G0445	High intensity behavioral counseling to prevent sexually transmitted infection; face-to-face, individual, includes: education, skills training and guidance on how to change sexual behavior; performed semi-annually, 30 minutes		Fecal Bacteriotherapy		CPT 2013	October 2018	The specialty societies indicated that they tried to develop a category I code to replace 44705 which is not currently covered by Medicare, but the CPT Editorial Panel did not accept the coding change proposal due to a lack in literature provided. The Workgroup recommended that these services be reviewed in 2 year after additional utilization data is available (October 2018). In October 2018, the RUC recommended to remove from list , no demonstrated technology diffusion that impacts work or practice expense.	<input checked="" type="checkbox"/>

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

Seema Verma
Administrator
Center for Medicare
Centers for Medicare and Medicaid Services
7500 Security Boulevard
Baltimore, MD 21244-1850

Dear Ms. Verma:

The RUC Health Care Professionals Advisory Committee (HCPAC) Review Board submits the enclosed recommendation to the Centers for Medicare and Medicaid Services (CMS). At the October 2018 meeting, the following issue was reviewed by the HCPAC:

- Auditory Function Evaluation (92626, 92627)

The RUC and HCPAC are fully committed to this ongoing effort to improve relativity in the work, practice expense, and professional liability insurance values. The HCPAC appreciates the opportunity to provide recommendations related to the 2020 Medicare Physician Payment Schedule. If you have any questions regarding this submission, please contact Samantha Ashley (ph: 312-464-4720; email: samantha.ashley@ama-assn.org) at the AMA for clarification regarding these recommendations.

Sincerely,

Michael D. Bishop, MD
HCPAC Chair

Dee Adams Nikjeh, PhD, CCC-SLP

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS Request - Audiology Services / High Volume Growth

October 2018

Auditory Function Evaluation

In October 2016, the Relativity Assessment Workgroup (RAW) identified CPT code 92626 through the High-Volume Growth screen and in October 2017 through the CMS Request - Audiology Services screen. CPT code 92627 was included in the CMS Request - Audiology Services screen as the add-on code for this service.

92626 Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); first hour

The HCPAC reviewed the survey results from 71 audiologists for CPT code 92626 and determined that the proposed work RVU of 1.40, which is the current work RVU and below the survey median, appropriately accounts for the work required to perform this service. The HCPAC recommends 7 minutes of pre-service time, 60 minutes intra-service time and 10 minutes post-service time.

The typical patient for this service is being tested to see if they are a candidate for implant surgery and the code can also be used after the device is implanted to test for efficacy. The specialty recommended and the HCPAC agreed that although the age of the patient population has changed from typically a child to typically an adult, the work associated with the service has not changed and maintaining the current time and work RVU is appropriate. The HCPAC compared the survey code to CPT code 92606 *Therapeutic service(s) for the use of non-speech-generating device, including programming and modification* (work RVU = 1.40, 7 minutes pre-service, 60 minutes intra-service and 10 minutes post-service time). Both codes are performed on patients with communication impairment. The times for both codes are identical and the work RVUs should be identical. The HCPAC also compared the service to the survey top key reference service 92620 *Evaluation of central auditory function, with report; initial 60 minutes* (work RVU = 1.50 and 60 minutes intra-service time) and agreed that the work involved is similar and the codes should be valued similarly. **The HCPAC recommends a work RVU of 1.40 for CPT code 92626.**

92627 Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); each additional 15 minutes (List separately in addition to code for primary procedure)

The HCPAC reviewed the survey results from 63 audiologists for CPT code 92627 and determined that the proposed work RVU of 0.33, the current work RVU and below the survey 25th percentile, appropriately accounts for the work required to perform this service. The HCPAC recommends 15 minutes intra-service time for this add-on code.

The typical patient for this service is being tested to see if they are a candidate for implant surgery and the code can also be used after the device is

implanted to test for efficacy. Typically, the additional time is needed because the patient requires time for additional testing and the patient has severe communication impairments that require more complex testing elements. The specialty recommended and the HCPAC agreed that maintaining the current time and work RVU is appropriate. The HCPAC compared the survey code to top key reference service CPT code 92621 *Evaluation of central auditory function, with report; each additional 15 minutes (List separately in addition to code for primary procedure)* (work RVU = 0.35, 15 minutes intra-service time) and agreed that the work involved is similar and the codes should be valued similarly. **The HCPAC recommends a work RVU of 0.33 for add-on code CPT code 92627.**

Practice Expense

The HCPAC approved the direct practice expense inputs as reviewed without modification by the Practice Expense Subcommittee.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 92626 Tracking Number WW4

Original Specialty Recommended RVU: **1.40**Global Period: XXX Current Work RVU: **1.40**Presented Recommended RVU: **1.40**RUC Recommended RVU: **1.40**

CPT Descriptor: Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); first hour

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female hearing aid user with progressive hearing loss is no longer receiving benefit from amplification. This is demonstrated by a reduced ability to understand speech in all listening environments, even with adjustments and optimization of the patient's amplification system. The patient is referred for an assessment of candidacy for an implanted hearing device.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The qualified health care professional reviews the chart for information related to the etiology of hearing loss, clinical notes regarding hearing aid or cochlear implant use, and other health issues that may influence communication and the ability to process auditory information.

Description of Intra-Service Work: The qualified health care professional takes a detailed case history with attention to history of hearing loss, incidence of familial hearing loss, and use of amplification. The electroacoustic integrity of existing hearing aids is verified prior to subsequent aided testing. The patient is seated in a sound-controlled environment with loudspeakers located at defined azimuths for controlled signal presentation and sound intensity. Speech perception of word and sentence intelligibility in a quiet environment is determined independently at varying sound intensity levels at one or more loudspeaker locations. Testing is then repeated in varying levels of background noise. The performance of each aided ear is quantified separately and then together in the binaural mode. Results of the examination are scored and interpreted based on available performance standards to determine implantation candidacy or prognosis for success and a report is prepared.

Description of Post-Service Work: The qualified health care professional describes the results to the patient and/or family/caregivers and discusses candidacy for an implant or other auditory interventions. The referring provider is notified of the test outcomes and recommendations.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT code 92626 was flagged by the Relativity Assessment Workgroup (RAW) due to unusually rapid growth in its Medicare utilization data from 2006 through 2011. The CPT Editorial Panel subsequently approved revisions to provide a more precise description of the intended use for CPT code 92626 and its add-on code 92627. *Additional background information is available at the end of the rationale.*

Survey Sample:

The survey data and recommendations are based upon a random sample of applicable subsets of the AAA and ASHA memberships. Specifically, the random sample was drawn from audiologists who indicated experience in cochlear implants and/or auditory rehabilitation. The total sample size was 4000 with 71 completed responses.

Expert Panel Recommendations:

A panel of audiologists was convened to consider the survey data and provide recommendations regarding appropriate times and professional work values, as outlined below.

We recommend **maintaining the current work RVU of 1.40 and the current times of 7 minutes (pre), 60 minutes (intra), and 10 minutes (post) for a total of 77 minutes.** We do not have compelling evidence to request increased work or times and believe the survey supports maintaining the current value.

To support this recommendation, we propose a direct crosswalk to **CPT code 92606** (Therapeutic service(s) for the use of non-speech-generating device, including programming and modification), also with a work RVU of 1.40 and a pre-service time of 7 minutes, an intra-service time of 60 minutes, and a post-service time of 10 minutes for a total of 77 minutes.

Time

The expert panel reviewed the median survey times of 15 minutes (pre), 60 minutes (intra), and 20 minutes (post) and agreed with the intra-service median of 60 minutes, which is also the current intra-service time. However, the panel recommended to decrease the pre- and post-service times to the current times. We believe the current times of 7 minutes (pre) and 10 minutes (post) are appropriate and reflect the complexity of working with patients with communication impairments. These times are also supported by the crosswalk code and key reference service.

Work RVU

The expert panel reviewed the median survey work RVU of 1.50. However, we do not have compelling evidence to support an increase in value. We believe that the current work RVU of 1.40 is appropriate and accurately reflects current practice, which has not fundamentally changed since the last review of 92626. Additionally, the recommended work RVU is supported by the key reference service, MPC codes, and direct crosswalk as outlined below.

Comparison to Other Codes

The following table outlines the key reference service, MPC, and crosswalk codes to illustrate appropriate rank order and support the requested values for time and professional work for 92626.

CPT Code	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	Note
92557*	Comprehensive audiometry threshold evaluation and speech recognition (92553 and 92556 combined)	0.60	0.0210	28	3	20	5	2 nd key reference
92507	Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual	1.30	0.0215	60	5	50	5	HCPAC MPC
92626	Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); first hour	1.40	0.0170	77	7	60	10	Survey code
92606	Therapeutic service(s) for the use of non-speech-generating device, including programming and modification	1.40	0.0170	77	7	60	10	Crosswalk

CPT Code	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	Note
92540	Basic vestibular evaluation, includes spontaneous nystagmus test with eccentric gaze fixation nystagmus, with recording, positional nystagmus test, minimum of 4 positions, with recording, optokinetic nystagmus test, bidirectional foveal and peripheral stimulation, with recording, and oscillating tracking test, with recording	1.50	0.0187	77	7	60	10	HCPAC MPC
92620	Evaluation of central auditory function, with report; initial 60 minutes	1.50	0.0187	77	7	60	10	1 st key reference
92603*	Diagnostic analysis of cochlear implant, age 7 years or older; with programming	2.25	0.0165	122	20	82	20	2 nd key reference

* The survey yielded a tie between CPT codes 92557 (comprehensive audiometry) and 92603 (analysis of cochlear implant) for 2nd key reference. The expert panel selected 92603 to include as the 2nd key reference on the SOR because it is a more comparable service to 92626. However, 92557 is listed in the table for additional reference.

Background

In 2013, CPT code 92626 was flagged by the Relativity Assessment Workgroup (RAW) due to unusually rapid growth in its Medicare utilization data from 2006 through 2011. In July 2014, a coding brief was published in the CPT Assistant to clarify that it was to be used to report the evaluation of the auditory function of a patient either prior to or after receiving hearing devices, auditory osseointegrated implants, middle-ear implants, and/or cochlear implant(s), or to monitor the progress of therapeutic intervention.

The RAW requested that the specialties (audiology) review CPT code 92626 three years after the 2014 publication of the CPT Assistant coding brief. The audiology specialty societies reviewed this code in 2017 and determined that utilization continued to increase despite education efforts. At the October 2017 RUC meeting, RAW agreed with the specialty societies' recommendation to bring this code back to CPT for revision to clarify its intended use. At its May 2018 meeting, the CPT Editorial Panel approved revisions to provide a more precise description of the intended use for CPT code 92626.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Although 92626 includes add-on code 92627 for each additional 15 minutes of evaluation time, Medicare data shows that 92627 is billed in addition to 92626 less than 50% of the time.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 92627	Tracking Number WW5	Original Specialty Recommended RVU: 0.33
		Presented Recommended RVU: 0.33
Global Period: ZZZ	Current Work RVU: 0.33	RUC Recommended RVU: 0.33

CPT Descriptor: Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); each additional 15 minutes (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female hearing aid user with progressive hearing loss is no longer receiving benefit from amplification. This is demonstrated by a reduced ability to understand speech in all listening environments, even with adjustments and optimization of the patient's amplification system. The patient is referred for an assessment of candidacy for an implanted hearing device. The patient requires an additional 15 minutes of testing beyond the first hour.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The patient is seated in a sound-controlled environment with loudspeakers located at defined azimuths for controlled signal presentation and sound intensity. Speech perception of word and sentence intelligibility in a quiet environment is determined independently at varying sound intensity levels at one or more loudspeaker locations. Testing is then repeated in varying levels of background noise. The performance of each aided ear is quantified separately and then together in the binaural mode.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT code 92627 is the add-on code to CPT code 92626. 92626 was flagged by the Relativity Assessment Workgroup (RAW) due to unusually rapid growth in its Medicare utilization data from 2006 through 2011. The CPT Editorial Panel subsequently approved revisions to provide a more precise description of the intended use for CPT code 92626 and its add-on code 92627. *Additional background information is available at the end of the rationale.*

Survey Sample:

The survey data and recommendations are based upon a random sample of applicable subsets of the AAA and ASHA memberships. Specifically, the random sample was drawn from audiologists who indicated experience in cochlear implants and/or auditory rehabilitation. The total sample size was 4000 with 63 completed responses.

Expert Panel Recommendations:

A panel of audiologists was convened to consider the survey data and provide recommendations regarding appropriate times and professional work values, as outlined below.

We recommend **maintaining the current work RVU of 0.33 and the median survey times of 0 minutes (pre), 15 minutes (intra), and 0 minutes (post) for a total of 15 minutes.** We do not have compelling evidence to request increased work and believe the survey supports maintaining the current value.

To support this recommendation, we propose a direct crosswalk to **CPT code 90785** (Interactive complexity [List separately in addition to the code for primary procedure]) with a work RVU of 0.33 and a pre-service time of 0 minutes, an intra-service time of 0 minutes, and a post-service time of 11 minutes for a total time of 11 minutes.

Time

The expert panel reviewed the median survey times of 0 minutes (pre), 15 minutes (intra), and 0 minutes (post) and agreed with the intra-service median of 15 minutes, which is also the current time.

Work RVU

The expert panel reviewed the median work RVU of 0.60. However, we do not have compelling evidence to support an increase in value. We believe that the current work RVU of 0.33 is appropriate and accurately reflects current practice, which has not fundamentally changed since the last review of 92627. To support this, we reviewed the RUC database for ZZZ codes. Although we were unable to find one that is a direct crosswalk for both work and time, we propose CPT code **90785** as an option. It is a ZZZ code with 0.33 work RVUs and 11 minutes of total time. We also offer CPT code **95885** as an additional comparison because it is a ZZZ code with a similar work RVU of 0.35 and the same intra-service time of 15 minutes. Finally, the recommended work RVU is supported by the key reference service and MPC codes as outlined below.

Comparison to Other Codes

The following table outlines the key reference service, MPC, and crosswalk codes to illustrate appropriate rank order and support the requested values for time and professional work for 92627.

CPT Code	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	Note
97150	Therapeutic procedure(s), group (2 or more individuals)	0.29	0.0290	10	0	10	0	HCPAC MPC
92627	Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); each additional 15 minutes	0.33	0.0220	15	0	15	0	Survey code
90785	Interactive complexity (List separately in addition to code for primary procedure)	0.33	0.0000	11	0	0	11	Crosswalk
95885	Needle electromyography, each extremity, with related paraspinal areas, when performed, done with nerve conduction, amplitude and latency/velocity study; limited (List separately in addition to code for primary procedure)	0.35	0.0233	15	0	15	0	Additional comparison code
92621	Evaluation of central auditory function, with report; each additional 15 minutes (List separately in addition to code for primary procedure)	0.35	0.0233	15	0	15	0	1st key reference service

CPT Code	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST	Note

92557	Comprehensive audiometry threshold evaluation and speech recognition (92553 and 92556 combined)	0.60	0.0210	28	3	20	5	2nd key reference

Background

CPT code 92627 is the add-on code to 92626. In 2013, CPT code 92626 was flagged by the Relativity Assessment Workgroup (RAW) due to unusually rapid growth in its Medicare utilization data from 2006 through 2011. In July 2014, a coding brief was published in the CPT Assistant to clarify that it was to be used to report the evaluation of the auditory function of a patient either prior to or after receiving hearing devices, auditory osseointegrated implants, middle-ear implants, and/or cochlear implant(s), or to monitor the progress of therapeutic intervention.

The RAW requested that the specialties (audiology) review CPT code 92626 three years after the 2014 publication of the CPT Assistant coding brief. The audiology specialty societies reviewed this code in 2017 and determined that utilization continued to increase despite education efforts. At the October 2017 RUC meeting, RAW agreed with the specialty societies recommendation to bring this code back to CPT for revision to clarify its intended use. At its May 2018 meeting, the CPT Editorial Panel approved revisions to provide a more precise description of the intended use for CPT codes 92626 and 92627.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Medicare 5% file data shows that of the 333 times reported in 2016, 92627 was billed with its base code 92626 99% of the time, 92504 (ear microscopy) 73% of the time, and 92585 (auditory evoked potentials) 56% of the time.

CPT Code	Descriptor	RVW	Global	Total Time	PRE	INTRA	POST	% billed with
92626	Evaluation of auditory rehabilitation status; first hour	1.40	XXX	77	7	60	10	99%
92504	Binocular microscopy (separate diagnostic procedure)	0.18	XXX	9	2	5	2	73%
92585	Auditory evoked potentials for evoked response audiometry and/or testing of the central nervous system; comprehensive	0.50	XXX	12	-	-	-	56%

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor:

92626 Evaluation of auditory function for surgically implanted device(s) candidacy or post-operative status of a surgically implanted device(s); first hour

92627 each additional 15 minutes (List separately in addition to code for primary procedure)

Global Period: 92626 - XXX 92627 - ZZZ Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
The practice expense elements were determined by a consensus panel of audiologists from different practice settings (eg, private practice, clinic, hospital-based) and geographic regions of the country.
2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:
The panel drew upon the current practice expense inputs for CPT codes 92626 and 92627.
3. Is this code(s) typically billed with an E/M service?
92626 – No 92627 – No

Is this code(s) typically billed with the E/M service in the nonfacility?
92626 – No 92627 – No
4. What specialty is the dominant provider in the nonfacility?
92626 – Audiologist 92627 – Audiologist

What percent of the time does the dominant provider provide the service(s) in the nonfacility?
92626 - 91% 92627 – 95%

Is the dominant provider in the nonfacility different then for the global?
92626 – No 92627 – No
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: **N/A – we are not recommending clinical labor time**
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time. **N/A – we are not recommending an increase over the current aggregate cost.**
7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**

8. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*: **N/A**
9. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. **N/A**
10. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: **N/A**
11. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. **N/A**
12. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
13. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
14. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:
 - **EQ285 Speakers, sound field** – highly technical
 - **EQ053 Audiometer, clinical-diagnostic** – highly technical
 - **EQ054 Audiometric soundproof booth (exam and control rooms)** – highly technical

Because the provider of the entire service is the qualified health care professional, we are using the QHP’s intra-service time to calculate the equipment time.

15. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:

92626: The consensus panel recommends removing medical supply item SA033 (kit, therapeutic toys-games), as the typical patient is no longer pediatric. The consensus panel also recommends adding medical supply items SJ053 (swab-pad, alcohol) and SM025 (specula tips, otoscope). Adding these two items does not increase the aggregate current cost, given the removal of the toy kit.

92627: The consensus panel recommends removing SA033 (kit, therapeutic toys-games). The consensus panel also recommends decreasing the number of audiology scoring forms (SK008) from 4 to 1.

See the table on page 3 for further details on each recommendation.

16. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**

17. Please include an explanation of each line item:

Recommendations for 92626

ROW	CODE	92626 (first hour)	current	REC	Rationale
MEDICAL SUPPLIES					
102	SA033	Kit, therapeutic toys-games	1	0	Remove – the typical patient has changed from pediatric to adult
103	SK008	Audiology scoring forms	4	4	Retain – forms are used to score required tests
105	SJ053	Swab-pad, alcohol	0	2	Add – required to clean the audiometric equipment
106	SM025	Specula tips, otoscope	0	1	Add – required for the otoscopic exam
EQUIPMENT					
112	EQ285	Speakers, sound field	60	60	Retain – highly technical equipment needed for duration of intraservice time.
113	EQ053	Audiometer, clinical-diagnostic	60	60	Retain – highly technical equipment needed for duration of intraservice time.
114	EQ054	Audiometric soundproof booth (exam and control rooms)	60	60	Retain – highly technical equipment needed for duration of intraservice time.

Recommendations for 92627

ROW	CODE	92627 (each additional 15 min.)	current	REC	Rationale
MEDICAL SUPPLIES					
102	SA033	Kit, therapeutic toys-games	1	0	Remove – the typical patient has changed from pediatric to adult
103	SK008	Audiology scoring forms	4	1	Decrease – 4 forms is based on 60 minutes and is too high. We divided the current input by four to reflect each additional 15 minutes
EQUIPMENT					
112	EQ285	Speakers, sound field	15	15	Retain – highly technical equipment needed for duration of intraservice time.
113	EQ053	Audiometer, clinical-diagnostic	15	15	Retain – highly technical equipment needed for duration of intraservice time.
114	EQ054	Audiometric soundproof booth (exam and control rooms)	15	15	Retain – highly technical equipment needed for duration of intraservice time.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Site of Service Anomaly - 2017

October 2018

Tissue Grafting Procedures

In October 2017, the Relativity Assessment Workgroup reviewed services with anomalous sites of service when compared to Medicare utilization data. One service was identified, CPT code 20926 *Tissue grafts, other (eg, paratenon, fat, dermis)*, in which the Medicare data from 2013-2016 indicated that it was performed less than 50% of the time in the inpatient setting, yet includes inpatient hospital Evaluation and Management services within the global period. The specialty societies submitted an action plan and indicated that they believe the site of service issue is due to miscoding. The CPT manual includes a parenthetical that was added in 2011 that states, (For injection(s) of platelet rich plasma, use 0232T). The parenthetical resulted in some decrease in utilization for a few years, but currently the utilization has been increasing again. The specialty societies believe the typical patient receiving this service would be treated in a facility setting and that the site of service anomaly, for both the outpatient and the office setting is the result of miscoding. The specialty societies proposed to address this miscoding by developing a CPT assistant article and possible introductory language to emphasize correct coding. The RUC recommended that CPT code 20926 be referred to the CPT Editorial Panel for the May 2018 CPT Editorial meeting to add/revise the introductory language and referred to CPT Assistant for education on when to report this service. In May 2018 the CPT Editorial Panel replaced CPT code 20926 with five codes in the Integumentary section to better describe tissue grafting procedures. CPT code 15771 is a brand-new code that essentially replaces code 20926 and describes new technology to perform tissue transfer that was unavailable at the time the original code was established. Four additional codes, 15771-15774, were created in addition to CPT code 15769, to describe the use of autologous fat grafting harvested by liposuction technique, prepared with centrifugation, and then injected in multiple small aliquots to fill a soft tissue defect. These codes are volume-based and include both a base code and add-on code depending on the area of the body grafted.

Compelling Evidence

CPT deleted code 20926 as the service was frequently misreported. The RUC understands that the 35% of claims representing services performed in the office represent miscoding. The RUC discussed compelling evidence for the code family and determined that the original CPT code 20926 was poorly described and never surveyed (Harvard study). Therefore, the argument of flawed methodology for compelling evidence was accepted.

15769 Grafting of autologous soft tissue, other, harvested by direct excision (eg, fat, dermis, fascia)

The RUC reviewed the survey results from 163 otolaryngologists and plastic surgeons and determined that the survey 25th percentile work RVU of 6.68 accurately reflects the physician work necessary for this service. CPT code 15769 was created to describe the excision of a block of soft tissue and then placement in to the defect. This code is, in essence, a replacement for CPT code 20926. The previous code served as a catch all code and reflected multiple methods and approaches for obtaining grafting material which are now better identified with greater specification in the newly created code set. The survey code represents significant work and effort in the obtaining and placement of grafting material, accounting for the recommended increase in value when compared to code 20926. The RUC recommends the following physician time components: 38 minutes of

pre-service time (25 minutes evaluation time, 3 minutes positioning time, 10 minutes scrub/dress/wait time), 45 minutes of intra-service time and 15 minutes of immediate post-service time, 1-99238 discharge management, 1-99213 and 2-99212 office visits. Unlike the rest of the code family, an overnight stay for the patient is typical for CPT code 15769.

The RUC compared CPT code 15769 to the second key reference service CPT code 21556 *Excision, tumor, soft tissue of neck or anterior thorax, subfascial (eg, intramuscular); less than 5 cm* (work RVU = 7.66 and 60 minutes intra-service time) and noted that the reference code has higher intra-service time and lower intensity. The survey code is a difficult procedure due to graft placement and the cranial/facial nerves being at risk. The RUC noted that there is increased complexity in the contouring of the face and is typically performed in areas that have been previously operated on before. In addition, CPT code 15769 has two surgical sites, so twice the risk of hematoma and infection. For additional support, the RUC reviewed MPC code 67904 *Repair of blepharoptosis; (tarso) levator resection or advancement, external approach* (work RVU = 7.97 and 45 minutes intra-service time) and noted that the intra-service time is identical and total times are similar. The RUC concluded that CPT code 15769 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 6.68 for CPT code 15769.**

15771 Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50cc or less injectate

The RUC reviewed the survey results from 60 plastic surgeons and determined that the survey 25th percentile work RVU of 6.73 accurately reflects the physician work necessary for this service. The RUC recommends the following physician time components: 50 minutes of pre-service time (30 minutes evaluation time, 10 minutes positioning time, 10 minutes scrub/dress/wait time), 60 minutes of intra-service time, and 16 minutes of immediate post-service time, 1-99213 and 2-99212 office visits. The additional minute of survey post-service time compared to CPT code 15773 is due to the need for a bra or post-operative garment to be placed on the patient afterwards since the work is being done on the upper trunk, not the face.

The RUC compared CPT code 15771 to the top key reference service CPT code 15120 *Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)* (work RVU = 10.15 and 75 minutes intra-service time) and noted that the reference code is appropriately valued higher due to the complexity of the procedure where the typical patient is a trauma victim and there is the increased chance of complications due to the procedure being performed on the face. For additional support, the RUC reviewed MPC code 25076 *Excision, tumor, soft tissue of forearm and/or wrist area, subfascial (eg, intramuscular); less than 3 cm* (work RVU= 6.74 and 45 minutes intra-service time) and noted that the survey code has greater intra-service time but less total time than the comparator code and the survey code is more intense. The RUC concluded that CPT code 15771 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 6.73 for CPT code 15771.**

15772 Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50cc injectate, or part thereof (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 60 plastic surgeons and determined that the survey 25th percentile work RVU of 2.50 accurately reflects the physician work necessary for this service. CPT code 15772 is the add-on code for autologous fat grafting to the trunk, breasts, extremities, or scalp for each additional 50cc of injectate. This volume was derived from the typical amount of injectable fat obtained from one round

of centrifugation. The RUC recommends 45 minutes of intra-service time. That time is justified because for each additional 50cc, the work is essentially duplicated. The only work that is different is the surgeon does not have to open and close the access site.

The RUC compared CPT code 15772 to the top key reference service CPT code 15121 *Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 2.00 and 30 minutes intra-service time) and noted that the survey code has greater intra-service time and should have a higher physician work value to account for the additional time and effort required to harvest, prepare, and inject additional volumes of grafted fat. However, the reference service is being performed on the face and therefore has greater intensity due to its complexity and increased risk of complications.

For additional support, the RUC reviewed ZZZ global codes with identical intra-service time and similar amount of physician work. CPT code 13153 *Repair, complex, eyelids, nose, ears and/or lips; each additional 5 cm or less (List separately in addition to code for primary procedure)* (work RVU= 2.38 and 45 minutes intra-service time) and CPT code 77293 *Respiratory motion management simulation (List separately in addition to code for primary procedure)* (work RVU= 2.00 and 45 minutes intra-service time). The RUC concluded that CPT code 15772 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 2.50 for CPT code 15772.**

15773 Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25cc or less injectate

The RUC reviewed the survey results from 55 plastic surgeons and determined that the survey 25th percentile work RVU of 6.73 accurately reflects the physician work necessary for this service. CPT code 15773 is the base-code for autologous fat grafting to the sensitive areas of the face, hands, feet, and genitalia for up to 25cc of injectate. This volume was derived from the typical volume of fat grafted into these smaller areas compared to the trunk. The RUC recommends the following physician time components: 50 minutes of pre-service time (30 minutes evaluation time, 10 minutes positioning time, 10 minutes scrub/dress/wait time), 60 minutes of intra-service time and 15 minutes of immediate post-service time, 1-99213 and 2-99212 office visits. A discharge day was not included in the survey. The RUC noted that the intra-service time is the same despite the volume of material grafted being only half that of code 15771. This is because, as stated in the vignette, the patient has been previously operated on and the face takes more time per unit grafted.

The RUC compared CPT code 15773 to the top key reference and MPC code 15823 *Blepharoplasty, upper eyelid; with excessive skin weighting down lid* (work RVU = 6.81 and 45 minutes intra-service time) and noted that both services have intra-service time. Although the survey code involves more total time, both services have an overall similar amount of physician work. The RUC also compared the survey code to the second key reference service CPT code 15120 *Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)* (work RVU = 10.15 and 75 minutes intra-service time) and noted that the reference code has higher times and involves more physician work overall but the codes have similar intensity/complexity due to being performed in a similar region.

For additional support, the RUC reviewed MPC code 25076 *Excision, tumor, soft tissue of forearm and/or wrist area, subfascial (eg, intramuscular); less than 3 cm* (work RVU= 6.74 and 45 minutes intra-service time) and noted that the survey code has greater intra-service time but very similar physician work as the comparison code. The RUC concluded that CPT code 15773 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 6.83 for CPT code 15773.**

15774 Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25cc injectate, or part thereof (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 54 plastic surgeons and determined that the survey 25th percentile work RVU of 2.41 accurately reflects the physician work necessary for this service. CPT code 15774 is the add-on code for autologous fat grafting to the sensitive areas of the face, hands, feet, and genitalia for up to 25cc of injectate. This volume was derived from the typical volume of fat grafted into these smaller areas compared to the trunk. The RUC recommends 45 minutes of intra-service. Similar to CPT code 15772, that time is justified because for each additional 25cc, the work is essentially duplicated. It is a smaller volume of injectate than in code 15772 but in more difficult areas.

The RUC compared CPT code 15774 to the top key reference service CPT code 14302 *Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 3.73 and 40 minutes intra-service time) and noted that the reference code has a much higher IWPOT and is appropriately valued higher given its shorter intra-service time and greater intensity. The RUC also compared the survey code to the second key reference service CPT code 15121 *Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 2.00 and 30 minutes intra-service time) and noted that the survey code has greater intra-service time and a higher physician work value to account for the additional time and effort required to harvest, prepare, and inject additional volumes of grafted fat. However, the reference service has less intra-service time and greater intensity.

For additional support, the RUC reviewed ZZZ global codes with identical intra-service time and similar amount of physician work. CPT code 13153 *Repair, complex, eyelids, nose, ears and/or lips; each additional 5 cm or less (List separately in addition to code for primary procedure)* (work RVU= 2.38 and 45 minutes intra-service time) and CPT code 77293 *Respiratory motion management simulation (List separately in addition to code for primary procedure)* (work RVU= 2.00 and 45 minutes intra-service time) were the only two comparators that had been RUC-reviewed since 2012. The RUC concluded that CPT code 15774 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 2.41 for CPT code 15774.**

Practice Expense

The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

New Technology/New Services

CPT codes 15769 – 15774 will remain on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

RAW Flag

In addition to New Technology, CPT code 15769 should be re-reviewed in the first year of utilization by the Relativity Assessment Workgroup to evaluate whether the new code is being coded with other codes (ie, closure of donor site) and whether it is being used in non-facility settings.

Work Neutrality

The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery Integumentary Other Flaps and Grafts				
<i>Code 15740 describes a cutaneous flap, transposed into a nearby but not immediately adjacent defect, with a pedicle that incorporates an anatomically named axial vessel into its design. The flap is typically transferred through a tunnel underneath the skin and sutured into its new position. The donor site is closed directly.</i>				
<i>Neurovascular pedicle procedures are reported with 15750. This code includes not only skin but also a functional motor or sensory nerve(s). The flap serves to reinnervate a damaged portion of the body dependent on touch or movement (eg, thumb).</i>				
<i>Repair of donor site requiring skin graft or local flaps should be reported as an additional procedure.</i>				
<i>For random island flaps, V-Y subcutaneous flaps, advancement flaps, and other flaps from adjacent areas without clearly defined anatomically named axial vessels, see 14000-14302.</i>				
<u>Code 15769 may be used to report autologous soft tissue grafts such as fat, dermis, fascia, or other soft tissues which are harvested from the patient using an excisional technique. The autologous soft tissue grafts are then placed into a defect during the same operation. Autologous grafts that are already defined in the CPT code set including skin, bone, nerve, tendon, fascia lata or vessels should be reported with the specific codes for each tissue type. For harvesting, preparation or injection(s) of platelet-rich plasma, use 0232T.</u>				
<u>Codes 15771, 15772, 15773, 15774 may be used to report autologous fat grafting when the adipose cells are harvested via a liposuction technique, prepared with minimal manipulation, and then injected via cannula in multiple small aliquots to the defect. The regions listed refer to the recipient area (not the donor site). Volumes are based on total injectate. For multiple sites of injection, sum the total volume of injectate to anatomic sites that are grouped together into the same code descriptor. Do not report 11950, 11951, 11952, 11954 in conjunction with 15771, 15772, 15773, 15774 for the same anatomic site.</u>				

● 15769	B1	Grafting of autologous soft tissue, other, harvested by direct excision (eg, fat, dermis, fascia) (For injection[s] of platelet-rich plasma, use 0232T)	090	6.68
● 15771	B2	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50cc or less injectate (Report 15771 only once per session)	090	6.73
✚ ● 15772	B3	each additional 50cc injectate, or part thereof (List separately in addition to code for primary procedure) (Use 15772 in conjunction with 15771)	ZZZ	2.50
● 15773	B4	Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25cc or less injectate (Report 15773 only once per session)	090	6.83
✚ ● 15774	B5	each additional 25cc injectate, or part thereof (List separately in addition to code for primary procedure) (Use 15774 in conjunction with 15773)	ZZZ	2.41

		(For injection[s], autologous white blood cell concentrate [autologous protein solution], any site, including image guidance, harvesting and preparation when performed, use 0481T) (Do not report 15769, 15771, 15772, 15773, 15774 in conjunction with 15876, 15877, 15878, 15879, 0232T, 0481T, 0489T, 0490T)		
Musculoskeletal System Grafts (or Implants) Codes for obtaining autogenous bone, cartilage, tendon, fascia lata grafts, bone marrow, or other tissues through separate skin/fascial incisions should be reported separately, unless the code descriptor references the harvesting of the graft or implant (eg, including obtaining graft). <u>Autologous grafts that are already defined in the CPT code set including skin, bone, nerve, tendon, fascia lata, or vessels should be reported with the more specific codes for each tissue type. Code 15769 may be used for other autologous soft tissue grafts harvested by direct excision. See 15771, 15772, 15773, 15774 for autologous fat grafting harvested by liposuction technique.</u> <i>Do not append modifier 62 to bone graft codes 20900-20938.</i> <i>(For spinal surgery bone graft[s] see codes 20930-20938)</i> 20900 <i>Bone graft, any donor area; minor or small (eg, dowel or button)</i> 20902 <i>major or large</i> 20910 <i>Cartilage graft; costochondral</i> 20912 <i>nasal septum</i> <i>(For ear cartilage, use 21235)</i> 20920 <i>Fascia lata graft; by stripper</i> 20922 <i>by incision and area exposure, complex or sheet</i> 20924 <i>Tendon graft, from a distance (eg, palmaris, toe extensor, plantaris)</i>				
D 20926	-	Tissue grafts, other (eg, paratenon, fat, dermis) (Do not report 20926 in conjunction with 0489T, 0490T) (For harvesting of adipose tissue for autologous adipose-derived regenerative cell therapy, see 0489T, 0490T) (For injection of autologous adipose-derived regenerative cells, see 0489T, 0490T)	090	N/A (2018 work RVU = 5.79)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 15769	Tracking Number	Original Specialty Recommended RVU: 6.68
		Presented Recommended RVU: 6.68
Global Period: 090	Current Work RVU:	RUC Recommended RVU: 6.68

CPT Descriptor: grafting of autologous soft tissue, other, harvested by direct excision (eg, fat, dermis, fascia)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58-year-old male presents with a left sided parotid mass. The mass is excised, leaving a defect in the parotid bed. An enbloc fat graft is planned to correct the soft tissue deficiency.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 74% , In the ASC 25%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 38% , Overnight stay-less than 24 hours 45% , Overnight stay-more than 24 hours 17%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 27%

Description of Pre-Service Work:

- Review NPO status
- Mark appropriate side and site of surgery.
- Review medical history. Reconcile medications and allergies.
- Review results of preadmission testing (lab, EKG, chest x-ray)
- Meet with patient and family to review planned procedure and post-operative management, including post-operative pain management and likely post-operative cosmetic and functional results.
- Check prescription drug monitoring database.
- Reexamine patient to make sure that physical findings have not changed and update H&P
- Obtain informed consent
- Review airway and medical management with anesthesiologist, including avoidance of paralysis.
- Review planned airway management and procedure with OR staff
- Verify that all required instruments and supplies are available
- Change into scrub clothes
- Monitor/assist with positioning of patient - with placement of a transverse shoulder roll to provide neck extension.
- Mark out planned incisions at recipient and donor sites
- Inject planned incision with topical vasoconstrictor and local anesthesia.
- Monitor/assist with prepping and draping
- Scrub and gown
- Perform surgical

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection and preparation of the recipient bed and facial nerve identification. The margins of the previous incision are re-excised with fibrous and poorly vascularized tissue being debrided and removed. Hemostasis is obtained, and the wound is packed with wet sponges. The needed graft size is measured and planned. The donor site is carefully measured and remarked. An elliptical abdominal incision is preformed just through the epithelium. All of the epithelium is then fastidiously removed from the dermis. The elliptical incision is then performed again but the second time being through the dermis and subcutaneous tissues. A dissection deep to the subcutaneous tissues is performed. The graft is removed and set aside in saline for later

implantation. The wound is undermined and is closed primarily in three separate layers. The sponges are removed from the recipient wound and the site is reinspected. The donor abdominal dermis and fat is trimmed to fill the defect, and placed en bloc into the defect to fill the soft tissue void. The graft is then fixed in place with long-lasting absorbable sutures. A drain is brought out through a separate stab incision and is sutured in place. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site parotid bed. Operative report is dictated. Postoperative orders are written.

Discharge Management Visit: Discharge medications are reconciled and prescriptions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

Post op visit 1: 99213

The patient's convalescence to that point is reviewed and discussed. The dressings from the donor and recipient sites are removed. The drain output is assessed, and the drain suture and drain are removed, if appropriate. The donor site wound is inspected and palpated. Facial nerve function and vascular status of the recipient wound are checked. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A compression dressing is fashioned, and the recipient site wound is redressed and re-wrapped.

Post op visit 2: 99212

The patient's convalescence to that point is reviewed. The compression dressing from the recipient site is removed. If the drain was not removed at the initial postoperative visit, the drain output is assessed, and the drain suture and drain are removed, if appropriate. The wound is inspected and palpated. The status of the recipient wound is checked. The donor site wound is rechecked. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212

The patient's convalescence to that point is reviewed. The sutures from the donor and recipient sites are removed. The wounds are inspected and palpated. Patient and family questions and concerns are addressed. Long term care, strategies to maximize cosmesis, and expected outcomes are discussed in detail.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Why is this code being reviewed?

A code change proposal was brought before the CPT Editorial Panel in May 2018 requesting modifications to the 20926 with five codes in the Integumentary section to better describe tissue grafting procedures. This was a result of the service hitting the Site of Service Anomaly Screen in 2017.

Description of Random Survey Sample

Our physician work RVU recommendation was derived by conducting a targeted random survey of AAO-HNS and ASPS members. The AAOHNS members sample focused on those with a designation of facial plastics in our database. The standard 090 global survey instrument was utilized.

Physician Time**Pre-Time**

Regarding physician time, we recommend using pre-service package 3 straightforward patient/ difficult procedure which includes 33 minutes of evaluation, 3 minutes of positioning, and 15 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that this procedure utilizes general anesthesia. We took the lesser of the package or the survey, where applicable.

Evaluation time: Our experts felt that the 25 minutes of evaluation time provided by respondents was appropriate and therefore, reduced the survey time for evaluation by 8 minutes.

Positioning time: Regarding time for positioning, our expert panel reviewed the 3 minutes of time assigned by package and felt this was sufficient for this particular procedure.

Scrub, Dress, and Wait time: Last, we recommend the survey time of 10 minute for scrub, dress, and wait.

Total Pre-Time: These modifications result in an overall pre-service time recommendation of 25/3/10, totaling 38 minutes for 15769.

Intra Time

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 45 minutes for intra service work.

Immediate Post Time

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 15 minutes.

Physician Work / Compelling Evidence

We believe the above recommendation is supported by the key reference codes, as well as a robust survey response. We therefore are recommending the survey's 25th percentile value of 6.68. This is an increase in value from the existing service of 20926 which had an RVU of 5.79. We believe this is appropriate based on a change in dominant specialty. Previously, the dominant specialty was Orthopedics. Per the RUC database, this had now changed to Otolaryngology. The increase in work value is also justified given that the previous code, 20926, reflected multiple methods and approaches for obtaining grafting material, which are now better identified with greater specification in the newly created codes. This code, 15769, represents significant work and effort in the obtaining and placement of grafting material, accounting for the request for the increase in value. Our vignette and DOW represent significantly increased work and effort when compared to 20926, which served as a catch all code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20926

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty American Society of Plastic Surgeons

How often? Sometimes

Specialty American Academy of Otolaryngology-Head and Neck Surgery

How often? Sometimes

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 6000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume per the RUC database.

Specialty Otolaryngology	Frequency 5400	Percentage 90.00 %
--------------------------	----------------	--------------------

Specialty Plastic Surgery	Frequency 300	Percentage 5.00 %
---------------------------	---------------	-------------------

Specialty Neurosurgery	Frequency 300	Percentage 5.00 %
------------------------	---------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,000

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Oto	Frequency 1800	Percentage 90.00 %
---------------	----------------	--------------------

Specialty Plastic Surgeons	Frequency 100	Percentage 5.00 %
----------------------------	---------------	-------------------

Specialty Neurosurgeons	Frequency 100	Percentage 5.00 %
-------------------------	---------------	-------------------

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 15770

RUC Recommended RVU: **6.73**

CPT Descriptor: Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50cc or less injectate

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year-old female patient presents with a post lumpectomy defect in the superior medial pole of the breast wishes to use her own tissue to repair the concavity. Exam documents a 40 ml volumetric defect in the area of the lumpectomy. Fat grafting to the breast is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 48% , In the ASC 50%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 90% , Overnight stay-less than 24 hours 10% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 33%

Description of Pre-Service Work: Orders for preoperative medications are written, and laboratory results, imaging, and patient photographs, are reviewed. The planned procedure and postoperative management are reviewed with the patient and the patient's family. The patient's history and physical are updated. The operative site is marked, and the proposed areas for both graft injection and graft harvest are reviewed with the patient. Informed consent is obtained. The length and type of anesthesia are reviewed with the anesthesiologist. The availability of all required supplies and instruments are verified. The patient is transferred from the gurney and positioned on the operating room table. Bony prominences are padded, and thermal regulation drapes are applied. The position of the extremities and head is assessed and adjusted, as needed based on the multiple surgical sites and secured in the typical scenario where the patient will be sat upright during the operation. The surgeon scrubs and gowns. Both recipient and donor sites are prepared and draped with additional time often required for the multiple sites of surgery. A surgical time-out is performed with the operating surgical team.

Description of Intra-Service Work: The graft donor sites (often thighs or abdomen) are infiltrated with a liposuction wetting ("tumescence") solution. After waiting for the hemostatic effects of the epinephrine and anesthetic effects of the lidocaine, a liposuction cannula is connected to gentle sub-atmospheric pressure and used to harvest the fat and associated aspirate from the donor site soft tissues taking care to avoid the creation of soft tissue deformities. The donor incisions are closed in a layered fashion. The lipoaspirate is placed into syringes and then placed in an operating room centrifuge. After completion of the centrifuge cycle, the separated blood is then drained and the oil is wicked away from the usable fat graft. The graft is then transferred into small volume syringes. Small cannulas are then used to subcutaneously inject the fat in small aliquots to fill the soft tissue defect. This requires placement of the grafts in multiple planes and depths in order to ensure viability of the graft. The fat grafts are infiltrated into the soft tissues until the desired volumetric filling is achieved. Filling is often evaluated with the patient in an upright position on the operating room table which requires sitting the patient up. The small stab wounds are then closed primarily.

Description of Post-Service Work:

Immediate Post-Op - Sterile dressings are applied along with a post-operative compression garment to the donor site. The patient is transferred to the recovery room with signout to the recovery room nursing staff. The procedure and outcome are discussed with the patient and family. An operative note is dictated. Post-operative instructions are written and orders for discharge are completed.

