removal of breast tissue-partial	6.65	5.74
19180 Removal of breast-simple, complete	8.15	8.09

SUMMARY OF RECOMMENDATION

CPT Code: 19318 **Global Period:** 090 **1995 RVW:** 11.08 **Recommended RVW:** 16.90

CPT Descriptor: Reduction mammoplasty

Source and Summary of Comment to HCFA on this service: A plastic and reconstructive surgeon singularly submitted a request for review of 19318 (public comment HCFA control number 442). He compared the bilateral work value ($16.72 = 11.08 \times 1.5$) of reduction mammoplasty to an orthopaedic, a general surgery, a urology, and a neurosurgical procedure, which he believed to require a similar amount of pre-, intra-, and post-operative time and care and surgical training.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 30-year old female presents with excessively large breasts and symptoms of pain and discomfort in her back and neck. She demonstrates notching of the subcutaneous tissue over both shoulders underneath the normal location of her bra straps. She also described intermittent submammary intertriginous, dermatitis in warm weather. She also indicates the fact that her lifestyle is restricted and she avoids sports that require jogging or running and does not participate in aerobics. She currently wears a 38DD bra and is approximately 15 pounds overweight. At operation, a reduction mammoplasty is performed, utilizing an inferior pedicle technique. Note: Ratings of relative work for this operation are for one breast (unilateral) reduction only.

Description of Pre-Service Work:

Pre-service work begins on the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural laboratory and imaging studies, with special attention to mammograms and ultrasounds of the breast; communicating with other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal preparation, patient marking, skin preparation; supervision of the positioning, and draping of the patient; and ensuring that surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

After the satisfactory induction of general endotracheal anesthesia, the previously applied markings for surgery (done in the standing position prior to surgery) are scratched on the skin with a needle. Then the final skin preparation and draping is accomplished. It should be noted that the skin markings are critical to ensure proper positioning of the nipple/areolar complex in the completed reduction. The operation commences with deep epithelization of the inferior-based pedicle. Extreme care must be taken to suture an adequate base for the pedicle so the blood supply to the nipple/areola complex is maintained. The medial and lateral triangular wedges of skin, subcutaneous tissue, fat, and breast gland are excised. Hemostasis must be meticulous to prevent excessive blood loss.

The remaining breast skin and gland are undermined to the clavicle and excess gland is removed from this flap to provide a uniformly thin flap.

The medial and lateral segments are approximated and the closure completed in layers. The nipple/areolar complex is likewise sutured into place. Drains are placed as indicated.

A bulky dressing, simulating a brassiere, is fabricated and applied over topical antibiotic cream and antiseptic gauze and secured in place.

Description of Post-Service Work:

Post-service work begins after skin closure in the operating room and includes frequent monitoring of the areolar complex to ensure viability; monitoring patient stabilization; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incision; monitoring, care, and removal of drains, if used; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

SURVEY DATA:

Specialty: American Society of Plastic & Reconstructive Surgeons, Inc.

Survey n:	150	RVW	PRE	INTRA	POST						
Response:	34		total min	total min	Day 1	ICU		Hosp. - Other		Office	
Rate %:	23%				total min	# visits	total min	# visits	total min	# visits	
low	9.53		90								
25th%	14.27		120								
med	16.90	60	150	30	0	0	20	1	60	4	
75th%	20.00		190								
high	25.00		240								

KEY REFERENCE SERVICE(S):

1995 RVW	Global	CPT	Descriptor
10.07	090	19316	Suspension of breast
31.15	090	19368	Breast reconstruction
15.40	090	30420	Reconstruction of nose

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

There is no other surgical procedure which properly approximates 19318 in complexity on the MPC reference list. 19316 has many of the technical features but typically does not remove any glandular tissue. The intensity and risks (which were noted above average -- 3.73 to 3.50) are perhaps most closely compared to 30420 and 19368 as the final result is so dependent on the careful execution of each step of the procedure.

Although the number of respondents are slightly smaller than we would have expected, the 25th and 75th percentiles are well grouped and all the survey number very consistent.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The significant portions of the work include the criticality of the preparative planning done in the erect position. Once the patient is placed on the operating table and anesthetized, the operating plan cannot be revisited and must not be changed. The need for continuous and meticulous hemostasis and the extensive incisions to be carefully closed are reflected in the operative time.

The survey noted that most respondents felt that the work and intensity were to be ranked at 4 (out of 5). But all agreed that the procedure had not changed significantly in work or site of service in the last 5 years.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 19350 Global Period: 090 1995 RVW: 8.21 Recommended RVW: 10.00

CPT Descriptor: Nipple / areola reconstruction

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 19350 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

This 46-year old female had a modified radical mastectomy on the right for invasive carcinoma of the right breast. She simultaneously had a transverse rectus abdominous myocutaneous flap reconstruction of the right breast and was now four months post mastectomy and breast reconstruction. The reconstructed breast was quite symmetrical, but lacked a nipple and areola. A nipple and areola graft on the right breast was planned. The patient was measured in the standing position for a location of the nipple and areola on the right breast. Under local anesthesia, a Skate flap was elevated at the site selected for the nipple reconstruction and a full thickness skin graft was taken from the right groin to reconstruct the areola. The right groin donor site was closed primarily.

Description of Pre-Service Work:

Pre-service work begins on the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural laboratory and imaging studies, with special attention to previous history, mammograms and ultrasounds of the breast; communicating with other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal and patient preparation; supervision of the positioning, prepping, and draping of the patient; and ensuring that surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

The patient is measured in the standing position to ensure even balanced position for a location of the nipple and areola graft on the right breast. Under local anesthesia, a Skate flap is elevated at the site selected for the nipple reconstruction and constructed. A full-thickness skin graft is taken from the right groin to reconstruct the areola. The right groin donor site is closed primarily in layers.

Description of Post-Service Work:

Post-service work consists of communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incision. Discharge management includes the surgeon's examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures and care of two operative sites.

SURVEY DATA:

Specialty: American Society of Plastic & Reconstructive Surgeons, Inc.

Survey n:	150	RVW	PRE	INTRA	POST						
Response:	27		total min	total min	Day 1	ICU		Hosp. - Other		Office

25th%	8.00			86							
med	10.00	45		90	30	0	0	0	0	60 4	
75th%	11.00			106							
high	12.20			150							

KEY REFERENCE SERVICE(S):

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
-----------------	---------------	------------	-------------------

7.18	090	14040	Local flap tissue closure - face, hands, genitalia
8.05	090	14060	Local flap tissue closure - nose, eyes, ears
5.43	090	14000	Adjacent tissue transfer or rearrangement, trunk; defect 10 sq cm or less
7.46	090	15200	Full thickness graft, free, including direct closure of donor site, trunk; 20 sq cm or less

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The component procedures of 19350 are 14040 (the flap reconstruction) and 15200 full-thickness skin graft).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

19350 is essentially a combination of 14040 (7.18) and 15200 (7.46). Combining them with the normal 50% reduction would leave approximately 11.00 RVW. The survey respondents had a median of 9.77 which is recommended.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW
RUC RECOMMENDATIONS**

Orthopaedic Surgery

Originally, the American Academy of Orthopaedic Surgeons (AAOS) submitted a study conducted by Abt Associates, Inc. of 1,300 orthopaedic services for review during the five-year review. In addition, the AAOS submitted detailed comments on 41 procedures. The Abt study involved a combination of a telephone survey of randomly selected orthopaedic surgeons and multiple consensus panels comprised of orthopaedic subspecialists and generalists. The relative values that resulted from the study were considered by AAOS to be much more appropriately aligned than the Medicare RBRVS. In addition, the AAOS believes that the relative values in the current scale are compressed at both the low and the high end, whereas the Abt values expand the scale in both directions.

In general, AAOS felt that the Harvard RBRVS study underestimated the intra-service work of many of the services its members provide. They are particularly concerned about the fitness-to-rate issue as the relative values for many of the services are based on a survey of general orthopaedic surgeons with little or no experience performing highly specialized services performed by subspecialists within orthopaedic surgery (eg, pediatric orthopaedic surgeons). For example, Harvard included general orthopaedic surgeons in the survey for 28262 *Capsulotomy, midfoot; extensive, including posterior talotibial capsulotomy and tendon(s) lengthening as for resistant clubfoot deformity* while AAOS surveyed pediatric orthopaedic surgeons with much more experience performing the procedure. The AAOS survey confirmed that the Harvard study had underestimated intra-service time.

In April, the RUC's Research Subcommittee reviewed the methodology used by Abt and concluded that the RUC should consider a survey of representative codes using RUC methodology to validate the relationship of the Abt-developed relative values to RUC-developed relative values. With HCFA's concurrence, the AAOS elected instead to withdraw the Abt study and the 41 codes, and conduct a RUC survey of the work involved in 83 codes which they felt were misvalued. The AAOS involved 11 national orthopaedic subspecialty organizations in this survey.

The RUC reviewed and is recommending increases for 37 of the 83 codes presented by AAOS. An additional 15 services were reviewed based on comments from the American Academy of Pediatrics (AAP), American Society of Plastic and Reconstructive Surgeons (ASPRS), and Carrier Medical Directors (CMDs). In general, the RUC did not accept recommendations for increased values when the AAOS survey time data was similar to Harvard data or when the reference services cited were not appropriate. The RUC is recommending increased work RVUs to correct rank order anomalies, in codes in which AAOS surveys confirm that the intra-service time for the procedure was underestimated in the Harvard study, and the patient population has changed in the past five years.

The RUC also reviewed and recommends decreases for 10 of the 11 orthopaedic services (CPT codes 25065, 26992, 27000, 27001, 27003, 27006, 27040, 27090, 27265, 27266, 27323, 27550, 64763, 64766) which were identified by a special analysis of trends in claims data and intrawork per unit of time for clinically related groups of services. The description and rationale for these decreases is included in the RUC Report on the entire group of services identified as potentially overvalued.

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
Replacement or Revision of Major Joint Procedures					
23472	Reconstruct shoulder joint	16.09	16.09	The AAOS survey pre-, intra-, and post-service time is similar to Harvard data for these codes. No compelling evidence presented to increase the RVU.	2
24363	Replace elbow joint	17.66	17.66		2
27134	Revise hip joint replacement	24.54	27.00	<p>The patients requiring these services have become more complex since the Harvard study. The frequency of "repeat" revisions is increasing.</p> <p>Patients undergoing revision of hip joint surgery have poor bone stock, distorted anatomy, require significant time in removing the existing prosthesis, often require supplementary fixation devices and bone grafting, and have significantly higher complication rates as compared to those undergoing first time or primary total hip replacement. Revisions also have a dislocation rate that is three times higher than a primary total hip replacement, which requires careful attention to positioning, rehabilitation, and soft tissue reconstruction.</p> <p>The increment of work between this service and the primary replacement code 27130 <i>Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft</i> (RVU = 18.68) is currently inappropriate.</p> <p>A CMD recommended the <u>same</u> increased value (28.47) for <u>both</u> procedures 27134 and 27487 which represents approximately 1.5 times the <u>average</u> of the RVUs for the primary replacement codes (CPT 27130 (18.68) and CPT 27447 (19.69)).</p> <p>The RUC determined that an increase was appropriate but did not agree with the AAOS and CMD recommendation of 28.47. A new value of 27.00 was computed by multiplying the AAOS survey time by the Harvard intensity of work per unit of time (IWPUT).</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
27137	Revise hip joint replacement	18.67	18.67	The AAOS survey pre-, intra-, and post-service time is similar to Harvard data. No compelling evidence was presented to increase the RVUs. The RUC recommends that the current value be maintained until the AAOS presents further evidence at the February RUC meeting.	2
27138	Revise hip joint replacement	18.93	18.93		2
27487	Revise knee joint replace	21.69	21.69		2
27486	Revise knee joint replace	16.63	18.00	<p>The patients requiring these services have become more complex since the Harvard study. The frequency of "repeat" revisions is increasing.</p> <p>Patients undergoing revision of knee joint surgery have poor bone stock, distorted anatomy, require significant time in removing the existing prosthesis, often require supplementary fixation devices and bone grafting, and have significantly higher complication rates as compared to those undergoing first time or primary total knee replacement. Revisions also have a dislocation rate that is three times higher than a primary total knee replacement, which requires careful attention to positioning.</p> <p>27486 is more similar in work to 27447 <i>Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)</i> (RVU = 19.69).</p> <p>The RUC agreed that this service was undervalued, but did not believe that 27486 should be valued the same as (AAOS Rec = 22.00) 27447.</p>	4
27488	Removal of knee prosthesis	14.48	14.48	The AAOS survey intra-service time is similar to the Harvard data. No other compelling evidence was presented.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
27827	Treat lower leg fracture	9.90	12.95	<p>A recommendation was made to increase the RVU for this service in June 1992. The following selected text presents HCFA's response to this request:</p> <p><u>"Treatment of fractures of weight-bearing articular surface of the tibia (CPT code 27827).</u> The RUC recommended work RVU of 13.5 for code 27827, noting that the work was 34 percent greater than that for code 27822, the treatment of an open trimalleolar ankle fracture. We disagree with this recommendation because we do not agree with the reference service. We set the work RVUs at 8.01, which is comparable to the work RVUs for the open treatment of a trimalleolar fracture (27822), which we view as a service of greater intensity." [Federal Register, Vol. 57, No. 228, November 25, 1992]</p> <p>The decision to use 27822 as a comparable reference service was inappropriate. 27822 can be used as a reference service, however, it is less work than 27827, not more. Surgical treatment is more difficult in 27827 than it is in reference service 27822 because it requires a more complex surgical approach, an exacting reduction involving multiple small bone fragments of the weight bearing surface of the distal tibia and extensive fixation using multiple screws and plates. Pre-and post operative care is more difficult due to the magnitude of bony and soft tissue injury and the increased danger of soft tissue infection, osteomyelitis, and post-traumatic arthritis and joint stiffness.</p> <p>The RUC reaffirms its June 1992 recommendations for these codes minus the budget neutrality adjustment.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Spine					
21610	Partial removal of rib	8.54	13.66	<p>The AAOS survey data confirms that the Harvard study underestimated the intra-service time of this service. The AAOS survey is based on the responses of orthopaedic surgeons who are members of the North American Spine Society and the American Spinal Injury Association, who are familiar with the complexities and intricacies of this procedure.</p> <p>A recommendation to increase the work RVU was made in 1992. The following text presents HCFA's response to this request:</p> <p>"Costotransversectomy (code 21610). The current work RVUs for this procedure are 6.30. The requested work RVUs were 11.46. There was considerable disagreement regarding the work of this service. Because of this disagreement, we considered keeping the current value. However, in light of the fact that the majority of reviewers recommended an increase, we have assigned work RVUs of 9.00 to this procedure. We believe this procedure involves slightly less work than the excision of a cervical rib (code 21615), which has work RVUs of 9.51." [Federal Register, Vol. 57, No. 228, November 25, 1992, pg 55940].</p> <p>The decision to use 21615 as a comparable reference service that involves more work was incorrect. By definition, costotransversectomy includes excision of a rib AND transverse process. A more appropriate reference service is 63064 <i>Costovertebral approach with decompression of spinal cord or nerve root(s), (eg, herniated intervertebral disk), thoracic; single segment</i> (rvu = 23.23) which is very similar in work in the approach and exposure. 63064 requires additional intra-service time for decompression of the spinal canal.</p> <p>The RUC computed a new RVU by multiplying the AAOS survey times by the Harvard 3 intensity factors.</p>	4

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
Knee Ligament Reconstruction and Arthroscopy Procedures					
27428	Reconstruction, knee	10.68	13.28	The current RVU for this service represents an anomaly in the MFS. For this service, the open procedure represents the same amount of total work as the arthroscopically assisted procedure (29888) and, therefore, should have the same work RVU. The similar intraoperative times of the Harvard study for 29888 confirms this rationale.	1
27429	Reconstruction, knee	11.86	14.67	The AAOS survey confirms the argument that Harvard underestimated the intra-service work of the procedure. AAOS argued that the work of 27429 is equal to the work of 29888 <i>Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction</i> (rvu = 13.28) plus the intra-operative work of 27427 <i>Ligamentous reconstruction (augmentation), knee; extra-articular</i> (rvu = 8.68), which is performed through a separate incision. The RUC agreed that this code is undervalued, but developed new values by using 27428 and 29888 as the base at 13.28 and adding an increment for the extra intra-service time and post-service work.	4
29889	Knee arthroscopy/surgery	10.76	14.41	29888 and 29889 were both valued the same in the original Harvard study. Code 29888 was reviewed by HCFA in the 1992 refinement process and increased, however, 29889 was overlooked. This has created an anomaly between the two services. 29889 is actually more intense and technically difficult than 29888. The RUC agreed that this code is undervalued, but developed new values by using 27428 and 29888 as the base at 13.28 and adding an increment for the extra intra-service time and post-service work.	4

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
Miscellaneous Repairs and Soft Tissue Procedure					
23395	Muscle transfer, shoulder/arm	12.42	16.00	The Harvard intra-service time was underestimated as confirmed by the AAOS survey. The intra-service work and time of 23395 is greater than 23462 <i>Capsulorrhaphy, anterior, any type; with caraciod process transfer</i> (rvw = 14.62) because of mobilization and transfer of a major muscle with its neurovascular pedicle. Additionally, the post-operative care of the patient is greater for 23395 due to the continuing assessment of muscle functioning and neurovascular status and necessary bracing/casting.	1
23420	Repair of shoulder	12.60	12.60	The AAOS survey intra-service time was similar to the Harvard data. No other compelling evidence to increase the current value was presented.	2
23466	Repair shoulder capsule	13.65	13.65	The AAOS survey intra-service time was similar to the Harvard data. No other compelling evidence to increase the current value was presented.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
27397	Transplants of thigh tenons	9.33	10.53	<p>The AAOS survey confirms that the intra-service time for this service was underestimated in the Harvard study.</p> <p>27397 is more work than codes 27691 <i>Transfer or transplant of single tenon (with muscle redirection or rerouting); anterior tibial or posterior tibial through interosseous space</i> (9.25) and 27692 <i>Transfer or transplant of single tendon (with muscle redirection or rerouting); each additional tendon combined</i> (1.87).</p> <p>The current RVU for this service represents an anomaly when compared with other services involving similar exposure and tendon transfer/transplant. The recommended increased RVU accurately places the work value for 27397 "relative" to similar procedures in the MFS.</p>	4
27435	Incision of knee joint	8.74	8.74	No compelling evidence to increase the current value was presented.	2
27052	Biopsy of hip joint	5.45	5.45	No compelling evidence to increase the current value was presented. AAOS will have the opportunity to present additional evidence at the February 1996 RUC meeting.	2
Upper Extremity (soft tissue) Procedures					
25107	Remove wrist joint cartilage	5.89	5.89	The AAOS survey intra-service time is similar to Harvard data. No other compelling evidence to increase the current value was presented.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
25115	Remove wrist/forearm lesion	6.26	8.00	<p>A rank order anomaly currently exists between this service and 25116 <i>Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis fungus, Tbc, or other granulomas, rheumatoid arthritis); extnesors, with or without transposition of dorsal retinaculum</i> (rvu = 6.44).</p> <p><i>25260</i> 25620 TK. <i>Repair, tendon or muscle, flexor, forearm and/wrist; primary, single, each tendon or muscle</i> (rvu = 7.33) for ONE tendon requires less intraoperative time and effort than this service which involves NINE tendons that undergo synovectomy. Additionally, if necessary, carpal tunnel release also adds to the intraoperative time and work of 25115. The need to identify and protect the median nerve also adds to the complexity and intensity of this service.</p>	4
26123	Release palm contracture	8.64	8.64	No compelling evidence to increase the current value was presented. Additionally, this service was included in the 1992 refinement process.	2
26442	Release palm & finger tendon	6.10	7.45	<p>The RUC agreed that the intra-service work was underestimated in the Harvard survey. Hand surgeons were not included in the Harvard study.</p> <p>This service is more than 150% of the work of 26440 <i>Tenolysis, simple, flexor tendon; palm OR finger, single, each tendon</i> (4.76) as it requires exposure of the palm AND finger and there is a dramatic amount of adhesion, while there is limited scarring with 26440.</p> <p>The RUC felt that the AAOS survey median of 10.00 was inappropriate and recommends a value of 7.45 which is slightly higher than 150% of 26440.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
26449	Release forearm/hand tendon	6.39	6.39	No compelling evidence to increase the current value was presented.	2
Nerve Decompression (neuroplasty) Procedures					
29848	Wrist arthroscopy/surgery	4.04	4.04	AAOS argued that this service should be at least equal to 29840 <i>Arthroscopy, wrist, diagnostic, with or without synovial biopsy (separate procedure)</i> (rvu = 5.39) A very detailed comment letter (489) was submitted by an individual for this service. The individual commenter also argued that this service should be equal to a diagnostic wrist arthroscopy. The RUC did not agree that 29848 is similar in work to 29840. Wrist arthroscopy for carpal tunnel is a more superficial procedure than the diagnostic arthroscopy.	2
64718	Revise ulnar nerve at elbow	5.48	5.48	The AAOS survey intra-service time is similar to Harvard data. No other compelling evidence to increase the current value was presented.	2
64721	Carpal tunnel surgery	3.99	3.99	The AAOS survey intra-service time is similar to Harvard data. No other compelling evidence to increase the current value was presented.	2
Debridement and Biopsy Procedures					
20225	Bone biopsy, trocar/needle	1.87	1.87	No compelling evidence to increase the current value was presented. The current value is similar to the RVU for needle biopsy in other organs.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	RUC Rationale	Key
27894	Decompression of leg	7.64	9.13	<p>The proportionality between 27894 and the other two fasciotomy with debridement procedures, 27892 <i>Decompression fasciotomy, leg; anterior and/or lateral compartments only, with debridement of nonviable muscle and/or nerve</i> (rvu = 6.10) and 27893 <i>Decompression fasciotomy, leg; posterior compartment(s) only, with debridement of nonviable muscle and/or nerve</i> (rvu = 6.06) is currently incorrect. The magnitude of difference in work between 27984 and 27982 or 27893 is greater than the magnitude of difference in work between 27602 and 27600 or 27601. This service is an infrequently performed procedure that is restricted to patients with limb-threatening conditions primarily due to the extensive death of muscle in multiple leg compartments. Necrosis of tissue in multiple compartments of a limb requires complex decision-making about amputation versus limb salvage, and intense interaction with the patient and family to a greater degree than patients requiring 27892 or 27893.</p> <p>The recommended RVU of 9.13 for this service is based on a multiple procedure calculation using the RVUs for codes 27893 and 27892 [6.10 + 50%(6.06) = 9.13].</p>	4

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

26010	Drainage of finger abscess	1.49	1.49	Individual commented that this service may be overvalued as compared to 10060 <i>Incision and drainage of abscess (eg, carbuncle, suppurative hidradenitis, cutaneous or subcutaneous abscess, cyst, furuncle, or paronychia); simple or single</i> (rvu = 1.12).	No evidence was presented to decrease the current value. The RUC recommends that drainage of an abscess on the finger is more difficult and should have a higher value than 10060.	2
26356	Repair finger/hand tendon	7.05	7.05	This code was identified as part of the American Society of General Surgeons comment letter which presented the results of their survey using the whipple procedure as a benchmark.	No compelling evidence was presented to increase the current value.	2
27259	Repair of hip dislocation	18.03	20.50	The Harvard survey data was underestimated. These codes are not used for the adult population and the Harvard survey respondents were general orthopaedic surgeons, not pediatric orthopaedic surgeons.	This service is similar in work to 27259 <i>Open treatment of spontaneous hip dislocation (developmental, including congenital or pathological), replacement of femoral head in acetabulum (including tenotomy, etc); with femoral shaft shortening</i> (rvu = 19.70). Both procedures are performed for developmental dysplasia of the hip. The RUC recommends a relative value of 20.50 which is based on a survey median of pediatric orthopaedic surgeons.	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

27725	Repair of lower leg	11.04	14.50	These codes were originally submitted by AAOS, but were then withdrawn. AAP conducted a survey and the RUC requests that they be included in the five-year review.	This service is similar in work to 27724 <i>Repair of nonunion or malunion, tibia; with iliac or other autograft (includes obtaining graft)</i> (rvu = 13.88). Both procedures involve the open treatment of tibial nonunions. The RUC recommends a relative value of 14.50 which is based on a survey median of pediatric orthopaedic surgeons.	1 add
28002	Treatment of foot infection	3.76	3.76		No compelling evidence was presented to increase the current value. The AAP will have the opportunity to present additional evidence at the February 1996 RUC meeting.	2 add
28760	Fusion of big toe joint	5.47	7.00	The code is undervalued and is similar to 27418 <i>Anterior tibial tubercleplasty (eg, for chondromalacia patellae)</i> (rvu = 9.82). Complexity is similar in children and adults. The procedure is commonly done in children and less commonly done in adults.	This service is slightly more work than 28750 <i>Arthrodesis, great toe; metatarsophalangeal joint</i> (rvu = 6.90). Both procedures involve great toe joint fusions.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

29700	Removal/revision of cast	0.88	0.57	Removal of casts are usually straightforward, low intensity services. The service should not be valued higher than the application of an Unna boot (code 29580, RVU = .57) or any higher than the application of a Denis-Browne splint (code 29590, RVU = .76).	The RUC agrees with the CMD recommendation.	3
29705	Removal/revision of cast	1.12	0.76	Removals of casts are usually straightforward, low intensity services. The service should not be valued much higher than the application of a Denis-Browne splint (code 29590, RVUs = .76).	The RUC agrees with the CMD recommendation.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27134 Global Period: 090 1995 RVW: 24.54 Recommended RVW: 28.47
Workgroup Recommended New Value: 27.00

CPT Descriptor: Revision of total hip arthroplasty; both components, with or without autograft or allograft

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

Additionally the Medicare Carrier Medical Directors (CMD) submitted a comment that this code is undervalued relative to 27487 in that it has higher intraservice work. [CMD recommendation = 28.47]

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old female, who four years previously, had undergone a THA and has severe pain in the hip secondary to loosening of the acetabular and femoral components, undergoes a revision of the total hip replacement, with replacement of the femoral and acetabular components

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of radiographs and scaled radiographs if necessary which were used for sizing and ordering of special implants or allografts. Review of hip aspiration/arthrogram, and review of preoperative laboratory tests; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes scrubbing; arranging for intraoperative cell saver; positioning the patient; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and implants that are necessary are present and available in the operative suite.

Intraoperative work: The skin incision is made down through subcutaneous tissue, followed by a fascial incision and splitting of the gluteus maximus. Dissection is made through scar tissue to identify the greater trochanter, vastus lateralis. The sciatic nerve is identified. This latter dissection is usually quite tedious and time consuming since the sciatic nerve is at risk. Short external rotators and capsule from posterior intertrochanteric insertions are removed; rotators are tagged and pulled over the sciatic nerve. Joint fluid is taken for culture. The leg length is measured, and wound towels are sewn in. Redundant tissue, fibrocapsular elements inferiorly to hip joint are removed to free up the superior capsule and pseudo capsule. The surgeon then attempts to dislocate the total hip with a bone hook and external rotation. Following this, the proximal vastus lateralis is incised and elevated, and the greater trochanter is osteotomized. The trochanter is retracted anteriorly with vastus lateralis and gluteus medius attached. The anterior capsule and fibrocapsular tissues are then excised. The surgeon then externally rotates the femur with leg over the opposite side of table. The proximal femur is elevated with refractors, and the femoral component is extracted. There is complete capsular and pseudo-capsular debridement, and the femur is packed to prevent bleeding. Following this, the leg is brought back up on to the table and slightly internally rotated. The femur is retracted anteriorly, with debridement of periacetabular reactive tissue and pseudo-capsule. Bone cement around the margins is fragmented. The surgeon drills the center of the cup and extract with acetabular extractor and removes the remainder of the cement. The pseudomembrane is also curetted from all bone defects. Assessment of the degree of bone loss on the acetabular walls is made. Acetabular reaming is done until there is contact on the anterior, posterior walls with absent bone superiorly.

Intraoperative work (continued):

At this point, attention is turned to the allograft. First, the superior pelvic area is prepared for the block allograft. The allograft is obtained from freezer. Soft tissue and articular cartilage are removed from the allograft, and it is fashioned to fit the superior defect. After it has been fashioned the allograft is fixed to the superior acetabulum with lag screws; it is then reamed to match the previously prepared acetabulum. The acetabulum is thoroughly irrigated and debrided. Bone is packed as a grout into the allograft-host junction. The bone cement (polymethylmethacrylate) is mixed and prepared. The acetabulum is irrigated, dried and packed. The cement is applied with pressurization techniques and the acetabulum placed in the proper position. It is important to maintain position and pressure on acetabulum while the cement cures. Extra cement from the acetabular edges is debrided, and the wound is irrigated copiously. At this point, the femur is externally rotated and placed over the side of the table, and the femoral refractors are replaced. The surgeon then manually fragments and removes proximal cement pieces with Moreland revision instruments. The membrane is removed back to the cortical bone. Ultrasound devices are utilized to fragment and remove distal cement mantle. Back cutting of cuffettes and revision instruments to thoroughly remove all cement and reactive membrane from the femoral canal is done. The risk of perforation of the femoral shaft and or fracture is high during this portion of the procedure. Intraoperative X-ray fluoroscopy is frequently used to monitor this cement removal.

The size of the proximal femoral deficiency is assessed, and the allograft for the proximal femur is obtained and thawed. The surgeon elevates the vastus lateralis to expose deficient proximal femoral bone; profundus femoral artery perforating vessels are also identified and ligated. Soft tissue from allograft is removed and the allograft is fashioned to cover the deficient area. The allograft is then applied and fixed with multiple cerclage cables with tensioning devices. The distal femur is reamed with increasing sizes until the cortical bone is adequately engaged, then the proximal femur is reamed with distal centralizing attachment while increasing sizes until adequate proximal bone contact is made with host bone and there is sufficient structural support from the allograft. The trial component is inserted with pre-templated neck length; x-ray is taken to assess position and fit. Leg length and stability are assessed by attaching various length neck/head combinations. The modular implant is then constructed, and the construct is impacted down into the femoral canal. The cerclage cables are further tightened and crimped, and X-rays are taken to evaluate for femoral fractures. The trial reduction is repeated and the appropriate neck/head is selected. The selected femoral head is placed on the implant and the joint is reduced. At this point, stability and range of motion are reassessed. If there is proper fit, the greater trochanter is reattached and fixed with a cable grip system. Bone grafts are placed in the trochanteric area and any residual defects. The area is copiously irrigated, and drains are inserted. The short external rotators and capsular elements are reattached through drill holes in the greater trochanter. The tensor fascia and gluteus maximus fascia are repaired. The subcutaneous tissue is closed; then the skin is closed.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressing and abduction splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab reports; care and removal of drains and dressings; supervision of physical or occupational therapy; ordering and reviewing postoperative X-rays; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care including home health care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Great attention to the possibility of postoperative hip dislocation must be given with this procedure by careful supervision of postoperative in-hospital care as well as the direction of physical therapy of postoperative exercise and recovery of activity. The incidence of dislocation is much higher in revision cases than with primary total hips hence the need for critical follow-up and the need to recover hip muscle strength.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
18.68	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
18.68	090	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
(21.69/28.47)*	090	27487	Revision of total knee arthroplasty, with or without allograft; all components

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 21.69 to 28.47, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The intraoperative time and work for CPT 27134 (*Revision of total hip arthroplasty; both components, with or without autograft or allograft*) is approximately twice the intraoperative time and work of CPT 27130 (*Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft*). Patients undergoing revision of hip joint surgery have poor bone stock, distorted anatomy, require significant time in removing the existing prosthesis, often require supplementary fixation devices and bone grafting, and have significantly higher complication rates as compared to those undergoing first time or primary total hip replacement. Revisions also have dislocation rate that is three times higher than a primary total hip replacement, which requires careful attention to post-operative positioning, rehabilitation, and soft tissue reconstruction.

CPT 27134 involves revision of a "major joint" arthroplasty, with intraoperative work that is comparable to CPT 27487 (*Revision of total knee arthroplasty, with or without allograft; all components*).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The following points were taken into consideration in determining the recommended new RVW for CPT 27134:

- a. The AMA/RUC survey indicates a higher intraoperative time for revision of total hip compared to revision of total knee, but comparable estimates for complexity/intensity in terms of technical skill & physical effort, mental effort and judgment, and stress. However, the median RVW was less for revision of total hip replacement. [This could be do to the fact that the reference services most often cited were the comparable primary joint replacement procedures (CPT 27130 and CPT 27447), where CPT 27447 (RVW=19.69) has a slightly higher value than CPT 27130 (RVW=18.68). In fact, the survey medians very closely approximate an RVW that is 1.5 times greater than the RVW for each service's comparable primary replacement procedure.]
- b. The Medicare CMDs commented that CPT 27134 (revision of total hip) was undervalued and used CPT 27487 (revision of total knee) as a reference stating that CPT 27134 has higher intraservice work than CPT 27487. They also commented that CPT 27487 (revision of total knee) was undervalued and used CPT 27134 (revision of total hip) as a reference stating they were comparable procedures. In the end, the CMD's recommended the same increased value (28.47) for both procedures that closely approximates 1.5 times the average of the RVWs for the primary replacement codes.

Even though the time estimates consistently show revision of total hip to require more time than revision of total knee, it is the opinion of the Orthopaedic RVS Advisory Panel presenting this recommendation, that the total work for both of these procedures are very comparable, and as such, the Advisory Panel agrees with the CMDs that both procedures should have the same value.

The Advisory Panel chose to conservatively recommend an RVW of 28.47, consistent with the CMDs recommendation. This RVW is conservative because it is lower than the average of the survey median RVWs for CPT 27134 and CPT 27487 ($29.01 = 28.02/2 + 30.00/2$) and it is lower than the average of 1.5 times the value for the comparable primary procedures [$28.78 = (1.5 \times (18.68 + 19.69) / 2)$].

It is also important to point out that patients requiring this service are becoming more complex. The frequency of "repeat" revisions is increasing. With repeat revisions, there is less bone, that is more fragile. Repeat revision patients require larger bone grafts and larger and more complicated prostheses (new technology), which translates into more complex procedures that take more time.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27486 Global Period: 090 1995 RVW: 16.63 Recommended RVW: 22.00
Workgroup Recommended New Value: 18.00
CPT Descriptor: Revision of total knee arthroplasty, with or without allograft; one component

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56-year-old female with a painful loose total knee arthroplasty undergoes a total knee revision of one of the components.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of radiographs and scaled radiographs if necessary which were used for sizing and ordering of special implants or allografts. Review of hip aspiration/arthrogram, and review of preoperative laboratory tests; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes scrubbing; arranging for intraoperative cell saver; positioning the patient; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and implants that are necessary are present and available in the operative suite.

Intraoperative work: (The revision of the tibial component is described here. In other revision cases, the femoral component only may be revised.) After the tourniquet is elevated following exsanguination, the old median parapatellar scar utilized to expose the joint. After everting the patella, initially, a synovectomy is performed to expose and visualize the joint. In doing this, tissue is removed that is underlying the implant that had violated the bone and interface. Having completed this and irrigated the joint, attention can be turned to extracting the tibial component. The tibia is cut from its interlock and taken out of the insert. The broken piece is then visualized in back and also then lifted out. The tibial surface is resected, removing bone in order to obtain a stable edge peripherally for supporting the implant. All remaining cement is excised with hand and power tools. The hole is reamed for the central peg. This leaves a sclerotic surface throughout. A right angle bur is then brought in and many small perforations are made in this sclerotic surface for engaging the cement. The entire top surface was previously burred to remove all fibrous tissue. At this point, we irrigate the knee completely, exsanguinate for tourniquet elevation and prepare the remaining bone surfaces using a bur to go over all of the exposed cortical type surfaces to be sure all fibrous tissue have been removed, and then right angle bur to bur small perforation in the sclerotic areas. After a trial reduction, attention is returned to the tibia, removing further bone to flex the bone cut, drop the posterior edge to allow this to seat completely at the top edge of the fibular tibial joint laterally and below that on the medial side but with good coverage and good stability. Components are selected to give complete extension and good tension. Having made all of the decisions, prepared the allograft (as needed) and made all of the cuts for the bone, cementing is begun. The tibia is cemented using pressure inject Simplex-P loaded with Nebcin into the tibial metaphyseal surface but not into the diaphysis and inserting the modular base. The tourniquet is released, hemostasis obtained, deep drain placed, and the wound closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressing and extension splint or continuous Passive Motion apparatus (CPM). Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab reports; care and removal of drains and dressings (careful inspection of the operative wound is critical since anterior skin slough with secondary infection is a definite complication); supervision of physical or occupational therapy; ordering and reviewing postoperative x-rays; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care including home health care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Supervising the recovery of range of motion as well as ambulatory status is most important during the postoperative course and involves not only oversight of in-hospital therapy but home care therapy as well.

HARVARD DATA for surveyed service and key reference service(s):

Harvard 27486:	53	141	32	0	0	95	9.5	50	5
Harvard 27447: Phase 4	58	139	37	0	0	100	10	60	4

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
18.68	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
19.69	090	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The intraoperative time and work for CPT 27486 is greater than the intraoperative time and work of CPT 27447 (*Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)*). Patients undergoing revision of knee joint surgery have poor bone stock, distorted anatomy, require significant time in removing the existing prosthesis, often require supplementary fixation devices and bone grafting, and have significantly higher complication rates as compared to those undergoing first time or primary total knee replacement. Revisions also have dislocation rate that is three times higher than a primary total hip replacement, which requires careful attention to positioning.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This recommended RVW brings up the relative value for CPT 27486 so that, in relationship to the recommended RVW for CPT 27487, it approximately corresponds to the current RVW difference between CPT 27486 and CPT 27487:

1995 MFS RVWs: CPT 27486 (16.63); CPT 27487 (21.69)

Recommended RVWs: CPT 27486 (22.00); CPT 27487 (28.47)

It is also important to point out that patients requiring this service are becoming more complex. The frequency of "repeat" revisions is increasing. With repeat revisions, there is less bone, that is more fragile. Repeat revision patients require larger bone grafts and larger and more complicated prostheses (new technology), which translates into more complex procedures that take more time.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 23222 Global Period: 090 1995 RVW: 16.64 Recommended RVW: 22.78
Accepted by Worgroup
CPT Descriptor: Radical resection for tumor, proximal humerus; with prosthetic replacement

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old with chondrosarcoma of the proximal humeral metaphysis undergoes a radical enbloc excision of the proximal humerus with replacement with a humeral prosthesis.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing preoperative imaging, pathology, and laboratory studies, with special attention to staging studies that tell the oncologist the local, regional and systemic extent of the tumor. These would include the following studies: MRI of the locally involved area; CT scan of the chest, abdomen, and pelvis; and PET. Preoperative work also includes consulting with the referring physician, if necessary, and other health care professionals; communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent; scrubbing; ordering blood replacement products and appropriate intra-arterial lines necessary for this extensive operation; arranging for intraoperative instrumentation and custom prosthetic constructs that would be appropriate for the patient's situation; careful positioning to allow for necessary local reconstruction. Marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: After an adequate level of general endotracheal anesthesia is induced and the patient has been placed in a semisitting position with the head elevated approximately thirty-five degrees and a bolster placed on the left scapula, a longitudinal incision is made from the region of the distal clavicle down across the deltopectoral groove, staying in the anterolateral portion of the arm. The skin is incised with the knife and the subcutaneous tissue is then spread using Weitlaner refractors and dissected with Metzenbam scissors and tooth forceps. Hemostasis is obtained. The superficial deltoid and biceps fascia is kept with the skin flaps to improve the vascularity. The deltoid muscle and the deltopectoral groove are identified with the cephalic vein. Taking care to leave a small portion of the cephalic vein with the medial portion of the exposure, the deltoid is then carefully subperiosteally elevated off the distal clavicle, acromioclavicular joint and acromion. The deltoid is then dissected down to its insertion on the humerus, resecting as necessary for removal of the tumor. The deltoid insertion is then removed from the humerus subperiosteally and the deltopectoral groove is then developed exposing the underlying rotator cuff and the biceps tendon of the long head. The insertion of the pectoralis major muscle to the humerus is then identified and resected off the humerus, leaving a small attachment close to the main tumor mass. It is tagged and left to retract with the suture tag on it medially. The biceps muscle brachiae long head is then identified in its tendinous portion and cut at its insertion onto the rotator cuff and retracted distally. The exposed shaft of the humerus is then measured and marked. With careful subperiosteal dissection at the mark, using the Cobb elevators, refractors are placed around the bone and a sagittal saw is used to transact the bone at this level.

Intraoperative work (continued)

On immediate transection, bone wax is used to plug the resection line at the specimen side and a curette is used to obtain tissue from the remaining medullary canal. After this is obtained, it is sent for frozen section and immediately plugged with bone wax. After obtaining the frozen section results, the resection proceeds. A bone clamp is placed on the specimen proximally and then with gentle upward retraction, the bone is dissected free of the soft tissue, while keeping a subperiosteal sleeve on the humerus in its entire posterior length. The latissimus dorsi and teres major insertion is identified with a tag suture and cut with the bovie cautery off the humerus, leaving a small tag attached to the specimen. The triceps insertion onto the posterior humerus is then dissected off carefully making sure that the radial nerve is protected at all times. The insertion of the triceps is left attached to the humerus. The dissection continues up medially and the medial rotator cuff is then transected in its attachment to the lesser tuberosity leaving a small cuff of tissue attached to the bone. The inferior glenohumeral ligament is then transected at the joint line and the dissection proceeded around from the medial inferior direction to a lateral superior direction. After the subscapularis is tagged, this is entirely removed with the lesser tuberosity leaving a small insertional cuff of tendon attached to the proximal humerus. The subscapularis tendon is then suture identified, tagged and using bovie cautery is removed off the greater tuberosity leaving a small cuff of tissue still attached to the bone preserving the subperiosteal region. After this is done, the humerus is retracted anteriorly with internal rotation and adduction and the inferospinatus and teres minor insertions onto the posterior aspect of the greater tuberosity are then released, after suture tagging. The remaining portion of the long head of the biceps is cut and the specimen is then sent to pathology. At this point, the entire wound is copiously irrigated with normal saline antibiotic impregnated solution and the attention is then turned towards insertion of the implant.

An appropriately sized proximal humeral prosthetic stem is then opened, along with an appropriately sized head. After reaming the distal humeral canal as necessary with a hand held reamer and a flexible drill bit, the trial prosthesis inside the allograft is inserted. This is then reduced into the glenohumeral joint, assessing the fit. The distal tip of the stem is fashioned for corrected fit. The head is chosen and implanted onto the prosthesis. This is then inserted again into the distal humeral shaft and placed in the proper position, reduced and asses for range of motion. Bone cement is inserted into a well lavaged distal humeral canal with some pressure. The prosthesis is inserted and the markings are aligned to insure proper rotational insertion. After this is done, the prosthesis is reduced and the rotator cuff is attached to the proximal prosthesis.

Next, attention is turned towards reattaching the pectoralis major, deltoid and latissimus dorsi teres insertions. A deep drain is placed and the biceps tendon is then tenodesed to its short head insertion of the coracoid process with #1 Vicryl. The wound is irrigated copiously and a second drain is placed. The deltoid is reapproximated to the acromion and clavicle acromioclavicular joint through the periosteal cuff that is left at the time of deltoid reflection. The superficial deltoid and biceps fascia is closed in interrupted simple fashion and the skin is closed in layers, securing the drains to the skin.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings, any necessary immobilization device (sling and swath). Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring of drainage from indwelling catheters as well as neurologic function of extremity; care and removal of drains; adjustments of immobilization sling and swath as permitted by patient's comfort and stability; supervision of physiotherapy; ordering and reviewing radiographs to determine position of prosthesis; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; assessment of physiotherapy progress; and antibiotic and pain medication adjustments.

Harvard 23222:	61	194	37	0	0	85	8.5	55	5.5
Harvard 23220:	55	146	27	0	0	78	7	59	5
Harvard 23470:	58	113	19	0	0	56	5	59	4

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
18.68	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
13.31	090	23220	Radical resection for tumor, proximal humerus;
16.12	090	23470	Arthroplasty with proximal humeral implant (eg, Neer type operation)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 23222 (*Radical resection for tumor, proximal humerus; with prosthetic replacement*) is equal to the total work of CPT 23470 (*Arthroplasty with proximal humeral implant (eg, Neer type operation)*) plus the intraoperative work of CPT 23220 (*Radical resection for tumor, proximal humerus*).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation, and the survey confirms, that the Harvard study did not correctly estimate the intraoperative time for patients requiring CPT 23222. Additionally, the preoperative work necessary for **positioning** and marking the patient and preparing materials for prosthetic implant was underestimated.

CPT 23222 is essentially the combination of CPT 23470 and CPT 23220, and by applying the multiple procedure payment rule, the RVW would equal 22.78 [16.12 + (13.31 x 50%)]. This RVW is recommended, instead of the survey median.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27076 Global Period: 090 1995 RVW: 17.93 Recommended RVW: 30.00
Worgroup Recommended New Value: 20.23

CPT Descriptor: Radical resection of tumor or infection; ilium, including acetabulum, both pubic rami, or ischium and acetabulum

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 53-year-old male with a chondrosarcoma of the peri-acetabular area of the pelvis undergoes a radical resection of the ilium, acetabulum, pubic and ischial rami. [Please note that any reconstructive procedures would be reported separately. Therefore, only consider the time and work involved in this radical resection procedure.]

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies, with special attention to X-RAY, MRI, CT and angiograms (these studies could include a CT scan of the chest, abdomen, and pelvis; MRI of the knee and whole involved femur; total body scan and PET Scan. These studies will determine the local extent of the tumor and the extent to which a successful local resection can be accomplished versus an amputation); consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; arranging for intra-operative blood; positioning to allow access to pelvis anteriorly and posteriorly; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: The incision extends from the posterosuperior iliac spine along the iliac crest and inguinal ligament to the symphysis pubis. The a vertical limb is made from this incision passing just posterior to the greater trochanter and extending into the upper thigh. The abdominal muscles are detached from the iliac crest and the peritoneum is displaced medially to expose the external iliac vessels. The following are then divided: the inguinal ligament and the inferior epigastric vessels. Detach the inguinal ligament from the pubic tubercle and the rectus abdominis from the pubic crest. Divide the pubis with a saw. The common iliac vessels and femoral nerve are exposed. The iliopsoas is preserved unless involved with tumor. The iliacus muscle is divided at the sacroiliac joint and the adductor muscles from the pubis. The obturator nerve and vessels are divided. The following muscles are divided: sartorius, tensor fascia lata, rectus femoris, gluteus medius and minimus. The hip capsule is opened and the femoral neck is cut with a saw. The gluteus maximus and external rotators are divided. The sacroiliac joint is divided with an osteotome after mobilizing the lumbosacral nerve trunk and retracting it medially. The following are next divided: levator ani muscle, sacrospinous and sacrotuberous ligaments and hamstring origin from the ischial tuberosity. The specimen is removed (entire ilium including acetabulum and femoral head) after releasing the adductor magnus from the ischial ramus. The femoral neck is covered by an adjacent muscle. The wound is closed in layers over drains.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and balance traction may be used or abduction splinting of the hip. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including care and removal of drain; supervision of use of crutches (several months) before a cane is possible); and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
18.68	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
17.32	27295	Disarticulation of hip

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
(12.52/17.32)*	090	27049	Radical resection of tumor (eg, malignant neoplasm), soft tissue of pelvis and hip area
21.05	090	49215	Excision of presacral or sacrococcygeal tumor

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 12.52 to 17.32, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27076 (*Radical resection of tumor or infection; ilium, including acetabulum, both pubic rami, or ischium and acetabulum*) is more complex and involves more work and time compared to CPT 27049 (*Radical resection of tumor (eg, malignant neoplasm), soft tissue of pelvis and hip area*), because in addition to soft tissue resection, CPT 27049 also involves bone resection.

CPT 27076 involves more exposure and exploration and includes significantly more work and time (including ICU care) and as compared to CPT 49215 (*Excision of presacral or sacrococcygeal tumor*)

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study underestimated the intraoperative time for CPT 27076, as confirmed by the current AMA/RUC survey. The patients requiring this service are becoming more complex. Because of an increase in the survival rate to the point of needing this service, patients are presenting with larger masses that are more difficult to dissect. The point is confirmed by the survey response to question 4b, that indicated patients are becoming more complex (more work).

Calculations that multiply the intraoperative time ratio of (CPT 27076 / CPT 49215) by the RVW for CPT 49215 affirm that a value of 30.00 for this service is reasonable and relative:

Harvard to RUC comparison: $(270/172) \times 21.05 = 33.04$

Harvard to Harvard comparison: $(230/172) \times 21.05 = 28.15$

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27329 Global Period: 090 1995 RVW: 11.74 Recommended RVW: 17.32
Worgroup Recommended New Value: 13.00

CPT Descriptor: Radical resection of tumor (eg, malignant neoplasm), soft tissue of thigh or knee area

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18-year-old male with a rhabdomyosarcoma of the quadriceps muscle undergoes radical enbloc resection of all involved soft tissues. (Report any reconstructive procedures separately using the appropriate codes)

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to studies that may include a CT scan of the chest, abdomen, and pelvis, an MRI of the knee and whole involved femur, a total body scan and PET Scan (these studies will determine the local extent of the tumor and the extent to which a successful local resection can be accomplished versus an amputation); consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes scrubbing; arranging for intraoperative blood, marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: A large previously planned incision is made from the iliac crest along the anterior thigh to well below the knee is made and the dissection proceeds as dictated by the preoperative imaging studies. These are available and used in the operating room. The interval between the tensor fascia lata and saartorius muscles is developed and the rectus femoris tendon identified and dissected from the ilium and anterior hip capsule. The quadriceps muscle is then dissected free medially and laterally taking care not to violate the muscle compartment. The femoral nerve is identified and taken with the entire vastus medialis. The lateral extent of the dissection involves removing the vastus lateralis together with the linea aspera taking care to identify and ligate each segmental vessel. This is the most tedious portion of the dissection. The dissection is then carried distally removing the periosteum with the quadriceps muscle to the level of the patella. Multiple perforating vessels are present laterally as well as the geniculatae vessels distally. The entire specimen is then removed en bloc (vastus medialis, vastus intermedius, vastus lateralis, and rectus femoris muscles) by dividing the quadriceps tendon at the level of the patella. Careful hemostasis is obtained and the wound is inspected for remaining tumor. Frozen sections of the tumor margins of the specimen are often obtained to make sure the entire tumor has been removed. Careful closure of the skin flaps over suction drainage is necessary because of the extent of the dissection and dead space. The skin flaps are approximated or rotated as is necessary. Careful monitoring of blood loss during the procedure is necessary with appropriate blood and fluid replacement.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and an extension splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including care and removal of drain; adjustments of splint; supervision of ambulation of the patient with crutches will be necessary as well as bracing since active knee extension after the surgical removal of the anterior muscles); and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)
17.32	27295	Disarticulation of hip

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
17.32	090	27295	Disarticulation of hip

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27329 (*Radical resection of tumor (eg, malignant neoplasm), soft tissue of thigh or knee area*) involves similar work as compared with CPT 27295 (*Disarticulation of hip*).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study underestimated the intraoperative time for CPT 27329, as confirmed by the current AMA/RUC survey. It is the judgment of the Advisory Panel that CPT 27329 and CPT 27295 represent similar procedures, and as such, the RVW for CPT 27295 is being recommended, instead of the higher survey median.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27365 Global Period: 090 1995 RVW: 13.84 Recommended RVW: 22.88
Worgroup Recommended New Value: 15.00

CPT Descriptor: Radical resection of tumor, bone, femur or knee

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 17-year-old female with osteosarcoma of the distal femur undergoes a radical en bloc excision of the entire distal femur and knee joint. (Report any reconstructive procedures separately using the appropriate codes)

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to staging studies that tell the orthopaedic oncologist the local, regional, and systemic extent of the bone cancer. These studies could include a CT scan of the chest, abdomen, and pelvis; MRI of the knee and whole involved femur; total body scan and PET Scan. These studies will determine the local extent of the tumor and the extent to which a successful local resection can be accomplished versus an amputation. Preoperative work also includes consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Pre-service work also includes pre-operative scrubbing; ordering preoperative appropriate allografts or prosthetic devices needed to accomplish the reconstruction; arranging for intra-operative blood transfusions necessary for the operation; positioning as necessary to allow for the exposure of the entire extremity, marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: Resection is begun with an incision directed down medially over the anterior medial thigh and excising the previous area of the incisional biopsy site that is through the medialis muscle. At this point the fascia is incised and along the line of the incision, and is carried down to the area of the attachment of the patellar tendon to the tibia along with the pes anserinus. The fascia is incised along the incision and careful dissection, both sharply and bluntly, around to the lateral and medial, to the medial intermuscular septum as well as the lateral intermuscular septum is accomplished. A cut above the medial joint line is necessary to obtain a clear margin. The femur proximally is identified and, the femur is divided. With the use of a bone clamp, careful dissection around posteriorly and medially is accomplished to envision the Hunter's canal and the attachment of the adductor muscles, which were then carefully removed. The neurovascular bundle is identified and further dissection of the muscle, leaving a well-marginated cuff of muscle medialis around the tumor, is done and freed both medially and laterally. This is carried down to the joint line. The pes anserinus could be preserved easily and resected off the area of the proximal tibia, where the tibia would be cut with the saw. Careful resection or dissection around posteriorly to identify the neurovascular bundle is accomplished, and the small bleeders were clamped and tied with #2-0 and clamped with metal clips as necessary. This freed up the neurovascular bundle down to the posterior capsule of the tibia, and a saw is then used to divide the tibia within a centimeter of the osteoarticular surface. After this, the lateral dissection is also carried laterally around to the lateral intermuscular septum, and this is divided in careful dissection around posteriorly to the proximal fibula area and tibia area and the specimen is then delivered. Careful measurement, prior to the resection, is accomplished to align the femur with Steinmann pins, and a stem plate using the alignment guide. At this point in time, the tourniquet is let down and hemostasis obtained.

Postoperative work begins after skin closure in the operating room and includes application of cast and bulky dressing (may need special brace). Post-service work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring of the hemodynamics of the salvaged limb; care and removal of drainage tubes; adjustments of brace or cast; supervision of physical therapy; ordering and reviewing x-rays of lower operated limb to allow for best functional results; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

HARVARD DATA for surveyed service and key reference service(s):

Harvard 27365:	52	138	33	0	0	70	7	50	5
Harvard 27447: Phase 4	58	139	37	0	0	100	10	60	4

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
18.68	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

KEY REFERENCE SERVICE(S):

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
19.69	090	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Compared to CPT 27447 (*Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)*), CPT 27365 (*Radical resection of tumor, bone, femur or knee*) requires more skill and judgment and more intraoperative time for exposure of the tumor and for exploration and protection of neurovascular structures while resecting the tumor and bone(s). Postoperatively, chemotherapy adds to the care of this patient.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study did not correctly estimate the intraoperative time for patients requiring CPT 27305. This service correlates well with CPT 27447, so it is reasonable to adjust the RVW to reflect the difference in intraoperative time.

To calculate an RVW for CPT 27365, that is "relative" to the current RVW for CPT 27447, but is adjusted for intraoperative time differences, one would multiply the intra-RVW* for 27447 by the additional intraoperative time ratio necessary for CPT 27365; and add this value to the total RVW for CPT 27447, as follows:

$19.69 \text{ (RVW for CPT 27447)} \times 55\% \text{ (Harvard \% intra-time)} = 10.83 \text{ intra-RVW for 27447}$

$10.83 \times 41\text{min}/139\text{min} = 3.19 \text{ (extra RVW for extra intra-time)}$

$19.69 + 3.19 = 22.88 \text{ (recommended value for 27365)}$

*The **intraoperative** RVW for 27447 is 10.83. This is equal to 55% of the **total** RVW, per Harvard's estimation of intra- vs. pre-/post-operative "work" (not time), as reported in Harvard Phase 3 - Final Report.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28116 Global Period: 090 1995 RVW: 6.17 Recommended RVW: 9.00
Workgroup Recommended New Value: 7.00

CPT Descriptor: Ostectomy, excision of tarsal coalition

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 8-year-old with a painful calcaneo-navicular coalition undergoes resection of the bone bridging the calcaneus and navicular.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging (routine X-rays, special views of the subtalar joint or CT scanning), pathology, and laboratory studies; with special attention to preoperative radiographs, hematologic status; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; arranging for intraoperative radiographic table, pneumatic tourniquet; positioning the patient; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: After a pneumatic tourniquet is placed about the upper thigh and the involved lower leg and foot are prepped and draped free and leg is exsanguinated with an Esmark bandage and the pneumatic tourniquet is inflated to an appropriate pressure, a skin incision is made directly over the sinus tarsi. The extensor tendons are identified and retracted medially. The peroneal tendons and the sural nerve are identified laterally and protected. The origin of the extensor digitorum brevis muscle over the sinus tarsi is identified and mobilized with sharp dissection. The fat within the sinus tarsi is removed with rongeurs. This will allow visualization of the calcaneonavicular coalition. This may need to be confirmed radiographically with either plain radiographs or fluoroscopy. When the area of the coalition has been clearly identified a 1 to 2 cm segment is removed with care not to damage the articular surface of the talonavicular or calcaneocuboid joints. The ostectomy site is smoothed with a rongeur. The raw bone edges may be sealed with bone wax to prevent bleeding that may lead to reformation. Following the ostectomy subtalar joint motion should be significantly improved, if not normal. Absorbable sutures are then used to secure the fascial origin of the extensor digitorum brevis muscle into the created bony defect. Using Keith needles the sutures are passed through the area of the ostectomy and brought out through the medial side of the foot. This allows the extensor digitorum brevis to be pulled into the ostectomy site. This also aids in the preventing reformation of the coalition. The sutures are tied over a padded, plastic button. Once this has been completed, the pneumatic tourniquet is deflated and hemostasis is achieved with electrocoagulation. The wound is irrigated and closed over a Hemovac drain. The subcutaneous tissues and skin are closed in layers. Steri strips are applied to the skin edges.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and short leg splint or cast (split to accommodate post surgical swelling). Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status; care and removal of Hemovac drain; adjustments of splint or cast; supervision of physical therapy; ordering and reviewing postoperative radiographs; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures after 14 days with a cast change; evaluation of periodic imaging and laboratory reports, antibiotic and pain medication adjustments; and ordering appropriate orthoses when necessary. Once wound healing has occurred the surgeon orders an appropriate physical therapy program and oversees the recovery of hindfoot motion.

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
10.86	090	28725 Subtalar arthrodesis
9.80	090	28264 Capsulotomy, midtarsal (Heyman type procedure)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
10.86	090	28725	Subtalar arthrodesis
6.62	090	28122	Partial excision (craterization, saucerization, or diaphysectomy) of bone (eg, for osteomyelitis or tarsal bossing), tarsal or metatarsal bone, except talus or calcaneus
(7.33/10.86)*	090	28130	Talectomy (astragalectomy)

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 7.33 to 10.86, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 28116 (*Ostectomy, excision of tarsal coalition*) involves the same intraoperative exposure and work effort, and slightly less time, as compared to CPT 28725 (*Subtalar arthrodesis*). Postoperative care of the weightbearing extremity is also similar.

CPT 28122 (*Partial excision (craterization, saucerization, or diaphysectomy) of bone (eg, for osteomyelitis or tarsal bossing), tarsal or metatarsal bone, except talus or calcaneus*) requires less intraoperative work in terms of depth and degree of procedure and less time than CPT 28116. Postoperative care of the weightbearing extremity is similar.

CPT 28116 requires slightly less intraoperative work (intensity) to excise and fuse the involved bone surfaces, as compared to the excision involved with CPT 28130 (*Talectomy (astragalectomy)*). Postoperative care of the weightbearing extremity is similar.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This RVW is lower than the key reference services CPT 28725 and CPT 28130 and higher than CPT 28122 and reflects the similarities and differences in intraoperative time and work, as discussed in the comparison to key references section above.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study did not correctly estimate the work (time plus intensity) for this service. The current survey and the judgment of the Advisory Panel equate this service to slightly less intraoperative work than CPT 28725 and CPT 28130 and more intraoperative work than CPT 28122, and, as such, the survey median RVW, is recommended to set an appropriate value for CPT 28116 "relative" to the key reference services.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28262 Global Period: 090 1995 RVW: 12.19 Recommended RVW: 15.00
Accepted by Workgroup

CPT Descriptor: Capsulotomy, midfoot; extensive, including posterior talotibial capsulotomy and tendon(s) lengthening as for resistant clubfoot deformity

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

Additionally, the American Academy of Pediatrics submitted a request for review of 28262 (public comment HCFA control number 347) as an undervalued service. CPT 27165 and 63017 were cited as key references. [AAP recommendation = 16.20]

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 15-month-old child with a resistant club foot undergoes a capsulotomy of the midfoot with tendon lengthening and posteromedial and lateral capsular releases.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of all X-rays, operative plan, lab work; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; arranging for intraoperative X-rays, leg tourniquet, advise as to intraoperative drugs, antibiotics; positioning the patient; applying Webril and tourniquet to leg; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: A standard Turco type incision is often made from the palpable border of the medial navicular cuneiform joint posteriorly just inferior to the medial malleolus and then dead posteriorly ascending up the back of the calf, approximately 1/3 to 1/2 of the way to the knee. The skin is opened using a #15 blade and subcutaneous tissue is dissected using sharp dissecting shears. The posterior portion of the wound is opened and incised first. After dissection of the subcutaneous tissue, the palpable tendo-achilles cord is identified. After circumferential dissection of soft tissue and peritendon fat, the Achilles tendon is localized. The small plantaris tendon is also tenolysed and a small section of the plantaris is sent for specimen. Again, the Achilles tendon itself is localized, isolated and a longitudinal incision is made through the length of the Achilles tendon in the operative field. This incision is approximately 3-4 cm. in length. Tendon lengthening continues in such a fashion that the distal end is brought out medially and the proximal end is brought out laterally and both ends, after complete tenolysis, are then clamped. After this is done, dissection is carried through the sub cutaneous tissues in a distal medial direction, such as to identify the other tendons. The neurovascular bundle is dissected posterior to the medial malleolus and then isolated using a vascular vessel loop. After isolation of the neurovascular bundle and retraction, dissection is still carried out in a distal direction, such that the insertion of the posterior tibial tendon is identified. The retinaculum is then incised over the posterior tibialis tendon and dissection of the soft tissues is carried back up in a proximal direction. The tendon is then lengthened at the most proximal extent of the wound. After lengthening, the end of this is clamped off and retracted out of the wound.

Intraoperative work (continued):

Next, the common digital flexor, as well as the flexor hallucis longus, are identified and the retinaculum over these 2 tendons is opened as well. Dissection then proceeds distally along the tunnel of the flexor digitorum longus to the talonavicular joint. After localization of the talonavicular joint, the capsule is incised, first medially, then anteriorly and posteriorly to open up the joint freely. Next, dissection carries us back distally to the subtalar joint. The subtalar joint is then traced out using blunt dissecting scissors and pickups and the capsule around the medial portion of the talonavicular joint is then incised. Our dissection then carries us again distally. The neurovascular bundle is then reflected in a more anterior and posterior subtalar joint. This joint capsule is then incised, allowing even more freedom in the foot and the deforming forces are being alleviated quickly. The next joint that is released is the posterior ankle joint, which is easily located underneath the Achilles tendon that had been previously reflected. Soft tissue is dissected off using blunt scissors and the joint opened from posterior using sharp dissecting scissors. Next, the flexor hallucis longus tendon is again re-identified and at this point, it appears that there is still a small medial and varus vector force, secondary to the tight flexor hallucis tendon. Hence, this tendon is tenolysed near its insertion. After this is done, it should appear that the foot can come back to a neutrally rotated position. After this is done it appears that the foot has come back to a neutrally rotated position. At this time, a wire is placed posteriorly in the talus and fired in a distal direction in such a manner to catch the navicular joint and reduce the joint in its proper orientation relative to the talar head. After this is done, the X-ray image intensified is moved in briefly and quickly to verify initial reduction of the talonavicular joint. After this is done, a transverse K-wire is fired through the posterior portion of the calcaneus and a small traction bow is applied. After this is done, the wound is irrigated with copious amounts of normal sterile saline and the Achilles tendon is then repaired using #2-0 Dexon suture. There are 3 figure of 8 sutures required. After this is done, soft tissue is closed in the subcutaneous level using #2-0 interrupted Vicryl sutures. After that is done, this skin is closed using #4-0 running subcuticular sutures.

Postoperative work begins after skin closure in the operating room and includes application of dressing, Webril and mold cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring daily entire patient status review with physical exam; antibiotic and pain medication management; lab studies; x-rays as needed. Critical observation of the circulation of the foot is mandatory since local circulation can be compromised due to the extensive nature of the soft tissue dissection and radical change of position and alignment of the foot. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures and cast changes with pin removal; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

SURVEY DATA: Specialty(s): American Academy of Orthopaedic Surgeons; Pediatric Orthopaedic Society of North America; American Orthopaedic Foot and Ankle Society

Harvard 27165:	55	147	28	0	0	99	9	60	5
Harvard 63017: Phase 4	66	168	10	0	0	70	7	45	3

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
16.20	090	27165 Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast
9.80	090	28264 Capsulotomy, midtarsal (Heyman type procedure)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
16.20	090	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast
16.03	090	63017	Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or diskectomy, (eg, spinal stenosis), more than 2 vertebral segments; lumbar

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The total work of CPT 27165 (*Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast*) is less than to CPT 28262 (*Capsulotomy, midfoot; extensive, including posterior talotibial capsulotomy and tendon(s) lengthening as for resistant clubfoot deformity*) and less than CPT 63017 (*Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or diskectomy, (eg, spinal stenosis), more than 2 vertebral segments; lumbar*).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study did not correctly estimate the intraoperative time for CPT 28262. The current survey, the judgment of the Advisory Panel equate this service to slightly less intraoperative work than CPT 63017 and more intraoperative work than CPT 27165, and, as such, the survey median RVW, is recommended to set an appropriate value for CPT 28262 "relative" to the key reference services.

CPT 28262 is recognized by those surgeons most familiar with this procedure (pediatric and foot and ankle) to require high technical skill, in which great judgment must be exercised during the procedure. The risk of iatrogenic harm (compartment syndrome or extremity loss) is high since anomalies in the neurovascular supply of these deformed feet is common. These surgeons are most "fit-to-rate" the work value, and through the AAOS AMA/RUC survey, they have estimated the work and time of CPT 28262 similar to CPT 63017 and 27165.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28261 Global Period: 090 1995 RVW: 8.92 Recommended RVW: 12.00
Workgroup Recommended New Value: 10.95

CPT Descriptor: Capsulotomy, midfoot; with tendon lengthening

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 9-month-old girl has residual equinus and forefoot adduction following conservative treatment for a clubfoot. She undergoes midfoot capsulotomies and lengthening of the foot and ankle tendons.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of x-rays, preoperative plan, lab work; review patient history, especially allergies, medical problems, and family history; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; arranging for intraoperative x-ray, leg tourniquet, advise as to intraoperative drugs, antibiotics; positioning the patient on OR table, apply Webril and tourniquet to leg and steridrape protector; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: The initial incision is a posterior medial ankle incision halfway between the Achilles tendon and the medial malleolus in a longitudinal fashion, starting at the os calcis and going proximally about 2-3 inches. The dissection is conducted down through the subcutaneous fat and then directed posteriorly toward the Achilles tendon. This must be dissected free from the tendon sheath attachments from the os calcis proximally to the musculotendinous junction. The plantaris tendon is identified and cast, or tenotomized. A moist tongue blade is then passed behind the Achilles tendon with the foot in equinus and a step cut incision is performed with a number I surgical blade. The incision is begun in the middle of the tendon distally on the medial side, cutting half of the tendon from the middle to the medial side. The incision is then carried longitudinally through the center of the tendon proximally to the musculotendinous junction where a second transverse incision is performed, this time going laterally. This normally allows the foot to come into a neutral, or dorsiflexion, position.

A second incision is now made for the medial release as a curvilinear incision from the base of the first metatarsal back to the tip of the medial malleolus. The curve is directed toward the dorsum of the foot. Again, dissection is carried through the soft tissues, cauterizing any bleeders seen. Once a dissection is down onto the medial capsules, we then identify the metatarsal/medial cuneiform joint. A transverse incision is made to open up this joint. That involves dissecting the tibialis anterior tendon free but not releasing it. The capsule of this joint is released dorsally, medially and on the plantar surface. Secondly, the medial cuneiform/ navicular joint is identified and a similar transverse release is accomplished sharply by scalpel, releasing the dorsal, medial and plantar portions of the capsule. Finally, the talo-navicular joint is identified and this joint is also released in a similar fashion.

Intraoperative work (continued):

A manipulation of the foot is then conducted by holding the heel of the hand against the lateral border of the hindfoot and pushing the forefoot over by pressure against the first metatarsal head. This should allow the foot to become straight or with some metatarsal abducted position. In that position, an .062 smooth K-wire is then drilled between the first and second metatarsals and headed proximally across the various joints into the talus to hold the reduction achieved by the manipulation. All the wounds are irrigated, If the forefoot continues to roll into inversion, then the posterior incision is reinspected and dissection is carried down to identify the tibialis posterior tendon which is released from its tendon sheath. This is usually found to be excessively tight and needs to be lengthened by a step cut release as described for the Achilles tendon. The lengthened tendons are then repaired with a non absorbable 0 or I suture. Both incisions are irrigated and the subcutaneous tissues are approximated with 3.0 interrupted suture. A running 4.0 subcuticular suture is used to close both skin incisions.

Postoperative work begins after skin closure in the operating room and includes application of dressing, Webril and mold cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab studies; x-rays as needed; vital signs, etc.; care and removal of cast and pin; supervision of home health nursing if necessary; ordering and reviewing postoperative X-rays; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures, internal fixation pins and cast changes; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
16.20	090	27165 Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast
9.80	090	28264 Capsulotomy, midtarsal (Heyman type procedure)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
(12.19/15.00)*	090	28262	Capsulotomy, midfoot; extensive, including posterior talotibial capsulotomy and tendon(s) lengthening as for resistant clubfoot deformity
16.20	090	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast
16.03	090	63017	Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, foraminotomy or discectomy, (eg, spinal stenosis), more than 2 vertebral segments; lumbar

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 12.19 to 15.00, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The exposure and overall work of CPT 28261 (Capsulotomy, midfoot; with tendon lengthening) is less extensive, but similar to the each of the reference services: CPT 28262, CPT 27165, and CPT 63017.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study did not correctly estimate the intraoperative time for patients requiring CPT 28261 and CPT 28262. A discussion that compares CPT 28262 to CPT codes 27165 and 63017 is presented on a summary of recommendation form for that code. Because pre- and postoperative care for CPT 28262 is similar to 28261, it is reasonable to calculate an RVW for 28261 based on the difference in intraoperative times.

To calculate an RVW for CPT 28261, that is "relative" to the recommended* RVW for CPT 28262, but is adjusted for intraoperative differences, one would subtract the portion of the intra-RVW** for CPT 28262 that represents the additional intraoperative time for this procedure over CPT 28261, as follows:
 $[9.00 \times (37/140) = 2.38]$; $[15.00 - 2.38 = 12.62]$.

The survey median RVW of 12.00, which is less than the calculated RVW, takes into account the difference in intraoperative intensity for the more extensive intraoperative work of CPT 28262 over CPT 28261.

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 12.19 to 15.00, is being presented.

The **intraoperative RVW for the recommended total RVW for CPT 28262 is 9.00. [This is equal to 60% of the total RVW, per Harvard's estimation of intra- vs. pre-/postoperative "work" (not time), as reported in Harvard Phase 3 - Final Report.]

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28309 Global Period: 090 1995 RVW: 8.83 Recommended RVW: 12.00
Accepted by Workgroup

CPT Descriptor: Osteotomy, metatarsals, multiple, for cavus foot (Swanson type procedure)

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 15-year-old with cavus foot deformity due to neuromuscular disease undergoes multiple metatarsal osteotomies to correct the deformity.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to x-ray review, alignment of lower extremity ipsi and contralateral; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: To perform multiple metatarsal osteotomies for a cavus foot, one must first release the tightened plantar fascia and plantar structures from the prolonged cavus deformity. A medial incision is made at the junction of the medial and planter skin over the heel. Careful blunt and sharp dissection is carried out, care being taken to avoid branches of the calcaneal nerve. The plantar fascia is exposed and cut from its origin at the calcaneal tuberosity. Further dissection is then carried out to release the intrinsic musculature from its origin on the calcaneus right up to the calcaneocuboid joint. A second medial incision is made at the junction of the medial and plantar skin in the midportion of the arch. Small crossing veins are cauterized. Blunt and sharp dissection reveals this portion of the plantar fascia. It is carefully identified and cut across the bottom of the foot.

With the planter fascia and intrinsic musculature adequately released, tension is directed dorsally to the metatarsals. Metatarsal 1 is approached through a dorsomedial incision, metatarsals 2 and 3 through an intermetatarsal incision between 2 and 3, and metatarsals 4 and 5 through intermetatarsal incision between 4 and 5, these being longitudinal incisions approximately 3 inches in length. The respective metatarsal is approached with blunt and sharp dissection, subperiosteally dissected over the area of the osteotomy site, and a dorsal lateral wedge is created in the respective metatarsal to allow elevation and lateral positioning of the involved metatarsal. When all necessary metatarsals have been osteotomized, they are pinned in place using multiple 0.62 K wires. The position of the metatarsals is assessed through radiographic control, and the position of the metatarsal osteotomies on the position of the foot is assessed so that the foot can be plantigrade with proper distribution of weight bearing in the forepart of the foot. Pins are cut short and bent, left protruding from the skin. All wounds are closed in layers after copious irrigation. Sterile dressing and splint are applied.

Postoperative work begins after skin closure in the operating room and includes application of cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status; care and removal of drain; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures, removal of internal fixation pins and cast changes; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. The surgeon initiates and orders physical therapy to regain normal ambulatory function and range of motion.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
10.90	090 27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip
10.86	090 28725	Subtalar arthrodesis

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
10.90	090	27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip
10.86	090	28725	Subtalar arthrodesis

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 28309 (*Osteotomy, metatarsals, multiple, for cavus foot (Swanson type procedure)*) requires a more extensive surgical dissection and involves more structures (all metatarsals and soft tissue plantar release), and additional incisions than both CPT 28725 (*Subtalar arthrodesis*) and CPT 28723 (*Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip*).

CPT 28309 requires a more extensive exposure, involves more bones, and additional incisions as compared to CPT 28723

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study did not correctly estimate the intraoperative time for CPT 28309. Additionally, the postoperative work which is significantly higher than the reference services CPT 28725 and 28723, was underestimated (through prediction).

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION ***REVISED 8/14/95***

CPT Code: 27870 Global Period: 090 1995 RVW: 10.42 Recommended RVW: 13.00
Accepted by Workgroup

CPT Descriptor: Arthrodesis, ankle, any method

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

Additionally the Medicare Carrier Medical Directors submitted a comment that this code is undervalued has about two thirds the intraservice work of 27715 *Osteoplasty, tibia and fibula, lengthening* (RVW=12.97) with equal follow-up. CPT 27792 *Open treatment of distal fibular fracture (lateral malleolus) w/wo internal or external fixation* (RVW=7.04) was also cited as a reference service. [CMD recommendation = 12.97]

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male, who sustained a severe intra-articular ankle fracture 20 years ago, undergoes an ankle fusion for traumatic arthritis and mild varus deformity.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging (possible CT scanning of the ankle joint), and laboratory studies; with special attention to X-ray review (AP, lateral and mortise views of the ankle joint), vascular status, alignment of whole lower extremity particularly the hindfoot, ankle and knee (ipsi and contralateral); consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. Arrangements for the use of portable intra-operative fluoroscopy (C-arm) is made.