Office Visits - At each visit, a discussion is held with patient including post-operative recovery concerns and patient-reported outcomes. Dressings are taken down. Donor and recipient sites are evaluated for wound infection, hematoma, edema, and soft tissue contours. Pain controlled is assessed. Sutures are removed, when appropriate. The wounds are redressed. Patient questions are answered, and instructions on wound care, activity, and bathing are reinforced. Progress notes are entered into medical record and letters to the primary care/referring physician are completed at each visit. For the first post-op visit at one week post-op, the focus of the visit is on immediate post-operative recovery and evaluation for surgical site complications. Instruction is reviewed on immediate post-operative restrictions, signs of concern, and expectations. For the second post-op visit at four weeks post-op, the focus is on residual surgical site concerns along with evaluation of significant contour deformities or fat necrosis. The relaxation of post-op restrictions is reviewed and patient expectations are addressed. The third post-op visit is at three months post-op and includes an overall evaluation of the effects of the fat grafting on the soft tissues and discussion with the patient regarding future grafting if indicated. The donor sites are also evaluated for soft tissue contour irregularities. Post-operative photographs are taken.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2017, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. One service was identified, CPT code 20926, in which the Medicare data from 2013-2016 indicated that it was performed less than 50% of the time in the inpatient setting yet include inpatient hospital Evaluation and Management services within the global period.

The specialty societies submitted an action plan and indicated that they believe the site of service issue is due to miscoding. The CPT manual includes a parenthetical that was added in 2011 that states (For injection(s) of platelet rich plasma, use 0232T) which resulted in some decrease in utilization for a few years, but now the utilization is creeping up again. The specialty societies believe the typical patient related to this code would be treated in a facility setting and that the site of service anomaly, for both the outpatient and the office setting is the result of miscoding.

The specialty societies proposed to address this miscoding by developing a CPT assistant article and possible introductory language to emphasize correct coding. The RUC recommended that CPT code 20926 be referred to the CPT Editorial Panel for the May 2018 CPT Editorial meeting to add/revise the introductory language and referred to CPT Assistant for education on when to report this service.

After discussions, the specialty societies involved found differences in how the code was utilized. It was believed that ~1/3 of the cases represented use of a soft tissue graft harvested by an excisional technique, ~1/3 of the cases represented autologous fat grafting primarily by plastic surgeons harvested via a liposuction technique and then injected via cannula to fill soft tissue defects, and ~ 1/3 was misuse for protein rich plasma injections or other procedures. The specialty societies agreed that 20926 should be deleted and five new codes which better describe tissue grafting procedures by site and volume be created. 15769 was created to describe the excision of a block of soft tissue and then placement in to the defect. This code is, in essence, a replacement for 20926 and was supported by multiple specialties at the CPT panel meeting. Four additional codes, 15771-15774, were created to describe the use of autologous fat grafting harvested by liposuction technique, prepared with centrifugation, and then injected in multiple small aliquots to fill a soft tissue defect. These codes are volume-based and include both a base code and add-on code depending on the area of the body grafted.

Compelling Evidence:

15771 is a brand-new code and describes a procedure that was otherwise not described in CPT. The code describes new technology to perform tissue transfer that was unavailable as the time the original code was established. As such, CPT code 20926 was used while waiting to see about procedural longevity. In addition, the primary specialty for 20926 historically has been orthopedic surgery and the primary specialty for 15771 is expected to be plastic surgery.

Survey Sample and Process:

A survey request was sent to a random selection of members from the American Society of Plastic Surgeons who have indicated that they perform tissue grafting procedures.

Recommendation:

We are recommending a work RVU of 6.73, the survey 25th percentile.

Pre-time Package 3-FAC (Straightforward Patient/Difficult Procedure)

Evaluation Time – We are recommending 30 minutes of evaluation time which is a decrease of 3 minutes from the pre-service package time based on our survey median.

Positioning Time – We are recommending 10 minutes of positioning time which is an increase of 7 minutes from the pre-service package time due to the multiple sites and the need to secure arm which is supported by our median survey time.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is a decrease of 5 minutes from the selected pre-service package time based on our survey median.

Post-time Package 9A (General Anes or Complex Reg Blk/Straightforward Procedure)

Recommended time has been reduced to 16 minutes which is a decrease of 14 minutes from the post package time selected to match our survey time.

15120	Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)	0.0679	10.15	258	72	75	30	0.5	2	1
14301	Adjacent tissue transfer or rearrangement, any area; defect 30.1 sq cm to 60.0 sq cm	0.0698	12.65	287	58	100	25	0.5	3	1

MPC Comparison

CPT	DESCRIPTOR	IWPUT	RVW	TOTAL TIME	PRE	INTRA	POST	99238	99213	99212
25076	Excision, tumor, soft tissue of forearm and/or wrist area, subfascial (eg, intramuscular); less than 3 cm	0.0467	6.74	206	60	45	20	0.5	2	1
15771	grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50cc or less injectate	0.058	6.73	193	50	60	16	0	1	2
15823	Blepharoplasty, upper eyelid; with excessive skin weighting down lid	0.0722	6.81	161	16	485	10	0.5	1	3

Review of IWPUT demonstrated that 15771 is similar to both our KRC and MPC codes with a wRVU at the 25th percentile.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20926

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Plastic Surgeons How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 6000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Plastic Surgeons Frequency 6000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,000

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Plastic Surgeons Frequency 3000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 19318

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 15772	Tracking Number B3	Original Specialty Recommended RVU: 2.50
		Presented Recommended RVU: 2.50
Global Period: ZZZ	Current Work RVU:	RUC Recommended RVU: 2.50

CPT Descriptor: Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50cc injectate, or part thereof (list separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35 year-old female patient presents with a post lumpectomy defect in the superior medial pole of the breast wishes to use her-own tissue to repair the concavity. Exam documents a 75ml volumetric defect in the area of the lumpectomy. Fat grafting to the breast is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: As an add-on code to 15X01, the additional work involved includes the additional time and effort required to harvest, prepare, and inject additional volumes of grafted fat. This includes infiltration of the donor site with a liposuction wetting (“tumescence”) solution. After waiting for hemostatic effects of the epinephrine and anesthetic effects of the lidocaine, a liposuction cannula is connected to gentle sub-atmospheric pressure and used to harvest the additional fat and associated aspirate from the donor site soft tissues taking care to avoid the creation of soft tissue deformities. The donor incisions are closed in a layered fashion. The lipoaspirate is placed into syringes and then placed in an operating room centrifuge. Each centrifuge is able to hold six syringes which results in an average of 50cc of additional usable fat graft. After completion of the centrifuge cycle, the separated blood is then drained and the oil is wicked away from the usable fat graft. The graft is then transferred into small volume syringes. Small cannulas are then used to subcutaneously inject the fat in small aliquots to fill the soft tissue defect. This requires placement of the grafts in multiple planes and depths in order to ensure viability of the graft. The fat grafts are infiltrated into the soft tissues until the desired volumetric filling is achieved. Filling is often evaluated with the patient in an upright position on the operating room table which requires sitting the patient up.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2017, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. One service was identified, CPT code 20926, in which the Medicare data from 2013-2016 indicated that it was performed less than 50% of the time in the inpatient setting yet include inpatient hospital Evaluation and Management services within the global period.

The specialty societies submitted an action plan and indicated that they believe the site of service issue is due to miscoding. The CPT manual includes a parenthetical that was added in 2011 that states (For injection(s) of platelet rich plasma, use 0232T) which resulted in some decrease in utilization for a few years, but now the utilization is creeping up again. The specialty societies believe the typical patient related to this code would be treated in a facility setting and that the site of service anomaly, for both the outpatient and the office setting is the result of miscoding.

The specialty societies proposed to address this miscoding by developing a CPT assistant article and possible introductory language to emphasize correct coding. The RUC recommended that CPT code 20926 be referred to the CPT Editorial Panel for the May 2018 CPT Editorial meeting to add/revise the introductory language and referred to CPT Assistant for education on when to report this service.

After discussions, the specialty societies involved found differences in how the code was utilized. It was believed that ~1/3 of the cases represented use of a soft tissue graft harvested by an excisional technique, ~1/3 of the cases represented autologous fat grafting primarily by plastic surgeons harvested via a liposuction technique and then injected via cannula to fill soft tissue defects, and ~ 1/3 was misuse for protein rich plasma injections or other procedures. The specialty societies agreed that 20926 should be deleted and five new codes which better describe tissue grafting procedures by site and volume be created. 15769 was created to describe the excision of a block of soft tissue and then placement in to the defect. This code is, in essence, a replacement for 20926 and was supported by multiple specialties at the CPT panel meeting. Four additional codes, 15771-15774, were created to describe the use of autologous fat grafting harvested by liposuction technique, prepared with centrifugation, and then injected in multiple small aliquots to fill a soft tissue defect. These codes are volume-based and include both a base code and add-on code depending on the area of the body grafted. 15772 is the add-on code for autologous fat grafting to the trunk, breasts, extremities, or scalp for each additional 50cc of injectate. This volume was derived from the typical amount of injectable fat obtained from one round of centrifugation.

Compelling Evidence:

15772 is a brand-new add-on code and describes a procedure that was otherwise not described in CPT. The code describes a new technology to perform tissue transfer that was unavailable at the time the original code was established. As such, CPT code 20926 was used while waiting to see about procedural longevity. In addition, the primary specialty for 20926 historically has been orthopedic surgery and the primary specialty for 15772 is expected to be plastic surgery.

Survey Sample and Process:

A survey request was sent to a random selection of members from the American Society of Plastic Surgeons who have indicated that they perform tissue grafting procedures.

Recommendation:

We are recommending a work RVU of 2.50, the survey 25th percentile.

Key Reference Codes

CPT	DESCRIPTOR	IWPUT	RVW	TOTAL TIME	PRE	INTRA	POST	99238	99213	99212
15772	grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50cc injectate, or part thereof (list separately in addition to code for primary procedure)	0.056	2.50	45	0	45	0	0	0	0
15121	Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)	0.0667	2.00	30	0	30	0	0	0	0
14302	Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)	0.0933	3.73	40	0	40	0	0	0	0

MPC Comparison

CPT	DESCRIPTOR	IWPUT	RVW	TOTAL TIME	PRE	INTRA	POST	99238	99213	99212
37253	Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel (List separately in addition to code for primary procedure)	0.0709	1.44	21	0	20	1	0	0	0
15772	grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50cc injectate, or part thereof (list separately in addition to code for primary procedure)	0.056	2.50	45	0	45	0	0	0	0
36476	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)	0.0883	2.65	30	0	30	0	0	0	0

Review of IWPUT demonstrated that 157712 is similar to both our KRC and MPC codes with a wRVU at the 25th percentile.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

RUC Recommended RVU: **6.83**

CPT Descriptor: Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25cc or less injectate

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year-old male patient presented 15 years after radical local excision of a rhabdomyosarcoma of his left masseter followed by irradiation. Exam shows a 20 ml volumetric soft tissue defect on left jaw at the previous surgical site.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 45% , In the ASC 47%, In the office 7%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 96% , Overnight stay-less than 24 hours 4% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Orders for preoperative medications are written, and laboratory results, imaging, and patient photographs, are reviewed. The planned procedure and postoperative management are reviewed with the patient and the patient's family. The patient's history and physical are updated. The operative site is marked, and the proposed areas for both graft injection and graft harvest are reviewed with the patient. Informed consent is obtained. The length and type of anesthesia are reviewed with the anesthesiologist. The availability of all required supplies and instruments are verified. The patient is transferred from the gurney and positioned on the operating room table. Bony prominences are padded, and thermal regulation drapes are applied. The position of the extremities and head is assessed and adjusted, as needed based on the multiple surgical sites and secured in the typical scenario where the patient will be sat upright during the operation. The surgeon scrubs and gowns. Both recipient and donor sites are prepared and draped with additional time often required for the multiple sites of surgery. Protective corneal shields are placed. A surgical time-out is performed with the operating surgical team.

Description of Intra-Service Work: The patient is brought back to the operating room. Both the face and the abdominal donor site are prepped. The abdominal donor site is infiltrated with a liposuction wetting ("tumescent") solution. A liposuction cannula is connected to gentle sub-atmospheric pressure and used to harvest the fat and associated aspirate from the abdominal soft tissue. The donor incisions are closed. The lipoaspirate is placed into syringes and then placed in an operating room centrifuge. The separate blood is then drained and the oil is wicked away from the usable fat graft. The graft is then transferred into small volume syringes. Small cannulas are then used to subcutaneously inject the fat in small aliquots to fill the soft tissue defect. This requires placement of the grafts in multiple planes and depths in order to ensure viability of the graft. The small stab wounds are then closed primarily.

Description of Post-Service Work:

Immediate Post-Op - Sterile dressings are applied along with a post-operative compression garment to the donor site. The patient is transferred to the recovery room with signout to the recovery room nursing staff. The procedure and outcome are discussed with the patient and family. An operative note is dictated. Post-operative instructions are written and orders for discharge are completed.

Office Visits - At each visit, a discussion is held with patient including post-operative recovery concerns and patient-reported outcomes. Dressings are taken down. Donor and recipient sites are evaluated for wound infection, hematoma, edema, and soft tissue contours. Pain controlled is assessed. Sutures are removed, when appropriate. The wounds are redressed. Patient questions are answered, and instructions on wound care, activity, and bathing are reinforced. Progress notes are entered into medical record and letters to the primary care/referring physician are completed at each visit. For the first post-op visit at one week post-op, the focus of the visit is on immediate post-operative recovery and evaluation for surgical site complications. Instruction is reviewed on immediate post-operative restrictions, signs of concern, and expectations. For the second post-op visit at four weeks post-op, the focus is on residual surgical site concerns along with evaluation of significant contour deformities or fat necrosis. The relaxation of post-op restrictions is reviewed and patient expectations are addressed. The third post-op visit is at three months post-op and includes and overall evaluation of the effects of the fat grafting on the soft tissues and discussion with the patient regarding future grafting if indicated. The donor sites are also evaluated for soft tissue contour irregularities. Post-operative photographs are taken.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2017, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. One service was identified, CPT code 20926, in which the Medicare data from 2013-2016 indicated that it was performed less than 50% of the time in the inpatient setting yet include inpatient hospital Evaluation and Management services within the global period.

The specialty societies submitted an action plan and indicated that they believe the site of service issue is due to miscoding. The CPT manual includes a parenthetical that was added in 2011 that states (For injection(s) of platelet rich plasma, use 0232T) which resulted in some decrease in utilization for a few years, but now the utilization is creeping up again. The specialty societies believe the typical patient related to this code would be treated in a facility setting and that the site of service anomaly, for both the outpatient and the office setting is the result of miscoding.

The specialty societies proposed to address this miscoding by developing a CPT assistant article and possible introductory language to emphasize correct coding. The RUC recommended that CPT code 20926 be referred to the CPT Editorial Panel for the May 2018 CPT Editorial meeting to add/revise the introductory language and referred to CPT Assistant for education on when to report this service.

After discussions, the specialty societies involved found differences in how the code was utilized. It was believed that ~1/3 of the cases represented use of a soft tissue graft harvested by an excisional technique, ~1/3 of the cases represented autologous fat grafting primarily by plastic surgeons harvested via a liposuction technique and then injected via cannula to fill soft tissue defects, and ~ 1/3 was misuse for protein rich plasma injections or other procedures. The specialty societies agreed that 20926 should be deleted and five new codes which better describe tissue grafting procedures by site and volume be created. 15769 was created to describe the excision of a block of soft tissue and then placement in to the defect. This code is, in essence, a replacement for 20926 and was supported by multiple specialties at the CPT panel meeting. Four additional codes, 15771-15774, were created to describe the use of autologous fat grafting harvested by liposuction technique, prepared with centrifugation, and then injected in multiple small aliquots to fill a soft tissue defect. These codes are volume-based and include both a base code and add-on code depending on the area of the body grafted. 15773 is the base-code for autologous fat grafting to the sensitive areas of the face, hands, feet, and genitalia for up to 25cc of injectate. This volume was derived from the typical volume of fat grafted into these smaller areas compared to the trunk.

Compelling Evidence:

15773 is a brand-new code and describes a procedure that was otherwise not described in CPT. The code describes a new technology to perform tissue transfer that was unavailable at the time the original code was established. As such, CPT code 20926 was used while waiting to see about procedural longevity. In addition, the primary specialty for 20926 historically has been orthopedic surgery and the primary specialty for 15773 is expected to be plastic surgery.

Survey Sample:

A survey request was sent to a random sample of members from the American Society of Plastic Surgeons who have indicated that they perform tissue grafting procedures.

Recommendation:

We are recommending a work RVU of 6.83, which is the 25th percentile of the survey.

Pre-time Package 3-FAC (Straightforward Patient/Difficult Procedure)

Evaluation Time – We are recommending 30 minutes of evaluation time which is a decrease of 3 minutes from the pre-service package time based on our survey.

Positioning Time – We are recommending 10 minutes of positioning time which is an increase of 7 minutes from the pre-service package time due to the multiple sites and the need to secure arms. This time is supported by our survey.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is a decrease of 5 minutes from the selected pre-service package time based on our survey response.

Post-time Package 9A (General Anes or Complex Reg Blk/Straightforward Procedure)

Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected based on our survey responses.

CPT	DESCRIPTOR	IWPUT	RVW	TOTAL TIME	PRE	INTRA	POST	99238	99213	99212
25076	Excision, tumor, soft tissue of forearm and/or wrist area, subfascial (eg, intramuscular); less than 3 cm	0.0467	6.74	206	60	45	20	0.5	2	1
15773	grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25cc or less injectate	0.060	6.83	193	50	60	15	0	1	2
26615	Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone	0.0443	7.07	217	55	45	20	0.5	2	2

Review of IWPUT demonstrated that 15773 is similar to both our KRC and MPC codes with a wRVU at the 25th percentile.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 20926

SUMMARY OF RECOMMENDATION**

CPT Code: 15774	Tracking Number	Original Specialty Recommended RVU: 2.41
		Presented Recommended RVU: 2.41
Global Period: ZZZ	Current Work RVU:	RUC Recommended RVU: 2.41

CPT Descriptor: Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25cc injectate, or part thereof (list separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year-old male patient presented 15 years after radical local excision of a rhabdomyosarcoma of his left masseter followed by irradiation. Exam shows a 40 ml volumetric soft tissue defect on left jaw at the previous surgical site.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: As an add-on code to 15X03, the additional work involved includes the additional time and effort required to harvest, prepare, and inject additional volumes of grafted fat. This includes infiltration of the donor site with a liposuction wetting ("tumescent") solution. After waiting for hemostatic effects of the epinephrine and anesthetic effects of the lidocaine, a liposuction cannula is connected to gentle sub-atmospheric pressure and used to harvest the additional fat and associated aspirate from the donor site soft tissues taking care to avoid the creation of soft tissue deformities. The donor incisions are closed in a layered fashion. The lipoaspirate is placed into syringes and then placed in an operating room centrifuge. Each centrifuge is able to hold six syringes which results in an average of 50cc of additional usable fat graft. After completion of the centrifuge cycle, the separated blood is then drained and the oil is wicked away from the usable fat graft. The graft is then transferred into small volume syringes. Small cannulas are then used to subcutaneously inject the fat in small aliquots to fill the soft tissue defect. This requires placement of the grafts in multiple plane and depths in order to ensure viability of the graft. The fat grafts are infiltrated into the soft tissues until the desired volumetric filling is achieved. Filling is often evaluated with the patient in an upright position on the operating room table.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2017, AMA Staff reviewed services with anomalous sites of service when compared to Medicare utilization data. One service was identified, CPT code 20926, in which the Medicare data from 2013-2016 indicated that it was performed less than 50% of the time in the inpatient setting yet include inpatient hospital Evaluation and Management services within the global period.

The specialty societies submitted an action plan and indicated that they believe the site of service issue is due to miscoding. The CPT manual includes a parenthetical that was added in 2011 that states (For injection(s) of platelet rich plasma, use 0232T) which resulted in some decrease in utilization for a few years, but now the utilization is creeping up again. The specialty societies believe the typical patient related to this code would be treated in a facility setting and that the site of service anomaly, for both the outpatient and the office setting is the result of miscoding.

The specialty societies proposed to address this miscoding by developing a CPT assistant article and possible introductory language to emphasize correct coding. The RUC recommended that CPT code 20926 be referred to the CPT Editorial Panel for the May 2018 CPT Editorial meeting to add/revise the introductory language and referred to CPT Assistant for education on when to report this service.

After discussions, the specialty societies agreed that 20926 should be deleted and 5 new codes which better describe tissue grafting procedures by site and volume be created.

Compelling Evidence:

15774 is a brand-new add-on code and describes a procedure that was otherwise not described in CPT. As such, CPT code 20926 was used while waiting to see about procedural longevity.

Survey Sample and Process:

A survey request was sent to a random selection of members from the American Society of Plastic Surgeons who have indicated that they perform tissue grafting procedures.

Recommendation:

We are recommending a work RVU of 2.41, the survey 25th percentile.

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor:

Global Period: 090 Meeting Date: September 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our specialties formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of oral and maxillofacial surgery and general otolaryngologists. The expert panel members also practice in settings that vary by size, geography, and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized the existing PE inputs as a reference for CPT Code 20926.

3. Is this code(s) typically billed with an E/M service? **No**
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence:

Regarding compelling evidence, we believe that compelling evidence exists because the dominant specialty has changed from orthopedics to otolaryngology.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. N/A
9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: N/A
10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: N/A
11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

We are only recommending a power table for the facility setting. This is used in the post operative visits and uses the post operative formula.

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: N/A
13. If there is any other item on your spreadsheet that needs further explanation please include here: N/A
14. Please include an explanation of each line item:

Line 15 – staff must complete pre-service and diagnostic/referral forms

Line 16 – staff coordinate pre-surgery services

Line 17 – staff schedule space and equipment in the facility

Line 18 staff provide pre-service education and get patient consent

Line 19 staff complete pre-procedure phone calls

Line 74 – a discharge management visit is conducted to properly discharge the patient from the facility setting

Line 88 – two post operative 99212 visits are performed. These are the second and third visits after the procedure.

Line 89 – one 99213 post operative visit is performed. This is the first visit after the procedure.

Line 102 – multispecialty packs are used at each of the three post operative visits

Line 104 – pack, post op incision care (suture) – For suture removal at post-operative visit

Line 140 – power table – used to perform the procedure in the office and for the post operative visits

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor:

Global Period: 090 Meeting Date: September 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our specialties formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of oral and maxillofacial surgery and general otolaryngologists. The expert panel members also practice in settings that vary by size, geography, and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized the existing PE inputs as a reference for CPT Code 20926.

3. Is this code(s) typically billed with an E/M service? **No**
Is this code(s) typically billed with the E/M service in the nonfacility? **No**
(Please see provided data in PE Subcommittee folder)
4. What specialty is the dominant provider in the nonfacility? **Otolaryngology**
What percent of the time does the dominant provider provide the service(s) in the nonfacility? **36%**
Is the dominant provider in the nonfacility different then for the global? **No**
(Please see provided data in PE Subcommittee folder)
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

Supplies – we have removed the post operative incision pack (staple) and replaced it with the (suture) pack.

Equipment – we have removed the cast cutter which is not needed for the procedure.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:
9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:
10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. **N/A**
11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:
12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. **N/A**
13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:

The only equipment needed for the post op visits is the table. We used the post op visit formula for that item.
16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: **N/A**
17. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**
18. Please include an explanation of each line item:

Line 88 – two post operative 99212 visits are performed. These are the second and third visits after the procedure.

Line 89 – one 99213 post operative visit is performed. This is the first visit after the procedure.

Line 102 – multispecialty packs are used during each of the three post operative visits

Line 104 – pack, post op incision care (suture) – For suture removal at post-operative visit

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

Meeting Date: October 2018

Global Period: 090

CPT Long Descriptor:

15771 - Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50cc or less injectate

Global Period: ZZZ

CPT Long Descriptors:

15772 - Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50cc injectate, or part thereof

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our specialties formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of oral and maxillofacial surgery and general otolaryngologists. The expert panel members also practice in settings that vary by size, geography, and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized the existing PE inputs as a reference for CPT Code 20926.

3. Is this code(s) typically billed with an E/M service? **No**
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence:

Regarding compelling evidence, we believe that compelling evidence exists because the dominant specialty has changed from orthopedics to plastic surgery.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. **N/A**

Line 19 staff complete pre-procedure phone calls

Line 88 – two post operative 99212 visits are performed. These are the second and third visits after the procedure.

Line 89 – one 99213 post operative visit is performed. This is the first visit after the procedure.

Line 140 – power table – used to perform the procedure and for the post operative visits

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

Meeting Date: October 2018

Global Period: 090

CPT Long Descriptor:

15771 - Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50cc or less injectate

Global Period: ZZZ

CPT Long Descriptors:

15772 - Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50cc injectate, or part thereof

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our society formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and clinical experts. The expert panel members also practice in settings that vary by size, geography and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized existing PE inputs for CPT code 20926 as a reference.

3. Is this code(s) typically billed with an E/M service? No

Is this code(s) typically billed with the E/M service in the nonfacility? No
(Please see provided data in PE Subcommittee folder)

4. What specialty is the dominant provider in the nonfacility? Plastic Surgeons

What percent of the time does the dominant provider provide the service(s) in the nonfacility?

Based on RUC database, we estimate 36% of procedures may be done in the non-facility

Is the dominant provider in the nonfacility different then for the global? No

(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

- 6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.**

We are establishing non-facility time for this procedure which did not historically have PE inputs in this site of service and was only done in the facility. Per the RUC database, it is now done 36% of the time in the non-facility and therefore, we felt it required modification to reflect actual practice. None of the times requested are above the standards for those activities, however, the total PE inputs/time has increased due to adding the new site of service.

Regarding compelling evidence – the dominant specialty has changed from orthopedics to plastic surgery.

Supplies – we have removed the post operative incision pack (staple) and replaced it with the (suture) pack. We also added in the supplies needed to perform this procedure in the non-facility setting which is discussed above.

Equipment – we have removed the cast cutter and replaced it with the equipment needed to perform this procedure in the non-facility setting which is discussed above.

- 7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: N/A**
- 8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)**
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

Staff must take the following vitals: Heart rate, blood pressure and pulse oximetry

- 9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, Assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:**

Staff are present during the entire procedure, Staff are there directly assisting the physician passing instruments, receiving the donor specimen, keeping the surgical field clear with suction, passing gauze, sutures and dressing supplies.

- 10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. N/A**

- 11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:**

Existing PE was all lumped into the assist during procedure line item. We have divided out clinical staff activities for the necessary activities and assigned the standard time for those activities per the PE guidelines.

- 12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source.** Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.

N/A

- 13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:** *invoices pending*

- 14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:** *invoices pending*

- 15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”).** If you have selected “other formula” for any of the equipment please explain here:

The only equipment needed for the post op visits is the camera. We used the post op visit formula for that item. For the remaining items, we only require those items when procedure is done in the non-facility.

- 16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:** *N/A*

- 17. If there is any other item on your spreadsheet that needs further explanation please include here:** *N/A*

18. Please include an explanation of each line item:

Line 15 – staff must complete pre-service and diagnostic/referral forms

Line 16 – staff coordinate pre-surgery services

Line 17 – staff schedule space and equipment in the facility

Line 18 staff provide pre-service education and get patient consent

Line 19 staff complete pre-procedure phone calls

Line 33 – greet patient, gown them and ensure any records needed are available.

Line 34 – obtain 3 vitals: Heart rate, blood pressure and pulse oximetry

Line 37 – prepare the room for the patient’s arrival and set up materials needed for procedure.

Line 40 – prepare, set up and start IV

Line 49 – the staff are assisting directly during the entire 45 minute procedure

Line 60 – patients are monitored for 15 minutes after the procedure, so the standard time of 15 minutes per hour was reduced to accurately reflect 15 minutes of monitoring (3.75 was rounded up).

Line 62 – staff clean the room and chair after the procedure.

Line 64 – staff clean the basic instrument pack after the procedure

CPT Code: 15771, 15772

Specialty Society: American Society of Plastic Surgeons

Line 67 – check dressings, wounds – looking for any dehiscence, signs of infection

Line 73 – review home care instructions – review potential signs to look for and what the patient will experience the days following procedure.

Line 88 – two post operative 99212 visits are performed. These are the second and third visits after the procedure.

Line 89 – one 99213 post operative visit is performed. This is the first visit after the procedure.

Line 102 – multispecialty packs are used at each of the three post operative visits

Line 104 – pack, post op incision care (suture) – For suture removal at post-operative visit #1

Line 105 – iv starter kit

Line 106, cap surgical – used to cover the surgeons hair and maintain sterile environment

Line 108 – chlorhexidine 0.12% (Peridex) – disinfectant before surgery

Line 109 – Lidocaine 1% with epi For local anesthesia and vasoconstriction

Line 110 - sterile drape for Mayo stand – used to cover the Mayo stand and keep a sterile environment for the supplies

Line 112 – catheter, suction To suction fat during procedure.

Line 113 – drape, sterile, fenestrated 16x29 – one drape needed to cover the donor site

Line 114 – drape, towel, sterile 18 in x 26 in - one drape needed to cover the recipient site

Line 115 – invoice pending

Line 116 - invoice pending

Line 117 - invoice pending

Line 118 - invoice pending

Line 119 – syringe – used to draw up the fat

Line 120 – microspunge, cellulose (10 pack) To wick oil off the fat

~~Line 121 – test tube To collect fat-DELETED~~

Line 122 – tray, suturing To close the wounds

Line 123 – suture, nylon – to close ports/stab incisions

Line 124 – bandage, strip (bandaid) – to cover the sutures

Line 127 – tape, surgical paper Used to secure dressing

Line 133 – dressing, 4 x 4 (Tegaderm) to cover wounds

~~Line 132 – canister, suction – used to hold suctioned blood during procedure~~

Line 140– power table – used to perform the procedure in the office and for the post operative visits

Line 141 - mayo stand – holds the instruments during the procedure

Line 142 – instrument pack – contains knife handle, scissors, forceps and retractors needed for procedure

Line 143- exam light – used to light the surgical field during the procedure.

Line 144 – centrifuge, with rotor – used to separate fat

Line 145 – camera, digital – used to obtain post op photos

Line 146- invoice pending

Line 147- invoice pending

Line 148- invoice pending

Line 149- invoice pending

Line 150- invoice pending

Line 151 - invoice pending

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

Meeting Date: October 2018

Global Period: 090

CPT Long Descriptor:

15773 - Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25cc or less injectate

Global Period: ZZZ

CPT Long Descriptor:

15774 - Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25cc injectate, or part thereof

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our specialties formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of oral and maxillofacial surgery and general otolaryngologists. The expert panel members also practice in settings that vary by size, geography, and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized the existing PE inputs as a reference for CPT Code 20926.

3. Is this code(s) typically billed with an E/M service? **No**
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence:

Regarding compelling evidence, we believe that compelling evidence exists because the dominant specialty has changed from orthopedics to plastic surgery.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. **N/A**
9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:
12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: **N/A**
13. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**
14. Please include an explanation of each line item:

Line 15 – staff must complete pre-service and diagnostic/referral forms

Line 16 – staff coordinate pre-surgery services

Line 17 – staff schedule space and equipment in the facility

Line 18 staff provide pre-service education and get patient consent

Line 19 staff complete pre-procedure phone calls

Line 88 – two post operative 99212 visits are performed. These are the second and third visits after the procedure.

Line 89 – one 99213 post operative visit is performed. This is the first visit after the procedure.

Line 140 – power table – used to perform the procedure and for the post operative visits

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

Meeting Date: October 2018

Global Period: 090

CPT Long Descriptor:

15773 - Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25cc or less injectate

Global Period: ZZZ

CPT Long Descriptor:

15774 - Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25cc injectate, or part

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our society formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and clinical experts. The expert panel members also practice in settings that vary by size, geography and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized existing PE inputs for CPT code 20926 as a reference.

3. Is this code(s) typically billed with an E/M service? No
Is this code(s) typically billed with the E/M service in the nonfacility? No
(Please see provided data in PE Subcommittee folder)

4. What specialty is the dominant provider in the nonfacility? Plastic Surgeons
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Based on RUC database, we estimate 36% of procedures may be done in the non-facility
Is the dominant provider in the nonfacility different then for the global? No
(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Pre time: we are requesting the standard pre time for a 90 day global. Previously all pre-time was lumped into one line item for regulatory compliance, likely before the standards were established by the PE Subcommittee.

6. **If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.**

We are establishing non-facility time for this procedure which did not historically have PE inputs in this site of service and was only done in the facility. Per the RUC database, it is now done 36% of the time in the non-facility and therefore, we felt it required modification to reflect actual practice. None of the times requested are above the standards for those activities, however, the total PE inputs/time has increased due to adding the new site of service.

Regarding compelling evidence – the dominant specialty has changed from orthopedics to plastic surgery.

Supplies – we have removed the post operative incision pack (staple) and replaced it with the (suture) pack. We also added in the supplies needed to perform this procedure in the non-facility setting which is discussed above.

Equipment – we have removed the cast cutter and replaced it with the equipment needed to perform this procedure in the non-facility setting which is discussed above.

7. **If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:** N/A
8. **How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)**
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

Staff must take the following vitals: Heart rate, blood pressure and pulse oximetry

9. **Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:***

Staff are present during the entire procedure, Staff are there directly assisting the physician passing instruments, receiving the donor specimen, keeping the surgical field clear with suction, passing gauze, sutures and dressing supplies.

10. **If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.** N/A

- 11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:**

Existing PE was all lumped into the assist during procedure line item. We have divided out clinical staff activities for the necessary activities and assigned the standard time for those activities per the PE guidelines.

- 12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. N/A**

- 13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:** *invoices pending*

- 14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:** *invoices pending*

- 15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:**

The only equipment needed for the post op visits is the camera. We used the post op visit formula for that item. For the remaining items, we only require those items when procedure is done in the non-facility.

- 16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:** *N/A*

- 17. If there is any other item on your spreadsheet that needs further explanation please include here:** *N/A*

- 18. Please include an explanation of each line item:**

Line 15 – staff must complete pre-service and diagnostic/referral forms

Line 16 – staff coordinate pre-surgery services

Line 17 – staff schedule space and equipment in the facility

Line 18 staff provide pre-service education and get patient consent

Line 19 staff complete pre-procedure phone calls

Line 33 – greet patient, gown them and ensure any records needed are available.

Line 34 – obtain 3 vitals: Heart rate, blood pressure and pulse oximetry

Line 37 – prepare the room for the patient’s arrival and set up materials needed for procedure.

Line 40 – prepare, set up and start IV

Line 49 – the staff are assisting directly during the entire 45 minute procedure

Line 60 – patients are monitored for 15 minutes after the procedure, so the standard time of 15 minutes per hour was reduced to accurately reflect 15 minutes of monitoring (3.75 was rounded up).

Line 62 – staff clean the room and chair after the procedure.

Line 64 – staff clean the basic instrument pack after the procedure

Line 67 – check dressings, wounds – looking for any dehiscence, signs of infection

CPT Code: 15773, 15774

Specialty Society: American Society of Plastic Surgeons

Line 73 – review home care instructions – review potential signs to look for and what the patient will experience the days following procedure.

Line 88 – two post operative 99212 visits are performed. These are the second and third visits after the procedure.

Line 89 – one 99213 post operative visit is performed. This is the first visit after the procedure.

Line 102 – multispecialty packs are used at each of the three post operative visits

Line 104 – pack, post op incision care (suture) – For suture removal at post-operative visit #1

Line 105 – iv starter kit

Line 106, cap surgical – used to cover the surgeons hair and maintain sterile environment

Line 108 – chlorhexidine 0.12% (Peridex) – disinfectant before surgery

Line 109 – Lidocaine 1% with epi For local anesthesia and vasoconstriction

Line 110 - sterile drape for Mayo stand – used to cover the Mayo stand and keep a sterile environment for the supplies

Line 112 – catheter, suction To suction fat during procedure.

Line 113 – drape, sterile, fenestrated 16x29 – one drape needed to cover the donor site

Line 114 – drape, towel, sterile 18 in x 26 in - one drape needed to cover the recipient site

Line 115 – invoice pending

Line 116 - invoice pending

Line 117 - invoice pending

Line 118 - invoice pending

Line 119 – syringe – used to draw up the fat **UPDATE made to #s for x3 code**

Line 120 – microspunge, cellulose (10 pack) To wick oil off the fat

~~Line 121 – test tube To collect fat-DELETED~~

Line 122 – tray, suturing To close the wounds

Line 123 – suture, nylon – to close ports/stab incisions

Line 124 – bandage, strip (bandaid) – to cover the sutures

Line 127 – tape, surgical paper Used to secure dressing

Line 133 – dressing, 4 x 4 (Tegaderm) to cover wounds

~~Line 132 – canister, suction – used to hold suctioned blood during procedure~~

Line 140– power table – used to perform the procedure in the office and for the post operative visits

Line 141 - mayo stand – holds the instruments during the procedure

Line 142 – instrument pack – contains knife handle, scissors, forceps and retractors needed for procedure

Line 143- exam light – used to light the surgical field during the procedure.

Line 144 – centrifuge, with rotor – used to separate fat

Line 145 – camera, digital – used to obtain post op photos

Line 146- invoice pending

Line 147- invoice pending

Line 148- invoice pending

Line 149- invoice pending

Line 150- invoice pending

Line 151 - invoice pending

AMA/Specialty Society RVS Update Committee Summary of Recommendations
** Different Performing Specialty from Survey**

October 2018

Drug Delivery Implant Procedures

In October 2017, code 11981 was identified as being performed by a different specialty than who originally surveyed this service. In January 2018, the RUC recommended to refer CPT codes 11980 -11982 to CPT to better define these services and differentiate between the use in musculoskeletal procedures and use in urological or gynecological procedures. In May 2018, the CPT Editorial Panel approved the addition of six add-on codes to describe orthopaedic drug delivery to differentiate the service from the service described in code 11981.

Integumentary System

11980 Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)

The specialty societies indicated that CPT code 11980 was recently surveyed for CPT 2015 and the physician work has not changed since then. The RUC confirmed that the physician time and work remain appropriately relative to CPT codes 11981-11983. **The specialty societies requested and the RUC agreed to affirm the January 2014 RUC recommendation of 1.10 work RVUs 7 minutes evaluation, 2 minutes positioning, 1 minute scrub, dress, wait pre-service time, 12 minutes intra-service time and 5 minutes immediate post-service time for CPT code 11980.**

11981 Insertion, non-biodegradable drug delivery implant

The RUC reviewed the survey results from 111 gynecologists and urologists and determined that the survey 25th percentile work RVU of 1.30, a decrease from the current work RVU, accurately accounts for the work required to perform this service. The RUC recommends 15 minutes evaluation, 1 minute positioning, 4 minutes scrub, dress, wait pre-service time, 5 minutes intra-service time and 5 minutes post-service time. The RUC noted that this service is typically provided for the insertion of a subdermal contraceptive for women or insertion of a drug implant for men with metastatic prostate cancer. The RUC confirmed that the 15 minutes of evaluation time is necessary to explain the risks and benefits of the implant including bleeding, infection, hormone changes, hot flashes, weight gain and muscle loss, examination of the insertion site and obtain consent. The RUC noted that since this is a bimodal service, the median intra-service time was 5 minutes as indicated by the gynecologists who completed the majority of the surveys. The current source is CMS/Other and that the crosswalk or methodology used in the valuation of this service is unknown and not resource-based, therefore it is invalid to compare the current time and work to the surveyed time and work.

The RUC noted that CPT code 11981 is a different procedure compared to 11980. CPT code 11980 is the subcutaneous implantation of a biodegradable compounded pellet that can be placed anywhere in the body with a needle and trocar. Whereas, CPT code 11981 is the insertion of a non-biodegradable implant that must be placed in a specific location in the arm. CPT code 11981 is the placement of a silastic capsule with a trocar system and removal of the placement device. Therefore, the physician time and work is different.

The RUC compared the surveyed code to the top two key reference services as indicated by the surveyees, CPT code 55876 *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple* (work RVU = 1.73, 20 minutes intra-service time and 59 total minutes) and 57500 *Biopsy of cervix, single or multiple, or local excision of lesion, with or without fulguration (separate procedure)* (work RVU = 1.20, 15 minutes intra-service time and 29 total minutes). The majority of survey respondents that selected the top key reference code 55876 had indicated that both services have identical intensity and complexity. The RUC noted that since 11981 has such a low intra-service time and is a 000-day service comparing the intra-service per unit of time (IWPUT) is not a useful comparison. Additionally, the key reference services were established before the pre-service packages therefore making the IWPUTs incongruent. The RUC compared the surveyed code to 67515 *Injection of medication or other substance into Tenon's capsule* (work RVU = 1.40, 5 minutes intra-service time and 21 minutes total time), which also has 5 minutes intra-service time and requires similar physician work to perform. The RUC also referenced MPC codes 12013 *Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm* (work RVU = 1.22 and 27 total minutes) and 12004 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm* (work RVU = 1.44 and 29 total minutes), both which have similar physician work and total time. **The RUC recommends a work RVU of 1.30 for CPT code 11981.**

11982 Removal, non-biodegradable drug delivery implant

The RUC reviewed the survey results from 110 gynecologists and urologists and determined that the survey 25th percentile work RVU of 1.70 accurately accounts for the work required to perform this service. The RUC recommends 13 minutes evaluation, 1 minute positioning, 4 minutes scrub, dress, wait pre-service time, 15 minutes intra-service time and 5 minutes post-service time. The RUC confirmed that the 13 minutes of evaluation time is necessary to explain the risks and benefits of removal including bleeding, infection and recurrence of cancer with the removal of the hormonal ablation medication for men and for women to explain the procedure, review allergies and obtain consent. CMS questioned if this service is reported with an Evaluation and Management (E/M) service on the same day. The data indicates that CPT code 11982 is only reported with an E/M 6% of the time, so it is not typical. Since this service is not reported with an E/M, the physician must reiterate all the risks associated with this service and discuss any subsequent treatment (for prostate cancer patients) in the pre-service time.

The current source is CMS/Other and that the crosswalk or methodology used in the valuation of this service is unknown and not resource-based, therefore it is invalid to compare the current time and work to the surveyed time and work.

The RUC confirmed that CPT code 11982 requires more intra-service time to perform than the insertion, CPT code 11981, because to remove the capsule, the physician must first dissect away the fibrotic tissue that has formed a pseudo capsule around the actual capsule. A sharp incision into the tissue sheath is required to mobilize and remove the implant.

The RUC compared the surveyed code to the top key reference service as indicated by the surveyees, CPT code 54150 *Circumcision, using clamp or other device with regional dorsal penile or ring block* (work RVU = 1.90, 15 minutes intra-service time and 45 total minutes). The majority of survey respondents that selected the top key reference code 54150 had indicated that both services have identical intensity and complexity, and should be valued similarly. The RUC noted that since CPT code 11982 has such a low intra-service time and is a 000-day service comparing the intra-service per unit of time (IWPUT) is not a useful comparison. For additional support, the RUC compared the survey code to MPC code 12004 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm* (work RVU = 1.44). **The RUC recommends a work RVU of 1.70 for CPT code 11982.**

11983 Removal with reinsertion, non-biodegradable drug delivery implant

The RUC reviewed the survey results from 112 gynecologists and urologists and determined that the survey 25th percentile work RVU of 2.10 accurately accounts for the work required to perform this service. The RUC recommends 15 minutes evaluation, 1 minute positioning, 4 minutes scrub, dress, wait pre-service time, 15 minutes intra-service time and 5 minutes post-service time. The RUC confirmed that the 15 minutes of evaluation time is necessary to review previous hormone ablation history, alternative therapies with the patient, side effects and risks.

The current source is CMS/Other and that the crosswalk or methodology used in the valuation of this service is unknown and not resource-based, therefore it is invalid to compare the current time and work to the surveyed time and work.

The RUC confirmed that CPT code 11983 requires more intra-service time to perform than the insertion only, CPT code 11981, because to remove the capsule, the physician must first dissect away the fibrotic tissue that has formed a pseudo capsule around the actual capsule. A sharp incision into the tissue sheath is required to mobilize and remove the implant. The RUC noted that the intra-service time for 11982 and 11983 are the same because the only thing that is shared is the incision site, but the physician uses z-type insertion needle to place the new capsule in a slightly different location within the arm.

The RUC compared the surveyed code to the 2nd top key reference service as indicated by the surveyees, CPT code 55700 *Biopsy, prostate; needle or punch, single or multiple, any approach* (work RVU = 2.50, 15 minutes intra-service time and 35 total minutes). The survey respondents indicated that CPT code 11983 overall requires the same or more intensity and complexity to perform as 55700. The RUC noted that since CPT code 11983 has such a low intra-service time and is a 000-day service comparing the intra-service per unit of time (IWPUT) is not a useful comparison. The RUC also referenced MPC codes 54150 *Circumcision, using clamp or other device with regional dorsal penile or ring block* (work RVU = 1.90, 15 minutes intra-service time and 45 total minutes) and 52281 *Cystourethroscopy, with calibration and/or dilation of urethral stricture or stenosis, with or without meatotomy, with or without injection procedure for cystography, male or female* (work RVU = 2.75 and 20 minutes intra-service time and 46 minutes total time). **The RUC recommends a work RVU of 2.10 for CPT code 11983.**

Musculoskeletal System

Compelling Evidence

Code 11981 was identified as being performed by a different specialty than who originally surveyed this service. In January 2018, the RUC recommended to refer CPT codes 11980 -11982 to CPT to better define these services and differentiate between the use in musculoskeletal procedures and use in urological or gynecological procedures. The musculoskeletal procedures were never meant to be reported with codes 11981-11983 because those codes were clearly created for subcutaneous insertion of a 1-3 year, non-biodegradable drug-releasing implant. CPT required the specialty societies to use the long form CPT proposal and submit literature to support the proposed musculoskeletal codes. No descriptor changes were requested to the current codes 11981-11983 as those codes will continue to represent insertion and removal of a non-biodegradable drug-releasing implant. **The RUC agreed that these new codes in the 20000 series in CPT describe new technology and it would not be appropriate to review their valuation in comparison to previous time and valuation of 11980-11982.**

20700 Manual preparation and insertion of drug delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 139 orthopaedic surgeons and determined that the survey 25th percentile work RVU of 1.50 accurately accounts for the work required to perform this service. The RUC recommends 5 minutes evaluation pre-service time, 20 minutes intra-service time and 2 minutes post-service time. This add-on code is typically reported with debridement or arthrotomy procedures. The pre-service work includes obtaining informed consent, explaining the risks and benefits, review culture data, select antibiotics if necessary and confirm all materials are available and set up (antibiotic powder and cement). The intra-service work starts after the physician has performed the debridement or cleaned the infected bone. A “dead space” remains, in which the physician will insert the device. The surgeon makes this device on the back table by mixing the cement powder with the antibiotic powder, adds liquid monomer and mixes it under a vacuum. As the cement hardens but is still soft the surgeon rolls it out like dough into tube formations, cuts it into small segments, rolls it into beads, threads the beads on the suture evenly and ties a large knot on the end incorporating a metallic marker for imaging. The RUC confirmed that there is no overlap in work of the clinical staff and the surgeon. The post-service work is documentation and x-ray review.

CMS questioned why the removal of the musculoskeletal drug delivery devices are less than the insertions. The specialties confirmed that the insertions require more physician work and time because of the requirements for preparing materials and limited time of the hardening of the mediums used for the musculoskeletal drug delivery devices.

The RUC compared the surveyed code to the top key reference services as indicated by the surveyees, CPT code 11047 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 1.80, and 30 minutes intra-service time) and agreed with the respondents that 20700 is more intense and complex than CPT code 11047. The RUC referenced MPC codes 64484 *Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU = 1.00 and 10 minutes intra-service time) and 36227 *Selective catheter placement, external carotid artery,*

unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure) (work RVU = 2.09 and 20 minutes intra-service time), both which support the relativity of 20700 among similar services. **The RUC recommends a work RVU of 1.50 for CPT code 20700.**

20701 Removal of drug delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 133 orthopaedic surgeons and determined that the survey 25th percentile work RVU of 1.13 accurately accounts for the work required to perform this service. The RUC recommends 1 minute evaluation pre-service time, 15 minutes intra-service time and 2 minutes post-service time. The pre-service work includes explaining the service to the patient, obtaining informed consent, reviewing the x-ray and prior operative report, noting the number beads that previously inserted to ensure all are removed. The intra-service work includes a marginal dissection in addition to what was in the base procedure to expose the drug delivery device and remove it. The post-service work is the documentation of the removal and confirmation removal with X-rays.

CMS questioned why the removal of the musculoskeletal drug delivery devices are less than the insertions. The specialties confirmed that the insertions require more physician work and time because of the requirements for preparing materials and limited time of the hardening of the mediums used for the musculoskeletal drug delivery devices.

The RUC compared the surveyed code to the top key reference services as indicated by the surveyees, CPT code 11047 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 1.80, and 30 minutes intra-service time) and agreed with the respondents that 20701 is more intense and complex than CPT code 11047. The RUC referenced MPC codes 64484 *Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, each additional level (List separately in addition to code for primary procedure)* (work RVU = 1.00 and 10 minutes intra-service time) and 64480 *Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, each additional level (List separately in addition to code for primary procedure)* (work RVU = 1.20 and 15 minutes intra-service time), both which support the relativity of 20701 among similar services. **The RUC recommends a work RVU of 1.13 for CPT code 20701.**

20702 Manual preparation and insertion of drug delivery device(s), intramedullary (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 141 orthopaedic surgeons and determined that the survey 25th percentile work RVU of 2.50 accurately accounts for the work required to perform this service. The RUC recommends 5 minutes evaluation pre-service time, 25 minutes intra-service time and 2 minutes post-service time. This add-on code is typically reported with debridement or arthrotomy procedures. The pre-service work includes obtaining informed consent, explaining the risks and benefits, review culture data, select antibiotics if necessary and confirm all materials are available and set up (antibiotic powder and cement). The pre-service work is slightly more difficult compared to the deep (subfacial) insertion of drug delivery device code 20700 because the surgeon must find a chest tube of the appropriate size to make the device.

The intra-service work starts after the physician has performed the debridement or cleaned the infected bone. A “dead space” remains, in which the physician will insert the device. The surgeon makes this device on the back table by taking the silicone tubing or chest tube, cutting it to the correct length, lubricating the tube with sterile mineral oil, mixing the cement powder with the antibiotic powder, adding the liquid monomer and mixes it under a vacuum. The surgeon then transfers the container with the cement in liquid form to a pressurized insertion gun. One end of the tube is clamped and the liquid cement is injected under pressure to completely fill the tube. While the cement is still soft, a small diameter rod or wire is passed down the tube, the clamp is removed and the wire is advanced until it exits the other end. After the cement has hardened, the tube is cut and stripped off the “antibiotic nail”. Under fluoroscopic control, the surgeon inserts the device down the medullary canal and the position is confirmed. The proximal end of the wire or rod is cut at the appropriate length to allow subsequent removal when performed. The RUC confirmed that there is no overlap in work of the clinical staff and the surgeon. The post-service work is documentation and x-ray review.

The RUC confirmed that 20702 takes longer than 20700 because it takes longer to create the drug delivery device itself as well as longer to insert it into the intramedullary canal under fluoroscopy, check its positioning and trim it. Instead for CPT code 20700, where the surgeon places the drug delivery device in the wound.

CMS questioned why the removal of the musculoskeletal drug delivery devices are less than the insertions. The specialties confirmed that the insertions require more physician work and time because of the requirements for preparing materials and limited time of the hardening of the mediums used for the musculoskeletal drug delivery devices.

The RUC compared the surveyed code to the top key reference services as indicated by the surveyees, CPT code 11047 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 1.80, and 30 minutes intra-service time) and agreed with the respondents that 20702 is more intense and complex than CPT code 11047. The RUC referenced MPC codes 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU = 4.88 and 45 minutes intra-service time) and 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU = 2.09 and 20 minutes intra-service time), both which support the relativity of 20702 among similar services. **The RUC recommends a work RVU of 2.50 for CPT code 20702.**

20703 Removal of drug delivery device(s), intramedullary (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 139 orthopaedic surgeons and determined that the survey 25th percentile work RVU of 1.80 accurately accounts for the work required to perform this service. The RUC recommends 1 minute evaluation pre-service time, 20 minutes intra-service time and 2 minutes post-service time. The pre-service work includes explaining the service to the patient, obtaining informed consent, reviewing the x-ray and prior operative report and ensure removal instruments are available. The intra-service work includes a marginal dissection in addition to what was in the base procedure to loosen and expose the drug delivery device and remove it, identifying

any shards that broke off with fluoroscopy and remove them as well. The post-service work is the documentation of the removal and confirmation removal with X-rays.

The RUC compared the surveyed code to the top key reference services as indicated by the surveyees, CPT code 11047 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 1.80, and 30 minutes intra-service time) and agreed with the respondents that 20703 is more intense and complex than CPT code 11047. The RUC referenced MPC codes 37253 *Intravascular ultrasound (noncoronary vessel) during diagnostic evaluation and/or therapeutic intervention, including radiological supervision and interpretation; each additional noncoronary vessel (List separately in addition to code for primary procedure)* (work RVU = 1.44 and 20 minutes intra-service time) and 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU = 2.09 and 15 minutes intra-service time), both which support the relativity of 20703 among similar services. **The RUC recommends a work RVU of 1.80 for CPT code 20703.**

20704 Manual preparation and insertion of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 141 orthopaedic surgeons and determined that the survey 25th percentile work RVU of 2.60 accurately accounts for the work required to perform this service. The RUC recommends 5 minutes evaluation pre-service time, 30 minutes intra-service time and 2 minutes post-service time. This add-on code is typically reported with debridement or arthrotomy procedures. The pre-service work includes obtaining informed consent, explaining the risks and benefits, review culture data, select antibiotics if necessary and confirm all materials are available and set up (antibiotic powder and cement). The pre-service work is slightly different compared to the codes 20700 and 20702 because the surgeon must choose a pre-fabricated silicone mold that is the appropriate size to make the device.

The intra-service work starts after the physician has performed a resection of a joint for infection. The “dead space” remains, in which the physician will insert the drug delivery device. The surgeon makes this device on the back table by mixing the cement powder with the antibiotic powder, adding the liquid monomer and mixing it under a vacuum. The surgeon inserts the cement into the silicone mold. After the cement has hardened, the surgeon peels off the silicone mold and make sure it is the correct side. The surgeon then mixes another batch of cement and attach the device to the end of the bone with the cement. The RUC confirmed that there is no overlap in work of the clinical staff and the surgeon. The post-service work is documentation and x-ray review.

The RUC confirmed that 20704 takes longer than 20700 and 20702 because it takes longer to create the drug delivery device itself as well as longer to insert it within the joint.

CMS questioned why the removal of the musculoskeletal drug delivery devices are less than the insertions. The specialties confirmed that the insertions require more physician work and time because of the requirements for preparing materials and limited time of the hardening of the mediums used for the musculoskeletal drug delivery devices.

The RUC compared the surveyed code to the top key reference services as indicated by the surveyees, CPT code 11047 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 1.80, and 30 minutes intra-service time) and agreed with the respondents that 20704 is more intense and complex than CPT code 11047. The RUC referenced MPC codes 57267 *Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)* (work RVU = 4.88 and 45 minutes intra-service time) and 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU = 2.09 and 20 minutes intra-service time), both which support the relativity of 20704 among similar services. **The RUC recommends a work RVU of 2.60 for CPT code 20704.**

20705 Removal of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 140 orthopaedic surgeons and determined that the survey 25th percentile work RVU of 2.15 accurately accounts for the work required to perform this service. The RUC recommends 1 minute evaluation pre-service time, 25 minutes intra-service time and 2 minutes post-service time. The pre-service work includes explaining the service to the patient, obtaining informed consent, reviewing the x-ray and prior operative report and ensure removal instruments are available. This service is for the removal of the intra-articular drug delivery device, in which the surgeon is not performing a revision. The intra-service work is more difficult and takes longer than 20701 and 20703. The surgeon must remove a device that is cemented to both sides of the joint without removing too much bone in the process. The post-service work is the documentation of the removal and confirmation removal with X-rays.

The RUC compared the surveyed code to the top key reference services as indicated by the surveyees, CPT code 11047 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 1.80, and 30 minutes intra-service time) and agreed with the respondents that 20705 is more intense and complex than CPT code 11047. The RUC referenced MPC codes 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU = 2.09 and 15 minutes intra-service time) and 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU = 2.65 and 30 minutes intra-service time), both which support the relativity of 20705 among similar services. **The RUC recommends a work RVU of 2.15 for CPT code 20705.**

Practice Expense

For CPT 11981-11983 the Practice Expense Subcommittee made minor reductions to the supplies. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee. For CPT codes 20700-20705, there are no direct practice expense inputs associated with these services.

New Technology

CPT codes 20700-20705 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery Integumentary System Introduction				
(f)11980	C1	Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)	000	1.10 Affirmed January 2014 RUC Recommendation
(f)11981	C2	Insertion, non-biodegradable drug delivery implant (For manual preparation and insertion of deep [eg, subfascial], intramedullary, or intra-articular drug delivery device, see 20700, 20702, 20704) (Do not report 11981 in conjunction with 20700, 20702, 20704)	XXX 000	1.30

Musculoskeletal System**General****Introduction or Removal**

(For injection procedure for arthrography, see anatomical area)

(For injection of autologous adipose-derived regenerative cells, see 0489T, 0490T)

Manual preparation involves the mixing and preparation of antibiotics, or other therapeutic agent(s) with a carrier substance, by the physician or other qualified health care professional during the surgical procedure, and then shaping the mixture into a drug delivery device(s) (eg, beads, nails, spacers) for placement in the deep (eg, subfascial) intramedullary, or intra-articular space(s). Codes 20700, 20702, 20704 are add-on codes for the manual preparation and insertion of the drug delivery device during the associated primary surgical procedure listed with each add-on code. Codes 20701, 20703, 20705 are add-on codes for the removal of drug delivery device(s) during the associated primary surgical procedures listed in the parenthetical codes associated with each add-on code. Insertion of a prefabricated drug device(s) may not be reported with 20700, 20702, 20704. Report 20680 if removal of drug delivery device(s) is performed alone. Report 20700, 20702, 20704, 20701, 20703, 20705 once per anatomic location.

RE: 11980 *Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)*

Dear Dr. Smith,

On behalf of the American Urological Association, we write to you today asking the RUC to reaffirm the physician work values for CPT code 11980 *Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)* that is currently on the agenda for the October 2018 RUC meeting.

This code was previously surveyed and reviewed by the RUC in January 2014. The RUC recommended physician work RVU of 1.10. There has been no change in the physician work since the survey. The AUA does not believe this code needs to be re-surveyed at this time. We request that the RUC reaffirm the values established from the January 2014 meeting.

Please contact us if you have any questions.

Sincerely,

Thomas Turk, MD
AUA RUC Advisor

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 11981	Tracking Number C2	Original Specialty Recommended RVU: 1.30
		Presented Recommended RVU: 1.30
Global Period: 000	Current Work RVU: 1.48	RUC Recommended RVU: 1.30

CPT Descriptor: Insertion, non-biodegradable drug delivery implant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Obstetrics/Gynecology Vignette: A 25-year-old woman who desires to prevent pregnancy presents for insertion of a subdermal contraceptive. Urology Vignette: A 70-year-old male with metastatic prostate cancer presents for the insertion of a non-biodegradable drug delivery implant.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Obstetrics/Gynecology: Patient history is reviewed for appropriateness of immediate insertion, ideally Day 1-5 following the onset of menses. Her present method of contraception is confirmed as effectiveness of the implant will be impacted by concurrent hormonal contraception and timing of the insertion. Review of pregnancy test results may be necessary. Consent for procedure is obtained. The patient is placed in the supine position. Her non-dominant arm is placed above her head, externally rotated with the elbow flexed and resting comfortably supported. The inner aspect of the upper arm is palpated to identify the medial epicondyle of the humerus. The insertion site is measured and marked 8-10 cm above the landmark. The second mark is made more proximal to serve as an insertion guide. The skin is cleansed with antiseptic solution. The skin is injected with local anesthetic to form a wheal and then the needle is passed into the subdermal space to continue the injection 4- 5 cm along the planned insertion tunnel. The insertion device is removed from the sterile packaging and the implant is confirmed to be appropriately positioned.

Urology: A physical examination and history is performed on the patient. Specific history components are paid attention to including the indication for hormone ablation, failure or noncompliance with other forms of hormone ablation such as intermittent injection therapy and possible refusal of other forms of therapy including orchiectomy with surgical castration. Patient is counseled about the risks and benefits of the implant including bleeding, infection, hormone changes including hot flashes, weight gain and muscle loss. Patient is also counseled about current guidelines for follow-up after hormone ablation including need for cardiac screening, bone density monitoring, exercise and addition of vitamin D to their diet to prevent bone loss. Examination includes evaluation of the non-dominant arm for an appropriate insertion site. Consent form is discussed with the patient and signed by the provider and patient. The non-dominant arm is placed above the head, externally rotated with the elbow flexed and resting comfortably supported. The inner aspect of the upper arm is palpated to identify the medial epicondyle of the humerus. The insertion site is measured and marked 8-10 cm above the landmark. The second mark is made more proximal to serve as an insertion guide. The surgeon washes hands and places sterile gloves on. The area of insertion is cleansed with the provided antiseptic solution. The area is draped to provide a sterile field. The surgeon prepares the operative field with a syringe, 22gauge needle and local anesthetic. The anesthetic solution is drawn up into the syringe under sterile conditions. The provider then palpates the area of insertion site to ensure that there are no contraindications for placement of the medication. The skin is infiltrated with the anesthetic solution to provide a wheal

and then a deep injection is performed for both hydro-dissection and anesthetic. Five minutes is allowed to pass for the anesthetic solution to take effect.

Description of Intra-Service Work: Obstetrics/Gynecology: The skin around the insertion site is stretched taut. The needle is inserted bevel up at the marked insertion site at a slight angle. The needle is then moved to a horizontal position, tenting the skin. The needle is gently inserted to its full length following the planned insertion line by aiming at the previous mark. The implant is released into the subdermal soft tissue. The insertion needle is removed. The distal and proximal tip of the implant are both palpated, confirming release of the implant from the applicator needle and a subdermal position. Any bleeding is controlled. A steri-strip is placed over the wound. A pressure dressing is placed.

Urology: The skin around the insertion site is stretched taut and the insertion trochar is inserted with the bevel up at the marked insertion site at a slight angle. The trochar is then inserted to its full length following the planned insertion line by aiming at the previous mark and the implant is released into the subdermal soft tissue. The insertion needle is removed. The distal and proximal tip of the implant are both palpated, confirming release of the implant from the applicator needle and a subdermal position. Any bleeding is controlled. Steri-strips are placed over the wound. A pressure dressing is placed.

Description of Post-Service Work: Obstetrics/Gynecology: The patient is instructed to continue with the pressure dressing for 24 hours and to keep the area clean and dry. Instructions are given for relief of discomfort with ice packs and OTC analgesics. Based upon the timing of the procedure and present method of contraception, additional counselling regarding back up contraception is provided. The procedure is recorded in the patient record.

Urology: The patient is instructed to continue with the pressure dressing for 24 hours and to keep the area clean and dry. Instructions are given for relief of discomfort with ice packs and OTC analgesics. Pain control counseling is provided. Post procedure patient handout is given to both the patient and his care provider which includes wound care, return precautions, side effect expectation management, and recommended follow-up for patients newly treated with hormone ablation per the guidelines for cardiac screening, exercise prescription, and bone health. The procedure is recorded in the patient record.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 11981 was identified in the 'different performing specialty from survey' screen. The CPT editorial panel created six add-on codes to describe orthopaedic drug delivery to differentiate the service from the service described in code 11981. CPT Codes 11982 and 11983 were identified as part of the 11981 family.

Time

The drug delivery implant procedures are typically performed in the office setting, so package 6 was selected. A minute was added to the positioning time.

Medicare 2017 data for 11981

OBG: 506 in office; 198 in facility

URO: 396 in office; 152 in facility

Billed Together

CPT Code 11981 is not typically billed with another service, nor is it typically billed with an E/M (1%).

Specialty Specific Data

The survey data by specialty is included on the summary spreadsheet. Note: The anticipated utilization of this service is suspected to be similar between urology and obstetrics/gynecology. The number of specialty responses (urology 36% and ob/gyn 64%) is disproportionate to the current and anticipated utilization.

Global Periods

The global period is changing from XXX to 000.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11981

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Gynecology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national estimate is not available.

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,711

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is difficult to estimate the utilization moving forward with this code family. We estimate that after the orthopedic utilization is removed and reported with their new CPT Codes, the remaining utilization for these services will be approximately 4000, with the primary reporters being urology and obstetrics/gynecology.

Specialty Urology	Frequency 600	Percentage 16.16 %
-------------------	---------------	--------------------

Specialty Obstetrics/Gynecology	Frequency 800	Percentage 21.55 %
---------------------------------	---------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 11981

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 11982	Tracking Number C2	Original Specialty Recommended RVU: 1.70
		Presented Recommended RVU: 1.70
Global Period: 000	Current Work RVU: 1.78	RUC Recommended RVU: 1.70

CPT Descriptor: Removal, non-biodegradable drug delivery implant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Obstetrics/Gynecology Vignette: A 25-year-old woman who desires to begin pregnancy planning presents for removal of a subdermal contraceptive. Urology Vignette: A 70-year-old male presents for removal of a non-biodegradable drug delivery implant.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Obstetrics/Gynecology: The history is reviewed to assure no allergies to anesthetic or antiseptic solution. The appropriate consent for treatment is obtained. The patient is placed in the supine position. Her nondominant arm is placed above her head, externally rotated with the elbow flexed and comfortably supported. The prior insertion site is palpated to locate the implant device. The area is prepped with antiseptic solution. The anesthetic lidocaine is injected into the skin over the palpated distal tip of the implant.

Urology: A physical examination and history is performed on the patient. Specific history components are paid attention to including the indication for hormone ablation and the indication for the removal of the device. The patient is counseled about the risks and benefits of removal including bleeding, infection and recurrence of the cancer with the removal of the hormonal ablation medication. Consent form is discuss with the patient and signed by the provider and patient. The arm with the device is placed above the head, externally rotated with the elbow flexed and resting comfortably supported. The arm is examined for evidence of device location and possible infection. The prior insertion site is palpated to locate the implant device. The surgeon washes their hands and places sterile gloves on. The area is prepped with antiseptic solution. The surgical field is draped with sterile drapes. The surgeon prepares the operative field with a syringe, 22 gauge needle and local anesthetic. The anesthetic is drawn up into the sterile syringe. The anesthetic is injected into the skin over the palpated distal tip of the implant and then deep around the implant to provide pain relief. The surgeon waits for five minutes for the anesthetic to take effect.

Description of Intra-Service Work: Obstetrics/Gynecology: An incision is made with a scalpel to access the implant. Fibrotic tissue is bluntly dissected away from the implant tip. Sharp incision into the tissue sheath may be required to mobilize the implant. The implant is pushed from the proximal end toward the incision. The implant is grasped with forceps and removed in an intact manner. Bleeding is controlled. Steri-strips and sterile dressing are applied to the incision.

Urology: An incision is made with a scalpel to access the implant. Scar tissue is dissected away from the implant with cautery. Sharp incision into the tissue sheath may be required to mobilize the implant. The implant is pushed from the proximal end toward the incision. The implant is grasped with forceps and removed in an intact manner. The implant is

carefully inspected to ensure it is intact. Bleeding is controlled. Steri-strips are used to close the wound. Sterile pressure dressing is applied to the incision.

Description of Post-Service Work: Obstetrics/Gynecology: The patient is instructed to continue with the pressure dressing for 24 hours and keep the area clean and dry. Instructions are given for relief of discomfort with ice packs and OTC analgesics. Patient is provided information regarding prenatal vitamins and pregnancy planning. The procedure is recorded in the patient record.

Urology: The patient is instructed to continue with the pressure dressing for 24 hours and to keep the area clean and dry. Instructions are given for relief of discomfort with ice packs and OTC analgesics. Pain control counseling is provided. Post procedure patient handout is given to both the patient and his care provider which includes wound care, return precautions, side effect expectation management, and recommended follow-up for monitoring of the prostate cancer after the removal of the hormone ablation. The procedure is recorded in the patient record.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 11981 was identified in the 'different performing specialty from survey' screen. The CPT editorial panel created six add-on codes to describe orthopaedic drug delivery to differentiate the service from the service described in code 11981. CPT Codes 11982 and 11983 were identified as part of the 11981 family.

Time

The drug delivery implant procedures are typically performed in the office setting, so package 6 was selected. A minute was added to the positioning time.

Medicare 2017 data for 11982

OBG: 462 in office; 113 in facility

URO: 49 in office; 9 in facility

Billed Together

CPT Code 11982 is not typically billed with another service, nor is it typically billed with an E/M (2%).

Specialty Specific Data

The survey data by specialty is included on the summary spreadsheet. Note: The anticipated utilization of this service is suspected to be similar between urology and obstetrics/gynecology. The number of specialty responses (urology 35% and ob/gyn 65%) is disproportionate to the current and anticipated utilization.

Global Periods

The global period is changing from XXX to 000.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11982

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Gynecology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national estimate is not available.

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,339

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is difficult to estimate the utilization moving forward with this code family. We estimate that after the orthopedic utilization is removed and reported with their new CPT Codes, the remaining utilization for these services will be approximately 1500, with the primary reporter being obstetrics/gynecology.

Specialty obstetrics/gynecology	Frequency 600	Percentage 44.80 %
---------------------------------	---------------	--------------------

Specialty urology	Frequency 100	Percentage 7.46 %
-------------------	---------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 11983	Tracking Number C4	Original Specialty Recommended RVU: 2.10
		Presented Recommended RVU: 2.10
Global Period: 000	Current Work RVU: 3.30	RUC Recommended RVU: 2.10

CPT Descriptor: Removal with reinsertion, non-biodegradable drug delivery implant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Gynecology Vignette: A 28-year-old woman who desires to continue prevention of pregnancy presents for removal of an expired subdermal contraceptive and subsequent re-insertion of same. Urology Vignette: A 70-year-old male with metastatic prostate cancer symptoms presents for removal of an expired non-biodegradable drug delivery implant and subsequent insertion of the same non-biodegradable drug delivery implant.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Obstetrics/Gynecology: Patient history is reviewed for allergies to antiseptic or anesthetic. Appropriate consent for procedure is obtained. The patient is placed in the supine position. Her non-dominant arm is placed above her head, externally rotated with the elbow flexed and resting comfortably supported. The patient's prior insertion site is palpated to locate the implant device and prior incision. The inner aspect of the upper arm is palpated to identify the medial epicondyle of the humerus and measure its position to the implant. A mark is made over the desired site of incision and more proximal to serve as an insertion guide for the new implant. The area is prepped with antiseptic solution. The distal end of the device is palpated, and lidocaine is injected along the implant.

Urology: A physical examination and history is performed on the patient. Specific history components are paid attention to including the indication for hormone ablation, failure or noncompliance with other forms of hormone ablation such as intermittent injection therapy and possible refusal of other forms of therapy including orchiectomy with surgical castration. Alternative therapies area reviewed with the patient. History is reviewed for possible side effects that may have occurred from the current implanted device including infection, pain and skin discomfort. The risks of replacement are discussed including bleeding, infection, hormone changes including hot flashes, weight gain and muscle loss. The patient is also counseled about current guidelines for follow-up after hormone ablation including need for cardiac screening, bone density monitoring, exercise and addition of vitamin D to their diet to prevent bone loss. Consent form is discuss with the patient and signed by the provider and patient. The arm with the device is placed above the head, externally rotated with the elbow flexed and resting comfortably supported. The arm is examined for evidence of device location and possible infection. The prior insertion site is palpated to locate the implant device. The surgeon washes their hands and places sterile gloves on. The area is prepped with antiseptic solution. The surgical field is draped with sterile drapes. The surgeon prepares the operative field with a syringe, 22gauge needle and local anesthetic. The anesthetic is drawn up into the sterile syringe. The anesthetic is injected into the skin over the palpated distal tip of the implant and then deep around the implant to provide pain relief. The surgeon waits for five minutes for the anesthetic to take effect.

Description of Intra-Service Work: Obstetrics/Gynecology: An incision is made to access the implant. Fibrotic tissue is bluntly dissected away from the implant tip. Sharp incision into the tissue sheath is made to mobilize the implant. The

implant is pushed from the proximal end toward the incision. The implant is grasped with forceps and removed in an intact manner. The patient is checked for adequate anesthetic along the planned insertion tunnel. Additional anesthetic is injected as required. A new transducer device with loaded implant is removed from sterile packaging and appropriate position of the implant within the needle is confirmed. The skin around the insertion site is stretched taut. The needle is inserted bevel up at a slight angle. The needle is then moved to a horizontal position, tenting the skin. The needle is gently inserted to its full length following the planned insertion line. The implant is released into the subdermal soft tissue. The insertion needle is removed. The distal and proximal tips of the new implant are palpated confirming release of the implant from the insertion needle and a subdermal position. Any bleeding is controlled. Steri-strips are applied to the incision. A pressure dressing is applied.

Urology: An incision is made with a scalpel to access the implant. Scar tissue is dissected away from the implant using cautery. Sharp incision into the tissue sheath may be required to mobilize the implant. The implant is pushed from the proximal end toward the incision. The implant is grasped with forceps and removed in an intact manner. The implant is carefully inspected to ensure it is intact. Bleeding is controlled. Steri-strips are used to close the wound. The skin around the insertion site is stretched taut and the insertion trochar is inserted with the bevel up at the marked insertion site at a slight angle. The trochar is then inserted to its full length following the planned insertion line by aiming at the previous mark and the implant is released into the subdermal soft tissue. The insertion needle is removed. The distal and proximal tip of the implant are both palpated, confirming release of the implant from the applicator needle and a subdermal position. Bleeding is controlled. Steri-strips are applied. Sterile pressure dressings are applied to both wounds.

Description of Post-Service Work: Obstetrics/Gynecology: The patient is instructed to continue with the pressure dressing for 24 hours and keep the area clean and dry. Instructions are given for relief of discomfort with ice pack and OTC analgesics. The procedure is recorded in the patient record.

Urology: The patient is instructed to continue with the pressure dressing for 24 hours and to keep the area clean and dry. Instructions are given for relief of discomfort with ice packs and OTC analgesics. Pain control counseling is provided. Post procedure patient handout is given to both the patient and his care provider which includes wound care, return precautions, side effect expectation management, and recommended follow-up for patients treated with hormone ablation per the guidelines for cardiac screening, exercise prescription, and bone health. The procedure is recorded in the patient record.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 11981 was identified in the 'different performing specialty from survey' screen. The CPT editorial panel created six add-on codes to describe orthopaedic drug delivery to differentiate the service from the service described in code 11981. CPT Codes 11982 and 11983 were identified as part of the 11981 family.

Time

The drug delivery implant procedures are typically performed in the office setting, so package 6 was selected. A minute was added to the positioning time.

Medicare 2017 data for 11983

OBG: 198 in office; 31 in facility

URO: 475 in office; 69 in facility

Billed Together

CPT Code 11983 is not typically billed with another service, nor is it typically billed with an E/M (0%).

Specialty Specific Data

The survey data by specialty is included on the summary spreadsheet. Note: The anticipated utilization of this service is suspected to be similar between urology and obstetrics/gynecology. The number of specialty responses (urology 36% and ob/gyn 64%) is disproportionate to the current and anticipated utilization.

Global Periods

The global period is changing from XXX to 000.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11983

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Gynecology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national estimate is not available.

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,185

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is difficult to estimate the utilization moving forward with this code family. We estimate that after the orthopedic utilization is removed and reported with their new CPT Codes, the remaining utilization for these services will be approximately 1300, with the primary reporter being obstetrics/gynecology.

Specialty Urology	Frequency 600	Percentage 50.63 %

Global Period: ZZZ Current Work RVU:

RUC Recommended RVU: **1.50**

CPT Descriptor: Manual preparation and insertion of drug delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 19-year-old male undergoes surgical treatment of infected bone and soft tissues (reported separately). The surgeon then fabricates an antibiotic cement device that is placed deep (subfascial) in the affected area. [Note: This is an add-on code. Only consider the additional work for manual preparation and insertion of the antibiotic delivery device.]

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The surgeon discusses the purpose of the drug delivery device with the patient and/or family; provides a brief description of the technical aspects; outlines the risks, benefits, alternatives and expected outcome; discusses the possible need for additional surgery to remove the device; and obtains informed consent.

The results of cultures and sensitivity data are reviewed to guide antibiotic selection. The surgeon confirms the patient is not allergic to the planned antibiotics and other materials that will be used to prepare the drug delivery device.

The surgeon confirms the availability and presence of the supplies and equipment needed to prepare the device (e.g. antibiotic powder; polymethyl methacrylate [PMMA] powder and liquid monomer; vacuum mixing system; and large caliber unbraided non-absorbable suture or wire).

Description of Intra-Service Work: Following thorough debridement of the infected bone and soft tissue (separately reported), the size of the “dead space” or defect is estimated. On the back table, the surgeon then makes the device. PMMA powder is mixed with antibiotic powder; most commonly 3.6 g of tobramycin and 1 g of vancomycin are used for each 40-g package of cement. Liquid monomer is added and the materials are mixed in a vacuum mixing system. As the cement begins to harden but is still soft, it is rolled into long rods 1.5 – 2.0 cm in diameter. These are cut into small segments 1.0 – 2.0 cm in length, each of which are then rolled into 1.5 – 2.0 cm diameter round beads. The beads are then threaded on the suture, maintaining reasonably equal spacing. After the cement has hardened, each bead is checked to make sure it is securely centered on the suture. A large knot is tied on one end, incorporating a metallic marker for imaging (e.g. vessel clip).

The string of beads is then provisionally set in the defect until adequate fill is obtained; beads are removed from the suture as needed. A large knot is then tied on the other end of the suture, with a metallic marker. The entire string of beads is removed, counted, and then re-inserted.

Description of Post-Service Work: The device, preparation, materials used and number and size of beads are documented in the medical record (e.g. written brief operative note and dictated complete operative note). Post-operative radiographs are reviewed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The RAW noted that this service was first surveyed in 2001 by the American Urological Association (AUA), but the

2016 Medicare utilization no shows orthopedic surgery as the primary provider. The RUC recommended that the service be referred to the CPT Panel to better define these services and to determine if musculoskeletal procedures should have separate codes to report.

At the May 2018 CPT Panel meeting, the Panel accepted a proposal for six new add-on codes supported by literature to report insertion and removal of drug delivery implant devices in conjunction with specific orthopedic primary procedures. These six new add-on codes are included in the musculoskeletal section of the CPT codebook and includes introductory guidelines and parenthetical notes. Separately, the CPT Panel addressed the current code family based on urology and obstetrics/gynecology procedures by adding parentheticals after codes 11981 and 11982. The code descriptors for 11981-11983 were not changed and remain based on urology and obstetrics/gynecology procedures.

Compelling Evidence for Codes 20700-20705

For CPT 2002, three new codes were developed specifically to describe insertion, removal, and removal with reinsertion of a non-biodegradable manufactured drug delivery implant. These codes were initially created to describe a once-yearly implant containing leuprolide acetate for the treatment of prostate cancer. However, because various types of medications for various indications can be administered using this type of implant, the CPT Editorial Panel voted to keep the descriptors generic. That is why the type of drug is not listed in the descriptors of these codes.

At the April 2001 RUC meeting, the RUC recommended that CMS develop RVUs for these codes by cross-walking the RVUs from CPT codes 11975, 11976, and 11977, insertion, removal and removal with reinsertion of implantable contraceptive capsules.

In April 2002, urology again submitted a letter requesting a crosswalk to the contraceptive capsule codes. The RUC adopted this as an interim solution and requested that AUA survey these codes for review at a future RUC meeting. The RUC understands that a survey of urologists who perform this procedure for a drug specific to urology would not apply to other specialties that may use this code for other drug implants in the future. The RUC agreed that the implant insertion would be equivalent work to the contraceptive capsule insertion and a survey is unlikely to produce different results and did not require a survey.

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The AAOS submitted an Action Plan that recommended referral to CPT to differentiate the musculoskeletal procedures that were never meant to be reported with codes 11981-11983 because those codes were clearly created for subcutaneous insertion of a once yearly manufactured drug-releasing implant. CPT required the AAOS to use the long form CPT proposal and submit literature to support the proposed musculoskeletal codes. AUA and ACOG did not make any changes to the current codes 11981-11983 as these codes will continue to represent insertion in the arm of a once yearly manufactured drug-releasing implant.

- ***Evidence that technology and patient has changed***

When codes 11981-11983 were created in 2002, drug delivery implants were only available for manufactured time-released implant products that were inserted just under the skin in the upper inside arm through a small puncture hole. Since that time, orthopedic surgeons have developed a method to manually fabricate drug delivery implants at the time of surgery—typically antibiotic-impregnated beads—to be implanted deep (eg, subfascial, intramedullary, intra-articular) at the time of a major open procedure for infections. The beads may subsequently be removed after the infection has resolved and a definitive procedure is performed. The work of 11981 and 11983 never included the manual preparation and implantation of a drug delivery device during a major open operation for infection and 11982 and 11983 never included the removal of the implant during a major open operation.

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, such as a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.***

Although it may appear that this compelling evidence argument would apply to the codes in this tab, the fact is that the services represented by codes 11981-11983 (insert/removal of manufactured time-released drug implant) have not changed from the original application submitted in 2001 and subsequent review by the RUC. Orthopaedic surgeons were not part of the original application in 2001 and valuation, and orthopaedic surgeons were not aware that these codes were only meant to describe subcutaneous insertion of a manufactured time-released drug implant. This resulted

in the codes being inadvertently reported for very different deep musculoskeletal procedures. The societies recommended and the RAW agreed, that referral to CPT for creation of new codes for this new and different work was appropriate. This required submission of a code change application and supporting literature to clearly describe the musculoskeletal work for a surgeon's manual preparation of drug delivery devices to be implanted deep.

Survey Sample and Process

A survey request was sent to a random selection of members from the American Academy of Orthopaedic Surgeons, American Association of Hip and Knee Surgeons, and Orthopaedic Trauma Association. The survey included all six codes.

Work Recommendation – 20700

The survey median work RVU of 2.00 is recommended for code 20700.

Time recommendation

An expert panel reviewed the survey data and determined that there was some confusion about whether the backbench manual preparation of the implant device was pre-time or intra-time. Specifically, some respondents included significantly more time in the pre-time category than the intra-time. This is evident by the increasing median pre-time for codes 20700, 20702, and 20704 (ie, the preparation of the implant for 20704 takes longer than 20700). However, we do not agree that the pre-time represents the time to manually prepare the device and that this time is mixed between the two categories of pre- and intra-time in the data.

Our expert panel believes the median total time of 30 minutes is accurate for the entire additional work required for 20700 which includes: consent for a device implant, collection of supplies and equipment to prepare the device, manually preparing the device intra-operatively, inserting the device, and then documenting the work and device (type, lot, manufacturer, etc.). We considered requesting collapsing all time into the intra-category, similar to what the RUC allows for other societies where there is a gray zone of the components of work. For example, pathology collapses all time (including review of records and dictation and documentation of final report) into the intra-time category. Allergy and immunology has similarly collapsed all work and time into the intra-time category.

We do not know of a rule about assigning work and time to add-on codes, so we are leaving the survey times in the three categories. However, we have collapsed the service description to the intra-service work category similar to what other specialties have done.

We strongly recommend the survey total time of 30 minutes as accurate for the total work of add-on code 20700 and we present the time data as 5/20/5 per the survey statistics.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 206X0 in conjunction with 11010, 11011, 11012, 11043, 11044, 11046 11047, 20240, 20245, 20250, 20251, 21010, 21025, 21026, 21501, 21502, 21510, 21627, 21630, 22010, 22015, 23030, 23031, 23035, 23040, 23044, 23170, 23172, 23174, 23180, 23182, 23184, 23334, 23335, 23930, 23931, 23935 24000, 24134, 24136, 24138, 24140, 24147, 24160, 25031, 25035, 25040, 25145, 25150, 25151, 26070, 26230, 26235, 26236, 26990, 26991, 26992, 27030, 27070, 27071, 27090, 27301, 27303, 27310, 27360, 27603, 27604, 27610, 27640, 27641, 28001, 28002, 28003, 28020, 28120, 28122)

FREQUENCY INFORMATION

-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,446

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The expert panel summed the 2017 Medicare data for 11981, 11982, 11983 attributable to orthopaedic surgeons, plastic surgeons, hand surgeons, and podiatry and added 10% to account for reporting using unlisted codes or modifier 22 appended to the primary procedure. The expert panel also estimates a 15% / 15% / 70% split within each set of codes (deep, intramedullary, intra-articular) and a 50% split for 11983 between the insert and remove set of new codes. The result is: 20700=1446; 20702=1446; 20704=6748; 20701=511; 20703=511; 20705=2388 (see separate Excel utilization file for calculations).

CPT Descriptor: Removal of drug delivery device, deep(s) (eg, subfascial) (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 19-year-old male undergoes removal of a deep (subfascial) antibiotic delivery device during surgical treatment of a deep infection. [Note: This is an add-on code. Only consider the additional work for removal of the antibiotic delivery device.]

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The surgeon reviews removal of the device with the patient and/or family; provides a brief description of the technical aspects; outlines the risks, benefits, alternatives and expected outcome; discusses the potential inability to remove the device totally, or in part, and the implications, including the need for additional surgery; and obtains informed consent.

Pre-operative radiographs, including anteroposterior and lateral views are evaluated to assess the location of the device, position of any metallic markers, and the total number of components or “beads” which is compared to the prior operative report.

Description of Intra-Service Work: The prior incision(s), in part or in total, are utilized. Exposure and dissection are completed until the device is identified. Soft tissues are carefully stripped from the device and it is manually removed. The number of beads are counted and fluoroscopy is used to confirm that the entire device has been removed..

Description of Post-Service Work: Removal of the device is documented in the medical record (e.g. written brief operative note and dictated complete operative note). Post-operative radiographs are reviewed..

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The RAW noted that this service was first surveyed in 2001 by the American Urological Association (AUA), but the

2016 Medicare utilization no shows orthopedic surgery as the primary provider. The RUC recommended that the service be referred to the CPT Panel to better define these services and to determine if musculoskeletal procedures should have separate codes to report.

At the May 2018 CPT Panel meeting, the Panel accepted a proposal for six new add-on codes supported by literature to report insertion and removal of drug delivery implant devices in conjunction with specific orthopedic primary procedures. These six new add-on codes are included in the musculoskeletal section of the CPT codebook and includes introductory guidelines and parenthetical notes. Separately, the CPT Panel addressed the current code family based on urology and obstetrics/gynecology procedures by adding parentheticals after codes 11981 and 11982. The code descriptors for 11981-11983 were not changed and remain based on urology and obstetrics/gynecology procedures.

Compelling Evidence for Codes 20700-20705

For CPT 2002, three new codes were developed specifically to describe insertion, removal, and removal with reinsertion of a non-biodegradable manufactured drug delivery implant. These codes were initially created to describe a once-yearly implant containing leuprolide acetate for the treatment of prostate cancer. However, because various types of medications for various indications can be administered using this type of implant, the CPT Editorial Panel voted to keep the descriptors generic. That is why the type of drug is not listed in the descriptors of these codes.

At the April 2001 RUC meeting, the RUC recommended that CMS develop RVUs for these codes by cross-walking the RVUs from CPT codes 11975, 11976, and 11977, insertion, removal and removal with reinsertion of implantable contraceptive capsules.

In April 2002, urology again submitted a letter requesting a crosswalk to the contraceptive capsule codes. The RUC adopted this as an interim solution and requested that AUA survey these codes for review at a future RUC meeting. The RUC understands that a survey of urologists who perform this procedure for a drug specific to urology would not apply to other specialties that may use this code for other drug implants in the future. The RUC agreed that the implant insertion would be equivalent work to the contraceptive capsule insertion and a survey is unlikely to produce different results and did not require a survey.

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The AAOS submitted an Action Plan that recommended referral to CPT to differentiate the musculoskeletal procedures that were never meant to be reported with codes 11981-11983 because those codes were clearly created for subcutaneous insertion of a once yearly manufactured drug-releasing implant. CPT required the AAOS to use the long form CPT proposal and submit literature to support the proposed musculoskeletal codes. AUA and ACOG did not make any changes to the current codes 11981-11983 as these codes will continue to represent insertion in the arm of a once yearly manufactured drug-releasing implant.

- ***Evidence that technology and patient has changed***

When codes 11981-11983 were created in 2002, drug delivery implants were only available for manufactured time-released implant products that were inserted just under the skin in the upper inside arm through a small puncture hole. Since that time, orthopedic surgeons have developed a method to manually fabricate drug delivery implants at the time of surgery—typically antibiotic-impregnated beads—to be implanted deep (eg, subfascial, intramedullary, intra-articular) at the time of a major open procedure for infections. The beads may subsequently be removed after the infection has resolved and a definitive procedure is performed. The work of 11981 and 11983 never included the manual preparation and implantation of a drug delivery device during a major open operation for infection and 11982 and 11983 never included the removal of the implant during a major open operation.