Intraoperative work: To perform an ankle arthrodesis, an incision is made over the distal third of the fibula laterally crossing the tip of the fibula until one reaches the anterior process of the calcaneus. Small crossing veins are cauterized, and the distal third of the fibula is subperiosteally dissected. Approximately an inch and a half above the joint line, an oblique osteotomy is made in the fibula with the obliquity being proximal lateral and distal medial. The osteotomy is completed with an osteotome and the distal third of the fibula is dissected free and removed from the field. With careful subperiosteal dissection, the lateral joint line, the anterior joint line and the posterior joint line of the tibiotalar joint are dissected free of any previous scarring from prior trauma or arthritis. The scar tissue is typically adherent to the bone, and sharp dissection must be carefully done to avoid injury to the neurovascular structures.

With the anterior, lateral and posterior portions of the distal tibia and talus visible, osteotomy of the distal tibial articular surface is carried out with a sagittal saw to the level of the medial malleolus and completed with an osteotome. Similarly, a corresponding matching osteotomy of the talar dome is carried out with a sagittal saw and completed with an osteotome. The osteotomy sites are planned and confirmed so that the foot will rest in a neutral plantigrade position with the heel in about 5 to 10 degrees of valgus. Because of impingement of the medial malleolus, the osteotomy sites usually do not come easily together, and a counter-incision is usually made medially over the medial malleolus. The medial malleolus is subperiosteally dissected and approximately one to one-and-a-half centimeters of medial malleolus are removed, allowing the osteotomy sites to coaptate.

Intraoperative work (continued):

Attention is then directed to the sinus tarsi. Subperiosteal dissection of the sinus tarsi and lateral talus expose an area where wires for cannulated screws can be passed from the lateral talar body approaching it from the sinus tarsi through the talus into the distal tibial articular surface and emerging out of the medial tibia above the medial malleolus. Two parallel wires are used emerging from the medial articular surface, sized and then drilled and appropriate lag screws with washers are placed to cause coaptation of the arthrodesis surfaces. These are then checked with x-ray control. The position of the foot is reassessed and it is important to assess the fact that the foot is plantigrade, the forefoot is pronated or supinated, and the heel is in above 5 to 10 degrees of valgus. Copious irrigation is carried out and the wound is closed in layers. The technique may vary somewhat if previous infection was present. In this circumstance, after all infected bone is excised an external fixture is used in the distal tibia and either talus or calcaneus instead of using the screws (as described above) for internal fixation after the joint surface is prepared as described above.

Postoperative work begins after skin closure in the operating room and includes application of cast (or external fixation). Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status; care and removal of drain; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging to assess bony fusion and laboratory reports, if needed; and antibiotic and pain medication adjustments. While awaiting fusion, the patients ambulatory status is directed by the surgeon. The amount of weight bearing is dependant on the degree of healing that has occurred. Once complete healing has occurred the surgeon directs the physical therapist in weaning the patient from external support (crutches or cane) to independent weight bearing. Proper footwear prescription is also necessary to achieve an optimal outcome.

10.86	090	28725	Subtalar arthrodesis
14.23	090	28705	Pantalar arthrodesis
12.18	090	28715	Triple arthrodesis

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27170 (Repair/graft femur head/neck) involves the same work as CPT 27870 in terms of time. Additionally, similar postoperative imaging is necessary in both until bone healing (of fusion) has been achieved.

CPT 27715 (Revision of lower leg) requires less intraoperative work when compared to CPT 27870 in terms of time. Additionally, similar postoperative imaging is necessary in both until bone healing (of fusion) has been achieved.

CPT 28725 (Subtalar fusion) is a tarsal arthrodesis procedure in which the talus is fused to the calcaneus in order to provide a stable "platform" upon which to stand and walk in conditions of pain (eg, rheumatoid arthritis and post traumatic arthritis) and instability (eg, posterior tibial tendon rupture and neuromuscular imbalance). The subtalar joint is exposed through a lateral hind foot incision. The articular surface is denuded down to bleeding subchondral bone. A local bone graft is used, followed by internal fixation with staples or a screw inserted from the plantar aspect of the calcaneus and extending across the subtalar joint into the talus. A cast is always used until bony fusion is achieved. Pre-service work of 28725 is similar to 27870. Intra-service work and time is greater for 27870 than 28725. Post-service work is somewhat higher for 27870 as compared with 28725 because the time to achieve fusion is greater and the likelihood of any fusion at all is less certain with 27870 as compared with 28725 (higher non-union rate with 27870 than 28725).

CPT 28715 (Triple arthrodesis) requires two incisions and precision in the amount of bone resected from all three joints in order to properly balance the hind foot with the mid- and fore-foot. An oblique skin incision is made directly over the sinus tarsi. The extensor tendons are mobilized and retracted medially. The peroneal tendons and the sural nerve are identified and protected. The origin of the extensor digitorum brevis muscle is mobilized to expose the sinus tarsi. The fatty tissue within the sinus tarsi is excised with a rongeur. With sharp dissection this muscle is further dissected distally thereby exposing the calcaneocuboid joint. The talonavicular joint can typically be visualized within the sinus tarsi. Osteotomes are used to remove the articular cartilage of the calcaneocuboid joint and the underlying subchondral bone. This will further allow visualization of the talonavicular joint. The cartilage and subchondral bone is removed in a similar manner.

CPT 28715 (Triple arthrodesis) continued:

This joint is more convex and several cuts are frequently necessary in order to adequately excise the joint. A small medial incision is sometimes necessary in order to visualize the navicular tuberosity and more completely excise the talonavicular cartilage and subchondral bone. Using an osteotome the posterior facet of the subtalar joint is excised next. This is followed by the medial facet. Care must be taken when excising the medial facet to avoid transacting the flexor hallucis longus tendon. When all three joints have been excised the foot is positioned in the reduced or corrected position. This is typically accomplished by abducting the midfoot which then pushes the calcaneus posteriorly. Final alignment is achieved by excising wedges of bone to achieve the desired position of each joint. Typically, the wedges are removed from the lateral aspect of the calcaneocuboid and subtalar joints. This will allow correction of hindfoot varus and forefoot adduction. Once the final alignment is achieved the two or three joints are stabilized with Blount staples. Intraoperative radiographs are obtained to assess position. Any remaining fragments of cancellous bone from the excised bone fragments is packed into the sinus tarsi and any other spaces of the three joints. The extensor digitorum brevis muscle is repaired over the area of the sinus tarsi. Comparisons between reference service 28715 and surveyed service 27870 demonstrate similarities in terms of pre- and intra- service work and times. Post-service work is more variable and problematic since the non-union rate of CPT 27870 is higher than CPT 28715 with, therefore, a greater amount of post-service time and work. Overall, CPT 27870 represents a somewhat greater degree of work than 28715.

CPT 28705 (Pantalar arthrodesis) is a tarsal arthrodesing operation in which all bones articulating with the talus are fused (tibia, calcaneus, navicular and well as calcaneocuboid). As such, CPT 28705 involves the work of both CPT 28715 (Triple arthrodesis) and CPT 27870 (ankle arthrodesis). To perform a pantalar arthrodesis, an incision is made on the lateral side of the ankle along the lateral border of the fibula covering its distal third, extending to the base of the 4th metatarsal, establishing the neural interval between the superficial peroneal nerve and the sural nerve. The distal third of the fibula is subperiosteally dissected. An oblique osteotomy is made 1 inch to 2 inches above the lateral joint line with an obliquity proximal, lateral, distal medial. The osteotomy is made with a sagittal saw. The distal portion of the fibula is dissected away and removed from the operative field. The soft tissue and scar tissue covering the lateral tibiotalar joint are removed and careful sharp dissection reveals the anterior, posterior and lateral surfaces of the distal tibia and the talus. The sinus tarsi is exposed by mobilizing the sinus tarsi fatpad along with the adjacent origin of the extensor brevis musculature which is brought up as a flap after subperiosteally dissecting the contents of the sinus tarsi out, and sharp and blunt dissection is carried out to a point to where the subtalar posterior facet, middle facet, and anterior facets are carefully visualized. Also the calcaneal cuboid joint is visualized and the lateral portion of the talonavicular joint is visualized. Lamina spreaders are placed within the sinus tarsi and within the involved joints, and careful decortication of the articular surface of the subtalar joints, calcaneocuboid joint, and the lateral portion of the talonavicular joint are carried out. Using an oscillating saw, distal articular surface of the tibia is removed up to the level of the medial malleolus, and a coapting surface of the talus is removed corresponding to the tibial articular surface. To allow the surfaces to coapt, a counter incision is made over the medial malleolus, and one to one-and-a-half centimeters of medial malleolus is removed so the tibiotalar surface coapts nicely. Another incision is made medially over the talonavicular joint. The posterior tibial tendon is mobilized and the medial portion of the talonavicular joint is decorticated. Assessment of the foot is then carried out and wedges are taken in the subtalar or calcaneocuboid joint to create a foot that has a hindfoot in 5 to 10 degrees of valgus, a forefoot in neutral varus or valgus, and a foot that is plantigrade. Temporary fixation is carried out with guide wires and x-rays confirm position. At this time the tightness of the Achilles tendon is assessed, and if necessary, it is percutaneously lengthened. With proper position, the calcaneocuboid joint is fixed with a staple and/or a screw. The subtalar joint is fixed with large lag screws from the calcaneus into the talus, and the tibiotalar joint is fixed with large oblique lag screws from the lateral talus at the level of the sinus tarsi up through the tibia emerging out above the medial metaphyseal surface. If correction is needed for lengthening of the lateral column or to correct excess valgus of the heel, tricortical iliac crest grafts are taken to be inserted at the appropriate spot. After good fixation and reassessment of the position, copious irrigation is carried out. The wound is closed in layers after drains have been inserted.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work; time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The current AMA/RUC survey and comparison to key reference services, the judgment of the AAOS RVS Advisory Panel, and the Medicare CMDs equate this service to more work than CPT 28725, 28715 and 27715, less work than CPT 28705, and similar to CPT 27170.

In 1992, the "foot bone fusion" family of codes was reviewed as part of the HCFA refinement process. Table 1 presents the results of HCFA's review.

CPT	Description	1992 RVW	Requested RVW	1993 RVW*	Basis for Decision**	1995 RVW
27870	Arthrodesis, ankle, any method	10.99	13.50	X	1	10.42
28705	Pantalar arthrodesis	11.27	15.25	14.58	2	14.23
28715	Triple arthrodesis	10.36	13.75	12.48	2	12.18
28725	Subtalar arthrodesis	9.14	12.00	11.12	2	10.86

28737	Arthrodesis, midtarsal navicular-cuneiform, with tendon lengthening and advancement (Miller type procedure)	7.46	10.25	9.11	2	8.89

Source: Federal Register, Vol. 57, No. 228, November 25, 1992, pp. 55921-2.

*X indicates no change.

**A "1" indicates the refinement panel recommended no change. A "2" indicates a new value emerged from the analysis of the refinement panel ratings.

As a result of the 1992 refinement process, a family anomaly was created, where CPT 27870 was not revalued along with other family ankle and hind foot arthrodesis codes. The original RVW established for CPT 27870 was set appropriately greater than 28715 and less than 28705. The current AMA/RUC survey median of 13.00 and the CMD recommended value of 12.97 emphasize that the RVW for CPT 27870 should be between the current RVW for CPT 28715 (RVW=12.18) and CPT 28705 (RVW=14.23). **Therefore, the survey median RVW of 13.00 is recommended for CPT 27870.**

In addition, Table 2 on the next page shows that the calculated IWPUT for the recommended RVW of 13.00 is more in-line with the other services in the family for foot bone fusion codes.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28750 Global Period: 090 1995 RVW: 4.77 Recommended RVW: 8.00
Workgroup Recommended New Value: 6.90

CPT Descriptor: Arthrodesis, great toe; metatarsophalangeal joint

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

Additionally, the American Podiatric Medical Association submitted a request for review of 28750 (public comment HCFA control number 216) as an undervalued procedure. CPT codes 28296 (work is similar) and 26841 (work is less) were cited as key references. [APMA recommendation = 7.77]

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 38-year-old truck driver with severe degenerative arthritis of the big toe metatarsophalangeal joint undergoes an arthrodesis of this joint.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to x-rays, examination of ipsi and contralateral lower extremity; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: To perform an arthrodesis of the great toe, metatarsophalangeal joint: with the patient in the supine position, a medial incision is made to the metatarsal phalangeal joint. Blunt dissection protects the associated neural structures. Small crossing veins are cauterized. The capsule is opened along the course of the incision and subperiosteally reflected dorsally and proximally. The joint is visualized, and Homan retractors are inserted to expose the ends of the 1st metatarsal and base of the proximal phalanx. Matching cuts are made in the distal metatarsal and the proximal phalanx so as to effect a union of the two bones that will result in 20 degrees of dorsiflexion to 10 degrees of medial deviation of the great toe without any axial rotation. The angles may vary as to the individual needs of the patient. With the two surfaces firmly coapted, the osteotomy is held together with two lag screws and/or a small fragment plate. In bone which is severely osteoporotic large threaded Stinman pins are drilled across the osteotomy site as internal fixation. Copious irrigation is carried out and the wound is closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status; and antibiotic and pain medication management; Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures, cast changes and pin removal (if used); evaluation of periodic imaging until bone fusion occurs and laboratory reports, if needed; and antibiotic and pain medication adjustments.

SURVEY DATA: Specialty(s): American Academy of Orthopaedic Surgeons; American Orthopaedic Foot and Ankle Society

HARVARD DATA for surveyed service and key reference service(s):

Harvard 28750:	40	51	23	0	0	0	0	35	3.5
Harvard 28293:	40	72	23	0	0	12	1	47	4
Harvard 28296:	51	90	23	0	0	15	1	49	4
Harvard 26841:	37	74	21	0	0	6	0	47	4

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
10.86	28725	Subtalar arthrodesis
7.04	27792	Open treatment of distal fibular fracture (lateral malleolus), with or without internal or external fixation

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
6.79	090	26841	Arthrodesis, carpometacarpal joint, thumb, with or without internal fixation;
8.25	090	28293	Hallux valgus (bunion) correction, with or without sesamoidectomy; resection of joint with implant
8.69	090	28296	Hallux valgus (bunion) correction, with or without sesamoidectomy; with metatarsal osteotomy (eg, Mitchell, Chevron, or concentric type procedures)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 28293 (*Hallux valgus (bunion) correction, with or without sesamoidectomy; resection of joint with implant*) is identical to CPT 28750 (*Arthrodesis, great toe; metatarsophalangeal joint*) as far as exposure and prep, but instead of reconstruction with an implant, the procedure involves performing an exacting alignment and fixation.

The intraoperative work of CPT 28750 is greater than CPT 26841 (*Arthrodesis, carpometacarpal joint, thumb, with or without internal fixation;*) because arthrodesis of the great toe generally requires skeletal fixation. Also, postoperative complications associated with the fusion of a weightbearing joint are greater than the carpometacarpal joint of the thumb.

The total work of CPT 28750 closely approximates the work of CPT 28296 (*Hallux valgus (bunion) correction, with or without sesamoidectomy; with metatarsal osteotomy (eg, Mitchell, Chevron, or concentric type procedures)*).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The current AMA/RUC survey and the judgment of the Advisory Panel equate this service to more work than 26841 and similar to 28293 and 28296. as discussed in the comparison to key reference services section. As such, the survey median RVW, is recommended to set an appropriate value for CPT 28750 "relative" to these codes.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28740 Global Period: 090 1995 RVW: 6.20 Recommended RVW: 9.95
Workgroup Recommended New Value: 7.40

CPT Descriptor: Arthrodesis, midtarsal or tarsometatarsal, single joint

Source and Summary of Comment to HCFA on this service: The American Orthopaedic Foot and Ankle Society (AOFAS), a group of orthopaedists specializing in ankle and foot conditions, identified four interrelated midfoot arthrodeses procedures as currently undervalued within a larger group of undervalued Foot Reconstructive Procedures. On behalf of AOFAS, the American Academy of Orthopaedic Surgeons included those four orthopaedic codes on its list of codes to survey during the five-year review process. CPT 28730 is one of the codes AOFAS considers undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female with rheumatoid arthritis and advanced arthritic changes at the talonavicular joint and sparing of the associated joints undergoes an arthrodesis of only the talonavicular joint.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to X-rays, evaluation of ipsi and contralateral lower extremity; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: To perform an arthrodesis of a single midtarsal joint, with the patient in a supine position, a medial longitudinal incision is made over the talonavicular joint. Small crossing veins are cauterized. Blunt and sharp dissection reveals the joint after opening the capsule. The posterior tibial tendon is mobilized and reflected plantarward, and the entire talonavicular joint is visualized both dorsally, plantarward, and medially. With dissection and use of small curettes and small rongeurs, the articular surface is completely removed from the talonavicular joint surfaces. With the foot in proper orientation, the talonavicular joint is positioned, a guide wire is placed across and x-rays confirm the position. One or two screws are then passed from the distal surface of the navicular across the talonavicular joint into the talus under x-ray control. Following good fixation and copious irrigation, the mobilized posterior tibial tendon is resutured, the capsule is closed. The wound is further closed in layers after copious irrigation

Postoperative work begins after skin closure in the operating room and includes application of splint/cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status; care and removal of drain; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures and cast changes; evaluation of periodic imaging until bone fusion has occurred and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
10.86	28725	Subtalar arthrodesis
9.80	28264	Capsulotomy, midtarsal (Heyman type procedure)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
10.86	090	28725	Subtalar arthrodesis

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 28725 (*Subtalar arthrodesis*) involves more work and time than CPT 28740 (*Arthrodesis, midtarsal or tarsometatarsal, single joint*) due to a greater exposure and more fusion.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the judgment of the Orthopaedic RVS Advisory Panel that is making this recommendation that CPT 28740 is slightly less work than CPT 28725 because it involves less exposure and less fusion. As such, the survey median RVW is recommended to set an appropriate value for CPT 28740 "relative" to CPT 28725.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27580 Global Period: 090 1995 RVW: 12.26 Recommended RVW: 19.69
Workgroup Recommended New Value: 18.20

CPT Descriptor: Fusion of knee, any technique

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 76-year-old female presents with failure and persisting sepsis of a secondary total knee implantation after a treated infected primary total knee arthroplasty. The implants are removed and the infection treated. A knee arthrodesis (fusion) is subsequently performed.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of radiographs and scaled radiographs if necessary for sizing, ordering and review of knee aspiration/arthrogram if necessary, and review of preoperative laboratory tests; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; arranging for intraoperative cell saver; positioning the patient; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: The knee is frequently totally unstable, hyperextending 30 degrees, going mediolateral 30 degrees, flexing to 90. The old anterior skin incision is used, carried down to the fascia along the surface which has generally dense scar tissue. This is incised where a normal median parapatellar incision would be performed. If a patella is still present it may be used for local bone graft. Any fluid is cultured. Removal of all scar tissue between the ends of femur and tibia must be done. We then dissect and debride all the soft tissues off the femoral condyle exposing the end of the bone. We then isolate the proximal tibia where significant bone loss is frequently found to have occurred. Having cleaned up all of the soft tissues in the area, we then open up the femoral intramedullary canal, pass progressive reamers to 17 mm. and then impact the preoperatively planned 17 mm. diameter femoral rod. This is then driven to a level where a saw cut could be made taking off only a few millimeters of bone but creating flat cancellous bone surfaces. Using a femoral saw guide with a complete exposure, we then attach the femoral locking screw guide and place drill holes through the femur and over the first hole there is overdrilling of the bone on the medial cortex. A screw is inserted. We then turn our attention to the tibia. This is reamed, followed by driving in the tibial rod with attached collar. Having driven it into the appropriate level, the saw guide is then attached to this and the proximal tibia cut revealing a 1-2 mm. bone loss but a flat area of contact with minimal intact bone medially. We then take off the cutting guide and attach the drill guide and place two more 5 mm. screws through the tibia in locking holes of the intramedullary rod. These are done through stab wounds in the skin. Having placed these and confirmed their position fluoroscopically, we then attempt to reduce the joint. The fibula remains quite proud here in its locked, closing the gap between the bone.

Intraoperative work (continued):

We then shell out the proximal tibia, taking great care to not go around the sides of it and avoid injury to the peroneal nerve, having shelled it out, saving this bone, we can then reduce the device to bring the bone in together. Having brought everything into alignment, we then tighten the collar on the tibial rod over the thread to the ends of the femoral rod. Using a wrench to stabilize the femoral rod, tighten the collar until bone compression and firm locking of the two devices have been obtained. To achieve this we cut a small window, the anteromedial tibia, to insert the pins for spinning the collar and a small window to apply the wrench and stabilize the femoral component. Having completed all of this, the two bone ends are securely opposed and pressed together in absolutely rigid straight leg with foot pointing straight up. We then carefully expose all of the adjoining and opposing bony surfaces and then pack all of the bone that had been removed in the resection. Earlier we had irrigated thoroughly with antibiotic solution. We then close over ConstaVac drain after checking everything with fluoroscope, repairing the fascia and subq with Vicryl and the skin with stainless steel staples. We also close the stab wounds.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressing and extension splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab reports; care and removal of drains and dressings; supervision of physical or occupational therapy; ordering and reviewing postoperative X-rays; and antibiotic and pain medication management. Critical wound care and inspection is required when such a procedure is done following a septic total joint as described in the vignette. Recurrent purulent drainage must be evaluated and treated promptly. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care including home health care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Supervision and the prescription of physical therapy to regain ambulatory status with either crutches or a walker is critical to the success of the operation. Weight bearing must be appropriately ordered depending on the stability of the fusion site as determined at surgery and the progression of fusion as identified by periodic X-rays.

HARVARD DATA for surveyed service and key reference service(s):

Harvard 27580:	58	130	30	0	0	65	6.5	45	4.5
Harvard 27447: Phase 4	58	139	37	0	0	100	10	60	4

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)
15.98	27514	Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
19.69	090	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27580 (*Fusion of knee, any technique*) is the same intraoperative procedure in terms of depth (e.g., exposure, bone cuts, intraoperative radiographs to assess alignment, graft/prosthetic implant) and degree (intensity) as compared to CPT 27447 (*Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)*) until the point of closure, when fixation is performed for CPT 27580 and arthroplasty is performed for CPT 27447. Postoperative care (e.g., review of radiographs, monitoring neurovascular recovery) is also similar for both procedures. With CPT 27580 the physician must assess the progress of bone healing on X-ray while with CPT 27447 one assesses range of motion progress.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Because CPT 27580 compares well with the RVW for the key reference service (CPT 27447), as discussed in the comparison to key references section, the current value for 27447 is recommended instead of the higher survey median..

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 23802 Global Period: 090 1995 RVW: 14.67 Recommended RVW: 19.00
Workgroup Recommended New Value: 15.62

CPT Descriptor: Arthrodesis, shoulder joint; with primary autogenous graft (includes obtaining graft)

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female with a history of a septic shoulder joint treated at age 20, presents with a painful limited motion shoulder joint that is markedly degenerated on X-ray. A shoulder arthrodesis (fusion) with an iliac bone graft is performed.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering preoperative antibiotics; arranging for intraoperative radiographic/fluoroscopic exposure; prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. The surgeon carefully positions the patient in a "beach chair" or semi-sitting position on the operating table. This may involve using a Mayfield head support at the top of the table to ensure free access to the anterior, lateral and posterior aspects of the shoulder.

Intraoperative work: Under general anesthesia, and with the patient in a lateral decubitus position, an incision is made parallel to the posterior iliac crest, dissection is carried down through subcutaneous fat to the bone. We elevate subperiosteally and the muscle is reflected off the outer cortex. We then split the iliac crest with osteotome and remove the outer cortex and then use the gouge to remove cancellous bone in the posterior superior iliac spine. After completely removing all of this cancellous bone, we thoroughly irrigate the wound with antibiotic containing solution. The bone is set aside, protected in a sterile fashion for later on in the procedure. We then close the posterior iliac crest with Vicryl over a drain and use stainless steel staples on the skin. Sterile dressing is applied. An anterior lateral incision is made in the shoulder joint and a capsulectomy performed. The spinus scapulum acromion is identified. The undersurface of the acromion is denuded of its soft tissue and cancellous bone as is the glenoid and the head of the humerus denuded of its cartilage. After preparing the glenohumeral joint for an arthrodesis by denuding all articular cartilage from the humeral head and glenoid. Next, the shoulder joint is reduced and held in the desired position of fusion by using an 8 hole compression plate that had been bent, securing compression plate both to the spine of the scapula, to the acromion, and to the proximal humerus. Screws are also placed across the glenohumeral joint in order to provide for good fixation of the shoulder joint. The wound is irrigated with a saline and antibiotic solution. An X-ray is taken to assess fixation of the shoulder joint. Subcutaneous and fascial sutures are placed in an interrupted manner.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and a spica cast or brace. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring upper extremity neurologic and vascular status; wound evaluation daily; care and removal of the drain; adjustments of the cast/brace; supervision of ambulation and instruction in self-care activities and restrictions; ordering and reviewing radiographs; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; assessment of physiotherapy progress; evaluation of periodic imaging to assess bony fusion and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
18.68	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
18.10	27158	Osteotomy, pelvis, bilateral (eg, for congenital malformation)
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
(16.09/19.18)*	090	23472	Arthroplasty with glenoid and proximal humeral replacement (eg, total shoulder)
(15.62/19.75)**	090	27284	Arthrodesis, hip joint (includes obtaining graft);

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 16.09 to 19.18, is being presented.

**Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 15.62 to 19.75, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 23802 (*A rthrodesis, shoulder joint; with primary autogenous graft (includes obtaining graft)*) is similar to CPT 27284 (*A rthrodesis, hip joint (includes obtaining graft);*) in terms of degree and depth of intraoperative work.

CPT 22802 is approximately equivalent to CPT 23472 (*A rthroplasty with glenoid and proximal humeral replacement (eg, total shoulder)*) plus the work of an autograft. Also, the critical intraoperative anatomical alignment for CPT 23802 is more difficult and intensive.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This RVW compares well with the RVW for the key reference services (CPT 23472 and 27284) and takes into account their similarities in work.

The patient requiring CPT 23802 has become more complex. New imaging technology has led to an increase in the number of complex patients presenting for this service who are post-traumatic or represent failed total joint with a lot of bone loss, as opposed to patients who are post-infection (not as complex).

This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 18-month-old with a subluxated hip is treated with an open reduction and iliac osteotomy.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of X-rays, ultrasound studies; preoperative arthrogram; review of preoperative plan, lab work; review of patient history; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering preoperative blood in bank; arranging for intraoperative X-ray to check pin and hip location; ordering cell saver; positioning patient on OR table and applying peroneal sticky drape; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: An anterior Smith-Peterson type incision is made from several inches back on the iliac crest down over the anterior thigh. After dissecting through the soft tissues and cauterizing bleeders, the anterior fascia is opened to identify the anterior-superior iliac spine and the origin of the sartorius muscle. Our first effort is to identify the lateral femoral cutaneous nerve which exits the pelvis just medial to the ASIS. The section is carried out medial to the sartorius until the nerve is identified. A vessel loop is passed around the nerve, and it is then dissected distally, taking care to preserve its several branches. Once the nerve is retracted out of the operative site, the origin of the sartorius can be taken down with a small piece of cartilage to facilitate reattachment. The sartorius muscle is then dissected distally by several inches in order to expose the anterior capsule of the hip joint as well as the anterior-inferior iliac spine. On that bony prominence, we can identify the origin of the rectus femoris with its straight and reflected heads. These are identified and also removed with a small piece of cartilage to facilitate reattachment. This muscle is also dissected distally. Both muscles are wrapped in a moist sponge in order to protect from tissue drying. The hip is then flexed about 30 degrees and dissection is carried down along the lateral wall of the iliopsoas muscle, following it down to its lesser trochanteric insertion. Careful dissection in this area allows for the identification of the psoas tendon attachment to this bony prominence. That tendinous insertion is released sharply with a scalpel under direct vision, leaving the iliacus muscle insertion intact. The iliac apophysis is then split along the crest for several inches, dividing the cartilaginous apophysis in half. A Cobb elevator is then used to dissect subperiosteally, exposing the inner and outer tables of the iliac crest all the way to the sciatic notch posteriorly. The dissection is also carried down along the anterior segment of the ilium to the anterior-inferior iliac spine, freeing all soft tissues from their attachment in those areas. With the use of a moderately long right angle clamp, the periosteal attachments to the sciatic notch are teased away in order to allow passage of a Gigli saw. The handles are attached to the Gigli saw and tissue protectors are provided medially and laterally while the saw is used to cut from the sciatic notch out to the anterior-inferior iliac spine. Care must be taken to be sure that the cut of the saw is transverse to the body axis alignment. Next a wedge of bone is outlined, including from the anterior-inferior iliac spine posteriorly to the mid portion of the iliac crest. An oscillating saw is then used to make a transverse cut from the outer to the inner table after having grasped firmly the future bone graft with a towel clamp. The bone graft itself must be fashioned to have a wedge shape with linear edges which are transverse to the inner and outer table of the graft. Lewin bone holding forceps are used to grasp into the remaining portions of the ilium above and below the site of the osteotomy made by the Gigli saw.

Intraoperative work (continued):

The lower portion of the ilium is pulled laterally and inferiorly in order to open up a gap while leaving the osteotomy in the sciatic notch essentially closed. A laminectomy spreader can then be applied anteriorly to stretch the additional soft tissues to allow for full opening of the osteotomy anteriorly. The bone graft is then inserted after having been grasped with a large, straight Kocher clamp. Again, care must be taken to make the placement of the graft parallel with the long axis of the body. Traction from the clamps can then be released to allow the graft to be held in place by compression. The two smooth Kirschner wires .062 in diameter are then inserted through the proximal ilium, across the graft and into the superior part of the acetabulum. Once this has been accomplished, care must be taken to be sure that the pins do not pass into the acetabulum by measuring with a comparable pin and by fluoroscopic or radiographic assessment. The wires are bent over the top of the iliac crest and cut off for later retrieval. This completes the innominate osteotomy procedure. It must be noted that a bone graft is ALWAYS done and is an integral part of the innominate osteotomy.

For open reduction of the hip, the soft tissues surrounding the hip capsule are dissected superiorly, anteriorly, and inferiorly. A scalpel is then carefully used to cut along the edge of the acetabulum, leaving a 2-3 mm. cuff of capsular tissue for future repair. Once the capsule is opened and the femoral head visualized, a skid can be introduced under the capsule and the dissection cut down onto the metal protector to avoid damaging the femoral head. This is done down to the inferior portion of the capsule and up around to the mid portion of the superior aspect of the capsule. A transverse incision is then made along the femoral neck from the midpoint of the previous capsular incision, This then creates a T-shaped incision that allows the two flaps to be opened and the femoral head to be visualized. It can then be partially displaced into the incision so that the ligamentum teres can be identified and carefully dissected off of the femoral head. This then allows the femoral head to be moved further out of the acetabulum and the intra-acetabular attachment of the ligamentum teres can then be cut. Additionally, the limbus, if folded, can be dissected free and the transverse acetabular ligament inferiorly in the acetabulum is released to facilitate reduction of the femoral head. Once the femoral head is reduced, the superior triangular flap of the capsule can be removed so that a reduction capsuloplasty repair can be performed. Once the flap is removed, then the remaining capsular edges are sutured together, using number one non-absorbable suture in an interrupted fashion. Usually half a dozen stitches are necessary from the superior portion of the acetabulum down over the anterior part of the femoral head. The inferior triangular flap is then sutured over top of the previous incision in a pants-over-vest arrangement to further secure the capsular repair. Once the capsular repair is started, the femoral head must be held into the joint by positioning the hip in flexion, abduction and internal rotation, usually about 25 degrees for each position.

After completing the pelvic osteotomy and/or open reduction of the hip, the insertion of the rectus femoral is reattached to the anterior-inferior iliac spine. This involves passing a heavy suture through the bone after a hole has been placed through which the suture can be passed. A number one non-absorbable suture is used to tie the tendon back to its origin. Next the sartorius is reattached to the ilium above that. The anterior-superior iliac spine has been used as part of the wedge graft, so the sartorius is merely attached to the upper edge of the ilium through a similar mechanism of drilling a hole and passing a number one suture through that hole before tying it. The vessel loop around the lateral femoral cutaneous nerve is removed and the nerve is allowed to lie back in its bed. The superficial fascia layer is then approximated with 2.0 Vicryl suture. The subcutaneous tissues are closed by multiple interrupted sutures of 3.0 Vicryl and a running subcuticular 4.0 Vicryl suture is the final closure.

Postoperative work begins after skin closure in the operating room and includes application of dressing and postoperative spica cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab studies, postoperative x-rays, vital signs, etc.; care and removal of postoperative drain; adjustments of cast (trim and/or repair); supervision of postoperative physical therapy- review progress and adjust ; ordering and reviewing postoperative x-rays; evaluating leg length; ordering shoe lift as needed ; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, including home health nursing, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures, internal fixation pins and cast changes; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
18.10	27158	Osteotomy, pelvis, bilateral (eg, for congenital malformation)
16.20	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
18.10	090	27158	Osteotomy, pelvis, bilateral (eg, for congenital malformation)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27147 (*Osteotomy, iliac, acetabular or innominate bone; with open reduction of hip*) is a similar bony procedure, but is more work and involves more time than CPT 27158 (*Osteotomy, pelvis, bilateral (eg, for congenital malformation)*) because CPT 27147 involves more soft tissue repair, special repair of the capsule, open hip reduction, and includes application of an exacting spica cast. Those patients requiring CPT 27147 generally have a lower tolerance for blood loss, which corresponds to a greater intensity intraoperatively.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The current value for CPT 27147 represents an anomaly in the Medicare Fee Schedule. Although the times are similar to CPT 27158, the intensity and complexity of work are higher, so that total work for CPT 27147 is more than CPT 27158, however, the current RVW is less.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation, along with the survey respondents that are "fit-to-rate" this service that CPT 27147 is more work than CPT 27158. The survey median RVW is recommended to appropriately value this service and correct an anomaly.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27146 Global Period: 090 1995 RVW: 13.72 Recommended RVW: 16.55
Workgroup Recommended New Value: 16.90

CPT Descriptor: Osteotomy, iliac, acetabular or innominate bone;

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 4-year-old girl has an iliac osteotomy to correct a residual acetabular dysplasia after undergoing closed reduction of a developmental hip dislocation soon after birth.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of X-rays, CT scan with 3-D reconstruction tape; review of operative plan and lab work; review of patient history; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; arranging for intraoperative X-ray to check pin placement, cell saver; advise re: intraoperative drugs; position patient on OR table; apply peroneal sticky drape; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite

Intraoperative work: An anterior Smith-Peterson type incision is made from several inches back on the iliac crest down over the anterior thigh. After dissecting through the soft tissues and cauterizing bleeders, the anterior fascia is opened to identify the anterior-superior iliac spine and the origin of the sartorius muscle. Our first effort is to identify the lateral femoral cutaneous nerve which exits the pelvis just medial to the ASIS. The section is carried out medial to the sartorius until the nerve is identified. A vessel loop is passed around the nerve, and it is then dissected distally, taking care to preserve its several branches. Once the nerve is retracted out of the operative site, the origin of the sartorius can be taken down with a small piece of cartilage to facilitate reattachment. The sartorius muscle is then dissected distally by several inches in order to expose the anterior capsule of the hip joint as well as the anterior-inferior iliac spine. On that bony prominence, we can identify the origin of the rectus femoris with its straight and reflected heads. These are identified and also removed with a small piece of cartilage to facilitate reattachment. This muscle is also dissected distally. Both muscles are wrapped in a moist sponge in order to protect from tissue drying. The hip is then flexed about 30 degrees and dissection is carried down along the lateral wall of the iliopsoas muscle, following it down to its lesser trochanteric insertion. Careful dissection in this area allows for the identification of the psoas tendon attachment to this bony prominence. That tendinous insertion is released sharply with a scalpel under direct vision, leaving the iliacus muscle insertion intact. The iliac apophysis is then split along the crest for several inches, dividing the cartilaginous apophysis in half. A Cobb elevator is then used to dissect subperiosteally, exposing the inner and out tables of the iliac crest all the way to the sciatic notch posteriorly. The dissection is also carried down along the anterior segment of the ilium to the anterior-inferior iliac spine, freeing all soft tissues from their attachment in those areas. With the use of a moderately long right angle clamp, The periosteal attachments to the sciatic notch are teased away in order to allow passage of a Gigli saw. The handles are attached to the Gigli saw and tissue protectors are provided medially and laterally while the saw is used to cut from the sciatic notch out to the anterior-inferior iliac spine. Care must be taken to be sure that the cut of the saw is transverse to the body axis alignment. Next a wedge of bone is outlined, including from the anterior-inferior iliac spine posteriorly to the mid portion of the iliac crest, An oscillating saw is then used to make a transverse cut from the outer to the inner table after having grasped firmly the future bone graft with a towel clamp. The bone graft itself must be fashioned to have a wedge shape with linear edges which are transverse to the inner and outer table of the graft. Lewin bone holding forceps are used to grasp into the remaining portions of the ilium above and below the site of the osteotomy made by the Gigli saw.

Intraoperative work (continued)

The lower portion of the ilium is pulled laterally and inferiorly in order to open up a gap while leaving the osteotomy in the sciatic notch essentially closed. A laminectomy spreader can then be applied anteriorly to stretch the additional soft tissues to allow for full opening of the osteotomy anteriorly. The bone graft is then inserted after having been grasped with a large, straight Kocher clamp. Again, care must be taken to make the placement of the graft parallel with the long axis of the body. Traction from the clamps can then be released to allow the graft to be held in place by compression. The two smooth Kirschner wires .062 in diameter are then inserted through the proximal ilium, across the graft and into the superior part of the acetabulum. Once this has been accomplished, care must be taken to be sure that the pins do not pass into the acetabulum by measuring with a comparable pin and by fluoroscopic or radiographic assessment. The wires are bent over the top of the iliac crest and cut off for later retrieval. The superficial fascia layer is then approximated with 2.0 Vicryl suture. The subcutaneous tissues are closed by multiple interrupted sutures of 3.0 Vicryl and a running subcuticular 4.0 Vicryl suture is the final closure. It must be noted that a bone graft is ALWAYS done and is an integral part of the innominate osteotomy.

Postoperative work begins after skin closure in the operating room and includes application of dressing and postoperative spica cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab studies, postoperative x-rays, vital signs, etc.; care and removal of postoperative drain; adjustments of cast (trim and/or repair); supervision of postoperative physical therapy- review progress and adjust ; ordering and reviewing postoperative x-rays; evaluating leg length; ordering shoe lift as needed ; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, including home health nursing, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures, internal fixation pins and cast changes; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
18.10	27158	Osteotomy, pelvis, bilateral (eg, for congenital malformation)
16.20	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
16.20	090	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27165 (*Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast*) and CPT 27146 (*Osteotomy, iliac, acetabular or innominate bone;*) represent similar osteotomies, only the former is below the hip and the latter is above the hip. The intraoperative time is the same for both.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT 27146 and CPT 27165 are similar procedures that require similar time and work and, as such, should have similar RVWs. This recommended RVW places a value on CPT 27146 that is "relative" to CPT 27165.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27151 Global Period: 090 1995 RVW: 18.58 Recommended RVW: 21.50
Accepted by Workgroup

CPT Descriptor: Osteotomy, iliac, acetabular or innominate bone; with femoral osteotomy

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 6-year-old with residual hip dislocation of the hip undergoes an open reduction, femoral shortening, and iliac osteotomy.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of all preoperative x-rays, scans, CT or MRI including 3-D studies; review preoperative plan; lab work; patient history, especially allergies, medical problems and family history; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering preoperative blood in bank; arranging for intraoperative x-rays and C-arm; ordering cell saver; advising anesthesia re: intraoperative rugs (antibiotics); positioning patient on OR table using bean bag; applying peroneal sticky drape; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. A GU Foley catheter must be available if the case is expected to take over three hours.

Intraoperative work: An anterior Smith-Peterson type incision is made from several inches back on the iliac crest down over the anterior thigh. After dissecting through the soft tissues and cauterizing bleeders, the anterior fascia is opened to identify the anterior-superior iliac spine and the origin of the sartorius muscle. Our first effort is to identify the lateral femoral cutaneous nerve which exits the pelvis just medial to the ASIS. The section is carried out medial to the sartorius until the nerve is identified. A vessel loop is passed around the nerve, and it is then dissected distally, taking care to preserve its several branches. Once the nerve is retracted out of the operative site, the origin of the sartorius can be taken down with a small piece of cartilage to facilitate reattachment. The sartorius muscle is then dissected distally by several inches in order to expose the anterior capsule of the hip joint as well as the anterior-inferior iliac spine. On that bony prominence, we can identify the origin of the rectus femorus with its straight and reflected heads. These are identified and also removed with a small piece of cartilage to facilitate reattachment. This muscle is also dissected distally. Both muscles are wrapped in a moist sponge in order to protect from tissue drying. The hip is then flexed about 30 degrees and dissection is carried down along the lateral wall of the iliopsoas muscle, following it down to its lesser trochanteric insertion. Careful dissection in this area allows for the identification of the psoas tendon attachment to this bony prominence. That tendinous insertion is released sharply with a scalpel under direct vision, leaving the iliacus muscle insertion intact. The iliac apophysis is then split along the crest for several inches, dividing the cartilaginous apophysis in half. A Cobb elevator is then used to dissect subperiosteally, exposing the inner and out tables of the iliac crest all the way to the sciatic notch posteriorly. The dissection is also carried down along the anterior segment of the ilium to the anterior-inferior iliac spine, freeing all soft tissues from their attachment in those areas. With the use of a moderately long right angle clamp, The periosteal attachments to the sciatic notch are teased away in order to allow passage of a Gigli saw. The handles are attached to the Gigli saw and tissue protectors are provided medially and laterally while the saw is used to cut from the sciatic notch out to the anterior-inferior iliac spine. Care must be taken to be sure that the cut of the saw is transverse to the body axis alignment. Next a wedge of bone is outlined, including from the anterior-inferior iliac spine posteriorly to the mid portion of the iliac crest. An oscillating saw is then used to make a transverse cut from the outer to the inner table after having grasped firmly the future bone graft with a towel clamp.

Intraoperative work (continued):

The bone graft itself must be fashioned to have a wedge shape with linear edges which are transverse to the inner and outer table of the graft. Lewin bone holding forceps are used to grasp into the remaining portions of the ilium above and below the site of the osteotomy made by the Gigli saw. The lower portion of the ilium is pulled laterally and inferiorly in order to open up a gap while leaving the osteotomy in the sciatic notch essentially closed. A laminectomy spreader can then be applied anteriorly to stretch the additional soft tissues to allow for full opening of the osteotomy anteriorly. The bone graft is then inserted after having been grasped with a large, straight Kocher clamp. Again, care must be taken to make the placement of the graft parallel with the long axis of the body. Traction from the clamps can then be released to allow the graft to be held in place by compression. The two smooth Kirschner wires .062 in diameter are then inserted through the proximal ilium, across the graft and into the superior part of the acetabulum. Once this has been accomplished, care must be taken to be sure that the pins do not pass into the acetabulum by measuring with a comparable pin and by fluoroscopic or radiographic assessment. The wires are bent over the top of the iliac crest and cut off for later retrieval. This completes the innominate osteotomy procedure. It must be noted that a bone graft is ALWAYS done and is an integral part of the innominate osteotomy.

For the femoral osteotomy, a separate longitudinal incision is made from the greater trochanter along the lateral thigh for several inches. The dissection is carried down through the subcutaneous tissues to the fascia lata. Care is taken to dissect the fatty tissues off of the fascia lata to facilitate later closure. The fascia lata is then opened in the mid substance longitudinally from the greater trochanter distally for a total of 4-5 inches. This then exposes the fascia of the vastus lateralis which is dissected free from the fascia lata and this fascia layer is opened posteriorly in order to come in behind the vastus lateralis to reach the lateral border of the thigh. This reduces the chance for denervation of the posterior musculature. A periosteal incision is made and the periosteum stripped from the outer edge of the greater trochanter distally. Bennett retractors are then used to hold the vastus lateralis muscle up anteriorly. A Scott-McCracken periosteal elevator is then used to release the linea aspera fascial attachment so that a Bennett retractor can be placed around the femur posteriorly. Then, under C-arm control, a guide wire is drilled up the femoral neck from the lateral femoral shaft, but shy of the proximal femoral physis. The guide wire position is confirmed to be central on both AP and frog lateral views. A cannulated drill is then drilled over the guide wire to penetrate the outer cortex. The screw tap is then used to set the threads for the lag screw that will be placed up the femoral neck. The appropriate length of screw is selected and inserted. The transverse osteotomy is then cut now 5 mm. below the inferior penetration of the cortex by the lag screw. Another transverse osteotomy a centimeter below that is made in order to remove a centimeter of length from the femur. A 2-inch three hole side plate (or a 3-inch 4 hole side plate in the older child) is used with a 140 degree neck/shaft angle, to attach to the lag screw. The side plate is then clamped to the femoral shaft by a verbouge clamp. Care is taken to preserve rotational alignment, maintaining 20-30 degrees of anteversion in the femoral neck with regard to the coronal axis of the femur, drills are then used to drill through the holes in the plate. A depth gauge is used to select the proper size screws and they are placed into the screw holes after tapping the screw threads. The gap where the cortex section was resected is closed before securing the side plate to the shaft. A hemovac drain is then placed after irrigation of the wound with a Bacitracin irrigation. The fascia of the vastus lateralis is repaired, as is the fascia lata, with O-Vicryl suture. The soft tissue is approximated with 2.0 Vicryl suture and the running subcuticular Vicryl closure is the final skin closure.

Postoperative work begins after skin closure in the operating room and includes application of dressing and spica cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab studies; postoperative x-rays; vital signs, etc.; care and removal of postoperative drains; adjustments of cast (trim and/or repair); supervision of nursing care in hospital, postoperative physical therapy--review progress and adjust; ordering and reviewing postoperative x-rays, evaluation of leg length--order shoe lift as needed; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, including coordination of home health nursing, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures, pin removal and cast changes; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Ordering of physical therapy at an appropriate time during healing to allow weight bearing depending on the degree of bone healing on X-ray. Direction is given to physical therapy to recover range of motion of the affected hip.

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
(13.72/16.55)*	090	27146	Osteotomy, iliac, acetabular or innominate bone;
16.20	090	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 13.72 to 16.55, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27151 (*Osteotomy, iliac, acetabular or innominate bone; with femoral osteotomy*) represents the sum of 100% of CPT 27146 (*Osteotomy, iliac, acetabular or innominate bone;*) plus the intraoperative portion of CPT 27165 (*Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast*). These procedures are performed through separate incisions.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT 27151 represents the sum of CPT 27146 plus the intraoperative portion of CPT 27165. These procedures are performed through separate incisions. Using the multiple procedure rule, this equates to 24.65 [16.55 + (16.20 x 50%)]. Although this value is higher than the survey median, the median RVW is recommended

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27156 Global Period: 090 1995 RVW: 20.16 Recommended RVW: 23.62
Accepted by Workgroup

CPT Descriptor: Osteotomy, iliac, acetabular or innominate bone; with femoral osteotomy and with open reduction of hip

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 2-year-old with a developmental dislocation of the hip undergoes a femoral shortening, open reduction, and iliac osteotomy.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of all preoperative-rays, scans, CT or MRI including 3-D studies; review preoperative plan, lab work; patient history, esp. allergies, medical problems, family history; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes scrubbing; ordering blood in bank; arranging for intraoperative X-ray and/or C-arm; order cell saver; advise anesthesia re: intraoperative drugs, antibiotics; positioning the patient on OR table using bean bag; apply peroneal sticky drape; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: An anterior Smith-Peterson type incision is made from several inches back on the iliac crest down over the anterior thigh. After dissecting through the soft tissues and cauterizing bleeders, the anterior fascia is opened to identify the anterior-superior iliac spine and the origin of the sartorius muscle. Our first effort is to identify the lateral femoral cutaneous nerve which exits the pelvis just medial to the ASIS. The section is carried out medial to the sartorius until the nerve is identified. A vessel loop is passed around the nerve, and it is then dissected distally, taking care to preserve its several branches. Once the nerve is retracted out of the operative site the origin of the sartorius can be taken down with a small piece of cartilage to facilitate reattachment. The sartorius muscle is then dissected distally by several inches in order to expose the anterior capsule of the hip joint as well as the anterior-inferior iliac spine. On that bony prominence, we can identify the origin of the rectus femorus with its straight and reflected heads. These are identified and also removed with a small piece of cartilage to facilitate reattachment. This muscle is also dissected distally. Both muscles are wrapped in a moist sponge in order to protect from tissue drying. The hip is then flexed about 30 degrees and dissection is carried down along the lateral wall of the iliopsoas muscle, following it down to its lesser trochanteric insertion. Careful dissection in this area allows for the identification of the psoas tendon attachment to this bony prominence. That tendinous insertion is released sharply with a scalpel under direct vision, leaving the iliacus muscle insertion intact. The iliac apophysis is then split along the crest for several inches, dividing the cartilaginous apophysis in half, A Cobb elevator is then used to dissect subperiosteally, exposing the inner and outer tables of the iliac crest all the way to the sciatic notch posteriorly. The dissection is also carried down along the anterior segment of the ilium to the anterior-inferior iliac spine, freeing all soft tissues from their attachment in those areas. With the use of a moderately long right angle clamp, The periosteal attachments to the sciatic notch are teased away in order to allow passage of a Gigli saw. The handles are attached to the Gigli saw and tissue protectors are provided medially and laterally while the saw is used to cut from the sciatic notch out to the anterior-inferior iliac spine. Care must be taken to be sure that the cut of the saw is transverse to the body axis alignment. Next a wedge of bone is outlined, including from the anterior-inferior iliac spine posteriorly to the mid portion of the iliac crest. An oscillating saw is then used to make a transverse cut from the outer to the inner table after having grasped firmly the future bone graft with a towel clamp.

Intraoperative work (continued):

The bone graft itself must be fashioned to have a wedge shape with linear edges which are transverse to the inner and outer table of the graft. Lewin bone holding forceps are used to grasp into the remaining portions of the ilium above and below the site of the osteotomy made by the Gigli saw. The lower portion of the ilium is pulled laterally and inferiorly in order to open up a gap while leaving the osteotomy in the sciatic notch essentially closed. A laminectomy spreader can then be applied anteriorly to stretch the additional soft tissues to allow for full opening of the osteotomy anteriorly. The bone graft is then inserted after having been grasped with a large, straight Kocher clamp. Again, care must be taken to make the placement of the graft parallel with the long axis of the body. Traction from the clamps can then be released to allow the graft to be held in place by compression. The two smooth Kirschner wires .062 in diameter are then inserted through the proximal ilium, across the graft and into the superior part of the acetabulum. Once this has been accomplished, care must be taken to be sure that the pins do not pass into the acetabulum by measuring with a comparable pin and by fluoroscopic or radiographic assessment. The wires are bent over the top of the iliac crest and cut off for later retrieval. This completes the innominate osteotomy procedure. It must be noted that a bone graft is ALWAYS done and is an integral part of the innominate osteotomy.

For open reduction of the hip, the soft tissues surrounding the hip capsule are dissected superiorly, anteriorly, and inferiorly. A scalpel is then carefully used to cut along the edge of the acetabulum, leaving a 2-3 mm. cuff of capsular tissue for future repair. Once the capsule is opened and the femoral head visualized, a skid can be introduced under the capsule and the dissection cut down onto the metal protector to avoid damaging the femoral head. This is done down to the inferior portion of the capsule and up around to the mid portion of the superior aspect of the capsule. A transverse incision is then made along the femoral neck from the midpoint of the previous capsular incision. This then creates a T-shaped incision that allows the two flaps to be opened and the femoral head to be visualized. It can then be partially displaced into the incision so that the ligamentum teres can be identified and carefully dissected off of the femoral head. This then allows the femoral head to be moved further out of the acetabulum and the intra-acetabular attachment of the ligamentum teres can then be cut. Additionally, the limbus, if folded, can be dissected free and the transverse acetabular ligament inferiorly in the acetabulum is released to facilitate reduction of the femoral head. Once the femoral head is reduced, the superior triangular flap of the capsule can be removed so that a reduction capsuloplasty repair can be performed. Once the flap is removed, then the remaining capsular edges are sutured together, using number one non-absorbable suture in an interrupted fashion. Usually half a dozen stitches are necessary from the superior portion of the acetabulum down over the anterior part of the femoral head. The inferior triangular flap is then sutured over top of the previous incision in a pants-over-vest arrangement to further secure the capsular repair. Once the capsular repair is started, the femoral head must be held into the joint by positioning the hip in flexion, abduction and internal rotation, usually about 25 degrees for each position,

The femoral osteotomy is performed through a separate longitudinal incision made from the greater trochanter along the lateral thigh for several inches. The dissection is carried down through the subcutaneous tissues to the fascia lata. Care is taken to dissect the fatty tissues off of the fascia lata to facilitate later closure. The fascia lata is then opened in the mid substance longitudinally from the greater trochanter distally for a total of 4-5 inches. This then exposes the fascia of the vastus lateralis which is dissected free from the fascia lata and this fascia layer is opened posteriorly in order to come in behind the vastus lateralis to reach the lateral border of the thigh. This reduces the chance for denervation of the posterior musculature. A periosteal incision is made and the periosteum stripped from the outer edge of the greater trochanter distally. Bennett retractors are then used to hold the vastus laterals muscle up anteriorly. A Scott-McCracken periosteal elevator is then used to release the linea aspera fascial attachment so that a Bennett retractor can be placed around the femur posteriorly. Then, under C-arm control, a guide wire is drilled up the femoral neck from the lateral femoral shaft, but shy of the proximal femoral physis. The guide wire position is confirmed to be central on both AP and frog lateral views. A cannulated drill is then drilled over the guide wire to penetrate the outer cortex. The screw tap is then used to set the threads for the lag screw that will be placed up the femoral neck. The appropriate length of screw is selected and inserted. The transverse osteotomy is then cut now 5 mm. below the inferior penetration of the cortex by the lag screw. Another transverse osteotomy a centimeter below that is made in order to remove a centimeter of length from the femur. A 2-inch three hole side plate (or a 3-inch 4 hole side plate in the older child) is used with a 140 degree neck/shaft angle, to attach to the lag screw. The side plate is then clamped to the femoral shaft by a verbouge clamp. Care is taken to preserve rotational alignment, maintaining 20-30 degrees of anteversion in the femoral neck with regard to the coronal axis of the femur. Drills are then used to drill through the holes in the plate. A depth gauge is used to select the proper size screws and they are placed into the screw holes after tapping the screw threads. The gap where the cortex section was resected is closed before securing the side plate to the shaft. A hemovac drain is then placed after irrigation of the wound with a Bacitracin irrigation and the wound closed in layers.

Intraoperative work (continued):

After completing the pelvic osteotomy and/or open reduction of the hip, the insertion of the rectus femoral is reattached to the anterior-inferior iliac spine. This involves passing a heavy suture through the bone after a hole has been placed through which the suture can be passed. A number one non-absorbable suture is used to tie the tendon back to its origin. Next the sartorius is reattached to the ilium above that. The anterior-superior iliac spine has been used as part of the wedge graft, so the sartorius is merely attached to the upper edge of the ilium through a similar mechanism of drilling a hole and passing a number one suture through that hole before tying it. The vessel loop around the lateral femoral cutaneous nerve is removed and the nerve is allowed to lie back in its bed. The superficial fascia layer is then approximated with 2.0 Vicryl suture. The subcutaneous tissues are closed by multiple interrupted sutures of 3.0 Vicryl and a running subcuticular 4.0 Vicryl suture is the final closure.

Postoperative work begins after skin closure in the operating room and includes application of dressing and postoperative spica cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring lab studies; postoperative x-rays; care and removal of drains; adjustments of cast (trim and/or repair); physical therapy--review progress and adjust program; ordering and reviewing x-rays; evaluation of leg length post-cast--order shoe lift as needed ; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, including home health care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures, removal of pins and cast changes; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Ordering of physical therapy at an appropriate time during healing to allow weight bearing depending on the degree of bone healing on X-ray. Direction is given to physical therapy to recover range of motion of the affected hip.

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
(17.58/19.70)*	090	27147	Osteotomy, iliac, acetabular or innominate bone; with open reduction of hip
16.20	090	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 17.58 to 19.70, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27156 (Osteotomy, iliac, acetabular or innominate bone; with femoral osteotomy and with open reduction of hip) represents the sum of 100% of CPT 27147 (*Osteotomy, iliac, acetabular or innominate bone; with open reduction of hip*) plus the intraoperative portion of CPT 27165 (*Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast*). These procedures are performed through separate incisions.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT 27156 represents the sum of CPT 27147 plus the intraoperative portion of CPT 27165. These procedures are performed through separate incisions. Using the multiple procedure rule, this equates to 27.80 [19.70 + (16.20 x 50%)]. Although this value is higher than the survey median, the median RVW is recommended

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27454 Global Period: 090 1995 RVW: 12.26 Recommended RVW: 16.90
Workgroup Recommended New Value: 16.55

CPT Descriptor: Osteotomy, multiple, femoral shaft, with realignment on intramedullary rod
(Sofield type procedure)

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A child with osteogenesis imperfecta and bowing of the femur as a result of many previous fractures undergoes multiple osteotomies and intra-medullary fixation (Sofield technique) to straighten the femur.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to preoperative radiographic measurements and hematologic status; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering implants such as Rush rods; arranging for intraoperative radiographic table, blood; positioning the patient in 45 degree lateral decubitus position; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: The entire shaft of the femur is then exposed through a long transverse skin incision. The fascia lata is divided and the vastus lateralis muscle mobilized anteriorly. The perforating vessels are coagulated or ligated as necessary. Multiple osteotomies are performed to allow for complete correction of the angular deformity. The piriformis fossa at the base of the femoral neck is exposed proximally by dissecting through the gluteus medius muscle. A drill is used to create a starting hole. This hole may also be created in a retrograde fashion with the Rush rod or drill if necessary. A Rush rod of appropriate length and diameter is then selected. The rod should be of sufficient diameter to fill the medullary canal of the osteotomy segments. It should terminate just proximal to the distal femoral epiphysis. The rod is advanced distally and the bone is usually of such softness that the segments do not require drilling. They are threaded over the rod in a napkin ring manner. If soft tissues become tight due to the straightening of the shaft of the femur one or two bone segments may be removed. The hooked end of the rush rod is placed over the greater trochanter. This allows easy identification and removal for exchange rodding in the future. After rod insertion its position is checked with anteroposterior and lateral radiographs. The wound typically is drained. The fascia lata, subcutaneous tissue and skin are closed in layers. Steri-strips are applied to the skin edges.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and well padded hip spica. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status and hematologic status; care and removal of Hemovac drain; adjustments of cast; ordering and reviewing postoperative radiographs; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; removal of cast when X-rays done at each office visit demonstrate bone healing; ordering new orthoses (braces to protect the extremity); ordering of physical therapy after bone healing and removal of the cast to restore joint range of motion; laboratory reports, if needed; and antibiotic and pain medication adjustments.

HARVARD DATA for surveyed service and key reference service(s):

Harvard 27454:	50	133	31	0	0	45	4.5	45	4.5
Harvard 24410:	58	129	29	0	0	17	2	59	5
Harvard 27165:	55	147	28	0	0	99	9	60	5

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
14.28	24410	Multiple osteotomies with realignment on intramedullary rod, humeral shaft (Sofield type procedure)
16.20	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
14.28	090	24410	Multiple osteotomies with realignment on intramedullary rod, humeral shaft (Sofield type procedure)
16.20	090	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 24410 (*Multiple osteotomies with realignment on intramedullary rod, humeral shaft (Sofield type procedure)*) is less work than CPT 27454 (*Osteotomy, multiple, femoral shaft, with realignment on intramedullary rod (Sofield type procedure)*) because exposure is required and more osteotomies are necessary on the larger femur bone.

CPT 27165 (*Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast*) is slightly less work than CPT 27454 which requires additional exposure and has the potential for greater blood loss.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT 27454 is slightly more work than CPT 27165 and more than CPT 24410, as discussed in the key reference comparison section above. The survey median RVW is recommended because it appropriately places the value of CPT 27454 "relative" to CPT 27165 and CPT 24410.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27712 Global Period: 090 1995 RVW: 11.81 Recommended RVW: 16.00
Workgroup Recommended New Value: 13.20

CPT Descriptor: Osteotomy; multiple, with realignment on intramedullary rod (Sofield type procedure)

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A child with osteogenesis imperfecta and bowing of the leg as a result of many previous fractures undergoes multiple osteotomies and intra-medullary fixation (Sofield technique) to straighten the tibia.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to preoperative radiographic measurements, hematologic status; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes scrubbing; ordering implants such as Rush rods; arranging for intraoperative radiographic table, blood; positioning the patient supine or 45 degree lateral decubitus; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: If only the tibia is to be rodded, it is possible to use a pneumatic tourniquet about the upper thigh, but care must be taken to avoid femoral shaft fractures. The tibia is exposed through a long anterior skin incision. Subperiosteal stripping may be attempted but is difficult due to the stiffness of the bone. The fascia of the anterior compartment must be completely released to prevent a possible postoperative compartment syndrome. The fibula may need to be exposed through a second lateral incision and above the lateral compartment muscles. Osteotomies or osteoclasis is performed but no rod is inserted. The knee joint is open through a medial parapatellar incision. With the knee held in the flexed position a drill hole is placed through the articular surface of the knee just anterior to the anterior tibial spine. Multiple tibial osteotomies are performed to allow for straightening. A Rush rod of appropriate diameter and length is then selected. The rod is advanced through the proximal drill hole and each of the osteotomy segments is passed over the rod. The rod should terminate just above the distal tibial epiphysis. The hooked end of the rod overlaps the tibial tuberosity proximally. Once the rod is inserted final alignment is assessed with anteroposterior and lateral radiographs. If these are acceptable the wounds are then closed in layers. The wound may be drained if necessary. The periosteum, (but not the fascia of the anterior compartment), subcutaneous tissue and skin are closed in layers. Steri strips are applied to the skin edges. Of particular importance in this intraoperative portion of the procedure is achieving perfect alignment of the postoperative tibia in relation to the knee and ankle joints for proper weight bearing.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and a long leg cast or in heavy patients a hip spica cast may be used. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status and hematologic status; care and removal of Hemovac drain; adjustments of cast; ordering and reviewing postoperative radiographs; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; removal of cast when X-rays done at each office visit demonstrate bone healing; ordering new orthoses (braces to protect the extremity); ordering of physical therapy after bone healing and removal of the cast to restore joint range of motion; laboratory reports, if needed; and antibiotic and pain medication adjustments.

HARVARD DATA for surveyed service and key reference service(s):

Harvard 27712:	50	119	30	0	0	65	6.5	45	4.5
Harvard 24410:	58	129	29	0	0	17	2	59	5
Harvard 27165:	55	147	28	0	0	99	9	60	5

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
14.28	24410	Multiple osteotomies with realignment on intramedullary rod, humeral shaft (Sofield type procedure)
16.20	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
14.28	090	24410	Multiple osteotomies with realignment on intramedullary rod, humeral shaft (Sofield type procedure)
16.20	090	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 24410 (*Multiple osteotomies with realignment on intramedullary rod, humeral shaft (Sofield type procedure)*) is less work than CPT 27712 (*Osteotomy; multiple, with realignment on intramedullary rod (Sofield type procedure)*) because a second incision must be made in CPT 27712 to osteotomize the fibula in order to allow correction of the tibia. More osteotomy cuts are frequently necessary with CPT 27712 since the alignment of the postoperative tibia for proper weight bearing is more critical than with CPT 24410.

CPT 24410 demands the knee joint be widely exposed, whereas CPT 27712 needs no joint exposure.

CPT 27165 (*Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast*) is more intense than CPT 27712 because of the potential of greater blood loss, but less work because of a more limited exposure, lack of arthrotomy and single osteotomy (but a more exacting osteotomy). The bone of 27165 is considerably easier to work with than soft osteogenesis imperfecta bone of CPT 27712.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Although CPT 27712 involves less time than CPT 27165 it includes more complex work. CPT 27712 is also more work than CPT 24410, as discussed in the key reference comparison section above. The survey median RVW is recommended because it appropriately places the value of CPT 27712 "relative" to CPT 27165 and CPT 24410.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27227 Global Period: 090 1995 RVW: 15.39 Recommended RVW: 22.00
Accepted by Workgroup

CPT Descriptor: Open treatment of acetabular fracture(s) involving anterior or posterior (one) column, or a fracture running transversely across the acetabulum, with internal fixation

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old laborer falls from a scaffold and sustains a displaced acetabular fracture involving the posterior column. He is treated by open reduction and internal fixation through a posterior approach.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to adequacy of radiographs (AP pelvis, Judet views, CT, 3-dimensional reconstruction), evaluation for other injuries (GI, GU, vascular, neurologic), close collaboration with general surgeons, urologists or others planning surgery; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. The interpretation of all imaging studies is vitally important in the surgeon must understand the relationships of each fracture fragment to one another further, the decision concerning the proper surgical approach is dependent on the characteristics of the fracture. Preoperative work also includes preoperative scrubbing; ordering preoperative ultrasound scan for deep venous thrombosis, somatosensory evoked potential baseline studies (SSEP), arterial line, central venous line antibiotics; arranging for intraoperative SSEP monitoring; cell-saver, consulting with anesthesia, fluoroscopy, blood supply; positioning the patient supine, lateral or prone depending on surgical approach, on a special radiolucent operating table extension; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. After patient positioning, the C-arm should be used prior to draping to ascertain whether adequate views including obliques can be obtained.

Intraoperative work: Fractures of the acetabulum involving one column, or transverse fractures, may be approached through one incision, usually. For anterior fractures, the patient will be positioned supine and an ilioinguinal approach performed. For posterior fractures, the position will be lateral or prone, and a Kocher-Langenbeck incision is the most common. Both are done on a radiolucent operating table extension, with a cell saver, somatosensory evoked potential (SSEP) monitoring, and fluoroscopy. After prepping and draping, the surgeon must attach sterile monitoring electrodes to the posterior tibial nerve and the peroneal nerve and secure them to the skin. These surgical approaches must be extensile to allow adequate mobilization of soft tissues and adequate visualization of vital structures and the fracture. Inadequate exposure will lead to inadequate internal fixation and potential injury to vital structures.

The **ilioinguinal approach** begins with a skin incision starting at the anterior superior iliac spine (ASIS) and extending proximally and laterally along the iliac crest, and distally and medially to the pubis. The lateral window is developed first. The insertion of the abdominal muscles onto the iliac crest is identified and they are removed subperiosteally, leaving a cuff of tissue on the outside of the crest to assist in the closure. The iliacus muscle is elevated from the inside of the pelvis deeply, around to the sacroiliac (SI) joint in back and the pelvic brim medially. This portion of the wound is packed with a swab. The fascia of the external oblique is cleaned carefully from the subcutaneous fat over the abdomen. The spermatic cord is identified and a rubber strip placed around it.

Intraoperative work (continued)

The external ring of the inguinal canal is identified and the fascia of the external oblique is divided carefully from the ASIS to the external ring leaving 3–5 mm of fascia on the inguinal ligament. The lateral femoral cutaneous nerve is identified and protected. The conjoint tendon (fascia of the internal oblique and transversalis) is cleaned and divided 4 mm from the inguinal ligament from the ASIS to the iliopectineal fascia. This fascia represents the lateral border of the vascular compartment. An elevator is carefully advanced subperiosteally along the anterior column of the acetabulum inside the pelvis, underneath the iliopsoas muscle and femoral nerve. This is facilitated by flexion of the hip. A rubber strip is placed around these structures to aid retraction and protection. The iliopectineal fascia is then cleaned carefully on both sides and then divided back along the pelvic brim. The femoral artery and nerve are carefully retracted upward. The surgeon must beware of a connection between the femoral and obturator arteries. If it exists, it must be identified and ligated, lest serious hemorrhage occur. A rubber strip is placed around the vessels. The ipsilateral insertion of the rectus abdominis is then identified and divided, leaving a cuff of tissue to allow repair. Care must be taken to protect the bladder during exposure of the pubis. The exposure is then completed by careful subperiosteal exposure of the anterior column from inside the pelvis, working over the iliac crest, between the nerve and the vessels, or medial to the vessels (the three "windows"). Once the fracture is exposed, the surfaces are cleaned of clot.

The fracture is reduced indirectly by means of manipulation of the bone fragments through the windows. This may be helped by placement of a screw into the proximal femur, allowing an assistant to apply lateral traction, and pull the femoral head out of the pelvis. A variety of specialized reduction clamps are available to perform the reduction. This requires an intimate understanding of the anatomy of this complex joint. Once reduced, the quality of reduction must be evaluated using fluoroscopy in anterior–posterior and oblique projections. This requires an experienced X-ray tech, and is often difficult to interpret. If the reduction is judged to be perfect, plates and screws are applied from inside the pelvis. Flexible reconstruction plates are used, and these must be shaped carefully and exactly to fit the inside of the pelvic brim. Sometimes, additional flexible plates are needed to stabilize the fixation construct. Screws must be directed in such a manner as to hold the fracture without penetrating the joint surface or other dangerous areas, such as the obturator foramen. This requires intimate familiarity with the pelvic anatomy. Once screws are in place, they must be evaluated using fluoroscopy. Some surgeons use a sterile esophageal stethoscope to auscultate the hip for evidence of screw penetration of the joint.

Closure of this approach involves: re-attachment of the rectus abdominis insertion, repair of the conjoint tendon to the inguinal ligament, repair of the external ring taking care to re-establish the correct ring size, repair of the fascia of the external oblique, re-attachment of the abdominal muscles to the iliac crest with suture anchors inserted into bone, and layered closure of the skin and subcutaneous tissues. Hemovac drains are left in the internal iliac fossa, and in the space of Retzius behind the pubis. Portable X-rays are obtained with the patient asleep and the back table sterile.

The Kocher–Langenbeck approach for posterior lesions begins with an incision at the greater trochanter, extending proximally and posteriorly toward the posterior superior iliac spine, and distally along the shaft of the femur. Subcutaneous tissue is divided in line with the incision and the fascia lata is split distally. The gluteus maximus muscle is bluntly split proximally. A portion of the gluteus maximus tendon may be divided. The sciatic nerve is identified distal to the zone of injury behind the quadratus femoris muscle, and followed proximally. The nerve is kept lax by constant vigilance to keep the knee flexed and the hip extended, thus making it less liable to injury. The tendons of the piriformis and of the obturator internus are identified, tagged, divided close to the bone and retracted. A retractor is placed in the bursa of the obturator internus to protect the sciatic nerve. The posterior column of the acetabulum is then exposed subperiosteally, from the ischial tuberosity proximally to the greater sciatic notch and beyond. Care is taken to protect the superior gluteal nerve and artery exiting from the notch. Posterior wall fractures are identified and cleaned of debris, keeping the capsular attachments intact to protect vascularity. Access to the joint is through fracture lines rather than through the capsule.

Intraoperative work (continued)

The head of the femur is retracted from the joint by use of the femoral distractor, a device which provides controlled distraction through screws placed in the ilium and in the proximal femur. The interior of the joint is inspected for fracture fragments or debris. If there is marginal impaction of the acetabular joint surface, it is carefully elevated and molded to the femoral head, and then supported with bone graft taken from a small window made in the greater trochanter. The posterior column fracture is reduced by use of a manipulation screw placed in the ischium, or by use of special reduction clamps. This may require manipulation of bone fragments from inside the pelvis using instruments placed through the greater sciatic notch. It is then stabilized with a flexible reconstruction plate bent and shaped to fit the column. At this point the posterior wall fragments are replaced, and are stabilized with Kirschner wires. Labral tears may be sutured back in place. The reduction is evaluated with fluoroscopy in AP and oblique projections. If it is perfect, another reconstruction plate (with or without supplemental "spring" plates), is contoured carefully to fit over the fragments and buttress them in place. Screws are placed, and may include lag screws through the fragments. Extreme care must be taken to avoid penetration of the joint surface with screws, and this is evaluated with fluoroscopy and/or with a sterile esophageal stethoscope. Sterile drains are placed. Closure of the KL approach consists of: re-attachment of the tendons of the piriformis and obturator internus, repair of the gluteus maximus tendon, closure of the fascia lata, layered closure of the skin. The patient is turned supine and portable X-rays are taken prior to awakening the patient and breaking down the back table.

Postoperative work begins after skin closure in the operating room and includes turning the patient supine take radiographs prior to awakening the patient; and application of dressings, pulsatile stockings, continuous passive motion machine. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including ICU care and monitoring neurologic, vascular, urologic and GI system evaluation, blood counts, cardiopulmonary function; care and removal of drains; adjustments of CPM; supervision of mobilization and ambulation; ordering and reviewing radiographs to assess hardware position and fracture reduction, postoperative CAT scan and ultrasound DVT scans (deep venous thrombosis); and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. This also includes ordering radiation therapy for heterotopic bone prophylaxis, anticoagulation for DVT prophylaxis, and assessing physical therapy progress.

18.68	090	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
21.44	090	27132	Conversion of previous hip surgery to total hip replacement, with or without autograft or allograft
10.95	090	27222	Closed treatment of acetabulum (hip socket) fracture(s); with manipulation, with or without skeletal traction

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27227 (Open treatment of acetabular fracture(s) involving anterior or posterior (one) column, or a fracture running transversely across the acetabulum, with internal fixation) involves a treatment of a complex fracture of the body's major weight-bearing joint, requiring careful preoperative planning that integrates information from a variety of imaging studies (eg, X-ray, CT) and extensive preoperative work to review available studies, plan the operation, and supervise and/or personally prepare the patient (positioning) for this emergent operation.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): (continued)

In comparison to CPT 27130 (*Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft*), CPT 27227 is more intense because it involves more complex positioning, more complicated surgical anatomical exposure, and more complexity in terms of fixation, which equates to more preoperative and more intraoperative time. In contrast to total hip replacement patients, the majority of which are medically stable, complex acetabular fractures usually occur in severely injured patients who have greater metabolic, nutritional and hemodynamic derangements. This increase in the severity of associated systemic problems increases the work associated with preoperative, intraoperative, and postoperative management of these fracture patients. Additionally, since many of the acetabular fixations require an extensive intra-pelvic surgical approach or two major incisions, the risk of intraoperative and postoperative complications is far greater than that associated with a total hip replacement.

The surgical approach for a total hip replacement is less extensive than that utilized for acetabular fixation, and is not made through traumatized tissue in which anatomic relationships are often disturbed and the risk of complications is increased. Total hip replacement involves the excision of the proximal femur and the acetabular lining followed by replacement with pre-manufactured standard components which are inserted with a predictable technique. In contrast, fixation of complex acetabular fractures requires exposure, repositioning, and stabilization of multiple displaced bone fragments in order to restore normal hip anatomy. The work involved in this type of bony reconstruction is of greater duration and intensity than the work that is necessary for replacement of the hip joint.

Total hip patients are commonly walking within a few days of the operation, while complex acetabular fractures must be kept non-weight-bearing for three months following the operation. Postoperative and rehabilitative care for the acetabular patient is more complex and requires more physician work than that associated with total hip surgery.

The intensity and complexity of the preoperative and intraoperative work for CPT 27227 is more comparable, if not greater than, CPT 27132 (*Conversion of previous hip surgery to total hip replacement, with or without autograft or allograft*).