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, such as a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.***

Although it may appear that this compelling evidence argument would apply to the codes in this tab, the fact is that the services represented by codes 11981-11983 (insert/removal of manufactured time-released drug implant) have not changed from the original application submitted in 2001 and subsequent review by the RUC. Orthopaedic surgeons were not part of the original application in 2001 and valuation, and orthopaedic surgeons were not aware that these codes were only meant to describe subcutaneous insertion of a manufactured time-released drug implant. This resulted

in the codes being inadvertently reported for very different deep musculoskeletal procedures. The societies recommended and the RAW agreed, that referral to CPT for creation of new codes for this new and different work was appropriate. This required submission of a code change application and supporting literature to clearly describe the musculoskeletal work for a surgeon's manual preparation of drug delivery devices to be implanted deep.

Survey Sample and Process

A survey request was sent to a random selection of members from the American Academy of Orthopaedic Surgeons, American Association of Hip and Knee Surgeons, and Orthopaedic Trauma Association. The survey included all six codes.

Work Recommendation – 20701

The survey 25th percentile work RVU of 1.13 is recommended for code 20701.

Time recommendation

Unlike the codes for manual preparation and insertion of a drug delivery device, codes 20701, 20703, and 20705 are clear typical add-on codes with limited pre- and post-work related to the add-on service that is not part of the primary procedure.

Our expert panel believes the survey respondents may have overestimated the pre-service time which would include addition time related to discussion removal of the implant during the consent process and to confirm availability of equipment necessary to remove the device. We also believe the survey respondents may have overestimated the post-service time which would include addition time related to documentation of the additional work. **We recommend one minute for pre-service work and two minutes for post-service work related to the add-on code 20701 that is not included in the work of the primary procedure.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 206X3 in conjunction with 11010, 11011, 11012, 11043, 11044, 11046 11047, 20240, 20245, 20250, 20251, 21010, 21025, 21026, 21501, 21502, 21510, 21627, 21630, 22010, 22015, 23030, 23031, 23035, 23040, 23044, 23170, 23172, 23174, 23180, 23182, 23184, 23334, 23335, 23930, 23931, 23935 24000, 24134, 24136, 24138, 24140, 24147, 24160, 25031, 25035, 25040, 25145, 25150, 25151, 26070, 26230, 26235, 26236, 26990, 26991, 26992, 27030, 27070, 27071, 27090, 27301, 27303, 27310, 27360, 27603, 27604, 27610, 27640, 27641, 28001, 28002, 28003, 28020, 28120, 28122)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11982, 11983, 20999, or primary procedure with modifier 22 appended

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 511
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The expert panel summed the 2017 Medicare data for 11981, 11982, 11983 attributable to orthopaedic surgeons, plastic surgeons, hand surgeons, and podiatry and added 10% to account for reporting using unlisted codes or modifier 22 appended to the primary procedure. The expert panel also estimates a 15% / 15% / 70% split within each set of codes (deep, intramedullary, intra-articular) and a 50% split for 11983 between the insert and remove set of new codes. The result is: 20700=1446; 20702=1446; 20704=6748; 20701=511; 20703=511; 20705=2388 (see separate Excel utilization file for calculations).

RUC Recommended RVU: **2.50**

CPT Descriptor: Manual preparation and insertion of drug delivery device(s), intramedullary (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 19-year-old male undergoes surgical treatment of infected bone and soft tissues (reported separately). The surgeon then fabricates an antibiotic cement device that is placed within the intramedullary canal of the tibia. [Note: This is an add-on code. Only consider the additional work for manual preparation and insertion of the antibiotic delivery device.]

Percentage of Survey Respondents who found Vignette to be Typical: 71%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

The surgeon discusses the purpose of the drug delivery device with the patient and/or family; provides a brief description of the technical aspects; outlines the risks, benefits, alternatives and expected outcome; discusses the possible need for additional surgery to remove the device; and obtains informed consent.

Pre-operative radiographs, including anteroposterior and lateral views of the entire bone are evaluated to estimate the size (length and diameter) of the intramedullary drug delivery device that will be prepared.

The results of cultures and sensitivity data are reviewed to guide antibiotic selection. The surgeon confirms the patient is not allergic to the planned antibiotics and other materials that will be used to prepare the drug delivery device.

The surgeon confirms the availability and presence of the supplies and equipment needed to formulate the device (e.g. antibiotic powder; polymethyl methacrylate [PMMA] powder and liquid monomer; vacuum mixing system; pressurized insertion gun; lubricant; appropriately sized silicone tubing or chest tube; and a small diameter nail, rod or wire).

Description of Intra-Service Work: Following thorough debridement of the infected bone and soft tissue (separately reported), the length and diameter of the drug delivery nail device are finalized. The instruments that were used for the “dirty” portion of the procedure are removed, new instruments are opened and set-up, the patient’s limb is prepped again and re-draped, and the surgical team changes gowns and gloves. The “clean” portion of the procedure begins.

On the back table, the surgeon makes the device. An appropriate diameter silicone tubing or chest tube is selected and then cut to the correct length. Sterile mineral oil is used to lubricate the inner portion. PMMA powder is mixed with antibiotic powder; most commonly 3.6 g of tobramycin and 1 g of vancomycin are used with each 40-g package of cement. Liquid monomer is added and the materials are mixed in a vacuum mixing system. A container with the cement in liquid form is

then transferred to a pressurized insertion gun. One end of the tube is clamped and the liquid cement is injected under pressure to completely fill the tube.

While the cement is still soft, a small diameter rod or wire (e.g. 5.0 mm threaded Harrington rod, 4.5 mm Ender nail, 4.0 mm ball-tipped guide-wire) is passed down the tube, the clamp is removed and the wire is advanced until it exits the other end. After the cement has hardened, the tube is cut and stripped off the “PMMA antibiotic nail”. At the distal end of the nail, the wire is bent and/or a nut is threaded onto the rod.

Under fluoroscopic control, the device is advanced down the medullary canal and the position is confirmed. The proximal end of the wire or rod is cut at the appropriate length to allow subsequent removal when performed.

Description of Post-Service Work: The device preparation, materials and construct dimensions are documented in the medical record (e.g. written brief operative note and dictated complete operative note). Post-operative radiographs are reviewed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The RAW noted that this service was first surveyed in 2001 by the American Urological Association (AUA), but the 2016 Medicare utilization no shows orthopedic surgery as the primary provider. The RUC recommended that the service be referred to the CPT Panel to better define these services and to determine if musculoskeletal procedures should have separate codes to report.

At the May 2018 CPT Panel meeting, the Panel accepted a proposal for six new add-on codes supported by literature to report insertion and removal of drug delivery implant devices in conjunction with specific orthopedic primary procedures. These six new add-on codes are included in the musculoskeletal section of the CPT codebook and includes introductory guidelines and parenthetical notes. Separately, the CPT Panel addressed the current code family based on urology and obstetrics/gynecology procedures by adding parentheticals after codes 11981 and 11982. The code descriptors for 11981-11983 were not changed and remain based on urology and obstetrics/gynecology procedures.

Compelling Evidence for Codes 20700-20705

For CPT 2002, three new codes were developed specifically to describe insertion, removal, and removal with reinsertion of a non-biodegradable manufactured drug delivery implant. These codes were initially created to describe a once-yearly implant containing leuprolide acetate for the treatment of prostate cancer. However, because various types of medications for various indications can be administered using this type of implant, the CPT Editorial Panel voted to keep the descriptors generic. That is why the type of drug is not listed in the descriptors of these codes.

At the April 2001 RUC meeting, the RUC recommended that CMS develop RVUs for these codes by cross-walking the RVUs from CPT codes 11975, 11976, and 11977, insertion, removal and removal with reinsertion of implantable contraceptive capsules.

In April 2002, urology again submitted a letter requesting a crosswalk to the contraceptive capsule codes. The RUC adopted this as an interim solution and requested that AUA survey these codes for review at a future RUC meeting. The RUC understands that a survey of urologists who perform this procedure for a drug specific to urology would not apply to other specialties that may use this code for other drug implants in the future. The RUC agreed that the implant insertion would be equivalent work to the contraceptive capsule insertion and a survey is unlikely to produce different results and did not require a survey.

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The AAOS submitted an Action Plan that recommended referral to CPT to differentiate the musculoskeletal procedures that were never meant to be reported with codes 11981-11983 because those codes were clearly created for subcutaneous insertion of a once yearly manufactured drug-releasing implant. CPT required the AAOS to use the long form CPT proposal and submit literature to support the proposed musculoskeletal codes. AUA and ACOG did not make any changes to the current codes 11981-11983 as these codes will continue to represent insertion in the arm of a once yearly manufactured drug-releasing implant.

- ***Evidence that technology and patient has changed***

When codes 11981-11983 were created in 2002, drug delivery implants were only available for manufactured time-released implant products that were inserted just under the skin in the upper inside arm through a small puncture hole. Since that time, orthopedic surgeons have developed a method to manually fabricate drug delivery implants at the time of surgery—typically antibiotic-impregnated beads—to be implanted deep (eg, subfascial, intramedullary, intra-articular) at the time of a major open procedure for infections. The beads may subsequently be removed after the infection has resolved and a definitive procedure is performed. The work of 11981 and 11983 never included the manual preparation and implantation of a drug delivery device during a major open operation for infection and 11982 and 11983 never included the removal of the implant during a major open operation.

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, such as a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.***

Although it may appear that this compelling evidence argument would apply to the codes in this tab, the fact is that the services represented by codes 11981-11983 (insert/removal of manufactured time-released drug implant) have not changed from the original application submitted in 2001 and subsequent review by the RUC. Orthopaedic surgeons were not part of the original application in 2001 and valuation, and orthopaedic surgeons were not aware that these codes were only meant to describe subcutaneous insertion of a manufactured time-released drug implant. This resulted in the codes being inadvertently reported for very different deep musculoskeletal procedures. The societies recommended and the RAW agreed, that referral to CPT for creation of new codes for this new and different work was appropriate. This required submission of a code change application and supporting literature to clearly describe the musculoskeletal work for a surgeon's manual preparation of drug delivery devices to be implanted deep.

Survey Sample and Process

A survey request was sent to a random selection of members from the American Academy of Orthopaedic Surgeons, American Association of Hip and Knee Surgeons, and Orthopaedic Trauma Association. The survey included all six codes.

Work Recommendation – 20702

The survey median work RVU of 3.25 is recommended for code 20702.

Time recommendation

An expert panel reviewed the survey data and determined that there was some confusion about whether the backbench manual preparation of the implant device was pre-time or intra-time. Specifically, some respondents included significantly more time in the pre-time category than the intra-time. This is evident by the increasing median pre-time for codes 20700, 20702, and 20704 (ie, the preparation of the implant for 20704 takes longer than 20700). However, we do not agree that the pre-time represents the time to manually prepare the device and that this time is mixed between the two categories of pre- and intra-time in the data.

Our expert panel believes the median total time of 38 minutes is accurate for the entire additional work required for 206X1 which includes: consent for a device implant, collection of supplies and equipment to prepare the device, manually preparing the device intra-operatively, inserting the device, and then documenting the work and device (type, lot, manufacturer, etc.). We considered requesting collapsing all time into the intra-category, similar to what the RUC allows for other societies where there is a gray zone of the components of work. For example, pathology collapses all time (including review of records and dictation and documentation of final report) into the intra-time category. Allergy and immunology has similarly collapsed all work and time into the intra-time category.

We do not know of a rule about assigning work and time to add-on codes, so we are leaving the survey times in the three categories. However, we have collapsed the service description to the intra-service work category similar to what other specialties have done.

We strongly recommend the survey total time of 38 minutes as accurate for the total work of add-on code 20702 and we present the time data as 8/25/5 per the survey statistics.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 206X1 in conjunction with, 20680, 20690, 20692, 20694, 20802, 20805, 20838, 23170, 23180, 23184, 23935, 24134, 24138, 24140, 24147, 24516, 25145, 25150, 25151, 25400, 25515, 25525, 25526, 25545, 25574, 25575, 27245, 27259, 27360, 27470, 27506, 27640, 21510, 23035, 23515, 23615, 24430, 25035, 27720)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11981, 11983, 20999, or primary procedure with modifier 22 appended

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,446

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The expert panel summed the 2017 Medicare data for 11981, 11982, 11983 attributable to orthopaedic surgeons, plastic surgeons, hand surgeons, and podiatry and added 10% to account for reporting using unlisted codes or modifier 22 appended to the primary procedure. The expert panel also estimates a 15% / 15% / 70% split within each set of codes (deep, intramedullary, intra-articular) and a 50% split for 11983 between the insert and remove set of new codes. The result is: 20700=1446; 20702=1446; 20704=6748; 20701=511; 20703=511; 20705=2388 (see separate Excel utilization file for calculations).

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 20690

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 20703	Tracking Number C8	Original Specialty Recommended RVU: 1.80
		Presented Recommended RVU: 1.80
Global Period: ZZZ	Current Work RVU:	RUC Recommended RVU: 1.80

CPT Descriptor: Removal of drug delivery device, intramedullary (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 19-year-old male undergoes removal of an intramedullary antibiotic cement device during surgical treatment of a deep infection. [Note: This is an add-on code. Only consider the additional work for removal of the antibiotic delivery device.]

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The surgeon reviews removal of the device with the patient and/or family; provides a brief description of the technical aspects; outlines the risks, benefits, alternatives and expected outcome; discusses the potential inability to remove the device totally, or in part, and the implications, including the need for additional surgery; and obtains informed consent.

Pre-operative radiographs, including anteroposterior and lateral views are evaluated to assess the location and integrity of the device.

The surgeon confirms the presence of the equipment and specialized instruments required for removal (e.g. thin flexible osteotomes, high speed burr, nail/implant extraction kits).

Description of Intra-Service Work: The prior incision(s), in part or in total, are utilized. Exposure and dissection are completed until the device is identified.

Thin osteotomes are used to loosen the device at the bone cement interface, taking care to minimize bone loss. An extraction tool is attached and the device is removed. Not infrequently the cement fractures and multiple fragments must be removed individually. Supplemental anchoring components and/or cement in the medullary canal are removed with osteotomes, curettes, and grasping instruments; fluoroscopic control may be utilized for this portion.

Fluoroscopy is used to confirm that the entire device has been removed..

Description of Post-Service Work: Removal of the device is documented in the medical record (e.g. written brief operative note and dictated complete operative note). Post-operative radiographs are reviewed..

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The RAW noted that this service was first surveyed in 2001 by the American Urological Association (AUA), but the 2016 Medicare utilization no shows orthopedic surgery as the primary provider. The RUC recommended that the service be referred to the CPT Panel to better define these services and to determine if musculoskeletal procedures should have separate codes to report.

At the May 2018 CPT Panel meeting, the Panel accepted a proposal for six new add-on codes supported by literature to report insertion and removal of drug delivery implant devices in conjunction with specific orthopedic primary procedures. These six new add-on codes are included in the musculoskeletal section of the CPT codebook and includes introductory guidelines and parenthetical notes. Separately, the CPT Panel addressed the current code family based on urology and obstetrics/gynecology procedures by adding parentheticals after codes 11981 and 11982. The code descriptors for 11981-11983 were not changed and remain based on urology and obstetrics/gynecology procedures.

Compelling Evidence for Codes 20700-20705

For CPT 2002, three new codes were developed specifically to describe insertion, removal, and removal with reinsertion of a non-biodegradable manufactured drug delivery implant. These codes were initially created to describe a once-yearly implant containing leuprolide acetate for the treatment of prostate cancer. However, because various types of medications for various indications can be administered using this type of implant, the CPT Editorial Panel voted to keep the descriptors generic. That is why the type of drug is not listed in the descriptors of these codes.

At the April 2001 RUC meeting, the RUC recommended that CMS develop RVUs for these codes by cross-walking the RVUs from CPT codes 11975, 11976, and 11977, insertion, removal and removal with reinsertion of implantable contraceptive capsules.

In April 2002, urology again submitted a letter requesting a crosswalk to the contraceptive capsule codes. The RUC adopted this as an interim solution and requested that AUA survey these codes for review at a future RUC meeting. The RUC understands that a survey of urologists who perform this procedure for a drug specific to urology would not apply to other specialties that may use this code for other drug implants in the future. The RUC agreed that the implant insertion would be equivalent work to the contraceptive capsule insertion and a survey is unlikely to produce different results and did not require a survey.

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The AAOS submitted an Action Plan that recommended referral to CPT to differentiate the musculoskeletal procedures that were never meant to be reported with codes 11981-11983 because those codes were clearly created for subcutaneous insertion of a once yearly manufactured drug-releasing implant. CPT required the AAOS to use the long form CPT proposal and submit literature to support the proposed musculoskeletal codes. AUA and ACOG did not make any changes to the current codes 11981-11983 as these codes will continue to represent insertion in the arm of a once yearly manufactured drug-releasing implant.

- ***Evidence that technology and patient has changed***

When codes 11981-11983 were created in 2002, drug delivery implants were only available for manufactured time-released implant products that were inserted just under the skin in the upper inside arm through a small puncture hole. Since that time, orthopedic surgeons have developed a method to manually fabricate drug delivery implants at the time of surgery—typically antibiotic-impregnated beads—to be implanted deep (eg, subfascial, intramedullary, intra-articular) at the time of a major open procedure for infections. The beads may subsequently be removed after the infection has resolved and a definitive procedure is performed. The work of 11981 and 11983 never included the manual preparation and implantation of a drug delivery device during a major open operation for infection and 11982 and 11983 never included the removal of the implant during a major open operation.

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, such as a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.***

Although it may appear that this compelling evidence argument would apply to the codes in this tab, the fact is that the services represented by codes 11981-11983 (insert/removal of manufactured time-released drug implant) have not changed from the original application submitted in 2001 and subsequent review by the RUC. Orthopaedic surgeons were not part of the original application in 2001 and valuation, and orthopaedic surgeons were not aware that these codes were only meant to describe subcutaneous insertion of a manufactured time-released drug implant. This resulted in the codes being inadvertently reported for very different deep musculoskeletal procedures. The societies recommended and the RAW agreed, that referral to CPT for creation of new codes for this new and different work was appropriate. This required submission of a code change application and supporting literature to clearly describe the musculoskeletal work for a surgeon's manual preparation of drug delivery devices to be implanted deep.

Survey Sample and Process

A survey request was sent to a random selection of members from the American Academy of Orthopaedic Surgeons, American Association of Hip and Knee Surgeons, and Orthopaedic Trauma Association. The survey included all six codes.

Work Recommendation – 20703

The survey 25th percentile work RVU of 1.80 is recommended for code 20703.

Time recommendation

Unlike the codes for manual preparation and insertion of a drug delivery device, codes 20701, 20703, and 20705 are clear typical add-on codes with limited pre- and post-work related to the add-on service that is not part of the primary procedure.

Our expert panel believes the survey respondents may have overestimated the pre-service time which would include addition time related to discussion removal of the implant during the consent process and to confirm availability of equipment necessary to remove the device. We also believe the survey respondents may have overestimated the post-service time which would include addition time related to documentation of the additional work. **We recommend one minute for pre-service work and two minutes for post-service work related to the add-on code 20703 that is not included in the work of the primary procedure.**

Key Reference Codes

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
11047	Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)	1.80	0.059	31	0	30	1

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 206X4 in conjunction with 20694, 20690, 20692, 20694, 20802, 20805, 20838, 23170, 23180, 23184, 23935, 24134, 24138, 24140, 24147, 24516, 25145, 25150, 25151, 25400, 25515, 25525, 25526, 25545, 25574, 25575, 27245, 27259, 27360, 27470, 27506, 27640, 21510, 23035, 23515, 23615, 24430, 25035, 27720)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11982, 11983, 20999, or primary procedure with modifier 22 appended

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 511
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The expert panel summed the 2017 Medicare data for 11981, 11982, 11983 attributable to orthopaedic surgeons, plastic surgeons, hand surgeons, and podiatry and added 10% to account for reporting using unlisted codes or modifier 22 appended to the primary procedure. The expert panel also estimates a 15% / 15% / 70% split within each set of codes (deep, intramedullary, intra-articular) and a 50% split for 11983 between the insert and remove set of new codes. The result is: 20700=1446; 20702=1446; 20704=6748; 20701=511; 20703=511; 20705=2388 (see separate Excel utilization file for calculations).

Specialty orthopaedic surgery	Frequency 480	Percentage 93.93 %
-------------------------------	---------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

Global Period: ZZZ Current Work RVU:

RUC Recommended RVU: **2.60**

CPT Descriptor: Manual preparation and insertion of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male undergoes surgical treatment of a native joint infection (reported separately). The surgeon then fabricates an antibiotic cement device that is placed intra-articular. [Note: This is an add-on code. Only consider the additional work for manual preparation and insertion of the antibiotic delivery device.]

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The surgeon discusses the purpose of the drug delivery with the patient and/or family; provides a brief description of the technical aspects; outlines the risks, benefits, alternatives and expected outcome; discusses the possible need for additional surgery to remove the device; and obtains informed consent.

Pre-operative radiographs, including anteroposterior and lateral views are evaluated to estimate the size of the intra-articular device.

The results of cultures and sensitivity data are reviewed to guide antibiotic selection. The surgeon confirms the patient is not allergic to the planned antibiotics and other materials that will be used to prepare the drug delivery device.

The surgeon confirms the availability and presence of the material and equipment needed to formulate the device (e.g. antibiotic powder; polymethyl methacrylate [PMMA] powder and liquid monomer; vacuum mixing system; pressurized insertion gun; lubricant; and appropriately sized molds).

Description of Intra-Service Work: Following thorough debridement of the infected bone and soft tissue (separately reported), the type of drug delivery device and size of the components are selected. The instruments that were used for the “dirty” portion of the procedure are removed, new instruments are opened and set-up, the patient’s limb is prepped again and re-draped, and the surgical team changes gowns and gloves. The “clean” portion of the procedure begins.

On the back table, the surgeon makes the device. An appropriately sized mold is selected. Sterile mineral oil or ultrasound gel is used to lubricate the inner portion of the mold. PMMA powder is mixed with antibiotic powder; most commonly 3.6 g of tobramycin and 1 g of vancomycin are used with each 40-g package of cement. Liquid monomer is added and the materials are mixed in a vacuum mixing system. A container with the cement in liquid form is then transferred to a pressurized insertion gun. The liquid cement is injected under pressure to completely fill the mold. After the cement is hardened, the device is removed from the mold.

The size and fit of the device are determined by temporary application to the bone ends; range of motion and joint stability are assessed. The device is removed, the bone ends are prepared with pulse irrigation and dried. Another batch of antibiotic cement is then prepared in similar fashion. The liquid cement is applied to the bone ends +/- the medullary canal, the device is inserted and stabilized until the cement is hard and then excess cement is removed. A commercially available nail, rod, or wire may be used to supplement the cement fixation. Stability and mobility are confirmed.

Description of Post-Service Work: The device preparation, materials and construct details are documented in the medical record (e.g. written brief operative note and dictated complete operative note). Post-operative radiographs are reviewed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The RAW noted that this service was first surveyed in 2001 by the American Urological Association (AUA), but the

2016 Medicare utilization no shows orthopedic surgery as the primary provider. The RUC recommended that the service be referred to the CPT Panel to better define these services and to determine if musculoskeletal procedures should have separate codes to report.

At the May 2018 CPT Panel meeting, the Panel accepted a proposal for six new add-on codes supported by literature to report insertion and removal of drug delivery implant devices in conjunction with specific orthopedic primary procedures. These six new add-on codes are included in the musculoskeletal section of the CPT codebook and includes introductory guidelines and parenthetical notes. Separately, the CPT Panel addressed the current code family based on urology and obstetrics/gynecology procedures by adding parentheticals after codes 11981 and 11982. The code descriptors for 11981-11983 were not changed and remain based on urology and obstetrics/gynecology procedures.

Compelling Evidence for Codes 20700-20705

For CPT 2002, three new codes were developed specifically to describe insertion, removal, and removal with reinsertion of a non-biodegradable manufactured drug delivery implant. These codes were initially created to describe a once-yearly implant containing leuprolide acetate for the treatment of prostate cancer. However, because various types of medications for various indications can be administered using this type of implant, the CPT Editorial Panel voted to keep the descriptors generic. That is why the type of drug is not listed in the descriptors of these codes.

At the April 2001 RUC meeting, the RUC recommended that CMS develop RVUs for these codes by cross-walking the RVUs from CPT codes 11975, 11976, and 11977, insertion, removal and removal with reinsertion of implantable contraceptive capsules.

In April 2002, urology again submitted a letter requesting a crosswalk to the contraceptive capsule codes. The RUC adopted this as an interim solution and requested that AUA survey these codes for review at a future RUC meeting. The RUC understands that a survey of urologists who perform this procedure for a drug specific to urology would not apply to other specialties that may use this code for other drug implants in the future. The RUC agreed that the implant insertion would be equivalent work to the contraceptive capsule insertion and a survey is unlikely to produce different results and did not require a survey.

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The AAOS submitted an Action Plan that recommended referral to CPT to differentiate the musculoskeletal procedures that were never meant to be reported with codes 11981-11983 because those codes were clearly created for subcutaneous insertion of a once yearly manufactured drug-releasing implant. CPT required the AAOS to use the long form CPT proposal and submit literature to support the proposed musculoskeletal codes. AUA and ACOG did not make any changes to the current codes 11981-11983 as these codes will continue to represent insertion in the arm of a once yearly manufactured drug-releasing implant.

- ***Evidence that technology and patient has changed***

When codes 11981-11983 were created in 2002, drug delivery implants were only available for manufactured time-released implant products that were inserted just under the skin in the upper inside arm through a small puncture hole. Since that time, orthopedic surgeons have developed a method to manually fabricate drug delivery implants at the time of surgery—typically antibiotic-impregnated beads—to be implanted deep (eg, subfascial, intramedullary, intra-articular) at the time of a major open procedure for infections. The beads may subsequently be removed after the infection has resolved and a definitive procedure is performed. The work of 11981 and 11983 never included the manual preparation and implantation of a drug delivery device during a major open operation for infection and 11982 and 11983 never included the removal of the implant during a major open operation.

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, such as a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.***

Although it may appear that this compelling evidence argument would apply to the codes in this tab, the fact is that the services represented by codes 11981-11983 (insert/removal of manufactured time-released drug implant) have not changed from the original application submitted in 2001 and subsequent review by the RUC. Orthopaedic surgeons were not part of the original application in 2001 and valuation, and orthopaedic surgeons were not aware that these codes were only meant to describe subcutaneous insertion of a manufactured time-released drug implant. This resulted

in the codes being inadvertently reported for very different deep musculoskeletal procedures. The societies recommended and the RAW agreed, that referral to CPT for creation of new codes for this new and different work was appropriate. This required submission of a code change application and supporting literature to clearly describe the musculoskeletal work for a surgeon's manual preparation of drug delivery devices to be implanted deep.

Survey Sample and Process

A survey request was sent to a random selection of members from the American Academy of Orthopaedic Surgeons, American Association of Hip and Knee Surgeons, and Orthopaedic Trauma Association. The survey included all six codes.

Work Recommendation – 20704

The survey median work RVU of 4.00 is recommended for code 20704.

Time recommendation

An expert panel reviewed the survey data and determined that there was some confusion about whether the backbench manual preparation of the implant device was pre-time or intra-time. Specifically, some respondents included significantly more time in the pre-time category than the intra-time. This is evident by the increasing median pre-time for codes 20700, 20702, and 20704 (ie, the preparation of the implant for 20704 takes longer than 20700). However, we do not agree that the pre-time represents the time to manually prepare the device and that this time is mixed between the two categories of pre- and intra-time in the data.

Our expert panel believes the median total time of 45 minutes is accurate for the entire additional work required for 20704 which includes: consent for a device implant, collection of supplies and equipment to prepare the device, manually preparing the device intra-operatively, inserting the device, and then documenting the work and device (type, lot, manufacturer, etc.). We considered requesting collapsing all time into the intra-category, similar to what the RUC allows for other societies where there is a gray zone of the components of work. For example, pathology collapses all time (including review of records and dictation and documentation of final report) into the intra-time category. Allergy and immunology has similarly collapsed all work and time into the intra-time category.

We do not know of a rule about assigning work and time to add-on codes, so we are leaving the survey times in the three categories. However, we have collapsed the service description to the intra-service work category similar to what other specialties have done.

We strongly recommend the survey total time of 45 minutes as accurate for the total work of add-on code 20704 and we present the time data as 10/30/5 per the survey statistics.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 206X2 in conjunction with 22864, 22865, 23040, 23044, 23334, 24000, 24160, 25040, 25250, 25251, 26070, 26075, 26080, 26990, 27030, 27090, 27301, 27310, 27603, 27610, 28020)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11981, 11983, 20999, or primary procedure with modifier 22 appended

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,748

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The expert panel summed the 2017 Medicare data for 11981, 11982, 11983 attributable to orthopaedic surgeons, plastic surgeons, hand surgeons, and podiatry and added 10% to account for reporting using unlisted codes or modifier 22 appended to the primary procedure. The expert panel also estimates a 15% / 15% / 70% split within each set of codes (deep, intramedullary, intra-articular) and a 50% split for 11983 between the insert and remove set of new codes. The result is: 20700=1446; 20702=1446; 20704=6748; 20701=511; 20703=511; 20705=2388 (see separate Excel utilization file for calculations).

SUMMARY OF RECOMMENDATION**

CPT Code: 20705 Tracking Number C10

Original Specialty Recommended RVU: **2.15**Presented Recommended RVU: **2.15**

Global Period: ZZZ Current Work RVU:

RUC Recommended RVU: **2.15**

CPT Descriptor: Removal of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old male undergoes removal of an intra-articular antibiotic cement device during surgical treatment of an intra-articular infection. [Note: This is an add-on code. Only consider the additional work for removal of the antibiotic delivery device.]

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The surgeon reviews removal of the device with the patient and/or family; provides a brief description of the technical aspects; outlines the risks, benefits, alternatives and expected outcome; discusses the potential inability to remove the device totally, or in part, and the implications, including the need for additional surgery; and obtains informed consent.

Pre-operative radiographs, including anteroposterior and lateral views are evaluated to assess the location and integrity of the device.

The surgeon confirms the presence of the equipment and specialized instruments required for removal (e.g. long flexible osteotomes, high speed burr, nail/implant extraction kits).

Description of Intra-Service Work: The prior incision(s), in part or in total, are utilized. Exposure and dissection are completed until the device is identified, typically at the insertion site, but frequently also at the site of the infection and/or fracture.

Soft tissues are carefully stripped and a semi-circular osteotome is used to loosen the bone-device interface. An extraction tool is attached to the nail/rod/wire and attempts are made to remove the device under fluoroscopic control. However, not infrequently, the cement fractures and multiple fragments must be removed individually via the medullary canal and/or via the infection/fracture site. Fluoroscopy is used to confirm that the entire device has been removed..

Description of Post-Service Work: Removal of the device is documented in the medical record (e.g. written brief operative note and dictated complete operative note). Post-operative radiographs are reviewed..

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The RAW noted that this service was first surveyed in 2001 by the American Urological Association (AUA), but the 2016 Medicare utilization no shows orthopedic surgery as the primary provider. The RUC recommended that the service be referred to the CPT Panel to better define these services and to determine if musculoskeletal procedures should have separate codes to report.

At the May 2018 CPT Panel meeting, the Panel accepted a proposal for six new add-on codes supported by literature to report insertion and removal of drug delivery implant devices in conjunction with specific orthopedic primary procedures. These six new add-on codes are included in the musculoskeletal section of the CPT codebook and includes introductory guidelines and parenthetical notes. Separately, the CPT Panel addressed the current code family based on urology and obstetrics/gynecology procedures by adding parentheticals after codes 11981 and 11982. The code descriptors for 11981-11983 were not changed and remain based on urology and obstetrics/gynecology procedures.

Compelling Evidence for Codes 20700-20705

For CPT 2002, three new codes were developed specifically to describe insertion, removal, and removal with reinsertion of a non-biodegradable manufactured drug delivery implant. These codes were initially created to describe a once-yearly implant containing leuprolide acetate for the treatment of prostate cancer. However, because various types of medications for various indications can be administered using this type of implant, the CPT Editorial Panel voted to keep the descriptors generic. That is why the type of drug is not listed in the descriptors of these codes.

At the April 2001 RUC meeting, the RUC recommended that CMS develop RVUs for these codes by cross-walking the RVUs from CPT codes 11975, 11976, and 11977, insertion, removal and removal with reinsertion of implantable contraceptive capsules.

In April 2002, urology again submitted a letter requesting a crosswalk to the contraceptive capsule codes. The RUC adopted this as an interim solution and requested that AUA survey these codes for review at a future RUC meeting. The RUC understands that a survey of urologists who perform this procedure for a drug specific to urology would not apply to other specialties that may use this code for other drug implants in the future. The RUC agreed that the implant insertion would be equivalent work to the contraceptive capsule insertion and a survey is unlikely to produce different results and did not require a survey.

In January 2018, the RAW identified code 11981 through a screen of "Different Performing Specialty from Survey." The AAOS submitted an Action Plan that recommended referral to CPT to differentiate the musculoskeletal procedures that were never meant to be reported with codes 11981-11983 because those codes were clearly created for subcutaneous insertion of a once yearly manufactured drug-releasing implant. CPT required the AAOS to use the long form CPT proposal and submit literature to support the proposed musculoskeletal codes. AUA and ACOG did not make any changes to the current codes 11981-11983 as these codes will continue to represent insertion in the arm of a once yearly manufactured drug-releasing implant.

- ***Evidence that technology and patient has changed***

When codes 11981-11983 were created in 2002, drug delivery implants were only available for manufactured time-released implant products that were inserted just under the skin in the upper inside arm through a small puncture hole. Since that time, orthopedic surgeons have developed a method to manually fabricate drug delivery implants at the time of surgery—typically antibiotic-impregnated beads—to be implanted deep (eg, subfascial, intramedullary, intra-articular) at the time of a major open procedure for infections. The beads may subsequently be removed after the infection has resolved and a definitive procedure is performed. The work of 11981 and 11983 never included the manual preparation and implantation of a drug delivery device during a major open operation for infection and 11982 and 11983 never included the removal of the implant during a major open operation.

- ***Evidence that incorrect assumptions were made in the previous valuation of the service, such as a previous survey was conducted by one specialty to obtain a value, but in actuality that service is currently provided primarily by physicians from a different specialty according to utilization data.***

Although it may appear that this compelling evidence argument would apply to the codes in this tab, the fact is that the services represented by codes 11981-11983 (insert/removal of manufactured time-released drug implant) have not changed from the original application submitted in 2001 and subsequent review by the RUC. Orthopaedic surgeons were not part of the original application in 2001 and valuation, and orthopaedic surgeons were not aware that these codes were only meant to describe subcutaneous insertion of a manufactured time-released drug implant. This resulted in the codes being inadvertently reported for very different deep musculoskeletal procedures. The societies recommended and the RAW agreed, that referral to CPT for creation of new codes for this new and different work was appropriate. This required submission of a code change application and supporting literature to clearly describe the musculoskeletal work for a surgeon's manual preparation of drug delivery devices to be implanted deep.

Survey Sample and Process

A survey request was sent to a random selection of members from the American Academy of Orthopaedic Surgeons, American Association of Hip and Knee Surgeons, and Orthopaedic Trauma Association. The survey included all six codes.

Work Recommendation – 20705

The survey 25th percentile work RVU of 2.15 is recommended for code 20705.

Time recommendation

Unlike the codes for manual preparation and insertion of a drug delivery device, codes 20701, 20703, and 20705 are clear typical add-on codes with limited pre- and post-work related to the add-on service that is not part of the primary procedure.

Our expert panel believes the survey respondents may have overestimated the pre-service time which would include addition time related to discussion removal of the implant during the consent process and to confirm availability of equipment necessary to remove the device. We also believe the survey respondents may have overestimated the post-service time which would include addition time related to documentation of the additional work. **We recommend one minute for pre-service work and two minutes for post-service work related to the add-on code 20705 that is not included in the work of the primary procedure.**

Key Reference Codes

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
11047	Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)	1.80	0.059	31	0	30	1
20705	Removal of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)	2.15	0.083	28	1	25	2
29826	'Arthroscopy, shoulder, surgical; decompression of subacromial space with partial acromioplasty, with coracoacromial ligament (ie, arch) release, when performed (List separately in addition to code for primary procedure)	3.00	0.075	40	0	40	0

MPC Codes

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
36227	Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)	2.09	0.139	15	0	15	0
20705	Removal of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)	2.15	0.083	28	1	25	2
36476	Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)	2.65	0.088	30	0	30	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 206X5 in conjunction with 22864, 22865, 23040, 23044, 23334, 24000, 24160, 25040, 25250, 25251, 26070, 26075, 26080, 26990, 27030, 27090, 27301, 27310, 27603, 27610, 28020)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11982, 11983, 20999, or primary procedure with modifier 22 appended

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,388

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The expert panel summed the 2017 Medicare data for 11981, 11982, 11983 attributable to orthopaedic surgeons, plastic surgeons, hand surgeons, and podiatry and added 10% to account for reporting using unlisted codes or modifier 22 appended to the primary procedure. The expert panel also estimates a 15% / 15% / 70% split within each set of codes (deep, intramedullary, intra-articular) and a 50% split for 11983 between the insert and remove set of new codes. The result is: 20700=1446; 20702=1446; 20704=6748; 20701=511; 20703=511; 20705=2388 (see separate Excel utilization file for calculations).

Specialty orthopaedic surgery	Frequency 2250	Percentage 94.22 %
-------------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

CPT Code: 11981-11983
Specialty Society: ACOG & AUA

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

Global Period: 000 **REVISED – At Meeting** Meeting Date: October 2018

CPT Long Descriptor(s):

11981: Insertion, non-biodegradable drug delivery implant
11982: Removal, non-biodegradable drug delivery implant
11983: Removal with reinsertion, non-biodegradable drug delivery implant

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

ACOG and AUA convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these drug delivery implant procedures.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

CPT Codes 11981-11983 are current codes. As such, we included the existing direct practice expense inputs on the PE spreadsheet.

**3. Is this code(s) typically billed with an E/M service?
Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)**

These codes are not typically billed with E/M services:

- 11981 – 5%
- 11982 – 6%
- 11983 – 23%

These codes are not typically billed with an E/M service in the nonfacility:

- 11981 – 50%
- 11982 – 38%
- 11983 – 47%

**4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?**

CPT Code: 11981-11983
Specialty Society: ACOG & AUA

**Is the dominant provider in the nonfacility different then for the global?
(Please see provided data in PE Subcommittee folder)**

The current dominant provider in the nonfacility setting is orthopedic surgery:

- 11981-65%
- 11982-64%
- 11983-47%

However, the reason for the survey is that new CPT codes have been created to report the orthopedic surgery work for these services.

The current dominant provider in the global (+ tc services) setting are as follows:

- 11981-gynecology 38%
- 11982-gynecology 50%
- 11983-urology 59%

- 5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:**

N/A

- 6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.**

We are requesting an increase in aggregate current costs for supplies due to changes in technique of the services. The current implant only includes the trocar and medication, as such all the necessary items to perform need to be included.

- 7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:**

N/A

- 8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:**

We are recommending 3 minutes for obtain vital signs, based on the vital signs standards (1-3). The vital signs for these procedures include: blood pressure, height, weight. **It would not appear that the vital signs were increased to 5 minutes based on the CMS 'vital signs' initiative.*

CPT Code: 11981-11983
Specialty Society: ACOG & AUA

9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:

Assist physician
Open and pass supplies/anesthetic to physician
Patient attention
Chaperone

10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

N/A

12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.

N/A

13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:

N/A

14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:

N/A

15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

EF023 Exam Table -- Default + Post Procedure Monitoring (CA022) **recognized/recommended by CMS*
EQ168 light, exam -- Default + Post Procedure Monitoring (CA022) **recognized/recommended by CMS*
EF027 table, instrument, mobile -- Default + Post Procedure Monitoring (CA022)
**recognized/recommended by CMS*

Formatted: Font: 10 pt, Italic

CPT Code: 11981-11983
Specialty Society: ACOG & AUA

~~*Note: Because we are using the default equipment formula, CA022 time is not included in the equipment formulas. However, the patient does recover in the room, so that time is not being captured.~~

16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:

We are requesting 5 minutes for education and consent to address issues including side effects, long term implications, confusion, etc. Discussions around use of hormones is much more complex today.

The patient recovers for approximately 10 minutes after the procedure, with the nurse coming to check in on the patient. We are requesting 2 minutes for post procedure monitoring (instead of 2.5 minutes).
*See note in #15.

Post procedure phone call is to check on bruising and ensure not having any issues with hematoma development.

17. If there is any other item on your spreadsheet that needs further explanation please include here:

The old PE spreadsheets that these codes were crosswalked to had time in the pre-service and the post-service that is not reflected in the RUC database.

The codes are changing from an XXX global period to a 000 global period.

18. Please include an explanation of each line item:

SA027	Kit, Scissors and clamp	Used in 11982&11983 in order to open the fibrosis around the existing implant
SB006	drape, non-sterile, sheet 40in x 60in	Patient cover
SB007	drape, sterile barrier	For instrument table
SB014	Drape, sterile, three-quarter sheet	For injection area
SB024	gloves, sterile	Nurse and MD
SB026	gown, patient	Patient gown
SB036	paper, exam table	Exam table paper
SB037	pillow case	Pillow case
SB044	underpad 2ft x 3ft (Chux)	Under the operative site for blood collection
SC029	needle, 18-27g	1 to aspirate the anesthetic from the anesthetic supply bottle and the other to inject the patient with.
SC051	syringe 10-12ml	
SF044	Blade, surgical, super-sharp	Initial incision for the implant
SG014	bandage, elastic, self-adherent wrap 1in (Coban)	Provides pressure to reduce bruising
SG040	dressing, 5in x 9in (Adaptic)	Placed over the gauze
SG055	gauze, sterile 4in x 4in	Folded over the incision
SG074	steri-strip (6 strip uou)	2 steri-strips to close incision
SH046	lidocaine 1% w-epi inj (Xylocaine w-epi)	Local anesthetic for procedure – w/epi for hemostasis
SJ043	povidone swabsticks (3 pack uou)	Used to prepare the arm for implant
SJ053	swab-pad, alcohol	Wipe off top off anesthetic bottle

Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

+20700	Manual preparation and insertion of drug delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)
+20702	Manual preparation and insertion of drug delivery device(s), intramedullary (List separately in addition to code for primary procedure)
+20704	Manual preparation and insertion of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)
+20701	Removal of drug delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)
+20703	Removal of drug delivery device(s), intramedullary (List separately in addition to code for primary procedure)
+20705	Removal of drug delivery device(s), intra-articular (List separately in addition to code for primary procedure)

Global Period: ZZZ Meeting Date: October 2018

****No direct practice expense inputs recommended****

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:
3. Is this code(s) typically billed with an E/M service?
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence:
6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:
8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.
9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:
11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:
12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:
13. If there is any other item on your spreadsheet that needs further explanation please include here:
14. Please include an explanation of each line item:

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

+20700	Manual preparation and insertion of drug delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)
+20702	Manual preparation and insertion of drug delivery device(s), intramedullary (List separately in addition to code for primary procedure)

Global Period: ZZZ Meeting Date: October 2018

****No direct practice expense inputs recommended****

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:
3. Is this code(s) typically billed with an E/M service?
Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)
4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different then for the global?
(Please see provided data in PE Subcommittee folder)
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.
7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:
9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:
10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:
12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.
13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:
14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:
15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:
16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:
17. If there is any other item on your spreadsheet that needs further explanation please include here:
18. Please include an explanation of each line item:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Growth screen

January 2014

Hormone Pellet Implantation

At the October 2013, meeting the Relativity Assessment Workgroup reviewed High Volume Growth Services where Medicare utilization increased by at least 100% from 2006 to 2011. The RUC requested that these services be surveyed for physician work and develop practice expense inputs for the January 2014 RUC meeting. In January 2014 the RUC questioned whether CPT code 11981 should also be reviewed since it is “CMS/Other” and has not been reviewed. **The RUC requests the specialty societies submit an action plan to the RAW in April to consider whether 11981 is part of this family and should be surveyed.**

The RUC discussed the physician time and intensity associated with CPT Code 11980 *Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)* and the appropriate work RVU relative to similar services. The specialty societies indicated and the RUC agreed that 10 minutes of pre-service time, 12 minutes of intra-service time, and 5 minutes of post-service time, adequately accounts for the physician time required to perform this service. The RUC noted that the time has decreased since this code was last reviewed in February 2000 and acknowledged that the reduction in time may be a result of the creation of pre- and post-time packages. Based on this reduction in time, rather than maintain the current work RVU, the RUC recommended a direct crosswalk to CPT Code 11730 *Avulsion of nail plate, partial or complete, simple; single* (work RVU=1.10) with identical intra service time of 12 minutes and similar intensity. To further support the value the RUC compared the surveyed code to CPT Code 51705 *Change of cystostomy tube; simple* (work RVU= 0.90) and agreed that 11980 should be valued higher since this requires more physician work. The RUC also compared CPT Code 11980 to CPT Code 67810 *Incisional biopsy of eyelid skin including lid margin* (work RVU=1.18) and agreed that this procedure requires slightly more physician time and intensity, accounting for the higher work value. **The RUC recommends a work RVU of 1.10, a direct crosswalk to CPT code 11730 for CPT code 11980.**

Practice Expense

The RUC reviewed and approved the direct practice expense inputs with modifications as approved by the Practice Expense Subcommittee.

Work Neutrality

The RUC’s recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (●New)	CPT Descriptor	Global Period	Work RVU Recommendation
11980	Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)	000	1.10

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 11980	Tracking Number	Original Specialty Recommended RVU: 1.48
		Presented Recommended RVU: 1.48
Global Period: 000		RUC Recommended RVU: 1.10

CPT Descriptor: Subcutaneous hormone pellet implantation (implantation of estradiol and/or testosterone pellets beneath the skin)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56 year old man has a diagnosis of hypogonadism, his serum testosterone is below the lower limit of the range of normal for testosterone. After discussion with his physician, he decides to undergo implantation of testosterone pellet(s).

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: An explanation of the procedure is provided and informed consent is obtained. The patient is placed in either the supine, prone or Sim's position and the patient's skin is scrubbed with betadine followed by alcohol. After draping with sterile drapes, the abdominal skin area is anesthetized by raising a skin wheal with 10 cc 1% lidocaine.

Description of Intra-Service Work: A small incision is made into the skin with a scalpel and a trocar is inserted with a pellet implanter and the trocar is withdrawn. Forceps are used to place the hormone pellets in the external opening of the cannula and implant them 6 to 10 cm from the puncture wound with the blunt trocar into the subcutaneous area. Bleeding is controlled with a few minutes of pressure with sterile 4 x 4 gauze squares.

Description of Post-Service Work: A steri-strip is placed over the wound and additional dressing is held in place with non-allergic tape. The sterile bandage is left in place overnight. The patient is instructed to replace the bandage daily with band-aids until the puncture wound is completely closed. Dictate office notes. Provides patient with instructions

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AUA sent a “do you do letter” to a random number of members. The surveys were then sent to the individual physicians who answered that they do the procedure and would complete the RUC survey. The survey was sent to 87 individuals and of those individuals, 49 responses were received for a response rate of 56.32%. In 2013, 22,910 of these procedures were performed in the Medicare population so the number of responses to this survey meets the new RUC criteria of 30 respondents as the minimum survey sample size for this code.

The AUA RUC expert panel reviewed the survey results. The expert panel added two minutes of positioning time in the pre-service time. The current intraservice time is 12.5 minutes. The survey results for intraservice time came to 12 minutes. The current work RVU is 1.48. The median work value from the survey is 2.10. The 25th percentile of the work RVU was 1.69. The survey median postservice time was five minutes and the expert panel suggests that time be considered instead of the postservice time package for this procedure.

Since there was a minimal reduction in the intraservice time, it is the recommendation of the AUA RUC expert panel that the current RVU of 1.48 be maintained for CPT code 11980.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11980

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology

How often? Commonly

Specialty Radiation Oncology

How often? Sometimes

Specialty Diagnostic Radiology

How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 21531

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare X 125%

Specialty Urology	Frequency 16421	Percentage 76.26 %
-------------------	-----------------	--------------------

Specialty Radiation Oncology	Frequency 3938	Percentage 18.28 %
------------------------------	----------------	--------------------

Specialty Diagnostic Radiology	Frequency 776	Percentage 3.60 %
--------------------------------	---------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

17,225 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Please explain the rationale for this estimate. RUC Database

Specialty Urology	Frequency 13137	Percentage 76.26 %
-------------------	-----------------	--------------------

Specialty Radiation Oncology	Frequency 3150	Percentage 18.28 %
------------------------------	----------------	--------------------

Specialty Diagnostic Radiology	Frequency 620	Percentage 3.59 %
--------------------------------	---------------	-------------------

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Skin

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 11980

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey, summary of recommendation forms and practice expense recommendations are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair, AMA Representative and Alternate AMA Representative.)

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs**

CPT Long Descriptor:

11980

Global Period: xxx Meeting Date: January 2014

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: RUC Advisors from each specialty society involved in this survey process reviewed the practice expense recommendations and approved them.
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: We are using existing CPT code inputs as reference code.
3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:
5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Visit prior to procedure:

Provide pre-service education and obtain consent from patient

Day of Procedure – Pre-Service

Greet the patient

Provide gown

Ensure appropriate medical records are available

Obtain three vitals (BP, weight and temperature)

Prepare room, equipment and supplies

Intra-Service Clinical Labor Activities:

Assist physician during procedure

Post-Service Clinical Labor Activities:

Clean the room and equipment

Provide follow up information to patient.

Patient education/teaching as appropriate based upon the visit

Confers with the MD verbally for any last minute instructions for patient.

Next appointment is set up for patient while checking out.

Next day after patient leaves the office, calls patient.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2018

Aortic Graft Procedures

At the September 2017 CPT Editorial Panel meeting, the Panel created one new add-on code to report hemi-aortic arch graft replacement. Existing CPT codes 33860, 33863 and 33864 were identified as a family codes for review at the January 2018 RUC meeting. At the January 2018 RUC meeting, the specialty societies only presented survey data and a recommendation for new CPT code 33866. The specialties did not survey the ascending aortic replacement codes 33860, 33863 or 33864 for the January 2018 RUC meeting and provided their rationale for not surveying the codes to the RUC at the meeting. Although the new add-on code was designed to be reported with the ascending aortic replacement codes, 33860, 33863 or 33864, the specialty societies noted that the work involved in the hemi-aortic arch replacement procedure represented an advancement in surgical technique that has evolved over the past five years and did not reflect work that is currently accounted for in the ascending aortic procedures. The specialty societies indicated that the hemi-aortic arch replacement is more closely related to the transverse aortic arch replacement code 33870. At the January 2018 meeting, the RUC recommended an interim value for new CPT code 33866 and for the full family of services to be surveyed and presented at the April 2018 RUC meeting, including codes 33860, 33863, 33864, 33866, 33870. The RUC observed that the current draft parenthetical following CPT code 33870, did not preclude 33870 from being coded with base codes 33860-33864 nor did it direct users to instead use 330X1 when hemi-aortic arch graft replacement is performed. The RUC recommended that the CPT Editorial Panel consider parenthetical additions for CPT code 33870. The RUC referred the entire family of codes for review at the April 2018 RUC meeting. Accordingly, at the February 2018 CPT Editorial Panel meeting, the Panel revised the introductory language in addition to parentheticals for code 33870 to clarify that the code is not reported for hemi-aortic arch graft.

At the April 2018 RUC meeting, the specialty societies noted that during their preparations for the April 2018 RUC meeting, they determined that this family of services should be submitted to the CPT Editorial Panel for the following revisions: 1) To develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies. The specialties expressed that there is a sufficient difference in the work associated with these procedures and now there is sufficient volume to allow for more accurate capture of the work and outcomes data for these distinct patient populations, which was not the case when the code was first developed. 2) Revise the descriptor for the transverse arch code, 33870 to further clarify the difference in work between that code and the new add-on code 33866. 3) Revise the guidelines to provide additional instructions on the appropriate use of these codes. The specialty societies had already submitted a new coding proposal for consideration at the May 2018 CPT Editorial Panel meeting for CPT 2020. The RUC supported referral to CPT and rescinded the interim value recommendation to CMS for code 33866 for CPT 2019.

In May 2018, the CPT Editorial Panel approved the deletion of two codes and addition of four new codes to distinguish between repairs for aortic dissection and repairs for aortic diseases other than dissection.

33858 *Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic dissection*

The RUC reviewed the survey results from 41 cardiothoracic surgeons and agreed on the following physician time components: 40 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, 300 minutes of intra-service time, 60 minutes of immediate post-service time, 3-99291 visits, 2-99233 visits, 1-99232 visit, 1-99231 visit, 1-99238 discharge visit, 1-99214 office visit and 1-99213 office visit. The RUC agreed with the specialty that the standard evaluation time of 40 minutes is warranted for this emergent procedure. Although this is an emergent procedure, the patient is still evaluated to determine a definitive diagnosis and the extent of the dissection. The surgeon will obtain consent, review and explain the procedure to the patient and/or family. The surgeon will review the pertinent imaging which will include chest x-rays, CT Scan, MRI, aortogram and TEE, if available to identify the extent of the dissection. The trans-esophageal echocardiogram is reviewed with the anesthesiologist and/or cardiologist with special attention to quality of the ascending aorta, location and extent of false lumen, degree and nature of aortic insufficiency and assessment of ventricular function. The RUC agreed with the specialty that a 12-minute increase in time over standard pre-time package 4 for a total positioning time of 15 minutes was warranted, which is common for major cardiothoracic procedures and can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation. The RUC agreed with the specialty that the 27 minutes of additional immediate post-service time above standard package 9b was warranted due to the additional time needed for immediate post-operative patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished. The RUC agreed with the specialties that this emergent code requires more post-operative visits relative to planned procedures. Critical care extends to the third postoperative day due to the complexity of the procedure and the need to carefully monitor several organ systems that can be impacted by the dissection. These organ systems include pulmonary, renal, cardiovascular, gastrointestinal, and neurologic. The STS Database shows a mean intra-service time of 301 minutes and a median time of 281 minutes, however the database data available at this time does not distinguish the time for dissections versus aortic repair for other aortic disease such as aneurysm.

The RUC reviewed the survey respondents' estimated physician work value and agreed that the respondents appropriately valued the physician work involved in performing this service at the median work RVU of 65.00. To justify a work RVU of 65.00, the RUC compared the survey code to top key reference code 33412 *Replacement, aortic valve; with transventricular aortic annulus enlargement (Konno procedure)* (work RVU of 59.00, intra-service time of 300 minutes) and noted that both services have identical intra-service time, whereas the survey code involves more total time and 86 percent of the survey respondents that selected this key reference indicated that the survey code is more intense and complex to perform, justifying the higher work RVU. Ascending aortic grafting for aortic dissection is an emergent procedure that requires a median sternotomy, cardiopulmonary bypass with cardiac arrest. The ascending aorta involved in the dissection is transected, resected and replaced with a graft. Reinforcement of the proximal ascending aortic wall with sewn-in circumferential Teflon felt strip is required and distal aortic wall reinforcement may also be necessary depending on the extent of the dissection and the friability of aortic tissue. The patients that require this intervention face very high mortality without both expeditious diagnosis and technically proficient surgery. **The RUC recommends a work RVU of 65.00 for CPT code 33858.**

33859 Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic disease other than dissection (eg, aneurysm)

The RUC reviewed the survey results from 40 cardiothoracic surgeons and agreed on the following physician time components: 60 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, 240 minutes of intra-service time, 60 minutes of immediate post-service time, 2-99291 visits, 2-99233 visits, 1-99232 visit, 1-99231 visit, 1-99238 discharge visit and 1-99214 office visit. The RUC agreed with the specialty that the additional evaluation time of 20 minutes above standard pre-time package 4 is warranted for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, coronary angiogram, echocardiogram, cardiac catheter report, CT scans and echocardiography is required to identify the extent of the aortic disease, the amount of aortic resection necessary, the type and size of the aortic valve and the graft. The RUC agreed with the specialty that a 12-minute increase in time over standard pre-time package 4 for a total positioning time of 15 minutes was warranted, which is common for major cardiothoracic procedures and can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation. The RUC agreed with the specialty that the 27 minutes of additional immediate post-service time above standard package 9b was warranted due to the additional time needed for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished. The STS Database shows a mean intra-service time of 301 minutes and a median time of 281 minutes, however the database data available at this time does not distinguish the time for dissections versus aortic repair for other aortic disease such as aneurysm.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 50.00. To justify a work RVU of 50.00, the RUC compared the survey code to top key reference code 33430 *Replacement, mitral valve, with cardiopulmonary bypass* (work RVU of 50.93, intra-service time of 232) and noted that the survey code involves slightly more intra-service time and is somewhat more intense to perform. Even though the reference code involves more total time, both services involve a similar total amount of physician work as the higher intensity of the survey code mitigates the difference in total time. The RUC compared 33859 to 33858 and noted that the proposed times and values have appropriate relativity with each other — 33858 is a more intense emergent service whereas 33859 is a planned procedure which typically involves a shorter length of stay and fewer post-operative visits. **The RUC recommends a work RVU of 50.00 for CPT code 33859.**

33863 Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)

The RUC reviewed the survey results from 41 cardiothoracic surgeons and agreed on the following physician time components: 60 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, 300 minutes of intra-service time, 60 minutes of immediate post-service time, 2-99291 visits, 2-99233 visits, 1-99232 visit, 1-99231 visit, 1-99238 discharge visit and 1-99214 office visit. The RUC agreed with the specialty that the additional evaluation time of 20 minutes above standard pre-time package 4 is warranted for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure and the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, CT Scan, MRI, aortogram and trans-esophageal echocardiogram (TEE) is required to identify the aortic valve pathology, the extent of the aortic disease, the amount of aortic resection necessary

and the size of the graft. The TEE is reviewed with the anesthesiologist and/or cardiologist with special attention to quality of ascending aorta, degree and nature of aortic valve pathology and ventricular function. The RUC agreed with the specialty that a 12-minute increase in time over standard pre-time package 4 for a total positioning time of 15 minutes was warranted, which is common for major cardiothoracic procedures and can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation. The RUC agreed with the specialty that the 27 minutes of additional immediate post-service time above standard package 9b was warranted due to the additional time needed for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished. The RUC noted that the current physician times for 33863 included a longer length of stay, which was not proportionate to the existing valuation. The STS Database intra-service time shows a mean time of 298 minutes and a median time of 322 minutes. Based on the STS Database time, the specialty recommended and the RUC agreed that the survey respondents underestimated the intra-service time of the procedure and the 75th percentile of intra-service time from the survey is supported, which is 300 minutes.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 59.00. To justify a work RVU of 59.00, the RUC compared the survey code to top key reference code 33412 *Replacement, aortic valve; with transventricular aortic annulus enlargement (Konno procedure)* (work RVU of 59.00, intra-service time of 300 minutes) and note that both services have identical intra-service times, similar total time and should be valued the same. The RUC compared 33863 to 33858 and noted that the proposed times and values have appropriate relativity with each other — 33858 is a more intense emergent service whereas 33863 is a planned procedure which typically involves a shorter length of stay and fewer post-operative visits. **The RUC recommends a work RVU of 59.00 for CPT code 33863.**

33864 Ascending aorta graft, with cardiopulmonary bypass with valve suspension, with coronary reconstruction and valve-sparing aortic root remodeling (eg, David Procedure, Yacoub procedure)

The RUC reviewed the survey results from 40 cardiothoracic surgeons and agreed on the following physician time components: 60 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, 300 minutes of intra-service time, 60 minutes of immediate post-service time, 2-99291 visits, 2-99233 visits, 1-99232 visit, 1-99231 visit, 1-99238 discharge visit and 1-99214 office visit. The RUC agreed with the specialty that the additional evaluation time of 20 minutes above standard pre-time package 4 is warranted for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, coronary angiogram, echocardiogram, cardiac catheter report, CT scan and echo is required to identify the extent the aortic disease, the feasibility of a valve-sparing operation and the size of the graft. The trans-esophageal echocardiogram is reviewed with the anesthesiologist and/or cardiologist with special attention to the size and function of the native aortic valve as well as an assessment of the patient's ventricular function. The RUC agreed with the specialty that a 12-minute increase in time over standard pre-time package 4 for a total positioning time of 15 minutes was warranted, which is common for major cardiothoracic procedures and can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation. The RUC agreed with the specialty that the 27 minutes of additional immediate post-service time above standard package 9b was warranted due to the additional time needed for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was

accomplished. The STS Database intra-service time shows a mean time of 308 minutes and a median time of 320 minutes. This service involves more difficult and intense to perform than the Bentall procedure (CPT code 33863), as this procedure involves preserving the patient's native valve and only replacing the root. The Bentall procedure alternatively involves also implanting a mechanical or bioprosthetic valve which is a less intense and complex procedure. Due to this differentiation in work, the specialties noted and the RUC agreed that 33864 should be valued at a somewhat higher IWPOT even those both codes have identical physician time inputs.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 63.00. To justify a work RVU of 63.00, the RUC compared the survey code to top key reference code 33412 *Replacement, aortic valve; with transventricular aortic annulus enlargement (Konno procedure)* (work RVU of 59.00, intra-service time of 300 minutes) and noted that both services have identical intra-service time, whereas 78 percent of the survey respondents that selected this key reference indicated that the survey code is more intense and complex to perform. **The RUC recommends a work RVU of 63.00 for CPT code 33864.**

33866 Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 32 cardiothoracic surgeons and agreed on the following physician time components: 123 minutes of intra-service time. Aortic hemiarch grafting is a procedure that is performed in addition to an ascending aortic repair (33858, 33859, 33863 or 33864) when the ascending aortic disease extends into the proximal portion of the transverse aortic arch. In these cases, the surgical procedure includes isolation of the arch vessels to establish antegrade or retrograde cerebral protection/perfusion, cooling the patient for circulatory arrest, rewarming the patient and obtaining hemostasis at the end of the procedure. The graft is anastomosed under one or more of the arch vessels during the circulatory arrest or perfusion portion of the procedure.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 17.75. To justify a work RVU of 17.75, the RUC compared the survey code to top key reference code 33369 *Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with central arterial and venous cannulation (eg, aorta, right atrium, pulmonary artery) (List separately in addition to code for primary procedure)* (work RVU of 19.00, intra-service time of 160 minutes) and noted that although the reference code has more intra-service time, 92 percent of the respondents that selected the reference code rate the survey code as being much more intense and complex to perform. The specialties noted and the RUC agreed that this is a very intense service to perform and an IPWUT of 0.144 is appropriate. **The RUC recommends a work RVU of 17.75 for CPT code 33866.**

33871 Transverse aortic arch graft, with cardiopulmonary bypass, with profound hypothermia, total circulatory arrest and isolated cerebral perfusion with reimplantation of arch vessel(s) (eg, island pedicle or individual arch vessel reimplantation)

The RUC reviewed the survey results from 39 cardiothoracic surgeons and agreed on the following physician time components: 60 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, 363 minutes of intra-service time, 60 minutes of immediate post-service time, 2-99291 visits, 2-99233 visits, 1-99232 visit, 1-99231 visit, 1-99238 discharge visit and 1-99214 office visit.

The RUC agreed with the specialty that the additional evaluation time of 20 minutes above standard pre-time package 4 is warranted for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, CT scans, MRI, aortogram and TEE is required to identify the extent the aortic arch disease/dissection and the amount or resection, the best method for reimplantation of the arch vessels and the size of the graft(s). The RUC agreed with the specialty that a 12-minute increase in time over standard pre-time package 4 for a total positioning time of 15 minutes was warranted, which is common for major cardiothoracic procedures and can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation. The RUC agreed with the specialty that the 27 minutes of additional immediate post-service time above standard package 9b was warranted due to the additional time needed for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished. The STS Database intra-service time shows a mean time of 390 minutes and a median time of 400 minutes. Based on the STS Database time, the specialty noted and the RUC concurred that the survey respondents underestimated the intra-service time of the procedure and the 75th percentile of intra-service time from the survey is supported, which is 363 minutes.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 65.75. To justify a work RVU of 65.75, the RUC compared the survey code to top key reference code 33877 *Repair of thoracoabdominal aortic aneurysm with graft, with or without cardiopulmonary bypass* (work RVU of 69.03, intra-service time of 324 minutes) and noted that the survey code involves more intra-service time whereas the reference code involves more total time. 72 percent of the respondents that selected this key reference code indicated that the survey code was more intense and complex to perform. The RUC noted that a work RVU of 65.75 would establish the appropriate relativity with 33877 and with other major cardiothoracic procedures. The RUC compared 33863 to 33858 and noted that the proposed times and values have appropriate relativity with each other — 33858 is a more intense emergent service whereas 33863 is a planned procedure which typically involves a shorter length of stay and fewer post-operative visits. **The RUC recommends a work RVU of 65.75 for CPT code 33871.**

Practice Expense

The RUC reviewed and approved the direct practice expense inputs as approved without modification by the Practice Expense Subcommittee. The 090-day global codes included the standard 090-day clinical labor pre-service times, except for the appropriate reductions for the emergent aortic dissection code 33858. For two of the clinical inputs, the specialties recommended and the Practice Expense Subcommittee agreed that the times are typically higher than the standard emergent procedure clinical staff times. Although this is an emergent procedure, the clinical staff still assists with the following in a manner that is similar to the work involved for some aspects of a typical 090-day cardiothoracic procedure. The recommendations include the following changes to the standard times for an emergent procedure:

- For activity code CA002 *Coordinate pre-surgery services* the standard emergent time is 7 minutes. The RUC is recommending 10 minutes for this clinical activity because there are a number of tests and services that must be coordinated. Diagnostic tests may include chest x-rays, CT Scan, MRI, aortogram and TEE and any laboratory studies if available. The clinical staff must also coordinate with the other

specialists that will be needed to diagnose and perform the procedure, this will include, at a minimum coordination with neurology, anesthesia, assistant surgeon, the ICU, cardiology for the TEE, and perfusion.

- For activity code CA003 *Schedule space and equipment in facility* the standard emergent time is 4 minutes. The RUC is recommending the 8 minutes for this clinical activity. The clinical staff need to provide all of the same services to ensure that the correct space and all of the necessary equipment for a cardiothoracic procedure are available, which includes the equipment and supplies for cardiopulmonary bypass which is required for the procedure and deep hypothermic arrest which may be necessary in some cases.

Work Neutrality

The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

New Technology/New Services

Codes 33866 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions. The whole family of services should be reviewed in 3 years when reviewing the utilization data.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery Cardiovascular System Heart and Pericardium Electrophysiologic Operative Procedures Incision				
33255		<i>Operative tissue ablation and reconstruction of atria, extensive (eg, maze procedure); without cardiopulmonary bypass</i>		
33256		<i>with cardiopulmonary bypass</i>		
		(Do not report 33254-33256 in conjunction with 32100, 32551, 33120, 33130, 33210, 33211, 33390, 33391, 33404-33507, 33510-33523, 33533-33548, 33600-33853, 33860 33858-33864, 33910-33920)		
+33259		<i>Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), with cardiopulmonary bypass (List separately in addition to code for primary procedure)</i>		
		(Use 33259 in conjunction with 33120, 33251, 33261, 33305, 33315, 33322, 33335, 33390, 33391, 33404, 33405, 33406, 33410,		

33411, 33412, 33413, 33414, 33415, 33416, 33417, 33422-33468, 33474, ~~33475, 33476, 33478~~, 33496, 33500, 33504-33507, 33510-33516, 33533-33548, 33600-33688, 33692-~~33722~~33726, 33730, 33732, 33736, ~~33750-33766~~, 33767, 33770-~~33781~~33783, 33786-33788, 33814, 33853, ~~33860~~33858-33877, 33910, 33916-33922, 33926, ~~33935, 33945~~, 33975-33980, 33983 when the procedure is performed with cardiopulmonary bypass)

Thoracic Aortic Aneurysm

When ascending aortic disease involves the aortic arch, an aortic hemiarch graft may be necessary in conjunction with the ascending aortic graft and may be reported with add-on code 33866 in conjunction with the appropriate ascending aortic graft code (~~33860~~ 33858, 33859, 33863, or 33864). Aortic hemiarch graft requires all of the following components:

1. either total circulatory arrest or isolated cerebral perfusion (retrograde or antegrade);
2. incision into the transverse arch extending under one or more of the arch vessels (eg, innominate, left common carotid, or left subclavian arteries); and
3. extension of the ascending aortic graft under the aortic arch by construction of a beveled anastomosis to the distal ascending aorta and aortic arch without a cross-clamp (an open anastomosis).

An ascending aortic repair with a beveled anastomosis into the arch with a cross-clamp may not be reported separately as a hemiarch graft using 33866. Use 33866 for aortic hemiarch graft when performed in conjunction with the ascending aortic graft codes ~~33860~~ 33858, 33859, 33863, 33864.

Code 33871 describes a complete transverse arch graft placement, and is not used to report an aortic hemiarch graft procedure.

D 33860	-	Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed <u>(Do not report 33860 in conjunction with 33870)</u> <u>(33860 has been deleted. To report, see 33858, 33859)</u>	090	N/A (2018 work RVU = 59.46)
•33858	D1	Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic dissection	090	65.00

•33859	D2	for aortic disease other than dissection (eg, aneurysm)	090	50.00
(f)33863	D3	Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall) (Do not report 33863 in conjunction with 33405, 33406, 33410, 33411, 33412, 33413, 33860 , <u>33858</u> , <u>33859</u> , 33870)	090	59.00
(f)33864	D4	Ascending aorta graft, with cardiopulmonary bypass with valve suspension, with coronary reconstruction and valve-sparing aortic root remodeling (eg, David Procedure, Yacoub procedure) (Do not report 33864 in conjunction with 33860 , 33858, <u>33859</u> , 33863, 33870)	090	63.00
+•33866	D5 (CPT - 2019)	Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion (List separately in addition to code for primary procedure) (Use 33866 for aortic hemiarch graft when performed in conjunction with the ascending aortic graft codes 33858, 33859, 33863, 33864) (Do not report 33866 in conjunction with 33871)	ZZZ	17.75
D33870	-	Transverse arch graft, with cardiopulmonary bypass <u>(33870 has been deleted. To report, use 33871)</u>	090	N/A (2018 work RVU = 46.06)

•33871	D6	<p>Transverse aortic arch graft, with cardiopulmonary bypass, with profound hypothermia, total circulatory arrest and isolated cerebral perfusion with reimplantation of arch vessel(s) (eg, island pedicle or individual arch vessel reimplantation)</p> <p>(For aortic hemiarch graft performed in conjunction with the ascending aortic graft codes 33858, 33859,-33863, 33864, use 33866)</p> <p>(Do not report 33871 for aortic hemiarch graft)</p> <p>(Do not report 33871 in conjunction with 33866)</p>	090	65.75
Arteries and Veins Endovascular Repair of Abdominal Aorta and/or Iliac Arteries +34714 <i>Open femoral artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by groin incision, unilateral (List separately in addition to code for primary procedure)</i> (Use 34714 in conjunction with 32852, 32854, 33031, 33120, 33251, 33256, 33259, 33261, 33305, 33315, 33322, 33335, 33390, 33391, 33404-33417, 33422, 33425, 33426, 33427, 33430, 33460, 33463, 33464, 33465, 33468, 33474, 33475, 33476, 33478, 33496, 33500, 33502, 33504, 33505, 33506, 33507, 33510, 33511, 33512, 33513, 33514, 33516, 33533, 33534, 33535, 33536, 33542, 33545, 33548, 33600-33688, 33692, 33694, 33697, 33702, 33710, 33720, 33722, 33724, 33726, 33730, 33732, 33736, 33750, 33755, 33762, 33764, 33766, 33767, 33770-33783, 33786, 33788, 33802, 33803, 33814, 33820, 33822, 33824, 33840, 33845, 33851, 33853, 33860 , 33858, 33859, 33863, 33864, 33870 , 33871, 33875, 33877, 33880, 33881, 33883, 33884, 33886, 33910, 33916, 33917, 33920, 33922, 33926, 33935, 33945, 33975, 33976, 33977, 33978, 33979, 33980, 33983, 33990, 33991, 34701, 34702, 34703, 34704, 34705, 34706, 34707, 34708, 34841, 34842, 34843, 34844, 34845, 34846, 34847, 34848, 0254T) (34714 may only be reported once per side. For bilateral procedure, report 34714 twice) (Do not report 34714 in conjunction with 33362, 33953, 33954, 33959, 33962, 33969, 33984, 34812 when performed on the same side) +34716 <i>Open axillary/subclavian artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)</i> (Use 34716 in conjunction with 32852, 32854, 33031, 33120, 33251, 33256, 33259-33261, 33305, 33315, 33322, 33335, 33390, 33391, 33404-33417, 33422, 33425, 33426, 33427, 33430, 33460, 33463, 33464, 33465, 33468, 33474, 33475, 33476, 33478, 33496, 33500, 33502, 33504, 33505, 33506, 33507, 33510, 33511, 33512, 33513, 33514, 33516, 33533, 33534, 33535, 33536, 33542, 33545, 33548, 33600-33688, 33692, 33694, 33697, 33702-33722, 33724, 33726, 33730, 33732, 33736, 33750, 33755,

CPT Descriptor: Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic dissection

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male presents to the emergency room with severe tearing pain in the chest. Transesophageal echocardiogram confirms an aortic dissection and the patient is taken to the operating room for ascending aortic graft repair.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 97% , In the ASC 0%, In the office 3%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 61%

Description of Pre-Service Work: This service is typically performed as an emergency for Type I aortic dissection, with the pre-service period beginning on the day of surgery. Perform rapid trauma system directed evaluation and physical exam. Obtain history from patient or from EMT's and treating ED physicians. Pay specific attention to end-organ damage due to malperfusion syndromes (paraplegia, stroke, renal artery occlusion, and other peripheral artery perfusion). Preoperative orders are written. Preoperative imaging studies including chest x-rays, CT Scan, MRI, aortogram and TEE are reviewed if available. Preoperative laboratory studies (CBC, electrolytes, renal and liver function, coagulation) are reviewed if available. The surgical procedure is reviewed and explained to the patient and/or family if possible and informed consent is obtained. The OR start time is confirmed. Availability of the surgical assistant is confirmed. The patient is identified, the surgical site is marked per hospital policy, and any questions from the family are answered. Availability of blood and/or cross match and any special instruments or medical devices is ensured. Review planned incision and procedure. Review the length and type of anesthesia with anesthesiologist alerting the anesthesiologist of the potential for cardiac tamponade physiology, and the need to adjust induction techniques accordingly. Ensure anesthesiology and perfusionist are prepared for circulatory arrest if needed. Plan invasive monitoring including use of arterial line (right radial only) and pulmonary artery catheter. Review trans-esophageal echocardiogram with anesthesiologist and/or cardiologist with special attention to quality of ascending aorta, location and extent of false lumen, degree and nature of aortic insufficiency and assessment of ventricular function. The surgeon scrubs and puts on a gown and gloves. Prep and drape the skin of the chest, abdomen, and legs from the neck to the ankles including both groin areas. Ensure that the patient is properly positioned for the procedure

Description of Intra-Service Work: Following a standard median sternotomy incision, the sternum is divided with a saw. A determination of which artery will be used for arterial access while on cardiopulmonary bypass is made following median sternotomy and exposure of the heart and great vessels. This may require exposure and use of the aortic arch, the innominate artery, the subclavian artery, the brachial artery, or even the femoral artery depending on the extent of the dissection and the condition of the ascending aorta. If necessary, an eight-millimeter Dacron graft is anastomosed to a peripheral artery in order to facilitate cardiopulmonary bypass (reported separately). A venous cannula is placed directly into the right atrium. The patient is heparinized and cardiopulmonary bypass is initiated with immediate systemic cooling.

Since the ascending aorta is dissected to a variable and unpredictable degree, use of a standard antegrade cannula for cardioplegia solution delivery is not possible. A retrograde cardioplegia cannula is inserted into the coronary sinus to administer cardioplegia and induce cardiac arrest. The heart is continually assessed for distention, myocardial cooling and sustained cardioplegic arrest.

The aorta is cross-clamped just below the innominate artery. The heart is arrested with retrograde cardioplegia. The dissected aorta is transected. The two coronary ostia are identified, and direct cannulation allows for delivery of additional cardioplegia in antegrade fashion as necessary. The location and complete extent of the aortic intimal entry tear is determined and must be included in the resection specimen. Following resection of the ascending aorta, the remaining aorta is sized for an appropriate Dacron tube graft. The integrity of the aortic valve is assessed and, if necessary, the valve is re-suspended within the proximal ascending aorta. The cut end of the proximal ascending aorta is reinforced with a circumferential Teflon felt strip. The tube graft is sutured to this reinforced proximal aorta with a running 5-0 polypropylene stitch. The tube graft is measured to length distally and sutured to the distal aorta below the aortic cross clamp using running 5-0 polypropylene stitch. In some cases, the distal suture line is reinforced with Teflon felt prior to performing the anastomosis. In some cases the distal anastomosis may not be possible with the cross clamp in place due to the extent of dissection and/or quality of the aortic tissue. In these situations, the patient is cooled to a nasopharyngeal or bladder temp in the range of 15-20 degrees Centigrade. Once the patient is cooled to the desired temperature, the cardiopulmonary bypass machine circuit is turned off and circulation to the entire body is interrupted. Retrograde and/or antegrade cerebral perfusion is established in some cases. Upon achieving total circulatory arrest, any cross clamp, if present, can be removed allowing unobstructed view of the intimal integrity of the ascending aorta and transverse arch within a bloodless aorta. The entire extent of the entry aortic tear must be confirmed and resected. The aorta is then cut and prepared with Teflon felt reinforcement prior to performing the distal anastomosis to the dacron tube graft. Rewarming of the patient is started during this anastomosis.

Upon completion of the distal aortic anastomosis, the patient is placed in Trendelenburg. Air is evacuated from the graft as cardiopulmonary bypass is slowly re-established. Once full cardiopulmonary bypass is re-established, an aortic cross clamp can be re-applied to the prosthetic graft and antegrade/retrograde cardioplegia can be re-administered as needed during the rewarming period. When the patient has been rewarmed to an acceptable temperature, the cross-clamp is removed, cardioplegia is discontinued and the heart is allowed to resume normal electrical activity. The aortic root is vented until LV ejection has been present for 5-10 minutes. Confirmation of air evaluation from the left side of heart, as well as from the dacron tube graft together with assessment for any aortic valve insufficiency is accomplished using transesophageal echocardiogram (separately reported). Continued resuscitation of the heart is accomplished by allowing it to beat while unloaded on cardiopulmonary bypass. Establishing meticulous hemostasis is critical since the patients are most often profoundly coagulopathic following profound hypothermia and total circulatory arrest. Temporary pacing wires are placed and electrical pacing is initiated if necessary. The patient is carefully weaned from cardiopulmonary bypass. Arterial, venous and cardioplegia cannulas are removed and cannulation sites are secured/repared. Chest tubes are placed, and the sternum is re-approximated. The sternal wound is closed.

Description of Post-Service Work: Postoperative same day work through admission to intensive care: An operating room debriefing is performed. Sterile dressings are applied to the incision. Drapes are removed, with close attention to pacing wires (if any), tubes, and lines to ensure that none are dislodged or disconnected. This attention continues as the patient is moved to the intensive care unit (ICU) bed for transfer. In a coordinated team manner, the patient's overall condition is monitored as the anesthesia team converts the monitoring equipment (arterial blood pressure, pulmonary artery pressures, electrocardiogram [EKG]) to a portable monitor. The chest drainage system is observed periodically to assess interval bleeding, to ascertain that negative pressure is not lost, and to ensure that the tubes are not obstructed. The OR transporting team and the ICU receiving team confirm initiation of transfer. The patient is accompanied to the ICU, and the team is directed should the patient's condition change en route. Operating room forms, indicating pre- and postoperative diagnoses and the operation performed, are signed. A postoperative chest X ray is obtained and examined to assess expansion of the lungs and placement of the chest and nasogastric tubes (if inserted). Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. A brief operative note is written for the patient's chart. Daily progress notes of the pre- and postoperative diagnoses, operation performed, findings, blood loss, intraoperative IV fluids administered, complications, and specimens sent to pathology (if any) are documented. Intensive care and medications are reviewed with the staff. The patient's short-term goals are established with the ICU nursing staff. Procedure outcomes, including the procedure performed, any variance from the planned procedure, the general findings, an initial assessment of the degree of procedural success, and expectations for the remainder of the day of surgery and the longer term, are discussed with the family. The procedure outcome is discussed with the patient's family or caregiver after patient's emergence from anesthesia. A postoperative report is dictated, and the procedure outcome is discussed with the referring

physician. Care is coordinated with other physicians. A procedure outcome and expected recovery letter is dictated for the referring physician and/or the insurance company. A careful assessment of end-organ and extremity perfusion is mandatory at this point after any aortic dissection surgery.

Postoperative intensive care: Pharmacologic agents are initiated as needed to achieve strict blood pressure control. The patient's neurological state is assessed, and emergence from anesthesia is monitored. Sedatives, paralyzing agents, and analgesics are administered as needed. Gross neurologic function, including level of consciousness, behavioral appropriateness, and presence and nature of focal neurological defect if present, is evaluated. The evaluation is repeated until intraoperative neurologic injury is ruled out. The patient's hemodynamic condition, including cardiac rhythm, is assessed. Rate and conduction abnormalities are assessed. Temporary pacing is initiated as needed. A suitable mode is determined, and the output and sensitivity of the device are adjusted. The assessment of hemodynamic effects is repeated. Arrhythmias are assessed. Atrial extrasystoles or runs are differentiated from ventricular extrasystoles or runs and correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs or ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed. Filling pressures are correlated at baseline, calibration of transducers with zero level at the level of the right heart are confirmed, and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Chest tube bleeding is monitored. The character of the mediastinal drainage (rate, amount, stability of clot) is assessed. The patency of the mediastinal tubes is assessed to ensure that a cardiac tamponade state is avoided. Bleeding quantity and character are correlated with chest X ray, laboratory tests, hemodynamics, urine output, and physical exam. Laboratory results are assessed and correlated with other findings to determine the need for blood and/or blood products, including platelets, cryoprecipitate, and fresh frozen plasma. Other adjunctive pharmacologic therapies are considered for coagulopathy. The need for re-exploration is considered if the chest tube output exceeds acceptable limits or if tamponade is present. The respiratory system is assessed. Breath sounds are examined, chest mechanics observed, and mid-line tracheal position is ensured by physical exam. Ventilator settings are assessed; underlying respiratory pattern, baseline airway pressures generated, and minute gas flow are observed. The postoperative chest X ray is reevaluated if necessary. Endotracheal tube placement is confirmed by review of the postoperative chest X ray. Lungs are monitored for infiltrate/atelectasis. Pleural spaces are assessed for fluid collection. Blood gases are assessed, and the ventilator is adjusted as needed. Readiness for extubation is assessed. The patient is weaned from the ventilator. The patient is extubated, and airway and adequacy of ventilation are ensured. Adequacy of urine output is assessed, and postoperative creatinine in light of preoperative renal function is checked. Volume status is assessed, and fluids are administered as needed. The need for a diuretic is determined and, if indicated, the dose is determined, and response is monitored. Urine flow is correlated with blood pressure and compared to preoperative status. Interaction of cardiac output and vasoactive agents with renal function is assessed. Distal extremity perfusion is monitored, and peripheral pulses are assessed and compared to preoperative findings. A comprehensive evaluation is integrated with the patient's history, expected status based on conduct of the operation, and response to critical care interventions. The extent of inflammatory state is assessed, and treatment with antipyretics or steroids is considered as indicated. The patient's chart notes are reviewed with the nursing staff and other staff. Interval plans are discussed with the nursing staff. Parameters for interval adjustments in patient treatment are set, and the interval to the next patient evaluation, if expected goals have been met, is established. Questions from the nursing staff, other staff, and the patient's family are answered. Orders are written. The patient's progress notes are charted.

Postoperative other hospital work—beginning on postoperative day 4 until discharge day: A comprehensive history and physical exam are performed. All wounds are inspected for drainage, underlying hematoma, and inflammation. The patient's chart notes are reviewed with nursing and other staff. Postoperative pain, use of analgesics, and adequacy of response are assessed. Strict control of the patient's blood pressure is continued. Adequacy of respiration, character of breathing, relationship to surgical pain, and intravascular volume status are assessed. Character of pulmonary secretions and the patient's ability to clear his airway are assessed. Vital signs, intake and output, laboratory results, and patient daily weight are reviewed. The chest radiograph is reviewed, and the cardiac monitor is evaluated for rate, rhythm, and presence or absence of arrhythmia. The stored EKG monitoring history is evaluated if indicated. Progress of the system recovery and risk for development of complications are assessed. Ambulation and vigorous pulmonary physiotherapy are encouraged. Postoperative nutritional status, as maintained by both enteral (if necessary) and oral feedings, is carefully assessed and monitored. The chest tube is removed when appropriate (usually 24 to 48 hours postoperatively). Chest X-rays after tube removal and at least one more time before discharge as indicated by patient's condition are obtained and reviewed. The temporary pacemaker wires are removed if present. Questions from the patient, family, and nursing or other staff (verbal and written) are answered. An interval plan of care that includes drug therapy for underlying conditions (eg, diabetes),

surgically induced conditions, actual or anticipated complications (eg, beta blockers for atrial fibrillation, antibiotics for prophylaxis or treatment), and preventive care is developed. Insurance staff questions are answered. Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. The postoperative echocardiogram is evaluated and reviewed. The patient's progress is discussed (oral and written) with the referring physician. Care is coordinated with other physicians. Evaluation, patient progress, and the care plan are documented in the medical record.

Discharge day work: A history and physical exam are performed. The final pathology/laboratory/film reports are checked and discussed with the patient's the family or caregiver. Wounds and patient progress are checked. Dietary management, activities permitted, bathing, handling of wound, return appointment to office, and similar items are carefully explained to the patient's family. Expectations for recovery are outlined and adjusted to specific underlying cardiac state, associated chronic diseases, operative findings, and character of postoperative recovery. Potential complications, how to recognize them, and what to do if recovery is not as anticipated are described. Care is coordinated with other physicians. The patient's chart notes are reviewed with nursing and other staff. Post discharge wound care and activity limitations are reviewed with the family. Questions from the patient, family, and nursing and other staff are answered. Insurance staff questions are answered. Orders for post discharge laboratory tests, films, and medications are written. The patient's discharge notes are charted, and prescriptions and discharge instructions are written. The nature, purpose, and expected duration of use of new medications are explained. The importance of secondary prevention of cardiac disease through risk factor reduction is explained to the family. Specific instructions on the need to notify other treating physicians and dentists of the presence of a surgically implanted dacron prosthetic graft and the need for prophylactic periprocedural antibiotics are given. The patient's home medications and homeopathic agents are explained to ensure that additional agents are compatible or will not be used. A discharge summary is dictated. Communication is made with patient's primary care physician(s).

Postoperative office work: After discharge from the hospital, a detailed history and physical exam are performed. Medications are reviewed, and compliance is determined. Interval encounters are reviewed with other care providers. Wounds and patient progress are checked. Sutures/drains are removed. Post discharge laboratory tests/films are reviewed, specifically echo studies to assess myocardial and valve function and compare to preoperative studies. Medications are reviewed and orders for medications are written. Questions from the patient and family are answered. Insurance staff questions are answered. The patient's progress is discussed (verbal and written) with the referring physician. The patient's care is coordinated with other physicians. Progress is discussed with the patient and family. A patient progress note is dictated for the medical chart, and letters are sent to referring physicians. A detailed schedule for routine follow-up CT scans to evaluate the remainder of the descending and abdominal aorta is discussed with the patient.