In comparison to CPT 27222 (*Closed treatment of acetabulum (hip socket) fracture(s); with manipulation, with or without skeletal traction*), which is a non-operative procedure, the surgical intraoperative work in CPT 27227 involves: an extensive surgical approach through traumatized tissue, past vital neurovascular structures which must be protected throughout the procedure; an anatomic reduction of multiple joint surfaces fragments often requiring specialized instruments and reduction techniques; the application of provisional internal fixation with special clamps and pin fixation; intraoperative radiographs; and definitive internal fixation with custom contoured plates and screws, taking great care to avoid penetration of the joint and injury to neurovascular structures. Also, with the anterior approach, meticulous wound closure is necessary to avoid abdominal wall hernia or inguinal hernia. Postoperatively, CPT 27227 represents intense and prolonged wound care due to the severe nature of the original injury, and assessing the need for and ordering radiation therapy and medications to prevent heterotopic ossification about the operated hip. The intraoperative time for CPT 27227 more than twice that of CPT 27222, and the intensity and complexity is many more times that of CPT 27222.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended RVW, which is the survey median, is higher than CPT 27130 and similar to CPT 27132 and reflects the differences in pre-, intra- and postoperative time, intensity, and complexity, as discussed in the comparison to key references section above.

HCFA incorrectly "judged" CPT 27227 to be less work than CPT 27130 in its original valuation, without the advantage of having a service description (presenting the complexity and intensity of this service) or surveyed service time estimates. Many of the orthopaedic surgeons who served on the Technical Consulting Panel involved with the recommendation to initially value this procedure routinely perform total hip replacements as part of their practice. This is true also of the surgeons from the Orthopaedic Trauma Association and the American Association of Hip and Knee Surgeons who responded to the AMA/RUC 5-year-review survey. These surgeons are most "fit-to-rate" the work value in this complex acetabular fixation relative to total hip replacement, and they have estimated the work and time of CPT 27227 to be higher than for CPT 27130 (i.e., the AMA/RUC survey confirms that CPT 27227 requires more time than CPT 27130.)

In addition, the Orthopaedic RVS Advisory Panel, and the 14,000 Fellows it represents, would like to re-emphasize the concern about inappropriately crosswalking work values from deleted codes to new codes. Deleted codes and their replacement codes do not always represent the same work. Often times, codes are deleted because they have questionable and widely variable misunderstood descriptors, which do not accurately reflect current clinical practice. It should be noted that HCFA incorrectly based its valuation of CPT 27227 on the RVW of a deleted code.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27228 Global Period: 090 1995 RVW: 17.90 Recommended RVW: 30.00
Workgroup Recommended New Value: 25.59

CPT Descriptor: Open treatment of acetabular fracture(s) involving anterior and posterior (two) columns, includes T-fracture and both column fracture with complete articular detachment, or single column or transverse fracture with associated acetabular wall fracture, with internal fixation

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old laborer falls from a scaffold and sustains a displaced anterior and posterior column fracture of the acetabulum. He is treated by open reduction and internal fixation through combined anterior and posterior approaches.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to evaluation for intra-abdominal, urologic, or neurologic injury, reviewing and assessing radiographs (AP, Judet views), CT scan (transaxial and 3-dimensional), to decide how and in what order to approach; consulting other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering preoperative ultrasonography to evaluate venous thrombosis, somatosensory evoked potentials (SSEP) to evaluate sciatic nerve; arranging for arterial line, central venous line, and antibiotics; arranging for intraoperative SSEP monitoring, cell-saver, available blood for transfusion, fluoroscopy; positioning the patient first either supine or lateral (to be switched later to the other) on a radiolucent operating table extension; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. The procedure will begin with one exposure, either from the front or the back, based on which component of the fracture is more displaced. This determination is made by analysis of multiple imaging studies, and requires experience with the procedure to know how the reduction will be performed. After the patient is positioned on a radiolucent table, prepped and draped, and sterile monitoring leads are attached by the surgeon for evoked potential monitoring, the front side is addressed through an ilioinguinal approach.

Intraoperative work: The ilioinguinal approach begins with a skin incision starting at the anterior superior iliac spine (ASIS) and extending proximally and laterally along the iliac crest, and distally and medially to the pubis. The lateral window is developed first. The insertion of the abdominal muscles onto the iliac crest is identified and they are removed subperiosteally leaving a cuff of tissue on the outside of the crest to assist in the closure. The iliacus muscle is elevated from the inside of the pelvis deeply, around to the sacroiliac (SI) joint in back and the pelvic brim medially. This portion of the wound is packed with a swab. The fascia of the external oblique is cleaned carefully from the subcutaneous fat over the abdomen. The spermatic cord is identified and a rubber strip placed around it.

Intraoperative work (continued)

The external ring of the inguinal canal is identified and the fascia of the external oblique is divided carefully from the ASIS to the external ring, leaving 3–5 mm of fascia on the inguinal ligament. The lateral femoral cutaneous nerve is identified and protected. The conjoint tendon (fascia of the internal oblique and transversalis) is cleaned and divided 4 mm from the inguinal ligament from the ASIS to the iliopectineal fascia. This fascia represents the lateral border of the vascular compartment. An elevator is carefully advanced subperiosteally along the anterior column of the acetabulum inside the pelvis, underneath the iliopsoas muscle and femoral nerve. This is facilitated by flexion of the hip. A rubber strip is placed around these structures to aid retraction and protection. The iliopectineal fascia is then cleaned carefully on both sides and then divided back along the pelvic brim. The femoral artery and nerve are carefully retracted upward. The surgeon must beware of a connection between the femoral and obturator arteries. If it exists, it must be identified and ligated, lest serious hemorrhage occur. A rubber strip is placed around the vessels. The ipsilateral insertion of the rectus abdominis is then identified and divided, leaving a cuff of tissue to allow repair. Care must be taken to protect the bladder during exposure of the pubis. The exposure is then completed by careful subperiosteal exposure of the anterior column from inside the pelvis, working over the iliac crest, between the nerve and the vessels, or medial to the vessels (the three "windows"). Once the fracture is exposed, the surfaces are cleaned of clot.

The fracture is reduced indirectly by means of manipulation of the bone fragments through the windows. This may be helped by placement of a screw into the proximal femur, allowing an assistant to apply lateral traction, and pull the femoral head out of the pelvis. A variety of specialized reduction clamps are available to perform the reduction. This requires an intimate understanding of the anatomy of this complex joint. Once reduced, the quality of reduction must be evaluated using fluoroscopy in anterior–posterior and oblique projections. This requires an experienced X-ray technician, and is often difficult to interpret. If the reduction is judged to be perfect, plates and screws are applied from inside the pelvis. Flexible reconstruction plates are used, and these must be shaped carefully and exactly to fit the inside of the pelvic brim. Sometimes, additional flexible plates are needed to stabilize the fixation construct. Screws must be directed in such a manner as to hold the fracture without penetrating the joint surface or other dangerous areas, such as the obturator foramen. This requires intimate familiarity with the pelvic anatomy. Once screws are in place, they must be evaluated using fluoroscopy. If necessary, a sterile esophageal stethoscope is used to auscultate the hip for evidence of screw penetration of the joint. Closure of this approach involves: re-attachment of the rectus abdominis insertion, repair of the conjoint tendon to the inguinal ligament, repair of the external ring taking care to re-establish the correct ring size, repair of the fascia of the external oblique, re-attachment of the abdominal muscles to the iliac crest with suture anchors inserted into bone, and layered closure of the skin and subcutaneous tissues. Hemovac drains are left in the internal iliac fossa, and in the space of Retzius behind the pubis.

After closure of the anterior approach, the drapes are removed, the patient is positioned lateral or prone, re-prepped and draped, and a second surgical approach is performed. New sterile monitoring electrodes must be placed near the peroneal and posterior tibial nerves.

The most common posterior approach is the Kocher–Langenbeck. The Kocher–Langenbeck approach for posterior lesions begins with an incision at the greater trochanter, extending proximally and posteriorly toward the posterior superior iliac spine, and distally along the shaft of the femur. Subcutaneous tissue is divided in line with the incision and the fascia lata is split distally. The gluteus maximus muscle is bluntly split proximally. A portion of the gluteus maximus tendon may be divided. The sciatic nerve is identified distal to the zone of injury behind the quadratus femoris muscle, and followed proximally. The nerve is kept lax by constant vigilance to keep the knee flexed and the hip extended, thus making it less liable to injury. The tendons of the piriformis and of the obturator internus are identified, tagged, divided close to the bone and retracted. A retractor is placed in the bursa of the obturator internus to protect the sciatic nerve. The posterior column of the acetabulum is then exposed subperiosteally, from the ischial tuberosity proximally to the greater sciatic notch and beyond. Care is taken to protect the superior gluteal nerve and artery exiting from the notch.

Intraoperative work (continued)

Posterior wall fractures are identified and cleaned of debris, keeping the capsular attachments intact to protect vascularity. Access to the joint is through fracture lines rather than through the capsule. The head of the femur is retracted from the joint by use of the femoral distractor, a device which provides controlled distraction through screws placed in the ilium and in the proximal femur. The interior of the joint is inspected for fracture fragments or debris. If there is marginal impaction of the acetabular joint surface, it is carefully elevated and molded to the femoral head, and then supported with bone graft taken from a small window made in the greater trochanter. The posterior column fracture is reduced by use of a manipulation screw placed in the ischium, or by use of special reduction clamps. This may require manipulation of bone fragments from inside the pelvis using instruments placed through the greater sciatic notch. It is then stabilized with a flexible reconstruction plate bent and shaped to fit the column. At this point the posterior wall fragments are replaced, and are stabilized with Kirschner wires. Labral tears may be sutured back in place. The reduction is evaluated with fluoroscopy in AP and oblique projections. If it is perfect, another reconstruction plate (with or without supplemental "spring" plates), is contoured carefully to fit over the fragments and buttress them in place. Screws are placed, and may include lag screws through the fragments. Extreme care must be taken to avoid penetration of the joint surface with screws, and this is evaluated with fluoroscopy and/or with a sterile esophageal stethoscope. Sterile drains are placed. Closure of the KL approach consists of: re-attachment of the tendons of the piriformis and obturator internus, repair of the gluteus maximus tendon, closure of the fascia lata, and layered closure of the skin. The patient is turned supine and portable X-rays are taken prior to awakening the patient and breaking down the back table.

The intra operative work of this procedure is especially difficult since both anterior and posterior columns of the acetabulum are fractured and essentially are "floating free". Anchoring and stabilizing the fracture fragments is an especially difficult technical activity.

Postoperative work begins after skin closure in the operating room and includes application of dressings and continuous passive motion machine. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including ICU care and evaluating neurologic and vascular status, blood counts (hemoglobin), cardiopulmonary status; care and removal of suction drain, central line, and arterial line; adjustments of continuous passive motion device; supervision of mobilization and ambulation; coordination of care for other injuries; ordering and reviewing postoperative radiographs of the pelvis (AP and Judets), CAT scan, ultrasound duplex scans to assess deep venous thrombosis; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. This would also include ordering radiation therapy for heterotopic bone prophylaxis and anticoagulation for blood clot prophylaxis; supervising physical therapy and rehabilitation

18.68	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
29.67	090	20816	Replantation, digit, excluding thumb (includes metacarpophalangeal joint to insertion of flexor sublimis tendon); complete amputation
18.68	090	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft
21.44	090	27132	Conversion of previous hip surgery to total hip replacement, with or without autograft or allograft
28.82	090	35082	Direct repair of aneurysm, false aneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for ruptured aneurysm, abdominal aorta
(15.39/22.00) ^A	090	27227	Open treatment of acetabular fracture(s) involving anterior or posterior (one) column, or a fracture running transversely across the acetabulum, with internal fixation
(28.00) ^B	090	(473xx) ^B	Management of liver hemorrhage; exploration of hepatic wound, extensive debridement, coagulation and/or suture, with or without packing of liver

^A This procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 15.39 to 22.00, is being presented.

^B This new code was presented at the April 1995 AMA/RVS Update Committee meeting. The RVW shown is the recommended value. An RVW has not been published yet in the Federal Register.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27228 (*Open treatment of acetabular fracture(s) involving anterior and posterior (two) columns, includes T-fracture and both column fracture with complete articular detachment, or single column or transverse fracture with associated acetabular wall fracture, with internal fixation*) has been acknowledged by orthopaedic surgeons to be the most difficult management problem in the universe of orthopaedic trauma care.

It can be broadly stated that this procedure ranks par with CPT 473xx (*Management of liver hemorrhage; exploration of hepatic wound, extensive debridement, coagulation and/or suture, with or without packing of liver*) or CPT 35082 (*Direct repair of aneurysm, false aneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for ruptured aneurysm, abdominal aorta*). In general terms, all three procedures require extensive, exacting exposure; have a high operative risk to neurovascular structures; require an extraordinary amount of skill and experience to visualize and correct; and have a high risk of postoperative wound complications. In terms of **total work**, CPT 27228 makes up in time and complexity, what it may lack in life-threatening intensity as compared to CPT 473xx and CPT 35082.

Similarly, CPT 27228 ranks par with CPT 20816 (*Replantation, digit, excluding thumb (includes metacarpophalangeal joint to insertion of flexor sublimis tendon); complete amputation*). Both procedures require an extraordinary amount of skill and experience to visualize and correct; and both have a high risk of postoperative wound complications. Although CPT 20816 does not require extensive exposure because the finger has been completely amputated, significant time is required to microsurgically debride, dissect, and repair the severed tendons and neurovascular structures.

In comparison to CPT 27130 (*Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft*), CPT 27228 is more intense because it involves more complex positioning, more complicated surgical anatomical exposure, and more complexity in terms of fixation, which equates to more preoperative and more intraoperative time. In contrast to total hip replacement patients, the majority of which are medically stable, complex acetabular fractures usually occur in severely injured patients who have greater metabolic, nutritional and hemodynamic derangements. This increase in the severity of associated systemic problems increases the work associated with preoperative, intraoperative, and postoperative management of these fracture patients. Additionally, since many of the acetabular fixations require an extensive intra-pelvic surgical approach or two major incisions, the risk of intraoperative and postoperative complications is far greater than that associated with a total hip replacement. The surgical approach for a total hip replacement is less extensive than that utilized for acetabular fixation, and is not made through traumatized tissue in which anatomic relationships are often disturbed and the risk of complications is increased. Total hip replacement involves the excision of the proximal femur and the acetabular lining followed by replacement with pre-manufactured standard components which are inserted with a predictable technique. In contrast, fixation of complex acetabular fractures requires exposure, repositioning, and stabilization of multiple displaced bone fragments in order to restore normal hip anatomy. The work involved in this type of bony reconstruction is of greater duration and intensity than the work that is necessary for replacement of the hip joint. Total hip patients are commonly walking within a few days of the operation, while complex acetabular fractures must be kept non-weight-bearing for three months following the operation. Postoperative and rehabilitative care for the acetabular patient is more complex and requires more physician work than that associated with total hip surgery.

The intensity and complexity of the preoperative and intraoperative work for CPT 27228 is greater than, CPT 27132 (*Conversion of previous hip surgery to total hip replacement, with or without autograft or allograft*).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended RVW, which is the survey median, is similar to the published RVW for CPT codes 35083 and 20816, and the RUC-accepted RVW for CPT 473xx, and reflects the similarities in time and work, as discussed in the comparison to key references section above.

HCFA incorrectly "judged" CPT 27228 to be less work than CPT 27130 in its original valuation, without the advantage of having a service description (presenting the complexity and intensity of this service) or surveyed service time estimates. Many of the orthopaedic surgeons who served on the Technical Consulting Panel involved with the recommendation to initially value this procedure routinely perform total hip replacements as part of their practice. This is true also of the surgeons from the Orthopaedic Trauma Association and the American Association of Hip and Knee Surgeons who responded to the AMA/RUC 5-year-review survey. These surgeons are most "fit-to-rate" the work value in complex acetabular fixation relative to total hip replacement, and they have estimated the work and time of CPT 27228 to be higher than for CPT 27130 (i.e., the AMA/RUC survey confirms that CPT 27228 requires more time than CPT 27130 or CPT 27132.)

In addition, the Orthopaedic RVS Advisory Panel, and the 14,000 Fellows it represents, would like to re-emphasize the concern about inappropriately crosswalking work values from deleted codes to new codes. Deleted codes and their replacement codes do not always represent the same work. Often times, codes are deleted because they have questionable and widely variable misunderstood descriptors, which do not accurately reflect current clinical practice. It should be noted that HCFA incorrectly based its valuation of CPT 27228 on the RVW of a deleted code.

This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old football player sustained a fracture of his mid-shaft tibia during a game one year ago. The fracture healed, with a 30 degree varus angulation. After bone healing, the malunion is corrected by an osteotomy, plating, with an autograft from the iliac crest applied to the nonunion site.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to creation of preoperative planning sketches traced from X-rays of the malunited and normal tibia, which shows the planned level of bone cuts, placement of implants, expected correction and has a written surgical tactic (if a nonunion, may need bone scans or indium scans to R/O infection); consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering preoperative antibiotics; arranging for intraoperative portable radiographs, possible neurologic function monitoring, blood products (standby--type and cross); positioning and tourniquet placement (for correction of a tibial malunion, the patient is positioned supine on a radiolucent table, with a bump under the hip and a pneumatic tourniquet around the upper leg, the preoperative plan drawings made by the surgeon must be brought into the room and placed up on the viewbox, and the iliac crest should be prepped to allow bone graft harvest); supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: After inflation of the tourniquet, a straight incision is made anteriorly through the skin just lateral to the crest of the tibia and centered over the deformity. Full thickness skin and subcutaneous tissue flaps must be carefully developed, with very gentle handling of the tenuous soft tissue envelope in this region. Exposure of the tibia may be done subperiosteally or extraperiosteally, but it needs to be circumferential at the level of the osteotomy cut in order to allow protection of the neurovascular structures posterior to the bone. Excessive stripping should be avoided, yet exposure must be adequate to allow a safe osteotomy, and this requires experience and judgment. Once the bone is exposed, the osteotomy is performed using an oscillating saw, at the level and orientation as indicated on the preoperative plan. Neurovascular structures are protected with retractors. Prior to correction of the deformity, the fibula may need to be osteotomized, and this may usually be done with an osteotome through a small incision (but not percutaneously). In the case of an oblique osteotomy, the deformity is corrected by rotating the distal fragment around the axis of the osteotomy using a femoral distractor on the appropriate side. For correction of a varus deformity, the distractor is placed medially. Three dimensional alignment and length is corrected, a clamp is placed across the osteotomy, and a lag screw used to compress the cut surfaces.

Intraoperative work continued:

Usually intraoperative films showing the ankle and knee are obtained to verify alignment. If satisfactory, the bone contours may be fine-tuned, a neutralization plate shaped to fit the anteromedial surface of the tibia, and attached with cortical screws. Bone graft, either simultaneously or previously harvested from the iliac crest or distal femur, is placed around the osteotomy site. The wound is irrigated, Hemovac drains placed, and the soft tissues carefully closed in layers. If an extensive valgus deformity or excessive shortening exists, correction is often done using somatosensory evoked potential monitoring to reduce the risk of stretch injury to the nerves.

Postoperative work begins after skin closure in the operating room and includes application of dressing and splints or a cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status and function, wound status and healing (tenuous soft tissues); care and removal of suction drains; adjustments of removable splint; supervision of rehabilitation and ambulation, and use of bone stimulator for nonunion; ordering and reviewing radiographs to assess alignment, position, healing; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures and cast changes; evaluation of periodic imaging until bone healing has occurred and laboratory reports, if needed antibiotic and pain medication adjustments. The surgeon orders physical therapy and directs the ambulation recovery program dependant on the rate of bone healing.

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
10.51	27758	Open treatment of tibial shaft fracture, (with or without fibular fracture) with plate/screws, with or without cerclage
16.20	27165	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
10.51	090	27758	Open treatment of tibial shaft fracture, (with or without fibular fracture) with plate/screws, with or without cerclage
6.74	090	20902	Bone graft, any donor area; major or large

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

In comparison to CPT 27758 (*Open treatment of tibial shaft fracture, (with or without fibular fracture) with plate/screws, with or without cerclage*), CPT 27724 (*Repair of nonunion or malunion, tibia; with iliac or other autograft (includes obtaining graft)*) involves a radically more extensive exposure, with debridement of infected tissue often necessary. In the case of malaligned nonunion and malunions, there is extensive bone excision, osteotomy, and realignment. If internal fixation is necessary, it would be comparable to insertion of plate/screws or nail in CPT 27758.

The bone graft necessary for CPT 27724 is extensively applied to the poster and anterior fibula. Dissection goes in the plane between the calf muscles and interosseous member and the bone graft must be distributed across the surface of the tibia and space between tibia and fibula.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This increased RVW is more than the RVW for CPT 27758 (10.51) plus 50% of the RVW for CPT 20902 (6.74), and accurately reflects the work (and time) components that comprise this service.

$$[10.51 + 3.37 = 13.88]$$

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27827 Global Period: 090 1995 RVW: 9.90 Recommended RVW: 15.35
Workgroup Recommended New Value: 12.95

CPT Descriptor: Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal or external fixation; of tibia only

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 24-year-old male with a displaced articular (pilon) fracture of the distal tibia undergoes open reduction and internal fixation of the distal tibia and its articular surface.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies with special attention to evaluation of plain X-rays of injured and uninjured side for pre-operative planning sketches to show implant placement and preparing a written surgical tactic, obtaining CT scan with 3-dimensional reconstructions, and neurovascular exams; assessment of soft tissue swelling and status to confirm appropriate time for operation; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering preoperative antibiotics; arranging for intraoperative fluoroscopy and positioning of the patient on a radiolucent table extension; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. These fractures tend to produce fragments displaced in the anterior, posterior, lateral and transverse planes. The weight bearing surface of the distal tibia is severely distorted leaving little or no intact surface with which to articulate with the tibia. This displaced orientation is difficult to assess without the use of pre-operative CT scanning.

Intraoperative work: After the patient is positioned supine on a radiolucent table, with a bump under the hip, preoperative planning sketches and tactic are set up on the viewbox, and the iliac crest is prepped and draped for possible bone grafting, a femoral distractor or external fixator is applied to the medial side with pins placed proximally perpendicular to the shaft and distally through the calcaneus, through separate stab wounds. This allows partial correction of the deformity through indirect reduction. An anteromedial incision is made, after inflation of the tourniquet, medial and parallel to the anterior tibialis tendon, extending across the joint and then curving toward the medial malleolus. Delicate handling of this skin is imperative. Hemostasis is accomplished with the electrocautery. The tendon sheath of the anterior tibialis is reflected laterally and the fascia along its medial edge is incised, taking care not to enter the sheath. The dorsalis pedis artery and superficial peroneal nerve is reflected laterally with the tendon sheath. The joint capsule is opened and some of the anterior fat pad is resected to allow good exposure of the joint surface. Extra-periosteal exposure of the metaphysis and shaft is performed, taking care to be very gentle with the tenuous soft tissues, and maintain full thickness skin and subcutaneous tissue flaps. Fracture lines should be utilized for access to the joint and soft tissue attachments to bone fragment should be scrupulously preserved. The joint surface should be reduced and stabilized provisionally with Kirschner wires based upon the preoperative plan and surgical tactic. Generally, one begins with the anteromedial corner where it is attached to the fibula by strong syndesmotic ligaments, and rebuild the joint medially. Impacted metaphyseal fragment may need to be gently disimpacted, repositioned using the talar dome as a mold, and bone grafted using cancellous bone taken from the distal femur or iliac crest. Metaphyseal defects are grafted. Reduction is evaluated by visualizing the joint surface (aided by the distractor) and by use of the C-arm fluoroscope. The K-wires are then replaced by lag screws.

Intraoperative work (continued)

The reconstructed joint surface is then reconnected to the shaft using a plate. Generally a low-profile plate such as a clover-leaf plate would be used. The plate is placed anteriorly or medially. In some torsional-type fractures, a dynamic compression plate may be appropriate, but should be recessed into the metaphysis using an groove made with an osteotome. Shaft fragments and fracture lines should be stabilized using lag screws through the plate if possible. (At two hours of tourniquet time, the tourniquet should be deflated.) The wound is irrigated, a suction drain is placed, and the fascia is repaired to the anterior tibialis sheath. The joint capsule is closed. The skin is closed in layers, taking care to prevent any tension on the skin closure. If the wound can't be closed without tension, it should be left open and closed later, after the swelling has subsided.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring of swelling and neurovascular status; care and removal of drain; adjustments of splint; supervision of mobilization of patient and joint; ordering and reviewing radiographs to assess alignment; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; assessment of physiotherapy progress; evaluating weightbearing status; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Prolonged non-weight bearing status (up to 3 months) must be maintained by the surgeon until x-rays demonstrate healing.

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
10.90	27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip
15.95	27514	Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
15.95	090	27514	Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation
[7.61	090	27766	Open treatment of medial malleolus fracture, with or without internal or external fixation]*
[8.39	090	27822	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; without fixation of posterior lip]*
10.90	090	27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip

*CPT 27766 and CPT 27822 are presented here as a comparable services offered by HCFA in 1992. The discussion below and in the Rational section will discuss the appropriateness of these choices.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

In 1992, CPT 27766 (*Open treatment of medial malleolus fracture, with or without internal or external fixation*) was cited by HCFA as a comparable service to CPT 27827 (*Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal or external fixation; of tibia only*) (see Rationale). CPT 27766 is inappropriate to cite as comparable because it involves an isolated injury of a non-weight bearing portion of the ankle joint.

CPT codes 27822 (*Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; without fixation of posterior lip*) and 27823 (*Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip*) are more appropriate as reference services because they involve a greater portion of the ankle joint and reflect an injury that is more clinically similar to the injury involved in CPT 27827.

Surgical treatment is more difficult in CPT 27827 than it is in reference services 27822 and 27823 because it requires a more complex surgical approach, an exacting reduction involving multiple small bone fragments of the weight bearing surface of the distal tibia, and extensive fixation using multiple screws and plates. Pre- and postoperative care is more difficult due to the magnitude of bony and soft tissue injury and the increased danger of soft tissue infection, osteomyelitis, and post-traumatic arthritis and joint stiffness.

CPT 27827 (*Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal or external fixation; of tibia only*) is similar with respect to the estimated service time of CPT 27514 (*Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation*), however, because it involves a more demanding intra-articular fixation and more extensive exposure, CPT 27827 is a more intense procedure. Additionally, with CPT 27827, there are frequently problems with overlying skin that require careful soft tissue handling.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It should be noted that a recommendation to increase the RVW for CPT 27827 was made in 1992. The following selected text presents HCFA's response to this request:

"Treatment of fractures of weight-bearing articular surface of the tibia (CPT code 27827). The RUC recommended work RVUs of 13.65 for code 27827, noting that the work was 34 percent greater than that for code 27822, the treatment of an open trimalleolar ankle fracture. We disagree with this recommendation because we do not agree with the reference service. We set the work RVUs at 8.01, which is comparable to the work RVUs for the open treatment of a medial malleolar fracture (code 27766) and slightly less than those for the open treatment of a trimalleolar fracture (code 27822), which we view as a service of greater intensity. " [Federal Register, Vol. 57, No. 228, November 25, 1992]

The decision to use CPT 27766 as a comparable reference service and CPT 27822 as a service that involves more work was inappropriate (see discussion above in reference service comparison section). CPT code 27822 can be used as a reference service, however it is less work than 27827, not more.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the initial valuation of CPT 27827 did not correctly estimate the work involved in providing this service. The current survey and the judgment of the Advisory Panel equate this service to CPT 27514, and, as such, the survey median RVW, which approximates the RVW for 27514, is recommended to set an accurate value for CPT 27827.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27828 Global Period: 090 1995 RVW: 12.33 Recommended RVW: 18.00
Workgroup Recommended New Value: 15.12

CPT Descriptor: Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal or external fixation; of both tibia and fibula

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 27-year-old female with a displaced articular (pilon) fracture of the distal tibia and fibula undergoes an open reduction of the distal tibia, its articular surface, and the fibula.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies with special attention to evaluation of plain X-rays of injured and uninjured side for pre-operative planning sketches to show implant placement and preparing a written surgical tactic, obtaining CT scan with 3-dimensional reconstructions, and neurovascular exams; assessment of soft tissue swelling and status to confirm appropriate time for operation; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; ordering preoperative antibiotics; arranging for intraoperative fluoroscopy and positioning of the patient on a radiolucent table extension; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. These fractures tend to produce fragments displaced in the anterior, posterior, lateral and transverse planes. The weight bearing surface of the distal tibia is severely distorted leaving little or no intact surface with which to articulate with the tibia. This displaced orientation is difficult to assess without the use of pre-operative CT scanning.

Intraoperative work: After the patient is positioned supine on a radiolucent table, with a bump under the hip, preoperative planning sketches and tactic are set up on the viewbox, and the iliac crest is prepped and draped for possible bone grafting, a femoral distractor or external fixator is applied to the medial side with pins placed proximally perpendicular to the shaft and distally through the calcaneus, through separate stab wounds. This allows partial correction of the deformity through indirect reduction. The fibula fracture is addressed first. An incision is made over the posterior edge of the fibular shaft, allowing as much distance as feasible between the fibular incision and the planned tibial incision, at least 7-8 cm. The fibula should be exposed subperiosteally, taking care to protect the peroneal tendons posteriorly. Correction of fibular length and rotation is essential to restoring the overall alignment; anatomic reduction and fixation using lag screws and a neutralization plate is performed. Usually a thin 1/3 tubular plate is used. In cases of comminution, indirect reduction techniques may be employed. This wound is closed in layers. The fixation of the fibula should be performed prior to inflation of the tourniquet, to save tourniquet time for tibial fixation.

Attention is next directed to the fibula fracture. An anteromedial incision is made, after inflation of the tourniquet, medial and parallel to the anterior tibialis tendon, extending across the joint and then curving toward the medial malleolus. Delicate handling of this skin is imperative. Hemostasis is accomplished with the electrocautery. The tendon sheath of the anterior tibialis is reflected laterally and the fascia along its medial edge is incised, taking care not to enter the sheath. The dorsalis pedis artery and superficial peroneal nerve is reflected laterally with the tendon sheath. The joint capsule is opened and some of the anterior fat pad is resected to allow good exposure of the joint surface.

Intraoperative work (continued):

Extra-periosteal exposure of the metaphysis and shaft is performed, taking care to be very gentle with the tenuous soft tissues, and maintaining full thickness skin and subcutaneous tissue flaps. Fracture lines should be utilized for access to the joint and soft tissue attachments to bone fragment should be scrupulously preserved. The joint surface should be reduced and stabilized provisionally with Kirschner wires based upon the preoperative plan and surgical tactic.

Generally, one begins with the anteromedial corner where it is attached to the fibula by strong syndesmotic ligaments, and rebuilds the joint medially. Impacted metaphyseal fragment may need to be gently disimpacted, repositioned using the talar dome as a mold, and bone grafted using cancellous bone taken from the distal femur or iliac crest.

Metaphyseal defects are grafted. Reduction is evaluated by visualizing the joint surface (aided by the distractor) and by use of the C-arm fluoroscope. The K-wires are then replaced by lag screws. The reconstructed joint surface is then reconnected to the shaft using a plate. Generally a low-profile plate such as a clover-leaf plate would be used. The plate is placed anteriorly or medially. In some torsional-type fractures, a dynamic compression plate may be appropriate, but should be recessed into the metaphysis using a groove made with an osteotome. Shaft fragments and fracture lines should be stabilized using lag screws through the plate if possible. The wound is irrigated, a suction drain is left, and the fascia is repaired to the anterior tibialis sheath. The joint capsule is closed. The skin is closed in layers, taking care to prevent any tension on the skin closure. If the wound can't be closed without tension, it should be left open and closed later.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring of swelling and neurovascular status; care and removal of drain; adjustments of splint; supervision of mobilization of patient and joint; ordering and reviewing radiographs to assess alignment; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including removal of sutures; assessment of physiotherapy progress; evaluating weightbearing status; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Prolonged non-weight bearing status (up to 3 months) must be maintained by the surgeon until x-rays demonstrate healing.

Harvard 27814:	44	87	37	0	0	48	4	45	4

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
10.90	27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip
15.95	27514	Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

8.39	090	27822	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; without fixation of posterior lip
[9.87	090	27814	Open treatment of bimalleolar ankle fracture, with or without internal or external fixation]*
10.90	090	27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip

*CPT 27814 is presented here as a comparable service offered by HCFA in 1992. The discussion below and in the Rationale section will discuss the appropriateness of these choices.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27814 (*Open treatment of bimalleolar ankle fracture, with or without internal or external fixation*) was cited by HCFA as a comparable service to CPT 27828 (*Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal or external fixation; of both tibia and fibula*) (see Rationale). CPT 27828 is inappropriate to cite as comparable because it involves an injury to two areas of a non-weight bearing portions of the ankle joint.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): (continued)

CPT codes 27822 (*Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; without fixation of posterior lip*) and 27823 (*Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip*) are more appropriate as reference services because they involve a greater portion of the ankle joint and reflect an injury that is more clinically similar to the injury involved in CPT 27828.

Surgical treatment is more difficult in CPT 27828 than it is in reference services 27822 and 27823 because it requires a more complex surgical approach, an exacting reduction involving multiple small bone fragments of the weight bearing surface of the distal tibia and fibula, and extensive fixation using multiple screws and plates. Pre- and postoperative care is more difficult due to the magnitude of bony and soft tissue injury and the increased danger of soft tissue infection, osteomyelitis, and post-traumatic arthritis and joint stiffness.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It should be noted that a recommendation to increase the RVW for CPT 27828 was made in 1992. The following selected text presents HCFA's response to this request:

Treatment of fracture of weight-bearing articular surface of the tibia (CPT code 27825, 27828). The RUC recommended work RVUs of 15.93 for code 27828 based on a recommendation from AAOS that the work represented 1.57 times the work of code 27822. We do not agree with this comparison and have established work RVUs of 10.40, which are the work RVUs for the open treatment of a bimalleolar ankle fracture (code 27814), which we believe is a better reference service." [Federal Register, Vol. 57, No. 228, November 25, 1992]

The decision to use CPT 27814 as a comparable reference service was inappropriate (see discussion above in reference service comparison section). CPT codes 27822 and 27823 are better reference services

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the initial valuation of CPT 27828 did not correctly estimate the work involved in providing this service. The current AMA/RUC survey and the judgment of the Advisory Panel equate this service to 1.5 times the work for CPT codes 27822 and 27823, and, as such, the survey median RVW, is recommended .

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28415 Global Period: 090 1995 RVW: 13.28 Recommended RVW: 15.00
Accepted by Workgroup

CPT Descriptor: Open treatment of calcaneal fracture, with or without internal or external fixation;

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male sustains a comminuted calcaneal fracture after falling from a height. To reconstruct the fracture and joint surface, an open reduction of the intra-articular fracture of the calcaneus is performed using plates and screws.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to radiographs of the operative site, examination of lower extremity ipsi and contralateral; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes preoperative scrubbing; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: For open treatment of a calcaneal fracture, a large L-shaped incision is made on the lateral aspect of the foot and ankle starting just anterior to the Achilles tendon from the musculotendinous junction down along the border of the heel at the junction of the medial and plantar skin, going out to the base of the 5th metatarsal. This incision is then low enough to include and not embarrass the sural nerve. Subperiosteal dissection is then carried out over the lateral border of the heel proximally exposing the Achilles tendon, the Achilles tendon insertion, the lateral border of the calcaneus, the peroneal tendons and the base of the 5th metatarsal. Soft tissues attached to the lateral border of the calcaneus are subperiosteally dissected proximally including the peroneal tendons as they go under the fibula. This whole sheet of tissue including the tendons, neural and vascular structures, is refracted to proximal to the tip of the fibula and proximal to the subtalar joint and held in place with self-retaining wires that are placed within the fibula and within the body of the talus and bent backward to hold this large soft tissue flap without excess traction or embarrassment. In a solid portion of the calcaneal tuberosity, a pin is inserted as well as in the distal third of the tibia, and a bone distractor is applied to these two pins to help regain length of the crushed calcaneus. The fracture hematoma and scattered pieces of soft tissue are removed to expose the subtalar joint, body of the calcaneus and the sinus tarsi. The multiple depressions seen within the articular surface of the posterior facet and the malrotation of the fracture fragments are carefully repositioned and held in place with guide wires. The blown out lateral wall of the calcaneus is opened and further elevation of fragments is carried out with pressure from underneath the fragments using an osteotome.

Intraoperative work (continued):

A medial counter incision is then made over the sustentaculum tali on the medial side of the foot. Blunt and sharp dissection assure that no neurovascular structures are in the way, and a guide wire is then passed from the sustentaculum tali medially through the calcaneus emerging through the lateral wound. With the fracture fragments out to length and proper height, the multiple wires that have been used to position them are replaced with cannulated screws driven over the wires and confirmed by x-ray control. A calcaneal fracture plate, Y-type, is then positioned and bent to the appropriate diameter and configuration of the lateral wall with one of the holes including the guide wire going into the sustentaculum tali. With the fracture plate intact, multiple screws are then placed in the body of the calcaneus through this plate acting as a buttress plate laterally to hold the construct intact. Prior to putting on the plate, the distal calcaneocuboid articular surface is also inspected to make sure that it has been anatomically reduced, and additional screw fixation is carried out to maintain the integrity of that articular surface. The guide wire going through the sustentaculum tali is also replaced with a cannulated screw to get good fixation into that solid area of bone. The pins for the bone distractor are then removed. Copious irrigation is carried out. Drains are placed in the depth of the wound. The wound is closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of cast and splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status; care and removal of drains; cast and splint adjustments; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including cast/splint adjustments and removal; removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; assessing physiotherapy progress; and antibiotic and pain medication adjustments. Prolonged non-weight bearing status (up to 3 or 4 months) must be maintained by the surgeon until x-rays demonstrate healing.

Harvard 27827:	n/a								
Harvard 27514:	49	135	22	0	0	66	6	54	4

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
10.90	27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip
15.95	27514	Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
15.98	090	27514	Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation
(9.90/15.35)*	090	27827	Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal or external fixation; of tibia only

*Note: this procedure was surveyed as part of the 5-year review. A recommendation to increase the RVW from 9.90 to 15.35, is being presented.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 28415 (*Open treatment of calcaneal fracture, with or without internal or external fixation*;) is a more complex exposure (often requiring a second incision) of an intra-articular fracture with increased comminution and more difficult fixation than CPT 27514 (*Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation*)

CPT 27827 (*Open treatment of fracture of weight bearing articular surface/portion of distal tibia (eg, pilon or tibial plafond), with internal or external fixation; of tibia only*) represents similar work.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation, and the AMA/RUC survey confirms, that the Harvard study estimate of intraoperative time for CPT 28615 does not accurately reflect the current patient in need of this service. Advances in imaging technology have allowed for a better ability to characterize different patterns of this fracture. There has thus been a movement to address more complex patients who require more time and work. This is supported by the response to survey question 4b which indicated that patients requiring this service are now "more complex (more work)."

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 28615 **Global Period:** 090 **1995 RVW:** 5.12 **Recommended RVW:** 11.00
Workgroup Recommended New Value: 6.99

CPT Descriptor: Open treatment of tarsometatarsal joint dislocation, with or without internal or external fixation

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 28-year-old laborer falls from height sustaining tarsometatarsal dislocation. He undergoes open reduction with internal fixation.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of radiographs and examination of ipsi and contralateral extremity; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. The foot in such an injury is frequently severely swollen and may have soft tissue bruising. Careful evaluation of sensation and circulation must be done. Compartment syndromes of the foot can occur with this injury. Preoperative work also includes preoperative scrubbing; marking the patient for the planned incision; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: For open treatment of a tarsometatarsal dislocation, three longitudinal incisions are made on the dorsum on the foot, one dorsomedially over the first tarsometatarsal joint, one dorso midline over the lateral cuneiform and the intermetatarsal space of the second and third metatarsals, and one over the intermetatarsal space of the 4th and 5th metatarsals and over the cuboid. Subperiosteal and blunt and sharp dissection is carried out to reveal the dislocation sites. Very careful soft tissue handling must be employed due to the frequent soft tissue injury accompanying this injury. One then must assess whether there is marked comminution or just dislocation. The bases of the metatarsals are manually reduced using small instruments and dental picks to anatomically align the fracture fragments. Failure to do so will yield a stiff arthritic joint. The bones are held in place with guide wires going obliquely from the respective metatarsal bases into the cuneiforms and cuboid. With good bony stock proximally and distally, screws are placed over the guide wires to effect accurate reduction of the dislocation. The reduction is checked both by intraoperative radiograph evaluation and direct operative visualization, and adjustments made as necessary. Copious irrigation is then carried out, drains placed, if necessary, and the wounds are closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and a cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including cast adjustments; care and removal of drains, if placed; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the postoperative work for this procedure; including adjustments and removal of cast; removal of sutures; ordering and assessing planned physiotherapy progress; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

10.90	090	27823	Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

In comparison to CPT 27823 (*Open treatment of trimalleolar ankle fracture, with or without internal or external fixation, medial and/or lateral malleolus; with fixation of posterior lip*), CPT 28615 (*Open treatment of tarsometatarsal joint dislocation, with or without internal or external fixation*) requires several incisions to expose the dislocation and perform fixation with screws/wires/plates. Also, more complex joint arrangements add to the intensity.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study did not correctly estimate the intraoperative time for CPT 28615. This service is comparable to the key reference service 27823, with the additional intraoperative intensity due to more complex joint arrangement.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 21610 Global Period: 090 1995 RVW: 8.54 Recommended RVW: 20.00
Workgroup Recommended New Value: 16.00

CPT Descriptor: Costotransversectomy (separate procedure)

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 46-year-old female with a six-month history of back pain and X-ray evidence of a paravertebral mass undergoes a costotransversectomy for the decompression of the mass.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. Because selection of the correct site is critical, and intraoperative imaging sometimes difficult to interpret in the thoracic spine, it is often necessary to mark the appropriate rib and spinous process immediately preoperatively in coordination with a radiologist. Any unique surface or radiographic landmarks are sought and noted to assist with intraoperative localization. Arrangements are made for insertion and maintenance of a chest tube, should that become necessary. The intrinsic risks of spinal and chest surgery are discussed with patient and family along with any special risks presented by the patient's particular pathology, and consent obtained. The anesthesiologist is consulted preoperatively and informed of the possible needs for rapid hemodynamic and respiratory adjustments and provisions made for appropriate monitoring and lines. If indicated, arrangements are made for spinal cord monitoring. Provision for cell-saver and/or blood transfusion are made, as appropriate. The radiologist and/or technician who will assist with intraoperative imaging are consulted about the preoperative markings, the positioning, the draping, and any special equipment needed to provide adequate intraoperative imaging. The patient is positioned and prepped under the supervision of the surgeon to make sure that localization of the level of surgery is appropriate. This is facilitated by the use of skin markers and x-rays before the incision is made. Particular attention is given to arm positioning to protect from compression of nerves.

Intraoperative work: An incision is made, either vertically in the midline with a perpendicular incision along the rib to be excised, or vertically midway between the midline and the vertebral border of the scapula with a horizontal limb angling along the rib to be excised. The paravertebral muscles are divided horizontally. In the upper thoracic spine, more extensive muscle dissection may be necessary to mobilize the scapula. The costotransverse joints and transverse processes are cleared of muscle attachments. The periosteum of the rib is incised and stripped at least 8 cm laterally from the costotransverse joint. The pleura is protected and the rib is cut 8 cm from the joint with a bone cutting tool. The ligaments of the costotransverse joint are cut and the entire section of rib is removed. Intercostal neuro-vascular pedicles serve as landmarks to entry to the vertebral canal; they are ligated or protected as indicated for purpose of the procedure. Access to the intervertebral foramen is facilitated by removal of the transverse process with bone cutting tools. The pleura is protected with malleable retractors, the posterior mediastinum opened and the lateral surface of the vertebral body exposed. If the findings leave any doubt as to the appropriateness of exposure, imaging is used to reassess location. Any tumor, infection or other pathology encountered is attended by biopsy, decompression, and/or excision (which is coded separately). If indicated, a frozen section diagnosis is obtained and additional surgical measures provided as dictated by surgical findings. Drains are placed, a chest tube is inserted (if the pleura has been opened), and the muscles and skin are closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings. A chest tube, if used, is connected to a pump to maintain lung expansion and arrangements are made to monitor its function. Postoperative provision for pain management, antibiotics, and other medication is made. The family is informed of the procedure, findings, and expectations. Chest X-rays are evaluated with or without chest tube to assess presence of pneumothorax. Hemodynamic indicators are followed and blood or fluids given as needed. Any drains used to evacuate the lesion are monitored, advanced, and removed. The chest tube is removed and lung expansion rechecked. Depending upon the preoperative stability of the spine, the pathology found, and the extent of bone removed, bracing, ambulatory assistance devices, and activity limitations are assessed, discussed, and provided for. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Harvard 63064:	80	241	36	0	0	88	8	37	2

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
23.23	63064	Costovertebral approach with decompression of spinal cord or nerve root(s), (eg, herniated intervertebral disk), thoracic; single segment
14.21	63012	Laminectomy with removal of abnormal facets and/or pars inter-articularis with decompression of cauda equina and nerve roots for spondylolisthesis, lumbar (Gill type procedure)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
23.23	090	63064	Costovertebral approach with decompression of spinal cord or nerve root(s), (eg, herniated intervertebral disk), thoracic; single segment

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The total work of the approach and exposure for CPT 63064 (*Costovertebral approach with decompression of spinal cord or nerve root(s), (eg, hemiated intervertebral disk), thoracic; single segment*) is the same as for CPT 21610 (*Costotransversectomy (separate procedure)*). Additional intraoperative time is necessary for decompression of the spinal canal in CPT 63064.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel that is making this recommendation that the Harvard study did not correctly estimate the intraoperative time for patients requiring CPT 21610. Additionally, the postoperative work is underestimated and is more closely matched to CPT 63064.

To calculate an RVW for CPT 21610, that is "relative" to the current RVW for CPT 63064, but is adjusted for intraoperative time differences, one would multiply the intra-RVW* for 63064 by the additional intraoperative time ratio necessary for decompression of the spinal canal; and subtract this value from the total RVW for CPT 63064, as follows: $[13.63 \times (61/241) = 3.45]$; $[23.23 - 3.45 = 19.78]$

The recommended increased RVW, which is the survey median, reflects the similarities between CPT 21610 and CPT 63064 as discussed in the comparison to key references section and takes into account the difference in intraoperative time for decompression of the spinal canal as calculated above. This increased RVW also takes into account the similarity of IWP/UT for CPT 21610 and CPT 63064. The IWP/UT for CPT 21610, based on the recommended RVW of 20.00** is 0.0556. This compares with the IWP/UT of 0.0567 for CPT 63064, with an intra-RVW of 13.63.

It should be noted that a recommendation to increase the RVW for CPT 21610 was made in 1992. The following text presents HCFA's response to this request: "*Costotransversectomy* (CPT code 21610). The current work RVUs for this procedure are 6.30. The requested work RVUs were 11.46. There was considerable disagreement regarding the work of this service. Because of this disagreement, we considered keeping the current value. However, in light of the fact that the majority of reviewers recommended an increase, we have assigned work RVUs of 9.00 to this procedure. We believe this procedure involves slightly less work than the excision of a cervical rib (code 21615), which has work RVUs of 9.51." [Federal Register, Vol. 57, No. 228, November 25, 1992, pg 55940]

The decision to use CPT 21615 as a comparable reference service that involves more work was incorrect. By definition, costotransversectomy includes excision of a rib AND a transverse process of a vertebra (see intraoperative work description above).

Therefore, CPT 21610 cannot be less work than CPT 21615 (excision of a rib). If this assumption was based on the fact that the Harvard intraoperative time estimate for CPT 21610 was less than 21615, then the assumption was made in error because the Harvard reported intraoperative time of 68 minutes is based on the estimate of four general surgeons. In the Medicare population, 1994 NCH data show this procedure to be performed predominantly by neurosurgeons (32%), orthopaedics surgeons (18%), and thoracic surgeons (11%), with general surgeons representing less than 8% of the frequency. The AMA/RUC survey median intraoperative time of 180 minutes is based on the responses of orthopaedic surgeons who are members of the North American Spine Society and the American Spinal Injury Association, and who are familiar with the complexities and intricacies of this procedure.

Note: IWP/UT = intrawork per unit time

*The intraoperative RVW for 63064 is 13.63. This is equal to 67% of the total RVW, per Harvard's estimation of intra- vs. pre-/post-operative "work" (not time), as reported in Harvard Phase 3 - Final Report.

**The intraoperative RVW for 21610 is 10.00. This is equal to 50% of the total (recommended) RVW, per Harvard's estimation of intra- vs. pre-/post-operative "work" (not time), as reported in Harvard Phase 3 - Final Report.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27428 Global Period: 090 1995 RVW: 10.68 Recommended RVW: 13.28
Accepted by Workgroup

CPT Descriptor: Ligamentous reconstruction (augmentation), knee; intra-articular (open)

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old recreational skier sustains a complete tear of the anterior cruciate ligament and tear of the medial collateral ligament of the knee. The anterior cruciate ligament is reconstructed through a mini-arthrotomy approach. The medial collateral ligament is treated non-operatively.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging and laboratory studies, with special attention to reports concerning ligament stability examination and review of MRI, if available; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; supervision of positioning the patient supine with a special operative arm board; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary (i.e., drill guide devices and internal fixation devices for fastening grafts) are present and available in the operative suite. After administration of the anesthetic, the affected knee is carefully examined with ligament laxity recorded and correlations made with the office examination report. A tourniquet on the upper thigh may be used.

Intra-service work: An anterior incision is made over the knee. If a middle third patella tendon/bone autograft is to be taken the graft is now harvested using an oscillating saw to remove bone plugs from the patella and tibial tubercle in continuity with a 10 millimeter wide strip of central patella tendon. Heavy sutures are placed in each end of the bone plugs. An arthrotomy is then performed through the defect in the patella tendon by incising and retracting the fat pad. If hamstring autograft is to be used the semitendinosus and gracilis tendons are harvested with a tendon stripper. The tendons are then doubled and sutured together. A mini-arthrotomy is made through a small medial capsular incision to expose the knee joint. The knee joint is thoroughly inspected visually to identify the tear of the anterior cruciate ligament, inspect for loose bodies and inspect for any meniscal pathology. Torn menisci are excised or repaired (coded separately). The intercondylar notch is debrided with a rongeur with remnants of the torn anterior cruciate ligament being removed. The intercondylar notch is enlarged (a notch plasty) using osteotomes, curettes, rongeurs, gouges, or a power burr, as necessary.

The tibial tunnel is prepared using an appropriate drill guide to mark the anatomic center of the anterior cruciate ligament within the intercondylar notch. The extra-articular point of the drill guide is placed medial to the tibial tubercle and between the level of the tibial joint line and above the sartorius tendon. A guide pin is drilled through the drill guide from exterior to interior. It is very critical that the guide pin enter the knee joint in exactly the point desired by the surgeon. A reamer of appropriate size depending upon the diameter of the graft being used now overdrills the guide pin. The interior of the tibial tunnel and exit points both inside and outside the joint are chamfered with a rasp to insure a smooth bony tunnel.

Intra-service work (continued)

A point is selected far posterior in the intercondylar notch located approximately 7 millimeters anterior to the posterior wall of the rear of the intercondylar notch and lateral femoral condyle. A drill guide is used to place a guide pin at this pre-determined "isometric point" in the lateral superior portion of the intercondylar notch. This guide pin may be placed from inside the joint outward or from outside the joint inward, as appropriate. A reamer of appropriate size depending upon the diameter of the graft being used now overdrills the guide pin. The interior of the femoral tunnel and exit points both inside and outside the joint are chamfered with a rasp to insure a smooth bony tunnel. The tendon graft is passed from exterior through a bone tunnel then across the joint, exiting through the other bone tunnel. Holding the graft and maintaining tension on the sutures attached to each end of the graft, the knee is put through a range of motion to insure that there is no impingement by the femoral condyles or roof of the intercondylar notch on the graft, else the graft will become frayed, stretched and in time will fail. In addition, it must be carefully noted that there is no more than 2 millimeters of movement of the graft during range of motion of the knee. After range of motion assessment, the graft is secured on the femoral and tibial side according to the requirements of the tissue used for the graft and the desires of the surgeon (e.g., interference screws, staples, or sutures attached to bone). The knee is carefully tested for stability on the operating table prior to wound closure. A drain is placed. The wounds are closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings, an immobilizing splint, and a Continuous Passive Motion (CPM) apparatus, as necessary. Postoperative work also includes monitoring patient stabilization in the recovery room, with special attention to monitoring of neurovascular status and function of the foot; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including continued monitoring of neurovascular function; adjustments to the splint and CPM apparatus; care and removal of drain; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; periodic assessment and adjustment of the splint; evaluation of periodic imaging reports, if needed; direct patient physiotherapy instruction by the surgeon; ordering and assessing adjunctive physiotherapy progress; and pain medication adjustments. The primary goal of current post-operative rehabilitation is the surgeon seeing to it that the patient maintains the ability to fully extend the operated knee. Not to do so frequently leads poor gait patterns resulting from knee flexion contractures or quadriceps extension deficits. Further, the surgeon orders active and assistive flexion exercises be stated immediately after surgery. These are continued and progressed as the post operative course proceeds. Lack of return of knee motion after surgery is a primary reason for poor patient satisfaction.

Harvard 29888:	41	127	22	0	0	27	2	47	4

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
13.28	29888	Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction
15.98	27514	Open treatment of femoral fracture, distal end, medial or lateral condyle, with or without internal or external fixation

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
13.28	090	29888	Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 29888 (*Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction*) is the same service as CPT 27428 (*Ligamentous reconstruction (augmentation), knee; intra-articular (open)*), with the addition of endoscopic assistance. Pre- and post-operative work, time, and intensity are exactly the same. The intraoperative work of the two codes has come to differ only in that the arthroscope is used for visualization in CPT 29888, whereas an arthrotomy is employed in CPT 27428.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This increased RVW corrects a MFS anomaly. For this service, it is the opinion of the Orthopaedic RVS Advisory Panel recommending this RVW, that open procedure (CPT 27428) represents the same amount of total work as the arthroscopically assisted procedure (CPT 29888) and, therefore, should have the same RVW. The similar intraoperative times of the Harvard study for CPT 29888 confirm this rationale.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27429 Global Period: 090 1995 RVW: 11.86 Recommended RVW: 17.75
Workgroup Recommended New Value: 14.67

CPT Descriptor: Ligamentous reconstruction (augmentation), knee; intra-articular (open) and extra-articular

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old recreational skier sustains a complete tear of the anterior cruciate ligament, tear of the medial collateral ligament and injury to the posterior lateral capsular ligaments of the knee. The anterior cruciate ligament is reconstructed through a mini-arthrotomy approach followed by an open repair of the posterior lateral corner of the knee and extra-articular anterior-lateral tenodesis.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging and laboratory studies, with special attention to reports concerning ligament stability examination and review of MRI, if available; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; supervision of positioning the patient supine with a special operative arm board; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary (i.e., drill guide devices and internal fixation devices for fastening grafts) are present and available in the operative suite. After administration of the anesthetic, the affected knee is carefully examined with ligament laxity recorded and correlations made with the office examination report. A tourniquet on the upper thigh may be used.

Intra-service work: An anterior incision is made over the knee. If a middle third patella tendon/bone autograft is to be taken the graft is now harvested using an oscillating saw to remove bone plugs from the patella and tibial tubercle in continuity with a 10 millimeter wide strip of central patella tendon. Heavy sutures are placed in each end of the bone plugs. An arthrotomy is then performed through the defect in the patella tendon by incising and retracting the fat pad. If hamstring autograft is to be used, the semitendinosus and gracilis tendons are harvested with a tendon stripper. The tendons are then doubled and sutured together and a mini-arthrotomy is made through a small medial capsular incision to expose the knee joint.

The knee joint is thoroughly inspected visually to identify the tear of the anterior cruciate ligament, inspect for loose bodies and inspect for any meniscal pathology. If menisci are torn these are treated appropriately with excision or repair (coded separately). The intercondylar notch is debrided with a rongeur with remnants of the torn anterior cruciate ligament being removed. The intercondylar notch is enlarged (a notch plasty) using osteotomes, curettes, rongeurs, gouges, or a power burr, as necessary. The tibial tunnel is prepared using an appropriate drill guide to mark the anatomic center of the anterior cruciate ligament within the intercondylar notch. The extra-articular point of the drill guide is placed medial to the tibial tubercle and between the level of the tibial joint line and above the sartorius tendon. A guide pin is drilled through the drill guide from exterior to interior. [It is very critical that the guide pin enter the knee joint in exactly the point desired by the surgeon.] A reamer of appropriate size depending upon the diameter of the graft being used overdrills the guide pin. The interior of the tibial tunnel and exit points both inside and outside the joint are chamfered with a rasp to insure a smooth bony tunnel.

Intra-service work (continued)

A point is selected far posterior in the intercondylar notch located approximately 7 millimeters anterior to the posterior wall of the rear of the intercondylar notch and lateral femoral condyle. A drill guide is used to place a guide pin at this pre-determined "isometric point" in the lateral superior portion of the intercondylar notch. This guide pin may be placed from inside the joint outward or from outside the joint inward, as appropriate. A reamer of appropriate size depending upon the diameter of the graft being used overdrills the guide pin. The interior of the femoral tunnel and exit points both inside and outside the joint are chamfered with a rasp to insure a smooth bony tunnel. The tendon graft is passed from exterior through a bone tunnel then across the joint and then exiting through the other bone tunnel. Holding the graft and maintaining tension on the sutures attached to each end of the graft, the knee is put through a range of motion to insure that there is no impingement by the femoral condyles or roof of the intercondylar notch on the graft else the graft will become frayed, stretched and in time fail. In addition, it must be carefully noted that there is no more than 2 millimeters of movement of the graft during range of motion of the knee. After range of motion assessment, the graft is secured on the femoral and tibial side according to the requirements of the tissue used for the graft and the desires of the surgeon (e.g., interference screws, staples, or sutures attached to bone). The knee is carefully tested for stability on the operating table prior to wound closure. A drain is placed and the wounds are closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings, an immobilizing splint, and a Continuous Passive Motion (CPM) apparatus, as necessary. Postoperative work also includes monitoring patient stabilization in the recovery room, with special attention to monitoring of neurovascular status and function of the foot; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including continued monitoring of neurovascular function; adjustments to the splint and CPM apparatus; care and removal of drain; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; periodic assessment and adjustment of the splint; evaluation of periodic imaging reports, if needed; direct patient physiotherapy instruction by the surgeon; ordering and assessing adjunctive physiotherapy progress; and pain medication adjustments. The primary goal of current post-operative rehabilitation is the surgeon seeing to it that the patient maintains the ability to fully extend the operated knee. Not to do so frequently leads poor gait patterns resulting from knee flexion contractures or quadriceps extension deficits. Further, the surgeon orders active and assistive flexion exercises be stated immediately after surgery. These are continued and progressed as the post operative course proceeds. Lack of return of knee motion after surgery is a primary reason for poor patient satisfaction.

HARVARD DATA for surveyed service and key reference service(s):

Harvard 27429:	48	136	29	0	0	45	4.5	45	4.5
Harvard 27427:	51	91	18	0	0	32	3	52	4
Harvard 29888:	41	127	22	0	0	27	2	47	4

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
13.28	29888	Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction
8.68	27427	Ligamentous reconstruction (augmentation), knee; extra-articular

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
13.28	090	29888	Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction
8.68	090	27427	Ligamentous reconstruction (augmentation), knee; extra-articular

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 29888 (*Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction*) is a very comparable service to CPT 27429 (*Ligamentous reconstruction (augmentation), knee; intra-articular (open) and extra-articular*). CPT 29888 includes endoscopic assistance, while CPT 27429 includes extra-articular reconstruction, and consequently more intra-operative time and work.

The total work of CPT 27429 is equal to the work of CPT 29888 plus the intra-operative work of CPT 27427 (*Ligamentous reconstruction (augmentation), knee; extra-articular*), which is performed through a separate incision.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel recommending this RVW, that the Harvard study significantly underestimated the intraoperative time for CPT 27429. This is confirmed by the AAOS AMA/RUC large survey response which resulted in an estimated intraoperative time well above the Harvard estimate. In fact, even the estimate at the 25th percentile exceeded the Harvard estimate.

This increased RVW is approximately equal to the RVW for CPT 29888 (13.28) plus 51% of the RVW* for CPT 27427 (8.28), and is consistent with the total work components that comprise this service.

[13.28 + 4.22 = 17.50]

*The intraoperative RVW for 27427 is 4.22. [This is equal to 51% of the total RVW, per Harvard's estimation of intra- vs. pre-/post-operative "work" (not time), as reported in Harvard Phase 3 - Final Report.]

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 29889 Global Period: 090 1995 RVW: 10.76 Recommended RVW: 17.75
Workgroup Recommended New Value: 14.41

CPT Descriptor: Arthroscopically aided posterior cruciate ligament repair/augmentation or reconstruction

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 21-year-old skier tears the posterior cruciated ligament and requires arthroscopically aided ligament reconstruction.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging and laboratory studies, with special attention to reports concerning ligament stability examination and review of MRI, if available; consulting with the referring physician, if necessary, and other health care professionals; ordering preoperative supplemental steroid medication, if required; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; supervision of positioning the patient, using a mechanical leg holder to support the upper thigh and facilitate movement and exposure of the knee; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary (i.e., drill guide devices and internal fixation devices for fastening grafts) are present and available in the operative suite; and supervising the application of a tourniquet on the upper thigh, if appropriate.

Intraoperative work: A bone/middle third patella tendon/bone autograft (when used) is harvested through an anterior incision using oscillating saw to remove bone plugs and contiguous middle third of patella tendon. (Fresh frozen Achilles tendon allograft may also be used but this requires the same degree of "back table" sterile preparation of the graft as does the patella tendon autograft). When autograft or allograft is used, it is included in the work of 29889 and, as stated, the same degree of careful graft preparation is required with both auto- and allograft.

After graft preparation is complete, then arthroscopic instruments are inserted into the knee with gravity or pump inflow through a superior arthroscopic portal and the arthroscope inserted from inferior lateral. Instrumentation for the procedure is brought in through an inferior medial patella portal. Video arthroscopy of the procedure with appropriate photographs and videotaping is frequently done. A 2 centimeter posterior medial skin incision is made that allows protection of the posterior neurovascular structures and through this incision one can monitor equipment working in the posterior aspect of the knee joint. This posterior medial incision begins at the level of the knee joint and extends distally approximately 2 centimeters. After opening the deep fascia, the surgeon's finger can be passed anterior to the medial head of the gastrocnemius muscle and neurovascular structures and posterior to the capsule of the knee joint. The posterior cruciate ligament fossa can be palpated through the capsule. The surgeon's finger is maintained in an extra-capsular position. If the surgeon wishes to avoid the necessity of a posterior medial incision, then intraoperative x-ray (C-arm fluoroscopy) must be used periodically during the procedure to insure proper placement of drill guides and drills to insure safety to the posterior neurovascular structures.

Intraoperative work (continued)

A diagnostic arthroscopy is included as part of this procedure, however, any meniscal pathology that is corrected is coded separately. A "Notch plasty" is performed to enlarge the intercondylar notch using a power burr. The posterior cruciate ligament stumps are debrided with a power instrument leaving remnants to serve as anatomic landmarks. The posterior cruciate ligament fossa is debrided and the posterior capsule is elevated from bone using a special curved knife, rasp and elevator. The surgeon's finger placed posterior medially insures that this latter dissection is done in its proper location and is done safely. This capsular elevation extends approximately 2 centimeters below the posterior tibial ridge. A drill guide is positioned so that the guide wire enters the anterior medial proximal tibia approximately 2 centimeters below the tibial tubercle and exits the tibial ridge posteriorly. The tip of the guide wire is monitored at all times by the surgeon's finger tip in the posterior medial incision. The tibial tunnel is made with a cannulated tibial reamer of the appropriate size. Soft tissue is carefully removed from the openings of the tunnel. A femoral tunnel is made by passing a guide wire from outside the knee using a drill guide to enter the knee joint at the center of the posterior cruciate ligament stump. The femoral tunnel is reamed to the same size as the graft material with all reaming debris evacuated with motorized instrumentation. A Luque wire is passed through the tibial tunnel into the back of the knee joint. The wire is then pulled out through the femoral tunnel. This may be a very difficult and time consuming portion of the procedure since the wire must pass sharply at the posterior aspect of the tibial tunnel at the rear of the knee and then round into the center of the knee joint where it must then be grasped with arthroscopic tools and pulled up into the femoral tunnel. A flexible rasp is then attached to the Luque wire and pulled through both tunnels in order to smooth the tissues around the tunnel edges. The graft material is attached to the end of the flexible rasp with traction sutures and then pulled into position. The graft material is then secured at the tibial tunnel and the femoral tunnels with interference screw or button and suture fixation. Care must be made prior to securing the graft that no impingement on the graft occurs from surrounding bone during the full range of motion. Further, there must be no bony impingement upon the graft in the intercondylar notch. Testing the knee for proper ligament stability must be done with adjusting the positioning of the graft if ligament stability is not achieved. An interarticular drain is placed and brought out through the skin through one of the arthroscopic portals. The posterior medial skin incision is closed in layers.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings, an immobilizing splint, and a Continuous Passive Motion (CPM) apparatus, as necessary. Postoperative work also includes monitoring patient stabilization in the recovery room, with special attention to monitoring of neurovascular status and function of the foot; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including continued monitoring of neurovascular function; adjustments to the splint and CPM apparatus; care and removal of drain; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; periodic assessment and adjustment of the splint; evaluation of periodic imaging reports, if needed; direct patient physiotherapy instruction by the surgeon; ordering and assessing adjunctive physiotherapy progress; and pain medication adjustments. The primary goal of current post-operative rehabilitation is the surgeon seeing to it that the patient maintains the ability to fully extend the operated knee. Not to do so frequently leads poor gait patterns resulting from knee flexion contractures or quadriceps extension deficits. Further, the surgeon orders active and assistive flexion exercises be stated immediately after surgery. These are continued and progressed as the post operative course proceeds. Lack of return of knee motion after surgery is a primary reason for poor patient satisfaction.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
13.28	29888	Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction
19.69	27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee replacement)

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
13.28	090	29888	Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 29889 (*Arthroscopically aided posterior cruciate ligament repair/augmentation or reconstruction*) involves more work in terms of depth and degree as compared with CPT 29888 (*Arthroscopically aided anterior cruciate ligament repair/augmentation or reconstruction*). CPT 29889 frequently requires a secondary posterior incision to protect the popliteal artery and X-ray control is often necessary for accuracy in proper bone tunneling and graft placement. Postoperatively, CPT 29889 requires more visits for monitoring the progress of the patient's mobilization

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This increased RVW corrects a MFS anomaly. For this service, it is the opinion of the Orthopaedic RVS Advisory Panel recommending this RVW, and the survey confirms, that the Harvard study did not correctly estimate the intraoperative and postoperative time for patients requiring CPT 29889. The recommended increased RVW is higher than the RVW for the key reference service (CPT 29888) and takes into account the differences in total time and intraoperative intensity (due to the risk of injury and the need for protection of the popliteal neurovascular structures).

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 23395 Global Period: 090 1995 RVW: 12.42 Recommended RVW: 16.00
Accepted by Workgroup

CPT Descriptor: Muscle transfer, any type, shoulder or upper arm; single

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old worker with scapular disability and pain due to scapular winging undergoes pectoralis major transfer.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to review of neurovascular studies; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; arranging for preoperative antibiotics and intra-operative blood product supply; supervision of positioning changes, where the patient is initially placed in a supine position until adequate general anesthesia is obtained, after which the patient is repositioned to about 30 to 45 degrees onto the left/right side to allow adequate access to the anterior shoulder as well as to the inferior pole of the scapula; supervision of prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite. Additionally, a pneumatic tourniquet is placed about the upper thigh of the leg and then the leg is elevated and prepped and draped.

Intraoperative work: Attention is first directed to harvesting of the semi-tendinosus gracilis graft using instruments placed on a separate table, not touching the main operating room table, in order to isolate the two fields. A 3 to 4 cm incision is made just inferior and medial to the tibial tubercle. Sharp dissection is employed through the subcutaneous tissues. Subcutaneous flaps are mobilized. Sartorius tendon and layer one are palpated. The semi-tendinosus and gracilis are palpated just underneath this. Next a longitudinal incision is made just above these palpable tendons and using a Metzenbaum scissor, layer one is split. A right angle clamp is then placed underneath each tendon and fascia, with extension to the posterior crural fascia. Using a concept tendon stripper, each of the tendons is harvested and dissected at their insertions into the tibia and then taken to the back table where muscle is removed from their proximal portions. The tendons are then woven together parallel to one another in order to increase the thickness of the graft, leaving sutures at each end so the tendon could be passed. The tendon is placed into a sterile saline bath, hemostasis is obtained with electrocautery, and the incision is closed with interrupted 0 and 2-0 Vicryl and a running subcuticular PDS suture for the skin reinforced with Steri-Strips. The tourniquet is deflated and this area of the field is redraped off. Gloves are changed and attention is directed to the exposure of the pectoralis major.

Intraoperative work (continued)

An approximately 8 cm incision is made just lateral to the coracoid process and curving down into the axilla over the pectoralis major. Sharp dissection is employed through the subcutaneous tissues down to the fascia overlying the pectoralis major. The subcutaneous flaps are then mobilized medially and laterally. The deltopectoral groove is then identified along with the cephalic vein. By digital palpation, the sternal and clavicular portions of the pectoralis major are identified. Bluntly, the two heads are separated from one another by placing the surgeon's finger underneath the pectoralis major inferior border and coming up through the pectoralis major medial to the tendon. A vessel loop is placed around this portion of the pectoralis major and is sharply and bluntly divided from the clavicular portion and traced laterally. Its fascial extensions are divided sharply. The biceps tendon is isolated and manually retracted medially and, using a #15 blade, the tendon is divided right off the lateral lip of the bicipital groove. The tendon of the semi-tendinosus gracilis graft is then taken and woven in a Pulvertaft fashion through the end of the pectoralis major. No. 1 Ethibond suture is used to secure it.

Attention is then directed to exposure of the inferior pole of the scapula. An approximately 3 cm incision is made over the palpable inferior pole of the scapula with the arm in forward flexion and adduction in order to bring the scapula forward. Sharp dissection is employed through subcutaneous tissues down to the latissimus. This is then split bluntly and, using electrocautery, the soft tissues are subperiosteally elevated off the inferior pole of the scapula. A Homan retractor is placed on the external and internal surface of the scapula. The lateral ridge or thickening of the scapula was palpated and, using a Hall, a burr hole is made just medial to this of sufficient size to allow passage of the graft. A looped No. 1 suture is then passed through this hole.. Blunt dissection is performed along the chest wall from this incision up to the incision for the pectoralis major. A soft tissue opening was dilated in order to allow the graft to be passed and the sutures in the end of the graft and pectoralis major are pulled down through the tunnel, pulling the pectoralis major down along the chest wall and out the inferior incision. These sutures, along with the graft, are then passed through the inferior pole of the scapula hole and by pulling up on them the scapula is pulled forward and against the chest wall. No. 1 Ethibond sutures are then used to secure the graft to itself after going through the hole in the anterior pole of the scapula such that it is a loop or stirrup through the anterior pole of the scapula sewn to itself. It is sutured along its length to reinforce the strength of this graft. Assessment is made to assure that the graft has sufficient tension in it with the arm in flex position as well as at the side, indicating that tension had been established with the tendon transfer. The wounds were both irrigated and closed using interrupted 0 and 2-0 Vicryl and a running 3-0 PDS suture for the skin reinforced with Steri-Strips.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings supervision of placement of a shoulder immobilizer and a cryocuff. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including adjustments to the shoulder immobilizer; supervision of the mobilization and ambulation of the patient; care of several operative wounds; ordering and reviewing radiographs; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and proper care of the immobilizer or splint, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging, muscle testing and physical therapy review, neurologic evaluation (EMG), and laboratory reports, if needed; and antibiotic and pain medication adjustments.

HARVARD DATA for surveyed service and key reference service(s):

Harvard: 23395	47	92	30	0	0	35	3.5	40	4.0
Harvard: 23462	54	104	27	0	0	34	3	51	4

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
14.62	23462	Capsulorrhaphy, anterior, any type; with coracoid process transfer
12.69	23412	Repair of ruptured musculotendinous cuff (eg, rotator cuff); chronic

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
14.62	090	23462	Capsulorrhaphy, anterior, any type; with coracoid process transfer

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The intraoperative work and time of CPT 23395 (*Muscle transfer, any type, shoulder or upper arm; single*) is greater than CPT 23462 (*Capsulorrhaphy, anterior, any type; with coracoid process transfer*), because of the mobilization and transfer of a major muscle with its neurovascular pedicle. Additionally, the postoperative care of the patient is greater for CPT 23395 due to the necessary continued assessment of muscle functioning and neurovascular status and necessary bracing/casting.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This RVW is slightly higher than the key reference service (CPT 23462) and reflects the differences in intraoperative and postoperative care, as discussed in the comparison to key references section above.

It is the opinion of the Orthopaedic RVS Advisory Panel presenting this recommendation, and the AMA/RUC survey confirms, that the Harvard study underestimated the intraoperative time for all the different components of this service, and underestimated (through prediction) the postoperative care necessary to monitor most patients requiring this service.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27397 Global Period: 090 1995 RVW: 9.33 Recommended RVW: 12.00
Workgroup Recommended New Value: 10.53

CPT Descriptor: Transplant, hamstring tendon to patella; multiple

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 9-year-old boy with cerebral palsy, spastic diplegia, and a progressive gait disturbance undergoes bilateral multiple hamstring tendon transfer to the patella.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies, with special attention to review of seizure medication dosing (if applicable) and hematological status; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; arranging for intra-operative pneumatic tourniquet; supervising positioning, prepping and "free leg draping" of the patient's legs, well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: This procedure involves the transfer of the medial hamstrings, usually the gracilis and semitendinosus to the medial border of the patella or the quadriceps mechanism. This is usually performed under tourniquet control. After the patient is positioned supine on the operating table and the leg is exsanguinated with an Esmark bandage and a pneumatic tourniquet is inflated to an appropriate pressure, an incision is made along the medial aspect of the knee. The tendons of the gracilis and semitendinosus tendons are identified as close to their distal insertion as possible and divided. The semimembranosus may need to be recessed if it is contracted. Care is taken to avoid injury to the saphenous nerve. Through a lateral incision, the biceps femoris tendon is released from its attachment to the fibular head. The peroneal nerve must be protected and the fibular collateral ligament left uninjured. The tendons are mobilized proximally through a second incision so that they may be redirected anteriorly in a relatively straight line. With the knee in extension the patella is exposed through a third incision and a tunnel is made beneath the periosteum of the superomedial aspect. This is done through two parallel incisions followed by subperiosteal dissection. The hamstring tendons are then routed through this periosteal tunnel. They are then folded back onto themselves and repaired with interrupted nonabsorbable sutures. The tendons may also be woven into the quadriceps mechanism if there is insufficient length. The wound is then irrigated and the subcutaneous tissues and skin closed in layers. The wound may need to be drained. Steri strips are applied to the skin edges. This same procedure may then be performed on the opposite side.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and long leg cast. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular status and hematologic status; care and removal of Hemovac drain; assessing the need for a possible cast change; supervision of physiotherapy; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned physiotherapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures and cast; ordering new orthoses; assessing physiotherapy progress; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments.

Harvard 27692:	n/a								

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
12.69	23412	Repair of ruptured musculotendinous cuff (eg, rotator cuff); chronic
7.97	27394	Lengthening of hamstring tendon; multiple, one leg

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
12.69	090	23412	Repair of ruptured musculotendinous cuff (eg, rotator cuff); chronic
13.55	090	26498	Tendon transfer to restore intrinsic function; all four fingers
7.33	090	27396	Transplant, hamstring tendon to patella; single
9.25	090	27691	Transfer or transplant of single tendon (with muscle redirection or rerouting); anterior tibial or posterior tibial through interosseous space
1.87	ZZZ	27692	Transfer or transplant of single tendon (with muscle redirection or rerouting); each additional tendon

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 23412 (*Repair of ruptured musculotendinous cuff (eg, rotator cuff); chronic*) involves similar complex exposure, but less time than CPT 27397 (*Transplant, hamstring tendon to patella; multiple*).