SURVEY DATA

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

OVERALL RATIONALE

Tab 6 includes 6 codes that represent grafting procedures on the ascending aorta and the aortic arch. A new add-on code +33866 *Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic*

anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion (List separately in addition to code for primary procedure) that was developed to account for the additional work that is involved when the ascending aortic disease extends into the proximal portion of the transverse aortic arch was approved by the CPT Editorial Panel and surveyed for the January 2018 RUC meeting. The Expert Panel decided not to survey the ascending aortic replacement codes 33860, 33863 or 33864 for the January 2018 RUC meeting because they felt that the work involved in the aortic hemiarch replacement procedure represented an advancement in surgical technique representing new work that is not reflected in the work that is currently accounted for in the ascending aortic procedures. The specialties indicated that the aortic hemiarch replacement is more closely related to the work involved with the transverse aortic arch replacement code 33870 than to the work of the ascending aortic codes. At the January 2018 RUC meeting, the RUC determined that the specialties had to re-survey the family of aortic repair procedures including codes 33860, 33863, 33864, 33866, 33870 for the April 2018 RUC meeting. As the specialty reviewed the codes with consideration of re-surveying them, they determined that they should be submitted to the CPT Editorial Panel for the following revisions: 1) To develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies. The specialties felt that there is a sufficient difference in the work associated with these procedures and now there is enough volume to allow for more accurate capture of the work and outcomes data for these distinct patient populations, which was not the case when the code was first developed. 2) Revise the descriptor for the transverse arch code, 33870 to further clarify the difference in work between that code and the new add-on code 33866. 3) Revise the guidelines to provide additional instructions on the appropriate use of these codes. The CCA was submitted to the CPT Editorial Panel for consideration at the May 2018 CPT meeting. The CPT Editorial Panel approved the deletion of two existing codes, 33860 and 33870. Code 33860 will be replaced with two new codes, 33858 and 33859 for ascending aortic aneurysm repair for dissection and for other aortic disease respectively. Due to the extensive changes of the descriptor for code 33870 to further differentiate that code from the aortic hemiarch code 33866, the Panel decided to delete code 33870 and renumber it to the new code 33871. As a result, 4 ascending aortic grafting codes 33858, 33859, 33863 and 33864 and two aortic arch grafting codes 33866 and 33871 were surveyed for the October 2018 meeting.

The recommended values for these procedures result in an overall budget savings for Medicare as represented in the table below:

CPT Source	Deleted	Source 2017 Utilization	New/ Revised Code	New/ Revised Code Utilization (reference 2017)	Percent	Source RVU	STS Rec RVU	New/ Revised Total RVUs	Total Source RVUs	Difference New/Rev - Source

Code 33860 which is split into two new codes 33858 and 33859 results in a recommended increase in value for code 33858 (recommended RVW 65.00, current RVW 59.46) and a decrease in value for the more commonly performed code 33859 (recommended RVW 50.00, current RVW 59.46) resulting is an overall budget savings for that code. Code 33870 is also split into two new codes 33866 and 33871, which results in a recommended increase in value for code 33871 (recommended RVW 65.75, current RVW 46.06) and a decrease in value for the more commonly performed code 33866 (recommended RVW 19.74, current RVW 46.06) resulting is an overall budget savings for that code. The RVW recommendations for the other two codes, 33863 and 33864 result in slight increases for each code, but these increases are offset by the savings from the changes to the other codes. Additional information regarding the recommended revisions are included for each code.

Rationale 33858

Code 33858 is a new code for ascending aortic graft for aortic dissection. This procedure used to be reported with code 33860, which combined ascending aortic procedures for dissection and other aortic disease, such as aneurysms. The current Medicare volume for 33860 is 3800, which has been relatively consistent over the years per the RUC database. It is estimated that 30% of the ascending aortic repairs will be performed for aortic dissections, resulting in an estimated Medicare volume of 1140 procedures per year. Ascending aortic grafting for aortic dissection is an emergent procedure that requires a median sternotomy, cardiopulmonary bypass with cardiac arrest. The ascending aorta involved in the dissection is transected, resected and replaced with a graft. Reinforcement of the proximal ascending aortic wall with sewn-in circumferential Teflon felt strip is required and distal aortic wall reinforcement may also be necessary depending on the extent of the dissection and the friability of aortic tissue. The patients that require this intervention face very high mortality without both expeditious diagnosis and technically proficient surgery.

Pre-Time Package 4**Pre-Time Changes:**

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient. The survey only supported 15 minutes for scrub dress and wait time, so the Expert Panel is recommending a 5-minute reduction for a total of 15 minutes for the scrub dress and wait time for the procedure per the survey.

Evaluation (total = 40 minutes):

The survey supported 60 minutes of pre-service time. However, due to the emergent nature of this procedure, the Expert Panel determined that the package evaluation time of 40 minutes was more appropriate. Although this is an emergent procedure, the patient is still evaluated to determine a definitive diagnosis and the extent of the dissection. The surgeon will obtain consent, review and explain the procedure to the patient and/or family. Review the pertinent imaging which will include chest x-rays, CT Scan, MRI, aortogram and TEE, if available to identify the extent of the dissection. The trans-esophageal echocardiogram is reviewed with the anesthesiologist and/or cardiologist with special attention to quality of ascending aorta, location and extent of false lumen, degree and nature of aortic insufficiency and assessment of ventricular function. The Expert Panel felt that the package 4 evaluation time of 40 minutes was reasonable and would cover all aspects of the pre-service work involved with the procedure.

Positioning (total = 15 minutes):

The Expert Panel is recommending a 12-minute increase in time over the package for a total positioning time of 15 minutes, which is common for cardiac procedures and there are numerous examples in the RUC database supporting this time. The survey supported 15-minutes for positioning of the patient. The additional 12-minutes above the package time can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation.

Scrub, Dress and Wait (total = 15 minutes):

There is a 5-minute decrease from the package time, which represents the scrub dress and wait time from the survey.

Post-time Package 9b**Total = 60 minutes:**

The expert panel selected post-time package 9B for a general anesthesia or complex regional block/complex procedure. The Expert Panel is recommending a 27-minute increase in time over the package for a total immediate post time of 60 minutes and there are numerous examples in the RUC database and the cardiothoracic surgery codes supporting this time. The survey supported 60 minutes of immediate post time. The additional 27-minutes above the package time can be attributed to additional time for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, evaluation of neurologic status, assessment of peripheral circulation, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished.

Critical Care Visits

97% of the survey respondents replied that the procedure was performed in the hospital, and that 100% of the patients stayed overnight for more than 24 hours. 61% of the respondents indicated that they provided an E&M Visit on the same day of surgery.

The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient once the patient arrives in the ICU on the day of the procedure and an additional 40 minutes of critical care for two days after the procedure for a total of three critical care visits for the procedure. The critical care visits cover that time that the physician spends with the patient directly related to the procedure providing critical care services. Critical care extends to the 3rd postoperative day due to the complexity of the procedure and the need to carefully monitor several organ systems that can be impacted by the dissection. These organ systems include pulmonary, renal, cardiovascular, gastrointestinal, and neurologic. The survey supported three critical care visits for the procedure and the Expert Panel agreed.

Intensity and complexity of the procedure

41 surveys were completed by a random pool of 800 cardiac surgeons which consisted of 650 self-identified adult cardiac surgeons and 150 self-identified congenital cardiac surgeons. 14 respondents selected code 33412, aortic valve replacement as a reference code making it the 1st key reference service (KRS). That code has a lower value, the same intraservice time and a lower total time than the survey code. The survey respondents found that the survey code was more or much more complex than 33412 for all of the intensity/complexity measures. 7 respondents selected code 33877, thoracoabdominal aneurysm repair as a reference code making it the 2nd KRS. This code has a higher value with a longer intraservice and total service time. The respondents ranged in their intensity/complexity comparison saying that the survey code 33858 is identical to or much more intense/complex than 33877 for all of the intensity/complexity measures.

Recommended RVW

The survey data for code 33858 (ascending aortic graft or dissection) shows that the median intra-operative time is 300 minutes. The current intra-service time for this procedure is 305 minutes. The STS Database shows a mean intra-service time of 301 minutes and a median time of 281 minutes, however the database data that Expert Panel has available at this time does not distinguish the time for dissections versus aortic repair for other aortic disease such as aneurysm. The median intra-service time from the survey at 300 minutes is slightly less than the intra-time for the current code 33860. The surveys also supported three critical care visits during the post-operative period over two critical care visits included in the current code. The hospital LOS from the survey represents one day less than the LOS in the current code and the total time from the survey is slightly less at 911 minutes than that for the current code at 931 minutes. The Expert Panel felt that the survey accurately represented some of the work variances that exist between the ascending aortic repair for dissection versus ascending aortic repair for other aortic disease. Since code 33860 represents a blend of ascending aortic grafting for dissection and repairs for other aortic disease the time inputs from the existing code cannot be compared directly to those from the survey. The Recommended RVW and the total time for the survey code falls between the RVWs for the two KRS codes. The intraservice time of the survey code is the same as the 1st KRS and slightly lower than that of the 2nd KRS. The intensity (0.130) for the survey code is higher than the intensity for 1st (0.122) and 2nd (0.114) KRS codes. The Expert panel felt that this is appropriate and is supported by the intensity and complexity measures.

The Expert Panel is recommending the median work RVW of 65.00, with an intra-service time of 300 minutes, and total time of 911 minutes. Pre-time package 4 was selected with adjustments made to the positioning time for a total pre-service time of 70 minutes. Immediate post-service time package 9b with additional time added for a total time of 60 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33860

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2117

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

The 2017 Medicare frequency for 33860 is 3,800. The STS database shows that 65% of the patients that undergo an ascending aortic graft are non-Medicare patients.

It is estimated that 30% of ascending aortic grafts reported for 33860 are for dissection. This results in the following:

For code 33858, it is estimated that 2117 procedures per year will be provided nationally and 1140 procedures per year will be provided to Medicare patients.

Specialty cardiothoracic surgery Frequency 2117 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,140

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33860 is 3,800. The STS database shows that 65% of the patients that undergo an ascending aortic graft are non-Medicare patients.

It is estimated that 30% of ascending aortic grafts reported for 33860 are for dissection. This results in the following:

For code 33858, it is estimated that 2117 procedures per year will be provided nationally and 1140 procedures per year will be provided to Medicare patients.

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33860

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 33859	Tracking Number D2	Original Specialty Recommended RVU: 50.00
		Presented Recommended RVU: 50.00
Global Period: 090	Current Work RVU: 59.46	RUC Recommended RVU: 50.00

CPT Descriptor: Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic disease other than dissection (eg, aneurysm)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old male is followed with serial echocardiograms looking for increasing aortic dimensions. Echocardiogram shows a 5.5 cm ascending aorta that has increased in size by 1 cm in 1 year. The patient is referred for surgical repair.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 0%, In the office 5%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 57%

Description of Pre-Service Work: A complete or interval history and physical examination (comprehensive) are performed. Preoperative orders are written, and the work-up and notes from referring and primary physicians are reviewed if available. Preoperative imaging studies including chest x-rays, CT Scan, MRI, Aortogram and TEE are reviewed. Preoperative laboratory studies (CBC, electrolytes, renal and liver function, coagulation test values) are reviewed. Obtain cardiology assessment and pulmonary assessment as indicated. Indications, surgical procedure, expected recovery, and expected outcomes, including potential complications, are reviewed with the family. The family's questions are answered, and informed consent is obtained. The OR start time is confirmed and the patient and family are notified. Availability of the surgical assistant is confirmed. The patient is identified, the surgical site is marked per hospital policy, and any questions from the family are answered. Availability of blood and/or cross match and any special instruments or medical devices is ensured. Review planned incision and procedure. Review the length and type of anesthesia with anesthesiologist. Ensure anesthesiology and perfusionist are prepared for circulatory arrest if needed. Plan invasive monitoring including use of arterial line (right radial only) and pulmonary artery catheter. Review trans-esophageal echocardiogram with anesthesiologist and/or cardiologist with special attention to quality of ascending aorta, degree and nature of aortic insufficiency as well as assessment of ventricular function. The surgeon scrubs and puts on a gown and gloves. Prep and drape the skin of the chest, abdomen, and legs from the neck to the ankles including both groin areas. Ensure that the patient is properly positioned for the procedure

Description of Intra-Service Work: Perform standard median sternotomy skin incision, divide the sternum in the midline with a saw, place arterial cardiopulmonary bypass cannula above the aneurysmal portion of the aorta. A venous cannula is placed directly into the right atrium, Assesses ascending aorta. Administer heparin and determine level of heparinization, establish cardiopulmonary bypass, initiate systemic cooling, place antegrade and retrograde cardioplegia cannulas. The aorta is cross-clamped just below the innominate artery. The heart is arrested with antegrade and retrograde cardioplegia and assess heart for distention, cooling and efficacy of cardioplegic arrest.

The aorta is transected where the ascending aortic dilatation begins, most commonly at the sinotubular junction. The cut end of the aorta is sized for the appropriate tube graft. The tube graft is sutured to the proximal aorta with a running 5-0 polypropylene stitch. The tube graft is measured to length distally and sutured to the distal ascending aorta below the aortic

cross clamp using running 5-0 polypropylene stitch, thereby, excluding the entire aneurysmal portion of the ascending aorta.

The patient is placed in Trendelenburg. Air is evacuated from the left ventricle and ascending tube graft. The cross-clamp removed, and the aortic root is vented until LV ejection has been present for 5-10 minutes. Confirm evaluate air in left side of heart and assess for any aortic valve insufficiency using transesophageal echocardiogram (separately reported). Resuscitate the heart by allowing it to beat while unloaded on cardiopulmonary bypass. Ensure hemostasis, place temporary pacing wires and begin pacing if necessary. Discontinue cardiopulmonary bypass, remove cannulas and repair cannulation sites. Ensure hemostasis, place chest tubes, re-approximate the sternum and close chest wound.

Description of Post-Service Work: Postoperative same day work through admission to intensive care: An operating room debriefing is performed. Sterile dressings are applied to the incision. Drapes are removed, with close attention to pacing wires (if any), tubes, and lines, including possible epidural anesthesia catheter if present, to ensure that none are dislodged or disconnected. This attention continues as the patient is moved to the intensive care unit (ICU) bed for transfer. In a coordinated team manner, the patient's overall condition is monitored as the anesthesia team converts the monitoring equipment (arterial blood pressure, pulmonary artery pressures, electrocardiogram [EKG]) to a portable monitor. The chest drainage system is observed periodically to assess interval bleeding, to ascertain that negative pressure is not lost, and to ensure that the tubes are not obstructed. The OR transporting team and the ICU receiving team confirm initiation of transfer. The patient is accompanied to the ICU, and the team is directed should the patient's condition change en route. Operating room forms, indicating pre- and postoperative diagnoses and the operation performed, are signed. A postoperative chest X ray is obtained and examined to assess expansion of the lungs and placement of the chest and nasogastric tubes (if inserted). Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. A brief operative note is written for the patient's chart. Daily progress notes of the pre- and postoperative diagnoses, operation performed, findings, blood loss, intraoperative IV fluids administered, complications, and specimens sent to pathology (if any) are documented. Intensive care and medications are reviewed with the staff. The patient's short-term goals are established with the ICU nursing staff. Procedure outcomes, including the procedure performed, any variance from the planned procedure, the general findings, an initial assessment of the degree of procedural success, and expectations for the remainder of the day of surgery and the longer term, are discussed with the family. The procedure outcome is discussed with the patient's family or caregiver after patient's emergence from anesthesia. A postoperative report is dictated, and the procedure outcome is discussed with the referring physician. Care is coordinated with other physicians. A procedure outcome and expected recovery letter is dictated for the referring physician and/or the insurance company.

Postoperative intensive care: The patient's neurological state is assessed, and emergence from anesthesia is monitored. Sedatives, paralyzing agents, and analgesics are administered as needed. Gross neurologic function, including level of consciousness, behavioral appropriateness, and presence and nature of focal neurological defect if present, is evaluated. The evaluation is repeated until intraoperative neurologic injury is ruled out. The patient's hemodynamic condition, including cardiac rhythm, is assessed. Rate and conduction abnormalities are assessed. A temporary pacemaker is considered, and temporary pacing is initiated as needed. A suitable mode is determined, and the output and sensitivity of the device are adjusted. The assessment of hemodynamic effects is repeated. Arrhythmias are assessed. Atrial extrasystoles or runs are differentiated from ventricular extrasystoles or runs and correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs or ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed. Filling pressures are correlated at baseline, calibration of transducers with zero level at the level of the right heart are confirmed, and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Chest tube bleeding is monitored. The character of the mediastinal drainage (rate, amount, stability of clot) is assessed. The patency of the mediastinal tubes is assessed to ensure that a cardiac tamponade state is avoided. Bleeding quantity and character are correlated with chest X ray, laboratory tests, hemodynamics, urine output, and physical exam. Laboratory results are assessed and correlated with other findings to determine the need for blood and/or blood products, including platelets, cryoprecipitate, and fresh frozen plasma. Other adjunctive pharmacologic therapies are considered for coagulopathy. The need for reexploration is considered if the chest tube output exceeds acceptable limits or if tamponade physiology is present. The respiratory system is assessed. Breath sounds are examined, chest mechanics observed, and mid-line tracheal position is ensured by physical exam. Ventilator settings are assessed; underlying respiratory pattern, baseline airway pressures generated, and minute gas flow are observed. The postoperative chest X ray is reevaluated if necessary. Endotracheal tube placement is confirmed by review of the postoperative chest X ray. Lungs are monitored for infiltrate/atelectasis. Pleural spaces are assessed for fluid

collection. Blood gases are assessed, and the ventilator is adjusted as needed. The patient is weaned from the ventilator. Readiness for extubation is assessed. The patient is extubated, and airway and adequacy of ventilation are ensured. Adequacy of urine output is assessed, and postoperative creatinine in light of preoperative renal function is checked. Volume status is assessed, and fluids are administered as needed. The need for a diuretic is determined and, if indicated, the dose is determined, and response is monitored. Urine flow is correlated with blood pressure and compared to preoperative status. Interaction of cardiac output and vasoactive agents with renal function is assessed. Distal extremity perfusion is monitored, and peripheral pulses are assessed and compared to preoperative findings. A comprehensive evaluation is integrated with the patient's history, expected status based on conduct of the operation, and response to critical care interventions. The extent of inflammatory state is assessed, and treatment with antipyretics or steroids is considered as indicated. The patient's chart notes are reviewed with the nursing staff and other staff. Interval plans are discussed with the nursing staff. Parameters for interval adjustments in patient treatment are set, and the interval to the next patient evaluation, if expected goals have been met, is established. Questions from the nursing staff, other staff, and the patient's family are answered. Orders are written. The patient's progress notes are charted.

Postoperative other hospital work—beginning on postoperative day 3 until discharge day: A comprehensive history and physical exam are performed. All wounds are inspected for drainage, underlying hematoma, and inflammation. The patient's chart notes are reviewed with nursing and other staff. Postoperative pain, use of analgesics, and adequacy of response are assessed. Adequacy of respiration, character of breathing, relationship to surgical pain, and intravascular volume status are assessed. Character of pulmonary secretions and the patient's ability to clear his airway are assessed. Vital signs, intake and output, laboratory results, and patient daily weight are reviewed. The chest radiograph is reviewed, and the cardiac monitor is evaluated for rate, rhythm, and presence or absence of arrhythmia. The stored EKG monitoring history is evaluated if indicated. Progress of the system recovery and risk for development of complications are assessed. Ambulation and vigorous pulmonary physiotherapy are encouraged. Postoperative nutritional status, as maintained by both enteral (if necessary) and oral feedings, is carefully assessed and monitored. The chest tube is removed when appropriate (usually 24 to 48 hours postoperatively). Chest X-rays after tube removal and at least one more time before discharge as indicated by patient's condition are obtained and reviewed. The temporary pacemaker wires are removed if present. Questions from the patient, family, and nursing or other staff (verbal and written) are answered. An interval plan of care that includes drug therapy for underlying conditions (eg, diabetes), surgically induced conditions, actual or anticipated complications (eg, beta blockers for atrial fibrillation, antibiotics for prophylaxis or treatment), and preventive care is developed. Insurance staff questions are answered. Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. The postoperative echocardiogram is evaluated and reviewed. The patient's progress is discussed (oral and written) with the referring physician. Care is coordinated with other physicians. Evaluation, patient progress, and the care plan are documented in the medical record.

Discharge day work: A history and physical exam are performed. The final pathology/laboratory/film reports are checked and discussed with the patient's the family or caregiver. Wounds and patient progress are checked. Dietary management, activities permitted, bathing, handling of wound, return appointment to office, and similar items are carefully explained to the patient's family. Expectations for recovery are outlined and adjusted to specific underlying cardiac state, associated chronic diseases, operative findings, and character of postoperative recovery. Potential complications, how to recognize them, and what to do if recovery is not as anticipated are described. Care is coordinated with other physicians. The patient's chart notes are reviewed with nursing and other staff. Post discharge wound care and activity limitations are reviewed with the family. Questions from the patient, family, and nursing and other staff are answered. Insurance staff questions are answered. Orders for post discharge laboratory tests, films, and medications are written. The patient's discharge notes are charted, and prescriptions and discharge instructions are written. The nature, purpose, and expected duration of use of new medications are explained. The importance of secondary prevention of cardiac disease through risk factor reduction is explained to the family. Specific instructions on the need to notify other treating physicians and dentists of the presence of a surgically implanted ascending aortic prosthetic graft and the need for prophylactic periprocedural antibiotics are given. The patient's home medications and homeopathic agents are explained to ensure that additional agents are compatible or will not be used. A discharge summary is dictated. Communication is made with patient's primary care physician(s).

Postoperative office work: After discharge from the hospital, a detailed history and physical exam are performed. Medications are reviewed, and compliance is determined. Interval encounters are reviewed with other care providers. Wounds and patient progress are checked. Sutures/drains that remained in the patient on the day of discharge are removed. Post discharge laboratory tests/films are reviewed to confirm that no mediastinal enlargement compared to immediate postoperative chest x-ray, has occurred. Medications are reviewed and orders for medications are written. Questions from the patient and family are answered. Insurance staff questions are answered. The patient's progress is discussed (verbal and written) with the referring physician. The patient's care is coordinated with other physicians. Progress is discussed with the patient and family. A patient progress note is dictated for the medical chart, and letters are sent to referring physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)		10/2018

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

OVERALL RATIONALE

Tab 6 includes 6 codes that represent grafting procedures on the ascending aorta and the aortic arch. A new add-on code +33866 *Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion* (List separately in addition to code for primary procedure) that was developed to account for the additional work that

is involved when the ascending aortic disease extends into the proximal portion of the transverse aortic arch was approved by the CPT Editorial Panel and surveyed for the January 2018 RUC meeting. The Expert Panel decided not to survey the ascending aortic replacement codes 33860, 33863 or 33864 for the January 2018 RUC meeting because they felt that the work involved in the aortic hemiarch replacement procedure represented an advancement in surgical technique representing new work that is not reflected in the work that is currently accounted for in the ascending aortic procedures. The specialties indicated that the aortic hemiarch replacement is more closely related to the work involved with the transverse aortic arch replacement code 33870 than to the work of the ascending aortic codes. At the January 2018 RUC meeting, the RUC determined that the specialties had to re-survey the family of aortic repair procedures including codes 33860, 33863, 33864, 33866, 33870 for the April 2018 RUC meeting. As the specialty reviewed the codes with consideration of re-surveying them, they determined that they should be submitted to the CPT Editorial Panel for the following revisions: 1) To develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies. The specialties felt that there is a sufficient difference in the work associated with these procedures and now there is enough volume to allow for more accurate capture of the work and outcomes data for these distinct patient populations, which was not the case when the code was first developed. 2) Revise the descriptor for the transverse arch code, 33870 to further clarify the difference in work between that code and the new add-on code 33866. 3) Revise the guidelines to provide additional instructions on the appropriate use of these codes. The CCA was submitted to the CPT Editorial Panel for consideration at the May 2018 CPT meeting. The CPT Editorial Panel approved the deletion of two existing codes, 33860 and 33870. Code 33860 will be replaced with two new codes, 33858 and 33859 for ascending aortic aneurysm repair for dissection and for other aortic disease respectively. Due to the extensive changes of the descriptor for code 33870 to further differentiate that code from the aortic hemiarch code 33866, the Panel decided to delete code 33870 and renumber it to the new code 33871. As a result, 4 ascending aortic grafting codes 33858, 33859, 33863 and 33864 and two aortic arch grafting codes 33866 and 33871 were surveyed for the October 2018 meeting.

The recommended values for these procedures result in an overall budget savings for Medicare as represented in the table below:

CPT Source	Deleted	Source 2017 Utilization	New/ Revised Code	New/ Revised Code Utilization (reference 2017)	Percent	Source RVU	STS Rec RVU	New/ Revised Total RVUs	Total Source RVUs	Difference New/Rev - Source
33860	D	3800	33858	1140	0.3	59.46	65.00	74100	67784	6316
33860	D	3800	33859	2660	0.7	59.46	50.00	133000	158164	-25164
33863		1875	33863	1875	1	58.79	59.00	110625	110231	394
33864		282	33864	282	1	60.08	63.00	17766	16943	823
33870	D	999	33871	300	0.3	46.06	65.75	19725	13818	5907
33870	D	999	33866	699	0.7	46.06	19.74	13798	32196	-18398
Totals								369014	399136	-30122

Code 33860 which is split into two new codes 33858 and 33859 results in a recommended increase in value for code 33858 (recommended RVW 65.00, current RVW 59.46) and a decrease in value for the more commonly performed code 33859 (recommended RVW 50.00, current RVW 59.46) resulting in an overall budget savings for that code. Code 33870 is also split into two new codes 33866 and 33871, which results in a recommended increase in value for code 33871 (recommended RVW 65.75, current RVW 46.06) and a decrease in value for the more commonly performed code 33866 (recommended RVW 19.74, current RVW 46.06) resulting in an overall budget savings for that code. The RVW recommendations for the other two codes, 33863 and 33864 result in slight increases for each code, but these increases are offset by the savings from the changes to the other codes. Additional information regarding the recommended revisions are included for each code.

Rationale 33859

Code 33859 is a new code for ascending aortic graft for other aortic disease such as aneurysm. This procedure used to be reported with code 33860, which combined ascending aortic procedures for dissection and other aortic disease, such as aneurysms. The current Medicare volume for 33860 is 3800, which has been relatively consistent over the years per the RUC database. It is estimated that 70% of the ascending aortic repairs will be performed for other aortic disease such as aneurysm, resulting in an estimated Medicare volume of 2660 procedures per year. Ascending aortic grafting for other aortic disease such as aneurysm is a procedure that requires a median sternotomy and cardiopulmonary bypass with cardiac arrest. The ascending aorta involved in the aneurysm is transected and replaced with a graft. Depending on the patient and the repair, re-suspension of the aortic valve may also be necessary.

Pre-Time Package 4

Pre-Time Changes:

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient. The survey only supported 15 minutes for scrub dress and wait time, so the Expert Panel is recommending a 5-minute reduction for a total of 15 minutes for the scrub dress and wait time for the procedure per the survey.

Evaluation (total = 60 minutes): For the evaluation, the Expert Panel is recommending a 20-minute increase in time over the package for a total evaluation time of 60 minutes. This is supported by the survey data with 60 minutes of pre-service evaluation. The total evaluation time accounts for the review of the patient, by the surgeon and the collaborative efforts that go into each case. The additional evaluation time of 20 minutes accounts for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, coronary angiogram, echocardiogram, cath report, CT scan and echocardiography is required to identify the extent of the aortic disease, the amount of aortic resection necessary, the type and size of the aortic valve and the graft. The Expert Panel felt that adding 20 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the pre-service work involved with the procedure.

Positioning (total = 15 minutes): The Expert Panel is recommending a 12-minute increase in time over the package for a total positioning time of 15 minutes, which is common for cardiac procedures and there are numerous examples in the RUC database supporting this time. The survey supported 15-minutes for positioning of the patient. The additional 12-minutes above the package time can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation.

Scrub, Dress and Wait (total = 15 minutes): There is a 5-minute decrease from the package time, which represents the scrub dress and wait time from the survey.

Post-time Package 9b

Total = 60 minutes: The expert panel selected post-time package 9B for a general anesthesia or complex regional block/complex procedure. The Expert Panel is recommending a 27-minute increase in time over the package for a total immediate post time of 60 minutes. There are numerous examples in the RUC database and the cardiothoracic surgery codes supporting this time. The survey supported 60 minutes of immediate post time. The additional 27-minutes above the package time can be attributed to additional time for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished.

Critical Care Visits: 95% of the survey respondents replied that the procedure was performed in the hospital, and that 100% of the patients stayed overnight for more than 24 hours. 57% of the respondents indicated that they provided an E&M Visit on the same day of surgery.

The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient once the patient arrives in the ICU on the day of the procedure and an additional 40 minutes of critical care the day after the procedure for a total of two critical care visits for the procedure. The critical care visit covers that time that the physician spends with the patient directly related to the procedure providing critical care services. The survey supported two critical care visits for the procedure and the Expert Panel agreed.

Intensity and complexity of the procedure: 40 surveys were completed by a random pool of 800 cardiac surgeons which consisted of 650 self-identified adult cardiac surgeons and 150 self-identified congenital cardiac surgeons. 12 respondents selected code 33430, mitral valve replacement as a reference code making it the 1st key reference service (KRS). That code has a slightly lower value, a shorter intraservice time and a longer total time than the survey code. The survey respondents ranged in their intensity/complexity comparison saying that the survey code was identical or somewhat more complex than 33430 for all of the intensity/complexity measures. 8 respondents selected code 33877, thoracoabdominal aneurysm repair as a reference code making it the 2nd KRS. This code has a higher value with a longer intraservice and total service time. The respondents ranged in their intensity/complexity comparison saying that the survey code is identical to, somewhat or much more intense/complex than 33877 for all of the intensity/complexity measures except for the mental effort where 50% of the respondents indicated that the survey code was less complex than 33877.

Recommended RVW: The survey data for code 33859 (ascending aortic graft for other aortic disease) shows that the median intra-operative time is 240 minutes. The current intra-service time for this procedure is 305 minutes. The STS Database intra-service time shows a mean time of 301 minutes and a median time of 281 minutes. However, the database time data available to the Expert Panel at this time does not distinguish between dissections and other aortic disease such as aneurysms. The median intra-service time from the survey at 240 minutes is less than the intra-time for the current code 33860. The surveys also supported two critical care visits during the post-operative period which is the same number included in the current code. The hospital LOS from the survey represents one day less than the LOS in the current code and the total time from the survey is less at 778 minutes than that for the current code at 931 minutes. The Expert Panel felt that the survey accurately represented some of the work variances that exist between the ascending aortic repair for dissection versus ascending aortic repair for other aortic disease. Since code 33860 represents a blend of ascending aortic grafting for dissection and repairs for other aortic disease, the time inputs from the existing code cannot be compared directly to those from the survey. The Recommended RVW and the total time for the survey code falls on just above the RVW for the 1st KRS. The intraservice time of the survey code is slightly more than the intra-service time of the 1st KRS and lower than that of the 2nd KRS. The intensity (0.121) for the survey code is higher than the intensity for 1st (0.105) and 2nd (0.114) KRS codes. The Expert panel felt that this is appropriate and is supported by the intensity and complexity measures.

The Expert Panel is recommending the 25th percentile work RVW of 50.00, with a median intra-service time of 240 minutes, and total time of 778 minutes. Pre-time package 4 was selected with adjustments made to the evaluation and positioning time for a total pre-service time of 90 minutes. Immediate post-service time package 9b with additional time added for a total time of 60 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33860

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4940

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33860 is 3,800. The STS database shows that 65% of the patients that undergo an ascending aortic graft are non-Medicare patients.

It is estimated that 70% of the ascending aortic grafts reported for 33860 are for aortic disease other than dissection. This results in the following:

For code 33859, it is estimated that 4940 procedures per year will be provided nationally and 2660 procedures per year will be provided to Medicare patients.

Specialty cardiothoracic surgery Frequency 4940 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,660

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33860 is 3,800. The STS database shows that 65% of the patients that undergo an ascending aortic graft are non-Medicare patients.

It is estimated that 70% of the ascending aortic grafts reported for 33860 are for aortic disease other than dissection. This results in the following:

For code 33859, it is estimated that 4940 procedures per year will be provided nationally and 2660 procedures per year will be provided to Medicare patients.

Specialty cardiothoracic surgery Frequency 2660 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

CPT Descriptor: Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male with a history of a dilated aortic root and ascending aorta has been followed yearly. Transthoracic echo now shows the ascending aorta to be 6.5 cm in diameter with severe aortic insufficiency. The patient undergoes graft replacement of the ascending aorta, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg Bentall)

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 0%, In the office 5%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 58%

Description of Pre-Service Work: A complete or interval history and physical examination (comprehensive) are performed with special attention to dental condition or other possible future sources of prosthetic or native endocarditis. Identify absolute or relative contraindications to lifetime anticoagulation with Warfarin, including an assessment of patient compliance, lifestyle, work environment and coexistent diseases that predispose to hemorrhagic complications. If female, discuss possibility of future pregnancy. Preoperative orders are written, and the work-up and notes from referring and primary physicians are reviewed if available. Preoperative imaging studies including chest x-rays, coronary angiogram, echocardiogram, cath report, CT scan and echo report are reviewed. Preoperative laboratory studies (CBC, electrolytes, renal and liver function, coagulation) are reviewed. Obtain cardiology assessment and pulmonary assessment as indicated. Indications, surgical procedure, expected recovery, and expected outcomes, including potential complications, are reviewed with the family. Discuss alternative valve selection criteria, relative risks in short and long term of bioprosthesis vs mechanical prostheses, intraoperative findings that may force the decision. Discuss the possibility of complete heart block and the need for permanent pacing, as well as the standard risks of cardiac surgery. The family's questions are answered, and informed consent is obtained. The OR start time is confirmed and the patient and family are notified. Confirm surgical assistant. The patient is identified, the surgical site is marked per hospital policy, and any questions from the family are answered. Availability of blood and/or cross match and any special instruments or medical devices, including a full range of valve-conduits by size, is ensured. Review planned incision and procedure. Review the length and type of anesthesia with anesthesiologist alerting the anesthesiologist of the potential for cardiac tamponade physiology. Ensure anesthesiology and perfusionist are prepared for circulatory arrest if needed. Plan invasive monitoring including use of arterial line and pulmonary artery catheter. Review trans-esophageal echocardiogram with anesthesiologist and/or cardiologist with special attention to quality of ascending aorta, degree and nature of aortic valve pathology and ventricular function. Position patient supine and carefully pad the extremities to prevent pressure injury. The surgeon scrubs and puts on a gown and gloves. Prep and drape the skin of the chest, abdomen, and legs from the neck to the ankles including both groin areas. Ensure that the patient is properly positioned for the procedure

Description of Intra-Service Work: Perform standard median sternotomy skin incision, divide the sternum in the midline with a saw.

Assess ascending aorta and level of aneurysm. Determine if a period of total circulatory arrest will be necessary for distal graft anastomosis and plan systemic cooling accordingly. A determination of which artery will be used for arterial access while on cardiopulmonary bypass is made following median sternotomy and exposure of the heart and great vessels. This may require exposure and use of the aortic arch, the innominate artery, the subclavian artery, the brachial artery, or even the femoral artery depending on condition of the ascending aorta and the extent of pathology. Administer systemic heparin. Determine appropriate cannulas to use based on anatomy and patient BSA. Place purse string sutures in right atrium. Check with anesthesiologist and/or perfusionist regarding activated clotting time value to assess level of heparinization. If peripheral arterial cannulation is planned proceed with the following steps: assess size of arterial vessel and select cannula based on vessel diameter and patient's BSA. Apply vascular clamps to proximal and distal portions of exposed artery. Perform small transverse arteriotomy. If necessary, an eight-millimeter Dacron graft is anastomosed to the artery in order to facilitate cardiopulmonary bypass (reported separately). Atraumatically insert arterial cannula by removing proximal clamp verifying by echocardiography its position in the descending thoracic aorta if a long cannula is used. Change gloves after completing cannulation and before returning to chest incision. Insert venous right atrial cannula, vent left atrium. Initiate cardiopulmonary bypass, inspect aorta for signs of dissection. Initiate systemic cooling. Place antegrade and retrograde (if necessary) cardioplegia cannulas. Cross clamp the aorta and administer cardioplegia and topical hypothermia. Assess effectiveness of cardioplegia based on arrest of heart and temperature probe in ventricular septum; maintain septal temperature below 15 degrees Centigrade. Repeat cardioplegia every 20 minutes or as necessary while cross clamp in place. Assess heart for distention, cooling and cardioplegic arrest.

Open ascending aorta evaluate aneurysm (or dissection), the aortic root and aortic valve. Measure root. Dissect left coronary artery free with cuff of surrounding aortic wall to serve as a button. Dissect free the right coronary artery in similar fashion. Resect the aortic valve and entire ascending aorta. Size the aortic annulus to determine appropriate size for the prosthetic valve. If a composite graft (prosthetic valve attached to a Dacron tube graft) is used: select the appropriately sized composite graft. Place interrupted, braided valve sutures around native valve annulus. Place sutures into prosthetic valve sewing ring. Seat and secure the valve with each of annular sutures. To re-establish continuity between aortic blood flow and coronary circulation, both the right and left coronary arteries must be anastomosed to the side walls of the Dacron valve-conduit tube graft. Determine suitable position for left coronary anastomosis to the graft. Mark this location and create an opening in graft. Perform the left coronary artery/button anastomosis to the side wall of the graft with running polypropylene using thin felt strips on cuff of coronary artery. Perform a similar maneuver for the right coronary/button anastomosis to the side wall of the graft. Measure length of aortic prosthetic graft for distal aortic anastomosis and the cut graft to the appropriate length. Perform distal anastomosis with running polypropylene.

Rewarm at appropriate time. Place patient in Trendelenberg, evacuate air, remove cross-clamp. Vent aortic root until LV ejection present for 5-10 minutes. Check all suture lines, with particular attention to coronary anastomoses to graft. Evaluate air in left side of heart using transesophageal echocardiogram. Resuscitate the heart by allowing it to beat while unloaded on cardiopulmonary bypass. Recheck all suture lines. Place temporary pacing wires and begin atrial, atrio-ventricular, or ventricular pacing if indicated. Assess need for inotropic agents or intra-aortic balloon pump. Discontinue cardiopulmonary bypass by reducing arterial flow and retarding venous return to pump while continuously monitoring hemodynamics with arterial and pulmonary artery lines. Evaluate the post-procedure, intra-operative echocardiogram specifically examining for ventricular function, regional wall motion abnormalities, and valve function. When the patient is stable, give protamine to reverse heparin and remove the arterial and venous cannulas. If necessary, close peripheral artery cannulation site with running polypropylene suture. Arterial, venous, right superior pulmonary vein and cardioplegia cannulas are removed and cannulation sites are secured/repared. Chest tubes are placed, and the sternum is re-approximated. The sternal wound is closed.

Description of Post-Service Work: Postoperative same day work through admission to intensive care: An operating room debriefing is performed. Sterile dressings are applied to the incision. Drapes are removed, with close attention to pacing wires (if any), tubes, lines and possible epidural anesthesia catheter to ensure that none are dislodged or disconnected. This attention continues as the patient is moved to the intensive care unit (ICU) bed for transfer. In a coordinated team manner, the patient's overall condition is monitored as the anesthesia team converts the monitoring equipment (arterial blood pressure, pulmonary artery pressures, electrocardiogram [EKG]) to a portable monitor. The chest drainage system is observed periodically to assess interval bleeding, to ascertain that negative pressure is not lost, and to ensure that the tubes are not obstructed. The OR transporting team and the ICU receiving team confirm initiation of transfer. The patient is accompanied to the ICU, and the team is directed should the patient's condition change en route. Operating room forms, indicating pre- and postoperative diagnoses and the operation performed, are signed. A postoperative chest X ray is

obtained and examined to assess expansion of the lungs and placement of the chest and nasogastric tubes (if inserted). Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. A brief operative note is written for the patient's chart. Daily progress notes of the pre- and postoperative diagnoses, operation performed, findings, blood loss, intraoperative IV fluids administered, complications, and specimens sent to pathology (if any) are documented. Intensive care and medications are reviewed with the staff. The patient's short-term goals are established with the ICU nursing staff. Procedure outcomes, including the procedure performed, any variance from the planned procedure, the general findings, an initial assessment of the degree of procedural success, and expectations for the remainder of the day of surgery and the longer term, are discussed with the family. The procedure outcome is discussed with the patient's family or caregiver after patient's emergence from anesthesia. A postoperative report is dictated, and the procedure outcome is discussed with the referring physician. Care is coordinated with other physicians. A procedure outcome and expected recovery letter is dictated for the referring physician and/or the insurance company.

Postoperative intensive care: The patient's neurological state is assessed, and emergence from anesthesia is monitored. Sedatives, paralyzing agents, and analgesics are administered as needed. Gross neurologic function, including level of consciousness, behavioral appropriateness, and presence and nature of focal neurological defect if present, is evaluated. The evaluation is repeated until intraoperative neurologic injury is ruled out. The patient's hemodynamic condition, including cardiac rhythm, is assessed. Rate and conduction abnormalities are assessed. Temporary pacing is initiated as needed. A suitable mode is determined, and the output and sensitivity of the device are adjusted. The assessment of hemodynamic effects is repeated. Arrhythmias are assessed. Atrial extrasystoles or runs are differentiated from ventricular extrasystoles or runs and correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed. Filling pressures are correlated at baseline, calibration of transducers with zero level at the level of the right heart are confirmed, and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Chest tube bleeding is monitored. The character of the mediastinal drainage (rate, amount, stability of clot) is assessed. The patency of the mediastinal tubes is assessed to ensure that a cardiac tamponade state is avoided. Bleeding quantity and character are correlated with chest X ray, laboratory tests, hemodynamics, urine output, and physical exam. Laboratory results are assessed and correlated with other findings to determine the need for blood and/or blood products, including platelets, cryoprecipitate, and fresh frozen plasma. Other adjunctive pharmacologic therapies are considered for coagulopathy. The need for reexploration is considered if the chest tube output exceeds acceptable limits or if tamponade is present. The respiratory system is assessed. Breath sounds are examined, chest mechanics observed, and mid-line tracheal position is ensured by physical exam. Ventilator settings are assessed; underlying respiratory pattern, baseline airway pressures generated, and minute gas flow are observed. The postoperative chest X ray is reevaluated if necessary. Endotracheal tube placement is confirmed by review of the postoperative chest X ray. Lungs are monitored for infiltrate/atelectasis. Pleural spaces are assessed for fluid collection. Blood gases are assessed, and the ventilator is adjusted as needed. Readiness for extubation is assessed. When appropriate, the patient is extubated, and airway and adequacy of ventilation are ensured. Adequacy of urine output is assessed, and postoperative creatinine in light of preoperative renal function is checked. Volume status is assessed, and fluids are administered as needed. The need for a diuretic is determined and, if indicated, the dose is determined, and response is monitored. Urine flow is correlated with blood pressure and compared to preoperative status. Interaction of cardiac output and vasoactive agents with renal function is assessed. Distal extremity perfusion is monitored, and peripheral pulses are assessed and compared to preoperative findings. A comprehensive evaluation is integrated with the patient's history, expected status based on conduct of the operation, and response to critical care interventions. The extent of inflammatory state is assessed, and treatment with antipyretics or steroids is considered as indicated. The patient's chart notes are reviewed with the nursing staff and other staff. Interval plans are discussed with the nursing staff. Parameters for interval adjustments in patient treatment are set, and the interval to the next patient evaluation, if expected goals have been met, is established. Questions from the nursing staff, other staff, and the patient's family are answered. Orders are written. The patient's progress notes are charted.

Postoperative other hospital work—beginning on postoperative day 3 until discharge day: A comprehensive history and physical exam are performed. All wounds are inspected for drainage, underlying hematoma, and inflammation. The patient's chart notes are reviewed with nursing and other staff. Postoperative pain, use of analgesics, and adequacy of response are assessed. Adequacy of respiration, character of breathing, relationship to surgical pain, and intravascular volume status are assessed. Character of pulmonary secretions and the patient's ability to clear his airway are assessed. Vital signs, intake and output, laboratory results, and patient daily weight are reviewed. The chest radiograph is reviewed, and the cardiac monitor is evaluated for rate, rhythm, and presence or absence of arrhythmia. The stored EKG monitoring history is evaluated if indicated. Progress of the system recovery and risk for development of complications are assessed.

Ambulation and vigorous pulmonary physiotherapy are encouraged. Postoperative nutritional status, as maintained by both enteral (if necessary) and oral feedings, is carefully assessed and monitored. The chest tubes, if still present, are removed when appropriate. Chest X-rays after tube removal and at least one more time before discharge as indicated by patient's condition are obtained and reviewed. The temporary pacemaker wires are removed if present. Questions from the patient, family, and nursing or other staff (verbal and written) are answered. An interval plan of care that includes drug therapy for underlying conditions (e.g., diabetes), surgically induced conditions, actual or anticipated complications (e.g., beta blockers for atrial fibrillation, antibiotics for prophylaxis or treatment), and preventive care is developed. Insurance staff questions are answered. Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. The postoperative echocardiogram is evaluated and reviewed. The patient's progress is discussed (oral and written) with the referring physician. Care is coordinated with other physicians. Evaluation, patient progress, and the care plan are documented in the medical record.