CPT 26498 (*Tendon transfer to restore intrinsic function; all four fingers*) involves less exposure and depth than CPT 27397, but includes "multiple" tendon transfers.

CPT 27691 (*Transfer or transplant of single tendon (with muscle redirection or rerouting); anterior tibial or posterior tibial through interosseous space*) and CPT 27692 (*Transfer or transplant of single tendon (with muscle redirection or rerouting); each additional tendon*), taken together approximated the total work of CPT 27397, except the latter service involves separate incisions.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

It is the opinion of the Orthopaedic RVS Advisory Panel presenting this recommendation, and the AMA/RUC survey confirms, that the intraoperative time for CPT 27397 was underestimated in the Harvard study. CPT 27397 (multiple tendon transplant) is also more work than CPT codes 27691/27692 taken together as discussed in the comparison to key reference services section above. The combined RVW for these codes is 11.12, and, as such the RVW for CPT 27397 should be greater. CPT 27397 (multiple tendon transplant) takes as much time as CPT 26498 (tendon transfer, four fingers) because of exposure and depth, but may not be as intense and, as such, should reasonably be valued less than CPT 26498.

The current RVW for CPT 27397 represents an anomaly in the MFS when compared with other services involving similar exposure and tendon transfer/transplant as presented. The recommended increased RVW accurately places the work value for CPT 27397 "relative" to similar procedures in the MFS.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 25115 Global Period: 090 1995 RVW: 6.26 Recommended RVW: 9.00
Workgroup Recommended New Value: 8.00

CPT Descriptor: Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis, fungus, Tbc, or other granulomas, rheumatoid arthritis); flexors

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female with rheumatoid arthritis and marked flexor tendon synovitis at the wrist, carpal tunnel, and distal forearm requires surgical excision of all diseased synovium.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to surface anatomy landmarks and suspected area(s) of pathologic materials; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; arranging for intra-operative materials for taking cultures; supervision of the patient positioning and application of special arm operating board; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: An incision is made on the palmar aspect of the distal forearm, wrist, and extending over the carpal tunnel in the mid third of the palm. The incision is then carried through the subcutaneous fat, care is taken to incise the distal antebrachial fascia and to protect and preserve the palmar cutaneous branches of the median and ulnar nerves. An incision is made through the subcutaneous fat in the palm down to the palmar aponeurosis, which is then incised longitudinally. The ulnar nerve and artery are noted and protected in Guyons canal. The transverse carpal ligament is identified, a hemostat placed carefully in the carpal tunnel immediately under the transverse carpal ligament, and the transverse carpal ligament is then incised carefully fiber by fiber along its ulnar aspect under direct vision looking for any branches of the ulnar or medial nerve penetrating the ligament prior to completely incising this ligament. The hypertrophic and bulging and invasive synovium is carefully and tediously removed from about each of nine flexor tendons, individually taking care to preserve each tendon. Cultures of any pathologic fluid, whether it is abnormal tissue, pathologic deposits, or rice bodies that might be present are removed. Specimens are taken for aerobic, anaerobic, fungal and microbacterial cultures. This pathological material is stripped away from the tendons using a combination of scissors, rongeur, and knife. If ruptured tendons are found they may be repaired (coded separately). The median nerve is inspected and protected throughout this procedure. After thorough exploration of the carpal tunnel and the region of the flexor tendons, evidence of invasion of the material in to the wrist joint is noted. Opening and debridement of the wrist joint may be necessary (and coded separately). Material from the tendons is often adherent and has to be stripped away from each tendon individually. The tourniquet is then deflated, hemostasis is obtained, a drain may be inserted, the wound is closed in layers, closing the subcutaneous tissue and then the skin.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including; care, adjustment, and removal of the splint; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned therapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; ordering and assessing therapy progress; evaluation of periodic imaging and laboratory reports, if needed; and antibiotic and pain medication adjustments. Critical wound inspection must be done to ensure no skin slough or circulatory embarrassment occurred as a result of the extensive surgical dissection. The physician orders orthotic supports for the wrist and directs a post operative physical therapy program to recover finger, hand and wrist range of motion and function.

SURVEY DATA: Specialty(s): American Academy of Orthopaedic Surgeons; American Society for Surgery of the Hand

Survey n:	108	RVW	PRE total min	INTRA total min	POST

high	14.00										

HARVARD DATA for surveyed service and key reference service(s):

Harvard 25115:	30	73	22	0	0	25	2.5	40	4.0
Harvard 25260:	43	50	23	0	0	10	1	54	5

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

1995 RVW	CPT	Descriptor
7.33	25260	Repair, tendon or muscle, flexor, forearm and/or wrist; primary, single, each tendon or muscle
11.80	25023	Decompression fasciotomy, forearm and/or wrist; with debridement of nonviable muscle and/or nerve

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

1995 RVW	Global	CPT	Descriptor
7.33	090	25260	Repair, tendon or muscle, flexor, forearm and/or wrist; primary, single, each tendon or muscle

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 25260 (*Repair, tendon or muscle, flexor, forearm and/or wrist; primary, single, each tendon or muscle*) for ONE tendon requires less intraoperative time and effort than CPT 25115 (*Radical excision of bursa, synovia of wrist, or forearm tendon sheaths (eg, tenosynovitis, fungus, Tbc, or other granulomas, rheumatoid arthritis); flexors*) which involves NINE tendons that undergo synovectomy. Additionally, if necessary, carpal tunnel release also adds to the intraoperative time and work of CPT 25115. The need to identify and protect the median nerve adds to the complexity and intensity of CPT 25115.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This RVW is higher than the key reference service (CPT 25260) and reflects the differences in intraoperative time and intensity, as discussed in the comparison to key references section above.

Additionally, it should be noted that the initial valuation of CPT 25115, which was based on the Harvard study, underestimated the intraoperative time of this service.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 26442 Global Period: 090 1995 RVW: 6.10 Recommended RVW: 10.00
Workgroup Recommended New Value: 7.45

CPT Descriptor: Tenolysis, simple, flexor tendon; palm AND finger, each tendon

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male requires a single finger and palmar tenolysis of adhesions after a flexor tendon repair in no-man's land.

Preoperative work begins after the decision to operate is made, from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural imaging, pathology, and laboratory studies; with special attention to location of scarring from injury and previous surgery; consulting with the referring physician, if necessary, and other health care professionals; and communicating with the patient (and/or patient's family) to explain operative risks and benefits and to obtain informed consent. Preoperative work also includes pre-operative scrubbing; supervision of patient positioning with a special operative arm board; supervising prepping and draping the patient, as well as ensuring that the surgical instruments and supplies that are necessary are present and available in the operative suite.

Intraoperative work: An incision is made through the skin taking care to follow and note previous scars from the previous flexor tendon repair. The incision is made from at least the distal portion of the middle phalanx along the palmar aspect of the finger, proximal to the mid-third of the palm. Care is taken to tediously dissect (using loop magnification) the skin from the underlying scar tissue. The incision is carried down to the flexor tendon sheath. The nerve and artery on either side of the finger are dissected out carefully and protected throughout the procedure. The digital arteries and nerves may be adherent to a scar from the previous surgery, as well as adherent to the flexor tendon sheath. The location of the scarring is noted, and the flexor tendon sheath is entered, taking care to identify the area of the fourth annular and the second annular pulleys. The flexor tendon sheath is entered outside these pulleys. Initially, the dissection is done where there is little or no scarring proceeding from the nearly normal into the dense area of scar. The scar tissue is removed from the superficial surface of the flexor tendon. The profundus tendon which had been repaired is identified and, using a combination of knife, scissors, freers, and special dissectors, the profundus tendon is separated from the superficialis tendon. (If both the superficialis and profundus tendon each require tenolysis, they are coded separately.) The single tendon is then freed up. The profundus tendon, for instance, is freed up under the scar, separated from under the closely adherent first, fourth, and second annular pulleys (tendon sheath and bone). The tendon is pulled-on to see if it flexes the proximal interphalangeal and distal interphalangeal joints. If full flexion is not obtained (provided the joint allows full flexion), then additional dissection is done proximally and/or distally. The profundus tendon is identified proximal to the first annular pulley in the palm and freed up from any scar tissue. It is pulled-on to check the amount of excursion of the tendon and how much flexion and extension are obtained. The procedure is somewhat tedious and surgery is not stopped until, by pulling on the flexor tendon in the palm, full flexion of the finger can be obtained.

Another incision is made at the wrist flexion crease, and the profundus tendon identified to this finger after dissecting through the fascia, and pulling on this tendon to make sure that full flexion is obtained. If it is not obtained, then further dissection of the tendon and freeing up of scar tissue and adhesions is done. Once there is full excision of this tendon, and as full a range of motion as possible, then the tourniquet is let down, and hemostasis obtained. The circulation is checked in the finger and the skin closed with multiple sutures.

Postoperative work begins after skin closure in the operating room and includes application of sterile dressings and splint. Postoperative work also includes monitoring patient stabilization in the recovery room; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring neurovascular function of the hand; adjustments of splint; ordering and assessing immediate postoperative therapy; and antibiotic and pain medication management;. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care and planned therapy, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; assessment of therapy progress; evaluation of periodic imaging reports, if needed; and antibiotic and pain medication adjustments. Critical wound inspection must be done to ensure no skin slough or circulatory embarrassment occurred as a result of the surgical dissection. The physician orders orthotic supports for the finger and hand and directs a post operative physical therapy program to recover finger, and hand range of motion and function.

HARVARD DATA for surveyed service and key reference service(s):0

Harvard 26442:	37	63	20	0	0	10	1	35	3.5
Harvard 26390:	49	70	22	0	0	14	1	45	4

Note: Harvard Pre- and Postoperative times are "predicted," not surveyed.

Reference services cited most frequently by survey respondents (Please note that the survey respondent may have estimated an RVW for the surveyed service that is more or less than the reference service chosen):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
7.33	25260	Repair, tendon or muscle, flexor, forearm and/or wrist; primary, single, each tendon or muscle
11.80	25023	Decompression fasciotomy, forearm and/or wrist; with debridement of nonviable muscle and/or nerve

KEY REFERENCE SERVICE(S) cited for use by AAOS RVS ADVISORY PANEL:

<u>1995 RVW</u>	<u>Global</u>	<u>CPT</u>	<u>Descriptor</u>
8.73	090	26390	Flexor tendon excision, implantation of plastic tube or rod for delayed tendon graft, hand or finger

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The intraoperative work of CPT 26390 (Flexor tendon excision, implantation of plastic tube or rod for delayed tendon graft, hand OR finger) is less than CPT 26442 (Tenolysis, simple, flexor tendon; palm AND finger, each tendon) in terms of depth and degree of procedure.

The two procedures are however similar in that they each require exposure of the flexor tendon sheath and its contents.

Both procedures require the preservation of the pulley system, but CPT 26442 requires the meticulous dissection of one flexor tendon from another and the pulleys.

CPT 26390 includes the excision of the flexor tendons which requires lysis of adhesions as in 26442, but in a less meticulous fashion.

The neurovascular structures must be protected in each procedure.

CPT 26390 involves either the finger OR the palm while CPT 26442 includes the finger AND palm.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This RVW is slightly greater than the key reference service (CPT 26390) and reflects the greater total work of CPT 26442, as discussed in the comparison to key references section above.

It is the opinion of the Orthopaedic RVS Advisory Panel presenting this recommendation, and the AAOS AMA/RUC survey confirms, that the Harvard study underestimated the total time for all the different components of this service.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 27894 **Global Period:** 090 **1995 RVW:** 7.64 **Recommended RVW:** 9.13

CPT Descriptor: Decompression fasciotomy, leg; anterior and/or lateral, and posterior compartment(s), with debridement of nonviable muscle and/or nerve

Source and Summary of Comment to HCFA on this service: The original comments submitted by AAOS to HCFA were reviewed but not accepted in entirety by the AMA/RUC Research Subcommittee. AAOS was allowed to withdraw the original comments (representing approximately 1,300 codes) and submit a modest list of 83 codes to survey during the MFS five-year review. This list of misvalued codes was prepared by AAOS and 11 national orthopaedic subspecialty organizations.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old female, who had been trapped under rubble of a collapsed building for 24 hours, presents to the emergency department with one leg swollen and very painful with elevated tissue pressures of all compartments. Fasciotomy and debridement of devitalized muscle is performed as an emergency procedure.

Preoperative work that occurs within 24 hours of the operation involves the initial presentation and assessment of the patient for this emergency procedure. This includes the history and examination of the patient under emergency conditions. Evaluation for musculoskeletal injuries, neurovascular impairment of the extremity, and the general metabolic, renal and circulatory status of the patient must all be done upon initial evaluation of the patient. All pertinent laboratory and imaging studies must be ordered and reviewed promptly. Rapid measurement of pressures within all four compartments of the leg is done with a pressure transducer introduced with a needle into the muscle compartment. Rather than absolute tissue pressure measurement, considering the difference (ΔP) between tissue pressure and mean arterial pressure is a better indicator of tissue ischemia. The patient and family are thoroughly counseled as to the significance of the clinical problem which might result in amputation (at worst) or loss of muscle tissue and permanent ambulatory disability (at best). Other preoperative tasks involve scheduling an emergent surgery, making sure that appropriate preoperative antibiotics and IV fluids are being administered, as well as providing necessary tetanus prophylaxis. Direct communication with the anesthesiologist and possibly a vascular surgeon (should arterial repairs be necessary) is necessary prior to taking the patient to the operating room. The surgeon positions the patient on the operating table and supervises the skin preparation and applies surgical draping to allow complete access to the entire circumference of the leg from mid thigh to toes. Compartment tissue pressure measurements may be repeated at this time.

Intraoperative work: Release (decompression fasciotomy) of all the leg compartments is most commonly performed through two incisions.* This must be an extensive decompression unlike what is done for exercise-related compartment syndrome.

[*In previous years, a one-incision approach, with fibulectomy, was performed to gain access for decompression and debridement of all four compartments of the leg. Experience and patient outcome analysis has caused an abandonment of this one-incision technique for several reasons:¹ One incision is less likely to provide adequate decompression of compartments. It adds significant soft tissue damage to an already compromised limb by requiring circumferential fibular dissection. Reconstruction of the leg is compromised with fibulectomy in circumstances of a tibial fracture. Complaints often arise of muscle weakness affecting extensor and flexor muscle groups (superimposed upon any disability resulting from the debridement). Ankle instability often occurs as a result of upward displacement of the lateral malleolus remaining following a fibulectomy done within 8 cm. of the distal tip of fibula.²]

At operation, the two incisions, medial and lateral, are placed well around to the sides of the limb and over muscle so that split-thickness skin coverage will be possible if necessary. A lateral incision is made over the intermuscular septum between anterior and lateral compartments, and is long enough to allow access to the entire length of the compartments. It should extend from just distal to the head of the fibula to 5 cm proximal to the lateral malleolus. The superficial peroneal nerve must be located and protected. Both compartments are released by undermining the skin anteriorly and posteriorly and then longitudinally incising the fascia over each compartment separately. Another incision is made just medial to the border of the tibia, with identification and protection of the saphenous vein and nerve. The fascia is released from its insertion to the periosteum of the tibia, and bluntly dissected around the tibia posteriorly to identify and release the deep posterior compartment. This may require subperiosteal release of a separate fascial connection to the tibia. It is important to protect the posterior tibial artery, peroneal artery, and posterior tibial nerve and vein which lay in direct line to the exposure of the deep compartment. Muscle viability in all compartments is assessed by color, consistency, bleeding and contractility. Debridement of devitalized muscle and or nerves is performed as necessary. Compartment pressures are generally re-measured in the operating room to verify release of all four compartments. The wounds are generally left open and covered with fine mesh sterile dressing. The leg is placed in a plaster splint.

Postoperative work begins after application of sterile dressings and leg splint to prevent foot drop. Pulse oximeters are sometimes used in addition to careful monitoring of the circulation, sensation and motor function of the limb in the recovery room. The family is counseled in regards to the extent of the operative findings and if appropriate the possible need for returns to the operating room or possible future amputation. The operative note is dictated and orders are written. Monitoring of urinary output, kidney function, maintaining adequate intravenous fluid intake, antibiotic administration and hemoglobin levels are imperative. Returning the patient to the operating room within 5 days for wound inspection and closure or skin grafting is necessary (billed separately). The surgeon directs physical therapy in protected ambulation with crutches or a walker as well as the exercise to prevent joint contracture. Discharge day management includes the surgeon's final examination of the patient, instructions for continuing care, and preparation of discharge records. Frequent dressing changes and wound inspection are necessary during the post discharge period. Careful follow-up is necessary to identify and promptly treat any deformity that may develop as a result of muscle contracture. Permanent walking aids (orthotics, special shoes, or braces) are frequently necessary and are prescribed by the surgeon.

6.10	27892	Decompression fasciotomy, leg; anterior and/or lateral compartments only, with debridement of nonviable muscle and/or nerve
6.06	27893	Decompression fasciotomy, leg; posterior compartment(s) only, with debridement of nonviable muscle and/or nerve

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and postoperative time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT 27894 involves similar intraoperative exposure, debridement, and decompression as CPT 25033. Preoperative work for CPT 27984 is also similar to CPT 25033. Postoperative care for CPT 27894, involving recovery of weightbearing joints, may be greater than for CPT 25033.

CPT 27894 is a procedure that involves identification and debridement of nonviable muscle and/or nerves, in addition to decompression fasciotomy of compromised muscle compartments of the leg. Reference services 27600, 27601, and 27602 involve only the decompression fasciotomy, and as such, comprise a lesser degree of decision making, require less experience, and much less surgical time and effort than CPT 27894.

CPT 27984 requires twice the intraoperative time as compared with CPT 27602 (Decompression fasciotomy of the same compartments addressed in 27984) and significantly more intensity since the patient requiring CPT 27984 is always a trauma case that presents as a more critically ill patient than a patient requiring CPT 27602. Additionally, a patient requiring CPT 27894 has a much greater degree of postoperative morbidity due to muscle loss, adding to the postoperative intensity of care.

CPT 27984 represents the combination of CPT 27982 and 27983. The latter two procedures are each performed through a separate incision, while the former is performed through two incisions. Further, patients in need of either CPT 27982 or CPT 27983 have less soft tissue damage and, as such, are less susceptible to the metabolic abnormalities (preoperative) and the degree of postoperative disability as seen in patients requiring CPT 27894. Consequently, postoperative care for a patient requiring CPT 27984 is greater than for a patient requiring CPT 27982 or 27983.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A revised RVW of 9.13 is recommended for CPT 27894.

The results of the AAOS/RUC 5-year review survey for CPT 27984 indicate this service requires similar intraoperative work and slightly more postoperative work than CPT 25023, and, as such, the survey median RVW of 11.80 was originally recommended to set an appropriate value for CPT 27894 "relative" to CPT 25033. The RUC Workgroup rejected this rationale.

The Orthopaedic RVS Advisory Panel has reconsidered the original recommendation in light of the comments of the RUC Workgroup, who felt there was a correct rank order currently among CPT codes 27892, 27893, and 27894. While we also agree with the order, we disagree with the magnitude of difference in RVWs between CPT 27894 and the other two fasciotomy with debridement procedures, CPT 27982 and 27983. It should also be noted that the magnitude of difference in work between CPT 27984 and CPT 27982 or 27983 is greater than the magnitude of difference in work between CPT 27602 and CPT 27600 or 27601. CPT 27984 is an infrequently performed procedure that is restricted to patients with limb-threatening conditions primarily due to the extensive death of muscle in multiple leg compartments. Necrosis of tissue in multiple compartments of a limb requires complex decision-making about amputation versus limb salvage, and intense interaction with the patient and family to a greater degree than patients requiring CPT 27892 or 27893 (or 27600, 27601, 27602).

Rationale (continued):

As presented in the relationship to key reference services section above, CPT 27984 represents the sum of CPT 27982 plus CPT 27983, each of which are performed through a separate incision. CPT 27894 involves a significantly greater degree of work/intensity than either CPT 27892 or 27893 because it involves a potentially limb-threatening injury. The patient may be at risk of hypovolemic shock and myoglobin-induced renal failure and must be monitored closely. Further, because of the greater amount of soft tissue damage, postoperative care for patients requiring CPT 27984 is greater than for patients requiring CPT 27982 or 27983.

Given this discussion, it is still the opinion of the Orthopaedic RVS Advisory Panel that, without the assistance of surveyed service time estimates, the initial valuation of CPT 27894 by HCFA in 1992 did not correctly reflect the work involved in providing this service relative to the key reference services cited above. Additionally, it is likely that the one-incision technique was considered, instead of only the two-incision approach (which is now the norm), resulting in an underestimation of time and work when 27602 was valued in the Harvard study.

In comparing the percentage difference in RVW's (see Table 1 below) between the decompression fasciotomy alone and the paired decompression fasciotomy AND debridement codes one finds: a +22% between CPT codes 27600 and 27892; a +22% difference between CPT codes 27601 and 27893; BUT ONLY a +15% difference between CPT codes 27602 and 27894. This latter difference does not take into account the clinical nature of the difficult limb- and (sometimes) life-threatening condition present in a patient who requires CPT 27894 as discussed above.

Table 1: Comparison of 1995 RVWs and Intra-service Time Estimates for Selected Services

Decompression fasciotomy, leg;	WITHOUT debridement of muscle/nerve	WITH debridement of muscle/nerve	% RVW difference
Anterior and/or lateral compartments ONLY	CPT 27600 RVW = 5.02 Intra-time = 27 minutes*	CPT 27982 RVW = 6.10 Intra-time = not surveyed	22%
Posterior compartment(s) ONLY	CPT 27601 RVW = 4.98 Intra-time = 28 minutes*	CPT 27983 RVW = 6.06 Intra-time = not surveyed	22%
BOTH anterior/lateral AND posterior compartments	CPT 27602 RVW = 6.63 Intra-time = 45 minutes*	CPT 27984 RVW = 7.64 Intra-time = 90 minutes**	15%

*Harvard RBRVS Study time estimates.

** AAOS RUC 5-year review survey estimate.

The recommended RVW of 9.13 for CPT 27894 is based on a multiple procedure calculation using the RVW's for CPT codes 27983 and 27982 [$6.10 + 50\%(6.06) = 9.13$]. This RVW represents a +38% difference as compared to CPT 27602. We believe this difference is reasonable and appropriate when compared to the +22% difference for the other paired procedures because of the clinical details and changes in operative technique as described above.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 27259 Global Period: 090 Current RVW: 18.03 Recommended RVW: 20.50

CPT Descriptor:

Open treatment of spontaneous hip dislocation (developmental, including congenital or pathological), replacement of femoral head in acetabulum (including tenotomy, etc); with femoral shaft shortening

Source and Summary of Comment to HCFA on this service: AAP recommended an RVW of 24. The rationale was as follows: This code is not used in adults. Relative work is similar to 35646 or 21433.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 4 year old female with developmental dislocation of the hip undergoes open reduction of the hip and femoral shortening osteotomy.

Description of Pre-Service Work: Pre-service work provided from the day before surgery until the time of the procedure includes: the hospital admission work-up, as well as evaluation of initially obtained information including x-ray studies. Although the pre-operative decision processes occurred prior to the day before surgery, all of these records are reviewed and the parents of the patient are once again counseled in regards to the procedure, the risks, and implications as well as to the necessary post-operative course. This often occurs on the morning of surgery with same day admission. Current history and physical is taken to make sure that in addition to the orthopaedic history and physical, a brief general history and physical is taken to make sure that the child is not sick and that there are no contrary indications to the anesthesia and procedure. The patient is then brought to the operating room, and after induction of anesthesia, is carefully positioned in a manner to allow the hip to be approached and appropriate x-rays to be obtained. This procedure is always done with some type of radiographic monitoring, often with a c-arm. Checking the position of the patient to make sure that adequate radiographic control will occur during surgery is next performed. Appropriate draping of the patient to allow the hip area to be exposed is performed, followed by surgical preparation of the patient and scrubbing of the physician. The patient is draped to allow adequate exposure of the hip and mobilization of the extremity as is necessary. It should be noted that in the pediatric population, assistance with induction of anesthesia and placement of appropriate intravenous lines is often performed in conjunction with the anesthesiologist in the operating room.

Description of Intra-Service Work: Intra-service work involves the placement of usually two skin incisions, the first of which is along the iliac crest and exposes the anterior hip joint. This incision involves mobilization of the abductor musculature from the ileum, rectus femorous musculature from the pelvis, as well as sartorius musculature from the pelvis. The entire hip capsule is exposed anteriorly and opened in an appropriate manner to allow reduction of the hip. The acetabulum is cleaned of the ligamentum teres and the fat gland that may be present. The reduction of the hip is deferred until the femoral shaft osteotomy is performed. The surgeon may elect to extend the incision over the entire anterior leg extending laterally or to make a second incision over the greater trochanter and extending distally for 4 to 5 inches to expose the subtrochanteric area of the femur. This is exposed circumferentially after elevating the vastus lateralis and vastus intermedius muscle and dividing the tensor fasciae latae longitudinally. The femoral osteotomy is then performed to allow the femur to be shortened to take pressure off of the hip. At this point, the hip is then reduced and the reduction is checked for stability. At the appropriate femoral shaft length, the femur is cut and the proximal femur is then attached to the distal femur with some type of screw plate device often with a preliminary placement of guide pins in the femoral neck. This fixation is completed. The hip is then reduced and a capsulorrhaphy is performed in order to maintain the reduction. The wound is then closed. The closure involves approximation of all the muscles that have been divided from their origins including sartorius, rectus femorous, gluteus medius, and tensor fasciae latae. Through the lateral incision, the vastus lateralis and intermedius are re-attached and the tensor fasciae latae is approximated. Stability of the hip is checked under c-arm control prior to closure. The wounds are sterilely dressed.

CPT Code: 27259

Description of Post-Service Work: After completion of the surgical work, the patient is placed on a casting frame and x-ray verification of the position of the hip on the casting frame is often obtained. Bilateral spica cast is then applied. This involves placement of appropriate protective felt pads and the positioning of the hip that is more satisfactory for maintenance of the reduction and stabilization of the hip. The cast goes from the nipple line, usually to the toes of both feet. Following application of this cast, careful trimming of the cast to allow hygiene as well as urinary and perineal care is performed. An x-ray is taken in the cast to make sure the position of the hip is adequate. If necessary a post-operative CT scan of the hip is obtained to verify the position interpretation of these x-rays and interpretation of the CT scan if taken is necessary for follow-up care. The patient is then awakened. Care is taken to make sure there is adequate room in the cast for expansion of the abdomen during eating and breathing. Following awakening from anesthesia, and satisfactory of the patient, the operative note is dictated, and orders are written. Following this the surgeon will then counsel the family in regards to the procedure that has been performed, the expectations, and follow-up care.

The patient is subsequently seen on the day of surgery in follow-up to make sure that the distal extremity function is appropriate and there is appropriate room for the abdomen and additional trimming of the cast if necessary. The patient is then hospitalized for 4 days post-operatively, the patient being visited once or twice by the attending physician to make sure that function is adequate. Instruction of the parents and caregivers in regards to care of the patient including care of the cast is performed. Communication with the patient's primary care physician occurs usually on the day of surgery. Following discharge from the hospital, the patient is seen in approximately one week to make sure he is doing well in the cast with trimming as necessary and an x-ray being taken in the cast to make sure that the position is adequate. The patient is then seen in follow-up in 3 to 4 weeks after the initial follow-up visit with new x-rays being obtained, the patient is carefully examined, and the cast modified as necessary. At approximately 6 to 8 weeks after surgery, the patient is again seen in follow-up and the cast is either removed in the office and a new cast applied or the patient is scheduled for surgery for purposes of examination under anesthesia and placement of a new spica cast. This procedure is performed under anesthesia in the very young children where change of the cast in the office is not reasonable. The patient is then seen approximately one month after this cast change and seen monthly there after. Each visit consists of examination, x-rays, interpretation of the x-rays, and modification of the cast as necessary. At approximately 90 days post-operatively, the patient is removed from the spica cast and begun mobilization of the hips. This visit includes arrangements for any necessary physical therapy and gait instructions, evaluation of the extremities in regards to mobilization of the extremities, and arrangement of the necessary post-operative post-casting course at home. An average of four post-surgery office visits are performed.

SURVEY DATA:

Specialty: American Academy of Pediatrics

CPT Code: 27259**KEY REFERENCE SERVICE(S):**

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip replacement), with or without autograft or allograft	18.68
2)	27165*	Osteotomy, intertrochanteric or subtrochanteric including internal or external fixation and/or cast	16.20
3)	27254	Open treatment of hip dislocation, traumatic, with acetabular wall and femoral head fracture, with or without internal or external fixation	17.29

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

27259 involves 3.5 times more intra-service work than 27165, 1.75 times more than 27130, and 1.4 times more than 27254. Mental effort and judgement are higher for 27259 than the 3 referenced codes. Technical skill and effort are equal for 27259, both are more than the other reference codes. Psychological stress is the highest for 27259. Similar work is present for 27259 and 27130 pre-operative positioning and evaluation. However, significantly less consultation is necessary for 27130 as one is only dealing with the patient and not the entire family. This code does not involve the risks of growth of the hip that are present with 27259. The surgical procedure 27130 involves a similar but significantly less extensive surgical exposure of the hip joint and capsule and similar opening of the capsule. 27130 does not involve the femoral osteotomy and does not involve reduction of the hip into the acetabulum and capsulorrhaphy. 27130 does involve the prosthetic replacement of the proximal femur of acetabulum. Post-service period of 27130 does not involve application of the spica cast. It involves significantly less office visits and slightly more post-surgery hospitalization time.

27165 is identical to the femoral osteotomy portion of 27259 and could be used in conjunction with 27258 for separate coding of this procedure when done in separate operations.

27254 involves similar but less extensive acetabular exposure. It does involve fixation of the fracture fragments rather than the repair of the capsule and reduction of the hip.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Review of the survey results indicates the mean intra-operative time for 27259 is 3.5 times longer than for 27165, 1.75 times longer than 27130, and 1.4 times longer than 27254. The median surveyed intra-service time of 210 minutes is significantly greater than the 141 minutes suggested by the Harvard data. Thus, the Academy is recommending that the RVW be increased from 18.03 to 20.50.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 27725 Global Period: 090 Current RVW: 11.04 Recommended RVW: 14.50

CPT Descriptor:

Repair of nonunion or malunion, tibia; by synostosis, with fibula, any method

Source and Summary of Comment to HCFA on this service: AAOS recommended an RVW of 16.10 based on the Abt Study. The AAOS decided not to survey this code.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 10 year old male with non-union of the tibia undergoes transport of ipsilateral fibula and creation of proximal and distal synostosis, not including bone graft.

Description of Pre-Service Work: Pre-service work includes the admission evaluation including an updated history and physical to make sure that the patient is not ill as well as the evaluation of any changes that have occurred in the lower extremities since the time of the last office visit. Repeat counseling of the patient and the family will occur with an elaborate discussion of the risks and expectations. In the operating room, proper position of the patient must occur after induction of anesthesia to allow for appropriate x-rays to be taken on an intra-operative basis. Often the c-arm may be utilized. Positioning and testing of the c-arm is necessary. The tourniquet is then placed by the operating physician and proper preparation of the iliac crest donor site that may be used is also made. This procedure may be done in the lateral or prone position. Positioning involved in the prone and lateral position is significant to make sure that adequate positioning and avoidance of any skin pressure present as well as avoidance of any pressure on the opposite perineal nerve. The leg and the potential donor site are then prepped, usually by the operating room staff while the surgeon scrubs. After gowning and gloving, the surgeon drapes the wound to allow appropriate exposure. The extremity is then exsanguinated and the tourniquet elevated to a reasonable pressure to allow a relatively bloodless field for the surgical procedure.

Description of Intra-Service Work: This procedure is often done for an open unhealed tibia fracture. Exposure is usually made over the fibula and carried down carefully avoiding any damage to the perineal nerve, posterior tibial artery, or posterior tibial nerve. Exposure is carried down just posterior to the interosseous membrane to the level of the previous tibia fracture. Incision needs to be almost 80% of the length of the fibula to allow transport of the fibula to the tibia. After appropriate preparation of the tibial beds for transport, appropriate osteotomies are made on the proximal and distal fibula. The fibula is mobilized on its neurovascular bundle usually without dissection of the neurovascular bundle, to level of the tibia where it is approximated often with screws from the fibula to the tibia. Careful x-ray control to make sure that the alignment on the tibia is appropriate as the fibula is fixed to the tibia proximally and distally is made. Additional bone grafting is often used in this posterior bed. This is often obtained from the iliac crest with a separate incision. Careful evaluation of the blood supply is made. The tourniquet is deflated prior to any closure. The ankle is addressed and after the fibular osteotomy, it is often necessary to stabilize the remaining distal fibula to the tibia. This is usually done with 1 or 2 syndesmosis screws that are done under x-ray control from the fibula to the tibia. It is usually not necessary to stabilize the proximal fibula. The wound is then closed in layers over drains in an appropriate manner and the patient is immobilized in a splint or cast post-operatively. Vascular evaluation after the transfer is performed.

CPT Code: 27725

Description of Post-Service Work: After completion of the wound closure, a cast or splint is applied and the wound is dressed as the patient awakens in the recovery area. Evaluation of the neurological function after the patient is awakened occurs as well as any drainage, orders are written. Operative note is dictated and the family of the patient is counseled at length in regards to what has occurred. Post-operative x-rays are usually taken and evaluated in the recovery room. This is in addition to the intra-operative films. The patient is seen later that day and evaluated in regards to the neurovascular function and swelling. Post-operative visits in the hospital occur with evaluation of the lower extremity in regards to neurovascular function and swelling. Post-operative visits in the hospital occur with evaluation of the lower extremity in regards to neurological function, vascular supply, and swelling. If a patient has been placed in a splint, this may be changed to a cast prior to discharge. If a cast has been applied, it may be necessary to split the cast to allow for adequate circulation to occur. The patient is seen during the first 90 days post-operatively approximately four times. The patient is usually discharged on the fourth post-operative day. These visits include evaluation of the wound, x-rays that are taken at approximately one month, and at two months and at three months. If a shunt has been used in the hospital, casts are usually applied on the first post-discharge visit. This will be changed on a monthly basis in the office with removal of the cast. Evaluation of the wounds and application of a new cast will be done in the office. Post-discharge visits usually occur approximately one week following discharge, one month following surgery, two months following surgery, and three months following surgery.

SURVEY DATA:Specialty: American Academy of PediatricsSample Size: 103 Response Rate (%): 30% Median RVW: 14.5025th Percentile RVW: 12.00 75th Percentile RVW: 16.13 Low: 12.00 High: 45.00Median Pre-Service Time: 60 min Median Intra-Service Time: 150 min25th Percentile Intra-Svc Time: 120 min 75th Percentile Intra-Svc Time: 180 m Low: 90 m High: 240 m

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30 min</u>	
ICU:	<u>0 min</u>	<u>0</u>
Other Hospital:	<u>60 min</u>	<u>4</u>
Office:	<u>80 min</u>	<u>4</u>

CPT Code: 27725**KEY REFERENCE SERVICE(S):**

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	27758	Open treatment of tibial shaft fracture, (with or without fibular fracture) with plate/screws, with or without cerclage	10.51
2)	24410	Multiple osteotomies with realignment on intramedullary rod, humeral shaft (Sofield type procedure)	14.28

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

27758 involves significantly less pre-operative evaluation and counseling. The intra-operative procedure is a much more limited exposure with application of the fixation device. Osteotomy and transport of the fibula and fixation of the fibula is not necessary. The wound is much less involved than the wound in 27725. Position is necessary, but does not need to be as exact as with 27725.

24410 involves an exposure of similar difficulty with multiple osteotomies of the humerus and intramedullary rodding done under x-ray control. The level of difficulty of this surgical procedure is identical. The wound exposure is of equal significance in difficulty.

However, 27725 usually involves a much more complex situation with missing bone from the tibia being present. The overall level of difficulty of 24410 is very similar to 27725. Mental effort, judgment, technical skill, physical effort and psychological stress is dramatically lower for 27725 than 27758. The se factors are more for 27725 than 24410. 24410 demands more mental effort, technical skill, and psychological stress than 27758.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

27725 demands extensive technical skill and physical effort for the exposure and transport of the fibula to the tibia. This is often done with a dramatic defect in the tibia being present. AN increased time and physical effort is well documented by the median surveyed intra-operative times which are 2.5 times that of 27758 and 167% of 27514. In addition, the median surveyed intra-operative time of 150 minutes is significantly greater than the 121 minutes suggested by the Harvard data. Thus, the Academy is recommending an increase in the RVW from 11.04 to 14.50.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 28760 Global Period: 090 Current RVW: 5.47 Recommended RVW: 8.00

CPT Descriptor: Arthrodesis, great toe, interphalangeal joint, with extensor hallucis longus transfer to first metatarsal neck (Jones type procedure)

Source and Summary of Comment to HCFA on this service: AAP recommended an RVW of 9.82. The rationale was as follows: This code is undervalued. Relative work is similar to 27418. Complexity is similar in children and adults. This procedure is commonly done in children and less commonly done in adults.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14 year old female with cavus foot and claw toes undergoes transfer of the extensor hallucis longus tendon to the first metatarsal neck and arthrodesis of the great toe interphalangeal joint.

Description of Pre-Service Work: Pre-service work includes history and physical evaluation making sure that the patient being brought to surgery is not sick or developed any interim problems. Repeat evaluation of the foot just prior to surgery in the pre-anesthesia area or in the ward is performed to verify the indications and recommendations. This includes re-evaluation of all the x-rays that are available. Repeat counseling of the patient and family is performed with verification of the operative permission being obtained. The patient is brought to the operating room and anesthesia is inducted. The surgeon then positions the patient in a manner to allow exposure of the foot for the surgical procedure. X-ray control is often utilized for the arthrodesis portion of the great toe. Positioning the patient to allow adequate x-ray exposure is mandatory. Elevation of the pelvis to rotate the leg in an appropriate manner is necessary. The tourniquet is placed by the operating surgeon. The lower extremity is then prepped by the operating staff while the surgeon scrubs. After the surgeon is dressed, the lower extremity is draped and the tourniquet elevated to an appropriate pressure.

Description of Intra-Service Work: Intra-service work involves the planning of an appropriate incision to allow exposure and transfer of the extensor hallucis longus tendon, as well as exposure of the interphalangeal joint. Usually a fixation device is placed through the distal portion of the distal phalanx. Surgical exposure involves exposure of the extensor tendon, both at the IP joint level and the dorsal foot. Care to avoid division of the short extensor tendons and sensory nerves is made and the extensors hallucis longus tendon is brought proximal. It is necessary to expose the neck of the first metatarsal so that an appropriate hole can be made to transfer the extensor hallucis longus tendon through the metatarsal neck in the dorsiflexed position. After this has been passed through the appropriately prepared holes, it is sutured upon itself so that it may function as a dorsiflexor of the first metatarsal. Following this, the IP joint of the first toe is prepared for fusion by removing the cartilage from the distal proximal phalanx, making sure that these are prepared in a manner to place the toe in an ideal position. The joint is then reduced to the desired position and fixed with either longitudinal Steinmann pin, Kirschner wire or threaded screw. X-ray control is often obtained to make sure that the placement has been in the most desired position. The position of the foot is then evaluated, the wound irrigated and closed usually after release of the tourniquet. A sterile dressing is applied.

Description of Post-Service Work: Post-service work includes application of a splint with the ankle dorsiflexed at 90 degrees with the foot in the desired position or a short leg cast that will allow the patient to walk. After the patient is awakened and returned to the recovery room, circulation of the foot is evaluated. Post-operative orders are written and the operative note is dictated. The family then is counseled in regards to the procedure and plan. Later on the same surgical day, the patient is seen in follow-up to make sure that circulation is maintained. Post-operatively the patient is hospitalized for an average of 2 days with the necessity of a cast or splint being changed to a short-leg walking cast. As soon as the patient is comfortable and circulation is adequate, the patient is discharged to office follow-up, where an average of four visits are necessary within the first 90 days. The first visit usually takes place one week after surgery and the wound is inspected and the cast may be changed. The patient is seen one month, two months, and three months following surgery. Usually at a period of three months, the cast is discontinued and the patient allowed to ambulate. If a brace was necessary prior to surgery, the brace is refitted or refabricated as necessary.

CPT Code: 28760**SURVEY DATA:**Specialty: American Academy of PediatricsSample Size: 103 Response Rate (%): 30% Median RVW: 8.0025th Percentile RVW: 6.50 75th Percentile RVW: 9.80 Low: 5.00 High: 12.00Median Pre-Service Time: 60 min Median Intra-Service Time: 90 min25th Percentile Intra-Svc Time: 62.5 min 75th Percentile Intra-Svc Time: 102.5 m Low: 60 m High: 150 mMedian Post-Service Time: Total Time Number of Visits

1)	28285*	Hammertoe operation, one toe (eg, interphalangeal fusion, filleting, phalangectomy)	4.41
2)	28485*	Open treatment of metatarsal fracture, with or without internal or external fixation, each	5.31
3)	28725	Subtalar arthrodesis	10.86
4)	28264	Capsulotomy, midtarsal (Heyman type procedure)	9.80

*indicates presence on MPC

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Pre-operative time and intensity is significantly more for 28760 than for 28285 and is equal to 28485 and 28725. 28760 is significantly more physician work than 28285 and 28485. The physician work of 28760 is similar to that of 28725 and 28264.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Intra-operative time for 28760 are significantly more than for 28285 (6 times more) and 28485 (2 times more), and more similar to 28725 (86%) and 28264 (116 percent). Mental effort and judgment are identical for 28760, 28725, and 28264, and significantly higher than for 28285 and 28485. Technical skill and physical effort have a similar between 28760 and the reference services. Psychological stress is related in a similar manner. Also, the median surveyed intra-service time of 90 minutes is significantly greater than the 63 minutes suggested by Harvard data. Thus, the Academy is recommending an increase in the RVW from 5.47 to 8.00.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Podiatry

The American Podiatric Medical Association, Inc. (APMA) submitted comments to HCFA on services that their members frequently perform which may be inappropriately valued. Their comments were based on surveys of the members of the organization representing the spectrum of foot and ankle services as well as geographic diversity. In addition, the organization also relied on data from two previous national surveys on pre-service and intra-service care prepared by the APMA for the Physician Payment Review Commission.

APMA submitted recommendations to the RUC for review in two formats: 1) surveyed services with completed summary of recommendation forms; and 2) a letter detailing rationale for those services they did not survey. The RUC did not believe the APMA had provided compelling evidence for changing the RVUs for any of the services for which no survey was conducted.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28080	Removal of foot lesion	3.18	3.18	The work is similar to code 64774 <i>Excision of neuroma; cutaneous nerve, surgically identifiable</i> (work RVU = 4.86). The intraservice time of 28080 is greater as the physician is required to excise a "deep" neuroma. The intensity of the two services are the same.	The APMA survey time was equal to the Harvard survey. No other compelling evidence was presented.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28113	Part removal of metatarsal	4.09	4.23	<p>The work is similar to code 28112 <i>Ostectomy, complete excision; other metatarsal head (second, third, or fourth)</i> (rvw = 4.23). The work to perform an ostectomy of the fifth metatarsal is virtually the same, measured in time and intensity. In fact, the postoperative management of 28113 is frequently more complicated and often involves longer healing time and greater patient disability due to the lateral shoe pressure of the operative site.</p> <p>The AAOS commented that they agreed with this recommendation.</p>	The RUC agreed that the work RVU for 28113 should be equal to 28112.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28114	Removal of metatarsal heads	7.16	7.16	<p>This service is comparable to 28112 [RVW 4.23] billed three times and 28113 [4.09]. The multiple surgery rule would equal 10.51 (100% of 4.23, 50% of 4.23, 50% of 4.23, and 50% of 4.09). In addition, the new RVW of 10.51 would still not recognize the additional work associated with performing the partial phalangectomies at each metatarsophalangeal joint.</p> <p>AAOS agrees with recommendation and compares the work of this service to 28725 <i>subtalar arthrodesis</i> (work RVU = 10.86).</p>	No compelling evidence was presented to increase the current value. APMA will have the opportunity to present further evidence in February	2

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28285	Repair of hammertoe	4.41	4.41	The American Society of General Surgeons included this service in a list of codes submitted in their public comment letter. The ASGS comments were based on a study using the whipple procedure as a benchmark.	No survey data or other compelling evidence was presented for this service.	2
28288	Partial removal of foot bone	3.73	4.23	APMA commented that this service is comparable to 28285 <i>Repair of a hammertoe</i> (rvu = 4.41). These services require almost the same amount of pre- and intra-service work. The intensity and mental judgment and effort are essentially the same for both procedures	RUC evaluated the APMA survey and an AAOS comment and agreed that the work is similar to 28122 <i>Ostectomy, complete excision; metatarsal head (second, third, or fourth)</i> (RVU = 4.23). This procedure is typically performed on the 5th metatarsal and there is an increase in post-operative complications.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28292	Correction of bunion	6.24	6.24	These services are undervalued when compared to reference services 28296 <i>Hallux valgus (bunion) correction, with or without sesamoidectomy; with metatarsal osteotomy (eg, Mitchel, Chevron, or concentric type procedures)</i> (work RVU = 8.69)	The APMA survey intra-service time is equal to Harvard data. No other compelling evidence was presented.	2
28293	Correction of bunion	8.25	8.25			2
28299	Correction of bunion	8.46	8.46		APMA did not conduct a survey for this service. No other compelling evidence was presented.	2
28755	Fusion of big toe joint	4.48	4.48	APMA presented a letter recommending that this service be greater than code 28285 <i>Hammertoe operation, one toe (eg, interphalangeal fusion, filleting, phalngectomy)</i> (work RVU = 4.41) because there is an increased amount of intraservice and postservice work. The intensity for this service is also greater than 28285.	APMA did not conduct a survey for this service. No other compelling evidence was presented.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28238	Revision of foot tendon	7.27	7.27	This service is similar to 28296 <i>Hallux galgus (bonion) correction with metatarsal osteotomy</i> (rvu = 8.69).	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
28344	Repair extra toe(s)	3.89	3.89	This service is more work than 28285 <i>Repair of hammertoe</i> (rvu = 4.41).		2
28476	Repair metatarsal fracture	3.15	3.15	This service is similar to 26608 <i>Percutaneous skeletal fixation of metacarpal fracture, each bone</i> (rvu = 5.12).		2
28496	Repair big toe fracture	2.18	2.18	This service is similar to 26608 <i>Percutaneous skeletal fixation of metacarpal fracture, each bone</i> (rvu = 5.12). APMA recommends that the RVU for this service should be more than 28496.		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28531	Treat sesamoid bone fracture	2.01	2.01	This service is more work than 28525 <i>Open treatment of fracture, phalanx or phalanges, other than great toe, with or without internal or external fixation</i> (rvu = 3.08). This services involves working in an anatomical area that is less accessible than any phalanx.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
28576	Treat foot dislocation	3.75	3.75	This service is similar to 26676 <i>Percutaneous skeletal fixation of carpometacarpal dislocation, other than thumb (Bennett fracture), single, with manipulation</i> (rvu = 5.29).		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
28636	Treat toe dislocation	2.67	2.67	This service is identical to 26706 <i>Percutaneous skeletal fixation of metacarpophalangeal dislocation, single, with manipulation</i> (rvu = 4.92). The risks associated with performing this service may be greater than 28636 because of the increased postoperative hazards with performing a procedure on a weightbearing structure like the foot.	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
28666	Treat toe dislocation	2.56	2.56	This service is identical to 26776 <i>Percutaneous skeletal fixation of interphalangeal joint dislocation, single, with manipulation</i> (rvu = 4.60).		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality)

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
M0101	Cutting or removal of corns	0.37	0.45	This service is more work than 11050 <i>Paring or curettement of benign hyperkeratotic skin lesion with or without chemical cauterization (such as verrucae) not extending through the stratum corneum (eg, callus or wart) with or without local anesthesia; single lesion</i> (work RVU = .43). The technical skill for these services are similar, however physician physical effort is much greater for M0101. M0101 involves treating more than two skin lesions and trimming ten toenails.	M1010 was assigned a work RVU by HCFA. The APMA had no input and was not included in the Harvard study. Medicare has specific coverage guidelines for this service. The patients typically have poor circulation, and neurological deficit concomitant to systemic disease. Considering the patient population that receives this service, the RUC agreed that this code is undervalued. The work RVU should be higher than 11050.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 28113 Global Period: 090 Current RVW: 4.09

Recommended RVW: 4.50

CPT Descriptor: Ostectomy, complete excision; fifth metatarsal head

Source and Summary of Comment to HCFA on this service:

American Podiatric Medical Association

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 57 year-old female undergoes the complete resection of the fifth metatarsal head in a hospital outpatient surgery department.

Description of Pre-Service Work:

Review of chart with general medical history update including current medications and allergies. Physical examination includes evaluating the neurological and vascular status of the patient. Laboratory tests and roentgenograms are ordered and reviewed prior to surgery. The operative risks and benefits are discussed with the patient and informed consent is obtained. Pre-service work also includes pre-operative scrubbing, positioning, exsanguinating and draping the patient's extremity.

Description of Intra-Service Work:

A 3.5 cm. dorsolateral skin incision is made over the distal one third of the fifth metatarsal bone. The incision is deepened with a combination of sharp and blunt dissection to expose the fifth metatarsophalangeal joint capsule. Care is taken to protect all neurovascular structures. A linear capsulotomy is performed. The capsule and periosteum are underscored exposing the head of the fifth metatarsal. An osteotomy is performed perpendicular to the long axis of the fifth metatarsal at the surgical neck. The head of the metatarsal is removed by sharp dissection. Abrupt or rough edges of the metatarsal neck are rasped smooth. The capsule and periosteum are reapproximated with appropriate suture material. The fifth metatarsophalangeal joint capsule is hour-glassed using appropriate suture material. The superficial fascia and subcutaneous tissue are coapted and maintained with simple interrupted sutures. The skin is closed with an absorbable subcuticular suture. An appropriate amount of soluble steroid is injected into the surgical site. The foot is cleansed and dried, and Steri-strips are applied perpendicular to the incision line. A dry sterile dressing and compression wrap are applied to the foot.

Description of Post-Service Work:

The patient's vital signs and neurovascular status are evaluated and stabilized. Post-operative roentgenograms are ordered and reviewed. The medical record is completed, including postoperative orders. The operative report and discharge summary are dictated. Written homecare instructions are given and explained to the patient. Appropriate prescriptions are written, given and explained to the patient. The patient is seen five times in the office during the 90 day global period for dressing changes, suture removal and rehabilitation.

SURVEY DATA:

Specialty: Podiatric Medicine

Sample Size: 74 Response Rate (%): 85.1 Median RVW: 4.50

25th Percentile RVW: 4.0 75th Percentile RVW: 5.10

Other Hospital:	NA	NA
Office:	70	5

KEY REFERENCE SERVICE(S):

	CPT Code	CPT Descriptor	RVW
1)	28112	Ostectomy, complete excision; metatarsal head (second, third or fourth)	4.23

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre-, intra-, and post-service time and intensity reported by the survey results were virtually identical for 28113 and reference procedure 28112.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The correct RVW for 28113 should be 4.50. 4.23 is the RVW established by the fee schedule for reference procedure 28112 [Ostectomy, complete excision; other metatarsal head (second, third or fourth)]. It takes virtually the same amount work, measured in time and intensity, to perform an ostectomy (complete excision) of any lesser metatarsal head, including the fifth metatarsal. In fact, the postoperative management of a 28113 is frequently more complicated and often involves longer healing time and greater patient disability due to the lateral shoe pressure on the operative site.

SUMMARY OF RECOMMENDATION**

CPT Code: 28288 Global Period: 090 Current RVW: 3.73

Recommended RVW: 4.50

CPT Descriptor: Osteotomy, partial, exostectomy or condylectomy, single, metatarsal head, first through fifth, each metatarsal head

Source and Summary of Comment to HCFA on this service:

American Podiatric Medical Association

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year-old female undergoes a partial 5th metatarsal head resection in an office surgical suite (assumes block administered by surgeon).

Description of Pre-Service Work:

Review of chart with general medical history update including current medications and allergies. Physical examination includes evaluating the neurological and vascular status of the patient. Laboratory tests and Xrays are reviewed prior to surgery. The patient's vital signs are taken. The operative risks and benefits are discussed with the patient and an informed consent is obtained. The patient is placed in a supine position. A local anesthetic is administered. The instruments used in the procedure are removed from the sterilizer. Pre-service work also includes pre-operative scrubbing, positioning, prepping, tourniquet application, exsanguination, and draping the patient's extremity.

Description of Intra-Service Work:

A 3.5 cm dorsolateral linear skin incision is made over the distal one third of the fifth metatarsal bone. The incision is deepened with a combination of sharp and blunt dissection to expose the fifth metatarsophalangeal joint capsule. Care is taken to protect all neurovascular structures. A linear capsulotomy is performed. The capsule and periosteum are underscored exposing the head of the fifth metatarsal. The hypertrophic lateral aspect of the metatarsal head is resected and abrupt bone edges rasped smooth. The capsule and periosteum are reapproximated with appropriate suture material. The superficial fascia and subcutaneous tissue are coaptated and maintained with simple interrupted sutures. The skin is closed with an absorbable subcuticular suture. An appropriate amount of soluble steroid is injected into the surgical site. The foot is cleansed and dried, and Steri-strips are applied perpendicular to the incision line. A dry sterile dressing and compression wrap are applied to the foot.

Description of Post-Service Work:

A surgical shoe is fitted to the patient. The patient's vital signs and neurovascular status are evaluated and stabilized. Written homecare instructions are given and explained to the patient. Appropriate prescriptions are written, given and explained to the patient. The medical record is completed, including a written operative report. The patient is seen in the office five times during the 90 day global period for dressing changes, suture removal and rehabilitation.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	28112	Ostectomy, complete excision; metatarsal head (second, third or fourth)	4.23

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The survey indicated that the pre-, intra- and post-service time and intensity of 28288 was almost identical to key reference procedure 28112. The post-service time for 28288 during the 90 day global period was approximately 5% greater than 28112.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The correct RVW for 28288 should be 4.50 and not 3.73. 28288 compares very favorably with the amount of work performed by the physician doing reference procedure 28112 (RVW 4.23). 28112 requires almost the same amount of perioperative work, although the survey indicated that 28288 required slightly more post-service time and intra-service physician work. The intensity and mental judgment and effort are essentially the same for both procedures.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT* Code: M0101 Global Period: XXX Current RVW: 0.37

Recommended RVW: 0.70

CPT* Descriptor: Cutting or removal of corns, calluses and/or trimming of nails, application of skin creams and other hygienic and preventive maintenance care (excludes debridement of nail(s))

*HCPCS Code

Source and Summary of Comment to HCFA on this service:

American Podiatric Medical Association

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

A 74 year-old diabetic female with diminished pedal circulation, including absent dorsalis pedis pulses and cold feet, as well as thin shiny skin and thickened toenails has corns removed (pared) from the dorsum of the 2nd and 5th toes right foot, and 3rd and 5th toes left foot, each toe is padded with 1/8 inch adhesive felt U pad. Also, diffuse calluses are removed from the plantar aspect of both feet and adhesive moleskin pads are applied. All thickened toenails are trimmed.

Description of Pre-Service Work:

Review of office chart with general medical history update including current medications and last appointment with primary care physician. Physical examination includes evaluating the neurological and vascular status of the patient, along with a dermatologic examination. The patient's vital signs are taken. The procedural work is explained to the patient. The instruments used in treatment are removed from the sterilizer. The feet are cleansed and a skin softener is applied.

Description of Intra-Service Work:

All corns and calluses are debrided (pared) and thickened elongated toenails are trimmed. Accommodative pads are fabricated from 1/8 inch adhesive felt and moleskin and applied to the appropriate areas. Rough skin and nail edges are mechanically reduced. Antiseptic solution is applied to all nails. Skin cream is applied to both feet.

Description of Post-Service Work:

The doctor discusses future management and follow-up as necessary. The patient is advised on proper shoe gear and on diabetic foot care. The medical record is completed. Also, a note to the primary care physician is dictated as to the course and outcome of treatment and future management. (See Medicare Coverage Guidelines)

SURVEY DATA:

Specialty: Podiatric Medicine

Sample Size: 83 Response Rate (%): 95.4 Median RVW: 0.70

25th Percentile RVW: 0.54 75th Percentile RVW: 1.0 Low: 0.32 High: 4.0

Median Pre-Service Time: 5 Median Intra-Service Time: 15

25th Percentile Intra-Svc Time: 10 75th Percentile Intra-Svc Time: 20

Low: 3 High: 90

<u>Pre-Service Time:</u>	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	4	
ICU:	NA	NA
Other Hospital:	NA	NA
Office:	NA	NA

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	11050	Paring or curettement of benign hyperkeratotic skin lesion with or without chemical cauterization (such as verrucae or clavi) not extending through the stratum corneum (eg, callus or wart) with or without local anesthesia; single lesion	0.43
2)	11700	Debridement of nails, manual; five or less	0.32

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Surveys indicated that the pre-, intra-, and post-service time and the intensity of M0101 were all greater than each of the key reference procedures, 11050 and 11700. The M0101 pre- and post-service times were 10-20% greater than the key reference procedures, but the intra-service time of M0101 was slightly more than two and a half times greater than 11050 and 11700.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The correct RVW for M0101 should be 0.70 and not 0.37. The physician work associated with M0101 is significantly greater than the 0.43 RVW of reference procedure 11050 (paring or curettement of benign hyperkeratotic skin lesion with or without chemical cauterization (such as verrucae or clavi) not extending through the stratum corneum (eg callus or wart) with or without local anesthesia; single) and procedure 11700 (debridement of nails, manual; five or less). The pre-service work is slightly greater than reference procedures 11050 and 11700, but the intra-service work was reported by the survey as 250% greater than either reference procedure. When M0101 is used the physician is generally treating more than two skin lesions and trimming ten toenails. In addition, the physician also provides counseling and advice to patients receiving this kind of care.

The mental effort and judgment as well as the stress to the physician are much greater than 11050 and 11700. M0101 is typically performed on patients with poor circulation, and neurological deficit concomitant to systemic disease. Technical skill is about the same as 11050, but the physician's physical effort is much greater for M0101.

RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Otolaryngology and Maxillofacial Surgery

The American Academy of Otolaryngology - Head and Neck Surgery, Inc. (AAO-HNS) Abt study covered 800 codes, 417 of which are considered to be primary otolaryngology codes, and 100 of which were discussed in detailed comments to HCFA for the five-year review. These 100 codes represent approximately 10 percent of the universe of otolaryngology - head and neck surgery services. The comments reflect the opinions of about 40 AAO-HNS members with expertise in the services chosen.

In April, the RUC's Research Subcommittee reviewed the methodology used by Abt and concluded that the RUC should consider a survey of representative codes using RUC methodology to validate the relationship of the Abt-developed relative values to RUC-developed relative values. The AAO-HNS surveyed and submitted recommendations for 53 codes using the RUC methodology. The survey response rate was low for many of the codes originally commented on during the public comment phase and, therefore, AAO-HNS chose to withdraw these codes from the RUC review.

The RUC was concerned by the lack of compelling evidence for many of the services presented by AAO-HNS and recommends that their current value be maintained. Problems identified by the RUC for these services were that: survey results for preservice and postservice time appear to be overstated; inappropriate reference services with different global periods were used; the only argument was that the patient population presented increased risk of HIV and Hepatitis to the physician; the patients had previous radiation treatment; and, acceptable vocal cord capability is now more important to patients. In addition, many recommendations were made to increase the current work RVUs but the AAO-HNS data was very similar to the Harvard time data. The RUC also did not find the argument that intra-service work per unit time (IWPUT) was understated, without any other evidence, a compelling reason to increase the RVUs.

The RUC is recommending increased work RVUs for 30 codes to correct rank order anomalies, address problems where AAO-HNS surveys confirm that the intra-service time for the procedure was underestimated in the Harvard study, and where the patient population has changed in the past five years making the services more complex.

The American Academy of Oral and Maxillofacial Surgeons (AAOMS) and the American Society of Plastic and Reconstructive Surgeons, Inc. (ASPRS) also submitted comments to HCFA and presented recommendations to the RUC for some of the codes in this section.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
21025	Excision of bone, lower jaw	5.03	8.92	Code is similar to code 24134 <i>Sequestrectomy (eg, for osteomyelitis or bone abscess), shaft or distal humerus</i> (Work RVU = 8.98)	A rank order anomaly exists between this service and 21030 <i>Excision of benign tumor or cyst of facial bone other than mandible</i> (current = 7.05; recommended = 6.04) and 21041 <i>Excision of benign cyst or tumor of mandible; complex</i> (current = 5.03; recommended = 6.04). 21025 has never been surveyed. The AAOMS survey median for intra-service time is 120 minutes, which is significantly higher than 21041 (90 minutes) and reference service 24134. The RUC recommends that the AAOMS survey median of 8.92 be adopted.	1
21031	Remove exostosis, mandible	2.01	3.14	Code is similar to code 21032 <i>Excision of maxillary torus palatinus</i> (RVU = 4.27) in complexity and intraoperative time.	The RUC agrees that code 21031 and 21032 are identical in work and should be valued the same. However, the proposed value of 5.30 is too high when reviewing intra-work intensity. The frequency of codes 21031 and 21032 are approximately equal and should have a work neutral blended value of 3.14. Recommend to HCFA that code 21032 be included in the five-year review.	4
21032	Excision of exostosis, maxilla	4.27	3.14	N/A		5 add
21041	Removal of jaw bone lesion	5.03	6.04	Code is similar to 21030 <i>Excision of benign tumor or cyst of facial bone other than mandible</i> (Work RVU = 7.05) in intraoperative time and complexity.	21041 and 21030 are identical in work and should be valued the same. The frequency of codes 21041 and 21030 are approximately equal and should have a work neutral blended value of 6.04. Recommend to HCFA that code 21030 be included in the five-year review.	4
21030	Removal of face bone lesion	7.05	6.04	N/A		5 add

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
21110	Interdental fixation	5.03	5.03	This service should be the sum of codes 21497 <i>Interdental wiring, for condition other than fracture (does not include removal (3.61) and 20670 Removal of implant; superficial (eg, buried wire, pin or rod) (Separate procedure) (1.69).</i>	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
21150	Reconstruct midface, lefort	24.41	24.41	This service requires more intra-service work than 21433 <i>La Fort III:fracture repair (23.69)</i> and relates more closely to 61526 <i>Craniectomy (29.70)</i> and 33513 <i>Coronary Artery Bypass (30.12)</i> in risk, time, and intensity.	Society did not have adequate survey response and has withdrawn recommendation	2
21188	Reconstruction of midface	21.47	21.47	This service is comparable to 21147 <i>Reconstruction midface, LeFort I; three or more pieces, any direction, requiring bone grafts (includes obtaining autografts) (eg, ungrafted bilateral alveolar cleft or multiple osteotomies).</i>	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
21194	Reconstruct lower jaw bone	18.81	18.81	This service is similar to 21193 <i>Reconstruction of mandibular ramus, horizontal, vertical, "C" or "L" oteotomy, without bone graft (16.23)</i> except that 21193 also includes the harvesting and insertion of a bone graft. 21194 should be equal to 21193 plus 50% of 20902 <i>Bone graft, any donor area; major or large (6.74).</i>		2
21243	Reconstruction of jaw joint	18.98	18.98	Code is somewhat more complex than 21247 <i>Reconstruction of mandibular condyle with bone and cartilage autografts (includes obtaining grafts) (eg, for hemifacial microsomia), from another site (Work RVU = 21.15)</i>	The work RVU was increased during HCFA's refinement process for the 1993 MFS. No compelling evidence was provided that the work has changed since 1992.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
21270	Augmentation cheek bone	12.10	12.10	AAOMS commented in the public comment process that codes 21125 and 21270 were identical in work.	The society was under the impression that it could only survey a few of its most frequently performed services and chose not to survey these codes. No other medical society chose to survey. AAO-HNS, ASPRS, and AAOS do not agree with the AAOMS comment and stated that there is less aesthetic work in the mandible and therefore the RVU for 21270 should be higher than 21125.	2
21125	Augmentation lower jaw bone	6.22	6.22			The RUC recommends the current value be maintained, but will allow all interested providers to review both services for the February meeting.
21320	Treatment of nose fracture	1.82	1.82	This service requires less intra-service time than 30520 <i>Septoplasty</i> (5.55), but there is greater concern about stability and cosmetic result. Due to the traumatic nature of the procedure, there is also less control of the final result.	Society did not have adequate survey response and has withdrawn recommendation	2
21330	Repair of nose fracture	5.03	5.03	This service requires at least twice the time of both 30520 <i>Septoplasty</i> (5.55) and <i>Revision Rhinoplasty</i> (11.23). There is greater risk of injury to the surrounding tissue, because of the use of the drill.		2
21338	Repair nasoethmoid fracture	6.04	6.04	This service was compared to codes 21365 <i>Zygomatic complex fracture</i> (13.97), 31205 <i>External Ethmoidectomy</i> (9.65) and 21386 <i>Open Repair of Orbital Floor Fracture - Periorbital Approach</i> (8.56).		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
21339	Repair nasoethmoid fracture	7.56	7.56	This service was compared to codes 21365 <i>Zygomatic complex fracture</i> (13.97), 31205 <i>External Ethmoidectomy</i> (9.65) and 21386 <i>Open Repair of Orbital Floor Fracture - Periorbital Approach</i> (8.56).	Society did not have adequate survey response and has withdrawn recommendation	2
21435	Repair craniofacial fracture	16.12	16.12	This service is comparable to 15755 <i>Free flap (microvascular transfer)</i> (28.33), considering that once one has attained a certain level of competence, microvascular anastomosis becomes less intense, although it remains more precise. The physical effort for 21435 is more intense throughout this procedure and failure of adequate reduction compromises both appearance and masticatory function, often requiring further extensive surgery.		2
21453	Treat lower jaw fracture	5.18	5.18	An individual oral and maxillofacial surgeon commented that this service was undervalued in comparison to 66984 <i>Remove cataract with lens placement</i> (9.89).	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
21462	Repair lower jaw fracture	9.15	9.15	AAOMS: This code is undervalued and should be equal to its current value plus 50% of code 21453 <i>Closed treatment of mandible fracture with interdental fixation</i> (5.18). The CPT definition for this code indicates that removal of fixation is not included, however, several Medicare carriers interpret the removal to be included. An individual oral and maxillofacial surgeon commented that this service was undervalued in comparison to 66984 <i>Remove cataract with lens placement</i> (9.89).		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
21485	Reset dislocated jaw	3.73	3.73	The RVU for this code should equal 21453 <i>Closed treatment of mandibular fracture with interdental fixation</i> (5.18) plus 50% of 21480 <i>Closed treatment of temporomandibular dislocation; initial or subsequent</i> (5.50).	Since fewer than 1,000 claims are submitted for these services annually, the RUC did not believe a survey of practicing physicians would yield much useful information about these services. The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
30020	Drainage of nose lesion	1.38	1.38	This service is similar to 11603 <i>Excision of malignant lesion of the trunk, arms or legs; lesion diameter: 2.1 or 3.0 cm</i> (2.30).	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
30545	Repair nasal defect	10.89	10.89	This service is more work than 42200 <i>Palatoplasty for cleft plate, soft, and for hard palate only</i> (9.38) as there is much more dissection than for repair of a cleft palate. Many of the incisions and maneuvers are the same, but with extensive bony work to remove the atresia plate.	Society did not have adequate survey response rate and has withdrawn recommendation.	2
30903	Control of nosebleed	1.54	1.54	The intra-service work of these services is comparable to 42970 <i>Control of nasopharyngeal hemorrhage, primary or secondary (eg, postadenoidectomy); simple, with posterior nasal packs, with or without anterior packs and/or cauterization</i> (work RVU = 4.78). AAO-HNS also argued that the risk to the physician of HIV and Hepatitis exposure in controlling the nasal hemorrhage has increased the work of the service.	The AAO-HNS survey median time was very similar to the Harvard survey time. The use of 42970 as a reference service is problematic as it has a global period of 090, while these codes have a 000 global period. The presentation that the work has changed due to increased risk of HIV and Hepatitis was not compelling. Many surgical procedures and other services have also been affected by these increased risks.	2
30905	Control of nosebleed	1.97	1.97			2
30906	Repeat control of nosebleed	2.45	2.45			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
30920	Ligation upper jaw artery	7.46	8.79	This service is similar to 69631 <i>Tympanoplasty</i> (9.55) as both services involve microscopic surgery with similar amounts of skill and time required.	<p>This service is similar to 60220 <i>Total thyroid lobectomy, unilateral; with or without isthmusectomy</i> (work RVU = 9.86) and 31075 <i>Sinusotomy frontal; transorbital, unilateral (for mucocele or osteoma, Lynch type)</i> (work RVU = 8.57). Increased mental effort and technical skill is required due to the possibility of complications such as ligation of the optic nerve. Patients have been previously packed and tend to have advance sinusitis and a large amount of mucous membrane which will make the procedure very difficult.</p> <p>The AAO-HNS survey resulted in 42 more minutes of intra-service time than Harvard. The Harvard survey may not have reflected the difficult patient population.</p>	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31225	Removal of upper jaw	15.19	17.50	This service is similar to 21433 <i>Repair craniofacial fracture (23.69)</i> as the intra-operative time is the same and there is similar intensity in attempting to avoid iatrogenic injury to the orbit.	The current proportionality between the work RVUs for these two codes is incorrect. 31225 is a smaller operation than 31230 <i>Maxillectomy; with orbital exenteration (en bloc)</i> (work RVU = 21.06) but requires more technical skill and mental effort as preserving the orbit is more difficult than removing it. The AAO-HNS survey median suggests that the ratio of 31230 to 31225 should be 1.15. The RUC recommends a work neutral recommendation of 17.50 for 31225 and 20.00 for 31230.	4
31230	Removal of upper jaw	21.06	20.00	This service is more work than 21433 <i>Repair craniofacial fracture (23.69)</i> as there is considerably more blood loss and there is a real potential for entrance into the intracranial cavity during the operation.		5

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31290	Nasal/sinus endoscopy, surg	12.87	16.05	The overall intensity of these procedures is higher than the average case of endoscopic sinus surgery, since the surgery is being performed in the presence of a skull base defect and the possibility of creating an intracranial lesion is even more immediate.	Nasal/sinus endoscopy recommendations were developed by the RUC in 1993. HCFA subsequently decreased the value for many of the recommendations, based largely on erroneous crosswalk and frequency information. HCFA corrected the values for the more frequently provided diagnostic services in this family of codes but suggested that AAO-HNS might comment on these five services in the five-year review. AAO-HNS has re-surveyed these services and submits new values based on its survey median. Four of the recommendations are lower than the original RUC recommendations and one (31294) is higher. The intra-service work per unit time appears reasonable for these services. The rank order will be different than the original RUC recommendations for these codes, however, AAO-HNS and the RUC agree that it is now correct	1
31291	Nasal/sinus endoscopy, surg	13.52	17.00			1
31292	Nasal/sinus endoscopy, surg	10.45	13.83			1
31293	Nasal/sinus endoscopy, surg	11.43	15.15			1
31294	Nasal/sinus endoscopy, surg	13.06	18.00			1
31320	Diagnostic incision larynx	4.54	4.54			This service is comparable to exposure of the thyroid gland prior to its resection . It exceeds the level of intensity for exposure of the submandibular gland. Thyrotomy approximates 60240 <i>Thyroidectomy</i> (15.66) in time and intensity.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31360	Removal of larynx	15.19	15.19	These services require similar time and knowledge as 45110 <i>Proctectomy, AP resection with colostomy</i> (21.68). There may also be a slightly higher possibility for intraoperative blood loss with proctectomy but there is not the concern over airway obstruction occurring during the induction of anesthesia.	The AAO-HNS argument that the patient population for these services has changed in the past five years as it is now performed on patients following radiation therapy was not compelling. Many other procedures are affected by this changing patient population.	2
31365	Removal of larynx	21.83	21.83			2
31367	Partial removal of larynx	18.98	18.98	This service is similar to 55845 <i>Retropubic prostatectomy and pelvic node dissection</i> (26.73) in time and identification and preservation of anatomy. Complex anatomy must be resected and preserved while removing pathologic tissue.	Society did not have adequate survey response and has withdrawn recommendation	2
31368	Partial removal of larynx	23.72	23.72	This service is more technically demanding than 50230 <i>Nephrectomy</i> (20.56) because the physician must preserve the vocal and swallowing functions while removing cancerous tissue.		2
31370	Partial removal of larynx	18.50	18.50	This service is similar to 61510 <i>Craniotomy for brain tumor, supertentorial</i> (23.39) as both procedures require performing preliminary work, one tracheostomy, the other burr holes. Both require bone and cartilaginous cuts and flaps, perichondrium or dura, excised and developed. Both require resection of areas vital to normal life functions. One with airway protection, speech and deglutition function. The laryngeal post op function is critically dependent upon the technical execution of the operation. This same type of technical skill is not needed in a craneotomy.		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31380	Partial removal of larynx	18.50	18.50	This service is more work than <i>Prostatectomy</i> (21.68). The hemilaryngectomy is perceived to be more intense and technically more precise in the intraoperative decision making. Prostatectomy does not require as much precision for success and continued functional voicing ability. Both procedures require bypass procedures while healing occurs.	Society did not have adequate survey response and has withdrawn recommendation	2
31382	Partial removal of larynx	18.50	18.50	This service is comparable to 51596 <i>Cystectomy complete, with reconstruction of neobladder</i> (36.27). Both procedures require extraction of functionally important structures with reconstruction of a plastic nature in order to allow preservation and function of important bodily functions. The approach and exposure of the bladder procedure is more difficult and therefore takes more time.		2
31390	Removal of larynx & pharynx	21.15	25.00	This service was compared to 31766 <i>Reconstruction of windpipe</i> (48.34) and 38765 <i>Remove groin lymph nodes</i> (30.07).	<p>A rank order anomaly currently exists between this service and code 31365 <i>Laryngectomy; total, with radical neck dissection</i> (work RVU = 21.83). Code 31390 is more work than 31365 as it requires performing a pharyngolaryngectomy.</p> <p>In addition, the AAO-HNS survey intra-service time was 40 minutes greater than Harvard data. The final Harvard value is 25.33.</p>	1