Discharge day work: A history and physical exam are performed. The final pathology/laboratory/film reports are checked and discussed with the patient's the family or caregiver. Wounds and patient progress are checked. Dietary management, activities permitted, bathing, handling of wound, return appointment to office, and similar items are carefully explained to the patient's family. Expectations for recovery are outlined and adjusted to specific underlying cardiac state, associated chronic diseases, operative findings, and character of postoperative recovery. Potential complications, how to recognize them, and what to do if recovery is not as anticipated are described. Care is coordinated with other physicians. The patient's chart notes are reviewed with nursing and other staff. Post discharge wound care and activity limitations are reviewed with the family. Questions from the patient, family, and nursing and other staff are answered. Insurance staff questions are answered. Orders for post discharge laboratory tests, films, and medications are written. The patient's discharge notes are charted, and prescriptions and discharge instructions are written. The nature, purpose, and expected duration of use of new medications are explained. The importance of secondary prevention of cardiac disease through risk factor reduction is explained to the family. Specific instructions on the need to notify other treating physicians and dentists of the presence of a prosthetic heart valve and Dacron graft replacing the ascending aorta, as well as the need for prophylactic periprocedural antibiotics are given. The patient's home medications and homeopathic agents are explained to ensure that additional agents are compatible or will not be used. A discharge summary is dictated. Communication is made with patient's primary care physician(s). A schedule for anticoagulation testing is formulated for the patient.

Postoperative office work: After discharge from the hospital, a detailed history and physical exam are performed. Medications are reviewed, and compliance is determined. Interval encounters are reviewed with other care providers. Wounds and patient progress are checked. Sutures/drains are removed. Post discharge laboratory tests/films are reviewed, specifically echo studies to assess valve function and compare to preoperative studies. Medications are reviewed and orders for medications are written. Questions from the patient and family are answered. Insurance staff questions are answered. The patient's progress is discussed (verbal and written) with the referring physician. The patient's care is coordinated with other physicians. Progress is discussed with the patient and family. A patient progress note is dictated for the medical chart, and letters are sent to referring physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)		10/2018				
Presenter(s):	Jim Levett, MD; Kirk Kanter, MD; Joseph Turek, MD; Jacob Schroder, MD

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

OVERALL RATIONALE

Tab 6 includes 6 codes that represent grafting procedures on the ascending aorta and the aortic arch. A new add-on code +33866 *Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion* (List separately in addition to code for primary procedure) that was developed to account for the additional work that

is involved when the ascending aortic disease extends into the proximal portion of the transverse aortic arch was approved by the CPT Editorial Panel and surveyed for the January 2018 RUC meeting. The Expert Panel decided not to survey the ascending aortic replacement codes 33860, 33863 or 33864 for the January 2018 RUC meeting because they felt that the work involved in the aortic hemiarch replacement procedure represented an advancement in surgical technique representing new work that is not reflected in the work that is currently accounted for in the ascending aortic procedures. The specialties indicated that the aortic hemiarch replacement is more closely related to the work involved with the transverse aortic arch replacement code 33870 than to the work of the ascending aortic codes. At the January 2018 RUC meeting, the RUC determined that the specialties had to re-survey the family of aortic repair procedures including codes 33860, 33863, 33864, 33866, 33870 for the April 2018 RUC meeting. As the specialty reviewed the codes with consideration of re-surveying them, they determined that they should be submitted to the CPT Editorial Panel for the following revisions: 1) To develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies. The specialties felt that there is a sufficient difference in the work associated with these procedures and now there is enough volume to allow for more accurate capture of the work and outcomes data for these distinct patient populations, which was not the case when the code was first developed. 2) Revise the descriptor for the transverse arch code, 33870 to further clarify the difference in work between that code and the new add-on code 33866. 3) Revise the guidelines to provide additional instructions on the appropriate use of these codes. The CCA was submitted to the CPT Editorial Panel for consideration at the May 2018 CPT meeting. The CPT Editorial Panel approved the deletion of two existing codes, 33860 and 33870. Code 33860 will be replaced with two new codes, 33858 and 33859 for ascending aortic aneurysm repair for dissection and for other aortic disease respectively. Due to the extensive changes of the descriptor for code 33870 to further differentiate that code from the aortic hemiarch code 33866, the Panel decided to delete code 33870 and renumber it to the new code 33871. As a result, 4 ascending aortic grafting codes 33858, 33859, 33863 and 33864 and two aortic arch grafting codes 33866 and 33871 were surveyed for the October 2018 meeting.

The recommended values for these procedures result in an overall budget savings for Medicare as represented in the table below:

CPT Source	Deleted	Source 2017 Utilization	New/ Revised Code	New/ Revised Code Utilization (reference 2017)	Percent	Source RVU	STS Rec RVU	New/ Revised Total RVUs	Total Source RVUs	Difference New/Rev - Source
33860	D	3800	33858	1140	0.3	59.46	65.00	74100	67784	6316
33860	D	3800	33859	2660	0.7	59.46	50.00	133000	158164	-25164
33863		1875	33863	1875	1	58.79	59.00	110625	110231	394
33864		282	33864	282	1	60.08	63.00	17766	16943	823
33870	D	999	33871	300	0.3	46.06	65.75	19725	13818	5907
33870	D	999	33866	699	0.7	46.06	19.74	13798	32196	-18398
Totals								369014	399136	-30122

Code 33860 which is split into two new codes 33858 and 33859 results in a recommended increase in value for code 33858 (recommended RVW 65.00, current RVW 59.46) and a decrease in value for the more commonly performed code 33859 (recommended RVW 50.00, current RVW 59.46) resulting in an overall budget savings for that code. Code 33870 is also split into two new codes 33866 and 33871, which results in a recommended increase in value for code 33871 (recommended RVW 65.75, current RVW 46.06) and a decrease in value for the more commonly performed code 33866 (recommended RVW 19.74, current RVW 46.06) resulting in an overall budget savings for that code. The RVW recommendations for the other two codes, 33863 and 33864 result in slight increases for each code, but these increases are offset by the savings from the changes to the other codes. Additional information regarding the recommended revisions are included for each code.

Rationale 33863

Code 33863 is a code for ascending aortic disease that extends into the aortic root producing dilatation of the root and insufficiency of the aortic valve. The current Medicare volume for 33863 is 1875, and this low volume procedure has been relatively steady over the years per the RUC database. The specialties do not expect any changes in the volume. Ascending aortic grafting that involves the aortic root the aortic valve is a procedure that requires a median sternotomy and cardiopulmonary bypass with cardiac arrest. The ascending aorta involved in the aneurysm is transected and replaced with a graft, the right and left coronary arteries are dissected with cuffs, and the aortic root and aortic valve are resected. The aortic annulus is sized, and the aortic root and valve are replaced with a prosthetic valve/composite graft and the right and left coronary/buttons are re-implanted into the graft.

Pre-Time Package 4

Pre-Time Changes:

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient. The survey only supported 15 minutes for scrub dress and wait time, so the Expert Panel is recommending a 5-minute reduction for a total of 15 minutes for the scrub dress and wait time for the procedure per the survey.

Evaluation (total = 60 minutes): For the evaluation, the Expert Panel is recommending a 20-minute increase in time over the package for a total evaluation time of 60 minutes. This is supported by the survey data with 60 minutes of pre-service evaluation. The total evaluation time accounts for the review of the patient, by the surgeon and the collaborative efforts that go into each case. The additional evaluation time of 20 minutes accounts for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure and the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, CT Scan, MRI, Aortogram and TEE is required to identify the aortic valve pathology, the extent of the aortic disease, the amount of aortic resection necessary and the size of the graft. The trans-esophageal echocardiogram is reviewed with the anesthesiologist and/or cardiologist with special attention to quality of ascending aorta, degree and nature of aortic valve pathology and ventricular function. The Expert Panel felt that adding 20 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the pre-service work involved with the procedure.

Positioning (total = 15 minutes): The Expert Panel is recommending a 12-minute increase in time over the package for a total positioning time of 15 minutes, which is common for cardiac procedures and there are numerous examples in the RUC database supporting this time. The survey supported 15-minutes for positioning of the patient. The additional 12-minutes above the package time can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation.

Scrub, Dress and Wait (total = 15 minutes): There is a 5-minute decrease from the package time, which represents the scrub dress and wait time from the survey.

Post-time Package 9b

Total = 60 minutes: The expert panel selected post-time package 9B for a general anesthesia or complex regional block/complex procedure. The Expert Panel is recommending a 27-minute increase in time over the package for a total immediate post time of 60 minutes and there are numerous examples in the RUC database and the cardiothoracic surgery codes supporting this time. The survey supported 60 minutes of immediate post time. The additional 27-minutes above the package time can be attributed to additional time for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished.

Critical Care Visits: 95% of the survey respondents replied that the procedure was performed in the hospital, and that 100% of the patients stayed overnight for more than 24 hours. 58% of the respondents indicated that they provided an E&M Visit on the same day of surgery.

The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient once the patient arrives in the ICU on the day of the procedure and an additional 40 minutes of critical care the day after the procedure for a total of two critical care visits for the procedure. The critical care visit covers that time that the

physician spends with the patient directly related to the procedure providing critical care services. The survey supported two critical care visits for the procedure and the Expert Panel agreed.

Intensity and complexity of the procedure: 41 surveys were completed by a random pool of 800 cardiac surgeons which consisted of 650 self-identified adult cardiac surgeons and 150 self-identified congenital cardiac surgeons. 12 respondents selected code 33412, aortic valve replacement with transventricular aortic annulus enlargement as a reference code making it the 1st key reference service (KRS). That code has the same value and intraservice time and a slightly longer total time than the survey code. The survey respondents ranged in their intensity/complexity comparison saying that the survey code was identical or somewhat more complex than 33412 for all of the intensity/complexity measures. 8 respondents selected code 33877, thoracoabdominal aneurysm repair as a reference code making it the 2nd KRS. This code has a higher value with a longer intraservice and total service time. The respondents ranged in their intensity/complexity comparison saying that the survey code is identical to, somewhat or much more intense/complex than 33877 for all of the intensity/complexity measures except for the psychological stress where 100% of the respondents indicated that the survey code more complex than 33877.

Recommended RVW: The survey data for code 33863 (Ascending aorta graft with aortic root replacement using valved conduit and coronary reconstruction) shows that the median intra-operative time is 280 minutes. The current intra-service time for this procedure is 287 minutes. The STS Database intra-service time shows a mean time of 298 minutes and a median time of 322 minutes. Based on the STS Database time, the Expert Panel felt that the survey respondents underestimated the intra-service time of the procedure and are recommending the 75th percentile of intra-service time from the survey, which is 300 minutes. The 75th percentile of 300 minutes is supported by the STS database times with the surveyed 75th percentile time falling between the STS Database mean and median intra-service times. The survey also supported two critical care visits during the post-operative period which is the same number included in the current code. The hospital LOS from the survey represents two days less than the LOS in the current code and the total time from the survey is less at 838 minutes than that for the current code at 905 minutes. The Recommended RVW and the total time for the survey code are very close to the values for the 1st KRS. The intraservice time of the survey code is the same as the intra-service time of the 1st KRS and lower than that of the 2nd KRS. The intensity (0.126) for the survey code is slightly higher than the intensity for 1st (0.122) and 2nd (0.114) KRS codes. The Expert panel felt that this is appropriate and is supported by the intensity and complexity measures.

The Expert Panel is recommending the 25th percentile work RVW of 59.00, with the 75th percentile intra-service time of 300 minutes, and total time of 838 minutes. Pre-time package 4 was selected with adjustments made to the evaluation and positioning time for a total pre-service time of 90 minutes. Immediate post-service time package 9b with additional time added for a total time of 60 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these

data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33863

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2604

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33863 is 1875. The STS database shows that 72% of the patients that undergo Bentall are Medicare patients.

Specialty cardiothoracic surgery Frequency 2604 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,875

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33863 is 1875. The STS database shows that 72% of the patients that undergo Bentall are Medicare patients. The specialties do not expect any changes in the Medicare volume.

Specialty cardiothoracic surgery Frequency 1875 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33863

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 33864	Tracking Number D4	Original Specialty Recommended RVU: 63.00
		Presented Recommended RVU: 63.00
Global Period: 090	Current Work RVU: 60.08	RUC Recommended RVU: 63.00

CPT Descriptor: Ascending aorta graft, with cardiopulmonary bypass with valve suspension, with coronary reconstruction and valve-sparing aortic root remodeling (eg, David Procedure, Yacoub procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32-year-old male with Marfan's syndrome is followed with serial echocardiograms looking for increasing aortic root dimensions. Echocardiogram now shows a 5.5 cm ascending aorta with aortic annulus dilatation without aortic valve insufficiency. He is referred for a valve sparing root reconstruction

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 95% , In the ASC 0%, In the office 5%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 65%

Description of Pre-Service Work: A complete or interval history and physical examination (comprehensive) are performed. Preoperative orders are written, and the work-up and notes from referring and primary physicians are reviewed if available. Preoperative imaging studies including chest x-rays, coronary angiogram, echocardiogram, cath report, CT scan and echo report are reviewed with special attention to the feasibility of a valve-sparing operation. Preoperative laboratory studies (CBC, electrolytes, renal and liver function, coagulation) are reviewed. Obtain cardiology assessment and pulmonary assessment as indicated. Indications, surgical procedure, expected recovery, and expected outcomes, including potential complications, are reviewed with the family. Discuss the possibility of complete heart block and the need for permanent pacing, as well as the standard risks of cardiac surgery. In addition, the patient is informed of the possibility that valve-sparing cannot be accomplished, in which case the patient may require a more conventional valve-conduit type procedure (e.g., Bentall Procedure). The family's questions are answered, and informed consent is obtained. The OR start time is confirmed and the patient and family are notified. Confirm surgical assistant. The patient is identified, the surgical site is marked per hospital policy, and any questions from the family are answered. Availability of blood and/or cross match and any special instruments or medical devices, such as the availability of prosthetic valve conduits if valve-sparing cannot be accomplished, is ensured. Review planned incision and procedure. Review the length and type of anesthesia with anesthesiologist alerting the anesthesiologist of the potential for cardiac tamponade physiology, and the need to adjust induction techniques accordingly. Ensure anesthesiology and perfusionist are prepared for circulatory arrest if needed. Plan invasive monitoring including use of arterial line (right radial only) and pulmonary artery catheter. Review trans-esophageal echocardiogram with anesthesiologist and/or cardiologist with special attention to the size and function of the native aortic valve as well as an assessment of the patient's ventricular function. Position patient supine and carefully pad the extremities to prevent pressure injury. The surgeon scrubs and puts on a gown and gloves. Prep and drape the skin of the chest, abdomen, and legs from the neck to the ankles including both groin areas. Ensure that the patient is properly positioned for the procedure.

Description of Intra-Service Work: Following a standard median sternotomy incision, the sternum is divided with a saw. A determination of which artery will be used for arterial access while on cardiopulmonary bypass is made following median sternotomy and exposure of the heart and great vessels. This may require exposure and use of the aortic arch, the

innominate artery, the distal ascending aorta, the subclavian artery, the brachial artery, or even the femoral artery depending on condition of the ascending aorta and the extent of pathology. Administer systemic heparin. Determine appropriate cannulas to use based on anatomy and patient BSA. Place purse string sutures in right atrium

Check with anesthesiologist and/or perfusionist regarding activated clotting time value to assess level of heparinization. If peripheral arterial cannulation is planned proceed with the following steps: Assess size of arterial vessel and select cannula based on vessel diameter and patient's BSA; Apply vascular clamps to proximal and distal portions of exposed artery; Perform small transverse arteriotomy; If necessary, an eight-millimeter Dacron graft is anastomosed to the artery in order to facilitate cardiopulmonary bypass (reported separately); If direct arterial cannulation is used, atraumatically insert arterial cannula by removing proximal clamp. If a long femoral artery cannula is used, verify its position by echocardiography in the descending thoracic aorta. Change gloves after completing cannulation and before returning to chest incision. Insert venous right atrial cannula. A pledgeted mattress suture is placed on the anterior surface of the right superior pulmonary vein through which a venting cannula is placed into the left atrium. Cardiopulmonary bypass is initiated, and the patient is systemically cooled. Antegrade and retrograde cardioplegia cannulas are inserted. The aorta is cross clamped and cardioplegia is administered to achieve cardiac arrest. The heart is assessed for distention. The ascending aorta is opened and the aortic root and aortic valve are evaluated.

The aortic valve and annulus are assessed and sized. The proximal aortic root is excised mobilizing the right and left coronary artery ostia with cuffs of residual aortic tissue and leaving the native aortic valve and commissures intact. Multiple interrupted pledgetted sutures are placed beneath the aortic valve from the left ventricle to the base of the aortic root. These are passed through the proximal portion of a suitably sized Dacron graft. The graft is seated down and the sutures tied, thus fixing/remodeling the aortic annulus. The aortic valve and commissures are reattached at the appropriate height to the inside of the Dacron graft resuspending the valve using continuous running sutures. Oval shaped openings are created in the side walls of the Dacron graft and the right and left coronary "buttons" are reimplanted into the Dacron graft to re-establish continuity of aortic blood flow and coronary circulation. The distal portion of the Dacron graft is cut to the appropriate length and sewn to the normal distal ascending aorta, evacuating air from the left side of the heart before tying down the last stitch.

The patient is placed in Trendelenberg. The aortic cross-clamp is removed. The aortic root is vented during Left Ventricular ejection for 5-10 minutes. The absence of residual air in left side of heart is confirmed and the degree of any aortic valve insufficiency is evaluated using transesophageal echocardiogram. Resuscitate the heart by allowing it to beat while unloaded on cardiopulmonary bypass. Place temporary pacing wires and begin atrial, atrio-ventricular, or ventricular pacing if indicated. Assess need for inotropic agents or intra-aortic balloon pump. Discontinue cardiopulmonary bypass by reducing arterial flow and retarding venous return to pump while continuously monitoring hemodynamics with arterial and pulmonary artery lines. Meticulous hemostasis is achieved. Evaluate the post-procedure, intra-operative echocardiogram specifically examining for ventricular function, regional wall motion abnormalities, and aortic valve function. When the patient is stable, give protamine to reverse heparin and remove the arterial and venous cannulas. If necessary, close peripheral artery cannulation site with running polypropylene suture. Arterial, venous, right superior pulmonary vein and cardioplegia cannulas are removed and cannulation sites are secured/repared. Chest tubes are placed, and the sternum is re-approximated. The sternal wound is closed.

Description of Post-Service Work: Postoperative same day work through admission to intensive care: An operating room debriefing is performed. Sterile dressings are applied to the incision. Drapes are removed, with close attention to pacing wires (if any), tubes, lines and possible epidural anesthesia catheter to ensure that none are dislodged or disconnected. This attention continues as the patient is moved to the intensive care unit (ICU) bed for transfer. In a coordinated team manner, the patient's overall condition is monitored as the anesthesia team converts the monitoring equipment (arterial blood pressure, pulmonary artery pressures, electrocardiogram [EKG]) to a portable monitor. The chest drainage system is observed periodically to assess interval bleeding, to ascertain that negative pressure is not lost, and to ensure that the tubes are not obstructed. The OR transporting team and the ICU receiving team confirm initiation of transfer. The patient is accompanied to the ICU, and the team is directed should the patient's condition change en route. Operating room forms, indicating pre- and postoperative diagnoses and the operation performed, are signed. A postoperative chest X ray is obtained and examined to assess expansion of the lungs and placement of the chest and nasogastric tubes (if inserted). Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. A brief operative note is written for the patient's chart. Daily progress notes of the pre- and postoperative diagnoses, operation performed, findings, blood loss, intraoperative IV fluids administered, complications, and specimens sent to pathology (if any) are documented. Intensive care and medications are reviewed with the staff. The patient's short-term goals are established with the ICU nursing staff. Procedure outcomes, including the procedure performed, any variance from the planned procedure, the general findings, an initial assessment of the degree of procedural success, and expectations for the remainder of the day of

surgery and the longer term, are discussed with the family. The procedure outcome is discussed with the patient's family or caregiver after patient's emergence from anesthesia. A postoperative report is dictated, and the procedure outcome is discussed with the referring physician. Care is coordinated with other physicians. A procedure outcome and expected recovery letter is dictated for the referring physician and/or the insurance company.

Postoperative intensive care: The patient's neurological state is assessed, and emergence from anesthesia is monitored. Sedatives, paralyzing agents, and analgesics are administered as needed. Gross neurologic function, including level of consciousness, behavioral appropriateness, and presence and nature of focal neurological defect if present, is evaluated. The evaluation is repeated until intraoperative neurologic injury is ruled out. The patient's hemodynamic condition, including cardiac rhythm, is assessed. Rate and conduction abnormalities are assessed. A temporary pacemaker is considered, and temporary pacing is initiated as needed. A suitable mode is determined, and the output and sensitivity of the device are adjusted. The assessment of hemodynamic effects is repeated. Arrhythmias are assessed. Atrial extrasystoles or runs are differentiated from ventricular extrasystoles or runs and correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs or ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed. Filling pressures are correlated at baseline, calibration of transducers with zero level at the level of the right heart are confirmed, and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Chest tube bleeding is monitored. The character of the mediastinal drainage (rate, amount, stability of clot) is assessed. The patency of the mediastinal tubes is assessed to ensure that a cardiac tamponade state is avoided. Bleeding quantity and character are correlated with chest X ray, laboratory tests, hemodynamics, urine output, and physical exam. Laboratory results are assessed and correlated with other findings to determine the need for blood and/or blood products, including platelets, cryoprecipitate, and fresh frozen plasma. Other adjunctive pharmacologic therapies are considered for coagulopathy. The need for reexploration is considered if the chest tube output exceeds acceptable limits or if tamponade is present. The respiratory system is assessed. Breath sounds are examined, chest mechanics observed, and mid-line tracheal position is ensured by physical exam. Ventilator settings are assessed; underlying respiratory pattern, baseline airway pressures generated, and minute gas flow are observed. The postoperative chest X ray is reevaluated if necessary. Endotracheal tube placement is confirmed by review of the postoperative chest X ray. Lungs are monitored for infiltrate/atelectasis. Pleural spaces are assessed for fluid collection. Blood gases are assessed, and the ventilator is adjusted as needed. The patient is weaned from the ventilator. Readiness for extubation is assessed. The patient is extubated, and airway and adequacy of ventilation are ensured. Adequacy of urine output is assessed, and postoperative creatinine in light of preoperative renal function is checked. Volume status is assessed, and fluids are administered as needed. The need for a diuretic is determined and, if indicated, the dose is determined, and response is monitored. Urine flow is correlated with blood pressure and compared to preoperative status. Interaction of cardiac output and vasoactive agents with renal function is assessed. Distal extremity perfusion is monitored, and peripheral pulses are assessed and compared to preoperative findings. A comprehensive evaluation is integrated with the patient's history, expected status based on conduct of the operation, and response to critical care interventions. The extent of inflammatory state is assessed, and treatment with antipyretics or steroids is considered as indicated. The patient's chart notes are reviewed with the nursing staff and other staff. Interval plans are discussed with the nursing staff. Parameters for interval adjustments in patient treatment are set, and the interval to the next patient evaluation, if expected goals have been met, is established. Questions from the nursing staff, other staff, and the patient's family are answered. Orders are written. The patient's progress notes are charted.

Postoperative other hospital work—beginning on postoperative day 3 until discharge day: A comprehensive history and physical exam are performed. All wounds are inspected for drainage, underlying hematoma, and inflammation. The patient's chart notes are reviewed with nursing and other staff. Postoperative pain, use of analgesics, and adequacy of response are assessed. Adequacy of respiration, character of breathing, relationship to surgical pain, and intravascular volume status are assessed. Character of pulmonary secretions and the patient's ability to clear his airway are assessed. Vital signs, intake and output, laboratory results, and patient daily weight are reviewed. The chest radiograph is reviewed, and the cardiac monitor is evaluated for rate, rhythm, and presence or absence of arrhythmia. The stored EKG monitoring history is evaluated if indicated. Progress of the system recovery and risk for development of complications are assessed. Ambulation and vigorous pulmonary physiotherapy are encouraged. Postoperative nutritional status, as maintained by both enteral (if necessary) and oral feedings, is carefully assessed and monitored. The chest tubes, if still present are removed when appropriate. Chest X-rays after tube removal and at least one more time before discharge as indicated by patient's condition are obtained and reviewed. The temporary pacemaker wires are removed if present. Questions from the patient, family, and nursing or other staff (verbal and written) are answered. An interval plan of care that includes drug therapy for underlying conditions (e.g., diabetes), surgically induced conditions, actual or anticipated complications (e.g., beta blockers

for atrial fibrillation, antibiotics for prophylaxis or treatment), and preventive care is developed. Insurance staff questions are answered. Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. The postoperative echocardiogram is evaluated and reviewed. The patient's progress is discussed (oral and written) with the referring physician. Care is coordinated with other physicians. Evaluation, patient progress, and the care plan are documented in the medical record.

Discharge day work: A history and physical exam are performed. The final pathology/laboratory/film reports are checked and discussed with the patient's the family or caregiver. Wounds and patient progress are checked. Dietary management, activities permitted, bathing, handling of wound, return appointment to office, and similar items are carefully explained to the patient's family. Expectations for recovery are outlined and adjusted to specific underlying cardiac state, associated chronic diseases, operative findings, and character of postoperative recovery. Potential complications, how to recognize them, and what to do if recovery is not as anticipated are described. Care is coordinated with other physicians. The patient's chart notes are reviewed with nursing and other staff. Post discharge wound care and activity limitations are reviewed with the family. Questions from the patient, family, and nursing and other staff are answered. Insurance staff questions are answered. Orders for post discharge laboratory tests, films, and medications are written. The patient's discharge notes are charted, and prescriptions and discharge instructions are written. The nature, purpose, and expected duration of use of new medications are explained. The importance of secondary prevention of cardiac disease through risk factor reduction is explained to the family. Specific instructions on the need to notify other treating physicians and dentists of the presence of a prosthetic aortic graft and the need for prophylactic periprocedural antibiotics are given. Primary care physicians involved with the patients long-term care should be alerted to the need for frequent assessment of the patient's aortic valve function and the possibility of sudden or gradual aortic insufficiency. The patient's home medications and homeopathic agents are explained to ensure that additional agents are compatible or will not be used. A discharge summary is dictated. Communication is made with patient's primary care physician(s).

Postoperative office work: After discharge from the hospital, a detailed history and physical exam are performed. Medications are reviewed, and compliance is determined. Interval encounters are reviewed with other care providers. Wounds and patient progress are checked. Sutures/drains are removed. Post discharge laboratory tests/films are reviewed, specifically echo studies to assess valve function and compare to preoperative studies. Medications are reviewed and orders for medications are written. Questions from the patient and family are answered. Insurance staff questions are answered. The patient's progress is discussed (verbal and written) with the referring physician. The patient's care is coordinated with other physicians. Progress is discussed with the patient and family. A patient progress note is dictated for the medical chart, and letters are sent to referring physicians.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

OVERALL RATIONALE

Tab 6 includes 6 codes that represent grafting procedures on the ascending aorta and the aortic arch. A new add-on code +33866 *Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion* (List separately in addition to code for primary procedure) that was developed to account for the additional work that

is involved when the ascending aortic disease extends into the proximal portion of the transverse aortic arch was approved by the CPT Editorial Panel and surveyed for the January 2018 RUC meeting. The Expert Panel decided not to survey the ascending aortic replacement codes 33860, 33863 or 33864 for the January 2018 RUC meeting because they felt that the work involved in the aortic hemiarch replacement procedure represented an advancement in surgical technique representing new work that is not reflected in the work that is currently accounted for in the ascending aortic procedures. The specialties indicated that the aortic hemiarch replacement is more closely related to the work involved with the transverse aortic arch replacement code 33870 than to the work of the ascending aortic codes. At the January 2018 RUC meeting, the RUC determined that the specialties had to re-survey the family of aortic repair procedures including codes 33860, 33863, 33864, 33866, 33870 for the April 2018 RUC meeting. As the specialty reviewed the codes with consideration of re-surveying them, they determined that they should be submitted to the CPT Editorial Panel for the following revisions: 1) To develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies. The specialties felt that there is a sufficient difference in the work associated with these procedures and now there is enough volume to allow for more accurate capture of the work and outcomes data for these distinct patient populations, which was not the case when the code was first developed. 2) Revise the descriptor for the transverse arch code, 33870 to further clarify the difference in work between that code and the new add-on code 33866. 3) Revise the guidelines to provide additional instructions on the appropriate use of these codes. The CCA was submitted to the CPT Editorial Panel for consideration at the May 2018 CPT meeting. The CPT Editorial Panel approved the deletion of two existing codes, 33860 and 33870. Code 33860 will be replaced with two new codes, 33858 and 33859 for ascending aortic aneurysm repair for dissection and for other aortic disease respectively. Due to the extensive changes of the descriptor for code 33870 to further differentiate that code from the aortic hemiarch code 33866, the Panel decided to delete code 33870 and renumber it to the new code 33871. As a result, 4 ascending aortic grafting codes 33858, 33859, 33863 and 33864 and two aortic arch grafting codes 33866 and 33871 were surveyed for the October 2018 meeting.

The recommended values for these procedures result in an overall budget savings for Medicare as represented in the table below:

CPT Source	Deleted	Source 2017 Utilization	New/ Revised Code	New/ Revised Code Utilization (reference 2017)	Percent	Source RVU	STS Rec RVU	New/ Revised Total RVUs	Total Source RVUs	Difference New/Rev - Source
33860	D	3800	33858	1140	0.3	59.46	65.00	74100	67784	6316
33860	D	3800	33859	2660	0.7	59.46	50.00	133000	158164	-25164
33863		1875	33863	1875	1	58.79	59.00	110625	110231	394
33864		282	33864	282	1	60.08	63.00	17766	16943	823
33870	D	999	33871	300	0.3	46.06	65.75	19725	13818	5907
33870	D	999	33866	699	0.7	46.06	19.74	13798	32196	-18398
Totals								369014	399136	-30122

Code 33860 which is split into two new codes 33858 and 33859 results in a recommended increase in value for code 33858 (recommended RVW 65.00, current RVW 59.46) and a decrease in value for the more commonly performed code 33859 (recommended RVW 50.00, current RVW 59.46) resulting in an overall budget savings for that code. Code 33870 is also split into two new codes 33866 and 33871, which results in a recommended increase in value for code 33871 (recommended RVW 65.75, current RVW 46.06) and a decrease in value for the more commonly performed code 33866 (recommended RVW 19.74, current RVW 46.06) resulting in an overall budget savings for that code. The RVW recommendations for the other two codes, 33863 and 33864 result in slight increases for each code, but these increases are offset by the savings from the changes to the other codes. Additional information regarding the recommended revisions are included for each code.

Rationale 33864

Code 33864 is a code for ascending aortic disease that extends into the aortic root. The current Medicare volume for 33864 is 282 and has been relatively steady over the years per the RUC database. The specialties do not expect any changes to the volume. Ascending aorta grafting with valve-sparing aortic root remodeling and coronary reconstruction is a procedure that requires a median sternotomy and cardiopulmonary bypass with cardiac arrest. The ascending aorta involved in the aneurysm is transected and replaced with a graft. The right and left coronary arteries are dissected with cuffs. The proximal aortic root is excised. The aortic annulus is remodeled by seating the graft down and placing sutures beneath the native aortic valve from the left ventricle to the base of the aortic root. The right and left coronary buttons are reimplanted into the graft.

Pre-Time Package 4

Pre-Time Changes: The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient. The survey only supported 15 minutes for scrub dress and wait time, so the Expert Panel is recommending a 5-minute reduction for a total of 15 minutes for the scrub dress and wait time for the procedure per the survey.

Evaluation (total = 60 minutes): For the evaluation, the Expert Panel is recommending a 20-minute increase in time over the package for a total evaluation time of 60 minutes. This is supported by the survey data with 60 minutes of pre-service evaluation. The total evaluation time accounts for the review of the patient, by the surgeon and the collaborative efforts that go into each case. The additional evaluation time of 20 minutes accounts for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, coronary angiogram, echocardiogram, cath report, CT scan and echo is required to identify the extent the aortic disease, the feasibility of a valve-sparing operation and the size of the graft. The trans-esophageal echocardiogram is reviewed with the anesthesiologist and/or cardiologist with special attention to the size and function of the native aortic valve as well as an assessment of the patient's ventricular function. The Expert Panel felt that adding 20 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the pre-service work involved with the procedure.

Positioning (total = 15 minutes): The Expert Panel is recommending a 12-minute increase in time over the package for a total positioning time of 15 minutes, which is common for cardiac procedures and there are numerous examples in the RUC database supporting this time. The survey supported 15-minutes for positioning of the patient. The additional 12-minutes above the package time can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation.

Scrub, Dress and Wait (total = 15 minutes): There is a 5-minute decrease from the package time, which represents the scrub dress and wait time from the survey.

Post-time Package 9b

Total = 60 minutes: The expert panel selected post-time package 9B for a general anesthesia or complex regional block/complex procedure. The Expert Panel is recommending a 27-minute increase in time over the package for a total immediate post time of 60 minutes and there are numerous examples in the RUC database and the cardiothoracic surgery codes supporting this time. The survey supported 60 minutes of immediate post time. The additional 27-minutes above the package time can be attributed to additional time for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished.

Critical Care Visits: 95% of the survey respondents replied that the procedure was performed in the hospital, and that 100% of the patients stayed overnight for more than 24 hours. 65% of the respondents indicated that they provided an E&M Visit on the same day of surgery.

The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient once the patient arrives in the ICU on the day of the procedure and an additional 40 minutes of critical care the day after the procedure for a total of two critical care visits for the procedure. The critical care visit covers that time that the

physician spends with the patient directly related to the procedure providing critical care services. The survey supported two critical care visits for the procedure and the Expert Panel agreed.

Intensity and complexity of the procedure: 40 surveys were completed by a random pool of 800 cardiac surgeons which consisted of 650 self-identified adult cardiac surgeons and 150 self-identified congenital cardiac surgeons. 9 respondents selected code 33412, aortic valve replacement with transventricular aortic annulus enlargement as a reference code making it the 1st key reference service (KRS). That code has a lower value, the same intraservice time and a longer total time than the survey code. The survey respondents ranged in their intensity/complexity comparison saying that the survey code was identical or somewhat more complex than 33412 for all of the intensity/complexity measures. 7 respondents selected code 33877, thoracoabdominal aneurysm repair as a reference code making it the 2nd KRS. This code has a higher value with a longer intraservice and total service time. The respondents indicated that the survey code was more or much more intense/complex than 33877 for all of the intensity/complexity measures.

Recommended RVW: The survey data for code 33864 (ascending aortic graft with valve sparing root remodeling and coronary reconstruction) shows that the median intra-operative time is 300 minutes. The current intra-service time for this procedure is 300 minutes. The STS Database intra-service time shows a mean time of 308 minutes and a median time of 320 minutes. The median intra-service time from the survey at the 300 minutes is equivalent to the intra service time for the current code. The surveys also supported two critical care visits during the post-operative period which is the same number included in the current code. The hospital LOS from the survey is the same in the current code and the total time from the survey is slightly less at 838 minutes than that for the current code at 853 minutes, which is due to changes in the pre-service time. The Recommended RVW and the total time for the survey code is higher than the RVW for the 1st KRS. The intraservice time of the survey code is the same as the intra-service time of the 1st KRS and lower than that of the 2nd KRS. The intensity (0.140) for the survey code is higher than the intensity for the 1st (0.122) and 2nd (0.114) KRS codes. The Expert panel felt that this is appropriate and is supported by the intensity and complexity measures.

The Expert Panel is recommending the 25th percentile work RVW of 63.00, with a median intra-service time of 300 minutes, and total time of 838 minutes. Pre-time package 4 was selected with adjustments made to the evaluation and positioning time for a total pre-service time of 90 minutes. Immediate post-service time package 9b with additional time added for a total time of 60 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
-

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33864

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 535

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33864 is 282. The STS database shows that 90% of the patients that undergo a valve-sparing root remodeling are non-Medicare patients.

Specialty cardiothoracic surgery Frequency 313 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 282

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33864 is 282. The STS database shows that 90% of the patients that undergo a valve-sparing root remodeling are non-Medicare patients. The specialties do not expect any changes to the Medicare volume.

Specialty cardiothoracic surgery Frequency 282 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Description of Pre-Service Work:

Description of Intra-Service Work: Circumferentially dissect around the base of both the innominate and left common carotid arteries and place tapes around both arteries. Initiate hypothermia, once target temperature is obtained, discontinue cardiopulmonary bypass and tighten the tapes around the innominate and common carotid arteries. Hypothermic circulatory arrest is initiated and cerebral perfusion if performed. Remove the cross-clamp and transect the aorta. Inspect the inside of the aorta and determine the extent of the intimal tear. Resect the entirety of the intimal tear. Prepare the distal end of the cut aorta for anastomosis employ additional reinforcing techniques if necessary. Perform anastomosis of the open distal aortic anastomosis to the cut end of the aorta utilizing synthetic graft with a running suture at the origin of the transverse aortic arch superiorly. Inferiorly, the suture line extends obliquely across the lesser curvature of the transverse arch of the aorta. After ensuring hemostasis of this distal anastomosis, a cross-clamp is placed on the aortic graft and full cardiopulmonary bypass is reinstituted. An extended period of re-warming is required.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

OVERALL RATIONALE

Tab 6 includes 6 codes that represent grafting procedures on the ascending aorta and the aortic arch. A new add-on code +33866 *Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion*

(List separately in addition to code for primary procedure) that was developed to account for the additional work that is involved when the ascending aortic disease extends into the proximal portion of the transverse aortic arch was approved by the CPT Editorial Panel and surveyed for the January 2018 RUC meeting. The Expert Panel decided not to survey the ascending aortic replacement codes 33860, 33863 or 33864 for the January 2018 RUC meeting because they felt that the work involved in the aortic hemiarch replacement procedure represented an advancement in surgical technique representing new work that is not reflected in the work that is currently accounted for in the ascending aortic procedures. The specialties indicated that the aortic hemiarch replacement is more closely related to the work involved with the transverse aortic arch replacement code 33870 than to the work of the ascending aortic codes. At the January 2018 RUC meeting, the RUC determined that the specialties had to re-survey the family of aortic repair procedures including codes 33860, 33863, 33864, 33866, 33870 for the April 2018 RUC meeting. As the specialty reviewed the codes with consideration of re-surveying them, they determined that they should be submitted to the CPT Editorial Panel for the following revisions: 1) To develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies. The specialties felt that there is a sufficient difference in the work associated with these procedures and now there is enough volume to allow for more accurate capture of the work and outcomes data for these distinct patient populations, which was not the case when the code was first developed. 2) Revise the descriptor for the transverse arch code, 33870 to further clarify the difference in work between that code and the new add-on code 33866. 3) Revise the guidelines to provide additional instructions on the appropriate use of these codes. The CCA was submitted to the CPT Editorial Panel for consideration at the May 2018 CPT meeting. The CPT Editorial Panel approved the deletion of two existing codes, 33860 and 33870. Code 33860 will be replaced with two new codes, 33858 and 33859 for ascending aortic aneurysm repair for dissection and for other aortic disease respectively. Due to the extensive changes of the descriptor for code 33870 to further differentiate that code from the aortic hemiarch code 33866, the Panel decided to delete code 33870 and renumber it to the new code 33871. As a result, 4 ascending aortic grafting codes 33858, 33859, 33863 and 33864 and two aortic arch grafting codes 33866 and 33871 were surveyed for the October 2018 meeting.

The recommended values for these procedures result in an overall budget savings for Medicare as represented in the table below:

CPT Source	Deleted	Source 2017 Utilization	New/ Revised Code	New/ Revised Code Utilization (reference 2017)	Percent	Source RVU	STS Rec RVU	New/ Revised Total RVUs	Total Source RVUs	Difference New/Rev - Source
33860	D	3800	33858	1140	0.3	59.46	65.00	74100	67784	6316
33860	D	3800	33859	2660	0.7	59.46	50.00	133000	158164	-25164
33863		1875	33863	1875	1	58.79	59.00	110625	110231	394
33864		282	33864	282	1	60.08	63.00	17766	16943	823
33870	D	999	33871	300	0.3	46.06	65.75	19725	13818	5907
33870	D	999	33866	699	0.7	46.06	19.74	13798	32196	-18398
Totals								369014	399136	-30122

Code 33860 which is split into two new codes 33858 and 33859 results in a recommended increase in value for code 33858 (recommended RVW 65.00, current RVW 59.46) and a decrease in value for the more commonly performed code 33859 (recommended RVW 50.00, current RVW 59.46) resulting in an overall budget savings for that code. Code 33870 is also split into two new codes 33866 and 33871, which results in a recommended increase in value for code 33871 (recommended RVW 65.75, current RVW 46.06) and a decrease in value for the more commonly performed code 33866 (recommended RVW 19.74, current RVW 46.06) resulting in an overall budget savings for that code. The RVW recommendations for the other two codes, 33863 and 33864 result in slight increases for each code, but these increases are offset by the savings from the changes to the other codes. Additional information regarding the recommended revisions are included for each code.

Rationale 33866

Code 33866 is a new code that accounts for the additional work that is involved when the ascending aortic disease extends into the proximal portion of the transverse aortic arch. This procedure has been predominantly reported with code 33870 over the past few years. The current Medicare volume for 33870 is 999. The RUC database shows an increase in volume of this code starting in 2014, which is around the time that hemiarch grafting started to become more prevalent. An increased understanding of isolated cerebral perfusion/cooling and its protective effects has made it safer to perform procedures with total circulatory arrest and deep hypothermia. Due to the increased familiarity, safety and knowledge surrounding circulatory arrest and cerebral perfusion procedures, the hemiarch procedure is now safer to perform and better for the patient resulting in reduced risk to the patient by avoiding subsequent reoperation that that might be required without the aortic hemiarch replacement or the increased risk associated with a total transverse aortic arch replacement. It is estimated that 70% of the transverse aortic arch repairs will be performed using this hemiarch code 33866, resulting in an estimated Medicare volume of 699 procedures per year. Aortic hemiarch grafting is a procedure that is performed in addition to an ascending aortic repair (33858, 33859, 33863 or 33864) when the ascending aortic disease extends into the proximal portion of the transverse aortic arch. In these cases, the surgical procedure includes isolation of the arch vessels to establish antegrade or retrograde cerebral protection/perfusion, cooling the patient for circulatory arrest, rewarming the patient and obtaining hemostasis at the end of the procedure. The graft is anastomosed under one or more of the arch vessels during the circulatory arrest or perfusion portion of the procedure.

The aortic hemiarch code was surveyed for the January 2018 RUC meeting. That survey had 61 respondents with a 25th percentile work RVW of 19.74 and a median intra-service time of 165 minutes, which were recommended to the RUC.

Per the direction of the RUC, the aortic hemiarch code was resurveyed with the ascending aortic and transverse aortic arch grafting codes for this meeting.

In the initial submission, there were only 28 respondents to the second survey for code 33866, which is under the RUC required minimum sample size for codes with less than 100,000 Medicare claims. The RUC staff contacted the specialties and asked that they re-open the survey to try and get the minimal sample size. The specialties were able to get 4 additional responses for a total of 32 responses which meets the minimal sample size. This is compared to 61 respondents from the survey conducted for the January 2018 RUC meeting.

Intensity and complexity of the procedure: 32 surveys were completed by a random pool of 800 cardiac surgeons which consisted of 650 self-identified adult cardiac surgeons and 150 self-identified congenital cardiac surgeons. 12 respondents selected code 33369, cardiopulmonary bypass support with central cannulation for transcatheter aortic valve replacement (TAVR) as a reference code making it the 1st key reference service (KRS). That code has a slightly lower value and longer intraservice and total times than the survey code. The respondents indicated that the survey code is more or much more intense/complex than 33369 for all of the intensity/complexity measures. 6 respondents selected code 33523, arterial and venous CABG with 6 or more venous grafts as a reference code making it the 2nd KRS. This code has a lower value with longer intraservice and total times. The respondents indicated that the survey code is somewhat or much more intense/complex than 33523 for all of the intensity/complexity measures.