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31395	Reconstruct larynx & pharynx	26.19	28.00	This service was compared to 31766 <i>Reconstruction of windpipe</i> (48.34) and 38765 <i>Remove groin lymph nodes</i> (30.07).	<p>The role of reconstruction and post-service work is currently undervalued in this procedure. The RVU for this service should be equal to 31390 and the additional work of placing either a free tissue graft, myocutaneous flap, or other reconstructive techniques, such as a free gastric patch in place, using microvascular techniques. The reconstructive technique is billed separately, however, there is extra work in suturing the device. Additionally, all reconstructive techniques fail to provide sensation to the pharynx following reconstruction which leads to aspiration and difficulty in feeding. This service requires additional post-service time to coordinate with swallowing experts and counsel the family and patient.</p> <p>The AAO-HNS survey intra-service time was 76 minutes greater than Harvard data. The number and length of hospital visits was also significantly more. The final Harvard value is 29.62.</p>	1
31400	Revision of larynx	9.06	9.06	This service requires more time to perform the entire procedure and requires considerably more intensity in performing the movement and fixation of the vocal cord. There is also considerably more risk involved in the procedure in terms of airway problems, decreased voice performance and risk of aspiration.	Society did not have adequate survey response and has withdrawn recommendation	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31502	Change of windpipe airway	0.65	0.65	An individual commented that this service is undervalued in comparison to 31730 <i>Transtacheal (percutaneous) introduction of needle wire dilator/stent or indwelling tube for oxygen therapy (2.85)</i> .	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
31513	Injection into vocal cord	2.10	2.10	This service is more work than 41822 <i>Excision of gum lesion (2.26)</i> because it requires considerable more skill in placing the injection and is more intense.		2
31531	Operative laryngoscopy	3.73	3.79	The RUC identified rank order anomalies in this family of codes. Although the AAO-HNS had not submitted individual comments on 31531 and 31536, they were included in the Abt study submitted to HCFA.	<p>The AAO-HNS argued that the patient population had changed for these services in the past five years. There is a greater emphasis on an acceptable vocal result following this type of surgery.</p> <p>The Argument to increase the RVU to reflect increased pressures in preserving vocal content was not compelling. However, the RUC determined that rank order anomalies exist in this family of codes. The RUC reviewed the Abt study for AAO-HNS to determine an appropriate increment for the "add-on" for providing this service with an operating microscope. The RUC agreed that .40 was an appropriate increment and added this to the parent code's current RVU throughout the family as follows:</p> <p>31530 3.39 +.40 31531 3.79 31535 3.16 +.40 31536 3.56 31540 4.13 +.40 31541 4.53 31560 5.46 +.40 31561 5.86 31570 3.87 +.40 31571 4.27</p>	4 add
31536	Operative laryngoscopy	3.17	3.56			4 add

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31541	Operative laryngoscopy	3.56	4.53	This service is similar to 39400 <i>Mediastinoscopy with or without biopsy</i> (5.11). The airway is protected in the mediastinoscopy and not in laryngoscopy. Both require similar instrumentation. The mediastinoscopy requires an incision, but the complexity of the procedure is offset by the complexity of airway management in the laryngoscopy. The care and preciseness of the procedure is much greater with the biopsy and tumor removal of the larynx.	See previous page	4
31561	Operative laryngoscopy	4.90	5.86	This service is more work than 54520 <i>Orchiectomy, simple</i> (4.93) as there is much more intensity in the arytenoid resection than in the simple orchiectomy. Arytenoidectomy requires significantly more judgement and carries considerable more immediate and possible long term risk.		4
31571	Laryngoscopy with injection	3.52	4.27	This service is more work than 42820 <i>Tonsillectomy/adenoidectomy; under age 12</i> (3.59) as both require careful technique, both involve topical anesthetization requiring establishing careful rapport with a conscious patient. The actual injection requires more a intense precision and exacting technique.		4
31580	Revision of larynx	11.01	11.01	This service is similar to 40701 <i>Cleft lip, nasal deformity repair</i> (15.10) as a similar amount of time and intensity in the intra-service period is required. Both procedures require a great deal of precision, work on a delicate anatomic structure such as the nose or larynx.	AAO-HNS survey data was very similar to the Harvard data. No other compelling evidence was presented.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31587	Revision of larynx	7.98	10.00	The most appropriate reference services for this code are the laryngectomy codes (CPT 31360 - 31382). This service should be valued at 40-50% of these services.	<p>The changing patient population of neonates warrants an increase for this service. Infants who ordinarily would have been a candidate for a tracheotomy are now have been subjected to cricoid split as an alternative. This procedure has the same risk of pediatric tracheotomy and the risks of maintaining endotracheal intubation in the face of an open tracheal wound. There is significant risk of pneumothorax as well as air way loss should the endotracheal tube become dislodged.</p> <p>In addition, AAO-HNS survey intra-service time is 25 minutes greater than Harvard data.</p>	1
31600	Incision of windpipe	3.62	3.62	This service is comparable to 54520 <i>Orchiectomy, simple with or without testicular prosthesis, scrotal or inguinal approach</i> (4.93) and 39400 <i>Mediastinoscopy, with or without biopsy</i> (5.11). Both orchiectomy and mediastinoscopy take approximately one hour. In the case of mediastinoscopy, the anatomy is similar to a tracheostomy. In an orchiectomy with replacement of testicular prosthesis, the proper prosthesis must be selected for the patient's size just as the proper tracheostomy needs to be selected and checked.	The AAO-HNS argument that the patient population has changed is not convincing. The intra work per unit time already appears high. The Harvard data for intra-service time appears to be more accurate than the AAO-HNS survey data.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31601	Incision of windpipe	4.45	4.45	This service is comparable to 34201 <i>Embolectomy or thrombectomy, femoropopliteal, aortoliac artery, bileg incision</i> (8.04) in intra-service time. Both procedures require selection of the proper device and have significant risks association with them such as loss of an extremity or airway obstruction. The intensity this procedure in one hour is comparable to a neonatologist's day of evaluation and management services of a critically ill and unstable neonate or infant.	The argument that the patient population has changed is not convincing. The intra work per unit time and Harvard data appears reasonable.	2
31603	Incision of windpipe	4.15	4.15	An emergency tracheostomy is comparable to 35207 <i>Repair of blood vessel</i> (9.06) and 49000 <i>Exploratory laparotomy</i> (8.99). 35207 involves a limited amount of time to restore the blood flow to the severed digit or hand. 49000 requires quick decision making as the surgeon must be prepared to deal with unexpected findings.		2
31610	Incision of windpipe	7.87	7.87	This service is comparable to 43420 <i>Closure of fistula</i> (10.19) in terms of anatomy, length of time, and consideration of patient's ability to swallow.	Society did not have adequate survey response and has withdrawn recommendation	2
31611	Surgery/speech prosthesis	5.03	5.03	This service is comparable to 43831 <i>Place gastrostomy tube</i> (12.54).		2
31614	Repair windpipe opening	6.11	6.11	This service is comparable to 15240 <i>Skin full graft procedure</i> (8.30).	The AAO-HNS survey data is similar to Harvard data. No other compelling evidence was presented.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
31750	Repair of windpipe	9.05	11.73	This service is comparable to 43331 <i>Esophagomyotomy</i> (14.73).	<p>The Harvard survey underestimated intra-service time of this service. The patient population has also become more complex.</p> <p>The RUC did not agree with the recommended value of 15.00 and computed a new RVU by adding 69 minutes additional intra-service time in the AAO-HNS survey multiplied by the Harvard IWPUT to the current value.</p>	4
31780	Reconstruct windpipe	16.14	16.14	This service is comparable to 43312 <i>Esophagoplasty</i> (27.26).	<p>This code was included in the 1992 refinement process and the RVU was increased from 13.18 to 16.53.</p> <p>The evidence presenting regarding the increased complexity in the patient population was not compelling.</p>	2
38720	Removal of lymph nodes, neck	12.29	12.29	This service is comparable to 42415 <i>Excision of parotid tumor or parotid gland, lateral lobe with dissection and preservation of the facial nerve</i> (16.12) and 60240 <i>Thyroidectomy, total or complete</i> (15.66) in both time and skill. The pressure involved in the complete neck dissection is far greater than that of 42415 or 60240, because the potentially catastrophic consequences of injuring any of the nervous structures, jugular vein, carotid artery or the thoracic duct.	<p>Harvard intra-service time is greater than AAO-HNS data. Survey data does not support rationale for increasing the current value.</p> <p>Endoscopy is not included in the work of this service.</p>	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
38724	Removal of lymph nodes, neck	13.22	13.22	This service is more work than 42415 <i>Excision of parotid tumor or parotid gland, lateral lobe with dissection and preservation of the facial nerve</i> (16.12) and 60240 <i>Thyroidectomy, total or complete</i> (15.66) in both time and skill.	No compelling evidence presented to increase value.	2
40806	Incision of lip fold	0.31	0.31	This service is similar to 41010 <i>Incision of lingual frenum (frenotomy)</i> (1.19).	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
40808	Biopsy of mouth lesion	0.91	0.91	This service is similar to 11441 <i>Removal of skin lesion, benign, less than 1 cm</i> (1.56).		2
40820	Treatment of mouth lesion	1.23	1.23	AAO-HNS: This service is similar to 42808 <i>Excision or destruction, lesion of pharynx posterior pharynx</i> (2.25). An individual commented that this service may be overvalued in comparison to 17000 <i>Destruction by any method, including laser, with or without surgical curettage, all benign facial lesions or premalignant lesions in any location, or benign lesions other than cutaneous vascular proliferative lesions, including local anesthesia; one lesion</i> (0.64).		2
40843	Reconstruction of mouth	11.63	11.63	This service is similar to 40842 <i>Vestibuloplasty; unilateral</i> (8.31), but is more complex and requires more intraoperative time since the procedure is performed bilaterally and through separate incisions.		2
41000	Drainage of mouth lesion	1.25	1.25	This service is similar to 36140 <i>Introduction of needle or intracatheter; extremity artery</i> (2.01).		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
41005	Drainage of mouth lesion	1.21	1.21	AAOMS: This service is similar to 42325 <i>Fistulization of sublingual salivary cyst (ranula)</i> (2.65). AAO-HNS: This service is similar in work to 92004 <i>Ophthalmological services, medical examination and evaluation wit initiation of diagnostic and treatment program, comprehensive, new patient, one or more visits</i> (1.61).	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
41112	Excision of tongue lesion	2.63	2.63	This service is similar to 46255 <i>Hemorrhoidectomy, internal or external simple</i> (4.95).		2
41113	Excision of tongue lesion	3.09	3.09	This service is more work than 46255 <i>Hemorrhoidectomy, internal or external simple</i> (4.95).		2
41115	Excision of tongue fold	1.69	1.69	This service is similar to 40819 <i>Excision of frenum, labial or buccal (frenumectomy, frenulectomy, frenectomy)</i> (2.26).		2
41116	Excision of mouth lesion	2.36	2.36	This service is similar to 46255 <i>Hemorrhoidectomy, internal or external simple</i> (4.95).		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
41135	Tongue and neck surgery	14.29	21.15	This service is similar to 31365 <i>Laryngectomy and neck dissection</i> (21.83) and 30160 <i>Total Rhinectomy and neck dissection</i> combined with 38720 <i>Removal of lymph nodes, neck</i> (8.92 + 12.29).	<p>This procedure is complex due to the work of performing the surgery under the cover of the mandible. Previously, additional exposure could be afforded by dividing the patients lower lip, which is no longer acceptable to patients. The exposure for this type of surgery is now more limited.</p> <p>AAO-HNS and Harvard intra-service time is very similar. The final Harvard value is 20.35. The Intra-service work per unit time in the AAO-HNS survey appears reasonable. The RUC recommends the AAO-HNS survey median.</p>	1
41145	Tongue removal; neck surgery	27.58	27.58	The intensity of the work for this service is similar to 31395 <i>Laryngopharyngectomy with neck dissection and reconstruction</i> (26.29) and 31225 <i>Total maxillectomy and neck dissection</i> combined with 38720 <i>Removal of lymph nodes, neck</i> (15.19 + 12.29). The time may be 60-75 minutes longer for laryngopharyngectomy and neck dissection and 60 minutes less for maxillectomy with neck dissection.	Society did not have adequate survey response and has withdrawn recommendation	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
41150	Tongue, mouth, jaw surgery	19.36	21.00	This service involves more time than 31225 <i>Maxillectomy without orbital exenteration</i> (15.19). 31225 was also included as an undervalued service in the AAO-HNS comments to HCFA and the RUC has recommended an increase to 17.50.	The number of patients presenting for this surgery following radiation therapy has increased in the past five years. This has placed additional demands on the surgeon, both at the time of the procedure due to technical problems with radiated tissue, as well as the threat of post operative fistula formation.	1
				Close to 41140 in total work		
41155	Tongue, jaw, & neck surgery	23.40	25.60	This service involves less time, but is comparable to 31395 <i>Laryngopharyngectomy and neck dissection with reconstruction</i> (26.19). 31395 was included as an undervalued service in the AAO-HNS comments to HCFA and the RUC has recommended an increase to 28.00.	AAO-HNS Intra-service time is very similar to Harvard data. Harvard recommended an RVU of 20.85 for 41150 and 25.43 for 41155. Intra-service work per unit time appears reasonable. The RUC recommends the AAO-HNS survey median.	1
				Increment over 41150 should be greater than 41145 over 41140.		
41252	Repair tongue laceration	2.92	2.92	This service is comparable to 45380 <i>Colonoscopy, flexible, proximal to splenic flexure with biopsy</i> (4.01). The average colonoscopy takes 30-45 minutes, which includes obtaining the biopsy. There is no risk of airway obstruction with a colonoscopy, although, there is a risk of bowel perforation.	Society did not have adequate survey response and has withdrawn recommendation	2
42106	Excision lesion, mouth roof	2.63	2.05	Increment over reference services 42100 <i>Biopsy roof of mouth</i> (rvu = 1.26) and 42104 <i>Excision lesion, mouth roof</i> (rvu = 1.59) is too great. A simple closure following excision of a lesion is less than .50 RVUs.	The AAOMS, AAO-HNS, and AAD all agreed with the CMD recommendation. The RUC recommends that HCFA reduce the current RVU.	3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
42120	Remove palate/lesion	5.39	5.39	This service is comparable with 42700 <i>Palatoplasty for cleft palate, soft and/or hard palate only</i> (9.48).	The Harvard data for this service is very similar to the AAO-HNS survey data. No other compelling evidence presented to increase value.	2
42145	Repair,palate,pharynx/uv ula	7.04	7.04	This service is comparable with 42700 <i>Palatoplasty for cleft palate, soft and/or hard palate only</i> (9.48).	<p>The Harvard intra-service time is the same as the AAO-HNS survey. The RUC was not convinced that the pre-, and post-service time has increased for this service.</p> <p>In response to a HCFA question, the RUC confirmed that this is not the correct code for reporting this procedure performed by laser in the office. There is currently no CPT code for this service. Most insurance plans consider the laser technique experimental.</p> <p>It was also noted that the increased frequency of claims for this service is due to patient self-referrals and the growth of sleep centers.</p>	2
42182	Repair palate	3.78	3.78	This service is similar in scope, intensity, and time to 30520 <i>Septoplasty or submucous resection with or without cartilage scoring, contouring or replacement with graft</i> (5.55).	Society did not have adequate survey response and has withdrawn recommendation	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
42200	Reconstruct cleft palate	9.48	11.25	This service is undervalued when compared to 58260 <i>Vaginal hysterectomy</i> (11.39) and 47605 <i>Cholecystectomy</i> (11.53).	<p>This service closely approximates the stress, technical skill and mental effort of 40700 <i>Repair of cleft lip</i> (rvu= 12.04).</p> <p>This service is performed on a pediatric population and increasingly on a younger population (6-9 months). The stress and technical skill has increased, as this service is performed using a the new furrow technique requiring two Z-plasties in two different planes turned in two different directions. This technique involves a steep learning curve. In addition, this service involves greater stress due to iatrogenic risk to the patient.</p> <p>A proportionality problem also exists between this service and other services in this family of codes. After reviewing Harvard data and intensity, the RUC recommends 11.25.</p>	4
42210	Reconstruct cleft palate	10.02	13.75	This service is a complex code which encompasses work described in 42205 <i>Palatoplasty for cleft palate, with closure of alveolar ridge; soft tissue only</i> (8.96) plus half the value of 20903 <i>bone graft, any donor; major or large</i> (6.74).	<p>This service is comparable to 42200 with an additional increment for the bone graft that is included in the service.</p> <p>The RUC calculated a new value by adding 50% of code 20900 <i>Bone graft, any donor area; minor or small (eg, dowel or button)</i> (rvu = 5.09) to the recommend value for 42200.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
42260	Repair nose to lip fistula	4.17	9.18	This service is similar to 30600 <i>Repair fistula, oranasal</i> (5.87). They involve similar intraoperative time and postoperative care.	This service was not surveyed by Harvard. 42260 is more work than 14040 <i>Adjacent tissue transfer or rearrangement, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; defect 10 sq cm or less</i> (rvu = 7.18) and 14060 <i>Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less</i> (8.05) as it requires extra technical expertise in a tiny difficult location. The double flap is laid in a bipolar fashion which requires more mental effort in planning and execution than 14040 and 14060.	1
42305	Drainage of salivary gland	5.59	5.59	This service is comparable to 29881 <i>Arthroscopy, knee</i> (7.46)	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
42320	Drainage of salivary gland	2.30	2.30	This service is comparable to 42820 <i>Tonsillectomy</i> (3.59).		2
42340	Removal of salivary stone	4.47	4.47	This service is comparable to 26531 <i>Arthroplasty</i> (7.57).		2
42415	Excise parotid gland/lesion	16.12	16.12	The American Society of General Surgeons (ASGS) included this service in a list of codes submitted in their public comment letter. The ASGS comments were based on a study using the whipple procedure as a benchmark.	Society did not have adequate survey response and has withdrawn recommendation	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
42426	Excise parotid gland/lesion	19.88	19.88	This service is more work than 42415 <i>Lateral parotidectomy, dissection and preservation of the facial nerve</i> (16.12). 42426 is typically performed for high grade malignancies or extensive benign lesions, which requires far more extensive dissection around the facial nerve and higher risk of post-op nerve injury than 42415 which is performed for benign or low grade malignancies.	Society did not have adequate survey response and has withdrawn recommendation	2
42500	Repair salivary duct	4.06	4.06	This service is comparable to 35207 <i>Repair blood vessel, direct; hand, finger</i> (9.06) since both are usually traumatic, require surgical exploration to find proximal and distal end, and require precise surgical closure.		2
42505	Repair salivary duct	5.92	5.92	This service requires more time and work than 35207 <i>Repair blood vessel, direct; hand, finger</i> (9.06).		2
42507	Parotid duct diversion	5.96	5.96	This service is slightly less work than 54326 <i>Urethral reconstruction</i> (14.81).	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
42508	Parotid duct diversion	8.64	8.64	This service is more work than 54326 <i>Urethral reconstruction</i> (14.81) and 42440 <i>Excision of submandibular gland</i> (6.61) combined.		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
42720	Drainage of throat abscess	2.61	4.53	This service requires more mental effort, skill, and stress than 42820 <i>Tonsillectomy/adenoidectomy</i> (3.59).	<p>The Harvard data for this service failed to take into account the amount of pre-service work and immediate post-service work involved in this procedure. The intra-service component failed to capture the increased stress and anxiety due to the potential for airway compromise, aspiration and cardiac arrest.</p> <p>The RUC agreed that this code is currently undervalued and calculated a new value by adding 30 minutes of post-service work to the Harvard survey data.</p>	4
42725	Drainage of throat abscess	7.60	9.50	This service is comparable to 43420 <i>Cervical Esophagostomy Closure</i> (10.19).	<p>This service is similar in work to 60220 <i>Total thyroid lobectomy, unilateral; with or without isthmusectomy</i> (rvu = 9.86). The pre-service work is greater due to the need to consult other care givers regarding an individual who is toxic and possibly septic. The intra-service intensity is similar, however, the time needed to perform 60220 is much greater than 42725. The principal difference between these two services appears to be in the post-service work. 42725 requires nine post-operative visits and will include continued monitoring of the patient's general status with regard to antibiotic prophylaxis and treatment, as well as advancing drains and handling the wound complications.</p>	1

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
42809	Remove pharynx foreign body	1.76	1.76	This service is comparable to 31511 <i>Laryngoscopy, indirect (separate procedure); with removal of foreign body</i> (2.16).	Society did not have adequate survey response and has withdrawn recommendation	2
42815	Excision of neck cyst	6.75	6.75	This service is comparable to 43420 <i>Closure of esophagostomy or fistula, cervical approach</i> (10.19) as the time for the branchial tract dissection should be slightly longer and the intensity should be considerable greater, due to the variable course of the tract with vital structures close to all portions of the tract.		2
42820	Remove tonsils and adenoids	3.59	3.59	An individual commented during the public comment process that this service is comparable in work to 46250 <i>Hemorrhoidectomy, external, complete</i> (rvu = 5.00). AAO-HNS also responded that the work of providing this service has changed in the past five years. This is a reflection of the delay in referral for tonsillectomy and adenoidectomy, along with the general increased severity of children presenting for this surgery. The site-of-service has changed, according to 90% of the survey respondents, from inpatient to outpatient. This demands more follow-up calls and shifts the responsibility for patient education from the hospital to the physician's office.	The RUC was not convinced that the patient population for this service has become more complex. The Harvard time for this procedure is comparable to the AAO-HNS survey data.	2
42961	Control throat bleeding	5.18	5.18	This service is comparable to 42440 <i>Excision of submandibular gland</i> (6.61).	Society did not have adequate survey response and has withdrawn recommendation	2
42962	Control throat bleeding	6.64	6.64	This service is comparable to 49000 <i>Exploratory laparotomy</i> (8.99).		2
42972	Control nose/throat bleeding	6.55	6.55	This service is comparable to 49262 and should also be increased to 9.00.		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
43200	Esophagus endoscopy	1.59	1.59	This service is comparable to 31622 <i>Bronchoplasty</i> (2.80).	Society did not have adequate survey response and has withdrawn recommendation	2
60225	Partial removal of thyroid	11.65	13.31	Closer to the work of 60240 <i>Thyroidectomy, total or complete</i> (rvu = 15.66) Recommend value that is 15% less.	The RUC agrees with the CMD recommendation.	1
60240	Removal of thyroid	15.66	15.66	This service is comparable to 42415 <i>Excision of parotid tumor or parotid gland; lateral lobe, with dissection and preservation of facial nerve</i> (rvu = 16.12). In both cases cancer is usually the indication for surgery and both carry the risk of nerve injury. Although post operatively, both need observation, but need little care, once the immediate post operative potential problems are overcome.	The ASGS survey data is very similar to the Harvard data. No other compelling evidence presented to increase value.	2
60252	Removal of thyroid	15.40	17.23	Closer to the work of 60240 <i>Thyroidectomy, total or complete</i> (rvu = 15.66) Recommend value gives 10% more for neck dissection.	The RUC agrees with the CMD recommendations for these services.	1
60254	Extensive thyroid surgery	16.68	22.50	Radical neck dissection is considerable more work than <i>Thyroidectomy, total or complete</i> (rvu = 15.66).		1
64734	Incision of cheek nerve	4.62	4.50	This code is almost exactly the same as code 64736 <i>Transection of mental nerve</i> (4.40). These procedures have the same degree of difficulty and intraoperative time. They should have the same relative value of 4.50.	The RUC agrees with the AAOMS recommendation to decrease the RVU for this service.	3
64736	Incision of chin nerve	4.40	4.40	This service is the same as 64734 <i>Transection or avulsion of infraorbital nerve</i> (4.62). These procedures have the same degree of difficult and intraoperative time. Recommended value of 4.50.	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
69100	Biopsy of external ear	0.76	0.81	69100, which is site specific, should be the same work as 69120 <i>Excision external ear; complete amputation (rvu=3.95)</i> .	The RUC agreed that these services should be assigned the same work RVU. It should be noted that 11100 went through refinement and was increased for the 1993 MFS.	1
69110	Partial removal external ear	3.34	3.34	An individual commented that this service may be overvalued in comparison to 11100 <i>Biopsy of skin, subcutaneous tissue and/or mucous membrane (including simple closure), unless otherwise listed (separate procedure); single lesion (0.81)</i> .	The specialty provided no compelling evidence to support their comment, so the RUC recommends the current RVUs be maintained.	2
69150	Extensive ear canal surgery	13.01	13.01	The intra-service time and intensity associated with 69150 is at least 2.5 times that associated with 69646 <i>Revise middle ear and mastoid (17.35)</i> .	Society did not have adequate survey response and has withdrawn recommendation	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
69155	Extensive ear/neck surgery	17.03	19.09	The intra-service time and intensity associated with 69155 is at least 2.5 times that associated with 69646 <i>Revise middle ear and mastoid</i> (17.35) and at least 1.5 times that associated with 38720 <i>Cervical lymphadenectomy (complete)</i> (12.29). The risk of a facial nerve injury is considerably higher in performing a partial temporal bone resection.	<p>This service has been inappropriately undervalued due to the lack of realization of the amount of work involved in all three phases of its completion. Particularly, there has been undervaluation of the intra-service component. The technical accomplishment of a neck dissection alone accompanied with a complete mastoidectomy and then enbloc resection of the tympanic membrane, tymbone and external auditory canal with an oncologically safe margin was not realized in the Harvard data. Additionally, post operatively this patient faces all the risks of major operations, as is reflected in the amount of service time and number of visits which will be necessary in the 90 day global period.</p> <p>The RUC agreed that this service was undervalued, but computed a new value by adding 50% of 38720 <i>Cervical lymphadenectomy (complete)</i> (rvu= 12.29) to the current value of 69150 (13.01).</p>	4
69320	Rebuild outer ear canal	16.60	16.60	This service is comparable to 61526 <i>Craniectomy (mastoid) for excision of cerebellopontine angle tumor</i> (29.71).	Society did not have adequate survey response and has withdrawn recommendation	2
69530	Extensive mastoid surgery	18.04	18.04	This service is comparable to 61526 <i>Craniectomy (mastoid) for excision of cerebellopontine angle tumor</i> (29.71)		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
69535	Remove part of temporal bone	34.50	34.50	A contemporary subtotal or total temporal bone resection differs significantly from that described and performed 10 years ago. The experience and technical improvements realized with more sophisticated cranial base procedures now permit a more efficient, safer, and oncologically-sound removal of the temporal bone.	Society did not have adequate survey response and has withdrawn recommendation	2
69554	Remove ear lesion	25.78	31.27	This service requires slightly more time and intensity than 61530 <i>Craniectomy, bone flap craniotomy, transtemporal (mastoid) for excision of cerebellopontine angle tumor; combined with middle/posterior fossa craniotomy/craniectomy</i> (42.35).	The work in performing this procedure was not captured in the Harvard data. This service requires a greater amount of time, technical skill and physical effort than key reference service 21433 <i>Open treatment of craniofacial separation (LeFort III type); complicated (eg, comminuted or involving cranial nerve foramina), multiple surgical approaches</i> (rvu = 23.69). The mental effort, judgment and stress involved in resecting glomus tumors, which bleed quite profusely from the delicate structures about the temporal bone, middle ear and jugular bulb, is considerable. The key portion of this service actually involves removal of the jugular bulb with the drainage of the sigmoid sinus, internal jugular vein and inferior petrosal sinus all needing to be controlled simultaneously. Significant blood loss in the range of 6 to 12 units is not unheard of. The RUC agreed that this code is currently undervalued, however, the pre-service time appears to be overstated. The RUC developed a new work RVU by adding the additional intra-service time in the AAO-HNS survey multiplied by the IWPUT to the current value.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
69605	Mastoid surgery revision	18.04	18.04	This service requires more time and intensity than 61312 <i>Craniotomy/trephination for subdural hematoma (20.54)</i> .	Society did not have adequate survey response and has withdrawn recommendation	2
69660	Revise middle ear bone	11.64	11.64	This service is comparable to 42415 <i>Excise parotid gland/lesion (16.12)</i> and 63017 <i>Removal of spinal lamina (15.85)</i> .		2
69661	Revise middle ear bone	15.32	15.32	This service is more work than 42415 <i>Excise parotid gland/lesion (16.12)</i> and 63017 <i>Removal of spinal lamina (15.85)</i> .		2
69662	Revise middle ear bone	15.04	15.04	This service is comparable to 61312 <i>Craniectomy for evacuation of hematoma (20.54)</i> .		2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
69725	Release facial nerve	18.98	24.01	<p>This service is comparable to 61526 <i>Middle cranial fossa craniotomy with exposure of the internal auditory canal and fallopian canal</i> (29.71).</p> <p>This service should be valued closer to 61526 <i>Removal of Brain lesion</i> (rvu = 29.71). It is much more work than 69720 <i>Decompression of facial nerve, intratemporal; lateral to geniculate ganglion</i> (rvu = 13.95).</p>	<p>The Harvard data does not capture the amount of work involved in performing this procedure. The portion of the surgery near the geniculate ganglion is particularly hazardous, due to the fact that at this point the facial nerve is in close proximity to the bony structures of the inner ear-cochlea and semicircular canals. The work involved in this procedure is clearly greater than that of a standard typanoplasty with mastoidectomy (69642 - 16.37) due to the increased technical skill required to safely perform this procedure. There is a very real risk of permanent injury due to the inadvertent damage to the patient's hearing in the cochlea and balance due to potential injury of the semicircular canals.</p> <p>A new RVU was computed by adding 1) 73 minutes of intra-service time multiplied by the IWPUT and 2) 30 minutes additional post-service time multiplied by ICU IWPUT to the current value.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
69805	Explore inner ear	10.27	13.18	This service is comparable to 69602 <i>Mastoid surgery revision</i> (13.16).	<p>These services are infrequently performed neurotologic procedures which were underestimated in the Harvard study.</p> <p>The RUC compared these services to 55812 <i>Prostatectomy, perineal radical; with lymph node biopsy(s) (limited pelvic lymphadenectomy)</i> (25.65) which is similar in work and time to 69955 and 69960 and determined that these services are currently undervalued. However, the pre-service time appears to be overstated in the AAO-HNS survey.</p> <p>A new RVU was computed for all of these services by adding 1) the additional minutes in the AAO-HNS survey of intra-service time multiplied by the IWPUT and 2) the additional minutes in the AAO-HNS survey of post-service time multiplied by an IWPUT for visits to the current value. The rank order of the AAO-HNS survey medians was retained.</p> <p>AAO-HNS also noted that aural rehabilitation is not included in the work of this service and would be billed separately.</p>	4
69930	Implant cochlear device	14.00	16.13	This service is comparable to 69646 <i>Revised middle ear and mastoid</i> (17.35). The creation of the cocleostomy and placement of the electrode into the inner ear requires more skill and time compared to the reference service.		4
69950	Incise inner ear nerve	21.15	24.21	This service is comparable to 61526 <i>Transtemporal removal of a brain tumor</i> (29.71).		4
69955	Release facial nerve	22.12	25.54	This service is comparable to the combination of three separate procedures 69950 <i>Middle fossa</i> (21.15), 69643 <i>Intact canal wall mastoidectomy</i> (14.81), and 42415 <i>Lateral lobe parotidectomy with a dissection of the facial nerve</i> (16.12).		4
69960	Release inner ear canal	19.75	25.54	This service is similar to 61526 <i>Craniectomy, bone flap craniotomy, transtemporal (mastoid) for excision of cerebellopontine angle tumor</i> (29.71) and 61518 <i>Craniectomy for excision of brain tumor, infratentorial or posterior fossa</i> (32.27).		4
69970	Remove inner ear lesion	22.30	28.54	This service is similar to 61530 <i>Craniectomy combined with middle/posterior fossa craniotomy/craniectomy</i> (42.35).		4

KEY (1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended increase; 5 = Adopt decreased RVU to maintain neutrality)

add = The code was not originally identified in the comments to HCFA. The RUC is requesting that it be added to the five year review.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 21025

Global Period: 090 **Current RVW:** 5.03 **Recommended RVW:** 8.98

CPT Descriptor:

Excision of bone (e.g., for osteomyelitis or bone abscess); mandible

Source and Summary of Comment to HCFA on this service:

Code 21025 is similar to code 21030, (Work RVU-7.05) (excision of benign tumor or cyst of facial bone other than mandible), in terms of difficulty, but pre and postoperative visit patterns are significantly more. Code 21025 is also similar to code 24134 (Work RVU-8.98) (Sequestrectomy (eg, for osteomyelitis or bone abscess), shaft or distal humerus and should retain an RVU of 8.98. Source: AAOMS Special Committee on Physician Payment Review Commission.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

The procedures performed under this code include removal of sequestrums of nonvital bone from the mandible. Patients present with intra and extra oral swelling and suppuration from one or more fistulas. The procedure includes intra and/or extra oral soft tissue incision to gain access to the affected area. Nonvital bone of the mandible is removed with use of curettage, rongeurs and drills/burs. Continuity of the mandible remains. The inferior alveolar nerve is dissected and preserved. Drains are placed. Soft tissue incisions are closed. I.V. antibiotics and/or hyperbarometric oxygen are initiated with necessary follow up for 90 days. Complications are low but disease may advance, requiring resection, stabilization and bone grafting.

Description of Pre-Service Work:

See patient and family prior to going to operating room, review chart, change and be in operatory to position head, stabilize endotracheal tube, scrub and drape patient.

Description of Intra-Service Work:

Extraoral and intraoral incisions, culture tissues, debridement of nonvital bone, preservation of inferior alveolar nerve, placement of drains, and close incisions.

Description of Post Service Work:

Apply pressure dressings, write orders, dictate operative report, meet with family, change and recheck status of patient in recovery room. There are several hospital visits and discharge summary, on average 6-15 minutes postoperative visits are needed.

SURVEY DATA:

Specialty: Oral and Maxillofacial Surgery

Sample Size: 66 Response Rate (%): 45 Median RVW: 8.92

25th Percentile RVW: 7.61 75th Percentile RVW: 10.88 Low: 5 High: 15

Median Pre-Service Time: 75 min. Median Intra-Service Time: 120 min.

25th Percentile Intra-Svc Time: 75 75th Percentile Intra-Svc Time: 128 Low: 30 High: 270

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure	<u>42.5</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>52.5</u>	<u>2.5</u>
Office:	<u>87.5</u>	<u>6</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	21032	Excision of maxillary torus palatinus	4.27
2)	21215	Graft, bone; mandible (includes obtaining graft)	10.07
3)	21360	Open treatment of depressed malar fracture, including zygomatic arch and malar tripod	6.04
4)	21470	Open treatment of complicated mandibular fracture by multiple surgical approaches including internal fixation, interdental fixation, and/or wiring of dentures or splints	14.19

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and intensity (mental effort and judgment; technical skill & physical effort; and psychologist stress) of the service you are rating to the key reference services listed above.

21032: Excision of maxillary torus palatinus - is usually performed in the office and requires about 1/2 the pre-intra and post-service times. Intensity is less because less risk.

21215: Graft, bone; mandible (includes obtaining graft) requires the same pre-service and post service time on the day of surgery. Intra-service time is a little less because not taking graft. Intensity is about the same.

21360: Open treatment of depressed malar fracture, including zygomatic arch and malar tripod. Pre-service and post-service on the day of surgery are about the same. Intra-service work time is 1/3 to 1/2. Post-service office visits are 1/5.

21470: Open treatment of complicated mandibular fracture by multiple surgical approaches, including interdental fixation, and/or wiring of dentures or splints.

Pre-service and post-service on the day of surgery are the same. Intra-service time is less because no fixation is necessary. Post-operative hospital visits will be about the same, but post-operative office visit will be greater. The intensity is about the same.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from AMA or your own research.

We believe the increase in relative value is justified because of the nature of treatment for an osteomyelitis. The value for the mandible should not be that much different than other bones. Also, in a vertical evaluation of other oral surgery codes, it is currently undervalued.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 21031

Global Period: 090 **Current RVW:** 2.01 **Recommended RVW:** 5.30

CPT Descriptor:

Excision of torus mandibularis.

Source and Summary of Comment to HCFA on this service:

Code 21031 is similar to code 21032, (Work RVU-4.27) (excision of maxillary torus palatinus) and is closer to code 21041 (Work RVU-5.03) (Excision of benign cyst or tumor of mandible; complex) and 24120 (Work RVU-6.36) (Excision or curettage of bone cyst or benign tumor of head or neck of radius or olecranon process) in complexity and intra-operative time and should have a relative value in the same RVU range. Source: AAOMS Special Committee on Physician Payment Review Commission.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

This procedure is used to recontour a bony exostosis which interferes with placement of a prosthesis to restore function. A patient presents with a unilateral torus mandibularis which impedes placement of a prosthesis. The procedure includes intra oral incision of oral mucosa. A bur and/or chisel is used to remove the exostosis with rasps used to smooth the area. Soft tissue is closed and sutures placed. The complication rate is low with predictable outcomes.

Description of Pre-Service Work:

This is an office procedure 95% of the time. Meeting with family review of consent and surgical procedure.

Description of Intra-Service Work:

Includes a 5-7 cm intraoral incision reflection of mucoperiosteum, use of drills, saws, chisels and rasps to remove and smooth area. Tissue is closed with sutures.

Description of Post-Service Work:

Meeting with family, giving prescriptions, instructions, completing records. The patient usually requires 2 post-op visits.

SURVEY DATA:

Specialty: Oral and Maxillofacial Surgery

Sample Size: 66 Response Rate (%): (45%) 30 Median RVW: 4.13

25th Percentile RVW: 3.58 75th Percentile RVW: 4.48 Low: 3 High: 5

Median Pre-Service Time: 25 min. Median Intra-Service Time: 30 min.

25th Percentile Intra-Svc Time: 30 75th Percentile Intra-Svc Time: 44 Low: 15 High: 30

CPT Code: 21031

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure	<u>15</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>0</u>	<u>0</u>
Office:	<u>20</u>	<u>2</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	21030	Excision of benign tumor or cyst of facial bone other than mandible	7.05
2)	21032	Excision of maxillary torus palatinus	4.27
3)	11441	Excision, other benign lesion (unless listed elsewhere), face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 0.6 to 1.0 cm	1.56
4)	40819	Excision of frenum, labial or buccal (frenumectomy, frenulectomy, frenectomy)	2.26

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and intensity (mental effort and judgment; technical skill & physical effort; and psychologist stress) of the service you are rating to the key reference services listed above.

21030: Often times is an office procedure for oral surgeons, but may also require hospital care in 30% of the cases. Then, the presurgical and post-service time are increased. A small percentage of cases will be more complex requiring greater intra-operative time. An average post-operative office visit will be about the same.

21032: This is a similar procedure performed on the maxillary bone. The pre-intra and post-service time are very similar.

11441: The pre-service time and immediate post-service time are about the same or slightly less. The intra-operative time is substantially less than removal of a bone lesion.

CPT Code: 21031

40819: The pre-service time and immediate post-service time are about the same or slightly less. The intra-operative time is substantially less than removal of a bone lesion.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from AMA or your own research.

We feel this code is undervalued when compared to other similar oral surgery codes as expressed in the submitted data.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 21041

Global Period: 090 **Current RVW:** 5.03 **Recommended RVW:** 7.08

CPT Descriptor:

Excision of benign tumor or cyst of mandible; complex

Source and Summary of Comment to HCFA on this service:

Code 21041, is similar to code 21030 (Work RVU-7.05) (excision of benign tumor or cyst of facial bone other than mandible), in intra-operative time and complexity and in some cases can carry a slightly higher degree of difficulty. This can also be related to orthopedic code 24110 (Work RVU-7.08) (Excision or curettage of bone cyst or benign tumor, humerus). Source: AAOMS Special Committee on Physician Payment Review Commission.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

The procedures performed under this code involve removal of pathology of the mandible which has risks of fractures, nerve damage and loss or damage to adjoining teeth. Patient presents with radiographic evidence of Keratocyst or benign tumor greater than 3 cm in size impinging on adjacent structures. The procedure involves an intra oral incision of oral mucosa, reflection of mucoperiosteum, removal of bone for access, removal of cyst/tumor, dissection and preservation of inferior alveolar nerve and preservation of adjacent teeth. The size of the defect requires frequent irrigations and prolonged follow up for secondary healing.

Complications include paresthesia and secondary infection during the secondary healing phase. Mandibular fracture and damage or loss of teeth in the area are dependent on the degree of pathology.

Description of Pre-Service Work:

Review chart - see patient and family, change, in operating room, stabilize endotracheal tube, scrub, and drape.

Description of Intra-Service Work:

An intraoral incision and reflection of mucoperiosteum, removal of bone for access, removal of cyst - dissection of inferior alveolar nerve, dissection to preserve as many teeth as possible, placement of packing or drains, closure of incision.

Description of Post Service Work:

Apply pressure dressing, dictate chart, see family, change, check patient in recovery room. Usually discharged on 1st post-op day, discharge summary and hospital visit. Office follow-up visits include pack, drain, and suture removal, along with 6-8 post-op visit with irrigation while healing.

CPT Code: 21041

SURVEY DATA:

Specialty: Oral and Maxillofacial Surgery

Sample Size: 66 Response Rate (%): (45%) 30 Median RVW: 7.50

25th Percentile RVW: 7.05 75th Percentile RVW: 8.50 Low: 5.87 High: 13.5

Median Pre-Service Time: 60 min. Median Intra-Service Time: 90 min.

25th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 120 Low: 45 High: 150

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure	<u>30</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>30</u>	<u>1</u>
Office:	<u>75</u>	<u>6</u>

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	21030	Excision of benign tumor or cyst of facial bone other than mandible	7.05
2)	21422	Open treatment of palatal or maxillary fracture (LeFort I type);	7.78
3)	21470	Open treatment of complicated mandibular fracture by multiple surgical approaches including internal fixation, interdental fixation, and/or wiring of dentures or splints.	14.19
4)	21360	Open treatment of depressed malar fracture, including zygomatic arch and malar tripod	6.04

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and intensity (mental effort and judgment; technical skill & physical effort; and psychologist stress) of the service you are rating to the key reference services listed above.

21030: The pre-service work intra-service and post-service time and intensity are identical except the lesion is in the maxilla rather than the mandible.

21422: Pre-service work may be slightly more do to nature of emergency. Intra-service time is about the same as is the post-service work.

21470: Pre-service work may be slightly more. Intra-service work time is probably 1.5 - 2.0 times. The post-service hospital and office visits are about the same. The intensity may be a little higher.

21360: Pre-service is about the same. Intra-service time may be less and the post-service hospital and office visits are about half.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from AMA or your own research.

Code 21041 in relationship to other oral surgery codes is undervalued as demonstrated in enclosed data survey.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 30920 Global Period: 090 Current RVW: 7.46 Recommended RVW: 8.79

CPT Descriptor: Ligation arteries: internal maxillary artery, transantral

Source and Summary of Comment to HCFA on this service:

American Academy of Otolaryngology—Head and Neck Surgery

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The typical patient is a 75 year old hypertensive that has had uncontrolled nasal bleeding and is anemic. The operation is a microscopic procedure to ligate a major artery behind the paranasal sinuses. The anatomy is highly variable and the difficulty of procedure is high. Complications which may occur are: massive bleeding, complete anesthesia of the cheek, creation of an oral-sinus fistula and blindness.

Description of Pre-Service Work: The patient is encountered typically in the emergency room or after posterior nasal packing has been in place for 24 to 48 hours without successfully controlling the hemorrhage. There is a need for a history and physical examination, review of the patient's hospital course to date, review of the patient's coagulation status and labs, review of the risks and complications of the procedure and discussion with the patient's family and primary care physician.

Due to the emergency nature of this operation, there is typically less time for and orderly preparation of the patient as can be done for an elective procedure. In addition, the patient population consists of elderly individuals with hypertension, COPD and other significant medical problems.

Description of Intra-Service Work: The patient is placed on the operating room table in a supine position. The procedure may be performed under either a local or general anesthetic. In any event, vasoconstrictive solution is injected into the gingivobuccal sulcus and the greater palatine nerves.

The incision is made in the upper gingivobuccal sulcus. The soft tissues of the cheek are elevated from the face of the maxillary sinus. A Caldwell-Luc maxillary antrostomy is performed. The posterior wall of the maxillary sinus is identified and opened. The soft tissues of the pterygomaxillary fossa are identified. The internal maxillary artery and its subordinate branches are identified and hemostatic clips are identified. Other important neural and muscular tissues of the pterygomaxillary fossa are identified and dissected free.

All of this work is performed in close proximity to the orbital apex. There have been reported instances of ligation of the optic nerve or other critical technical errors in the performance of this procedure. All of the work is done via the microscope in a limited area with a hemodynamically fragile patient.

Upon completion of the ligation, the packing in the patient's nasal cavity is removed and the wound is inspected to ensure that the hemorrhage has ceased. An antral window is created and the gingivobuccal sulcus incision closed. The patient is taken to the recovery room.

Description of Post-Service Work: The patient will be followed closely as any other patient who has recently undergone treatment for a bleeding disorder. Serial hematocrit determinations will be required as well as careful monitoring of the patient's ventilatory status. The patient will be examined at least 2 to 3 times per day for 20 to 30 minutes each visit.

The patient will be examined as an outpatient 2 to 3 times at an intermediate (level 99213).

The patient often requires transfusion and treatment of hypertension over the next 24 to 48 hours. In addition, at least two follow up visits are required within the 90 day global period.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

Sample Size: 59 Response Rate (%): 54.24 Median RVW: 8.79

25th Percentile RVW: 8.25 75th Percentile RVW: 10.00 Low: 5.50 High: 15.50

Median Pre-Service Time: 60 Median Intra-Service Time: 120

25th Percentile Intra-Svc Time: 90 75th Percentile Intra-Svc Time: 150 Low: 40 High: 360

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>35</u>	
ICU:	<u>35</u>	<u>2</u>
Other Hospital:	<u>45</u>	<u>3</u>
Office:	<u>35</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
60220	Total thyroid lobectomy, unilateral; with or without isthmusectomy	9.86
31075	Sinusotomy frontal; transorbital, unilateral (for mucocele or osteoma, Lynch type).	8.57

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Respondents' choice of reference services varied widely. However, the two listed above each were selected by six physicians. CPT code 30920 and the above-listed reference services are all 90-day global services.

According to the survey results, the pre-, intra, and post-service times of these reference services are very similar to those of 30920. The mental effort, technical skill, and psychological stress also appear to be similar.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The difficulty of this procedure is great, with the possibility of serious complications. Often the procedure is performed as an emergency, which increases the mental effort and technical skill required. The ligation is performed in close proximity to the orbital apex. There have been reported instances of ligation of the optic nerve or other critical technical errors in the performance of this procedure. In addition, the post-operative course can be very complicated.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31225 Global Period: 090 Current RVW: 15.19 Recommended RVW: 18.40

CPT Descriptor: Maxillectomy; without orbital exenteration

Source and Summary of Comment to HCFA on this service: AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 60 year old with squamous cell carcinoma of the maxillary sinus with chronic obstructive pulmonary disease. Need for pre-op internal medical evaluation.

Description of Pre-Service Work: A history and physical examination have been completed previously. The radiographs are reviewed and reports are attached to the patient's chart. Any last minute questions with the family are reviewed. A thorough explanation of the acute and long-term disability from maxillectomy, particularly emphasizing the need for a maxillofacial prosthesis is once again reviewed. Discussion with the anesthesiologist regarding handling of the airway.

Description of Intra-Service Work: The patient is placed on the operating room table in a supine position. The entire face is sterilely prepped and draped. The leg is left out so that a skin graft may be harvested at a later time in the operation.

A Weber-Ferguson incision is made to allow exposure of the cheek. This incision is carried around the gingivo-buccal sulcus to allow exposure of the lateral and posterior aspects of the maxillary complex.

Bony cuts are made at the hard palate, zygomatic arch, nasal bone, ethmoid sinus and pterygoid plates.

The orbital contents are carefully retracted in a delicate fashion to preserve their function postoperatively. This typically requires more work than in a maxillectomy with orbital exenteration. The specimen is delivered and the wound is copiously irrigated and hemostasis obtained.

A frozen section analysis of the margins is obtained. A split thickness skin graft from the leg is obtained (additional code). This skin graft is sutured in place to provide a lining for the maxillofacial prosthesis. The prosthesis is secured in place and packing is positioned to provide support for the skin graft. The wound is closed in layers and the patient is taken to the recovery room.

Particularly and troublesome in this operation is the intense nature of the procedure. The wound is constantly bleeding and there is no way to obtain adequate hemostasis until the specimen has been removed. In addition, the operation of maxillectomy with orbital exenteration is actually more difficult than that of preserving the orbit despite the seemingly more limited surgery.

Description of Post-Service Work: The patient will be seen in the intensive care unit two times per day for the 2 days. The patient is customarily discharged to the floor and remains there for five to seven days. During that time, the patient is again customarily seen twice per day.

SURVEY DATA:Specialty: American Academy of Otolaryngology—Head and Neck SurgerySample Size: 47 Response Rate (%): 66.00 Median RVW: 18.4025th Percentile RVW: 15.63 75th Percentile RVW: 20.75 Low: 15.19 High: 28.00Median Pre-Service Time: 90 Median Intra-Service Time: 18025th Percentile Intra-Svc Time: 135 75th Percentile Intra-Svc Time: 232 Low: 90 High: 420

Office:	<u>80</u>	<u>6</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg, comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090
31360	Laryngectomy; total, without radical neck dissection	15.19	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 31225, which describes a maxillectomy without orbital exenteration was felt to lie within the range of reference services by those physicians responding to the AAO-HNS survey.

The pre service time of our survey of 90 minutes, exceeds that of any of the key reference services according to Harvard data.

The median intra service time of 180 minutes is consistent with the range of intra operative times given by Harvard data for the three reference services.

The post service time is actually greater than that of the Harvard data for the referenced services.

Maxillectomy without orbital exeneration encompasses similar type of work to reference service 21433. There is skeletonization of the facial framework with osteotomies necessary to release the maxilla. There is additional work in preserving the orbit. Most head and neck surgeons that maxillectomy without orbital exeneration, particularly preserving the integrity of the maxilla during its removal, is a harder procedure than maxillectomy with orbital exeneration.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

As stated above, most head and neck surgeons feel that maxillectomy without orbital exeneration is in point of fact a more difficult operation than doing the maxillectomy preserving the orbit. This is due to the fact of the complex relationships of the posterior aspect of the maxilla to the orbit.

The only reason to preserve the orbit is obviously to preserve vision. If in fact, during the removal of the maxilla, the orbit is compromised then the procedure has not been totally successful, even though there may be an adequate oncologic procedure performed.

This difficulty of this procedure was not captured in the initial Harvard survey data, upon which the current work RVU for this procedure has been promulgated. In particular, the increased intra operative work, accompanied with the intensity and number of visits post operatively are underestimated in the current evaluation by HCFA.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31290 Global Period: 010 Current RVW: 12.87 Recommended RVW: 16.05

CPT Descriptor: Nasal/sinus endoscopy, surgical, with repair of cerebrospinal fluid leak; ethmoid region

Source and Summary of Comment to HCFA on this service:

American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient presents with a history of head trauma and clear rhinorrhea. The rhinorrhea is unilateral and there is no history of allergy. Nasal endoscopy reveals unilateral clear rhinorrhea, but no definite site of origin is present. There is a large polyp on the same side. CT demonstrates that the ethmoid roof is displaced inferiorly on the side of the rhinorrhea and there is an associated intranasal mass. No definite leak is demonstrated with intrathecal contrast CT. MRI suggests there is a frontal lobe prolapse into the mass. The rhinorrhea is positive for B2 transferrin.

Description of Pre-Service Work: The patient's records and imaging studies (including angiogram when needed) are carefully evaluated to determine the best approach. The relative risks are discussed with the patient. The patient is re-endoscoped at the time of pre-admission evaluation to rule out intercurrent infection. The pre-anesthesia studies are reviewed and an admission note written. After the induction of general anesthesia, the patient is positioned and prepped for lumbar puncture. A spinal drain is placed, and intrathecal dye mixed with the patient's CSF is injected slowly over 5 minutes. The patient is then re-positioned and the face prepped and draped. The nasal mucosa is decongested by the application of topical decongestants.

Description of Intra-Service Work: A complete endoscopic ethmoidectomy (31255) and frontal sinusotomy (31276) is performed. Sphenoidotomy with removal of tissue (31288) is frequently required to expose additional skull base. A maxillary antrostomy (31267) may or may not be required for orientation and post-operative drainage. The skull base is carefully skeletonized and exposed. The middle or superior turbinate is frequently resected (30130). The meningo-encephalocele is approached and the defect localized. The protruding brain and dura is sequentially bipolar cauterized and resected in stages. The patient is carefully monitored during the resection. Attention is then directed towards the opposite nasal septum and a mucoperichondrial graft harvested under endoscopic visualization (20912). A bone graft may also be required. Additionally, a large defect will require that fascia be harvested from an additional site (temporalis) (20926). The bone graft is then fashioned to fit the defect, placed intracranially through the defect and secured in place. The mucoperichondrial graft is secured in place with micro-fibrillar collagen and packed into place with gelfoam and sponges. The donor site is covered with microfibrillar collagen and packed.

Description of Post-Service Work: The patient requires post-surgical visits on the night of surgery, 2x/day in the early post-operative period and once a day thereafter for a total hospitalization of 5-7 days. Neurological checks are performed for 12-24 hrs, the patient is maintained on I.V. antibiotics and monitored for meningitis. The spinal drain is left in place for 72 hrs and the patient remains on complete bed rest for four days. Packing is removed from one side of the nose the day following surgery. The sponges and some absorbable packing are removed from the second side of the nose prior to discharge. At this time the nose is carefully cleaned.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

Sample Size: 33 Response Rate (%): 84.85 Median RVW: 16.05

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>45</u>	
ICU:	<u>30</u>	<u>2</u>
Other Hospital:	<u>60</u>	<u>4</u>
Office:	<u>30</u>	<u>1</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
62100	Craniotomy for repair of dural/CSF leak, including surgery for rhinorrhea/otorrhea.	20.78
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37
31255	Nasal/sinus endoscopy, surgical; with ethmoidectomy, total (anterior and posterior).	6.96

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill

& physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Over one-third of the respondents used the craniotomy as a reference service. Regarding pre-service work, the evaluation of imaging studies and patient discussion is similar to the craniotomy. However, the extracranial approach requires additional nasal evaluation for deformities which may present intra-operative problems and, on the day prior to surgery, to exclude the presence of intercurrent infection. Similarly, placement of a lumbar drain is typically performed for this repair, but is not performed in the craniotomy. However, the intranasal approach does not require partial head shaving as is required with craniotomy. Overall, pre-service work time is greater with 31290 than with 62100.

In comparison to craniotomy, the overall intensity of 31290 is higher because there is no opening or closing time. The entire approach is performed in close proximity to the skull base and the orbit and must be performed with great care. Trauma to surrounding structures must be avoided at all costs.

Repair of CSF leak has a 10-day global period and the craniotomy carries a 90-day global period, but most of the post-operative care for the craniotomy occurs within the first 10 days.

The component parts of the repair of CSF leak include an endoscopic total ethmoidectomy (31255), frontal sinusotomy (31276) and frequently include endoscopic sphenoidectomy with removal of mucosa (31288), turbinate resection (30130), and maxillary antrostomy (31267). A mucosal graft is always harvested (20912), a bone graft is often required and a temporalis fascial graft (20926) may be required.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

We received an 84.85% response rate on the survey for this code. However, the number of respondents do not number 30, because the sample size was so small. This procedure is performed by only a small number of physicians across the country. This is evidenced by the small number of this procedure billed to Medicare for 1994 -- 36. We believe that the number of respondents is sufficient to base a valid recommendation.

Two-thirds of the respondents believe that the work required for the repair of the CSF leak has changed over the last five years. Over half of the respondents believe that the patients are more complex (none believe that the patients are less complex and three believe that there has been no change). The RUC previously recommended a work RVU of 18.33 (adjusted for 1995) for 31290. However, HCFA arbitrarily significantly reduced that recommendation based on a faulty crosswalk between old and new codes for functional endoscopic sinus surgery.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31291 Global Period: 010 Current RVW: 13.52 Recommended RVW: 17.00

CPT Descriptor: Nasal/sinus endoscopy, surgical, with repair of cerebrospinal fluid region: sphenoid region

Source and Summary of Comment to HCFA on this service:

American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient presents with a history of recurrent meningitis and bilateral clear rhinorrhea. Diagnostic evaluations including CT, MRI, and possibly angiogram reveal a bony erosion of the lateral wall of the sphenoid sinus and an associate intra-sinus mass. Careful evaluation has failed to provide any other likely cause for rhinorrhea or recurrent meningitis.

Description of Pre-Service Work: The patient's records and imaging studies are carefully evaluated to determine the best approach. An angiogram is performed and reviewed to exclude any significant intralesional blood vessels. The relative risks are considered and discussed with the patient. The patient is re-endoscoped at the time of pre-admission evaluation to rule out intercurrent infection. The pre-anesthesia studies are reviewed and an admission note written. After the induction of general anesthesia, the patient is positioned and prepped for lumbar puncture. A spinal drain is placed, and intrathecal dye mixed with the patient's CSF is injected slowly over 5 minutes. The patient is then re-positioned and the face prepped and draped. The nasal mucosa is decongested by the application of topical decongestants.

Description of Intra-Service Work: A complete endoscopic ethmoidectomy (31255) and sphenoidotomy with removal of tissue (31288) is performed. A maxillary antrostomy (31267) frequently may be required for orientation and post-operative drainage or a frontal sinusotomy (31276) to allow inspection of the entire ethmoid roof. The skull base is carefully skeletonized and exposed. The superior turbinate is resected (30130). Mucosa is removed from the sphenoid sinus. The meningo-encephalocele is approached and the defect localized. The protruding brain and dura is sequentially bipolar cauterized and resected in stages. The patient is carefully monitored during the resection. Attention is then directed towards the opposite nasal septum and a mucoperichondrial graft harvested under endoscopic visualization (20912). A bone graft is also harvested. Fascia may or may not be also harvested and placed as a first layer closure (20926). The bone graft is then fashioned to fit the defect, placed intracranially through the defect and secured in place. The mucoperichondrial graft is secured in place with micro-fibrillar collagen and packed into place with gelfoam and sponges. The donor site is covered with microfibrillar collagen and packed.

Description of Post-Service Work: The patient requires post-surgical visits on the night of surgery, 2x/day in the early post-operative period and once a day thereafter for a total hospitalization of 5-7 days. Neurological checks are performed for 12-24hrs, the patient is maintained on I.V. antibiotics and monitored for meningitis. The spinal drain is left in place for 72hrs and the patient remains on complete bed rest for four days. Packing is removed from one side of the nose the day following surgery. The sponges and some absorbable packing are removed from the second side of the nose prior to discharge. At this time the nose is carefully cleaned.

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
62100	Craniotomy for repair of dural/CSF leak, including surgery for rhinorrhea/otorrhea.	20.78
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.4

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Regarding pre-service work, the evaluation of imaging studies and patient discussion is similar to the craniotomy. However, the extracranial approach requires additional nasal evaluation for deformities which may present intra-operative problems and, on the day prior to surgery, to exclude the presence of intercurrent infection. Similarly, placement of a lumbar drain is typically performed for this repair, but is not performed in the craniotomy. However, the intranasal approach does not require partial head shaving as is required with craniotomy. Overall, pre-service work time is greater with 31291 than with 62100.

In comparison to craniotomy, the overall intensity of 31291 is higher because there is no opening or closing time. The entire approach is performed in close proximity to the skull base and the orbit and must be performed with great care. Trauma to surrounding structures must be avoided at all costs.

Repair of CSF leak has a 10-day global period and the craniotomy carries a 90-day global period, but most of the post-operative care for the craniotomy occurs within the first 10 days.

The component parts of the repair of CSF leak include an endoscopic total ethmoidectomy (31255), endoscopic sphenoidectomy with removal of mucosa (31288), turbinate resection (30130), and typically would include either frontal sinusotomy (31276) or maxillary antrostomy (31267). A mucosal graft is always harvested (20912), a bone graft is often required and a temporalis fascial graft (20926) may be required.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Over half of the respondents believe that the work required for the repair of the CSF leak has changed over the last five years. All of those who answered the question believe that the patients are more complex. The RUC previously recommended a work RVU of 19.31 (adjusted for 1995) for 31291. However, HCFA arbitrarily significantly reduced that recommendation based on a faulty crosswalk between old and new codes for functional endoscopic sinus surgery.

We received an 68.75% response rate on the survey for this code. However, the number of respondents do not number 30, because the sample size was so small. This procedure is performed by only a small number of physicians across the country. This is evidenced by the small number of this procedure billed to Medicare for 1994 -- 38. We believe that the number of respondents is sufficient to base a valid recommendation.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31292 Global Period: 010 Current RVW: 10.45 Recommended RVW: 13.83

CPT Descriptor: Nasal/sinus endoscopy, surgical; with medial or inferior orbital wall decompression

Source and Summary of Comment to HCFA on this service:

AAO-HNS
ARS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient presents with mild to moderate dysthyroid orbitopathy but with a significant recent visual deterioration and evidence of orbital apex compression. Ophthalmic examination confirms decreased visual acuity and color vision. CT demonstrates the typical changes of thyroid eye disease.

Description of Pre-Service Work: The patient's records and imaging studies are carefully evaluated to determine the best approach, based upon the anatomic findings present and the disease present. The surgical options are discussed along with their respective advantages and disadvantages in that particular patient. The patient is re-endoscoped at the time of pre-admission evaluation to rule out intercurrent infection. The pre-anesthesia studies are reviewed and an admission note written. After the induction of general anesthesia, the patient is prepped and draped. Topical and local anesthesia are applied.

Description of Intra-Service Work: A complete endoscopic ethmoidectomy (31255) and frontal sinusotomy (31276) is performed. Sphenoidotomy with removal of tissue (31288) is required to expose the orbital apex. Maxillary antrostomy (31267) is required for post-operative drainage. The skull base is carefully skeletonized and exposed. The middle turbinate may be resected (30130). The medial orbital wall is exposed throughout and then carefully removed. The underlying periosteum is incised with sequential linear incisions allowing protrusion of the orbital fat.

Description of Post-Service Work: The patient requires post-surgical visits on the night of surgery, daily in the post-operative period. Visual checks are performed for 12-24hrs. If packing is placed, it is removed on the day following surgery. Two endoscopic debridements (31237) are typically performed in the 10 day global period.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

Sample Size: 32 Response Rate (%): 71.88 Median RVW: 13.83

25th Percentile Intra-Svc Time: 120 75th Percentile Intra-Svc Time: 170 Low: 60 High: 300

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>35</u>	<u>2</u>
Other Hospital:	<u>40</u>	<u>2</u>
Office:	<u>30</u>	<u>1</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
31255	Nasal/sinus endoscopy, surgical; with ethmoidectomy, total (anterior and posterior).	6.96
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction.	16.37
42415	Excision of parotid tumor or parotid gland; lateral lobe, with dissection and preservation of facial nerve.	16.12
67570	Optic nerve decompression (eg, incision or fenestration of optic nerve sheath).	12.52
69632	Tympanoplasty without mastoidectomy (including canalplasty, atticotomy and/or middle ear surgery), initial or revision; with ossicular chain reconstruction (eg, postfenestration)	12.41

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Reference services selected by the respondents varied widely, with no one reference service standing out from the crowd. Several respondents did select each of the above-mentioned services. The interpretation of diagnostic studies, informed consent, and preoperative patient evaluation is clearly significantly more complicated for 31292 than for endoscopic sinus surgery for chronic sinusitis (31255, 31276, 31267).

The overall intensity of 31292 also is significantly higher than for endoscopic sinus surgery for chronic sinusitis. Moreover, the procedure includes a total ethmoidectomy (31255), frontal sinusotomy (31276), endoscopic sphenoidectomy (31287), and maxillary antrostomy (31267). Turbinate resection (30130) is frequently required.

31292 carries a 10-day global period and requires significant hospitalization and the patients need to be carefully monitored.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Almost two-thirds of the respondents believe that the work required for 31292 has changed over the last five years. Ten believe that the patients are more complex (none believe the patients are less complex and two believe there has been no change). The RUC previously recommended a work RVU of 15.27 (adjusted for 1995) for 31292. However, HCFA arbitrarily significantly reduced that recommendation based on a faulty crosswalk between old and new codes for functional endoscopic sinus surgery.

We received an 71.88% response rate on the survey for this code. However, the number of respondents do not number 30, because the sample size was so small. This procedure is performed by only a small number of physicians across the country. This is evidenced by the small number of this procedure billed to Medicare for 1994 -- 32. We believe that the number of respondents is sufficient to base a valid recommendation.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31293 Global Period: 010 Current RVW: 11.43 Recommended RVW: 15.15

CPT Descriptor: Nasal/sinus endoscopy, surgical; with medial orbital wall and inferior orbital wall decompression

Source and Summary of Comment to HCFA on this service:

American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient presents with severe dysthyroid orbitopathy, exposure keratitis, and diplopia and some recent visual deterioration. CT demonstrates the typical changes of severe thyroid eye disease.

Description of Pre-Service Work: The patient's records and imaging studies are carefully evaluated to determine the best approach, based upon the anatomic findings present and the disease present. In particular, the thickness of the medial and inferior orbital wall, the relationship of the orbital apex to the ethmoid/sphenoid sinuses and the presence of intercurrent chronic sinus disease are evaluated. The patient is re-endoscoped at the time of pre-admission evaluation to rule out intercurrent infection. The pre-anesthesia studies are review and an admission note written. After induction of general anesthesia, the patient is prepped and draped.

Description of Intra-Service Work: A complete endoscopic ethmoidectomy (31255) and frontal sinusotomy (31276) is performed. Sphenoidotomy with removal of tissue (31288) is required to expose the orbital apex. A very extensive maxillary antrostomy (31267) is required. In fact most of the medial wall of the maxillary sinus must be removed to provide access to the orbital floor and for post-operative drainage. The skull base is carefully skeletonized and exposed. The middle turbinate may be resected (30130). The medial orbital wall is exposed throughout. The medial orbital wall and the floor of the orbit is then carefully removed. The latter requires working with highly angled instruments and telescopes through the maxillary antrostomy and is technically demanding. The underlying periosteum is incised with sequential linear incisions allowing protrusion of the orbital fat.

Description of Post-Service Work: The patient requires post-surgical visits on the night of surgery, daily in the post-operative period. Visual checks are performed for 12-24hrs. If packing is placed, it is removed on the day following surgery. Two endoscopic debridements (31237) are typically performed in the 10 day global period.

69632	Tympanoplasty without mastoidectomy (including canalplasty, atticotomy and/or middle ear surgery), initial or revision; with ossicular chain reconstruction (eg, postfenestration)	12.41

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Reference services selected by the respondents varied widely, with no one reference service standing out from the crowd. Several respondents did select each of the above-mentioned services. The interpretation of diagnostic studies, informed consent, and preoperative patient evaluation is clearly significantly more complicated for 31293 than for endoscopic sinus surgery for chronic sinusitis (31255, 31276, 31267).

The overall intensity of 31293 also is significantly higher than for endoscopic sinus surgery for chronic sinusitis. Moreover, the procedure includes a total ethmoidectomy (31255), frontal sinusotomy (31276), endoscopic sphenoidectomy (31287), and maxillary antrostomy (31267). Turbinate resection (30130) is frequently required.

31293 carries a 10-day global period and requires significant hospitalization and the patients need to be carefully monitored.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Over half of the respondents believe that the work required for 31293 has changed over the last five years. Ten believe that the patients are more complex (none believe the patients are less complex and one believes there has been no change). The RUC previously recommended a work RVU of 16.73 (adjusted for 1995) for 31293. However, HCFA arbitrarily significantly reduced that recommendation based on a faulty crosswalk between old and new codes for functional endoscopic sinus surgery.

We received an 65.63% response rate on the survey for this code. However, the number of respondents do not number 30, because the sample size was so small. This procedure is performed by only a small number of physicians across the country. This is evidenced by the small number of this procedure billed to Medicare for 1994 -- 10. We believe that the number of respondents is sufficient to base a valid recommendation.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31294 Global Period: 010 Current RVW: 13.06 Recommended RVW: 18.00

CPT Descriptor: Nasal/endoscopy, surgical; with optic nerve decompression

Source and Summary of Comment to HCFA on this service:

American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient presents with a history of head trauma. On admission the patient was noted to have unilateral absent pupillary response and CT demonstrated a skull base fracture in the region of the optic canal. The patient has been on massive doses of IV steroids without response and, as the patient is beginning to regain consciousness, there is no vision in the affected eye.

Description of Pre-Service Work: The patient's records and imaging studies are carefully evaluated to determine the best approach, based upon the anatomic findings and fractures present. In particular, the relationship of the orbital apex and optic nerve to the ethmoid/sphenoid sinuses and the presence of intercurrent chronic sinus disease are evaluated. MRI & MRA are reviewed to evaluate for a hematoma in the area of the optic nerve and evaluate the ipsilateral carotid artery. Angiography may be required. Questions are answered. Nasal endoscopy may be required to examine the anatomy and to rule out intercurrent infection. The pre-anesthesia studies are reviewed and a note written. After the induction of general anesthesia, the patient is prepped, draped, and topical and local anesthesia are applied.

Description of Intra-Service Work: A complete endoscopic ethmoidectomy (31255) sinusotomy (31276) is performed. Sphenoidotomy with removal of tissue (31288) is required to expose the orbital apex. A maxillary antrostomy (31267) is typically required for orientation and postoperative drainage. The skull base is carefully skeletonized and exposed. The middle turbinate may be resected (30130). The medial orbital wall is exposed throughout. The medial orbital wall adjacent to the orbital apex is then carefully removed. Using a special drill, irrigation and intermittent suction the bone over the optic nerve is slowly thinned. Great care and skill is required not to injure the adjacent skull base or carotid artery. After the bone has been sufficiently "egg shelled", delicate otologic instruments are used to carefully remove the remaining bone. The nerve sheath is then gently incised. A small CSF leak may be encountered at this stage and, in these cases a mucosal graft is harvested from the opposite side of the nose and placed over the nerve.

Description of Post-Service Work: The patient requires post-surgical visits on the night of surgery, twice daily in the for the first 2-3 days and daily thereafter. Visual checks are performed for 12-24hrs. If packing is placed, it may be removed on the day following surgery. One endoscopic debridement (31237) is typically performed in the 10 day global period.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery
American Rhinologic Society

Sample Size: 31 Response Rate (%): 61.29 Median RVW: 18.00

Median Pre-Service Time: 100 Median Intra-Service Time: 210

25th Percentile Intra-Svc Time: 180 75th Percentile Intra-Svc Time: 240 Low: 90 High: 420

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>40</u>	
ICU:	<u>40</u>	<u>2</u>
Other Hospital:	<u>45</u>	<u>3</u>
Office:	<u>30</u>	<u>1</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
67570	Optic nerve decompression (eg, incision or fenestration of optic nerve sheath).	12.52	

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Reference services selected by the respondents varied widely, with a number of reference services receiving one or two votes. The above-mentioned services were the only ones that received more than two votes. The interpretation of diagnostic studies, informed consent, and preoperative patient evaluation is clearly significantly more complicated for 31294 than for endoscopic sinus surgery for chronic sinusitis (31255, 31276, 31267).

The overall intensity of 31294 also is dramatically higher than for endoscopic sinus surgery for chronic sinusitis. Moreover, the procedure includes a total ethmoidectomy (31255), endoscopic sphenoidectomy

(31287), and maxillary anrostomy (31267). Turbinate resection (30130) is frequently required. In addition to the components for the approach and the closure, a very delicate and difficult cranial nerve decompression (67570) must be performed and a mucosal graft may be required.

31294 carries a 10-day global period and requires significant hospitalization and the patients need to be monitored extremely closely. Decompression of the optic nerve (67570) carries a 90-day global period, but most of the postoperative care occurs within the first 10 days.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Over half of the respondents believe that the work required for 31294 has changed over the last five years. Eight believe that the patients are more complex (none believe the patients are less complex and two believe there has been no change). The RUC previously recommended a work RVU of 15.62 (adjusted for 1995) for 31294. However, HCFA arbitrarily significantly reduced that recommendation based on a faulty crosswalk between old and new codes for functional endoscopic sinus surgery.

We received an 61.29% response rate on the survey for this code. However, the numer of respondents do not number 30, because the sample size was so small. This procedure is performed by only a small number of physicians across the cuntry. This is evidenced by the small number of this procedure billed to Medicare for 1994 -- 8. We believe that the number of respondents is sufficient to base a valid recommendation.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31390 Global Period: 090 Current RVW: 21.15 Recommended RVW: 25.00

CPT Descriptor: Pharyngolaryngectomy, with radical neck dissection; without reconstruction

Source and Summary of Comment to HCFA on this service: AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 60 year old male with recent weight loss (10-20 #), moderate to severe throat pain, inability to swallow solids, difficulty with speech and breathing. Heavy smoker, moderate to heavy alcohol use. COPD, coronary artery disease, often with poor family support and inadequate coping skills; frequently has had prior radiation and/or chemotherapy.

Examination reveals a bulky tumor infiltrating and partially obstructing the larynx with potential airway obstruction and one or more cervical lymph nodes (3 cm or larger).

Description of Pre-Service Work:

1. record review/visit with patient and family
2. scrub/attend intubation
position/prep/drape
3. laryngoscopy, diagnostic

Description of Intra-Service Work:

1. scrub/prep/tracheotomy, local anesthesia
2. laryngoscopy, diagnostic
3. radical neck dissection
4. laryngopharyngectomy
5. thyroidectomy parathyroid autotransplantation

SURVEY DATA:Specialty: American Academy of Otolaryngology—Head and Neck SurgerySample Size: 48 Response Rate (%): 63.00 Median RVW: 25.0025th Percentile RVW: 21.15 75th Percentile RVW: 32.00 Low: 16.00 High: 37.43Median Pre-Service Time: 90 Median Intra-Service Time: 30025th Percentile Intra-Svc Time: 240 75th Percentile Intra-Svc Time: 300 Low: 140 High: 600

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>45</u>	
ICU:	<u>45</u>	<u>3</u>
Other Hospital:	<u>145</u>	<u>10</u>
Office:	<u>90</u>	<u>6</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
31360	Laryngectomy; total, without radical neck dissection	15.19	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 31390 was felt to encompass more work than either of the reference services; however, both of the reference services are similar major head and neck procedures.

Survey data from the AAO-HNS instrument demonstrates that the pre service time, intra service time and post service time are all greater than that of the Harvard data for the two key reference services.

Laryngopharyngectomy with radical neck dissection is an extensive head and neck surgical procedure similar to the scope of CPT Code 31365 laryngectomy with neck dissection, but having more work due entrance into the pharynx and removal of adjacent structures. This extra work is not realized in the current valuation for CPT Code 31390.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The extra work involved in performing a pharyngeal resection in addition to a total laryngectomy and neck dissection, has not been captured in the current valuation of CPT Code 31390. As indicated above, the current value for CPT Code 31365, which is a similar procedure, but lacking the pharyngeal component, is 21.83. This small difference in RVU does not explain the extra work, mental stress and effort required to perform the procedure under question. The AAO-HNS survey of physicians performing this work frequently better captures the relationship between these two procedures and the extra work involved in performing a pharyngolaryngectomy.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31395 Global Period: 090 Current RVW: 26.19 Recommended RVW: 28.00

CPT Descriptor: Pharyngolaryngectomy, with radical neck dissection; with reconstruction

Source and Summary of Comment to HCFA on this service: AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 60 year old male with recent weight loss (10-20 lbs), moderate to severe throat pain, inability to swallow solids, difficulty with speech and breathing. Heavy smoker, moderate to heavy alcohol use, COPD, coronary artery disease, often with poor family support and inadequate coping skills: frequently has had prior radiation and/or chemotherapy.

Examination reveals a bulky tumor infiltrating and partially obstructing the larynx with imminent airway obstruction and one or more cervical lymph nodes (3 cm or larger). Tumor extensively invades inferior pharyngeal wall and esophageal inlet. Surgical excision requires thyroidectomy, postoperative problems may include hypoparathyroidism.

Description of Pre-Service Work:

1. record review/visit with pt and family
2. scrub/attend intubation
position/prep/drape
3. laryngoscopy, diagnostic

Description of Intra-Service Work:

1. Radical neck dissection
2. Laryngopharyngectomy with primary mucosal closure

Description of Post-Service Work:

1. Dictate op/rept/write orders; attend transfer to rec rm; visit family; visit ICU (same day)
2. POD #1 - visit ICU arrange transfer to ward; visit on ward
3. POD #2-7 - visit on ward
4. POD #8 - arrange discharge plan
5. POD #9 - 14 visit on ward
6. POD #15 - 24 outpatient visits
7. POD #25 -90 outpatient visits

Day of Procedure:	<u>60</u>	
ICU:	<u>60</u>	<u>4</u>
Other Hospital:	<u>170</u>	<u>11</u>
Office:	<u>120</u>	<u>7.5</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
31360	Laryngectomy; total, without radical neck dissection	15.19	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg, comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 31395 describing pharyngolaryngectomy with neck dissection and reconstruction was felt to be valued greater than any of the key references by the respondents to the AAO-HNS survey. The survey pre service, intra service and post service times are all significantly greater than any of the Harvard data for the key reference services. On the other hand, all of the key reference services described major head and neck procedures.

CPT Code 31395 describes one of the most extensive head and neck surgical procedures performed. Of particular concern is the fact that there is undervaluation of the role of reconstruction in this procedure. Particularly concerning is the undervaluation of the post service work, which can be significant in this operation.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT Code 31395 describes an extensive head and neck procedure with removal of the neck contents on one side, the larynx and a major portion of the pharynx. This leaves a considerable void which must be

reconstructed by a secondary technique. The additional valuation afforded to this procedure over its counterpart CPT Code 31390, which describes the same procedure, but without need for reconstruction, is the additional work involved in placing either a free tissue graft, myocutaneous flap, or other reconstructive techniques, such as a free gastric patch in place, using microvascular techniques. While the reconstructive technique can obviously be billed as a secondary procedure, there is extra work and complication in suturing in such a device.

Additionally, all reconstructive techniques fail to provide sensation to the pharynx following reconstruction. Such lack of sensation leads to aspiration and difficulty in feeding. This complicates the post operative course of such patients demanding coordination with swallowing experts, and time and counseling the family and patient. This additional work necessary for Code 31395 is captured in the AAO-HNS survey data for this procedure.

15260	Full thickness graft, free, including direct closure of donor site, nose, ears, eyelids, and/or lips; 20 sq cm or less	9.56	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The respondents to our survey concerning CPT Code 31541 all felt that the relative work of this procedure fell into the range of the reference services even though CPT Code 31541 has a 0 day global period in contrast to the 90 day global period of the reference services.

The median pre service time of CPT Code of 31541 of 45 minutes exceeds the pre service time for any of the reference services. Similarly, the intra service median time for CPT Code 31541 of 60 minutes is consistent with the range of values for the reference services.

The immediate post service time for CPT Code 31541 of 20 minutes of the day of procedure is less than that of the reference services.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The work inherent in performing a stripping of the vocal cords utilizing the operating microscope and/or excision of small benign or malignant tumors is an exacting science which is increasing in its utilization. There has been a greater emphasis on voice saving procedures for early cancers of the larynx. As such, the margin for error in excision of these lesions (1-2mm) is greater than that for traditional open techniques. On the other hand, inadequate excision of tumors not matter what the technique or approach will result in recurrence of this lesion, and so there is a greater burden of responsibility on the operating surgeon to insure that he has done an adequate procedure. There is no assistant or other individual who can help the surgeon at this time, so that the mental stress and effort is considerable.

Additionally, there is a greater emphasis on and acceptable vocal result following this type of surgery. The surgeon is confronted with the need to balance the amount of tissue removed with leaving a satisfactory amount of vocal cord for phonation.

The Harvard data concerning this procedure failed to capture the increased amount of work required in this procedure. In addition, the advent of improved microsurgical techniques has allowed this procedure to be extended to patients who otherwise would have been subjected to open surgical operations.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 31561 Global Period: 000 Current RVW: 4.90 Recommended RVW: 8.13

CPT Descriptor: Laryngoscopy, direct, operative, with arytenoidectomy; with operating microscope

Source and Summary of Comment to HCFA on this service:
AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Usually adult patient with bilateral vocal cord paralysis and consequent laryngeal airway obstruction. Patient usually tracheotomy dependent with desire to be made independent of tracheostomy.

Description of Pre-Service Work: Meet and talk with patient (and family); obtain operative consent; review lab studies; prepare for operating room; set up laser (may need to calibrate).

Description of Intra-Service Work: Allow induction of general anesthesia, place endoscope; place microscope, perform surgical procedure through scope; in many cases with use of laser. Monitor patients as he awakens.

Description of Post-Service Work: Accompany patient to recovery room area, write orders. Talk with family; do post operative report, may use feeding tube temporarily, trach care; see patient later that day or more times. See patient in the morning and arrange discharge; discharge note. Later removal of tracheostomy tube, monitor for airway problem; see in follow up.

SURVEY DATA:

Specialty: Otolaryngology—Head and Neck Surgery

Sample Size: 47 Response Rate (%): 64.00 Median RVW: 8.13

25th Percentile RVW: 6.75 75th Percentile RVW: 11.13 Low: 4.80 High: 15.00

Median Pre-Service Time: 60 Median Intra-Service Time: 90

25th Percentile Intra-Svc Time: 60 75th Percentile Intra-Svc Time: 98 Low: 40 High: 150

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>15</u>	<u>1</u>
Office:	<u>0</u>	<u>0</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
30520	Septoplasty or submucous resection, with or without cartilage scoring, contouring or replacement with graft	5.55	090
42440	Excision of submandibular (submaxillary) gland	6.61	090
69660	Stapedectomy or stapedotomy with reestablishment of ossicular continuity, with or without use of foreign material	11.64	090
21360	Open treatment of depressed malar fracture, including zygomatic arch and malar tripod	6.04	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 31561 was felt to be of the same general magnitude as the range of the reference procedures even though the reference procedures were 90 day global surgical operations and laryngoscopy with arytenoidectomy is a 0 day global procedure.

The median pre service of 60 minutes from our survey for CPT Code 31561 is greater than the pre operative duration for any of the reference procedures. Similarly, the intra service time of 90 minutes from our survey for CPT Code 31561 is consistent with the range of intra operative times for each of the reference services.

The intensity of CPT Code 31561 is similar to that of a stapedectomy or a submandibular gland excision. In fact, the very real risk of potential airway compromise for patients undergoing arytenoidectomy is significant.

The post operative time of course is truncated due to the fact that this is a 0 day global procedure. It does, however, involve a mean of 30 minutes of post service time on the day of procedure in one visit in the hospital prior to release of 15 minutes.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The number and scope of patients presenting for laser arytenoidectomy has increased in the past five years. The majority of our respondents indicated that the patients they were seeing were more complex and that the setting for conducting this operation had moved from an inpatient to an outpatient area. They also felt that the vignette captured the typical patient undergoing this operation.

Arytenoidectomy, whether by traditional surgical means or use of the laser is an exacting procedure where an incremental improvement in the patient's airway is desired to provide an adequate port for ventilation while preserving the patient's ability to phonate with a whisper. This is a compromise, trade-off operation, which demands a great deal of skill from the surgeon to achieve this balance. This exacting technique, is analogous to that of a stapedectomy (CPT Code 69660). The Harvard data has failed to capture the scope of work for this procedure.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 31571 Global Period: 000 Current RVW: 3.52 Recommended RVW: 5.90

CPT Descriptor: Laryngoscopy, direct, with injection into vocal cord(s), therapeutic; with operating microscope

Source and Summary of Comment to HCFA on this service: AAO-HNS.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Usually an adult patient with vocal cord paralysis and chronic or life threatening aspiration or with breathy or weakened voice. May be patient with other forms of vocal dysfunction such as spastic dysphemia. Procedure done under general anesthesia usually.

Description of Pre-Service Work: Meet and talk with patient and obtain operative consent; review lab studies; be certain infector and material is ready; prepare for OR.

Description of Intra-Service Work: Wait for intravenous sedation, administer topical/local anesthesia to larynx and pharynx; place scope, set up and work through microscope, perform injection with meticulous technique; assess immediate result, may injections and assessments, disassemble equipment.

Description of Post-Service Work: See patients in recovery room, write orders, do operative note, see patient later in same day, discharge next morning, discharge not, post op discussion with patient, discharge summary.

May do post op stroboscopic exam and video recording.

SURVEY DATA:

Specialty: Otolaryngology—Head and Neck Surgery

Sample Size: 47 Response Rate (%): 64.00 Median RVW: 5.90

25th Percentile RVW: 5.00 75th Percentile RVW: 6.53 Low: 2.50 High: 9.56

Median Pre-Service Time: 45 Median Intra-Service Time: 40

25th Percentile Intra-Svc Time: 30 75th Percentile Intra-Svc Time: 60 Low: 20 High: 90

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>25</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>10</u>	<u>1</u>
Office:	<u>0</u>	<u>0</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
30520	Septoplasty or submucous resection, with or without cartilage scoring, contouring or replacement with graft	5.55	090
30620	Septal or other intranasal dermatoplasty (does not include obtaining graft)	5.55	090
42440	Excision of submandibular (submaxillary) gland	6.61	090
21330	Open treatment of nasal fracture; complicated, with internal and/or external skeletal fixation	5.03	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

It is important to note that the surveyed code, CPT Code 31571 is a 0 day global compared to the 90 day global periods for each of the reference services. On the other hand, the respondents to our survey felt that these reference services captured the relative amount of work involved in CPT Code 31571.

The pre service time for CPT Code 31571 is greater than that expressed in the Harvard data for any of the reference services.

The mean intra service time of 40 minutes for CPT Code 31571 is similarly consistent with the intra service times for each of the reference services.

There is a difference in post procedure time of CPT Code 31571 reflecting the fact that it is a 0 day global with approximately 25 minutes spent following the procedure and 1 10 minute visit in the hospital.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Laryngoscopy with injection into the vocal cords of therapeutic materials (CPT Code 31571) is generally performed for individuals with vocal cord paralysis due to a number of causes. The most common material injected is either Teflon or gelfoam.

The increased pre operative work in this procedure compared with those of the references is due to the time it takes to perform the pre operative set up and to adequately anesthetize the patient. This procedure is done under topic/local anesthesia so that the patient can attempt to phonate during the operation and assist the surgeon in determining the endpoint for this procedure.

The intra service duration of work 40 minutes is consistent with the reference services. This additionally is greater than that observed in the Harvard data for this procedure.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 31587 Global Period: 090 Current RVW: 7.98 Recommended RVW: 10.00

CPT Descriptor: Laryngoplasty, cricoid split

Source and Summary of Comment to HCFA on this service: AAO-HNS.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The typical patient is a neonate who has been intubated and is being weaned from the ventilator. The patient may have mild congenital subglottic stenosis or acquired subglottic stenosis and also may have other problems such as bronchopulmonary dysplasia. The child will have failed multiple attempts at extubation and is frequently below normal weight.

Description of Pre-Service Work: This includes reviewing the patient's lab. values, the preoperative ventilator settings, and the most recent radiographs as well as talking to the family about the procedure, planning the operative care with the intensive care staff since the patient will need to be paralyzed or heavily sedated, planning intra operative care with anesthesia, preparation of equipment in the operating room, waiting for the patient to arrive in the operating room, positioning the patient, scrubbing, and draping the patient.

Description of Intra-Service Work: An incision is made in the neck, dissection is carried out between the strap muscles, the trachea and larynx are identified, and an incision is made from approximately the first or second tracheal ring upwards through the cricoid cartilage and into the lower part of the laryngeal cartilage but not into the anterior commissure of the vocal cords (very important not to violate the anterior commissure). In some patients the posterior part of the larynx must be split (15-20%) which has the risk of tracheal esophageal fistula. This latter patient would have a very severe stenosis. A larger endotracheal tube is inserted, sutures are used to hold the edges of the split cartilages laterally and the wound closed in layers (much like a total laryngectomy).

Description of Post-Service Work:

- a. Day of surgery: Dictation taking patient to ICU, orders, talking to family, getting ventilator set. Visit later same day surgery and talk again to family.
 - b. Days 1-7: Post operatively : ICU visits 2/day.
 - c. Days 8,9: Floor care each day.
 - d. Day 10: Discharge day.
 - e. Office visits.
 - f. Follow-up.
-

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery

Sample Size: 48 Response Rate (%): 65.00 Median RVW: 10.00

25th Percentile RVW: 9.50 75th Percentile RVW: 14.00 Low: 6.00 High: 21.00

25th Percentile Intra-Svc Time: 45 75th Percentile Intra-Svc Time: 143 Low: 30 High: 240

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>90</u>	<u>6</u>
Other Hospital:	<u>52.5</u>	<u>4</u>
Office:	<u>45</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
42440	Excision of submandibular (submaxillary) gland	6.61	090
30520	Septoplasty or submucous resection, with or without cartilage scoring, contouring or replacement with graft	5.55	090
60220	Total thyroid lobectomy, unilateral; with or without isthmusectomy	9.86	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The respondents to the survey for 31587 all felt that the relative work value of this code was greater than that for the reference procedures. On the other hand, the initial approach and skeletonization of the larynx necessary to perform a cricoid split is similar in concept to that of a thyroidectomy (60220) and also requires the technical skill of a nasal septoplasty (30520). Specifically, the median pre service time of 60 minutes exceeded the Harvard values for any other reference services. Similarly, the intra service time was well within the range of values for the reference services. In fact only CPT Code 60220 at 159 minutes intra service time exceeded that of the value for our survey for CPT Code 31587.

The post operative phase of care for patients undergoing cricoid split is significantly more than any of the reference procedures. Our respondents indicated a median of 30 minutes on the day of the operation. Six visits were made to the intensive care unit for a total of 90 minutes, as well as four visits during the patients remaining hospitalization for a total of 52.5 minutes.

A patient would be examined in the office on three occasions of 15 minutes each.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Increasingly, infants who ordinarily would have been a candidate for a tracheotomy in years gone by have been subjected to cricoid split as an alternative. This procedure carries with it much of the same risk of pediatric tracheotomy, but additionally, has the risks of maintaining endotracheal intubation in the face of an open tracheal wound. As such, there is a significant risk of pneumothorax as well as air way loss should the endotracheal tube become dislodged.

There is also an increased amount of pre operative counseling necessary for the parents of such a child to explain to them the fact that should this procedure fail, a tracheotomy would be necessary. This is a confusion situation to explain concretely to parents who are necessarily anxious concerning the well being of their child.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 31750 Global Period: 090 Current RVW: 9.05 Recommended RVW: 15.00

CPT Descriptor: Tracheoplasty; cervical

Source and Summary of Comment to HCFA on this service: AAO-HNS.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old male with a history of head injury that required long term intubation and subsequent tracheostomy which resulted in tracheal stenosis. The patient presents with shortness of breath and audible inspiratory and expiratory stridor. Blood gas studies show chronic hypoxia and hypercapnea. There is a thick scar in the anterior cervical area at the site of the previous tracheostomy.

Description of Pre-Service Work: The patient & family are counselled. The patient is positioned, prepped, and draped.

Description of Intra-Service Work: The procedure must begin with securing the airway. Severe stenosis may make intubation difficult or impossible, and an emergency tracheostomy may be required which is made more difficult by the presence of the scar from the previous tracheostomy. A cervical incision is made down to the trachea, avoiding damage to the overlying thyroid gland, the adjacent major neck vessels and the recurrent laryngeal nerves.

The tracheal lumen is opened and the area of stenosis examined. Scar is excised, taking care not to enter the esophagus posteriorly. De-nuded cartilage is covered by mucosa utilizing adjacent transfer flaps or free buccal mucosal grafts which are sutured in place with the aid of the operating microscope. After the incision is closed, a post operative chest radiograph must be take to make sure that there is no pneumothorax.

Description of Post-Service Work: The stay in the ICU is usually 2 or 3 days to make sure that the airway is secure before transferring to the floor. Two visits a day for at least 15 minutes each are required to make sure that the patient is progressing properly. Vigorous pulmonary toilet is required to prevent atelectasis.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery

Sample Size: 47 Response Rate (%): 0.66 Median RVW: 15.00

25th Percentile RVW: 12.00 75th Percentile RVW: 18.00 Low: 6.00 High: 23.00

Median Pre-Service Time: 60 Median Intra-Service Time: 180

25th Percentile Intra-Svc Time: 120 75th Percentile Intra-Svc Time: 210 Low: 30 High: 510

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>55</u>	<u>2</u>
Other Hospital:	<u>60</u>	<u>3</u>
Office:	<u>60</u>	<u>4</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
31360	Laryngectomy; total, without radical neck dissection	15.19	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The respondents to the AAO-HNS survey concerning CPT Code 31750 agreed that its work value fell into the range of the references. In particular, the median pre service, intra service and post service times were very comparable to those of the Harvard values of the reference services. In point of fact, more post operative work was required of CPT Code 31750 than any of the key reference services. This is indicative of the necessary airway management for such patients undergoing cervical tracheoplasty. This included 30 minutes of work on the day of the procedure, 2 ICU visits totaling 55 minutes, 3 hospital visits of 20 minutes each and 4 office visits of 15 minutes each.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Cervical tracheoplasty (CPT Code 31750) is plastic surgery of the larynx. A great deal of skill and knowledge is necessary to accomplish these procedures with any degree of success. The Tracheal Lumen in all of these cases is narrowed, as that is the reason this is being done. Because of the physics and geometry of the airway, there is a logarithmic narrowing of the Tracheal Lumen with an arithmetic decrease in the diameter of the airway. Due to scarring and occasionally previous procedures, excess tissue available for restoration of the airway is quite limited. A major threat of hemorrhage, airway loss, atelectasis or pneumothorax is always present.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 41135 Global Period: 090 Current RVW: 14.29 Recommended RVW: 21.15

CPT Descriptor: Glossectomy; partial, with unilateral radical neck dissection

Source and Summary of Comment to HCFA on this service: AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 55-60 year old white male with sore mouth for 2-3 months, ear pain, weight loss, oral bleeding. One month history of a neck mass. Associated medical problems of cardiac chest pain, hypertension.

Description of Pre-Service Work:

Review of records
Informed consent
Equipment preparation
Dressing, scrubbing, and waiting
Scrubbing and preparing patient

Again excludes staging endoscopy (31535, 43200)

Description of Intra-Service Work: Partial glossectomy with neck dissection involves performing a standard or modified neck dissection, along with partial resection of the tongue for control of the primary tumor. This is analogous in work to 31365, laryngectomy and neck dissection, except that the tumor resection in 41135 is accomplished under the cover of the mandible which makes this procedure more difficult.

The neck is incised for cervical surgery. A neck dissection is completed. The incisions are extended to provide access to the oral cavity. This operation may be done as a "pull-through" or as a lip splitting procedure. The margins of the tumor in the tongue are identified and the tumor is excised with a margin of 1 to 2 cms. The margins are checked by frozen section analysis. At a point in the operation, a tracheotomy is usually performed to secure the airway postoperatively and to provide exposure to the field.

Estimate includes closure either primarily or with split thickness skin graft. In addition, tracheotomy (31600) is often performed in conjunction with the case.

Description of Post-Service Work: 5 days in hospital care with or without first night ICU. Visits, etc. same as others described.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery

Sample Size: 46 Response Rate (%): 67.00 Median RVW: 21.15

25th Percentile RVW: 18.38 75th Percentile RVW: 25.00 Low: 14.00 High: 40.00

Median Pre-Service Time: 90 Median Intra-Service Time: 240

50th Percentile Intra-Svc Time: 225 75th Percentile Intra-Svc Time: 300 Low: 135 High: 400

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>35</u>	
ICU:	<u>42.5</u>	<u>3</u>
Other Hospital:	<u>100</u>	<u>7</u>
Office:	<u>60</u>	<u>4</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
31360	Laryngectomy; total, without radical neck dissection	15.19	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 41135 describing a partial glossectomy with a unilateral radical neck dissection is valued significantly greater than either of the reference procedures. This operation combines performance of a neck dissection, in conjunction with removal of a portion of the tongue. This operation is done under the cover of the mandible, which makes this procedure more difficult in many respects than when the mandible is removed as part of the specimen.

The reference services described major head and neck procedures similar to that of the reference service, but are not directly related. The median pre service time, intra service time and post service time for the CPT 41135 are greater than the Harvard data and relative work units for the two reference codes.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT Code 41135 describes a procedure whereby cancer of the mobile tongue is treated with a unilateral neck dissection and resection of the tongue, but without removal of the intervening mandible. This procedure, which at first glance be thought of as less extensive than an operation which removes the jaw bone, is in point of fact difficult in itself, due to the work of performing the operation under the cover of the mandible. Previously, additional exposure could be afforded by dividing the patients lower lip. Today, however, due to patient preferences, this is not done as frequently, additionally limiting the exposure for this type of surgery. The increased work needed to perform this operation in these circumstances is reflected in the AAO-HNS survey data for CPT Code 41135.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 41150 Global Period: 090 Current RVW: 19.36 Recommended RVW: 21.00

CPT Descriptor: Glossectomy; composite procedure with resection floor of mouth and mandibular resection, without radical neck dissection

Source and Summary of Comment to HCFA on this service: AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An elderly 80 year old female in a nursing home is brought in with complaint of mouth pain, blood in the saliva, pain on swallowing, and unexplained weight loss. History of diabetes, congestive heart failure, arthritis. She is diagnosed as having squamous cell carcinoma of mouth extending into the gingiva. There is no evidence of neck metastasis on clinical exam on MRI.

Description of Pre-Service Work:

Review of records
Solicitation of informed consent
Preparation of equipment
Dressing, scrubbing, waiting
Scrubbing and preparing patient
Type of visits (excluding staging endoscopy):

It should be noted for all the head and neck cancers that a separate outpatient staging endoscopy with biopsies is performed. All patients have pre-operative chest x-ray, CT or MRI scan, blood tests, EKG and significant preoperative counselling of alternatives and, if the surgery is chosen, advised consent.

Description of Intra-Service Work: The patient is placed on the operating room table in a supine position and prepared for major head and neck surgery. In most instances, a preparatory tracheotomy will be performed (separate code).

The surgery may be approached via a facial degloving incision or a lip-splitting incision. The affected area of the mandible involved with cancer is outlined and mandibular osteotomies are performed. The tongue is grasped and the tumor resected from the tissues of the tongue, floor of mouth, mandible, soft palate and pharynx. Frozen section analysis of the margins is performed.

The wound is closed primarily, a skin graft may be performed, a pedicled myocutaneous flap employed or a free tissue transfer utilized for reconstruction. If primary closure is possible, attention is given to insuring that there is no tethering of the tongue or other oral tissues.

Suction drains are inserted and the wound is closed in layers. The patient is taken to the ICU.

The time estimate is based on the fact that the closure is performed without flap reconstruction, that is, by primary closure. Were a flap to be employed, the time would increase significantly. Does not include any reconstruction or tracheostomy.

Description of Post-Service Work: 7 days total as noted. ICU or highly trained hospital ward 1 day, and 6 total additional days. Visits 2 times per day.

SURVEY DATA:Specialty: American Academy of Otolaryngology—Head and Neck SurgerySample Size: 46 Response Rate (%): 65.00 Median RVW: 21.0025th Percentile RVW: 16.75 75th Percentile RVW: 23.25 Low: 14.00 High: 40.00Median Pre-Service Time: 90 Median Intra-Service Time: 21025th Percentile Intra-Svc Time: 180 75th Percentile Intra-Svc Time: 255 Low: 60 High: 360

42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
42440	Excision of submandibular (submaxillary) gland	6.61	090
60220	Total thyroid lobectomy, unilateral; with or without isthmusectomy	9.86	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 41150, similar to the reference procedures, is a major head and neck operation. This code describes removal of a portion of the patient's tongue, along with resection of the floor of the mouth on the same side, and a portion of the jaw bone or mandible. This procedure is customarily done for patients who present with epidermoid carcinoma of the larynx. The median pre service time, intra service time, and post service time are all greater than any of the key reference services from the Harvard data. This is also reflected in the higher RVW recommended for this service in comparison to the reference codes.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT Code 41150 represents a major surgical operation performed for patients with cancer of the head and neck. This operation involves removal of the mandible, floor of the mouth and a portion of the tongue, encompassing the tumor in a three dimensional sense. This operation is done for those occasional patients who do not require a formal neck dissection.

The lack of a preparatory neck dissection actually limits some of the surgeon's ability to pre resection delineate the important structures of the head and neck which must be preserved in this operation. As a result, much of this surgical time is spent identifying, preserving and protecting such structures so that they will not be injured during the subsequent resection of the cancer. There is a real risk of stroke, significant hemorrhage, and death from this procedure.

The extra technical skill, mental effort and judgment needed to perform this procedure, particularly realizing the exposure limitations is reflected in the survey data collected by the AAO-HNS.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 41155 Global Period: 090 Current RVW: 23.40 Recommended RVW: 25.60

CPT Descriptor: Glossectomy; composite procedure with resection floor of mouth, mandibular resection, and radical neck dissection (Commando type)

Source and Summary of Comment to HCFA on this service: CMD and AAO-HNS.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55 year old male with a 2-3 month history of oral bleeding, mouth pain, ear pain, 10 lb. weight loss, and a 6 week history of a neck mass. Patient has pre-existing hypertension, history of myocardial infarction 2 years ago, and adult-onset diabetes. The patient has squamous cell carcinoma of floor of mouth with unilateral neck metastasis.

Description of Pre-Service Work:

Review of records
Solicitation of informed consent
Preparation of equipment
Dressing, scrubbing, waiting
Scrubbing and preparing patient

It should be noted for all the head and neck cancers that a separate outpatient staging endoscopy with biopsies is performed. All patients have pre-operative chest x-ray, CT or MRI scan, blood tests, EKG and significant preoperative counselling of alternatives and, if the surgery is chosen, advised consent.

Description of Intra-Service Work: The patient is placed on the operating room table in a supine position and prepped and draped for head and neck surgery. Customarily, a preparatory tracheotomy is performed (separate code). A complete radical neck dissection is completed and left pedicled on the submandibular triangle.

The procedure may be accomplished with a visor flap or a lip-splitting incision. The affected area of the mandible involved with cancer is outlined and mandibular osteotomies are performed. The tongue is grasped and the tumor resected from the tissues of the tongue, floor of mouth, mandible, soft palate and pharynx. Frozen section analysis of the margins is performed.

The wound is closed primarily, a skin graft may be performed, a pedicled myocutaneous flap employed or a free tissue transfer utilized for reconstruction. If primary closure is possible, attention is given to insuring that there is no tethering of the tongue or other oral tissues.

Suction drains are inserted and the wound is closed in layers. The patient is taken to the ICU.

The time estimate is based on the fact that the closure is performed without flap reconstruction, that is, by primary closure. Were a flap to be employed, the time would increase significantly.

Description of Post-Service Work: Again ICU or highly trained hospital ward 1 day and 6 days total additionally (7 days altogether). Visits 2x/day with same follow-up.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery

Sample Size: 46 Response Rate (%): 65 Median RVW: 25.60

25th Percentile RVW: 22.66 75th Percentile RVW: 33.50 Low: 17.50 High: 55.00

Median Pre-Service Time: 90 Median Intra-Service Time: 320

25th Percentile Intra-Svc Time: 300 75th Percentile Intra-Svc Time: 390 Low: 180 High: 720

Median Post-Service Time:	Total Time	Number of Visits
Day of Procedure:	<u>37</u>	
ICU:	<u>45</u>	<u>3</u>
Other Hospital:	<u>120</u>	<u>8</u>
Office:	<u>70</u>	<u>5</u>

KEY REFERENCE SERVICE(S):

CPT Code	CPT Descriptor	RVW	Global Period
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
31360	Laryngectomy; total, without radical neck dissection	15.19	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 41155 is a classic “commando” procedure with a radical neck dissection, partial resection of the tongue, resection of the floor of the mouth, and mandible being accomplished in one procedure. As such, CPT Code 41155 essentially encompasses the work of CPT Code 41150 with 41135. This is the prototypical head and neck procedure. The median pre service, intra service and post service times from the AAO-HNS survey are all greater than that of the key reference services consistent with this procedure requiring more work.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT Code 41155 demands a high degree of technical skill, mental effort and judgment to competently perform. This procedure encompasses two of the major operations of head and neck surgery in a bundled code. Particularly in recent years, a number of patients presenting for this surgery following radiation therapy, has increased. This has placed additional demands on the surgeon, both at the time of the procedure due to technical problems with radiated tissue, as well as the threat of post operative fistula formation. The extra work involved in performing this procedure has not been realized in the Harvard data which forms the basis for the current Medicare work value. The AAO-HNS survey of surgeons performing head and neck surgery more accurately captures this information.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 42200 **Global Period:** 090 **1995 RVW:** 9.48 **Recommended RVW:** 12.70

CPT Descriptor: Palatoplasty for cleft palate, soft and/or hard palate only

Source and Summary of Comment to HCFA on this service: An Advisory Panel of surgeons representing the American Society of Plastic and Reconstructive Surgeons, the American Society of Maxillofacial Surgeons, the American Society for Reconstructive Microsurgery, the American Association for Hand Surgery, the American Association of Plastic Surgeons, and the American Society for Aesthetic Plastic Surgery reviewed the RVW relationship for the (Medicare) top ranked surgical codes for plastic and reconstructive surgery. The results of this review found code 42200 to be currently undervalued.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

An otherwise healthy child is born with a cleft of the secondary "hard and/or soft palate." He presents at the age of 9-20 months for a palatoplasty. (e.g., Von Langenbeck, Wardill-Kilner, intervelo-veloplasty, Furlow)

Description of Pre-Service Work:

Pre-service work begins on the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural laboratory and imaging studies; and communicating with the patient's family to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include patient preparation; supervision of the positioning, prepping, and draping of the patient; and ensuring that the special surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

After general oral endotracheal anesthesia has been induced and the anesthesiologist is satisfied that the monitoring equipment is functioning, the face is prepared and draped.

Exposure of the palate is gained through the insertion of a Dingman retractor. This critical step must ensure maintenance of the endotracheal tube position in the airway and the proper application of the blade to the base of the tongue.

Local anesthesia is placed in the palatal shelves. The operative plan is marked on the oral skin. The various flaps are developed with oral mucosa, muscle and nasal mucosal elements. Feeding and airway tubes are placed. Complete hemostasis is critical. Closure of each of these elements noted above is accomplished with interrupted sutures. Removal of the Dingman is just as critical as insertion to prevent accidental extubation.

Description of Post-Service Work:

Post-service work begins after extubation in the operating room and includes close monitoring of the patient's airway; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incision; monitoring, care, and removal of all tubes; and antibiotic and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging, pathology, and laboratory reports, if needed; and antibiotic and pain medication adjustments.

SURVEY DATA:

KEY REFERENCE SERVICE(S):

1995 RVWGlobal CPT Descriptor

12.04	090	40700	Repair cleft lip
12.73	090	42844	Extensive surgery of the throat

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Both of these key reference codes closely approximate the stress, technical skill and mental effort of palate repair.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

As indicated by the key reference services, cleft palate repair as published creates a RVW proportionality problem when compared with other codes in the family. The initial Harvard intensity value (IWPUT) for this service of 0.037 is proportionally too low compared to other cleft palate services. The recommended 12.70 RVW would be proportionally more appropriate.

In addition, the technique for this procedure has changed in the last few years due to an increasingly younger patient population.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 42210 **Global Period:** 090 **1995 RVW:** 10.02 **Recommended RVW:** 16.96

CPT Descriptor: Palatoplasty for cleft palate with closure of the alveolar ridge (includes obtaining graft)

Source and Summary of Comment to HCFA on this service: AAOMS comment

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

This is a healthy child born with complete unilateral (or bilateral) cleft lip. The lip has been repaired successfully. The patient now presents at approximately age 18 months for elective palatoplasty and concomitant bone graft to the alveolar ridge with mucosal flaps (osseus alveoplasty). Note: This procedure includes the development of the mucosal flaps, the harvesting of the bone graft, the inset of the bone graft and the fixation of the bone graft.

Description of Pre-Service Work:

Pre-service work begins from the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural laboratory and imaging studies; and communicating with the patient's family to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include supervision of the anesthetic induction, prepping, and draping of the patient; and ensuring that the special surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

After the satisfactory induction of anesthesia, the operative site is injected. The face and mouth are prepped and draped as well as the hip for the bone graft donor site.

Local infiltration of anesthetic containing adrenalin for hemostasis is done. Mucosal flaps are planned and elevated. Buccal mucosal flaps are outlined.

The bony gap is measured and a 3-dimensional drawing with precise measurements is completed. The plan is transferred to template material. The defect is packed with antibiotic soaked sponges while the bone graft is harvested.

Attention is turned to the iliac crest donor site where a skin incision is made and dissection is carried down to the flank muscles. These are split in the direction of their fibers and the iliac crest is exposed in the subperiosteal plane. A piece of the inner table is harvested leaving the crest edge intact if possible. A larger piece of bone than necessary is harvested with curettes. Some cancellous bone (marrow) is also harvested. The periosteum and muscle are repaired and the skin closed in layers. Drains are placed if required.

The bone graft is then sculpted to precisely fit the defect with power tools (burrs, etc.).

The sponges are removed and the bone surfaces freshened. The grafts are laid in place and final adjustments made. The cancellous bone graft is packed firmly into the remaining crevices. The mucosal flaps are laid in place and buccal mucosal flaps are incised and transposed into the defect. All suture lines are closed.

Description of Post-Service Work:

Post-service work begins with monitoring patient stabilization; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incision; monitoring, care, and removal of drains, if used; and antibiotic, nutritional and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital stay, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging, pathology, and laboratory reports, if needed; and antibiotic and pain medication adjustments.

SURVEY DATA:

Specialty: American Society of Plastic & Reconstructive Surgeons, Inc.

KEY REFERENCE SERVICE(S):

<u>1995 RVW</u>	<u>CPT</u>	<u>Descriptor</u>
16.92	21144	Reconstruct Mid-face - Lefort I
17.94	40845	Reconstruction of mouth
7.18	14040	Reconstruction of the face with flap

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The two reference codes, 21144 and 40845, are both quite similar in the anatomic region, the extent of dissection, and the visits involved. The technical skill and the psychological stress are level 4 (of 5).

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Proportionally, 42210 is not in appropriate alignment with 42200. It should be dealt with almost as a separate entity. However, the infrequency of this procedure provided a small response rate but relatively consistent numbers. A Service such as this is usually done only in relatively large cleft practices and should be considered a sophisticated procedure. It is apparent that the current RVW does not sufficiently include the work for the bone graft portion of the procedure.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 42260 Global Period: 090 1995 RVW: 4.17 Recommended RVW: 9.18

CPT Descriptor: Repair of nasal labial fistula

Source and Summary of Comment to HCFA on this service: AAOMS comment

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:

This is an otherwise healthy 14-year old male who was born with a unilateral cleft lip and palate. He underwent a lip repair at 18 months and a palate repair at 18 months of age. No attempt was made to close the alveolus in either operation. He presents now with an established nasal labial fistula, 4 mm in diameter, easily visible between the left lateral incisor tooth and the left canine, which are in good alignment. The patient seeks closure of this fistula to prevent further nasal regurgitation of fluids.

Description of Pre-Service Work:

Pre-service work begins the day before the surgery until the time of the procedure. This includes obtaining and reviewing pre-procedural laboratory and imaging studies; and communicating with the patient and patient's family to explain operative risks and benefits and to obtain informed consent. Other pre-operative services include personal and patient preparation; supervision of the positioning, prepping, and draping of the patient; and ensuring that surgical instruments and supplies that are necessary are present and available in the operative suite.

Description of Intra-Service Work:

After satisfactory induction of general anesthesia, the lips are retracted and the fistula visualized. An operative plan is outlined and local anesthesia containing adrenalin is infiltrated for hemostasis.

A "turn-over" flap is developed and rotated into the defect and sewn in place. A buccal sulcus flap is elevated and transposed into position and also sewn in place.

Topical antibiotics complete the regimen.

Description of Post-Service Work:

Post-service work includes monitoring patient stabilization; communication with the family and other health care professionals (including written and oral reports and orders); and all hospital visits and services performed by the surgeon, including monitoring and care of the incisions, if used; and antibiotic and pain medication management. Discharge management includes the surgeon's examination of the patient, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure; including removal of sutures; evaluation of periodic imaging, pathology, and laboratory reports, if needed; and antibiotic and pain medication adjustments.

KEY REFERENCE SERVICE(S):

1995 RVW	Global	CPT	Descriptor
7.18		14040	Reconstruction of face with flap

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S): Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

It is essentially a double flap repair (CPT 14040) but in a difficult bipplanar location.

RATIONALE: Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT 42260 presents another proportionality problem. It is not valued in proper proportion with 42200 and 42210. It should be dealt with almost as a separate entity. However, the infrequency of this procedure provided a small response rate but relatively consistent numbers. Service such as this is usually done only in relatively large cleft practices and should be considered a sophisticated procedure.

The extra work between 42260 and 14040 is the extra technical expertise required in a tiny difficult location. The double flap is laid in a bipolar fashion which requires more mental effort in planning and execution than 14040.

Examination of the Harvard data indicates that the initial intra-service and post-service work times were much too low. The actual work has not changed in the last 5 years.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 42720 Global Period: 010 Current RVW: 2.61 Recommended RVW: 6.00

CPT Descriptor: Incision and drainage abscess; retropharyngeal or parapharyngeal, intraoral approach

Source and Summary of Comment to HCFA on this service: AAO-HNS.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Patient with severe pharyngitis or other head and neck source of infection. Patient is usually toxic with fever, high white count, difficulty swallowing and breathing. There is evidence of sepsis. Generally done on an emergency basis.

Description of Pre-Service Work: Generally emergency patients seen in emergency room. Examination, tests done and procedure scheduled the same night. Multiple visits are necessary to patient and family. Aspiration and airway concerns require close monitoring. Adjunctive procedures must be explained to patient and family (e.g. possible need for tracheotomy). Arranging and reviewing contrast enhanced CT scan.

Description of Intra-Service Work: After intubation, set up similar to tonsillectomy with more care needed in positioning. Drainage is done with approach similar to tonsillectomy with exploration of wound, irrigation. There is always concern about aspiration of abscess material and cardiac arrest.

Description of Post-Service Work: May need frequent checks for swelling and signs of undrained collection or loculation. Airway monitoring is generally needed. Patients are sometimes kept intubated for 24-48 hours. Patient is in ICU x 2 days.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery

Sample Size: 47 Response Rate (%): 64.00 Median RVW: 6.00

25th Percentile RVW: 4.50 75th Percentile RVW: 7.50 Low: 2.52 High: 12.00

Median Pre-Service Time: 60 Median Intra-Service Time: 30

25th Percentile Intra-Svc Time: 25 75th Percentile Intra-Svc Time: 45 Low: 10 High: 90

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 30

ICU: 25 2

Other Hospital: 50 3

Office: 0 0

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
42440	Excision of submandibular (submaxillary) gland	6.61	090
30520	Septoplasty or submucous resection, with or without cartilage scoring, contouring or replacement with graft	5.55	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre service work of CPT Code 42720 (60 minutes) is greater than the Harvard data for either of the reference services (22 minutes each). Similarly, the post service work for the surveyed procedure CPT Code 42720 is greater than either of the reference services.

The intra service work component (30 minutes) surveyed for CPT Code 42720 is less than that of either of the references but of the same magnitude. The intra operative work for CPT Code 30520 is 58 minutes and for CPT Code 42440 is 71 minutes.

Intraoral drainage of a retro pharyngeal abscess carries with it a particular risk of airway loss and bradycardia and cardiac arrest. This is at variance with the procedures listed as key references.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The general magnitude of the work involved for CPT Code 42720 is similar to that of both the reference procedures. This is taking into account the fact that the reference procedures are 90 day global and this procedure is a 10 day global. The Harvard survey data for CPT Code 42720 failed to take into account the amount of pre operative work, along with the immediate post operative work involved in this procedure. The intra operative component failed to capture the increased stress and anxiety due to the potential for airway compromise, aspiration and cardiac arrest.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 42725 Global Period: 090 Current RVW: 7.60 Recommended RVW: 9.50

CPT Descriptor: Incision and drainage abscess; retropharyngeal or parapharyngeal, external approach

Source and Summary of Comment to HCFA on this service:
AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Toxic, possibly septic individual with abscess related to pharyngitis or other head and neck infection. Metabolic instability and compromise of swallowing and breathing are common. Airway control is often needed via intubation or tracheotomy. Nearly always an emergent situation.

Description of Pre-Service Work: Toxic patients in need of careful evaluation and assessment of airway and at risk for aspiration. Complex group of possible complications including mediastinitis and pharyngeal entry. Requires extensive discussion with patient and family. Monitoring of airway and signs of disease progression require multiple exams. Testing including CT scan requires careful review with radiologist. Going to OR with patient, positioning, prepping, and draping.

Description of Intra-Service Work: After the airway is secured incision and drainage is performed, dissection of great vessels and exploration for loculation is typical. Care is needed to avoid pharyngotomy and still completely open abscess cavity. Irrigation and partial closure follows.

Description of Post-Service Work: Frequent checks especially in toxic/septic patients along with repeated airway evaluation are needed especially when tracheotomy is not performed. Critical evaluation for inadequate drainage is done. Repeated dressing changes and packing changes are the rule.

SURVEY DATA:

Specialty: Otolaryngology—Head and Neck Surgery

Sample Size: 47 Response Rate (%): 64.00 Median RVW: 9.50

25th Percentile RVW: 7.50 75th Percentile RVW: 11.00 Low: 5.30 High: 9.75

25th Percentile Intra-Svc Time: 45 75th Percentile Intra-Svc Time: 90 Low: 20 High: 180

Median Post-Service Time: Total Time Number of Visits

Day of Procedure: 30

ICU: 35 2

Other Hospital: 60 4

Office: 40 3

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
42440	Excision of submandibular (submaxillary) gland	6.61	090
60220	Total thyroid lobectomy, unilateral; with or without isthmusectomy	9.86	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The pre service work of CPT Code 42725 is greater than that of either of the key reference services according to Harvard data. Similarly, the post service time is of the same magnitude but the number of visits and their duration are increased according to our survey data in comparison to the Harvard generated information.

Incision and drainage of a retro pharyngeal abscess is a formal surgical procedure with entrance into the neck, similar to that of CPT Code 42440 or 60220. There is additional complexity to CPT Code 42725

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The pre operative work for CPT Code 42725 is greater than that of either of the reference procedures. This is due to the need to consult with other care givers regarding an individual who is toxic and possibly septic. Individuals presenting for CPT Code 42440 or 60220 generally are in good health without an antecedent illness.

The intra operative work for CPT Code 42725 is similar, but of a lesser magnitude than that of either of the reference procedures. This is reflected in the difference between our survey data of 60 duration intra service time compared to 71 minutes for CPT Code 42440 and 159 minutes for CPT Code 60220 according to Harvard data.

The chief difference between these operations appears to be the post operative work component. Here we have detailed that there a total of nine post operative visits spread between the intensive care unit, hospital and office, which is greater than the number of visits of either of the reference services. This post operative work will include continued monitoring of the patient's general status with regard to antibiotic prophylaxis and treatment, as well as advancing drains and handling the wound complications which may ensue following this procedure.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 69155 Global Period: 090 Current RVW: 17.03 Recommended RVW: 23.00

CPT Descriptor: Radical excision external auditory canal lesion; with neck dissection

Source and Summary of Comment to HCFA on this service: AAO-HNS.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52 year old man with a nine-month history of progressive otalgia and constant otorrhea was noted to have a 1.8 cm ulceration along the floor of his left external auditory canal. The tympanic membrane was intact. A 1.5 cm, mobile, nontender jugulodigastric lymph node was palpated. Biopsy confirmed the presence of a well-differentiated squamous cell carcinoma. High-resolution CT demonstrated: (1) limited erosion of the tympanic bone but no extension to the mastoid or middle ear; and (2) several high cervical lymph nodes which were suspicious for metastatic disease.

Description of Pre-Service Work: A partial temporal bone resection with a cervical lymphadenectomy is performed when a temporal bone cancer is limited to the external auditory canal with clinical or radiographic evidence or the cervical region.

Review of chart, lab radiographs. Discussion with patient and family. Informed consent. Position patient, place monitors, prep and drape patient. Wait on line placement.

Description of Intra-Service Work: A partial temporal bone resection involves the removal of the entire tympanic bone and the tympanic membrane. This includes a complete mastoidectomy to expose the vertical segment of the facial nerve and to screen for an unanticipated extension of the tumor. The entire tympanic bone, the tympanic membrane, and the cartilaginous portion of the external auditory canal, including a 2 cm margin of normal tissue, are removed en-bloc by drill curettage and sharp dissection.

A noncontiguous cervical lymphadenectomy is then performed. In this pathological setting, the dissection is typically carried to the level of the jugular bulb with preliminary exposure and mobilization of the facial nerve from the stylomastoid foramen to at least the pes anserinus.

The resulting anterior soft tissue defect is surfaced with a skin graft. The remainder of the repair is similar to that of performing a canal-wall-down mastoidectomy with tympanoplasty with ossicular chain reconstruction. The cavity resulting from a partial temporal bone resection, however, is always lined with non-adherent dressing and stented with non-absorbent packing.

Description of Post-Service Work: The patient is typically seen on the night of surgery in ICU to confirm his or her stability, inspect the dressings, and to discuss the details of the surgery with both the patient and family. The patient is then seen one or two times on his or her first postoperative day (CPT 99231). The patient is seen for a final time on the morning of their second postoperative day (CPT 99238), at which time the ear dressing is removed and the surgical site cleaned of debris, the graft donor site is inspected and cleaned, if necessary, and suction drains are removed from the neck. The patient and his or her family are given detailed verbal and written instructions regarding at-home care of the wounds. Prescriptions for medications are explained and provided. The patient encounter is detailed in the medical chart and a discharge summary is dictated and later reviewed and signed. The patient is seen in the office one week postoperatively to have their stent removed, the wound cleaned of granulation tissue and sutures removed. They are then seen one or two times a month during the global period, depending on their rate of healing.

SURVEY DATA:Specialty: American Academy of Otolaryngology—Head and Neck SurgerySample Size: 47 Response Rate (%): 64.00 Median RVW: 23.0025th Percentile RVW: 21.00 75th Percentile RVW: 28.00 Low: 16.00 High: 38.09Median Pre-Service Time: 90 Median Intra-Service Time: 28525th Percentile Intra-Svc Time: 240 75th Percentile Intra-Svc Time: 323 Low: 140 High: 600

Other Hospital:	<u>90</u>	<u>7</u>
Office:	<u>90</u>	<u>5</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
31225	Maxillectomy; without orbital exenteration	15.19	090
31360	Laryngectomy; total, without radical neck dissection	15.19	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69155 describes a lateral temporal bone resection with a simultaneous radical neck dissection. As such, this is two procedures bundled into one. The current RVW for a complete neck dissection is 12.29 RVUs.

The median pre service time of 90 minutes for CPT Code 69155 is greater than that of the Harvard data for any of the key reference procedures. Similarly, the intra service time of 285 minutes also exceeds that of the Harvard data for any of the key reference procedures. The post service time is significant, with 30 minutes

being spent with the patient on the day of the procedure, in addition to one ICU visit of 15 minutes, 7 hospital visits totaling 90 minutes and 5 office visits totaling 90 minutes.

The otologic portion of this case involves performing a complete mastoidectomy with a facial recess approach. The tympanic membrane and external auditory canal are then removed as a unit to provide oncologic safety for this procedure. As such, this extends the normal boundaries of otologic surgery well beyond that of most operators.

Also, the radical neck dissection affords the opportunity for resection of lymphatic structures at the level of the jugular bulb. Once again, the technical skill and judgment required in performing this phase of the operation in this particular setting is greater than that which we see in a customary neck dissection.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT Code 69155 has been inappropriately undervalued due to lack of realization of the amount of work involved in all three phases of its completion. Particularly, there has been undervaluation of the intra service component of this procedure. The technical accomplishment of a neck dissection alone accompanied with a complete mastoidectomy and then enbloc resection of the tympanic membrane, tympanic bone and external auditory canal with an oncologically safe margin was not realized in the Harvard data for this procedure. Additionally, post operatively this patient faces all the risks of major operations, as is reflected in the amount of service time and number of visits which will be necessary in the 90 day global period.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 69554 Global Period: 090 Current RVW: 25.78 Recommended RVW: 38.00

CPT Descriptor: Excision aural glomus tumor; extended (extratemporal)

Source and Summary of Comment to HCFA on this service:
AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 33 year old female has pulsating red mass in ear. Hearing is a moderate mixed loss and she complains of pulsating tinnitus. High resolution CCT shows erosion of the jugulo-carotid spine, erosion into the descending Fallopian canal, and a non filling jugular vein and large temporal bone blush by venogram.

Description of Pre-Service Work: Review of lab. chart, radiographs. Family/patient discussion of risks, complications and alternatives. Informed consent. Shaves (2) with belly included. Sterile prep and drape. Await insertion of lines. Place cranial nerve monitoring electrodes.

Description of Intra-Service Work: Transtemporal dissection of lesion, not usually involving the labyrinth, but rather the jugular bulb, and inferior petrosal sinus. Preservation of VII while excision lesion from ossicle and middle ear sans damage to hearing. Ligation of ipsilateral jugular via neck dissection and control of sigmoid sinus just below superior petrosal sinus. Facial nerve monitoring. Closure employing abdominal wall adipose tissue.

Description of Post-Service Work: Wound dressing. Anesthetic emergence evaluation. Immediate transfer to ICU with regular neurologic checks. Operative report dictation. Progress notes and chart work. Rounds twice daily for a week (15-20 minutes each).

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg, comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69554 is over twice that of the most commonly referenced service - CPT Code 69642 with a current RVW of 16.37. The CPT Code 69554 in fact, was felt by our respondents to have a greater value than any of the key reference services.

This is a consistent observation in as much as the data from our survey for median pre service time, intra service time and post service time all are greater than the Harvard data for any of the key reference services.

In point of fact, CPT Code 69554 describes a much more technically difficult otologic surgical procedure than CPT Code 69642. CPT Code 69554 describes resection of a glomus tumor from the temporal bone which has extended to the extra temporal structures of the head and neck.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Using all parameters available for comparison, CPT Code 69554 uses a greater amount of time, technical skill and physical effort than any of the key reference services. The mental effort, judgment and stress involved in resecting glomus tumors which bleed quite profusely from the delicate structures about the temporal bone, middle ear and jugular bulb is considerable. The key portion of this procedure actually involves removal of the jugular bulb with the drainage of the sigmoid sinus, internal jugular vein and inferior petrosal sinus all needing to be controlled simultaneously. Significant blood loss and the range of 6 to 12 units is not unheard of.

Our respondents felt that the work involved in performing this procedure had not been captured in the initial Harvard data, which formed the basis for the current work evaluation of this procedure.

CPT Code: 69725 Global Period: 090 Current RVW: 18.98 Recommended RVW: 30.00

CPT Descriptor: Decompression facial nerve, intratemporal; including medial to geniculate ganglion

Source and Summary of Comment to HCFA on this service:

AAO-HNS

CMD

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Patient with facial paralysis due to tumor of the facial nerve, temporal bone fracture resulting in facial paralysis, idiopathic facial paralysis.

Description of Pre-Service Work: Evaluation of CT scan, MRI scan; discussion of the surgical procedures and options with the patient and family; extensive risks because of the craniotomy and risks to hearing and balance. Position, prep, drape patient. Place monitoring. Wait on insertion of lines and induction of anesthesia.

Description of Intra-Service Work: Requires microsurgery, and exposure requiring two different surgical approaches. First, mastoidectomy canal wall intact type must be performed. In addition, work must be much more precise because you need to remove bone over the fallopian canal, exposing the facial nerve without injuring the facial nerve.

Description of Post-Service Work: Patient requires Surgical Intensive Care Unit for 24 hours postop. Two visits to the Postop Intensive Care Unit is usually required. Daily visits: 15-30 minutes. 5-6 days postoperative care is required. This is similar to a comparison service of 61526.

SURVEY DATA:

Office:	<u>60</u>	<u>4</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg. comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090
69632	Tympanoplasty without mastoidectomy (including canalplasty, atticotomy and/or middle ear surgery), initial or revision; with ossicular chain reconstruction (eg. postfenestration)	12.41	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69725 is a more complicated otologic microsurgical procedure than that of CPT Code 69642, which was the most frequent cited reference procedure among our survey of physicians. In fact, the respondents felt that CPT Code 69725 was approximately twice as much work as that of a tympanoplasty and mastoidectomy (CPT Code 69642). The amount of pre service time, intra service time and post service time is indeed twice that of the Harvard survey data for CPT Code 69642.

The mental effort and technical skill required to perform a decompression of the facial nerve in its intra temporal course, including the area medial to the geniculate ganglion is several levels beyond that of a straight tympanoplasty with mastoidectomy. The facial nerve has a circuitous course through the temporal bone, with two major bends in its course. The first is a greater than a right angle turn at the level of the geniculate ganglion and the second is a bend as it courses about the oval window near stapes. During this dissection, not only is the facial nerve at risk from inadvertent injury during this operation, but also, the ossicles must be protected so that inadvertent acoustic trauma to the inner ear is not transmitted.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The Harvard data upon which the current valuation of the work for CPT Code 69725 does not capture the amount of pre intra and post service work involved nor does it reflect the mental effort, judgment, technical and physical skill needed to perform this procedure. The portion of the surgery near the geniculate ganglion is particularly hazardous, due to the fact that at this point the facial nerve is in close proximity to the bony structures of the inner ear - cochlea and semicircular canals. The work involved in this procedure is clearly greater than that of a standard tympanoplasty with mastoidectomy (CPT Code 69642) due to the increased technical skill required to safely perform this procedure. There is a very real risk of permanent injury due to inadvertent damage to the patient's hearing in the cochlea and balance due to potential injury of the semicircular canals.

69725			
61526	REMOVAL OF BRAIN LESION	29.71	090

CMD Comment:

Should be closer to the reference CPT CODE. Much more work than 69720. RADIOLOGY A large number of suggested revisions are based upon a general overvaluation of plain film studies relative to more complex radiographic studies, ultrasound studies, and the most common CT and MRI studies. The relevant reference procedures are 70450 (revised upward), 70551, 74020, 74280, 74400, 75650, 76700, and 76805. The values listed below largely reflect differences in time and need for supervision, as well as slightly less intensity in interpretation. These services also appear markedly overvalued relative to E & M services which involve broader cognitive skills and much more time. For example, the equivalence of a level 3, 15 minute established patient visit to reading 2 1/2 chest x-rays (71020) has no face validity. A visit may involve the review of two or three radiographic studies as less than half of the work of the visit.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION

CPT Code: 69805 Global Period: 090 Current RVW: 10.27 Recommended RVW: 15.00

CPT Descriptor: Endolymphatic sac operation; without shunt

Source and Summary of Comment to HCFA on this service:
AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old woman with classic Meniere's disease has disabling episodic vertigo despite appropriate medical treatment. After extensive counseling about treatment options, she undergoes an endolymphatic sac operation. After surgery she experiences some mild vertigo and fluctuation of hearing, but eventually returns to work.

Description of Pre-Service Work: Review of lab, chart, radiographs. Family/patient discussion of risks, complications and alternatives. Informed consent. Sterile prep and drape. Await insertion of lines. Place cranial nerve monitoring electrodes.

Description of Intra-Service Work: The operation is equivalent to an extended or revision mastoidectomy (69511, 69602). The surgeon must avoid entering the jugular bulb, the posterior semi-circular canal, the posterior fossa dura, or the mastoid segment of the facial nerve, all of which are at risk. Damage to the inner ear could result in permanent hearing loss or intractable dysequilibrium. These risks produce considerable psychological stress (reference mastoidectomy 69511, 69602)

Description of Post-Service Work: Take patient to recovery room, write orders, dictate or report and referral letter, talk to patient and family. Discharge instruction and summary. 3 outpatient visits on floor.

SURVEY DATA:

Specialty: Otolaryngology—Head and Neck Surgery

Sample Size: 49 Response Rate (%): 78.00 Median RVW: 15.00

25th Percentile RVW: 13.50 75th Percentile RVW: 17.00 Low: 10.00 High: 28.00

ICU: 0 0

Other Hospital: 30 2

Office: 50 3

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
69632	Tympanoplasty without mastoidectomy (including canalplasty, atticotomy and/or middle ear surgery), initial or revision; with ossicular chain reconstruction (eg. postfenestration)	12.41	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69805 describes completion of a complete mastoidectomy with then extension of the surgical dissection posterior to the inner ear structures of the semi-circular canals to uncover the endolymphatic sac. This operation is of the same order of magnitude as the two reference services. The median pre service time of our survey for CPT Code 69805 of 60 minutes is greater than that from the Harvard data for either of the reference services. This reflects the fact that CPT Code 69805 describes a neuro otologic procedure with attendant risks to major structures in the head and neck whereas both of the reference services are used for chronic ear disease.

The median intra service time of 120 minutes is consistent with both of the Harvard data for the two reference services. The post service time again is approximately the same as the two reference services.

The mental effort and judgment, along with technical skill to required to perform CPT Code 69805 is greater than that for either 69642 or 69632.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Decompression of the endolymphatic sac is done for individuals with Meniere's Disease who have disabling vertigo despite appropriate medical management. This is a neuro otologic procedure which involves some of the techniques in skull base surgery. As such, the dissection is more extensive than that seen in either of the key reference services with potential damage to the sigmoid sinus, semicircular canals, facial nerve and posterior cranial fossa. The endolymphatic sac lies in a sheath of dura in the posterior cranial fossa, and decompression of this structure necessarily involves wide exposure of the posterior cranial fossa dura. Essentially this procedure describes a mini craniotomy to provide decompression of the endolymphatic sac.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 69930 Global Period: 090 Current RVW: 14.00 Recommended RVW: 20.00

CPT Descriptor: Cochlear device implantation, with or without mastoidectomy

Source and Summary of Comment to HCFA on this service:
AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Bilateral profoundly deaf adult (18 years of age or older) or child (2 years - 18 years of age); subject does not achieve significant open-set word understanding with an appropriate hearing aid.

Description of Pre-Service Work: Requires evaluation of audiology, speech, and psychology reports; evaluation of CT scan to determine if cochlea is patent. Discussion of procedure with patient (if adult) and family or parents (if children), informed consent, selection of Cts for OR, positioning, prep, draping patient after cranial nerve monitors are placed.

Description of Intra-Service Work: Perform an intact canal wall mastoidectomy which provides entrance into the middle ear space. A cochleostomy is performed into the inner ear. A seat is drilled into the occipital cortex to provide a placement of the implanted hardware. The cochlear implant is then placed into the inner ear. This requires significant expertise to manipulate the electrode into the inner ear without damaging the electrode. The electrode is secured in the inner ear with a fascia patch. Electrodes are secured to the mastoid cortex and then electrophysiologic testing of the implant is performed following suturing of the wound closure.

Description of Post-Service Work: Dictation of the operative report, letter, writing order, talking to patient and family. The postoperative care requires changing the mastoid dressing and removing the drain on the first or second postoperative day, rounding on the patient approximately four times while the patient is in the hospital, and removal of stitches approximately one week after the procedure is performed. This is similar to an intact canal wall or revision mastoid surgery. The patient then returns one month following implantation for programming of the speech processor. This requires six to eight hours of time in an adult and 16 to 36 hours in a child. In comparison to the reference, time commitment is much more extensive than a revision mastoidectomy because of the speech processor programming.

SURVEY DATA:

Specialty: Otolaryngology—Head and Neck Surgery

Sample Size: 49 Response Rate (%): 76.00 Median RVW: 20.00

25th Percentile RVW: 18.00 75th Percentile RVW: 22.47 Low: 13.00 High: 33.50

Median Pre-Service Time: 120 Median Intra-Service Time: 180

25th Percentile Intra-Svc Time: 173 75th Percentile Intra-Svc Time: 240 Low: 80 High: 300

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>30</u>	
ICU:	<u>0</u>	<u>0</u>
Other Hospital:	<u>30</u>	<u>2</u>
Office:	<u>60</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
69660	Stapedectomy or stapedotomy with reestablishment of ossicular continuity, with or without use of foreign material	11.64	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The surgeons responding to this code felt that a cochlear implant was a service significantly valued greater than that of most cited reference service 69642, which is a tympanoplasty and mastoidectomy. A number of responders commented that placement of a cochlear implant is impossible without a mastoidectomy. In point of fact, the only individuals where a "mastoidectomy" would not be done, are those persons who have had this surgery previously.

The description of the pre service and intra service is greater than that for any of the key reference services. The post service time is significant for this procedure and is in keeping with the key reference services Harvard data.

The degree of technical skill required to accurately isolate the round window in the middle ear, and then to manipulate a micro electrode into cochlea is considerable. This micro electrode must pass through the two and one half turns of the cochlea in a space which is barely adequate to accommodate the diameter of the micro electrode. Neither the cochlea nor the electrode may be damaged during this procedure or the cochlear implant will fail.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The responders to our survey all felt that placement of a cochlear implant was greater work than that of any of the key reference services. In particular, the degree of mental effort, skill and judgment necessary to place the micro electrode within the two and a half turns of the cochlea in the inner ear, was significantly greater than the work involved in CPT Code 69642. In addition, this code requires preparation of a formal skin flap to provide coverage of the internal electronic devices necessary to allow the cochlear implant to work. If there is any failure in this portion of the operation, the device becomes exposed to the skin and will require removal. The opening into the inner ear is quite small, and is usually accomplished through a facial recess approach. This exposure is quite limited and can only be accomplished with a high degree of technical skill using micro surgical techniques similar to skull base surgery.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 69950 Global Period: 090 Current RVW: 21.15 Recommended RVW: 28.00

CPT Descriptor: Vestibular nerve section, transcranial approach

Source and Summary of Comment to HCFA on this service:
AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Patient with recurring spells of vertigo refractory to medical management. Patient has usually had psychological evaluation.

Description of Pre-Service Work: Review of peripheral vestibular system work-up including ENG, audiogram, MRI and CT scan evaluations; discussion of procedure with patient and family, informed consent, positioning, prepping, draping patient after placing cranial nerve monitors.

Description of Intra-Service Work: Requires slightly less time than the reference acoustic tumor excision, but same critical tolerance and microsurgical skills required; must preserve hearing; similar to a middle fossa facial nerve decompression.

Description of Post-Service Work: Take patient to recovery room, dictate letter and OR report, write orders, talk to patient and family. Requires visits to the Intensive Care Unit immediately postop x 2 day; 5-7 days, dependent upon vestibular compensation.

SURVEY DATA:

Specialty: Otolaryngology—Head and Neck Surgery

Sample Size: 49 Response Rate (%): 80.00 Median RVW: 28.00

25th Percentile RVW: 23.85 75th Percentile RVW: 32.72 Low: 10.00 High: 60.00

Median Pre-Service Time: 120 Median Intra-Service Time: 210

25th Percentile Intra-Svc Time: 180 75th Percentile Intra-Svc Time: 240 Low: 30 High: 360

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>45</u>	
ICU:	<u>30</u>	<u>2</u>
Other Hospital:	<u>82.5</u>	<u>5</u>
Office:	<u>60</u>	<u>3</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg. comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69950, vestibular nerve section using a transcranial approach is a neurosurgical approach to the vestibular nerve through the middle cranial fossa requiring critical tolerance and micro surgical skills.

The median pre service time of our survey of 120 minutes is greater of that of any of the key references. Similarly, the intra service of 210 minutes from our survey is more extensive than an of the key reference services Harvard data.

The post operative phase of this procedure is much more extensive than any of the key reference services due to the fact that this is a formal craniotomy and will require at least an overnight stay in the intensive care unit for observation of bleeding, cranial nerve deficits or change in sensorium.

The respondees felt that the value of CPT Code 69950 should be approximately twice that of the most frequently sighted reference procedure 69642-tympanoplasty with mastoidectomy.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

A sectioning of the vestibular nerve through a transcranial approach is a formal craniectomy with exposure of the middle cranial fossa and dissection along the "roof" of the temporal bone. To accurately isolate the vestibular nerve, one must have considerable microsurgical skills. The vestibular nerve lies between the cochlea and the semicircular canals. In this position, there is a real chance of inadvertent injury to the cochlear semicircular canals with concomitant permanent sensorineural hearing loss or continued vertigo. Inasmuch as the procedure is being done for patients with intractable vertigo, this particular complication is catastrophic. The degree of mental stress, and technical skill required to accomplish and is reflected in the survey data collected from the body of neuro-otologists and otologists in the AAO-HNS instrument.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 69955 Global Period: 090 Current RVW: 22.12 Recommended RVW: 30.00

CPT Descriptor: Total facial nerve decompression and/or repair (may include graft)

Source and Summary of Comment to HCFA on this service:
AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Patient with tumor of facial nerve or skull base requiring removal of the VIIth nerve and grafting or decompression of the VII nerve.

Description of Pre-Service Work: Evaluation of the CT and MRI scan, lab data, chart; explanation of surgical procedure, informal consent, positioning, prepping and draping patient right after placement of cranial nerve monitors.

Description of Intra-Service Work: Five to six hours of the time is microsurgical, middle fossa craniotomy, mastoidectomy, lateral lobe parotidectomy with facial nerve preservation, harvest of the sural nerve graft, microsurgical anastomosis of facial nerve in brainstem to the facial nerve in the parotid gland. Requires extensive expertise and microsurgical skill.

Description of Post-Service Work: The patient is in the Intensive Care Unit for approximately 24 hours postoperative. Dressing changes in patient bed 5-7 days.

SURVEY DATA:

Specialty: Otolaryngology—Head and Neck Surgery

Sample Size: 48 Response Rate (%): 77.00 Median RVW: 30.00

Office:	<u>60</u>	<u>4</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg. comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve	18.63	090
69632	Tympanoplasty without mastoidectomy (including canalplasty, atticotomy and/or middle ear surgery), initial or revision; with ossicular chain reconstruction (eg, postfenestration)	12.41	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69955 requires a greater expenditure of time and effort than any of the key reference services. This is reflected in the median pre service time of 120 minutes from our survey data compared to the Harvard information for any of the reference services. In fact, this is greater than twice the amount of effort noted in any of these services.

The median intra service time of 300 minutes is reflective of the extent of this operation. There is a need for both a middle cranial fossa approach (CPT Code 69950 current RVU 21.15) along with a complete mastoidectomy and decompression of the facial nerve (CPT Code 69725 current RVW 18.98). This is necessary due to the fact that the facial nerve has the most tortuous bony course of any cranial nerve. There are two major bends in the facial nerve - one at the geniculate ganglion and another as the facial nerve rounds the oval window. This is considerably greater technical expertise than is required for any of the key reference services.

The post operative phase is similarly extensive reflecting the fact that the patients undergoing CPT Code 69955 are routinely placed in the intensive care unit for observation of intracranial bleeding, change in sensorium or cranial neuropathies.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT Code 69955 describes an extensive surgical procedure involving the middle cranial fossa, as well as the mastoid. This extensive procedure to decompress the entire facial nerve is necessary due to the circuitous route which the facial nerve takes through the temporal bone. The degree of clinical skill, judgment and stress involved in this procedure is among the greatest in all of micro neurosurgery. This procedure can be justifiably classified as a skull base operation.

In addition, should the facial nerve require more than a decompression, the code involves repair of the facial nerve with or without a facial nerve graft. This again adds additional time and technical expertise to this procedure. In some instances, the facial nerve may need to be anastomosed at the level of the brain stem. This procedure requires extensive expertise and micro-surgical skills. Current RVW, derived from Harvard data, does not capture the intensity or degree of technical skill required for this procedure.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 69960 Global Period: 090 Current RVW: 19.75 Recommended RVW: 30.00

CPT Descriptor: Decompression internal auditory canal

Source and Summary of Comment to HCFA on this service: AAO-HNS

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient who has progressive neuropathway hearing loss and/or vestibular symptoms. The findings by high resolution CT scan and MRI indicate a restriction of the internal auditory canal space either by new bone formation, soft tissue mass, excluding an acoustic schwannoma, and inclusive of cholesteatoma, metastatic tumor, inflammatory lesion or traumatic lesion.

Description of Pre-Service Work: This is a rare situation and finding in medicine and requires a high degree of mental effort and judgment. The potential for making the patient worse is high if the diagnosis is not correct. It is an area of subspecialization and requires special training in otology. Determination of the specific lesion requires a broad survey of medicine and a very specific understanding of lesions of the temporal bone. Requires great technical skill and physical effort. Psychological stress is high. Prognosis is poor and outcome is very dependent upon extraordinary skill and judgment. Review lab data, chart, CT, MRI, discuss procedure with patient and family, get informed consent; position, prep and drape patient after placement of cranial nerve monitors.

Description of Intra-Service Work: The incision for such an operation is made just superior to the auricle. The squamous portion of the temporal bone is removed in a fashion analogous to a craniectomy to provide exposure to the middle cranial fossa. The temporal lobe of the brain is elevated and the superior surface of the temporal bone is exposed.

Using standard landmarks, the internal auditory canal is identified. The margin for error in this portion of the dissection is in fractions of millimeters. The bone of the superior surface of the temporal bone must be removed without entering the cochlea or the semicircular canals of the inner ear. This dissection would not be performed by residents, but rather is the subject of fellowship training.

Any work on the internal auditory canal must avoid injury to the facial nerve which is intimately adherent to the acoustic and vestibular portions of the eighth cranial nerve.

The wound is closed and the patient is taken to the intensive care unit.

Description of Post-Service Work: Take patient to recovery room, write orders, dictate referral letter and OR report, talk to patient and family. The patient will be in an intensive care setting for one to two days. All the precautions and observations necessary for neurosurgical procedures will be followed. The patient will be examined twice per day for 30 minutes each visit during this time.

The patient will be transferred to the floor where a similar pattern of visits will continue, except that they will not be as intense.

SURVEY DATA:Specialty: Otolaryngology—Head and Neck SurgerySample Size: 49 Response Rate (%): 63.00 Median RVW: 30.0025th Percentile RVW: 23.00 75th Percentile RVW: 36.50 Low: 18.00 High: 55.00Median Pre-Service Time: 100 Median Intra-Service Time: 24025th Percentile Intra-Svc Time: 205 75th Percentile Intra-Svc Time: 300 Low: 100 High: 600

Median Post-Service Time:	<u>Total Time</u>	<u>Number of Visits</u>
Day of Procedure:	<u>45</u>	
ICU:	<u>40</u>	<u>2</u>
Other Hospital:	<u>60</u>	<u>5</u>
Office:	<u>60</u>	<u>4</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
69632	Tympanoplasty without mastoidectomy (including canalplasty, atticotomy and/or middle ear surgery), initial or revision; with ossicular chain reconstruction (eg, postfenestration)	12.41	090
42420	Excision of parotid tumor or parotid gland: total, with dissection and preservation of facial nerve	18.63	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg, comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69960 was felt by our respondents to be significantly more work than any of the reference procedures. In fact, with the exception of CPT Code 21433, the degree of work, mental effort and stress was felt to be twice that of most of the reference procedures.

This is reflected in the median pre-service time of our survey for CPT Codes 69960 being 100 minutes with a median intra service time of 240 minutes. Again, this is greater than the Harvard data for any of the reference services.

The amount of post service work is extensive in this procedure, reflecting the fact that a middle cranial fossa approach is necessary to provide decompression of the internal auditory nerve. This procedure requires a high degree of technical skill and is similar to CPT Code 69950, which is a transcranial approach to the vestibular nerve which has a current RVU of 21.15, and a recommended RVW of 28.00.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Decompression of the internal auditory canal is an infrequent procedure performed only by those most expert in micro-surgical techniques of the temporal bone. This is a formal middle cranial fossa approach to the internal auditory canal and requires the surgeon to avoid inadvertent injury to the cochlea or the semi-circular canals. The blood vessels in the posterior cranial fossa and middle fossa are at risk and must be protected. Inadvertent injury to one of these small vessels could cause a brain stem infarction. The surgeon must also take care to avoid injuring the facial nerve which is intimately adherent to the eighth cranial nerve.

Postoperatively, this patient receives the same type of care as an individual undergoing a formal neuro-surgical procedure. This can be considered skull base surgery. The Harvard valuation of this service does not recognize the skill, expertise, mental stress and effort required to perform this procedure.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 69970 Global Period: 090 Current RVW: 22.30 Recommended RVW: 32.70

CPT Descriptor: Removal of tumor, temporal bone

Source and Summary of Comment to HCFA on this service:

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Patient would have symptoms and signs of dysfunction of the neural and vascular components of the temporal bone such as hearing loss, vestibular symptoms, facial nerve paralysis. These symptoms and signs would be documented by clinical findings, physical examination and imaging studies. The CT scan and MRI are suggestive of an acoustic nerve tumor.

Description of Pre-Service Work: Review MRI, CT, lab data, chart, audiogram, ENG. Talk to patient and family. Get informed consent. Position, prep, drape patient after placement cranial nerve monitors and vascular lines.

Description of Intra-Service Work: Removal of a tumor of the temporal bone is one of the most challenging operations in otolaryngology. This requires skill and knowledge of the three-dimensional anatomy of the temporal bone and its relationships to the brain, internal carotid artery, sigmoid sinus and jugular bulb as well as an appreciation of the need to accomplish a satisfactory tumor removal.

The tumor is approached by a combination of preliminary mastoid surgery to isolate the structures of the middle ear and mastoid, preparatory neck surgery to expose the great vessels and cranial nerves and exposure through a temporal craniectomy for protection of the brain.

The tumor and temporal bone are dissected en bloc. A high degree of skill is needed to isolate the structures which will need to be saved and at the same time remove the tumor in a satisfactory fashion. In every sense of the word, this is skull base surgery.

Following tumor removal, the surgeon must reconstruct the wound (separate code). This will most commonly require a free flap for reconstruction.

The most analogous code with which to compare the intraoperative work is CPT 61530 at 42.35 RVU's.

Description of Post-Service Work: ICU x 2 - 3 days. Inpatient days 4 - 7.

SURVEY DATA:

Specialty: American Academy of Otolaryngology—Head and Neck Surgery

Office:	<u>60</u>	<u>3.5</u>

KEY REFERENCE SERVICE(S):

<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>	<u>Global Period</u>
69642	Tympanoplasty with mastoidectomy (including canalplasty, middle ear surgery, tympanic membrane repair); with ossicular chain reconstruction	16.37	090
42420	Excision of parotid tumor or parotid gland; total, with dissection and preservation of facial nerve.	18.63	090
21433	Open treatment of craniofacial separation (LeFort III type); complicated (eg, comminuted or involving cranial nerve foramina), multiple surgical approaches	23.69	090

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

CPT Code 69970 describes a temporal bone resection which is most commonly done for epidermoid carcinoma of the temporal bone. This is one of the most challenging and difficult operations in otolaryngology. Before the advent of modern micro-surgical techniques and skull base surgery, this procedure enjoyed a nearly 50% mortality. Particularly difficult was the handling of the internal carotid artery at the depths of the wound.

The respondees to our survey for CPT Code 69970 felt that this procedure was significantly more difficult than any of the key reference procedures. This is reflected in the median pre service time of our survey of 120 minutes, which is greater than the Harvard data for any of the reference codes. Similarly, the intra service time of 330 minutes is also more extensive than that of any of the reference services by nearly 2 times. Lastly, the median post service time of this procedure reflects the degree of complexity and potential injury to key structures of the brain, carotid artery, facial nerve, jugular venous system and the very real potential for catastrophic infectious problems.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

CPT Code 69970 is among the most difficult procedures in all of otolaryngology - head and neck surgery. The degree of skill required to encompass the temporal bone and its relationships to the rest of the skull is considerable. This procedure will require a complete mastoidectomy, middle cranial fossa approach to the superior aspect of the temporal bone, dissection of the structures inferior to the temporal bone at the base of the skull and then appropriate handling of the anterior structures of the temporal bone as they relate to the mandible and parotid gland. This procedure is effective in treating cancer of the ear and temporal bone, but requires considerable skill and expertise on the part of the surgeon. This is a skull base operation with the attendant risks of death, stroke, blindness or significant intra-cranial injury, in addition to the potential for catastrophic infectious complications. The Harvard survey data upon which the current RVU is based, does not capture this scope of the difficulty required in this operation. The degree of technical skill, mental stress and effort are all considerable and are more accurately realized in the AAO-HNS survey of surgeons actively performing this operation.

**AMA SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Cardiothoracic and Vascular Surgery

Comments were submitted by the American Society of General Surgeons (ASGS) and the Society of Thoracic Surgeons (STS) stating that lung procedures were not appropriately valued in the Harvard RBRVS study. In particular, comments noted that pre- and postservice times had been estimated by Harvard rather than directly measured and that the current RVUs do not reflect the physician work involved in: (1) maintaining proper hemodynamics during initiation of anesthesia, (2) stabilizing the patient for transfer to the recovery room, and (3) accumulating sufficient evidence that immediate reoperation or other intervention for bleeding, impaired circulation, or air leak is not needed. The STS also commented on several cardiac operations which it believes have become more complex over time, and recommended slight increases in 11 CABG procedures. The RUC did not believe that sufficiently compelling evidence was provided to support increases in the RVUs for thoracic procedures because most of these services have already been reviewed by the RUC, and any changes in work since the Harvard study should have been reflected in the RUC's 1993 recommendations. The RUC agreed that increases were warranted in two of the cardiac surgery procedures, mitral valve repair with prosthetic ring (33426) and descending thoracic aorta graft (33875), which have become more complex over the last five years.

The comments submitted by the International Society for Cardiovascular Surgery/The Society for Vascular Surgery (SVS) described a number of problems in the current RBRVS for vascular surgery procedures, many of which are due to the lack of any distinct study of vascular surgical procedures or vascular surgeons in the Harvard RBRVS study. This omission could have particularly deleterious effects for the Medicare program because Medicare patients account for an exceptionally high percentage of total patients seen by vascular surgeons. The comment notes, for example, that no vascular surgeons were included in the Harvard Technical Consulting Groups. It also describes errors in the Harvard vignettes, which could have resulted from the absence of vascular surgeons on the Harvard TCGs and led to incorrect data. The comment also notes that some adjustments were made in these services for the 1993 RBRVS based on an Abt study, but that further refinements are needed. Finally, the comments report the results of an effort to obtain intraoperative times from 10 hospitals for nine vascular procedures and eleven other codes selected from the Multispecialty Points of Comparison (MPC). This study found that, while data on nonvascular codes corresponded closely to existing Harvard and RUC data for the services, for vascular surgical codes the current data were 20% lower than the hospital reported times. The ASGS also commented on two vascular surgical procedures, code 34201 for femoropopliteal embolectomy or thrombectomy and code 35654 for axillary-femoral-femoral bypass graft, with other than vein.

The RUC found that the arguments presents by the SVS presented a compelling reason to review the current RVUs for selected vascular surgery procedures. It did not adopt the particular approaches or proposed RVUs recommended by the SVS, however. The alternative methods used to calculate the RUC-recommended RVUs are described below.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Comments were received from the Society of Cardiovascular and Interventional Radiology (SCVIR), the American College of Surgeons (ACS), the American Society of Hematology (ASH), the American Thoracic Society (ATS), and the SVS and ASGS regarding nine other cardiovascular procedures. The RUC agreed with the SCVIR that there are anomalies in the current RVUs for codes 36215, 36218, 36245, and 36248. It is recommending a work neutral adjustment in the current RVUs for 36215 and 36245 to make them equal and is recommending a global period change for codes 36218 and 36248. The RUC adopted the increase recommended by the general and vascular surgeons for code 36830 for creation of arteriovenous fistula. For the remainder of the codes in this group, the RUC did not believe sufficient evidence was presented to support an increase and is recommending that the current RVUs be maintained.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
Thoracic Surgery						
32000	Drainage of chest	1.54	1.54	The Mayo Foundation commented that the work involved in thoracentesis is equivalent to tube thoracostomy (code 32020) because the intraservice times are equivalent.	None of the specialties on the RUC Advisory Committee elected to develop evidence supporting this contention, but data from the Harvard RBRVS study suggests tube thoracostomy requires more postservice work and time than thoracentesis. The RUC recommends maintaining the current RVUs.	2
32020	Insertion of chest tube	3.98	3.98	ASGS commented that the RVUs for tube thoracostomy should be increased from 3.98 to 4.94.	An Abt study for the ACS suggests the current RVUs are appropriate. The ASGS elected not to develop additional supporting evidence and the RUC recommends maintaining the current RVUs.	2
32100	Exploration/biopsy of chest	10.07	10.07	The STS and ASGS presented data on intraservice times for large numbers of patients who underwent thoracotomy (32100), pneumonectomy (32440), lobectomy (32480), and pulmonary wedge resection (32500), which suggested that the intraservice time assumptions underlying the current RVUs are too low.	A survey confirmed the STS comments that the intraservice times may be longer than the Harvard data suggest and that the recommended increases would make the services more appropriate in comparison to other codes in the family. The RUC recommends that the current RVUs be maintained, however, because they are based on recommendations made by the RUC and adopted by HCFA in 1993. Although the specialties provided ample evidence about the complexity of the services, they did not provide a compelling argument that the work had increased in the past two years.	2
32440	Removal of lung	19.15	19.15			2
32480	Partial removal of lung	16.84	16.84			2
32500	Partial removal of lung	13.10	13.10			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
32602	Thoracoscopy, diagnostic	5.96	5.96	The ASGS recommended that the RVUs for diagnostic thoracoscopy be increased from 5.96 to 11.81.	The current RVUs are based on a RUC recommendation. The RUC did not wish to revisit its previous recommendation and the ASGS elected not to develop and present additional evidence to support this comment. The RUC recommends maintaining the current RVUs.	2
Cardiac Surgery						
33010	Drainage of heart sac	2.24	2.24	Comments were submitted by an individual recommending that the RVUs be increased from 2.24 to 6.00.	None of the specialties on the RUC Advisory Committee elected to develop further evidence supporting this comment, and the RUC did not find the argument a convincing one.	2
33208	Insertion of heart pacemaker	7.28	7.28	The ASGS recommended the RVUs for pacemaker insertion or replacement be increased from 7.28 to 8.76.	The CPT codes for pacemaker services were recently reviewed by the RUC and neither the ASGS nor any of the other specialty societies pursued development of additional support for a change in the current RVUs.	2
33244	Remove generator	8.34	8.34	The American College of Cardiology recommended that the RVUs for 33244 be increased to 12.00.	The current RVUs for 33244 are based on recent recommendations from the RUC. No compelling evidence was presented to support another review of this code.	2

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
33425	Repair of mitral valve	25.57	25.57	The STS recommended an increase in the RVUs for mitral valve repair (33425) from 25.57 to 29.42, for mitral valve repair with prosthetic ring (33426) from 26.07 to 29.42, and for mitral valve repair involving radical reconstruction with or without ring (33427) from 32.07 to 35.00. The STS described the work involved in codes 33245 and 33246 as being equivalent to mitral valve replacement (code 33430, 29.42 RVUs).	After in-depth study, the STS concluded that the current RVUs for codes 33425 and 33427 should be maintained and the RUC agreed. The RUC recommends that the RVUs for 33426 be increased to equal the RVUs for 33430. Patients are more complex because those with mitral valve prolapse advancing to mitral regurgitation are surviving to an older age with medical management, with nearly half of Medicare patients aged 75 or older. Many of these patients have more advanced mitral regurgitation and present greater surgical challenges. The procedure is also being used for patients with mitral insufficiency. Also, whereas surgeons previously may have replaced the mitral valve with a prosthetic valve, they now attempt to reconstruct more valves because this is a safer option for patients. Such reconstruction may require insertion of a prosthetic ring in the dilated annulus, which is almost as much work as suturing in a prosthetic valve. A survey found that the code should actually be valued slightly higher than 33430, but the RUC did not find the survey data as compelling as the argument that the two codes should have equal work values.	2
33426	Repair of mitral valve	26.07	29.42			4
33427	Repair of mitral valve	32.07	32.07			2

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
33510	CABG, vein, single	23.29	23.29	The STS commented that, in the process of developing the practice expense RVUs for these codes when they were revised in 1993, HCFA made adjustments in the work RVUs which sharply reduced the RUC-recommended differential between the arterial and venous codes to 0.72 rather than 2.18. The comment requested a technical correction.	HCFA can determine if a "technical correction" is warranted. As the comment notes, the CPT codes for CABG procedures were changed in 1993 and the RUC reviewed the RVUs for these services at that time. For 8 of the 10 codes, the requested increase is less than 10% of the current RVUs, and the RUC does not believe the survey process is sufficiently precise to validate such small changes through a new survey of work, so if the issue involves more than a technical correction, the RUC recommends the current RVUs be maintained.	2
33511	CABG, vein, two	25.57	25.57			2
33512	CABG, vein, three	27.84	27.84			2
33513	CABG, vein, four	30.12	30.12			2
33514	CABG, vein, five	32.39	32.39			2
33516	CABG, vein, six+	34.66	34.66			2
33533	CABG, arterial, single	24.00	24.00			2
33534	CABG, arterial, two	26.99	26.99			2
33535	CABG, arterial, three	26.98	26.98			2
33536	CABG, arterial, four+	32.96	32.96			2
33530	Coronary artery, bypass/reop	5.86	5.86	Comments stated the RVUs for CABG reoperation should reflect the higher likelihood of major intra- and postoperative complications compared to a primary CABG operation. The transverse aortic arch graft was described as the most challenging cardiovascular procedure performed today, and an increase to 49.91 RVUs was recommended.	The STS stated it was withdrawing codes 33530 and 33870 as it was unable to gather sufficient evidence to support the change. The RUC recommends that the current RVUs be maintained.	2
33870	Transverse aortic arch graft	37.74	37.74			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
33875	Thoracic aorta graft	26.94	31.23	Comments stated the work involved in descending thoracic aorta graft has increased over time as the procedure is now performed almost invariably with bypass, although the code descriptor states "with or without bypass." An increase was recommended from 26.94 to 31.23 RVUs to make it equivalent to ascending aorta graft, a code which is also performed invariably with bypass.	A survey confirmed that the work of this service is equal to ascending aorta graft. Patients must be managed under both hypothermia and cardiopulmonary bypass, and the procedure entails risks of further aortic dissection and heavy bleeding. The RUC also noted that a high proportion of patients are African-Americans who are likely to have high blood pressure, renal disease, and other conditions which add to the procedure's complexity. Use of bypass is now the standard of care, which adds the time to put the patient on bypass and converts the service from a closed to an open heart procedure. In comparing 33875 to 33860, the greatest work difference is in the dissection, particularly since 33875 can cause paralysis in the patient, which is not a risk in 33860. The RUC recommends 33875 be increased as recommended.	1
Vascular Surgery						
34201	Removal of artery clot	8.04	8.04	The ASGS recommended an increase from 8.04 to 12.59 RVUs.	No survey was conducted of vascular surgeons' work for this service, and the RUC did not feel sufficient rationale or evidence was provided to support a change from the current RVUs.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
35081	Repair defect of artery	22.15	26.23	As noted above, SVS comments described problems in the current RBRVS for vascular surgery procedures, mainly due to the lack of any distinct study of vascular surgical procedures or vascular surgeons in the Harvard RBRVS study. Intraoperative times were obtained from 10 hospitals for nine vascular procedures.	<p>The RUC found that the SVS comments constituted a compelling reason to review and revalue the codes addressed in their comments. They did not agree, however, with the specific approaches used by the SVS to develop new proposed values.</p> <p>The RUC recommends an increase to 26.23 RVUs for 35081 based on the evidence gathered by the SVS, which showed that the 167 minutes of intraservice time from the Harvard study was 35 minutes too short, the preoperative time was 40 minutes too short, and the IWPOT of 0.074 was too low:</p> <ul style="list-style-type: none"> ●The sum of (1) the additional intraoperative time of 35 minutes at 0.08 per minute and (2) increasing the 167 minutes from the Harvard study from .074 to .08 per minute added 3.80 additional RVUs for intraservice work. ●The 40 additional minutes of preservice time at 0.028 units per minute added 1.00 RVUs for preservice work. ●Adding 3.80 and 1.00 to the Harvard RVUs of 21.31 produced the recommended RVUs of 26.23, which is lower than the 28.50 RVUs recommended by the SVS. 	4
35082	Repair artery rupture, aorta	28.82	34.20		<p>The RUC recommends an increase to 34.20 RVUs, which would maintain the current relationship between codes 35081 and 35082 (35082 is 30% higher than 35081), and which is lower than the 37.00 RVUs recommended by the SVS.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
35091	Repair defect of artery	28.10	33.16	See summary of SVS comment on previous page.	The RUC recommends an increase to 33.16 RVUs, which would maintain the current relationship between codes 35081 and 35091, and which is lower than the 36.50 RVUs recommended by the SVS.	4
35102	Repair defect of artery	23.44	28.80		The RUC considered the relationship between the SVS survey medians for codes 35081 and 35102 to be more appropriate than the ratio of the current RVUs for the codes. The SVS survey median for code 35102 was 30.74, and for code 35081 was 28.00. To calculate the recommended RVUs of 28.80 for 35102, the recommended RVUs of 26.23 for 35081 were multiplied by the ratio of the two survey medians. The SVS had originally recommended 31.50 RVUs for this service.	4
35301	Rechanneling of artery	15.95	17.79		The RUC recommendation for 35301 is based on data gathered by the SVS that it involves 143 minutes of intraoperative work rather than the two hours identified by the Harvard study. Valuing the additional 23 minutes at 0.08 IWPUT produced a new value of 17.79 RVUs.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
35556	Artery bypass graft	15.47	19.37	See summary of SVS comments on p. 7.	<p>The RUC recommendations for these codes recognize the additional work involved in 35556 that is not recognized in the current RVUs, correct a rank order anomaly that currently exists between codes 35566 and 35585, and establish correct relationships between bypasses with vein and bypasses with in-situ vein. The SVS survey demonstrated that the current RVUs significantly underestimate the work involved in 35556. With a slight reduction to preserve a previous adjustment for work neutrality that was made in this family of codes, the increment of work between codes 35566 [<i>Bypass graft, with vein; femoral-anterior tibial, posterior tibial, peroneal artery or other distal vessels</i>] and 35666 [<i>Bypass graft, with other than vein; femoral-anterior tibial, posterior tibial, or peroneal artery</i>] was added to the current RVUs of 15.47 for code 35556 [<i>Bypass graft, with vein; femoral-popliteal</i>]. The recommended RVUs for code 35583 [<i>In-situ vein bypass; femoral-popliteal</i>] are 3% higher than 35556, as they are currently. The current relationship between the femoral-popliteal and femoral-anterior tibial services is preserved in recommended increase for code 35566 from 20.21 to 24.45 RVUs. The recommended RVUs for code 35585 [<i>In-situ vein bypass; femoral-anterior tibial, posterior tibial, or peroneal artery</i>] are 6% higher than code 35566, rather than 6% lower as they are now. The current relationship between codes 35556 and 35656 [<i>Bypass graft, with other than vein; femoral-popliteal</i>] is also preserved in the recommended RVUs. The RUC-recommended values for these services are all lower than those proposed by the SVS.</p> <p>The newer, in-situ procedures involve somewhat more work than the older procedures because, instead of the vein being removed from its location and reversed, the incision is made along the entire length of the vein, the branches are tied off, and the two ends are freed up and sewn to the nearby artery. Since the veins have not been reversed, this leaves the problem of the one-way valves, which must then be mechanically disrupted to allow blood to flow through the conduit. Any false move with the valvutome can rip a huge hole in the vein, but publications suggest improved long-term graft patency when this in-situ technique is used.</p>	4
35566	Artery bypass graft	20.21	24.45			4
35583	Vein bypass graft	15.97	20.03			4
35585	Vein bypass graft	19.05	25.92			4
35656	Artery bypass graft	13.86	17.84			4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
35654	Artery bypass graft	17.62	17.62	The ASGS recommended an increase from 17.62 to 23.05 RVUs.	No survey was conducted of vascular surgeons' work for this service, and the RUC did not feel sufficient rationale or evidence was provided to support a change from the current RVUs.	2
35681	Artery bypass graft	8.05	3.93	The ACS recommended reducing the RVUs for 35681 and 35875 based on a survey of general and vascular surgeons. Code 35681 is listed separately in addition to the code for the primary procedure, which could be any of the bypass graft procedures. It involved making a composite graft of a donor vein and segment of synthetic material to create enough length to accomplish the primary procedure, and would be used only if the obvious vein segment was not long enough. Code 35875 is equivalent to code 47556 for biliary endoscopy, with dilation of the stricture of the common bile duct.	The RUC agreed with the recommended reductions.	3
35875	Removal of clot in graft	9.07	8.19			3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
Other Cardiovascular Procedures						
36215	Place catheter in artery	4.47	4.68	Comments from the SCVIR compared the work of code 36215 for [<i>Selective catheter placement arterial system; each first order thoracic or bracheocephalic branch within a vascular family</i>] to code 36245, which is for the same service but involves catheterization below the diaphragm. The comment states that previous RBRVS studies have demonstrated that the work involved in these services is equivalent whether the service is above or below the diaphragm, and an increase is recommended to make them equal.	The RUC agreed that codes 36215 and 36245 should have the same RVUs. No evidence was presented, however, that 36215 should be increased to equal the current RVUs for code 36245. The RUC recommends, therefore, that the RVUs for 36215 and 36245 be assigned a value equal to the frequency-weighted average of both codes. AMA data on Medicare claims indicate that 115,850 claims were submitted for code 36215 in 1994 and 63,952 claims were submitted for 35245, producing a new work-neutral value of 4.68 for both codes.	4
36245	Place catheter in artery	5.07	4.68			5 add
36218	Place catheter in artery	1.01 XXX	1.01 ZZZ	SCVIR comments identified codes 36218 and 36248 as undervalued because placement of a catheter in an additional second, third, or fourth order branch is frequently the most time and labor intensive aspect of selective and superselective arterial catheterization.	The RUC did not accept the SCVIR recommendation to increase the RVUs for codes 36218 and 36248 because no current survey data were presented. Since the codes for second and third order catheter placement can <i>never</i> be reported without also listing one of the codes for first order placement, however, the RUC recommends that the global periods for 36218 and 36248 be changed from XXX to ZZZ. Currently, the RVUs for these two services are reduced by 50% because they are reported as being done in addition to the first order placement. Since the codes are add-on codes, the RUC believes it would be more appropriate to assign a global period of ZZZ so that the RVUs are not halved every time the procedures are done.	4
36248	Place catheter in artery	1.01 XXX	1.01 ZZZ			4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
36489	Insertion of catheter, vein	1.22	1.22	The ATS commented that the RVUs for code 36489 should be increased to be equal to code 36010 for <i>[Introduction of catheter, superior or inferior vena cava, 2.43 RVUs]</i> .	The ATS did not provide sufficiently compelling evidence to support the proposed increase. In addition, as explained by the SCVIR, the RVU difference between 36010 and 36489 appears justified. The RUC recommends that the current RVUs for 36489 be maintained.	2
36520	Plasma and/or cell exchange	1.74	1.74	The ASH recommended that the RVUs for 36520 be increased above the RVUs for code 90937 for hemodialysis, repeated evaluation.	The RUC did not believe sufficient evidence was provided by the ASH to support an increase in the RVUs from 1.74 to 2.60 for therapeutic apheresis. HCFA had recently reviewed the RVUs for this service and changed the global payment policy to consider certain evaluation and management services as being bundled with the procedure. In addition, claims data indicated that only 12% of the services are provided by hematologists. Larger percentages are provided by nephrologists, pathologists, and internists, but these specialties were not surveyed about the work involved in the service. The RUC recommends maintaining the current RVUs.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
36533	Insertion of access port	3.82	5.00	The ACS commented that a survey of general and vascular surgeons found that code 36533 for insertion of implantable venous access port is undervalued and code 36534 is overvalued.	The RUC's recommendation for these codes is based on a survey conducted by the ACS. An increase in 36533 from 3.82 to 5.00 will more appropriately value this service relative to other catheter procedures and venous codes, such as 62350 [<i>Implantation, revision or repositioning of intrathecal or epidural catheter, for implantable reservoir or implantable infusion pump; without laminectomy, 6.25 RVUs</i>] and 63685 [<i>Incision and subcutaneous placement of spinal neurostimulator pulse generator or receiver, direct or inductive coupling, 6.29 RVUs</i>], which were recently reviewed by the RUC because of coding changes for <u>CPT 1996</u> . The recommended increase in 36533 is partially offset by a recommended decrease in 36534 from 3.79 to 2.73 RVUs, which achieves a better relationship within this family of codes. The RUC also compared the recommended RVUs to services on the MPC, including 32020 [<i>Insertion of chest tube, 3.98 RVUs</i>] and 32601 [<i>Diagnostic thoracoscopy, 5.46 RVUs</i>].	1
36534	Revision of access port	3.79	2.73			3
36620	Insertion catheter, artery	1.15	1.15	The ATS commented that the RVUs for code 36620 should be increased to be equal to code 36140 [<i>Introduction of needle or intracatheter; extremity artery, 2.01 RVUs</i>].	The ATS did not provide sufficiently compelling evidence to support the change. In addition, as explained by the SCVIR, the difference in RVUs between codes 36620 and 36140 appears justified. The RUC recommends that the current RVUs for 36140 be maintained.	2

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
36830	Artery-vein graft	7.78	11.25	The ACS, SVS, and ASGS commented that code 36830 was undervalued based on a survey of general and vascular surgeons.	The RUC's recommendation for code 36830 is based on a survey of general, vascular, and transplant surgeons about the work involved in this service. The new value of 11.25 RVUs seems particularly reasonable in comparison to code 36821 for A-V fistula with vein, eg, Cimino type (8.39 RVUs), since 36830 involves two vascular anastomoses rather than one, insertion and tunneling of a prosthetic graft, and usually two incisions rather than one, but the current RVUs for 36830 are lower than 36821. The increased value also appeared reasonable in comparison to code 35661 [<i>Bypass graft, with other than vein, femoral-femoral</i> , 11.81 RVUs], 43420 [<i>Closure of esophagostomy or fistula; cervical approach</i> , 10.19 RVUs], and 43331, [<i>Esophagomyotomy (Heller type); thoracic approach</i> , 14.73 RVUs].	1
37730	Removal of leg veins	6.63	6.63	The ASGS commented that the RVUs for code 37730 should be increased to 8.60.	The ASGS did not provide additional evidence besides its comment. The RUC did not believe that sufficient data or rationale was presented to support this increase and recommends the current RVUs be maintained.	2
39400	Visualization of chest	5.11	5.11	The ASGS commented that the RVUs for code 39400 for mediastinoscopy should be increased to 7.97.	Claims data indicate that 56% of mediastinoscopy services are provided by thoracic surgeons. Since the ASGS had surveyed general but not thoracic surgeons, the RUC did not find the comment compelling and recommends the current RVUs be maintained.	2

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Speech/Language/Hearing

The American Speech-Language-Hearing Association (ASHA) and the American Academy of Audiology (AAA) submitted public comments on the following list of codes. In general these the comments expressed concern regarding HCFA's payment policies for audiologists and speech pathologists. These organizations are concerned that the current practice expense component does not accurately reflect the technical work that is involved in performing the services. In addition, the AAA comment noted that the current Medicare RBRVS includes zero work RVUs for audiology services, even though the Harvard study included physician work values for these codes. AAA notes that audiologists are currently authorized to seek direct reimbursement from HCFA and argues that work components should be developed to capture the interpretation and report.

ASHA and the American Academy of Otolaryngology-Head and Neck Surgery had originally responded to survey these services, however, they have now requested that the codes be withdrawn from further consideration. A majority of these codes have been revised for CPT 1996 and the RUC submitted recommendations to HCFA in May 1995.

The CMDs commented that 92512 *Nasal function studies (eg, rhinomanometry)* is similar to 94060 *Bronchospasm evaluation; spirometry as in 94010, before and after bronchodilator (aerosol or parenteral) or exercise (rvu = .31)*. The RUC noted that Nasal function studies are performed to evaluate the normal or abnormal function of the nose. Rhinomanometry is a nasal function study that measures the flow and pressure of air through the nose. It enables the physician to assess the degree of obstruction, if any that may be present in the nasal passages. Anterior rhinomanometry, measures air flow in the front of the nasal cavity and is performed by inserting flexible air tubes into each nostril of the nose. The tubes are connected to a device that measures the amount and pressure of air that flows through them as the patient breathes. Measurements of air flow are recorded, and from this the physician calculates the degree of obstruction. Evaluation of wheezing (94060) is a distinctly different test which uses spirometry to measure exhaled gas and record the time of collection. 94060 is less intense than 92512 and requires less physician time than 92512. The RUC disagrees with this comment and recommends that the current value be maintained.

**AMA/SPECIALTY SOCIETY RVS UPDATE COMMITTEE
RBRVS FIVE-YEAR REVIEW**

RUC RECOMMENDATIONS

Cardiothoracic and Vascular Surgery

Comments were submitted by the American Society of General Surgeons (ASGS) and the Society of Thoracic Surgeons (STS) stating that lung procedures were not appropriately valued in the Harvard RBRVS study. In particular, comments noted that pre- and postservice times had been estimated by Harvard rather than directly measured and that the current RVUs do not reflect the physician work involved in: (1) maintaining proper hemodynamics during initiation of anesthesia, (2) stabilizing the patient for transfer to the recovery room, and (3) accumulating sufficient evidence that immediate reoperation or other intervention for bleeding, impaired circulation, or air leak is not needed. The STS also commented on several cardiac operations which it believes have become more complex over time, and recommended slight increases in 11 CABG procedures. The RUC did not believe that sufficiently compelling evidence was provided to support increases in the RVUs for thoracic procedures because most of these services have already been reviewed by the RUC, and any changes in work since the Harvard study should have been reflected in the RUC's 1993 recommendations. The RUC agreed that increases were warranted in two of the cardiac surgery procedures, mitral valve repair with prosthetic ring (33426) and descending thoracic aorta graft (33875), which have become more complex over the last five years.

The comments submitted by the International Society for Cardiovascular Surgery/The Society for Vascular Surgery (SVS) described a number of problems in the current RBRVS for vascular surgery procedures, many of which are due to the lack of any distinct study of vascular surgical procedures or vascular surgeons in the Harvard RBRVS study. This omission could have particularly deleterious effects for the Medicare program because Medicare patients account for an exceptionally high percentage of total patients seen by vascular surgeons. The comment notes, for example, that no vascular surgeons were included in the Harvard Technical Consulting Groups. It also describes errors in the Harvard vignettes, which could have resulted from the absence of vascular surgeons on the Harvard TCGs and led to incorrect data. The comment also notes that some adjustments were made in these services for the 1993 RBRVS based on an Abt study, but that further refinements are needed. Finally, the comments report the results of an effort to obtain intraoperative times from 10 hospitals for nine vascular procedures and eleven other codes selected from the Multispecialty Points of Comparison (MPC). This study found that, while data on nonvascular codes corresponded closely to existing Harvard and RUC data for the services, for vascular surgical codes the current data were 20% lower than the hospital reported times. The ASGS also commented on two vascular surgical procedures, code 34201 for femoropopliteal embolectomy or thrombectomy and code 35654 for axillary-femoral-femoral bypass graft, with other than vein.

The RUC found that the arguments presents by the SVS presented a compelling reason to review the current RVUs for selected vascular surgery procedures. It did not adopt the particular approaches or proposed RVUs recommended by the SVS, however. The alternative methods used to calculate the RUC-recommended RVUs are described below.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Comments were received from the Society of Cardiovascular and Interventional Radiology (SCVIR), the American College of Surgeons (ACS), the American Society of Hematology (ASH), the American Thoracic Society (ATS), and the SVS and ASGS regarding nine other cardiovascular procedures. The RUC agreed with the SCVIR that there are anomalies in the current RVUs for codes 36215, 36218, 36245, and 36248. It is recommending a work neutral adjustment in the current RVUs for 36215 and 36245 to make them equal and is recommending a global period change for codes 36218 and 36248. The RUC adopted the increase recommended by the general and vascular surgeons for code 36830 for creation of arteriovenous fistula. For the remainder of the codes in this group, the RUC did not believe sufficient evidence was presented to support an increase and is recommending that the current RVUs be maintained.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
Thoracic Surgery						
32000	Drainage of chest	1.54	1.54	The Mayo Foundation commented that the work involved in thoracentesis is equivalent to tube thoracostomy (code 32020) because the intraservice times are equivalent.	None of the specialties on the RUC Advisory Committee elected to develop evidence supporting this contention, but data from the Harvard RBRVS study suggests tube thoracostomy requires more postservice work and time than thoracentesis. The RUC recommends maintaining the current RVUs.	2
32020	Insertion of chest tube	3.98	3.98	ASGS commented that the RVUs for tube thoracostomy should be increased from 3.98 to 4.94.	An Abt study for the ACS suggests the current RVUs are appropriate. The ASGS elected not to develop additional supporting evidence and the RUC recommends maintaining the current RVUs.	2
32100	Exploration/biopsy of chest	10.07	10.07	The STS and ASGS presented data on intraservice times for large numbers of patients who underwent thoracotomy (32100), pneumonectomy (32440), lobectomy (32480), and pulmonary wedge resection (32500), which suggested that the intraservice time assumptions underlying the current RVUs are too low.	A survey confirmed the STS comments that the intraservice times may be longer than the Harvard data suggest and that the recommended increases would make the services more appropriate in comparison to other codes in the family. The RUC recommends that the current RVUs be maintained, however, because they are based on recommendations made by the RUC and adopted by HCFA in 1993. Although the specialties provided ample evidence about the complexity of the services, they did not provide a compelling argument that the work had increased in the past two years.	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
32440	Removal of lung	19.15	19.15			2
32480	Partial removal of lung	16.84	16.84			2
32500	Partial removal of lung	13.10	13.10			2
32602	Thoracoscopy, diagnostic	5.96	5.96	The ASGS recommended that the RVUs for diagnostic thoracoscopy be increased from 5.96 to 11.81.	The current RVUs are based on a RUC recommendation. The RUC did not wish to revisit its previous recommendation and the ASGS elected not to develop and present additional evidence to support this comment. The RUC recommends maintaining the current RVUs.	2
Cardiac Surgery						
33010	Drainage of heart sac	2.24	2.24	Comments were submitted by an individual recommending that the RVUs be increased from 2.24 to 6.00.	None of the specialties on the RUC Advisory Committee elected to develop further evidence supporting this comment, and the RUC did not find the argument a convincing one.	2
33208	Insertion of heart pacemaker	7.28	7.28	The ASGS recommended the RVUs for pacemaker insertion or replacement be increased from 7.28 to 8.76.	The CPT codes for pacemaker services were recently reviewed by the RUC and neither the ASGS nor any of the other specialty societies pursued development of additional support for a change in the current RVUs.	2
33244	Remove generator	8.34	8.34	The American College of Cardiology recommended that the RVUs for 33244 be increased to 12.00.	The current RVUs for 33244 are based on recent recommendations from the RUC. No compelling evidence was presented to support another review of this code.	2
33425	Repair of mitral valve	25.57	25.57	The STS recommended an increase in the RVUs for mitral valve repair (33425) from 25.57 to 29.42, for mitral valve repair with prosthetic ring (33426) from 26.07 to	After in-depth study, the STS concluded that the current RVUs for codes 33425 and 33427 should be maintained and the RUC agreed. The RUC recommends that the RVUs for 33426 be increased to equal the RVUs for	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
				29.42, and for mitral valve repair involving radical reconstruction with or without ring (33427) from 32.07 to 35.00. The STS described the work involved in codes 33245 and 33246 as being equivalent to mitral valve replacement (code 33430, 29.42 RVUs).	33430. Patients are more complex because those with mitral valve prolapse advancing to mitral regurgitation are surviving to an older age with medical management, with nearly half of Medicare patients aged 75 or older. Many of these patients have more advanced mitral regurgitation and present greater surgical challenges. The procedure is also being used for patients with mitral insufficiency. Also, whereas surgeons previously may have replaced the mitral valve with a prosthetic valve, they now attempt to reconstruct more valves because this is a safer option for patients. Such reconstruction may require insertion of a prosthetic ring in the dilated annulus, which is almost as much work as suturing in a prosthetic valve. A survey found that the code should actually be valued slightly higher than 33430, but the RUC did not find the survey data as compelling as the argument that the two codes should have equal work values.	
33426	Repair of mitral valve	26.07	29.42			4
33427	Repair of mitral valve	32.07	32.07			2
33510	CABG, vein, single	23.29	23.29	The STS commented that, in the process of developing the practice expense RVUs for these codes when they were revised in 1993, HCFA made adjustments in the work RVUs which sharply reduced the RUC-recommended differential between the arterial and venous codes to 0.72 rather than 2.18. The comment requested a technical correction.	HCFA can determine if a "technical correction" is warranted. As the comment notes, the CPT codes for CABG procedures were changed in 1993 and the RUC reviewed the RVUs for these services at that time. For 8 of the 10 codes, the requested increase is less than 10% of the current RVUs, and the RUC does not believe the survey process is sufficiently precise to validate such small changes through a new survey of work, so if the issue involves more than a technical correction, the RUC recommends the current RVUs be maintained.	2
33511	CABG, vein, two	25.57	25.57			2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
33512	CABG, vein, three	27.84	27.84			2
33513	CABG, vein, four	30.12	30.12			2
33514	CABG, vein, five	32.39	32.39			2
33516	CABG, vein, six+	34.66	34.66			2
33533	CABG, arterial, single	24.00	24.00			2
33534	CABG, arterial, two	26.99	26.99			2
33535	CABG, arterial, three	26.98	26.98			2
33536	CABG, arterial, four+	32.96	32.96			2
33530	Coronary artery, bypass/reop	5.86	5.86	Comments stated the RVUs for CABG reoperation should reflect the higher likelihood of major intra- and postoperative complications compared to a primary CABG operation. The transverse aortic arch graft was described as the most challenging cardiovascular procedure performed today, and an increase to 49.91 RVUs was recommended.	The STS stated it was withdrawing codes 33530 and 33870 as it was unable to gather sufficient evidence to support the change. The RUC recommends that the current RVUs be maintained.	2
33870	Transverse aortic arch graft	37.74	37.74			2
33875	Thoracic aorta graft	26.94	31.23	Comments stated the work involved in descending thoracic aorta graft has increased over time as the procedure is now performed almost invariably with bypass, although the code descriptor states "with or without bypass." An increase was recommended from 26.94	A survey confirmed that the work of this service is equal to ascending aorta graft. Patients must be managed under both hypothermia and cardiopulmonary bypass, and the procedure entails risks of further aortic dissection and heavy bleeding. The RUC also noted that a high proportion of patients are African-Americans who are likely to have high blood pressure, renal	1

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
				to 31.23 RVUs to make it equivalent to ascending aorta graft, a code which is also performed invariably with bypass.	disease, and other conditions which add to the procedure's complexity. Use of bypass is now the standard of care, which adds the time to put the patient on bypass and converts the service from a closed to an open heart procedure. In comparing 33875 to 33860, the greatest work difference is in the dissection, particularly since 33875 can cause paralysis in the patient, which is not a risk in 33860. The RUC recommends 33875 be increased as recommended.	
Vascular Surgery						
34201	Removal of artery clot	8.04	8.04	The ASGS recommended an increase from 8.04 to 12.59 RVUs.	No survey was conducted of vascular surgeons' work for this service, and the RUC did not feel sufficient rationale or evidence was provided to support a change from the current RVUs.	2
35081	Repair defect of artery	22.15	26.23	As noted above, SVS comments described problems in the current RBRVS for vascular surgery procedures, mainly due to the lack of any distinct study of vascular surgical procedures or vascular surgeons in the Harvard RBRVS study. Intraoperative times were obtained from 10 hospitals for nine vascular procedures.	<p>The RUC found that the SVS comments constituted a compelling reason to review and revalue the codes addressed in their comments. They did not agree, however, with the specific approaches used by the SVS to develop new proposed values.</p> <p>The RUC recommends an increase to 26.23 RVUs for 35081 based on the evidence gathered by the SVS, which showed that the 167 minutes of intraservice time from the Harvard study was 35 minutes too short, the preoperative time was 40 minutes too short, and the IWPOT of 0.074 was too low:</p> <p>•The sum of (1) the additional Intraoperative time of 35 minutes at 0.08 per minute and (2) increasing the 167 minutes from the Harvard study from .074 to .08 per minute added 3.80 additional RVUs for intraservice work.</p>	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
					<ul style="list-style-type: none"> •The 40 additional minutes of preservice time at 0.028 units per minute added 1.00 RVUs for preservice work. •Adding 3.80 and 1.00 to the Harvard RVUs of 21.31 produced the recommended RVUs of 26.23, which is lower than the 28.50 RVUs recommended by the SVS. 	
35082	Repair artery rupture, aorta	28.82	34.20		The RUC recommends an increase to 34.20 RVUs, which would maintain the current relationship between codes 35081 and 35082 (35082 is 30% higher than 35081), and which is lower than the 37.00 RVUs recommended by the SVS.	4
35091	Repair defect of artery	28.10	33.16	See summary of SVS comment on previous page.	The RUC recommends an increase to 33.16 RVUs, which would maintain the current relationship between codes 35081 and 35091, and which is lower than the 36.50 RVUs recommended by the SVS.	4
35102	Repair defect of artery	23.44	28.80		The RUC considered the relationship between the SVS survey medians for codes 35081 and 35102 to be more appropriate than the ratio of the current RVUs for the codes. The SVS survey median for code 35102 was 30.74, and for code 35081 was 28.00. To calculate the recommended RVUs of 28.80 for 35102, the recommended RVUs of 26.23 for 35081 were multiplied by the ratio of the two survey medians. The SVS had originally recommended 31.50 RVUs for this service.	4
35301	Rechannelling of artery	15.95	17.79		The RUC recommendation for 35301 is based on data gathered by the SVS that it involves 143 minutes of intraoperative work rather than the two hours identified by the Harvard study. Valuing the additional 23 minutes at 0.08 IWP/PUT produced a new value of 17.79 RVUs.	4

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
35556	Artery bypass graft	15.47	19.37	See summary of SVS comments on p. 7.	<p>The RUC recommendations for these codes recognize the additional work involved in 35556 that is not recognized in the current RVUs, correct a rank order anomaly that currently exists between codes 35566 and 35585, and establish correct relationships between bypasses with vein and bypasses with in-situ vein. The SVS survey demonstrated that the current RVUs significantly underestimate the work involved in 35556. With a slight reduction to preserve a previous adjustment for work neutrality that was made in this family of codes, the increment of work between codes 35566 (<i>Bypass graft, with vein; femoral-anterior tibial, posterior tibial, peroneal artery or other distal vessels</i>) and 35666 (<i>Bypass graft, with other than vein; femoral-anterior tibial, posterior tibial, or peroneal artery</i>) was added to the current RVUs of 15.47 for code 35556 (<i>Bypass graft, with vein; femoral-popliteal</i>). The recommended RVUs for code 35583 (<i>In-situ vein bypass; femoral-popliteal</i>) are 3% higher than 35556, as they are currently. The current relationship between the femoral-popliteal and femoral-anterior tibial services is preserved in recommended increase for code 35566 from 20.21 to 24.45 RVUs. The recommended RVUs for code 35585 (<i>In-situ vein bypass; femoral-anterior tibial, posterior tibial, or peroneal artery</i>) are 6% higher than code 35566, rather than 6% lower as they are now. The current relationship between codes 35556 and 35656 (<i>Bypass graft, with other than vein; femoral-popliteal</i>) is also preserved in the recommended RVUs. The RUC-recommended values for these services are all lower than those proposed by the SVS.</p> <p>The newer, in-situ procedures involve somewhat more work than the older procedures because, instead of the vein being removed from its location and reversed, the incision is made along the entire length of the vein, the branches are tied off, and the two ends are freed up and sewn to the nearby artery. Since the veins have not been reversed, this leaves the problem of the one-way valves, which must then be mechanically disrupted to allow blood to flow through the conduit. Any false move with the valvulome can rip a huge hole in the vein, but publications suggest improved long-term graft patency when this in-situ technique is used.</p>	4
35566	Artery bypass graft	20.21	24.45			4
35583	Vein bypass graft	15.97	20.03			4

Code	Descriptor	95 RVU	RUC REC RVU	Comment	RUC Rationale	Key
35585	Vein bypass graft	19.05	25.92			4
35656	Artery bypass graft	13.86	17.84			4
35654	Artery bypass graft	17.62	17.62	The ASGS recommended an increase from 17.62 to 23.05 RVUs.	No survey was conducted of vascular surgeons' work for this service, and the RUC did not feel sufficient rationale or evidence was provided to support a change from the current RVUs.	2
35681	Artery bypass graft	8.05	3.93	The ACS recommended reducing the RVUs for 35681 and 35875 based on a survey of general and vascular surgeons. Code 35681 is listed separately in addition to the code for the primary procedure, which could be any of the bypass graft procedures. It involved making a composite graft of a donor vein and segment of synthetic material to create enough length to accomplish the primary procedure, and would be used only if the obvious vein segment was not long enough. Code 35875 is equivalent to code 47556 for biliary endoscopy, with dilation of the stricture of the common bile duct.	The RUC agreed with the recommended reductions.	3
35875	Removal of clot in graft	9.07	8.19			3

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Other Cardiovascular Procedures						
36215	Place catheter in artery	4.47	4.68	Comments from the SCVIR compared the work of code 36215 for <i>Selective catheter placement arterial system; each first order thoracic or brachiocephalic branch within a vascular family</i> to code 36245, which is for the same service but involves catheterization below the diaphragm. The comment states that previous RBRVS studies have demonstrated that the work involved in these services is equivalent whether the service is above or below the diaphragm, and an increase is recommended to make them equal.	The RUC agreed that codes 36215 and 36245 should have the same RVUs. No evidence was presented, however, that 36215 should be increased to equal the current RVUs for code 36245. The RUC recommends, therefore, that the RVUs for 36215 and 36245 be assigned a value equal to the frequency-weighted average of both codes. AMA data on Medicare claims indicate that 115,850 claims were submitted for code 36215 in 1994 and 63,952 claims were submitted for 35245, producing a new work-neutral value of 4.68 for both codes.	4
36245	Place catheter in artery	5.07	4.68			5 add
36218	Place catheter in artery	1.01 XXX	1.01 ZZZ	SCVIR comments identified codes 36218 and 36248 as undervalued because placement of a catheter in an additional second, third, or fourth order branch is frequently the most time and labor intensive aspect of selective and superselective arterial catheterization.	The RUC did not accept the SCVIR recommendation to increase the RVUs for codes 36218 and 36248 because no current survey data were presented. Since the codes for second and third order catheter placement can <i>never</i> be reported without also listing one of the codes for first order placement, however, the RUC recommends that the global periods for 36218 and 36248 be changed from XXX to ZZZ. Currently, the RVUs for these two services are reduced by 50% because they are reported as being done in addition to the first order placement. Since the codes are add-on codes, the RUC believes it would be more appropriate to assign a global period of ZZZ so that the RVUs are not halved every time the procedures are done.	4
36248	Place catheter in artery	1.01 XXX	1.01 ZZZ			4
36489	Insertion of catheter,	1.22	1.22	The ATS commented that the RVUs for	The ATS did not provide sufficiently compelling	2

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

	vein			code 36489 should be increased to be equal to code 36010 for <i>Introduction of catheter, superior or inferior vena cava, 2.43 RVUs</i> .	evidence to support the proposed increase. In addition, as explained by the SCVIR, the RVU difference between 36010 and 36489 appears justified. The RUC recommends that the current RVUs for 36489 be maintained.	
36520	Plasma and/or cell exchange	1.74	1.74	The ASH recommended that the RVUs for 36520 be increased above the RVUs for code 90937 for hemodialysis, repeated evaluation.	The RUC did not believe sufficient evidence was provided by the ASH to support an increase in the RVUs from 1.74 to 2.60 for therapeutic apheresis. HCFA had recently reviewed the RVUs for this service and changed the global payment policy to consider certain evaluation and management services as being bundled with the procedure. In addition, claims data indicated that only 12% of the services are provided by hematologists. Larger percentages are provided by nephrologists, pathologists, and internists, but these specialties were not surveyed about the work involved in the service. The RUC recommends maintaining the current RVUs.	2
36533	Insertion of access port	3.82	5.00	The ACS commented that a survey of general and vascular surgeons found that code 36533 for insertion of implantable venous access port is undervalued and code 36534 is overvalued.	The RUC's recommendation for these codes is based on a survey conducted by the ACS. An increase in 36533 from 3.82 to 5.00 will more appropriately value this service relative to other catheter procedures and venous codes, such as 62350 (<i>Implantation, revision or repositioning of intrathecal or epidural catheter, for implantable reservoir or implantable infusion pump; without laminectomy, 6.25 RVUs</i>) and 63685 (<i>Incision and subcutaneous placement of spinal neurostimulator pulse generator or receiver, direct or inductive coupling 6.29 RVUs</i>), which were recently reviewed by the RUC because of coding changes for CPT 1996. The recommended increase in 36533 is partially offset by a recommended decrease in 36534 from 3.79 to 2.73 RVUs, which achieves a better relationship within this family of codes. The RUC also compared the recommended RVUs to services on the MPC, including 32020 (<i>Insertion of chest tube, 3.98 RVUs</i>) and 32601	1

KEY: 1 = Adopt specialty/CMD recommended increase; 2 = Maintain current RVU; 3 = Adopt specialty/CMD recommended decrease; 4 = Adopt increased RVU, but lower than specialty recommended; 5 = Adopt decreased RVU to maintain neutrality

					<i>Diagnostic thoracoscopy</i> , 5.46 RVUs.	
36534	Revision of access port	3.79	2.73			3
36620	Insertion catheter, artery	1.15	1.15	The ATS commented that the RVUs for code 36620 should be increased to be equal to code 36140 (<i>Introduction of needle or intracatheter; extremity artery</i> , 2.01 RVUs).	The ATS did not provide sufficiently compelling evidence to support the change. In addition, as explained by the SCVIR, the difference in RVUs between codes 36620 and 36140 appears justified. The RUC recommends that the current RVUs for 36140 be maintained.	2
36830	Artery-vein graft	7.78	11.25	The ACS, SVS, and ASGS commented that code 36830 was undervalued based on a survey of general and vascular surgeons.	The RUC's recommendation for code 36830 is based on a survey of general, vascular, and transplant surgeons about the work involved in this service. The new value of 11.25 RVUs seems particularly reasonable in comparison to code 36821 for A-V fistula with vein, eg, Cimino type (8.39 RVUs), since 36830 involves two vascular anastomoses rather than one, insertion and tunneling of a prosthetic graft, and usually two incisions rather than one, but the current RVUs for 36830 are lower than 36821. The increased value also appeared reasonable in comparison to code 35661 (<i>Bypass graft, with other than vein, femoral-femoral</i> , 11.81 RVUs), 43420 (<i>Closure of esophagostomy or fistula; cervical approach</i> , 10.19 RVUs), and 43331, (<i>Esophagomyotomy (Heller type); thoracic approach</i> , 14.73 RVUs).	1
37730	Removal of leg veins	6.63	6.63	The ASGS commented that the RVUs for code 37730 should be increased to 8.60.	The ASGS did not provide additional evidence besides its comment. The RUC did not believe that sufficient data or rationale was presented to support this increase and recommends the current RVUs be maintained.	2
39400	Visualization of chest	5.11	5.11	The ASGS commented that the RVUs for code 39400 for mediastinoscopy should be increased to 7.97.	Claims data indicate that 56% of mediastinoscopy services are provided by thoracic surgeons. Since the ASGS had surveyed general but not thoracic surgeons, the RUC did not find the comment compelling and	2

SUMMARY OF RECOMMENDATION**

CPT Code: 33426 Global Period: 090 Current RVW: 26.07 Recommended RVW: 30.00

CPT Descriptor: Valvuloplasty, mitral valve, with cardiopulmonary bypass; with prosthetic ring

Source and Summary of Comment to HCFA on this service: STS was the source of this comment. STS disagrees with the methodology that resulted in compressed and lowered values for this service in the original Hsaio study. Abt Associates did a follow-up study that directly measured both work and time and demonstrated greater amounts of work and time for this surgical procedure, especially in the pre- and postoperative period of complex operations. In addition, the rise in average age and severity of illness of these patients since the Hsaio study has increased the work and intensity factors of this procedure.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old woman with known heart murmur of mitral insufficiency of at least 20 yrs duration suddenly developed symptoms of heart failure. History and physical and transesophageal echocardiogram demonstrated a flail posterior leaflet of the mitral valve with severe mitral regurgitation, and normal ventricular contractility. Her symptoms proved refractory to medical therapy. The patient was admitted to the hospital prior to the scheduled operation and was reevaluated by the surgeon who again reviews her medical record, echocardiographic findings, and both laboratory and EKG results. Informed consent is obtained. The planned procedure was discussed with the anesthesiologist. At the time of operation via median sternotomy, the patient was placed on cardiopulmonary bypass, after which the left atrium was exposed posterior to the intraatrial groove after adequate mobilization. Inspection of the mitral valve revealed myxomatous changes of both the anterior and posterior leaflet. The middle portion of the posterior leaflet was flailed. A quadrangular incision of the flailed portion of the posterior leaflet was excised, and the leaflet was repaired with interrupted sutures of 5-0 Prolene. Because the annulus was dilated, an annuloplasty ring was inserted with multiple, interrupted Prolene sutures. After completion of cardiopulmonary bypass, transesophageal echocardiogram confirmed valvular competence. The patient was sent to the ICU and stabilized. Following a routine postop course, she was started on heparin anticoagulation and ultimately Coumadin. She was discharged after 8 days in hospital. Postoperative visits were for suture removal, routine postop checkups and Coumadin regulation.

Description of Pre-Service Work: The patient is admitted to the hospital the morning of the scheduled operation and is re-evaluated by the surgeon who again reviews the patient's medical record, echocardiograms, EKGs, and laboratory results. The risks and likely outcomes of the procedure are re-discussed with the patient. Informed consent is verified or obtained if not previously done. The planned procedure is discussed with the anesthesiologist. The surgeon then changes into surgical clothes and waits for the patient to be brought into the operating room. After the patient is anesthetized, the surgeon places the patient in the appropriate position on the operating room table. The surgeon then scrubs his or her hands and arms before gowning for the surgical procedure.

Description of Intra-Service Work: At the time of operation via median sternotomy, the patient is placed on cardiopulmonary bypass and cardioplegia is instituted, after which the left atrium is exposed posterior to the intraatrial groove after adequate mobilization. Inspection of the mitral valvular leaflets and subvalvular structures will determine the approach. For example, with myxomatous changes of both the anterior and posterior leaflet and the middle portion of the posterior leaflet flailed, the procedure would go as follows: A quadrangular incision of the flailed portion of the posterior leaflet is excised, and the leaflet is repaired with interrupted sutures of 5-0 Prolene. With the annulus dilated, an annuloplasty ring is inserted with multiple, interrupted Prolene sutures. After completion of cardiopulmonary bypass, transesophageal echocardiogram must confirm valvular competence.

Description of Post-Service Work: The patient is evaluated in the post-anesthesia recovery unit immediately upon arriving for bleeding and cardiac function. At least two postoperative transesophageal echocardiograms are reviewed. Fluid orders are written, pain control is initiated, and ventilatory parameters are adjusted if the patient remains intubated. When indicated, the patient is extubated and ICU orders are written. Within the next few hours the patient is transferred to an intensive care unit where the surgeon again evaluates the patient for bleeding and cardiopulmonary function. Valve status, hemodynamics, and cardiac rhythm are again tested and reviewed. Within the next 12 hours, two subsequent visits are made by the surgeon to evaluate similar parameters.

During the remainder of the hospitalization the patient is seen daily, during which time the patient is physically examined, transesophageal echocardiograms are reviewed, respiratory status and cardiac rhythm are observed, and general recovery is evaluated. The patient is started on a liquid diet the second postoperative day and advanced to a general diet on the third. Pain control is instituted with parenteral and oral medications. The chest tubes are removed one at a time over a two to three day period usually starting on the third or fourth postoperative day.

Following hospital dismissal, the patient is seen in an office setting within the next week and then monthly thereafter for 3 months, during which time the incision site, the chest, the anticoagulation regimen, and cardiac function are evaluated. Skin sutures are removed at the first office visit. Questions by both patient and family are answered.

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	33422	Valvotomy, mitral valve; open heart with cardiopulmonary bypass	23.72
2)	33430	Replacement, mitral valve; with cardiopulmonary	29.42

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The code is closely related to the other two codes. CPT 33422 is a mitral valve repair, also, but of a simpler nature, somewhat less intense, and thus valued lower. CPT 33430 is also a mitral valve procedure, of nearly the same level of difficulty as the mitral valvuloplasty with the annuloplasty ring insertion. The mitral valve procedure family of codes would be in appropriate rank order with the upgrading of CPT 33426.

It is notable that the pre-service work with mitral valvuloplasty sometimes exceeds that done with mitral valve repair because of the need to educate the patient regarding anticoagulation following surgery and the possibility of mitral valve replacement in the future,

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

Our survey data indicate that patients undergoing this procedure are more complex than they were five years ago. While mitral valve repairs are not necessarily done only in the elderly population, patients with mitral valve prolapse advancing to mitral regurgitation are surviving to an older age with medical management. Many of these patients have more advanced mitral regurgitation and present greater surgical challenges. Whereas, in the past we might have replaced their mitral valve with a prosthetic valve, now we are attempting to reconstruct more valves than we used to because it is a safer option for the patient. In many cases reconstruction necessitates the insertion of a prosthetic ring in the dilated annulus, which is almost as much work as suturing in a prosthetic valve. We believe, with the added preoperative work and the extra work of repair on a more diseased valve with the ring insertion, that this code deserves to be raised to 30.00 RVWs to be in appropriate rank order with the mitral valve surgery codes.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 33875 Global Period: 090 Current RVW: 26.94 Recommended RVW: 31.23

CPT Descriptor: Descending thoracic aorta graft, with or without cardiopulmonary bypass

Source and Summary of Comment to HCFA on this service: STS was the source of this comment. STS disagrees with the methodology that resulted in compressed and lowered values for this service in the original Hsaio study. Abt Associates did a follow-up study that directly measured both work and time and demonstrated greater amounts of work and time for this surgical procedure, especially in the pre- and postoperative period of complex operations. In addition, the rise in average age and severity of illness of these patients since the Hsaio study has increased the work and intensity factors of this procedure.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old hypertensive man was admitted to the hospital because of back pain and an enlarged descending thoracic aorta detected on chest x-ray. CT scan confirmed a descending thoracic aortic aneurysm measuring 6.5 cm in diameter in the mid-chest. A moderate left pleural effusion was noted. The patient was seen by a cardiothoracic surgeon who reviewed the patient's CT scan and laboratory studies and did a physical examination. Urgent graft replacement of the descending thoracic aorta was proposed and discussed with the patient and family and informed consent obtained. After discussing the planned procedure with the anesthesiologist and bypass team, the patient's chest was entered through a left posterolateral incision, and the left common femoral artery and left atrium were cannulated. The patient underwent partial cardiopulmonary bypass and mild hypothermia. The thoracic aortic aneurysm was excluded by placing a vascular clamp between the left carotid and left subclavian arteries and distally above the diaphragm. The aneurysm was then opened, intercostal arteries suture-ligated proximally and prepared for reimplantation distally, and the thoracic aorta replaced with a Dacron graft. The distal graft-to-aorta anastomosis was performed about 8 cm above the diaphragm and the intercostals reimplanted. The left atrium and femoral artery were decannulated and repaired. The patient's chest incision was then closed after control of bleeding, and he was taken to the surgical intensive care unit where he was stabilized. He was extubated within 24 hours and transferred out of intensive care on the 2nd postoperative day. He was discharged on the 8th postoperative day. He was seen for office visits for routine postoperative care and evaluation of followup CT scans.

Description of Pre-Service Work: The patient is admitted to the hospital the morning of the scheduled operation and is re-evaluated by the surgeon who again reviews the patient's C-T scan, x-ray findings, and laboratory results. The patient is physically examined. Informed consent is verified or obtained if not previously done. The planned procedure is now discussed with the anesthesiologist. The surgeon then changes into surgical clothes and waits for the patient to be brought into the operating room. After the patient is anesthetized, the surgeon places the patient in the left lateral decubitus position on the operating room table. The surgeon then scrubs his or her hands and arms before gowning for the surgical procedure.

Description of Intra-Service Work: Typically, the patient's chest is entered through a left posterolateral incision, and the left common femoral artery and left atrium are cannulated. The patient is put under partial cardiopulmonary bypass and mild hypothermia. The thoracic aortic aneurysm is excluded by placing a vascular clamp between the left carotid and left subclavian arteries and distally above the diaphragm. The aneurysm is then opened. It may be necessary to tuck back the intima and adventitia together and eliminate the false lumen produced between the adventitia and intima using a double Teflon sandwich technique. The intercostal arteries are suture-ligated proximally and prepared for reimplantation distally, and the thoracic aorta is replaced with a Dacron graft. The distal graft-to-aorta anastomosis was performed about 8 cm above the diaphragm and the intercostals are reimplanted. The

left atrium and femoral artery are decannulated and repaired. Stopping of retrograde cerebral perfusion, reinstatement of cardiopulmonary bypass, rewarming and termination of cardioplegia and cardiopulmonary bypass are done in sequence. Venting of air emboli is done in the cardiac chambers and in the graft. The patient's induced coagulopathy is dealt with. The patient's chest incision is then closed after control of bleeding.

Description of Post-Service Work: The patient is evaluated in the postanesthesia recovery unit immediately upon arriving for bleeding, cardiac function, blood pressure stability. Postoperative chest x-rays EKGs, C-T scans, angiograms, blood gases, cardiac rhythm, and hemodynamic status are reviewed. Fluid orders are written, pain control is initiated, and ventilatory parameters are adjusted if the patient remains intubated. When indicated, the patient is extubated; within the next few hours the patient is transferred to an intensive care unit where the surgeon again evaluates the patient for bleeding; cardiac function, hemodynamic status and neurologic function. Within the next 12 hours, two subsequent visits are made by the surgeon to evaluate similar parameters.

During the remainder of the hospitalization the patient is seen daily, during which time the patient is physically examined. Further chest x-rays and C-T scans are reviewed, hemodynamic status and cardiac rhythm are observed. The patient is started on a liquid diet the second postoperative day and advanced to a general diet on the third. Pain control is instituted with parenteral and oral medications. The chest tubes are removed one at a time over a two to three day period usually starting on the third or fourth postoperative day.

Following hospital dismissal, the patient is seen in an office setting within the next week and then monthly thereafter for 3 months, during which time the incision site, chest, cardiac function, and hemodynamic status are evaluated. Skin sutures are removed at the first office visit. Questions by both patient and family are answered.

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>RVW</u>
1)	33860	Ascending aorta graft, with cardiopulmonary bypass, with or without valve suspension	31.23
2)	33412	Replacement, aortic valve; with transventricular aortic annulus enlargement (Konno procedure)	32.26

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

The code under review is quite similar in work effort, intensity, and fundamental nature to 33860. Both involved graft repairs of the aorta, using similar operative techniques. The fact that the survey came up with a suggested RVW for 33875 that is the same as the reference code further reinforces this. The effort involved in 33412, the other reference code is also quite similar. This aortic valve replacement with aortic annulus enlargement is slightly more difficult because of the need to enlarge the aortic annulus to replace the valve.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill & physical effort; mental effort and judgement; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

This is a difficult operative procedure where the patient must be managed under both hypothermia and cardiopulmonary bypass. Our survey indicates that patients have become older, sicker, and more complex in the past 10 years. There is great intensity involved in the procedure because of the danger of further aortic dissection and heavy bleeding. Survey results which valued this procedure so closely to the ascending arch repair testify to the fact that this procedure has been undervalued. In addition, when this code was first established, the descriptor indicated that it could be done with or without cardiopulmonary bypass. The technology and the patient mix have changed to the point where now this procedure is virtually always done on cardiopulmonary bypass, thus increasing the overall work involved.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35081 **Global Period:** 090 **1995 RVW:** 22.15 **Recommended RVW:** 28.50

CPT Descriptor: Direct repair of aneurysm or excision (partial or total) and graft insertion for aneurysm, false aneurysm, and associated occlusive disease, abdominal aorta

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures. Accurate intraoperative (skin-to-skin) surgery times of commonly performed vascular and non-vascular procedures were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study identified the intra-service work of code 35081 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. This comparison of intra-service work formed the basis for choosing 35081 to be surveyed for all aspects of work in the five year review.

1994 Frequency of Service: 16,818

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71 year old hypertensive asymptomatic 5'10" male weighing 95 kilograms with a history of a myocardial infarction and a 50 pack-year history of smoking has a 6.5 cm infrarenal abdominal aortic aneurysm by ultrasound. Extensive pre-op work-up is done. Appropriate invasive monitoring is done with insertion of a Swan-Ganz catheter, arterial line, Foley catheter, NG tube and sequential compression devices applied. Standard aortic aneurysmectomy with a tube graft is performed. The patient is in the ICU on a ventilator for 48 hours postoperatively and requires real-time hemodynamic monitoring, close monitoring of urinary output, diuretic support, and fluid management. The patient is transferred to the floor after 72 hours. The remainder of his postoperative course is uneventful and he is discharged to home on the 10th postoperative day.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before surgery until the time of the procedure. This work includes review of hospital admission workup with special attention to cardiopulmonary and hematologic status; review of CT scans, ultrasound studies, arteriograms, and laboratory tests; communication with referring physician, cardiologist, anesthesiologist and other health care professionals as necessary; review of indications, risks and benefits of surgery with patient and family; signature of informed consent; and preview of expected hospital course, pain management, discharge plans etc. with patient and family. Pre-service work also includes changing into OR scrubs, hand scrubbing, and waiting for surgery: supervision of positioning, skin preparation, and draping of the patient; and insuring that surgical instruments and necessary supplies are present and available in the operative suite. Surgical presence is also required as the anesthesiology team proceeds with lumbar epidural catheter placement and testing, insertion of a Swan-Ganz catheter, insertion of arterial pressure line, and induction of general endotracheal anesthesia.

Description of Intra-Service work: The abdomen is incised from the xiphoid to the pubis, the peritoneal cavity is opened, and general exploration is made for the presence of tumors, gall bladder abnormalities, adhesions, and correct positioning of the NG tube. The intestines are reflected to the right upper quadrant of the abdominal cavity. A self-retaining retractor system is connected to the operating table and appropriate blades are placed to achieve exposure of the aorta. The retroperitoneum and ligament of Treitz are incised, and the duodenum is reflected away from the aorta. The aneurysm is exposed proximally until normal aortic tissue is encountered at the level of the left renal vein. The renal vein is mobilized carefully, and the aorta at this level is mobilized sufficiently to prepare for its subsequent division. The upper portion of the aneurysm is inspected to insure that no unsuspected accessory renal arteries arise from its surface, and the inferior mesenteric artery, which arises from the body of the aneurysm, is identified and inspected for patency. The common iliac arteries are exposed to allow occlusion during aneurysm repair. Special attention is paid to avoid injury to the nearby ureters and iliac veins.

others, found in the vascular patient. The vignette patient, having had a previous myocardial infarction, is a true representative of the aortic aneurysm cohort. Preparation time in the OR is similar for 35081 and 47130. Both require full hemodynamic monitoring typically associated with operations which may induce physiologic instability. Thus, pre-service work of 107.5 minutes for 35081 is 28.5 minutes (36%) greater than 47130. The median survey intra-service time of 202.5 min. for 35081 is 29.5 min., or 12.7% less than the 232 min. intra-service time of 47130. Median post-service time on the day of surgery for 35081 of 60 min. is 20 min. more than the 40 min. same day post-service for 47130. Both codes have 4 ICU visits with a total of 60 min. (The Harvard / RUC summary suggests there are 4 x 10 minute visits for 47130, but the survey suggests 4 x 15 min visits. We used the higher value, giving any potential bias to the reference code) 35081 has 7 post-ICU hospital visits consuming 90 minutes while 47130 has 11 hospital visits requiring 110 minutes. 35081 has 2 x 20 minute post-discharge office visits while 47130 has 4.5 x 15 minute office visits. Overall, 35081 has 250 minutes of post-operative care in the global period compared to 278 minutes of post-service time for 47130. Thus, 35081 has 10% less post-service time than the comparison service.

Intensity Comparison to 47130: The mental effort and judgment, technical skill and physical effort, and psychological stress involved in 35081 is similar to that of 47130. Both procedures lie in the upper spectrum of surgical skill and effort for surgeons in general. For those whose practices are not focused on liver or aneurysm surgery, both procedures can be very taxing and fraught with challenges. For surgeons who specialize in hepatic or vascular surgery, these 2 procedures are considered challenging but not extraordinary. Both operations usually proceed without undue cardiovascular instability, but truly complex intraoperative situations, such as massive hemorrhage, does occur with with a low but real frequency.

Summary of comparison to 47130: 35081 has 36% more pre-service work, 12.7% less intra-service work, and 10% less post-service work than 47130. The 1995 work value for 47130 is 31.56 units. Sixty percent of the total work for this service is intra-service work, making the intraservice component 18.94 work units and the pre+post-service work 12.62 units. Pre-service work represents approximately 22% of the sum of pre and post service work for this service. Since 35081 has 36% more pre-service work and pre-service work is 22% of pre+post, then 35081 has 3.78 pre-service work units ($12.62 * 0.22 * 1.36$). Assuming 35081 has 12.7% less intra-service work, the relative intraservice work would be 16.53 units ($18.94 * 0.873$). Since 35081 has 10% less post-service work, the relative post-service work is 8.86 units ($12.62 * 0.78 * 0.90$). Thus, the total work for 35081 is the sum of 3.78 pre-service units, plus 16.53 intra-service units, plus 8.86 post-service units, or **29.17 units**.

Comparison to E/M Codes: The work of 35081 may be calculated as the sum of the following E/M services, using intensive care codes as the best comparison to the complex intra-service work involved in aortic aneurysm repair:

<u>Service</u>	<u>Time</u>	<u>E/M Code</u>	<u>RVW</u>
Pre-service	107.5	99215	1.51
Intra-service	202.5	99291 + 99292 x 5	12.84
Day of proc, post-op	60	99291	3.64
POD #1 ICU	30	99291	3.64
POD#2 ICU	15	99233	1.25
POD#3 ICU	15	99233	1.25
POD #4,5	15	99232 x 2	1.76
POD #6-9	10	99231 x 4	2.04
POD #10 Disch	20	99238	1.06
Office x2	40	99213	1.10
Total:			30.09

Thus, by using an E/M reference service building-block method the work of 35081 should be **30.09 units**.

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work; time; technical skill; and physical effort; mental effort; and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research

The recommended increase in RVW is based upon improvements in the accuracy of existing Harvard work, time, and intensity data for this code.

1. **Work:** The Harvard work value was originally estimated at 21.31 units by a panel without substantial participation by vascular surgeons. The RVW was increased by 4% in 1992 to 22.15 units, and no further adjustments have been made since then. The current survey suggests that the work value should be 28 units (median value), and even the 25th percentile survey RVW of 25 units is 13% greater than the current 1995 work value. The median survey value is justified by the detailed comparison to the key reference service which suggested a value of 29.17 units, and by the E/M building-block calculation of 30.09 units. In addition, the work survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report) suggests a work value of 29.49 for this service.
2. **Time:** Based on the survey data, the Harvard data underestimate all 3 time segments. The Harvard pre-service time for this procedure is 67.5 minutes, while the survey respondents' median pre-service time is 107.5. The Harvard intra-service time is 167 minutes, while the survey median intra-service time is 202.5 minutes. Our survey also requested that physicians report the actual times for their last three procedures. The mean value for those procedures was 192 minutes and the median was 185 minutes. As another measure of intra-service time, the survey requested respondents to supply actual time data for their hospitals, and the volume weighted mean of these institutions median time was 202 minutes. Finally, the SVS 10 hospital OR data analysis determined a median intra-service time of 230 minutes for a sample of 297 operations. These times are summarized in Table 2. Considered together, they suggest the best estimate of intra-service time for 35081 is 200-210 minutes, 30 to 40 minutes more than the current Harvard estimate. Finally, post-service time according to existing Harvard data is 203.5 minutes, while survey respondents' median time was 250 minutes.
3. **Intensity:** Intensity of most arterial reconstructive vascular procedures is quite high due to potential for intraoperative catastrophe such as major hemorrhage, and due to potential for major postoperative complications such as myocardial infarction. The intensity of 35081 was rated as having a median mental effort value of 4, median technical skill value of 4, and median psychological stress value of 4. While intensity is difficult to evaluate quantitatively, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. In contrast to the high intensity judged by the survey respondents, the IWPUT for 35081 in 1995 is 0.056 when calculated using the 1995 RVW and the accurate intra-service times from our SVS 10-hospital OR data analysis (Table 1). Likewise, RUC/Harvard IWPUT for this operation is only 0.074 according to the Summary of work and time estimates for services undergoing investigation (AMA RUC 6/8/95). This is less than that for TURP (0.120), cataract removal (0.110), total knee arthroplasty (0.084), and several other common services (Table 1). If 35081 is recalculated using the median IWPUT from the SVS study (0.082), a more accurate reflection of intra-service intensity is reached. By this technique, intra-work is $202.5 \times 0.082 = 16.61$ units. Since intra-work represents 0.54 of total work per the current survey, the total work is $16.61 / 0.54 = 30.76$ units (see Appendix for an expanded discussion). Thus, by adjusting the intensity of intra-service work to a more reasonable level, 35081 merits work value of 30.76 units.
4. **Summary:** Five different analyses suggest work values from 28.00 to 30.76 for this service:
 1. Median survey value is 28.
 2. Comparison to reference code 47130 suggests a work value of 29.17.
 3. The E/M building block method resulted in an estimate of 30.09.
 4. The American College of Surgeons survey suggested 29.49.
 5. The IWPUT method justified an RVW of 30.76.

Although our original letter of comment requested an RVW for 35081 of 32.10 units, the survey instrument and 4 different justification methods all suggest a slightly lower work value. After careful review of the survey results and 4 supplemental work analyses for 35081, we recommend an RVW of 28.50.

APPENDIX: IWPUT Method for work calculation of 35081

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.050 to 0.120 in the SVS Operative Log Data Analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 is 0.082.
4. The performance of 35081 with its attendant risks of hemorrhage and cardiac complications should merit at least the median level of intra-service work per unit time. The survey intensity ratings would actually support more than a median IWPUT level.
5. The survey intra-service median time for 35081 of 202.5 minutes is substantiated by our original OR log data analysis (230 min), and by the Hospital log data requested as additional information during the survey (202 min). In fact, these data would suggest that 202.5 is a conservative (low) number.
6. The intra-service work for 35081 should equal the operative time multiplied by the median surgical IWPUT, or $202.5 \times 0.082 = 16.61$
7. The pre and post-service work for 35081 are at least typical of the average operation of large magnitude, in that patients presenting for this operation commonly suffer from symptomatic coronary artery disease, hypertension, diabetes, hyperlipidemia, obesity, and COPD.
8. The RUC survey data indicates that intra-service work represents 0.54 of total work. In other words, total work = intra-work / 0.54.
9. The total work of 35081, based on a median IWPUT value, should be $16.61 / 0.54 = 30.76$

With distal dissection completed, graft placement begins. Heparin is administered intravenously to prevent intra-arterial thrombosis during the aortic cross-clamp interval. The proximal aorta and common iliac arteries are occluded with large vascular clamps, and the aneurysm is opened. Control of back-bleeding lumbar arteries is achieved by oversewing their orifices. The inferior mesenteric artery origin is oversewn or clamped for later reimplantation. An appropriately sized prosthetic tube graft is sewn circumferentially to the normal aorta just inferior to the renal arteries. The graft is clamped just below the suture line, and the proximal aortic cross-clamp is removed slowly to check for suture line leaks. These are corrected with individual or pledgeted sutures. The distal aorta is then transected. The synthetic graft is cut to appropriate length and sutured to the distal aorta. Clamps are removed very slowly to avoid hemodynamic instability caused by the sudden restoration of flow to the lower extremities. The distal anastomosis is inspected for hemostasis, and bleeding sites are sutured. The large intestine is examined for evidence of ischemia which would necessitate implantation of the inferior mesenteric artery onto the graft. Femoral pulses are palpated to insure blood flow through the graft and iliac arteries. When the surgeon is satisfied with the technical aspects of graft placement, intravenous protamine is administered to reverse the anticoagulation. The aneurysm wall and the retroperitoneum are closed to provide a protective tissue plane between the duodenum and the synthetic graft. The intestines are returned to the abdominal cavity, and a final exploration is made searching for evidence of visceral damage or retained sponges. The abdominal wall is closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile dressings, checking the extremities for pulses, transfer of the patient and monitoring equipment to a stretcher, and patient transport to the recovery unit or ICU. Postoperative orders are written, and hemodynamic stabilization is initiated. The extensive retroperitoneal dissection involved in aneurysm repair creates a large "third space" demand for blood and fluid volume replacement which must be treated aggressively on an individualized basis to avoid hypotension. Immediate post-service work also includes monitoring of blood gases, electrolytes, hemoglobin, and coagulation parameters with appropriate therapy as required. Pre-existing cardiac comorbidity usually necessitates some combination of intravenous nitroglycerine, beta-blockers, and/or pressors. As the patient rewarms and vasodilates, further individualized fluid management is required. Pulmonary comorbidity necessitates special attention to ventilator management and post-extubation respiratory therapy. Intravenous diuretics are almost always needed later in the ICU course. Post-service work also includes communication with the patient, family and health care professionals with ongoing written and telephone reports and orders. Post-ICU care focuses on assisted return to cardiopulmonary, gastrointestinal and hemodynamic homeostasis; ordering and reviewing post-operative radiographs and laboratory studies; monitoring and care of the incision; removal of all tubes and drains; antibiotics and pain management, and discharge planning. Discharge day management includes the surgeon's final examination of the patient, discussion of the likely post-hospital events, instructions for continuing care, preparation of discharge records, and communication with the referring physician and home-health agencies. Additionally, all post-discharge office visits for 90 days are part of the post-operative work for this procedure. This includes removal of sutures, wound checks, pain medication adjustments and renewal, and interpretation of imaging and laboratory tests obtained to evaluate the typical spectrum of postoperative problems.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35082 **Global Period:** 090 **1995 RVW:** 28.82 **Recommended RVW:** 37.00

CPT Descriptor: Direct repair of aneurysm or excision (partial or total) and graft insertion for aneurysm, false aneurysm, and associated occlusive disease, for ruptured aneurysm, abdominal aorta

Source and Summary of Comment to HCFA on this service: Reevaluation of this relatively uncommon code was requested by the American Society of General Surgery (ASGS). Since the code is primarily a vascular surgery code, and since the Society for Vascular Surgery (SVS) and International Society for Cardiovascular Surgery (ISCVS) agree that the code is undervalued, the SVS/ISCVS responded at "level 1" on the Level of Interest Forms. However, we felt that surveying this code would be unproductive based on the low frequency. We chose instead to offer logical argument for the recommended RVW based on a relationship to the two more common aortic aneurysm codes that were surveyed by our societies.

1994 Frequency of Service: 4,149

CLINICAL DESCRIPTION OF SERVICE:

Vignette: No survey vignette was generated for 35082. However, a typical vignette would describe an elderly patient presenting to the Emergency Department with intense abdominal pain, hypotension, and a pulsatile abdominal mass. He would be taken immediately to the operating room where emergent repair of the aneurysm would be undertaken. His postoperative course would be far more complicated than that of an elective aortic aneurysm repair, oftentimes requiring prolonged mechanical ventilation and hemodialysis.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before surgery until the time of the procedure. For a ruptured aortic aneurysm this work includes a full-speed-ahead abbreviated history and physical exam, blood drawing, an ECG, possibly an aortic ultrasound in the ED or an emergent CT scan (these only if the patient is hemodynamically stable and there is some question about the diagnosis), a rapid explanation of the diagnosis, indication for surgery and risks with the patient and/or family, and emergent transport to the OR.

Description of Intra-Service work: If the patient is severely hypotensive, a full midline incision is made with minimal preparation, simultaneous with the induction of general anesthesia and the placement of several large bore IV catheters. For patients with more stable vital signs, these steps are undertaken rapidly, but at a slightly less frantic pace. Upon entering the abdomen, the left lobe of the liver is rapidly mobilized, the aorta is identified and cleared of surrounding soft tissue at the level of the diaphragm, and a cross-clamp is placed. The retroperitoneal hematoma around the ruptured aneurysm is entered and the proximal and distal infrarenal aorta are rapidly dissected. Distal control is obtained, and backbleeding lumbar arteries are sewn closed. The aortic prosthesis is sewn in place, clamps are removed, and the suture lines are inspected for hemostasis. Since these patients have frequently bled most of their circulating volume into the retroperitoneum, attention must be paid rapidly to correction of consumptive coagulopathy. The abdomen is closed, and the patient transferred to the ICU for ongoing resuscitation.

Description of Post-Service work: Post-service work for the ruptured aortic aneurysm is vastly more complex than that for elective aneurysm repair. Patients are hypothermic, coagulopathic, acutely anemic, and usually hemodynamically unstable. Most are treated with combinations of intravenous vasoactive agents. A multitude of problems can demand simultaneous attention. The surgeon's continued presence at the bedside is mandatory until some degree of hemodynamic stability is achieved. The postoperative ICU stay is, on average, much longer for the ruptured aneurysm patient, with a higher degree of acuity. Many patients have prolonged ventilator dependence and acute renal failure, and some develop ischemic colitis. Those that survive often spend weeks in the ICU, but in fact, those that don't survive often spend more time in an ICU bed. Once the patients leave the unit, their in-hospital recovery and outpatient recovery times are also prolonged.

SURVEY DATA: Code not surveyed**RATIONALE:**

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work; time; technical skill; and physical effort; mental effort; and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research

This relatively uncommon service is difficult to evaluate. Patients who suffer a ruptured aortic aneurysm demand instantaneous and complete attention of the surgeon, anesthesiologist, and all support staff, if the patient's life is to be saved. All ongoing activity must be interrupted in order to deal with this problem. In the finest medical centers the mortality of ruptured aortic aneurysms approaches 50%. While a few patients die rapidly in the operating room, more commonly they survive operation and are transferred to the ICU where they consume huge resource expenditures until ultimate recovery or death.

1. **Work:** The original Harvard value of 28.92 for 35082 has actually decreased over 5 years to the current value of 28.82. The 1995 RVW is 28.82, and that for elective repair of an infrarenal aneurysm is 22.15, with the ratio of ruptured to elective being $28.82 / 22.15 = 1.30$. This is a reasonable ratio based on an increased intraoperative and post-operative work. The recommended RVW for 35081 is 28.00 units, and the proportional increase for 35082 may be calculated as $28.00 \times 1.3 = 36.40$ units. Another estimate of work for 35082 is provided in the survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report). That survey recommended a work value of 37.47.

2. **Time:** The Harvard / RUC database pre-service time of 85 minutes (42 minutes prior to OR entry and 43 minutes immediately pre) is less than the survey median pre-service time for elective aneurysm of 107.5 minutes, but is probably a decent estimate for this emergent situation. The intra-time of 226 minutes is essentially equal to the 200-210 minutes we determined as the most accurate estimate of intra-service time for elective repair of an infrarenal AAA. However, the Harvard / RUC post-service time of 256 minutes is equal to the survey respondents median post-service time for elective repair of an aortic aneurysm, and is certain to be a major underestimate. Thus, we interpret pre- and intra-service time to be accurate estimates, but post-service time is far too low.

3. **Intensity:** There is virtually no other medical service who's pre-, intra-, and post-service intensity equals that of the repair of a ruptured aortic aneurysm. The patient arrives in the ED, critically ill, and a diagnosis must be established immediately. All other ongoing clinical activity must cease to care for the patient with this problem. The surgeon must maintain order in what could otherwise be a chaotic situation in the operating suite as the hypotensive patient is readied for emergent surgery, and that surgeon must be technically astute to repair a ruptured aortic aneurysm successfully. Post-operative care is most analogous to an ongoing resuscitation in the intensive care unit, and the usual prolonged ICU recovery requires the attention of an astute clinician. While intensity is difficult to evaluate quantitatively, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The Harvard/RUC IWPUT for repair of a ruptured aortic aneurysm is 0.074, substantially less than that for TURP (0.120), cataract removal (0.110), total knee arthroplasty (0.084), and several other common services (Table 1). If 35082 is recalculated using a more realistic IWPUT of 0.09 and the Harvard/RUC intra-service time of 226, a more appropriate value of work for 35082 is obtained, at 37.67 (see appendix for an expanded discussion).

4. **Summary:** Three different analyses suggest work values from 36.40 to 37.67 for this service:

1. Constant proportion to infrarenal aortic aneurysm repair (35081) is 36.40.
2. The American College of Surgeons survey suggested 37.47.
3. The IWPUT method justifies an RVW of 37.67.

The original letter of comment from the American Society of General Surgeons recommended an RVW for 35082 of 37.35. After careful review of the 3 methods of analysis for 35082, we recommend an RVW of 37.00.

APPENDIX: IWPUT Method for work calculation for 35082

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.050 to 0.120 in the SVS Operative Log Data Analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 is 0.082.
4. The performance of 35082 with its attendant risks of immediate death from massive hemorrhage and should merit the highest reasonable IWPUT, perhaps 0.09.
5. The Harvard / RUC intra-service time for 35082 of 226 minutes is substantiated by analogy to elective repair of an infrarenal abdominal aortic aneurysm (35081) where accurate data documents an intra-service time of 200-210 min.
6. The intra-service work for 35082 should equal the operative time multiplied by the IWPUT, or $226 \times 0.090 = 20.34$
7. The pre and post-service work for 35082 are at least typical of the elective operation (35081)
8. The RUC survey data indicates that intra-service work for the elective aortic aneurysm repair represents 0.54 of total work, and this will be a conservative estimate for that of emergent repair. In other words, total work = intra-work / 0.54.
9. The total work of 35082, based on an IWPUT of 0.09, should be $20.34 / 0.54 = 37.67$

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35091 **Global Period:** 090 **1995 RVW:** 28.10 **Recommended RVW:** 36.50

CPT Descriptor: Direct repair of aneurysm or excision (partial or total) and graft insertion for aneurysm, false aneurysm, and associated occlusive disease, for abdominal aorta involving visceral vessels (mesenteric, celiac, renal)

Source and Summary of Comment to HCFA on this service: Reevaluation of this relatively uncommon code was requested by the American Society of General Surgery (ASGS). Since the code is primarily a vascular surgery code, and since the Society for Vascular Surgery (SVS) and International Society for Cardiovascular Surgery (ISCVS) agree that the code is undervalued, the SVS/ISCVS responded at "level 1" on the Level of Interest Forms. However, we felt that surveying this code would be unproductive based on the low frequency. We chose instead to offer logical argument for the recommended RVW based on a relationship to the two more common aortic aneurysm codes that were surveyed by our societies.

1994 Frequency of Service: 1,780

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: No survey was performed for this service. However, a typical vignette would be the following: A 71 year old hypertensive asymptomatic 5'10" male weighing 95 kilograms with a history of a myocardial infarction and a 50 pack-year history of smoking has a 6.5 cm abdominal aortic aneurysm which was diagnosed by ultrasound. Extensive pre-op work-up is done, including a CT scan which reveals that the aneurysm extends proximally to the level of the superior mesenteric artery. An arteriogram is performed to detail the upper aortic arterial anatomy. Pre-operative invasive monitoring includes insertion of a Swan-Ganz catheter, arterial line, Foley catheter, NG tube and sequential compression devices applied. The operation is performed through a thoracoretroperitoneal incision with separate reimplantation of the left renal artery. The patient is in the ICU on a ventilator for 48 hours postoperatively and requires real-time hemodynamic monitoring, close monitoring of urinary output, diuretic support, and fluid management. The patient is transferred to the floor after 72 hours. The remainder of his postoperative course is uneventful and he is discharged to home on the 10th postoperative day.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before surgery until the time of the procedure. This work includes review of hospital admission workup with special attention to cardiopulmonary and hematologic status; review of CT scans, ultrasound studies, arteriograms, and laboratory tests; communication with referring physician, cardiologist, anesthesiologist and other health care professionals as necessary; review of indications, risks and benefits of surgery with patient and family; signature of informed consent, and preview of expected hospital course, pain management, discharge plans etc. with patient and family. Pre-service work also includes changing into OR scrubs, hand washing, and waiting for surgery; supervision of positioning, skin preparation, and draping of the patient; and ensuring that surgical instruments and necessary supplies are present and available in the operative suite. Surgical presence is also required as the anesthesiology team proceeds with lumbar epidural catheter placement and testing, insertion of a Swan-Ganz catheter, insertion of arterial pressure line, and induction of general endotracheal anesthesia.

Description of Intra-Service work: (note: This operation differs from 35081 and 35102 in that more dissection is required in the upper abdomen, and transection of the diaphragm with entry into the chest is commonly required for proximal control. Depending on the particular case, one or more additional arterial anastomoses must be completed.) Skin incision is usually through a thoracoretroperitoneal approach which requires special positioning with the patient lying with his right side down and his left arm extended. The aorta is dissected free of attachments proximally until a segment of non-aneurysmal vessel is reached, and the diaphragm is often divided to accomplish this proximal exposure. The mesenteric and renal vessels are identified to avoid injury. The distal aortic exposure is completed as in the other aortic aneurysm operations. The patient is heparinized, and proximal and distal aortic clamps applied. The aneurysm is entered, and control of backbleeding vessels is achieved. Cold electrolyte solution is infused in the renal artery orifices to

minimize ischemic insult. The proximal aortic anastomosis is sewn rapidly to minimize visceral ischemic time. Mesenteric and renal arteries are sewn to the prosthesis as required, and reperfusion of these organs is accomplished as quickly as possible. The aortic cross-clamp is moved onto the body of the prosthesis allowing reperfusion of the viscera, and the distal aortic anastomosis is completed. The cross-clamp is released slowly to avoid hypotension related to rapid reperfusion of ischemic limbs. Anastomoses are checked for hemostasis which is secured with individual or pledgeted sutures. Femoral pulses are palpated to insure blood flow through and beyond the aortic prosthesis. Heparin anticoagulation is reversed with protamine. Abdominal closure is accomplished in three layers. Since there is no separate CPT code for an aneurysm which involves the visceral arteries and also extends into the iliac vessels, any extra work associated with distal extent of this aneurysm into the iliac arteries is also included in this code.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile dressings, checking the extremities for pulses, transfer of the patient and monitoring equipment to a stretcher, and patient transport to the ICU. Postoperative orders are written, and hemodynamic stabilization is initiated. The extensive retroperitoneal dissection involved in aneurysm repair creates a large "third space" demand for blood and fluid volume replacement which must be treated aggressively on an individualized basis to avoid hypotension. Immediate post-service work also includes monitoring of blood gases, electrolytes, hemoglobin, and coagulation parameters with appropriate therapy as required. Pre-existing cardiac comorbidity necessitates some combination of intravenous nitroglycerine, beta-blockers, and/or pressors. As the patient rewarms and vasodilates, further individualized fluid management is required. Pulmonary comorbidity necessitates special attention to ventilator management and post-extubation respiratory therapy. Intravenous diuretics are almost always needed later in the ICU course. Post-service work also includes communication with the patient, family, and health care professionals with ongoing written and telephone reports and orders. Post-ICU care focuses on assisted return to cardiopulmonary, gastrointestinal and hemodynamic homeostasis; ordering and reviewing post-operative radiographs and laboratory studies; monitoring and care of the incision; removal of all tubes and drains; antibiotics and pain management, and discharge planning. Discharge day management includes the surgeon's final examination of the patient, discussion of the likely post-hospital events, instructions for continuing care, preparation of discharge records, and communication with the referring physician and home-health agencies. Additionally, all post-discharge office visits for 90 days are part of the post-operative work for this procedure. This includes removal of sutures, wound checks, pain medication adjustments and renewal, and interpretation of imaging and laboratory tests obtained to evaluate the typical spectrum of postoperative problems.

SURVEY DATA: Code not surveyed

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work; time; technical skill; and physical effort; mental effort; and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research

The recommended increase in RVW for 35091 is based upon maintenance of the relative work of this service among the other aortic aneurysm repair codes in this family.

The relatively uncommon service includes both those aortic aneurysm repairs which terminate at the distal aorta and those which extend into the iliac arteries. Patients with this diagnosis are usually referred to tertiary care centers where their operations are performed by teams of surgeons and anesthesiologists with special training and experience in the repair of supra-renal aortic aneurysms. The risk of perioperative renal failure, mesenteric ischemia, spinal cord ischemia, and cardiac complications is substantially increased when aneurysmal degeneration involves the visceral

segment of the abdominal aorta. The original RVW for this service was 24.60, and it increased in 1993 to 28.10. No further changes in RVW have taken place.

1. **Work:** The 1995 RVW for 35091 is 28.10, and that for elective repair of an infrarenal aneurysm (35081) is 22.15, with the ratio of 35091 to 35081 being $28.10 / 22.15 = 1.27$. Based on the significant extra work involved in 35091, our societies estimate this ratio as being too low, but one method to compute a proportional RVW for 35091 is to multiply the recommended RVW for 35081 (28.00 units) by 1.27. Thus, a proportional increase for 35091 is $28.10 \times 1.27 = 35.69$. Another estimate of work for 35091 is provided in the survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report). That survey recommended a work value of 36.53.

2. **Time:** The Harvard / RUC database pre-service time of 93 minutes (53 minutes prior to OR entry and 40 minutes immediately pre) is less than the survey median pre-service time for elective infrarenal aneurysm repair of 107.5 minutes. This probably is an underestimate based on the extensive pre-operative workup and extra pre-operative positioning required for this procedure. The Harvard / RUC intra-time of 249 minutes is essentially equal to the 240 minute median survey time for 35102 (repair of infrarenal AAA with bifurcated graft), a significantly less involved aortic operation. Finally, the Harvard / RUC post-service time of 255 minutes is 5 minutes more than that for 35081 or 35102. We judge this to be accurate or slightly low. Thus, we interpret the existing Harvard / RUC pre- and intra-service times to be underestimates, and post-service time to be slightly low or accurate. Considered together, the current time data for 35091 is almost certainly too low.

3. **Intensity:** Intensity of most arterial reconstructive vascular procedures is quite high due to potential for intraoperative catastrophe such as major hemorrhage, and due to potential for major postoperative complications such as myocardial infarction. The intensity of 35091 is greater than that for repair of infrarenal aortic aneurysms (35081, 35012) due to the requirement for dissection at and above the origins of the visceral vessels, the need for rapid and effective arterial anastomotic technique to minimize the risk of visceral ischemia, and the increased risk of post-operative renal failure, mesenteric ischemia, and spinal cord ischemia. While intensity is difficult to evaluate quantitatively, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 35091 in the Harvard / RUC database is only 0.058 (Summary of work and time estimates for services undergoing investigation, AMA RUC 6/8/95). This is less than that for TURP (0.120), cataract removal (0.110), total knee arthroplasty (0.084), and several other common services (Table 1). If 35091 is recalculated using the median IWPUT from the SVS study (0.082), and the Harvard / RUC intra-service time (249 min), a more accurate reflection of intra-service intensity is reached. By this technique, intra-work is $249 \times 0.082 = 20.42$ units. Since intra-work represents 0.51 of total work according to the Harvard / RUC data, the total work is $20.42 / 0.51 = 40.04$ units (see Appendix for an expanded discussion). Thus, by adjusting the intensity of intra-service work to a more reasonable level, 35091 merits a work value of 40.04.

4. **Summary:** Three different analyses suggest work values from 35.69 to 40.04 for this service:

1. Constant proportion to infrarenal aortic aneurysm repair (35081) is 35.69.
2. The American College of Surgeons survey suggested 36.53.
3. The IWPUT method justifies an RVW of 40.04.

The original letter of comment from the American Society of General Surgeons recommended an RVW for 35091 of 29.61 units. However, three different methods suggest a higher work value is justified. Thus, we recommend for CPT 35091 an RVW of 36.50.

APPENDIX: IWPUT Method for work calculation for 35091

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.050 to 0.120 in the SVS Operative Log Data Analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 was 0.082.
4. The performance of 35091 with its attendant risks of hemorrhage, renal failure, and cardiac complications should merit at least the median level of intra-service work per unit time.
5. The Harvard / RUC intra-service time for 35091 of 249 minutes is substantiated by our accurate value of 200-210 minutes for 35081, and a firm estimate of 240-250 minutes for 35102. In fact, these data would suggest that 249 may lie on the low end of the true range.
6. The intra-service work for 35091 should equal the operative time multiplied by the median surgical IWPUT, or $249 \times 0.082 = 20.42$.
7. The pre and post-service work for 35091 are at least that of 35081 and 35102, in that patients presenting for this operation commonly suffer from symptomatic coronary artery disease, hypertension, diabetes, hyperlipidemia, obesity, and COPD. In addition, patients undergoing 35091 are more likely to suffer severe post-operative complications of renal failure, mesenteric ischemia, and spinal cord ischemia.
8. The Harvard / RUC data indicates that intra-service work represents 0.51 of total work (14.32/28.10). In other words, total work = intra-work / 0.51.
9. The total work for 35091, based on the median IWPUT is $20.42 / 0.51 = 40.04$.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35102 Global Period: 090 1995 RVW: 23.44 Recommended RVW: 31.50

CPT Descriptor: Direct repair of aneurysm or excision (partial or total) and graft insertion for aneurysm, false aneurysm, and associated occlusive disease, for abdominal aorta involving iliac vessels (common, hypogastric, external)

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures. Accurate intraoperative (skin-to-skin) surgery times of commonly performed vascular and non-vascular procedures were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study identified the intra-service work of code 35102 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. This comparison of intra-service work formed the basis for choosing 35102 to be surveyed for all aspects of work in the five year review.

1994 Frequency of Service: 8,816

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71 year old hypertensive asymptomatic 5'10" male weighing 95 kilograms with a history of a myocardial infarction and a 50 pack-year history of smoking has a 6.5 cm infrarenal abdominal aortic aneurysm by ultrasound. Extensive pre-op work-up is done. Appropriate invasive monitoring is done with insertion of a Swan-Ganz catheter, arterial line, Foley catheter, NG tube and sequential compression devices applied. Standard aortic aneurysmectomy with a tube graft is performed. The patient is in the ICU on a ventilator for 48 hours postoperatively and requires real-time hemodynamic monitoring, close monitoring of urinary output, diuretic support, and fluid management. The patient is transferred to the floor after 72 hours. The remainder of his postoperative course is uneventful and he is discharged to home on the 10th postoperative day.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before surgery until the time of the procedure. This work includes review of hospital admission workup with special attention to cardiopulmonary and hematologic status; review of CT scans, ultrasound studies, arteriograms, and laboratory tests; communication with referring physician, cardiologist, anesthesiologist and other health care professionals as necessary; review of indications, risks and benefits of surgery with patient and family; signature of informed consent; and preview of expected hospital course, pain management, discharge plans etc. with patient and family. Pre-service work also includes changing into OR scrubs, hand scrubbing, and waiting for surgery; supervision of positioning, skin preparation, and draping of the patient; and insuring that surgical instruments and necessary supplies are present and available in the operative suite. Surgical presence is also required as the anesthesiology team proceeds with lumbar epidural catheter placement and testing, insertion of a Swan-Ganz catheter, insertion of arterial pressure line, and induction of general endotracheal anesthesia.

Description of Intra-Service work: (note: This operation differs from 35081 in that more dissection is required in the pelvis, and one more arterial anastomosis must be completed.) The abdomen is incised from the xiphoid to the pubis, the peritoneal cavity is opened, and general exploration is made for the presence of tumors, gall bladder abnormalities, adhesions, and correct positioning of the NG tube. The intestines are reflected to the right upper quadrant of the abdominal cavity. A self-retaining retractor is connected to the operating table and appropriate blades are placed to achieve exposure of the aorta. The retroperitoneum and ligament of Treitz are incised, and the duodenum is reflected away from the aorta. The aneurysm is exposed proximally until normal aortic tissue is encountered at the level of the left renal vein. The renal vein is mobilized carefully, and the aorta at this level is mobilized sufficiently to prepare for its subsequent division. The upper portion of the aneurysm is inspected to insure that no unsuspected accessory renal arteries arise from its surface, and the inferior mesenteric artery, which arises from the body of the aneurysm, is identified and inspected for patency.

Attention is then turned to the iliac arteries to determine the distal extent of aneurysm involvement. When aneurysmal tissue extends into these vessels, a bifurcated graft must be used such that the graft limbs extend to normal arterial tissue. If normal distal iliac arteries can be reached safely from within the abdomen, distal dissection is carried directly into the pelvis with exposure of the common, external, and internal iliac arteries as required. Special attention is paid to avoiding ureteral and iliac vein injuries during the pelvic dissection since these can be life threatening complications. If the aneurysm extends beyond a region that can be reached safely from the abdominal incision, the iliacs are dissected enough to allow suture ligation distally. Separate incisions are then performed in each groin for exposure of the femoral arteries as target vessels for distal anastomosis. Retroperitoneal tunnels are fashioned to carry the graft limbs from the pelvic inlet, under the inguinal ligament, to the femoral triangle.

With the distal dissection completed, graft placement begins. Heparin is administered intravenously to prevent intra-arterial thrombosis during the aortic cross-clamp interval. The proximal aorta and distal iliacs are occluded with large vascular clamps, and the aneurysm is opened. Control of back-bleeding lumbar arteries is achieved by oversewing their orifices. The inferior mesenteric artery origin is oversewn or clamped for later reimplantation. An appropriately sized bifurcated synthetic graft is sewn circumferentially to the normal proximal aorta just inferior to the renal arteries. The graft is clamped just below the suture line, and the proximal aortic cross-clamp is removed slowly to check for suture line leaks. These are corrected with individual or pledgeted sutures. Attention is directed to the iliac (or femoral) arteries which are prepared for anastomosis of the distal graft limbs. Depending on the site of distal anastomosis, either the common iliac, external plus internal iliac, or the femoral bifurcation arteries are clamped. The target artery is opened. The prosthetic limb is cut to the appropriate length and sutured to the artery. Clamps are removed slowly to avoid hemodynamic instability caused by the sudden restoration of flow to the limb. The suture line is inspected for hemostasis with correction of any leaks. The second iliac (or femoral) artery anastomosis is performed in a similar manner. The large intestine is examined for evidence of ischemia which would necessitate implantation of the inferior mesenteric artery onto the graft. Femoral pulses are palpated to insure blood flow through and beyond the aortic prosthesis. When the surgeon is satisfied with the technical aspects of graft placement, intravenous protamine is administered to reverse the anticoagulation. The aneurysm wall and the retroperitoneum are closed to provide a protective tissue plane between the duodenum and the synthetic graft. The intestines are returned to the abdominal cavity, and a final inspection is made for visceral damage or retained sponges. The abdominal wall is closed in layers. If femoral incisions have been performed, these are closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile dressings, checking the extremities for pulses, transfer of the patient and monitoring equipment to a stretcher, and patient transport to the recovery unit or ICU. Postoperative orders are written, and hemodynamic stabilization is initiated. The extensive retroperitoneal dissection involved in aneurysm repair creates a large "third space" demand for blood and fluid volume replacement which must be treated aggressively on an individualized basis to avoid hypotension. Immediate post-service work also includes monitoring of blood gases, electrolytes, hemoglobin, and coagulation parameters with appropriate therapy as required. Pre-existing cardiac comorbidity usually necessitates some combination of intravenous nitroglycerine, beta-blockers, and/or pressors. As the patient rewarms and vasodilates, further individualized fluid management is required. Pulmonary comorbidity necessitates special attention to ventilator management and post-extubation respiratory therapy. Intravenous diuretics are almost always needed later in the ICU course. Post-service work also includes communication with the patient, family and health care professionals with ongoing written and telephone reports and orders. Post-ICU care focuses on assisted return to cardiopulmonary, gastrointestinal and hemodynamic homeostasis; ordering and reviewing post-operative radiographs and laboratory studies; monitoring and care of the incision(s); removal of all tubes and drains; antibiotics and pain management, and discharge planning. Discharge day management includes the surgeon's final examination of the patient, discussion of the likely post-hospital events, instructions for continuing care, preparation of discharge records, and communication with the referring physician and home-health agencies. Additionally, all post-discharge office visits for 90 days are part of the post-operative work for this procedure. This includes removal of sutures, wound checks, pain medication adjustment and renewal, and interpretation of imaging and laboratory tests obtained to evaluate the typical spectrum of postoperative problems.

SURVEY DATA:**Specialty:** Society for Vascular Surgery (SVS) / International Society for Cardiovascular Surgery (ISCVS)**Sample Size:** 58 **Response Rate:** 69% (40/58) **Median Survey RVW:** 30.74**25th percentile RVW:** 29 **75th percentile RVW:** 35 **Low:** 19.5 **High:** 65**Median Pre-Service Time:** 107.5 **Median Intra-Service Time:** 240**25th Percentile Intra-Svc Time:** 191 **75th Percentile Intra-Svc Time:** 277 **Low:** 120 **High:** 360

Median Post-Service Time:	<u>Total time</u>	<u>Number of Visits</u>
Day of Procedure:	60	
ICU:	60	4
Other Hospital:	90	7
Office:	40	2

KEY REFERENCE SERVICE(S):

	<u>CPT Code</u>	<u>CPT Descriptor</u>	<u>1995 RVW</u>
1.	47130	Hepatectomy, total right lobe	31.56
2.	43631	Gastrectomy, partial, distal; with gastroduodenostomy	18.10

RELATIONSHIP OF CODE UNDER SURVEY TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgement; technical skill & physical effort; and psychological stress) of the service your are rating to the key reference services listed above.

Construction of a reference service table (Table 3) for the 5 year reevaluation survey was difficult for the vascular surgery codes since most of the vascular procedures on the MPC list were submitted for reevaluation. The SVS/ISCVS advisors asked the RUC administrative staff for assistance with this table, and we were referred to Dr. Kwass, chair of the RUC research subcommittee and also chair of the workgroup to which these codes are assigned. The recommendation was to choose reference services from the general surgery codes on the MPC list since 1) all vascular surgeons have completed a full 5 year categorical general surgery residency and are therefore familiar with general surgery cases, and 2) while we are "vascular surgeons" by dint of concentrated training or fellowship programs in vascular surgery, many vascular surgeons have practices which include general surgery cases. Thus, while the reference services are related to the code being surveyed by pre-service work, operative time, intensity, and magnitude of the operation; in addition to post-service work and global periods, the actual operations may be dissimilar.

Comparison to 47130: Pre-service activities for major operations have similar intensities, allowing comparisons of work to be judged on the basis of time. The median pre-service time for 35102 by survey is 107.5 min. while that for 47130 is 79 min. (calculated from "Summary of Work and Time Estimates" provided by the RUC on 6/8/95 as pre (before OR) time of 49 min plus 30 min (1/2 of the 60 min immediate PrePost). The extra preservice time involved in 35102 may be attributed to the greater number of comorbidities, cardiac, pulmonary, and others, found in the vascular patient. The vignette patient, having had a previous myocardial infarction, is a true

representative of the aortic aneurysm cohort. Preparation time in the OR is similar for 35102 and 47130. Both require full hemodynamic monitoring typically associated with operations which may induce physiologic instability. Thus, pre-service work of 107.5 minutes for 35102 is 28.5 minutes (36%) greater than 47130. The median survey intra-service time of 240 min. for 35102 is 8 min., or 3% greater than the 232 min. intra-service time of 47130. Median post-service time on the day of surgery for 35102 of 60 min. is 20 min. more than the 40 min. same day post-service for 47130. Both codes have 4 ICU visits with a total of 60 min. (The Harvard / RUC data suggest that 47130 has 4 x 10 minute ICU visits, but the survey suggests 47130 has 4 x 15 min visits. We used 4 x 15 minutes for 47130, giving any potential bias to the comparison code). 35102 has 7 post-ICU hospital visits consuming 90 minutes while 47130 has 11 hospital visits requiring 110 minutes. 35102 has 2 x 20 minute post-discharge office visits while 47130 has 4.5 x 15 minute office visits. Overall, 35102 has 250 minutes of post-operative care in the global period compared to 278 minutes of post-service time for 47130. Thus, 35102 has 10% less post-service time than the comparison service.

Intensity Comparison to 47130: The mental effort and judgment, technical skill and physical effort, and psychological stress involved in 35102 is similar to or greater than that of 47130. Both procedures lie in the upper spectrum of surgical skill and effort for surgeons in general. For those whose practices are not focused on liver or aneurysm surgery, both procedures can be very taxing and fraught with challenges. For surgeons who specialize in hepatic or vascular surgery, these 2 procedures are considered challenging but not extraordinary. Both operations usually proceed without undue cardiovascular instability, but truly complex intraoperative situations, such as massive hemorrhage, does occur with with a low but real frequency.

Summary of comparison to 47130: 35102 has 36% more pre-service work, 3% more intra-service work, and 10% less post-service work than 47130. The 1995 work value for 47130 is 31.56 units. Sixty percent of the total work for this service is intra-service work, making the intraservice component 18.94 units and the pre+post-service work 12.62 units. Pre-service work represents approximately 22% of the sum of pre and post service work for this service. Assuming 35102 has 36% more pre-service work and pre-service work is 22% of pre + post, then 35102 has 3.78 pre-service work units ($12.62 * 0.22 * 1.36$). Since 35102 has 3% more intraservice work, the relative intraservice work would be 19.51 units ($18.94 * 1.03$). Since 35102 has 10% less post-service work, the relative post-service work is 8.86 units ($12.62 * 0.78 * 0.90$). Thus, by using a step-by-step comparison to 47130, the total work for 35102 should be the sum of 3.78 pre-service units, plus 19.51 intra-service units, plus 8.86 post service units, or **32.15 units**.

Comparison to E/M Codes: The work of 35102 may be calculated as the sum of the following E/M services, using intensive care codes as the best comparison to the complex intra-service work involved in aortic aneurysm repair:

<u>Service</u>	<u>Time</u>	<u>E/M Code</u>	<u>RVW</u>
Pre-service	107.5	99215	1.51
Intra-service	240	99291 + 99292 x 6	14.68
Post-day of proc	60	99291	3.64
POD #1 ICU	30	99291	3.64
POD#2 ICU	15	99233	1.25
POD#3 ICU	15	99233	1.25
POD #4,5	15	99232 x 2	1.76
POD #6-9	10	99231 x 4	2.04
POD #10 Disch	20	99238	1.06
Office x2	40	99213	1.10
Total:			31.93

Thus, by using an E/M reference service building-block method the work of 35102 should be **31.93 units**.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work; time; technical skill; and physical effort; mental effort; and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research

The recommended increase in RVW is based upon improvements in the accuracy of existing Harvard work and intensity data for this code.

1. Work: The Harvard work value was originally estimated at 23.67 units by a panel without substantial participation by vascular surgeons. The RVW was decreased by 4% in 1992 then increased by 3% in 1993 to its current value of 23.44. No further adjustments have been made since 1993. The median work survey value for 35102 is 30.74, and even the 25th percentile RVW of 29 is 24% greater than the current 1995 RVW. The key reference service comparison suggests a value of 32.15, and the E/M building-block calculation indicates a value of 31.93. In addition, the work survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report) suggests a work value for this service of 32.76.

2. Intensity: Intensity of most arterial reconstructive vascular procedures is quite high due to potentially preventable intraoperative catastrophes such as major hemorrhage, and to potential for major postoperative complications such as myocardial infarction. The intensity of 35102 was rated as having a median mental effort value of 4, median technical skill value of 4, and median psychological stress value of 4. While intensity is difficult to evaluate quantitatively, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. In contrast to the high intensity judged by the survey respondents, the IWPUT for 35102 in 1995 is only 0.044 when calculated using the 1995 RVW and the accurate intra-service times from our SVS 10-hospital OR data analysis (Table 1). Likewise, RUC / Harvard IWPUT for this operation is only 0.053 according to the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA RUC 6/8/95). This is less than that for TURP (0.120), cataract removal (0.110), total knee arthroplasty (0.084), and several other common services (Table 1). If 35102 is recalculated using the median IWPUT from the SVS study (0.082), a more accurate reflection of intra-service intensity is employed. By this technique, intra-service work is $240 \times 0.082 = 19.68$ units. Since intra-work represents 0.58 of total work per the current survey, the total work is $19.68 / 0.58 = 33.93$ units (see Appendix for an expansion of this argument). Thus, by adjusting the intensity of intra-service work to a more reasonable level, 35102 merits a work value of 33.93.

3. Summary: Five different analyses suggest work values from 30.74 to 33.93 for this service:

1. Median survey value is 30.74.
2. Comparison to reference code 47130 suggests a work value of 32.15.
3. The E/M building block method resulted in an estimate of 31.93.
4. The American College of Surgeons survey suggested 32.76.
5. The IWPUT method justified an RVW of 33.93.

Although our original letter of comment requested an RVW for 35102 of 37.00, the survey instrument and 4 different justification methods suggest a lower work value. After careful review of the survey results and 4 supplemental work analyses for 35102, we recommend an RVW of 31.5.

APPENDIX: IWPOT Method for work calculation of 35102

1. Intra-service work per unit time (IWPOT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPOT) ranged from 0.050 to 0.120 in the SVS Operative Log Data Analysis presented in Table 1.
3. The median IWPOT for the 12 non-vascular operations in Table 1 was 0.082.
4. The performance of 35102 with its attendant risks of hemorrhage and cardiac complications should merit at least the median level of intra-service work per unit time. The survey intensity ratings would actually support more than a median IWPOT level.
5. The survey intra-service median time for 35102 of 240 minutes is substantiated by our original OR log data analysis (296 min), and by the Hospital log data requested as additional information during the survey (239 min). In fact, these data would suggest that 240 may lie on the low end of the true range.
6. The intra-service work for 35102 should equal the operative time multiplied by the median surgical IWPOT, or $240 \times 0.082 = 19.68$
7. The pre and post-service work for 35102 are at least typical of the average operation of large magnitude, in that patients presenting for this operation commonly suffer from symptomatic coronary artery disease, hypertension, diabetes, hyperlipidemia, obesity, and COPD.
8. The RUC survey data indicates that intra-service work represents 0.58 of total work. In other words, total work = intra-work / 0.58.
9. The total work for 35102, based on the median IWPOT is $19.68 / 0.58 = 33.93$

the diameter of the artery. If a shunt has been used, it is removed just prior to completion of the arterial closure. Vascular clamps are released with reinitiation of blood flow, and hemostasis of the suture line is achieved. The incision is closed in 3 layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, waiting for emergence from anesthesia, and confirmation that the patient has an intact neurologic status. Once this is assured, the patient is transferred to the recovery room where postoperative orders are written. Immediate postoperative treatment commonly includes the use of intravenous vasopressors or antihypertensives to normalize blood pressure since significant blood pressure irregularity is a common finding for up to 24 hours after this operation. The surgeon reviews ECG, blood gas, and other blood test results, and monitors neurologic status. The family, referring physician, and consultant physicians are contacted. In-hospital post-service time includes all subsequent ICU and hospital visits, continued regulation of blood pressure, monitoring and care of the incision; monitoring, care, and removal of all tubes and drains; and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the likely post-hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for 90 days are part of the post-operative work. This includes removal of sutures, evaluation of periodic imaging studies and laboratory reports, and pain medication adjustments if necessary.

FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35301 **Global Period:** 090 **1995 RVW:** 15.95 **Recommended RVW:** 18.00

CPT Descriptor: Thromboendarterectomy, with or without patch graft; carotid, vertebral, subclavian, by neck incision

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures. Accurate intraoperative (skin-to-skin) surgery times of commonly performed vascular and non-vascular procedures were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study identified the intra-service work of code 35301 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. This comparison of intra-service work formed the basis for choosing 35301 to be surveyed for all aspects of work in the five year review.

1994 Frequency of Service: 71,538

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75 year old male with a history of a left cerebral hemisphere TIA is diagnosed with an 85% stenosis of his left internal carotid artery and a 60% stenosis of his right internal carotid artery, upon noninvasive vascular evaluation. Appropriate invasive monitoring is done with insertion of an arterial line, Foley catheter, and sequential compression devices applied. After appropriate positioning of the patient, he undergoes a standard left carotid endarterectomy utilizing cerebral perfusion precautions. The patient becomes hypertensive in the recovery room and receives oral pharmacologic management for 24 hours. The post-op course is uneventful and he is discharged from the hospital on the third post operative day.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before surgery until the time of the procedure. This includes review of the hospital admission workup with special attention to cardiac comorbidity which is ubiquitous among those with carotid atherosclerosis; review of CT scans, duplex ultrasound studies, arteriograms, and laboratory tests; communication with referring physician, cardiologist, anesthesiologist and other health care professionals as necessary; review of indications, risks and benefits of surgery with patient and family; signature of informed consent; and preview of expected hospital course, pain management, discharge plans etc. with patient and family. Other pre-operative services include dressing, scrubbing, and waiting for surgery; supervision of patient positioning and skin preparation, and ensuring that necessary surgical instruments and supplies are available. Surgical presence is also required as the anesthesiology team proceeds with induction of general endotracheal anesthesia and insertion of an arterial pressure line.

Description of Intra-Service work: The neck is incised along the anterior border of the sternocleidomastoid muscle, and the soft tissue is dissected away from the carotid sheath. The common carotid, internal carotid and external carotid arteries are exposed, mobilized, and encircled taking care not to injure the vagus or hypoglossal nerves. Systemic anticoagulation is administered, the arteries are occluded, and the common carotid artery is opened longitudinally. This incision is carried across the bifurcation, onto the internal carotid artery, and beyond the terminus of the obstructive plaque. Intraoperative EEG recording is frequently used in this portion of the operation to follow brain function as the blood flow is interrupted. A shunt may be inserted for cerebral perfusion if required. Using 2 to 3.5 power magnification glasses, the surgeon dissects the plaque from the common, external, and internal carotid arteries. The endarterectomy site is inspected carefully searching for residual remnants of plaque which are removed. Fine sutures are used to tack down any distal shelf at the endpoint of the endarterectomy in the internal carotid. When the surgeon is confident that no loose segments of plaque remain within the vessel, the arteriotomy is closed. Oftentimes a diamond-shaped synthetic or venous patch is incorporated in this arterial suture line to increase

RELATIONSHIP OF CODE UNDER SURVEY TO KEY REFERENCE SERVICE(S):

Although 35606 is not on the MPC list, it was chosen for inclusion on our reference service list (Table 3) because; 1) it has been used successfully as a reference service on previous RUC surveys conducted by our societies for vascular reconstructions in the neck, and 2) the work involved in 35606 very closely approximates that of 35301. Indeed, 34 of 40 survey respondents chose 35606 as the reference code for 35301. The pre-service work of 35301 is nearly identical to that of 35606 and involves review of the patient's history and physical exam, review of the carotid duplex scan, cerebral arteriogram, and head CT scan. Discussions with patient and family regarding operative indications and risks are also similar, as are preparations for surgery in the O.R. The intra-service time is similar for the two codes, but intensity for 35301 is slightly greater. Both services are quite intense, requiring careful dissection of the arterial structures of the neck with avoidance of injury to the nearby cranial nerves, but the mental effort, judgment, and technical skill of 35301 are more because a single false move during this operation can result in a devastating, permanent, stroke. The survey data supported a greater intensity for 35301 compared to 35606 with a median ratio of total intensity of the surveyed code to the reference code of 1.13.

Post-service work, on average, is slightly greater in the survey code than 35606 because patients undergoing carotid endarterectomy very frequently require administration of intravenous pressors or antihypertensives to compensate for carotid body baroreceptor malfunction induced by surgical manipulation. Overall, the survey respondents concluded that intra-service time of 35301 equals that of 35606 (median intra-time ratio = 1.00), and they concluded that the total time of the two services is equal (median total-time ratio = 1.00). The 1995 RVW for 35606 is 17.40. Thus, with a median intensity ratio of 1.13, and time ratios of 1.00, the comparison to key reference service supports a total work for 35301 of $17.40 * 1.13 * 1.00 = 19.66$.

RATIONALE

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work; time; technical skill; and physical effort; mental effort; and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research

The recommended increase in RVW for this code is based upon improvements in the accuracy of existing Harvard / RUC work, time, and intensity data for this code.

1. **Work:** The original Harvard work value for 35301 was estimated at 14.02, and this was increased to 16.13 in 1992. With introduction of a reoperation code in 1994, budget neutrality mandates resulted in a reduction in work value to the current level of 15.95. The median survey value for 35301 is 18.00, and a detailed comparison with the most frequently used reference service justifies a value of 19.66. Another estimate of work for 35301 is provided in the survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report). That survey recommended a work value of 17.81.

2. **Time:** The Harvard pre-service time is 36 minutes prior to O.R. entry, plus 1/2 of the immediate PrePost time of 61, or 31.5 minutes, for a total of 67.5 minutes. The survey median pre-service time is 90 minutes, or 33% more than the existing estimate. The Harvard intra-service time is 120 minutes, while several more recent and more accurate methods indicate the true intra-service time is essentially 140 minutes. Our median survey intra-service time was 143.5 minutes. The survey also requested that physicians report the actual time for their last 3 procedures. The median value of those data was 135 minutes. The survey also requested respondents to supply actual time data for their institutions, and the volume-weighted mean of institution's median actual intra time was 151 minutes. Finally, the SVS 10-hospital OR data analysis (Tables 1&2) documented the median time for 1,628 actual operations as 138 minutes. Considered together, these evaluations indicate that 140 minutes is a far more accurate measure of intra-service time than 120 minutes. The post-service time in the Harvard / RUC database is 140.5 minutes, while the survey post-service time is 130 minutes. Thus, pre-service time is 22.5 minutes longer and post-service time is 10.5 minutes shorter than existing data. This is almost a wash, and the major difference is work can be estimated based on the disparity in intra-service time. The survey respondents indicated that intra-work

represented 0.58 of total work for 35301 (the Harvard / RUC value is 0.54). Using the lower of these 2 values, intra-work for the 1995 RVW is 0.54×15.95 , or 8.61 units. To correct the intra-service work for a time of 140 minutes, we multiplied $140/120 \times 8.61 = 10.05$ intra-service work units. Since this represents 0.54 of total work, the new total work is $10.05 / 0.54$ or 18.61 units (the calculation comes out the same if one uses 0.58 as the percentage of intra-op service). Thus, by using more accurate intra-service time, and no adjustments for intensity, the RVW calculates to 18.61.

3. **Intensity:** The intensity of 35301 is the highest of all codes in our survey, including the key reference codes and those undergoing investigation, with a median mental effort value of 4, median technical skill value of 4, and median psychological stress value of 5. No other service scored a 5 for psychological stress, and no other service had a sum of 13 for these 3 parameters. These intensity values represent the fact that a single false move during this operation may result in a devastating stroke. While intensity is difficult to quantify, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 35301 in 1995 is 0.070 based on our SVS 10-hospital OR data analysis and 0.071 according to the "Summary of Work and Time Estimates for Services Undergoing Investigation (AMA RUC 6/8/95). This is less than that for TURP (0.120), Cataract removal (0.110), total knee arthroplasty (0.084), and several other common services (Table 1). If 35301 is recalculated using just the median IWPUT from the SVS study (0.082), a more accurate reflection of intra-service intensity is reached. By this technique, intra-work is $140 \times 0.082 = 11.48$ units. Since intra-work represents 0.58 of total work, the total work is $11.48 / 0.58 = 19.73$ RVUs (see Appendix for an expansion of this argument). Thus, by adjusting the intensity of intra-service work to a more reasonable level, 35301 merits a work value of 19.79.

4. **Summary** Five different analyses suggest work values from 17.81 to 19.79 for this service:

1. Median survey value is 18.
2. Comparison to reference code 35606 suggests a work value of 19.66.
3. The American College of Surgeons survey suggested 17.81.
4. A relative time analysis computes a work value of 18.61.
5. The IWPUT method justified an RVW of 19.79.

Our original letter of comment recommended an RVW for 35301 of 18.76 units. After careful review of the survey instrument and 4 supplemental work analyses for 35301, we recommend an RVW of 18.

APPENDIX: IWPUT Method for work calculation of 35301

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.050 to 0.120 in the SVS Operative Log Data Analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 was 0.082.
4. The performance of 35301 with its attendant stroke risk should merit at least the median level of intra-service work per unit time. The survey intensity ratings would actually support more than a median IWPUT level.
5. The intra-service time for 35301 is well-established at 140 minutes.
6. The intra-service work for 35301 should equal the operative time multiplied by the median surgical IWPUT, or $140 \times 0.082 = 11.48$
7. The pre and post-service work for 35301 are at least typical of the average operation of that magnitude, in that patients presenting for this operation commonly suffer from symptomatic coronary artery disease, hypertension, diabetes, hyperlipidemia, and COPD. In addition, post-operative management often includes the requirement for intravenous pressors or antihypertensives.
8. The RUC survey data indicates that intra-service work represents 0.58 of total work. In other words, $\text{total work} = \text{intra-work} / 0.58$.
9. The total work of 35301, based on a median IWPUT value, should be $11.48 / 0.58 = 19.79$

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35556 **Global Period:** 090 **1995 RVW:** 15.47 **Recommended RVW:** 22.00

CPT Descriptor: Bypass graft, with vein; femoral-popliteal

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures by collecting and analyzing accurate intraoperative surgery time (skin-to-skin) of commonly performed vascular and non-vascular procedures. Data were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-Service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study found the intra-service work of code 35556 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. These intra-service work comparisons formed the basis for choosing procedures to be surveyed for all aspects of work in the five-year review.

1994 Frequency of Service: 10,168

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 78 year old male with a 63 pack-year history of smoking presents with a history of a non healing ulcer over his left first metatarsal. He has long standing hypertension, recent diabetes controlled with oral medication, and mild angina on occasion. He has had a previous coronary artery bypass eleven years before, and the right saphenous vein was used. He has worsening pain in his foot at rest. Arteriography, as an out-patient, revealed an occlusion of his superficial femoral artery and reconstitution of the popliteal artery at the knee with a mildly diseased posterior tibial artery and an open peroneal artery as run-off. The anterior tibial artery is occluded throughout. Cardiac evaluation is done as an out-patient. He is admitted to the hospital; appropriate invasive monitoring is done, an epidural catheter is inserted for anesthesia, and a femoral-popliteal bypass using reversed saphenous vein is constructed below the knee. Postoperatively he spends one day in the ICU, and is able to be discharged from the hospital on the tenth postoperative day with a warm pain free foot.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before the operation until the beginning of the procedure. This includes obtaining and reviewing pre-procedural work-up, with special attention to cardiopulmonary and hematologic status; reviewing previous imaging studies (especially arteriograms) and laboratory studies; consulting with the referring physician and cardiologist, if necessary, and other health care professionals; and communicating with the patient and patient's family to review the operative risks, benefits, and alternative treatments, and to obtain informed consent. Other pre-operative services include dressing, being present while appropriate invasive monitoring is done with insertion of a Swan-Ganz catheter (if necessary), arterial line, and Foley catheter. Sequential compression devices (on the contralateral leg if desired by the surgeon) are applied and placement of non-invasive ECG and oxygen saturation monitoring devices, and satisfactory anesthesia, generally consisting of insertion of an epidural catheter (or establishing general anesthesia via endotracheal inhalation), is achieved. Additional pre-operative services include ensuring that sufficient blood, especially if the patient has previously donated blood, is available, that the surgical instruments and

supplies that might be necessary are available in the operative suite, scrubbing and supervision of the positioning, prepping, and draping of the patient. Appropriate lines are connected including electrocautery and suction tubes.

Description of Intra-Service work: An incision is made in the groin and the common femoral, superficial femoral, and profunda femoris arteries as well as the greater saphenous vein are isolated and encircled. The incision is then extended down the thigh and lower leg over the greater saphenous vein until sufficient vein is exposed to allow the bypass to be constructed, using one continuous segment of vein for the bypass. This usually requires an incision from the groin to mid-calf. The point for the distal anastomosis to the popliteal artery (almost always below the knee) is identified, and the medial incision below the knee is extended down to the popliteal artery. The branches of the vein are carefully dissected and ligated with meticulous attention to making sure the saphenous vein wall itself is not damaged. Measures to protect the vein endothelium are used and the distal end of the vein is then anastomosed to the femoral artery in an end-of-vein to side-of-artery fashion. The vein conduit is flushed with arterial flow to make sure the rate of flow is sufficient and any small bleeding points are carefully closed with fine sutures. The vein is then tunneled to the point of the distal anastomosis and an anastomosis is made between the vein and the popliteal artery. Once satisfactory flow into the distal arterial circulation is determined, the incision from the groin to mid-calf is carefully closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, checking the extremity for adequate arterial perfusion, and transfer of the patient to the recovery room where postoperative orders are written. Post-service work also includes stabilization of the patient in the recovery room, monitoring blood gas values as well as obtaining electrolytes and a hematocrit. It also includes communication with the family and other health care professionals (including written and oral reports and orders), all hospital visits and services performed by the surgeon, including ICU care and ventilator management as necessary, careful monitoring of cardiopulmonary, and hemodynamic status; ordering and reviewing post-operative radiographs and laboratory studies; monitoring and care of the incision which has a high incidence of incision edge necrosis; monitoring care, most especially physical therapy for training in ambulation, and removal of all tubes and drains; and antibiotics and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital and likely post hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure including removal of sutures, out-patient wound care, evaluation of periodic imaging and laboratory reports, and antibiotic and pain medication adjustments.

1) 35606	Bypass Graft, with other than vein, carotid-subclavian	17.40
2) 35372	Thromboendarterectomy, with or without patch graft; deep (profunda) femoral	12.28
3) 43631	Gastrectomy, partial, distal; with gastroduodenostomy	18.10
4) 47130	Hepatectomy, resection of liver; total right lobectomy	31.56

RELATIONSHIP OF CODE UNDER SURVEY TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Construction of a reference service table (Table 3) for the 5-year reevaluation was difficult for the vascular codes since most of the vascular procedures on the MPC list were submitted for reevaluation. The SVS/ISCVS advisors asked the RUC administrative staff for assistance with construction of the reference service table; we were referred to Dr. Kwass, chair of the RUC research subcommittee to which these codes are assigned. The recommendation was to choose some vascular codes if, in our opinion they were approximately correctly valued, as well as some reference services from the general surgery codes on the

MPC list since 1) all vascular surgeons have completed a full 5 year categorical general surgery residency and are therefore familiar with general surgery cases and 2) while we are "vascular surgeons" by dint of concentrated training or fellowship programs in vascular surgery, many vascular surgeons have practices which include general surgery cases in addition to their vascular practice. Thus, while the reference services are related to the code being surveyed by pre-service work, operative time, intensity, and magnitude of the operation, in addition to post-service work and global periods, the actual operations may be dissimilar.

Comparison to 35606: The survey respondents believed that the intra-service time spent for 35556 was 1.33 times greater than that of 35606, the total time was 1.44 times that of 35606, and the intensity was equivalent to that of 35606.¹ The calculated total work ratio was 1.46 times greater than 35606.² Applying this ratio to the current value (17.40 RVWs) of 35606, yields a work value of **25.40 RVWs** (17.40 x 1.46) for 35556. This result compares favorably with the recommended RVW of 22.00. Additional time and intensity data for 35606 from the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95) were not available for analysis.

Comparison to E/M codes: The work of 35556 may be calculated as the sum of the following E/M services, using intensive care codes as the best comparison to the complex intra-service work involved in this service:

<u>Service</u>	<u>Time</u>	<u>E/M Code</u>	<u>RVW</u>
Pre-Service	90	99215	1.51
Intra-service	200	99291 + 99292 x 5	12.84
Post-day of proc	40	99291	3.64
POD #1 ICU	30	99291	3.64
POD #2-9	10	99231 x 8	4.08
POD #10 Disch	35	99238	1.06
Office x 3	45	99213 x 3	1.65
Total			28.42

Thus, by using the E/M reference service building-block method, the work of 35556 should be **28.42 units**, which further justifies an RVW of 22.

¹For each respondent who listed the given reference service for the given survey code, the ratios of intra-service time, total time, and total intensity of the survey procedure to the reference procedure were calculated. The ratios shown represent the medians of the ratios calculated across those observations.

²For each respondent who listed the given reference service for the given survey code, the ratio of total time to total intensity was calculated. The ratio shown represents the median of the ratios calculated across those observations.

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in RVW is based upon improvements in the accuracy of existing Harvard work and time data for this code.

1. Work: The work value originally assigned was 17.05 units. It now has a value of 15.47. The current survey suggests that the work value should be 22 work units (median value). This value is easily justified by comparison to the key reference service which suggests a value of 25.40 units, and by the the E/M building block calculation of 28.42 units. In addition, the work survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA suggests a comparable work value of 21.62 units.

2. Time: The Harvard intra-service time is 156 minutes, while several more recent and more accurate methods indicate that the true intra-service time is considerably longer. Our median survey intra-service time was 200 minutes. The survey also requested that physicians report the actual times for their last three procedures. The median value for those procedures was 205 minutes. The survey also requested respondents to supply actual time data from their hospitals, and the volume weighted mean of these institution's median times was 224 minutes. Finally, the SVS 10 hospital OR data analysis (Table 1) revealed that the median time was 252 minutes. Considered together, these data suggest that 200 minutes is a conservative estimate of the median time and is a far more accurate measure of intra-service time than 156 minutes. Likewise, the Harvard data give a figure of 69.5 minutes for pre-service time, whereas the median survey pre-service time was 90 minutes. The Harvard post-service time was 162.5 minutes, whereas the survey time was 222.5 minutes. The Harvard survey did not include an ICU day. An ICU day is common after a limb salvage operation in a patient with many comorbidities who is likely to have an arterial line and an epidural catheter in place (only 2 of our 38 respondents felt that our vignette was atypical).

3. Intensity: The intensity of 35556 is high with a median mental effort/judgment of 4, a median technical skill value of 4, and median psychological stress value of 3. While intensity is difficult to compute back to work values, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 35556 in 1995 is 0.026 based on our SVS 10 hospital data analysis of OR log times for procedures (Table 1). It is 0.064 according to the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95). This is less than that accorded most other major procedures in all other specialties. If 35556 is recalculated using an IWPUT of 0.07 (the low end of the spectrum of major complicated and at least moderately intense procedures), a more accurate reflection of intra-service intensity is achieved. By this technique, intra-work is $200 \times 0.07 = 14.00$ units. Since intra-work represents 0.44 of total work based on the current survey, the total work is $14.00/0.44 = 31.81$ units (see attached Appendix for an expanded discussion). Thus, by adjusting the intensity of intra-service work to a more reasonable level, 35556 has a work value of 31.82 units.

4. Summary: Five different analyses suggest work values from 22.00 to 31.82 for this service:

1. Median survey value is **22.00**.
2. Comparison to 35606, the most frequently used reference service by our survey respondents, suggests a value of **25.40**.
3. The E/M building block method resulted in an estimate of **28.42**.
4. The American College of Surgeons survey suggested **21.62**.
5. Using the most conservative IWPUT figures, this analysis technique suggests a value of **31.82**.

After careful review of the survey results and supplemental work analyses for 35556, we recommend an RVW of 22.00.

Appendix: IWPUT Method for work calculation of 35556

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.026 to 0.12 in the SVS Operative Log Data analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 was 0.082. Almost all major operations with reasonably high level of intensity will have an IWPUT of at least 0.070. Almost all major vascular procedures have an IWPUT of less than 0.070.
4. The performance of 35556 with its attendant risks of cardiac complications, failure, and possible limb loss should merit at least the low end of the usual spectrum of major complicated and at least moderately intense procedures. (The survey intensity ratings would actually support more than a low-end IWPUT level.)
5. The Survey intra-service median time for 35556 of 200 minutes is substantiated by our original OR log data analysis (252 min).
6. The intra-service work for 35556 should equal the operative time multiplied by the low end major surgical IWPUT, or $200 \times 0.070 = 14$.
7. The pre- and post- service work for 35556 are at least typical of the average operation of large magnitude in that patients presenting for this operation commonly suffer from symptomatic coronary disease, hypertension, diabetes, hyperlipidemia, obesity and COPD.
8. The RUC survey data indicate that intra-service work represents 0.44 of total work. In other words $\text{total work} = \text{intra-work} / 0.44$.
9. The total work of 35556, based on a low end of the spectrum (0.070) IWPUT value, should be $14 / 0.44 = 31.81$.

by dint of concentrated training or fellowship programs in vascular surgery, many vascular surgeons have practices which include general surgery cases in addition to their vascular practice. Thus, while the reference services are related to the code being surveyed by pre-service work, operative time, intensity, and magnitude of the operation, in addition to post-service work and global periods, the actual operations may be dissimilar.

Comparison to 35606: The survey respondents believed that the intra-service time spent for 35566 was 1.64 times greater than the intra-service time of 35606, the total time was 1.62 times greater than that for 35606, and the intensity was 1.17 times that of 35606. The calculated total work ratio was 1.96 times that of 35606. Applying the ratio of 1.96 to 17.40 results in a work value of **34.10 RVWs** (1.96×17.40) for 35566. This comparison, therefore, suggests that a work value of **26.25 RVW** for 35566 is quite reasonable, using 35606 as a reference code. Additional time and intensity data for 35372 from the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95) were not available for analysis.

Comparison to E/M Codes: The work of 35566 may be calculated as the sum of the following E/M services, using intensive care codes as the best comparison to the complex intra-service work involved in this service:

<u>Service</u>	<u>Time</u>	<u>E/M Code</u>	<u>RVW</u>
Pre-Service	90	99215	1.51
Intra-service	258	99291 + 99292 x 7	16.52
Post-day of proc	40	99291	3.64
POD #1 ICU	30	99291	3.64
POD #2-9	10	99231 x 8	4.08
POD #10 Disch	35	99238	1.06
Office x 3	45	99213 x 3	1.65
Total			32.10

Thus, by using the E/M reference service building-block method, the work of 35566 should be 32.10 units, further justifying an RVW of 26.25.

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in RVW is based upon improvements in the accuracy of existing Harvard work, time, and intensity data for this code.

1. Work: The original Harvard work value assigned to 35566 was 18.65 units. This value was determined by a panel without substantial participation by vascular surgeons (see Introduction). The RVU was decreased to 15.47 in 1992 and increased to 20.21 in 1994. The median RVW of the current survey is 26.25 units. When comparing 35566 to the most frequently used reference service, CPT 35606, a work value of 34.10 is computed, providing additional evidence for an increase in the work units for this service. The E/M building block calculation of 32.10 units also compares favorably with the requested RVW of 26.25. Furthermore, the work survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII in that report) suggests a work value of 26.54.

2. Time: The Harvard intra-service time is 218 minutes, while several more recent and more accurate methods indicate that the true intra-service time is considerably longer. Our median survey intra-service time was 258 minutes. The survey also requested that physicians report the actual times for their last three procedures. The median value for those procedures was 254 minutes. The survey also requested respondents to supply actual time data from their hospitals, and the volume weighted mean of these institution's median times was 265 minutes. Finally, the SVS 10 hospital OR data analysis (Table 1) revealed that the median time was 341 minutes. Considered together, these data suggest that 258 minutes is a more accurate measure of intra-service time than the 218 minutes indicated by the Harvard data. Likewise, the Harvard data give a figure of 68.5 minutes for pre-service time, whereas the median survey pre-service time was 90 minutes. In addition, the Harvard post-service time was 162.5 minutes, whereas the survey post-service time was 230 minutes. The Harvard survey did not include an ICU day; however, an ICU day is common after a limb salvage operation in a patient with many comorbidities who is likely to have an arterial line and an epidural catheter in place (none of our respondents felt that our vignette was atypical).

3. Intensity: The intensity of 35566 is very high with a median mental effort/judgment of 4, a median technical skill value of 4 and median psychological stress value of 4. While intensity is difficult to compute back to work values, a commonly calculated figure is that of intra-service work per unit time, or IWPUT. The IWPUT for 35566 in 1995 is 0.038 based on our SVS 10 hospital data analysis of OR log times for procedures (Table 1). It is 0.056 according to the Summary of work and time estimates for services undergoing investigation (AMA/RUC 6/8/95). This is considerably less than that accorded most other major procedures in all other specialties. If 35566 is recalculated using an IWPUT of 0.07 (the low end of the spectrum of major complicated and at least moderately intense procedures), a more accurate reflection of intra-service time is achieved. By this technique, intra-work is $258 \times 0.07 = 18.06$ units. Since intra-work is 50% of the total work based on the survey data, the total work is $18.06/0.50 = 36.12$ units (see attached Appendix for an expanded discussion). Thus, this method of deriving work strongly supports the survey request of 26.25 units.

4. Summary: Five different analyses suggest work values from 26.25 to 36.12 for this service:

1. Median survey value is **26.25**.
2. Comparison to reference code 35606 suggests a work value of **34.10**.
3. The E/M building block method results in an estimate of **32.10**.

4. The American College of Surgeons survey suggested 26.54.
5. The IWPUT method, using conservative IWPUT figures, justified a value of 36.12.

After careful consideration of the survey results and supplemental work analyses for 35566, we recommend an RVW of 26.25.

Appendix: IWPUT Method for work calculation of 35566

1. Intra-service work per unit time (IWPUT) ranges from 0.05 to 0.12 for virtually all surgical services.
2. Intra-service work per unit time (IWPUT) ranged from 0.026 to 0.12 in the SVS Operative Log Data analysis presented in Table 1.
3. The median IWPUT for the 12 non-vascular operations in Table 1 was 0.082. Almost all major operations with reasonably high level of intensity will have an IWPUT of at least 0.070. Almost all major vascular procedures have an IWPUT of less than 0.070.
4. The performance of 35566 with its attendant risks of cardiac complications, failure, and possible limb loss should merit at least the low end of the usual spectrum of major complicated and at least moderately intense procedures. (The survey intensity ratings would actually support more than a low-end IWPUT level.)
5. The Survey intra-service median time for 35566 of 258 minutes is substantiated by our original OR log data analysis (341 min). In fact, these data would suggest that 258 is a conservative (low) number.
6. The intra-service work for 35566 should at least equal the operative time multiplied by the low end major surgical IWPUT, or $258 \times 0.070 = 18.06$.
7. The pre- and post- service work for 35566 are at least typical of the average operation of large magnitude in that patients presenting for this operation commonly suffer from symptomatic coronary disease, hypertension, diabetes, hyperlipidemia, obesity and COPD.
8. The RUC survey data indicate that intra-service work represents 0.50 of total work. In other words total work = intra-work / 0.50.
9. The total work of 35566, based on a low end of the spectrum (0.070) IWPUT value, should be $18.06 / 0.50 = 36.12$.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35566 **Global Period:** 090 **1995 RVW:** 20.21 **Recommended RVW:** 26.25

CPT Descriptor: Bypass graft, with vein, femoral-anterior tibial, posterior tibial, peroneal artery or other distal vessels

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures by collecting and analyzing accurate intraoperative surgery time (skin-to-skin) of commonly performed vascular and non-vascular procedures. Data were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study found the intra-service work of code 35566 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. These intra-service work comparisons formed the basis for choosing procedures to be surveyed for all aspects of work in the five-year review.

1994 Frequency of Service: 8,893

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 78 year old male with a 63 pack-year history of smoking presents with a history of a non healing ulcer over his left first metatarsal. He has long standing hypertension, recent diabetes controlled with oral medication, and mild angina on occasion. He has had a previous coronary artery bypass eleven years before, and the right saphenous vein was used. He has worsening pain in his foot at rest. Arteriography, as an out-patient, revealed an occlusion of his superficial femoral artery and reconstitution of the posterior tibial artery at the level of his medial malleolus. His anterior tibial artery and his peroneal artery were not acceptable out-flow conduits. Cardiac evaluation is done as an out-patient. He is admitted to the hospital; appropriate invasive monitoring is done, an epidural catheter is inserted for anesthesia, and a femoral-posterior tibial bypass using reversed saphenous vein is constructed. Postoperatively he spends one day in the ICU, and is able to be discharged from the hospital on the tenth postoperative day with a palpable posterior pulse.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before the operation until the beginning of the procedure. This includes obtaining and reviewing pre-procedural work-up, with special attention to cardiopulmonary and hematologic status; reviewing previous imaging studies (especially arteriograms) and laboratory studies; consulting with the referring physician and cardiologist, if necessary, and other health care professionals; and communicating with the patient and patient's family to review the operative risks, benefits, and alternative treatments, and to obtain informed consent. Other pre-operative services include dressing, being present while appropriate invasive monitoring is done with insertion of a Swan-Ganz catheter (if necessary), arterial line, and Foley catheter. Sequential compression devices (on the contralateral leg if desired by the surgeon) are applied and placement of non-invasive ECG and oxygen saturation monitoring devices, and satisfactory anesthesia, generally consisting of insertion of an epidural catheter (or establishing general anesthesia via endotracheal inhalation), is achieved. Additional pre-operative services include ensuring that sufficient blood,

especially if the patient has previously donated blood, is available, that the surgical instruments and supplies that might be necessary are available in the operative suite, scrubbing and supervision of the positioning, prepping, and draping of the patient. Appropriate lines are connected including electrocautery and suction tubes.

Description of Intra-Service work: An incision is made in the groin and the common femoral, superficial femoral, and profunda femoris arteries as well as the greater saphenous vein are isolated and encircled. The incision is then extended down the thigh and lower leg over the greater saphenous vein until sufficient vein is exposed to allow the bypass to be constructed using one continuous segment of vein for the bypass. This usually requires an incision from the groin to near the ankle. The point for the distal anastomosis is identified, an incision is made, and the distal artery is exposed. The vein is carefully dissected free with meticulous attention to making sure the vein wall is not damaged. Measures to protect the vein endothelium are used and the distal end of the vein is then anastomosed to the femoral artery in an end-of-vein to side-of-artery fashion. The vein conduit is flushed with arterial flow to make sure the rate of flow is sufficient and any small bleeding points are carefully closed with fine sutures. The vein is then tunneled to the point of the distal anastomosis and an anastomosis, using magnification, is made between the vein and the distal artery. Once satisfactory flow into the distal arterial circulation is determined, the incision from the groin to near the ankle is carefully closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, checking the extremity for adequate arterial perfusion, and transfer of the patient to the recovery room where postoperative orders are written. Post-service work also includes stabilization of the patient in the recovery room, monitoring blood gas values as well as obtaining electrolytes and a hematocrit. It also includes communication with the family and other health care professionals (including written and oral reports and orders), all hospital visits and services performed by the surgeon, including ICU care and ventilator management as necessary, careful monitoring of cardiopulmonary, and hemodynamic status; ordering and reviewing post-operative radiographs and laboratory studies; monitoring and care of the incision which has a high incidence of incision edge necrosis; monitoring care, most especially physical therapy for training in ambulation, and removal of all tubes and drains; and antibiotics and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital and likely post hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure including removal of sutures, out-patient wound care, evaluation of periodic imaging and laboratory reports, and antibiotic and pain medication adjustments.

RELATIONSHIP OF CODE UNDER SURVEY TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time and the intensity (mental effort and judgment; technical skill & physical effort; and psychological stress) of the service you are rating to the key reference services listed above.

Construction of a reference service table (Table 3) for the 5-year reevaluation was difficult for the vascular codes since most of the vascular procedures on the MPC list were submitted for reevaluation. The SVS/ISCVS advisors asked the RUC administrative staff for assistance with construction of the reference service table; we were referred to Dr. Kwass, chair of the RUC research subcommittee to which these codes are assigned. The recommendation was to choose some vascular codes if, in our opinion they were approximately correctly valued, as well as some reference services from the general surgery codes on the MPC list since 1) all vascular surgeons have completed a full 5 year categorical general surgery residency and are therefore familiar with general surgery cases and 2) while we are "vascular surgeons"

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
FIVE-YEAR REVIEW PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 35583 **Global Period:** 090 **1995 RVW:** 15.97 **Recommended RVW:** 24.00

CPT Descriptor: In-situ vein bypass; femoral-popliteal

Source and Summary of Comment to HCFA on this service: A Technical Consulting Panel of 11 vascular surgeons designed a study to measure the major component of work for vascular surgical procedures by collecting and analyzing accurate intraoperative surgery time (skin-to-skin) of commonly performed vascular and non-vascular procedures. Data were collected from operative logs and computer databases at ten hospitals, both private and University. Median intra-Service time and intra-service work per minute (IWPUT) were calculated (Table 1). The results of this study found the intra-service work of code 35583 to be significantly undervalued based on a comparison with typical "signature" procedures from many other surgical disciplines. These intra-service work comparisons formed the basis for choosing procedures to be surveyed for all aspects of work in the five-year review.

1994 Frequency of Service: 4,864

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 78 year old male with a 63 pack-year history of smoking presents with a history of a non healing ulcer over his left first metatarsal. He has long standing hypertension, recent diabetes controlled with oral medication, and mild angina on occasion. He has had a previous coronary artery bypass eleven years before, and the right saphenous vein was used. He has worsening pain in his foot at rest. Arteriography, as an out-patient, revealed an occlusion of his superficial femoral artery and reconstitution of the popliteal artery at the knee with a mildly diseased posterior tibial artery and an open peroneal artery as run-off. The anterior tibial artery is occluded throughout. Cardiac evaluation is done as an out-patient. He is admitted to the hospital; appropriate invasive monitoring is done, an epidural catheter is inserted for anesthesia, and a femoral-popliteal bypass using in-situ saphenous vein is constructed below the knee. Postoperatively he spends one day in the ICU, and is able to be discharged from the hospital on the tenth postoperative day with a warm pain free foot.

Description of Pre-Service work: Pre-service work begins after the decision to operate is made, from the day before the operation until the beginning of the procedure. This includes obtaining and reviewing pre-procedural work-up, with special attention to cardiopulmonary and hematologic status; reviewing previous imaging studies (especially arteriograms) and laboratory studies; consulting with the referring physician and cardiologist, if necessary, and other health care professionals; and communicating with the patient and patient's family to review the operative risks, benefits, and alternative treatments, and to obtain informed consent. Other pre-operative services include dressing, being present while appropriate invasive monitoring is done with insertion of a Swan-Ganz catheter (if necessary), arterial line, and Foley catheter. Sequential compression devices (on the contralateral leg if desired by the surgeon) are applied and placement of non-invasive ECG and oxygen saturation monitoring devices, and satisfactory anesthesia, generally consisting of insertion of an epidural catheter (or establishing general anesthesia via endotracheal inhalation), is achieved. Additional pre-operative services include ensuring that sufficient blood, especially if the patient has previously donated blood, is available, that the surgical instruments and supplies that might be necessary are available in the operative suite, scrubbing and supervision of the

positioning, prepping, and draping of the patient. Appropriate lines are connected including electrocautery and suction tubes.

Description of Intra-Service work: An incision is made in the groin and the common femoral, superficial femoral, and profunda femoris arteries as well as the greater saphenous vein are isolated and encircled. The incision is then extended down the thigh and lower leg over the greater saphenous vein until sufficient vein is exposed to allow the bypass to be constructed using one continuous segment of vein for the bypass. This usually requires an incision from the groin to mid-calf. The point for the distal anastomosis (almost always below the knee) is identified, and the medial incision below the knee is extended down to the popliteal artery. The branches of the vein are carefully dissected and ligated with meticulous attention to making sure the saphenous vein wall itself is not damaged. The proximal end of the vein is then anastomosed to the femoral artery in an end-of-vein to side-of-artery fashion. The distal vein is divided and mobilized sufficiently to allow an anastomosis of the distal vein to the popliteal artery. The vein valves are then disrupted mechanically and the vein conduit is flushed with arterial flow to make sure the rate of flow is sufficient and any small bleeding points are carefully closed with fine sutures. An anastomosis is then made between the vein and the popliteal artery. Once satisfactory flow into the distal arterial circulation is determined, the incision from the groin to mid-calf is carefully closed in layers.

Description of Post-Service work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, checking the extremity for adequate arterial perfusion, and transfer of the patient to the recovery room where postoperative orders are written. Post-service work also includes stabilization of the patient in the recovery room, monitoring blood gas values as well as obtaining electrolytes and a hematocrit. It also includes communication with the family and other health care professionals (including written and oral reports and orders), all hospital visits and services performed by the surgeon, including ICU care and ventilator management as necessary, careful monitoring of cardiopulmonary, and hemodynamic status; ordering and reviewing post-operative radiographs and laboratory studies; monitoring and care of the incision which has a high incidence of incision edge necrosis; monitoring care, most especially physical therapy for training in ambulation, and removal of all tubes and drains; and antibiotics and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the hospital and likely post hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for this procedure for 90 days after the day of the operation are considered part of the post-operative work for this procedure including removal of sutures, out-patient wound care, evaluation of periodic imaging and laboratory reports, and antibiotic and pain medication adjustments.

The SVS/ISCVS advisors asked the RUC administrative staff for assistance with construction of the reference service table; we were referred to Dr. Kwass, chair of the RUC research subcommittee to which these codes are assigned. The recommendation was to choose some vascular codes if, in our opinion they were

approximately correctly valued, as well as some reference services from the general surgery codes on the MPC list since 1) all vascular surgeons have completed a full 5 year categorical general surgery residency and are therefore familiar with general surgery cases and 2) while we are "vascular surgeons" by dint of concentrated training or fellowship programs in vascular surgery, many vascular surgeons have practices which include general surgery cases in addition to their vascular practice. Thus, while the reference services are related to the code being surveyed by pre-service work, operative time, intensity, and magnitude of the operation, in addition to post-service work and global periods, the actual operations may be dissimilar.

Comparison to 35606: The survey respondents believed that the intra-service time spent for 35583 was 1.50 times that required for 35606, the total time was 1.53 times that for 35606, and the intensity was 1.08 times that of 35606. The calculated total work ratio of 35583 to 35606 was 1.65. Applying this ratio to the current work value of 35606, results in 28.71 RVWs (17.40×1.65) for 35583. This calculation suggests that a work value for 35583 of 24 RVW is quite reasonable, using 35606 as a reference code. Additional time and intensity data for 35606 from the Summary of Work and Time Estimates for Services Undergoing Investigation (AMA/RUC 6/8/95) were not available for analysis.

Comparison to E/M Codes: The work of 35583 may be calculated as the sum of the following E/M services, using intensive care codes as the best comparison to the complex intra-service work involved in this code:

<u>Service</u>	<u>Time</u>	<u>E/M Code</u>	<u>RVW</u>
Pre-Service	90	99215	1.51
Intra-service	220	99291 + 99292 x 5	12.84
Post-day of proc	40	99291	3.64
POD #1 ICU	30	99291	3.64
POD #2-9	10	99231 x 8	4.08
POD #10 Disch	10	99238	1.06
Office x 3	40	99213 x 2.5	1.37
Total			28.14

Thus, by using the E/M reference service building-block method, the work of 35583 computes to 28.14 units and further justifies an RVW of 24.

RATIONALE:

Provide a detailed rationale for your recommendation, including a description of all applicable elements of work: time; technical skill and physical effort; mental effort and judgment; and stress. Your rationale should also describe how the work of performing the service has changed over the past five years. Attach any objective data that will support your rationale, including materials you received from the AMA or your own research.

The recommended increase in RVW is based upon improvements in the accuracy of existing Harvard work, time, and intensity data for this code.

- 1. Work:** The Harvard work value was originally estimated at 17.95 units by a panel without substantial participation by vascular surgeons as discussed in the Introduction. The RVW was decreased to 16.54 in 1992 and decreased further to 15.97 in 1994. The median RVW of the current survey is 24.00 units. Comparison of 35583 to 35606 results in a work value of 28.71. In addition, the E/M building block calculation of 28.14 units compares favorably with the recommended RVW of 24.00. Finally, the work survey reported by the American College of Surgeons in their February 6, 1995 Comment to HCFA (Appendix VIII of that report) suggests a slightly lower work value of 22.28 units.