From the 1st survey, 61 survey respondents indicated that the survey code was significantly more intense than both KRS codes. 36 respondents selected code 33369 as the 1st KRS and 11 respondents selected code 33523 as the 2nd KRS. For both of the KRS codes over 90% of the survey respondents indicated that the survey code was more or much more complex than both KRS codes for all of the intensity/complexity factors.

Recommended RVW: The October 2018 survey data for code 33866 (aortic hemiarch graft) shows a median intra-service time of 123 minutes and a 25th percentile RVW of 17.75 and a median RVW of 21.00. The January 2018 survey had a median intra-service time of 165 minutes and a 25th percentile RVW of 19.74 and a median RVW of 22.00. The Expert Panel feels that that the data from the 1st survey should be used to value code 33866. Even though 32 responses were received for the 2nd survey after it was re-opened and the RUC's minimum sample survey size was met. The 1st survey had 61 responses which is double the minimum sample size and the specialties feel that data is more statistically valid. The recommended 25th percentile RVW of 19.74 from the 1st survey is slightly higher than the RVWs for both KRS codes and the total time for the survey code falls between the total times of the KRS codes. The

intraservice time of the survey code is longer than the intra-service time of both the KRS codes. The intensity (0.120) for the survey code is higher than the intensity for the 1st (0.119) and 2nd (0.112) KRS codes. The Expert panel felt that this is appropriate and is supported by the intensity and complexity measures.

The Expert Panel is recommending the 25th percentile work RVW of 19.74, with the median intra-service time of 165 minutes, and total time of 165 minutes from the 1st survey.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33870, 33999, modifier -22 or it was not separately reported

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1049

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33870 is 999. The STS database shows that 60% of patients that receive a transverse aortic arch graft are non-Medicare patients.

It is estimated that 70% of aortic arch procedures for 33870 are for aortic hemiarch grafts. This results in the following:

For code 33X01, it is estimated that 1049 procedures per year will be provided nationally and 699 procedures per year will be provided to Medicare patients.

Specialty cardiothoracic surgery Frequency 1049 Percentage 100.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 699
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33870 is 999. The STS database shows that 60% of patients that receive a transverse aortic arch graft are non-Medicare patients.

It is estimated that 70% of aortic arch procedures for 33870 are for aortic hemiarch grafts. This results in the following:

For code 33X01, it is estimated that 1049 procedures per year will be provided nationally and 699 procedures per year will be provided to Medicare patients.

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:

Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33369

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 33871 Tracking Number D6

Original Specialty Recommended RVU: **65.75**Presented Recommended RVU: **65.75**Global Period: 090 Current Work RVU: **46.06**RUC Recommended RVU: **65.75**

CPT Descriptor: Transverse aortic arch graft, with cardiopulmonary bypass, with profound hypothermia, total circulatory arrest and isolated cerebral perfusion with reimplantation of arch vessel(s) (eg, island pedicle or individual arch vessel reimplantation)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Upon routine chest x-ray, a 60-year-old male is found to have an enlarged aortic arch with an aortic aneurysm and is referred for additional workup. Echocardiogram, computed tomography (CT), magnetic resonance imaging (MRI), and angiogram are obtained, and although the patient is asymptomatic, the findings show that the aneurysm involves the entire aortic arch. The patient is scheduled for a transverse aortic arch graft placement.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 94% , In the ASC 0%, In the office 6%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 61%

Description of Pre-Service Work: A complete or interval history and physical examination (comprehensive) are performed.

Preoperative orders are written, and the work-up and notes from referring and primary physicians are reviewed if available. Preoperative imaging studies including chest x-rays, CT Scan, MRI, Aortogram and TEE are reviewed. Preoperative laboratory studies (CBC, electrolytes, renal and liver function, coagulation) are reviewed. Obtain cardiology assessment and pulmonary assessment as indicated. Indications, surgical procedure, expected recovery, and expected outcomes, including potential complications, are reviewed with the family. The family's questions are answered, and informed consent is obtained. The OR start time is confirmed and the patient and family are notified. Availability of the surgical assistant is confirmed. The patient is identified, the surgical site is marked per hospital policy, and any questions from the family are answered. Availability of blood and/or cross match and any special instruments or medical devices is ensured. Review planned incision and procedure. Review the length and type of anesthesia with anesthesiologist. Ensure anesthesiology and perfusionist are prepared for circulatory arrest. Plan invasive monitoring including use of arterial line (right radial only) and pulmonary artery catheter. Review trans-esophageal echocardiogram with anesthesiologist and/or cardiologist. The surgeon scrubs and puts on a gown and gloves. Prep and drape the skin of the chest, abdomen, and legs from the neck to the ankles including both groin areas. Ensure that the patient is properly positioned for the procedure which may include extending the customary median sternotomy incision to include a left infra-clavicular incision/approach.

Description of Intra-Service Work: Perform standard median sternotomy skin incision, divide the sternum in the midline with a saw. A determination of which artery will be used for arterial access while on cardiopulmonary bypass is made following median sternotomy and exposure of the heart and great vessels. This may require exposure and use of the innominate artery, the right subclavian artery, the brachial artery, or even the femoral artery. If necessary, an eight-millimeter Dacron graft is anastomosed to a peripheral artery in order to facilitate cardiopulmonary bypass (reported separately). A venous cannula is inserted. The entire transverse arch including the innominate artery, the left carotid artery and the left subclavian artery are dissected free and isolated with vascular tapes. The recurrent laryngeal nerve, as it crosses

under the distal aortic arch, must be identified and protected. The patient is heparinized systemically and the level of heparinization is determined. Establish cardiopulmonary bypass, systemic cooling is initiated to establish deep hypothermia. Retrograde and/or antegrade cerebral perfusion is established with appropriate cannulae for delivery of cardioplegia when appropriate. An aortic cross clamp is applied to the ascending aorta and the aorta is transected above the cross clamp. An appropriately sized Dacron tube graft is anastomosed to the cut end of the ascending aorta. Once the patient is cooled to the desired temperature, the cardiopulmonary bypass machine circuit is turned off and circulation to the entire body is interrupted.

The arch vessels are transected at the base and the transverse arch is opened and resected. An appropriately sized tubular Dacron arch graft is anastomosed to the cut end of the proximal descending aorta. The remaining arch vessels (innominate artery, left carotid artery and left subclavian artery) may be individually anastomosed to the arch tube graft or the three arch vessels can be left attached to a remnant of the resected arch (configured as an island) which is then anastomosed to the newly constructed arch tube graft. A prolonged period of systemic warming is started as the anastomoses are being completed. This includes the final graft-to-graft (ascending aortic graft and transverse arch graft) anastomosis.

As the patient approaches normothermia and bleeding has been sufficiently controlled, the patient is placed in Trendelenburg and cardiopulmonary bypass is re-established slowly in order to evacuate air from the ascending aortic and transverse arch grafts. The aortic root is vented until LV ejection has been present for 5-10 minutes. Assessment of residual air (if any) in the left side of heart as well as assessing myocardial contractility is accomplished using transesophageal echocardiogram (separately reported). The heart is resuscitated by allowing it to beat while unloaded on cardiopulmonary bypass. Establishing meticulous hemostasis is critical since the patients are most often profoundly coagulopathic following profound hypothermia and total circulatory arrest. Temporary pacing wires are placed, and electrical pacing is initiated if necessary. The patient is carefully weaned from cardiopulmonary bypass. Arterial, venous and cardioplegia cannulas are removed and cannulation sites are secured/repared. Chest tubes are placed, and the sternum is re-approximated. The sternal wound is closed.

Description of Post-Service Work: Postoperative same day work through admission to intensive care: An operating room debriefing is performed. Sterile dressings are applied to the incision. Drapes are removed, with close attention to pacing wires (if any), tubes, and lines to ensure that none are dislodged or disconnected. This attention continues as the patient is moved to the intensive care unit (ICU) bed for transfer. In a coordinated team manner, the patient's overall condition is monitored as the anesthesia team converts the monitoring equipment (arterial blood pressure, pulmonary artery pressures, electrocardiogram [EKG]) to a portable monitor. The chest drainage system is observed periodically to assess interval bleeding, to ascertain that negative pressure is not lost, and to ensure that the tubes are not obstructed. The OR transporting team and the ICU receiving team confirm initiation of transfer. The patient is accompanied to the ICU, and the team is directed should the patient's condition change en route. Operating room forms, indicating pre- and postoperative diagnoses and the operation performed, are signed. A postoperative chest X ray is obtained and examined to assess expansion of the lungs and placement of the chest and nasogastric tubes (if inserted). Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. A brief operative note is written for the patient's chart. Daily progress notes of the pre- and postoperative diagnoses, operation performed, findings, blood loss, intraoperative IV fluids administered, complications, and specimens sent to pathology (if any) are documented. Intensive care and medications are reviewed with the staff. The patient's short-term goals are established with the ICU nursing staff. Procedure outcomes, including the procedure performed, any variance from the planned procedure, the general findings, an initial assessment of the degree of procedural success, and expectations for the remainder of the day of surgery and the longer term, are discussed with the family. The procedure outcome is discussed with the patient's family or caregiver after patient's emergence from anesthesia. A postoperative report is dictated, and the procedure outcome is discussed with the referring physician. Care is coordinated with other physicians. A procedure outcome and expected recovery letter is dictated for the referring physician and/or the insurance company.

Postoperative intensive care: The patient's neurological state is assessed, and emergence from anesthesia is monitored. Sedatives, paralyzing agents, and analgesics are administered as needed. Gross neurologic function, including level of consciousness, behavioral appropriateness, and presence and nature of focal neurological defect if present, is evaluated. The evaluation is repeated until intraoperative neurologic injury is ruled out. The patient's hemodynamic condition, including cardiac rhythm, is assessed. Rate and conduction abnormalities are assessed. Temporary pacing is initiated as needed. A suitable mode is determined, and the output and sensitivity of the device are adjusted. The assessment of hemodynamic effects is repeated. Arrhythmias are assessed. Atrial extrasystoles or runs are differentiated from ventricular extrasystoles or runs and correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed.

Filling pressures are correlated at baseline, calibration of transducers with zero level at the level of the right heart are confirmed, and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Chest tube bleeding is monitored. The character of the mediastinal drainage (rate, amount, tenacity, stability of clot) is assessed. The patency of the mediastinal tubes is assessed to ensure that a cardiac tamponade state is avoided. Bleeding quantity and character are correlated with chest X ray, laboratory tests, hemodynamics, urine output, and physical exam. Laboratory results are assessed and correlated with other findings to determine the need for blood and/or blood products, including platelets, cryoprecipitate, and fresh frozen plasma. Other adjunctive pharmacologic therapies are considered for coagulopathy. The need for re-exploration is considered if the chest tube output exceeds acceptable limits or if tamponade is present. The respiratory system is assessed. Breath sounds are examined, chest mechanics observed, and mid-line tracheal position is ensured by physical exam. Ventilator settings are assessed; underlying respiratory pattern, baseline airway pressures generated, and minute gas flow are observed. The postoperative chest X ray is reevaluated if necessary. Endotracheal tube placement is confirmed by review of the postoperative chest X ray. Lungs are monitored for infiltrate/atelectasis. Pleural spaces are assessed for fluid collection. Blood gases are assessed, and the ventilator is adjusted as needed. The patient is weaned from the ventilator. Readiness for extubation is assessed. The patient is extubated, and airway and adequacy of ventilation are ensured. Particular attention is paid to assessing possible post-extubation stridor secondary to left vocal cord dysfunction. Adequacy of urine output is assessed, and postoperative creatinine in light of preoperative renal function is checked. Volume status is assessed, and fluids are administered as needed. The need for a diuretic is determined and, if indicated, the dose is determined, and response is monitored. Urine flow is correlated with blood pressure and compared to preoperative status. Interaction of cardiac output and vasoactive agents with renal function is assessed. Distal extremity perfusion is monitored, and peripheral pulses are assessed and compared to preoperative findings. A comprehensive evaluation is integrated with the patient's history, expected status based on conduct of the operation, and response to critical care interventions. The extent of inflammatory state is assessed, and treatment with antipyretics or steroids is considered as indicated. The patient's chart notes are reviewed with the nursing staff and other staff. Interval plans are discussed with the nursing staff. Parameters for interval adjustments in patient treatment are set, and the interval to the next patient evaluation, if expected goals have been met, is established. Questions from the nursing staff, other staff, and the patient's family are answered. Orders are written. The patient's progress notes are charted.

Postoperative other hospital work—beginning on postoperative day 3 until discharge day: A comprehensive history and physical exam are performed. All wounds are inspected for drainage, underlying hematoma, and inflammation. The patient's chart notes are reviewed with nursing and other staff. Postoperative pain, use of analgesics, and adequacy of response are assessed. Adequacy of respiration, character of breathing, relationship to surgical pain, and intravascular volume status are assessed. Character of pulmonary secretions and the patient's ability to clear his airway are assessed. Vital signs, intake and output, laboratory results, and patient daily weight are reviewed. The chest radiograph is reviewed, and the cardiac monitor is evaluated for rate, rhythm, and presence or absence of arrhythmia. The stored EKG monitoring history is evaluated if indicated. Progress of the system recovery and risk for development of complications are assessed. Ambulation and vigorous pulmonary physiotherapy are encouraged. Postoperative nutritional status, as maintained by both enteral (if necessary) and oral feedings, is carefully assessed and monitored. Drainage from chest tubes (if still present) is assessed daily and removed when appropriate. Chest X-rays after tube removal and at least one more time before discharge as indicated by patient's condition are obtained and reviewed. The temporary pacemaker wires are removed if present. Questions from the patient, family, and nursing or other staff (verbal and written) are answered. An interval plan of care that includes drug therapy for underlying conditions (eg, diabetes), surgically induced conditions, actual or anticipated complications (eg, beta blockers for atrial fibrillation, antibiotics for prophylaxis or treatment), and preventive care is developed. Insurance staff questions are answered. Orders for postoperative laboratory tests, films, medications, diet, and patient activity are written. The postoperative echocardiogram is evaluated and reviewed. The patient's progress is discussed (oral and written) with the referring physician. Care is coordinated with other physicians. Evaluation, patient progress, and the care plan are documented in the medical record.

Discharge day work: A history and physical exam are performed. The final pathology/laboratory/film reports are checked and discussed with the patient's family or caregiver. Wounds and patient progress are checked. Dietary management, activities permitted, bathing, handling of wound, return appointment to office, and similar items are carefully explained to the patient's family. Expectations for recovery are outlined and adjusted to specific underlying cardiac state, associated chronic diseases, operative findings, and character of postoperative recovery. Potential complications, how to recognize them, and what to do if recovery is not as anticipated are described. Care is coordinated with other physicians. The patient's chart notes are reviewed with nursing and other staff. Post discharge wound care and activity limitations are reviewed with the family. Questions from the patient, family, and nursing and other staff are answered. Insurance staff questions are answered. Orders for post discharge laboratory tests, films, and medications are written. The patient's

discharge notes are charted, and prescriptions and discharge instructions are written. The nature, purpose, and expected duration of use of new medications are explained. The importance of secondary prevention of cardiac disease through risk factor reduction is explained to the family. Specific instructions on the need to notify other treating physicians and dentists of the presence of a Dacron, prosthetic graft and the need for prophylactic periprocedural antibiotics are given. The patient's home medications and homeopathic agents are explained to ensure that additional agents are compatible or will not be used. A discharge summary is dictated. Communication is made with patient's primary care physician(s). Special emphasis is made on communicating with primary care physician(s) the importance of continued evaluation the patient's neurologic function and adequacy of perfusion of the left and right upper extremities after the surgical re-implantation of the patient's innominate, left carotid and left subclavian arteries.

Postoperative office work: After discharge from the hospital, a detailed history and physical exam are performed. Medications are reviewed, and compliance is determined. Interval encounters are reviewed with other care providers. Wounds and patient progress are checked. Sutures/drains are removed. Post discharge laboratory tests/films are reviewed. Medications are reviewed and orders for medications are written. Questions from the patient and family are answered. Insurance staff questions are answered. The patient's progress is discussed (verbal and written) with the referring physician. The patient's care is coordinated with other physicians. Progress is discussed with the patient and family. A patient progress note is dictated for the medical chart, and letters are sent to referring physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)		10/2018				
Presenter(s):	Jim Levett, MD; Kirk Kanter, MD; Joseph Turek, MD; Jacob Schroder, MD					
Specialty Society(ies):	STS, AATS					
CPT Code:	33871					
Sample Size:	800	Resp N:	39	Response: 4.8 %

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

OVERALL RATIONALE

Tab 6 includes 6 codes that represent grafting procedures on the ascending aorta and the aortic arch. A new add-on code +33X01 Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion

(List separately in addition to code for primary procedure) that was developed to account for the additional work that is involved when the ascending aortic disease extends into the proximal portion of the transverse aortic arch was approved by the CPT Editorial Panel and surveyed for the January 2018 RUC meeting. The Expert Panel decided not to survey the ascending aortic replacement codes 33860, 33863 or 33864 for the January 2018 RUC meeting because they felt that the work involved in the aortic hemiarch replacement procedure represented an advancement in surgical technique representing new work that is not reflected in the work that is currently accounted for in the ascending aortic procedures. The specialties indicated that the aortic hemiarch replacement is more closely related to the work involved with the transverse aortic arch replacement code 33870 than to the work of the ascending aortic codes. At the January 2018 RUC meeting, the RUC determined that the specialties had to re-survey the family of aortic repair procedures including codes 33860, 33863, 33864, 33X01, 33870 for the April 2018 RUC meeting. As the specialty reviewed the codes with consideration of re-surveying them, they determined that they should be submitted to the CPT Editorial Panel for the following revisions: 1) To develop distinct codes for ascending aortic repair for dissection and ascending aortic repair for other ascending aortic disease such as aneurysms and congenital anomalies. The specialties felt that there is a sufficient difference in the work associated with these procedures and now there is enough volume to allow for more accurate capture of the work and outcomes data for these distinct patient populations, which was not the case when the code was first developed. 2) Revise the descriptor for the transverse arch code, 33870 to further clarify the difference in work between that code and the new add-on code 33X01. 3) Revise the guidelines to provide additional instructions on the appropriate use of these codes. The CCA was submitted to the CPT Editorial Panel for consideration at the May 2018 CPT meeting. The CPT Editorial Panel approved the deletion of two existing codes, 33860 and 33870. Code 33860 will be replaced with two new codes, 33858 and 33859 for ascending aortic aneurysm repair for dissection and for other aortic disease respectively. Due to the extensive changes of the descriptor for code 33870 to further differentiate that code from the aortic hemiarch code 33X01, the Panel decided to delete code 33870 and renumber it to the new code 33871. As a result, 4 ascending aortic grafting codes 33858, 33859, 33863 and 33864 and two aortic arch grafting codes 33X01 and 33871 were surveyed for the October 2018 meeting.

The recommended values for these procedures result in an overall budget savings for Medicare as represented in the table below:

CPT Source	Deleted	Source 2017 Utilization	New/ Revised Code	New/ Revised Code Utilization (reference 2017)	Percent	Source RVU	STS Rec RVU	New/ Revised Total RVUs	Total Source RVUs	Difference New/Rev - Source
33860	D	3800	33858	1140	0.3	59.46	65.00	74100	67784	6316
33860	D	3800	33859	2660	0.7	59.46	50.00	133000	158164	-25164
33863		1875	33863	1875	1	58.79	59.00	110625	110231	394
33864		282	33864	282	1	60.08	63.00	17766	16943	823
33870	D	999	33871	300	0.3	46.06	65.75	19725	13818	5907
33870	D	999	33X01	699	0.7	46.06	19.74	13798	32196	-18398
Totals								369014	399136	-30122

Code 33860 which is split into two new codes 33858 and 33859 results in a recommended increase in value for code 33858 (recommended RVW 65.00, current RVW 59.46) and a decrease in value for the more commonly performed code 33859 (recommended RVW 50.00, current RVW 59.46) resulting in an overall budget savings for that code. Code 33870 is also split into two new codes 33X01 and 33871, which results in a recommended increase in value for code 33871 (recommended RVW 65.75, current RVW 46.06) and a decrease in value for the more commonly performed code 33X01 (recommended RVW 19.74, current RVW 46.06) resulting in an overall budget savings for that code. The RVW recommendations for the other two codes, 33863 and 33864 result in slight increases for each code, but these increases are offset by the savings from the changes to the other codes. Additional information regarding the recommended revisions are included for each code.

Rationale 33871

Code 33871 is a renumbered code for aortic arch grafting with reimplantation of arch vessel(s). This procedure previously was reported with code 33870. The code descriptor was extensively revised to clearly differentiate between the work of a transverse arch graft repair and a hemiarch repair. The current Medicare volume for 33870 is 999. The RUC database shows an increase in volume of this code starting in 2014, which is around the time that hemiarch grafting started to become more prevalent. An increased understanding of isolated cerebral perfusion/cooling and its protective effects has made it safer to perform procedures with total circulatory arrest and deep hypothermia. Due to the increased familiarity, safety and knowledge surrounding circulatory arrest and cerebral perfusion procedures, the hemiarch procedure is now safer to perform and results in reduced risk to the patient by avoiding subsequent reoperation that that might be required without the aortic hemiarch replacement or the increased risk associated with a total transverse aortic arch replacement. It is estimated that 30% of the transverse aortic arch repairs will be performed using this code, resulting in an estimated Medicare volume of 300 procedures per year. Transverse aortic arch grafting with reimplantation of arch vessel(s) is a procedure that requires a median sternotomy, cardiopulmonary bypass, profound hypothermia, total circulatory arrest and isolated cerebral perfusion. The arch vessels are transected at the base, and the transverse aortic arch involved in the aneurysm is resected and replaced with a graft. The arch vessels (innominate artery, left carotid artery and left subclavian artery) are individually anastomosed to the arch tube graft or the three arch vessels are left attached to a remnant of the resected arch and anastomosed as an island to the newly constructed arch tube graft.

Pre-Time Package 4

Pre-Time Changes: The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient. The survey only supported 15 minutes for scrub dress and wait time, so the Expert Panel is recommending a 5-minute reduction for a total of 15 minutes for the scrub dress and wait time for the procedure per the survey.

Evaluation (total = 60 minutes): For the evaluation, the Expert Panel is recommending a 20-minute increase in time over the package for a total evaluation time of 60 minutes. This is supported by the survey data with 60 minutes of pre-service evaluation. The total evaluation time accounts for the review of the patient, by the surgeon and the collaborative efforts that go into each case. The additional evaluation time of 20 minutes accounts for the time the surgeon spends with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure including the associated aftercare. Extensive planning and review of pertinent imaging, which includes chest x-rays, CT Scan, MRI, Aortogram and TEE is required to identify the extent the aortic arch disease/dissection and the amount or resection, the best method for reimplantation of the arch vessels and the size of the graft(s). The Expert Panel felt that adding 20 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the pre-service work involved with the procedure.

Positioning (total = 15 minutes): The Expert Panel is recommending a 12-minute increase in time over the package for a total positioning time of 15 minutes, which is common for cardiac procedures and there are numerous examples in the RUC database supporting this time. The survey supported 15-minutes for positioning of the patient. The additional 12-minutes above the package time can be attributed to the time spent for careful protection of pressure points on the patient with this prolonged operation.

Scrub, Dress and Wait (total = 15 minutes): There is a 5-minute decrease from the package time, which represents the scrub dress and wait time from the survey.

Post-time Package 9b

Total = 60 minutes: The expert panel selected post-time package 9B for a general anesthesia or complex regional block/complex procedure. The Expert Panel is recommending a 27-minute increase in time over the package for a total immediate post time of 60 minutes and there are numerous examples in the RUC database and the cardiothoracic surgery codes supporting this time. The survey supported 60 minutes of immediate post time. The additional 27-minutes above the package time can be attributed to additional time for patient stabilization due to cardiopulmonary bypass, monitoring for bleeding, and more extensive documentation and communication requirements due to the complex aspects of the procedure including the final type of repair that was accomplished.

Critical Care Visits: 94% of the survey respondents replied that the procedure was performed in the hospital, and that 100% of the patients stayed overnight for more than 24 hours. 61% of the respondents indicated that they provided an E&M Visit on the same day of surgery.

The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient once the patient arrives in the ICU on the day of the procedure and an additional 40 minutes of critical care the day after the procedure for a total of two critical care visits for the procedure. The critical care visit covers that time that the physician spends with the patient directly related to the procedure providing critical care services. The survey supported two critical care visits for the procedure and the Expert Panel agreed.

Intensity and complexity of the procedure: 39 surveys were completed by a random pool of 800 cardiac surgeons which consisted of 650 self-identified adult cardiac surgeons and 150 self-identified congenital cardiac surgeons. 11 respondents selected code 33877, thoracoabdominal aneurysm repair as a reference code making it the 1st key reference service (KRS). That code has a slightly higher value, a shorter intraservice time and a longer total time than the survey code. The respondents ranged in their intensity/complexity comparison saying that the survey code is more or much more intense/complex than 33877 for all of the intensity/complexity measures except for the physical effort where the respondents indicated that the survey code identical or more complex than 33877. 8 respondents selected code 33622, complex cardiac anomaly reconstruction with palliation of single ventricle with aortic outflow obstruction and aortic arch hypoplasia, creation of cavo-pulmonary anastomosis and removal of right and left pulmonary bands as a reference code making it the 2nd KRS. This code has a slightly lower value with a shorter intraservice and a longer total time. The respondents ranged in their intensity/complexity comparison saying that the survey code is identical to, somewhat or much more intense/complex than 33622 for all of the intensity/complexity measures.

Recommended RVW: The survey data for code 33871 (transverse arch graft and arch vessel reimplantation) shows that the median intra-operative time is 320 minutes. The current intra-service time for this procedure is 330 minutes. The STS Database intra-service time shows a mean time of 390 minutes and a median time of 400 minutes. Based on the STS Database time, the Expert Panel felt that the survey respondents underestimated the intra-service time of the procedure and are recommending the 75th percentile of intra-service time from the survey, which is 363 minutes. The 75th percentile of 363 minutes is lower than the STS Database times. The 75th percentile intra-service time from the survey is more than the intra-time for the current code. The surveys also supported two critical care visits during the post-operative period which is the same number included in the current code. The hospital LOS from the survey represents one day less than the LOS in the current code and the total time from the survey is higher at 901 minutes than that for the current code at 770 minutes. The Recommended RVW and the total time for the survey code falls between the RVW and total time of both the KRS codes. The intraservice time of the survey code is longer than the intra-service time of both the KRS codes. The intensity (0.123) for the survey code is higher than the intensity for 1st (0.114) KRS code and is the same as the intensity for the 2nd (0.123) KRS code. The Expert panel felt that this is appropriate and is supported by the intensity and complexity measures.

The Expert Panel is recommending the 25th percentile work RVW of 65.75, with the 75th percentile intra-service time of 363 minutes, and total time of 901 minutes. Pre-time package 4 was selected with adjustments made to the evaluation and positioning time for a total pre-service time of 90 minutes. Immediate post-service time package 9b with additional time added for a total time of 60 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33870

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 450

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33870 is 999. The STS database shows that 60% of patients that receive a transverse aortic arch graft are non-Medicare patients.

It is estimated that 30% of aortic arch procedures for 33870 are for transverse aortic arch graft. This results in the following:

For code 33871, it is estimated that 450 procedures per year will be provided nationally and 300 procedures per year will be provided to Medicare patients.

Specialty cardiothoracic surgery Frequency 450 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 300

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2017 Medicare frequency for 33870 is 999. The STS database shows that 60% of patients that receive a transverse aortic arch graft are non-Medicare patients.

It is estimated that 30% of aortic arch procedures for 33870 are for transverse aortic arch graft. This results in the following:

For code 33871, it is estimated that 450 procedures per year will be provided nationally and 300 procedures per year will be provided to Medicare patients.

Specialty cardiothoracic surgery Frequency 300 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

33858	Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic dissection
33859	Ascending aorta graft, with cardiopulmonary bypass, includes valve suspension, when performed; for aortic disease other than dissection (eg, aneurysm)
33863	Ascending aorta graft, with cardiopulmonary bypass, with aortic root replacement using valved conduit and coronary reconstruction (eg, Bentall)
33864	Ascending aorta graft, with cardiopulmonary bypass with valve suspension, with coronary reconstruction and valve-sparing aortic root remodeling (eg, David Procedure, Yacoub procedure)
33871	Transverse aortic arch graft, with cardiopulmonary bypass, with profound hypothermia, total circulatory arrest and isolated cerebral perfusion with reimplantation of arch vessel(s) (eg, island pedicle or individual arch vessel reimplantation)
33866	Aortic hemiarch graft including isolation and control of the arch vessels, beveled open distal aortic anastomosis extending under one or more of the arch vessels, and total circulatory arrest or isolated cerebral perfusion (List separately in addition to code for primary procedure)

Global Period: 090 Meeting Date: 10/2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel was convened to develop the PE recommendations for codes 33858, 33859, 33863, 33864, 33871 and 33866.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Codes 33858 and 33871 are currently reported with code 33860. Codes 33871 and 33866 are currently reported with code 33870. 33863 and 33864 are existing codes that were re-surveyed as related codes. 33877 Repair of thoracoabdominal aortic aneurysm with graft, with or without cardiopulmonary bypass has been included as a reference code. 33877 represents an aortic procedure with similar inputs. 33877 was also selected as one of the KRS codes in the survey.

3. Is this code(s) typically billed with an E/M service?

No, none of these codes are typically billed with an E/M service.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Code 33858 is typically performed as an emergency for Type I aortic dissection. Although this is an emergent procedure, the clinical staff still assists with the following in a manner that is similar to the

work involved for some aspects of a typical 90 day cardiothoracic procedure. The specialties are recommending the following changes to the standard times for an emergent procedure:

- *For activity code CA002 Coordinate pre-surgery services the emergent time is 7 minutes. The specialties are recommending 10 minutes for this clinical activity because there are still a number of tests and services that must be coordinated. Diagnostic tests may include chest x-rays, CT Scan, MRI, aortogram and TEE and any laboratory studies if available. The clinical staff must also coordinate with the other specialists that will be needed to diagnose and perform the procedure, this will include, at a minimum coordination with neurology, anesthesia, assistant surgeon, the ICU, cardiology for the TEE, and perfusion.*
- *For activity code CA003 Schedule space and equipment in facility the emergent time is 4 minutes. The specialties are recommending the standard 90-day clinical staff time of 8 minutes for this clinical activity. The clinical staff will still need to provide all of the same services to ensure that the correct space and all of the necessary equipment for a cardiothoracic procedure are available, which includes the equipment and supplies for cardiopulmonary bypass which is required for the procedure and deep hypothermic arrest which may be necessary in some cases.*

The specialties are recommending the standard 90 day global clinical staff times for codes 33859, 33863, 33864 and 33871, which is the same as the PE inputs for the current codes.

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence:

N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:

N/A

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

N/A

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.

N/A

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:

N/A

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:

N/A

11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:

The only equipment included on the practice expense spreadsheet are the standard post-operative visit equipment, which includes an exam table for the total post-operative visit time.

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:

Code 33866 is an add-on code and does not have any associated PE inputs.

13. If there is any other item on your spreadsheet that needs further explanation please include here:

The majority of offices of our specialty utilize RN's or advance practice providers (PA's or NP's) because of the complexity of triaging outpatient care for cardiac surgery patients. Since CMS does not recognize PAs or NPs as clinical staff, the RN level has been traditionally accepted. This is a long-standing standard and is consistent in the family of cardiothoracic surgery codes that are not typically performed by multiple specialties. Codes 33858, 33859, 33863, 33864, 33871 and 33866 are all performed by cardiothoracic surgeons and would not be considered multi-specialty procedures.

14. Please include an explanation of each line item:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2018

Transanal Hemorrhoidal Dearterialization

In May 2018, the CPT Editorial Panel approved the replacement of a Category III code with a new Category I code and revision of two codes to report transanal hemorrhoidal dearterialization, including ultrasound guidance. In addition, codes 46945 and 46946 were revised to clearly indicate that they are performed without imaging guidance.

Compelling Evidence

The specialty societies presented compelling evidence that incorrect assumptions were made in the previous valuations of 46945 and 46946 due to a flawed methodology, ultimately resulting in a negative IWPUR for CPT code 46945 and a very low IWPUR for CPT code 46946. The first flawed valuation occurred in the First Five-Year Review in 1995, when the Contractor Medical Directors (CMD) nominated these services as overvalued when compared to in-office code 46221 *Hemorrhoidectomy, internal, by rubber band ligation(s)*. The CMDs stated that the Harvard study indicated the intra-service and pre/post-work for 46221 as being equal to CPT codes 46945 and 46946. However, the Harvard pre- and post-service work for CPT codes 46945 (Harvard intra = 120 minutes and pre/post-time = 187 minutes) and 46946 (Harvard intra = 163 minutes and pre/post time = 190 minutes) were more than twice the work value for CPT 46221, which is a 010-day global service (Harvard intra-time = 80 minutes and pre/post time = 81 minutes) and the Harvard intra-service work was not “equal”. At the time of RUC review in 1995, the specialty society did not have the Harvard Study data to refute the CMD rationale about the Harvard data and agreed to the recommended reduction in work RVUs without conducting a survey. The work RVU for 46945 was reduced by 38% and the work RVU for 46946 was reduced by 32% for 1997. Similarly, in the Fourth Five-Year Review in 2000, CPT codes 46945 and 46946 were included in a group of "Anus/Rectum – Hemorrhoids/Fistula" codes. The work RVUs for both codes were not based on survey data but decreased by 14% based on the RUC Workgroup recommendation to decrease the family anchor code 46262 by 14% from 8.73 to 7.50. This reduction resulted in a negative IWPUR (-0.04) for 46945 and a low IWPUR (0.03) for 46946. **The RUC agreed with the compelling evidence supporting previous flawed methodologies for valuing these services.**

Family of Services

The specialty societies indicated there are three sets of procedures to manage hemorrhoids. The first set of procedures are performed in the office: CPT code 46221 *Hemorrhoidectomy, internal, by rubber band ligation(s)*, which is reported to treat the majority of internal hemorrhoids in the United States, CPT code 46930 *Destruction of internal hemorrhoid(s) by thermal energy (eg, infrared coagulation, cautery, radiofrequency)* and CPT code 46500 *Injection of sclerosing solution, hemorrhoids*. All three of these codes typically involve a single hemorrhoid or a few independent small hemorrhoids.

The second set of hemorrhoidectomy procedures are for patients who have internal hemorrhoid column(s), who fail in-office procedures or have continued prolapse and bleeding. These patients are recommended for in-facility non-incisional therapy reported with CPT codes 46945, 46946 or 46948.

Lastly, the third set of hemorrhoidectomy procedures are excisional and include such as codes 46250 *Hemorrhoidectomy, external, 2 or more columns/groups* and 46255 *Hemorrhoidectomy, internal and external, single column/group*, which require excision and sutures. These are an represent a distinct approach to the treatment of complex hemorrhoids.

The RUC questioned why code 46930 *Destruction of internal hemorrhoid(s) by thermal energy (eg, infrared coagulation, cautery, radiofrequency)* is not part of the family of ligation codes since cautery would be similar to ligation. The specialty indicated that destruction of the hemorrhoid represented by CPT code 46930 is not typically accomplished with cautery, but rather by use of an infrared light source to treat grade 1 hemorrhoid(s). Further, CPT code 46930 does not require anesthesia and is typically performed during a brief office visit. In addition, it is not appropriate to use an infrared light source for treatment of grade 2 and 3 internal hemorrhoids. CPT codes 46945 and 46946 are reported to treat the higher-grade hemorrhoid column(s) in which suture ligation is used.

The current recommendations do not cause a rank order anomaly across the entire set of hemorrhoid treatment codes. **The RUC agreed with the explanation of the family of services identified and surveyed for this set of internal hemorrhoid treatment.**

46945 Hemorrhoidectomy, internal, by ligation other than rubber band; single hemorrhoid column/group, without imaging guidance

The RUC reviewed the survey results from 76 colorectal and general surgeons and determined that the survey 25th percentile work RVU of 3.69 accurately accounts for the work required to perform this procedure. The RUC recommends 25 minutes evaluation, 10 minutes positioning, 10 minutes scrub/dress/wait pre-service time, 15 minutes intra-service time, 15 minutes immediate post-service time, a half day discharge management 99238, one 99213 and one 99212 post-operative Evaluation and Management (E/M) office visits. The RUC confirmed that an extra 7 minutes of positioning time over the pre-time package are necessary for a total of five individuals to place the patient in the prone position after induction of anesthesia, to pad the head and extremities and efface the buttocks. The RUC confirmed that a 99213 E/M visit is required to discuss the patients' pain, diet, and activity restrictions, perform an anoscopy (not separately reportable) to assess for postoperative complications which may include delayed bleeding, sepsis, urinary retention, urinary tract infection, and/or fecal impaction. Also, one 99212 E/M office visit is required to discuss the patients' pain, diet, and activity restrictions, and perform a digital rectal exam to assess the wound.

The RUC compared the surveyed code to the two key reference services indicated by the survey respondents, codes 46270 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); subcutaneous* (work RVU = 4.92 and 15 minutes intra-service time, 169 minutes total time) and 46275 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); intersphincteric* (work RVU = 5.42 and 30 minutes intra-service time and 184 minutes total time) and determined that the surveyed code had the exact same intra-service time as CPT 46270, but is overall identical to somewhat more intense. The RUC referenced MPC codes 46930 *Destruction of internal hemorrhoid(s) by thermal energy (eg, infrared coagulation, cautery, radiofrequency)* (work RVU = 1.61 and 5 minutes intra-service time) and 33240 *Insertion of implantable defibrillator pulse generator only; with existing single lead* (work RVU = 5.80 and 45 minutes intra-service time), which support the relativity among similar well

recognized and established services. The RUC also noted that a work RVU of 3.69 for CPT code 46945 demonstrates the appropriate relativity among other 090-day global services with low intra-service time. **The RUC recommends a work RVU of 3.69 for CPT code 46945.**

The RUC compared the surveyed code to the two key reference services indicated by the survey respondents, codes 46270 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); subcutaneous* (work RVU = 4.92 and 15 minutes intra-service time, 169 minutes total time) and 46275 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); intersphincteric* (work RVU = 5.42 and 30 minutes intra-service time and 184 minutes total time) and determined that the surveyed code had the exact same intra-service time as CPT 46270, but is overall identical to somewhat more intense. The RUC referenced MPC codes 46930 *Destruction of internal hemorrhoid(s) by thermal energy (eg, infrared coagulation, cautery, radiofrequency)* (work RVU = 1.61 and 5 minutes intra-service time) and 33240 *Insertion of implantable defibrillator pulse generator only; with existing single lead* (work RVU = 5.80 and 45 minutes intra-service time), which support the relativity among similar well recognized and established services. The RUC also noted that a work RVU of 3.69 for CPT code 46945 demonstrates the appropriate relativity among other 090-day global services with low intra-service time. **The RUC recommends a work RVU of 3.69 for CPT code 46945.**

46946 Hemorrhoidectomy, internal, by ligation other than rubber band; 2 or more hemorrhoid columns/groups, without imaging guidance

The RUC reviewed the survey results from 79 colorectal and general surgeons and determined that the survey 25th percentile work RVU of 4.50 accurately accounts for the work required to perform this service. The RUC recommends 30 minutes evaluation, 10 minutes positioning, 10 minutes scrub/dress/wait pre-service time, 25 minutes intra-service time, 15 minutes immediate post-service time, half a day of discharge management 99238, one 99213 and one 99212 post-operative Evaluation and Management (E/M) office visits. The RUC confirmed that an extra 7 minutes of positioning time over the pre-time package are necessary for a total of five individuals to place the patient in the prone position after the induction of anesthesia to pad the head and extremities and efface the buttocks. The RUC confirmed that a 99213 E/M visit is required to discuss the patients' pain, diet, and activity restrictions, perform an anoscopy (not separately reportable) to assess for postoperative complications which may include delayed bleeding, sepsis, urinary retention, urinary tract infection, and/or fecal impaction. Also, one 99212 E/M office visit is required to discuss the patients' pain, diet, and activity restrictions, and perform a digital rectal exam to assess the wound.

The RUC compared the surveyed code to the two key reference services indicated by the survey respondents, codes 46247 *Hemorrhoidopexy (eg, for prolapsing internal hemorrhoids) by stapling* (work RVU = 5.57 and 30 minutes intra-service time and 170 minutes total time) and 46270 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); subcutaneous* (work RVU = 4.92 and 15 minutes intra-service time, 169 minutes total time) and determined that the physician work, time and intensity required to performed 46946 are perfectly relative compared to these services. The RUC compared the surveyed code to 64721 *Neuroplasty and/or transposition; median nerve at carpal tunnel* (work RVU = 4.97 and 25 minutes intra-service time), noting that both services require the same intra service time and similar work to perform. The RUC referenced MPC codes 46930 *Destruction of internal hemorrhoid(s) by thermal energy (eg, infrared coagulation, cautery, radiofrequency)* (work RVU = 1.61 and 5 minutes intra-service time) and 33240 *Insertion of implantable defibrillator pulse generator only; with existing single lead* (work RVU = 5.80 and 45 minutes intra-service time), which support the relativity among similar well recognized and established services. **The RUC recommends a work RVU of 4.50 for CPT code 46946.**

46948 Hemorrhoidectomy, internal, by transanal hemorrhoidal dearterialization, 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed

The RUC reviewed the survey results from 74 colorectal and general surgeons and determined that the survey 25th percentile work RVU of 5.57 accurately accounts for the work required to perform this service. The RUC recommends 30 minutes evaluation, 10 minutes positioning, 10 minutes scrub/dress/wait pre-service time, 40 minutes intra-service time, 15 minutes immediate post-service time, half a day of discharge management 99238, one 99213 and one 99212 post-operative Evaluation and Management (E/M) office visits. The RUC confirmed that an extra 7 minutes of positioning time over the pre-time package are necessary for a total of five individuals to place the patient in the prone position after anesthesia, to pad the head and extremities and efface the buttocks. The RUC confirmed that a 99213 E/M visit is required to discuss the patients' pain, diet, and activity restrictions, perform an anoscopy (not separately reportable) to assess for postoperative complications which may include delayed bleeding, sepsis, urinary retention, urinary tract infection, and/or fecal impaction. Also, one 99212 E/M office visit is required to discuss the patients' pain, diet, and activity restrictions, and perform a digital rectal exam to assess the wound.

This service includes the use of a large anoscope with an integrated Doppler where the physician can hear the blood pulsing in the vessels going to the hemorrhoid. Using the ultrasound probe, hemorrhoid artery ligation is performed with figure-of-eight ligation using absorbably suture at six positions correlating with the odd numbers of the clock. After each suture is tied by the device, ultrasound is used to confirm artery ligation. If an ultrasound signal is detected after 6 ligations, then additional suture ligation is performed, up to a maximum of eight. If significant mucosal/hemorrhoidal prolapse is present, mucopexy may also be performed by running the suture previously tied in a proximal-to-distal fashion, stopping 1 cm above the dentate line. At this point, the suture is tied back to itself at the apex of the hemorrhoidal column (location of initial ultrasound signal), creating a mucopexy of any redundant hemorrhoidal tissue. This procedure is repeated for each of the six terminal branches of the superior rectal artery so that six ligations and pexy sutures are performed. The RUC compared the surveyed code to the two key reference services indicated by the survey respondents, codes 46247 *Hemorrhoidopexy (eg, for prolapsing internal hemorrhoids) by stapling* (work RVU = 5.57 and 30 minutes intra-service time and 170 minutes total time) and 46280 *Surgical treatment of anal fistula (fistulectomy/fistulotomy); transsphincteric, suprasphincteric, extrasphincteric or multiple, including placement of seton, when performed* (work RVU = 6.39 and 45 minutes intra-service time, 199 minutes total time) and determined that the physician work, time and intensity for 46948 are appropriately relative to these services. The specialty noted and the RUC agreed that the intensity for 46948 is appropriately slightly less than 46947 because ligation is less intense than excision. The RUC referenced MPC codes 46930 *Destruction of internal hemorrhoid(s) by thermal energy (eg, infrared coagulation, cautery, radiofrequency)* (work RVU = 1.61 and 5 minutes intra-service time) and 33240 *Insertion of implantable defibrillator pulse generator only; with existing single lead* (work RVU = 5.80 and 45 minutes intra-service time), which support the relativity among similar well recognized and established services. **The RUC recommends a work RVU of 5.57 for CPT code 46948.**

Practice Expense

The Practice Expense Subcommittee approved compelling evidence for several inputs that increased due to changes in site of service and or omissions from submission in 2003. The RUC recommends the direct practice expense inputs as submitted by the specialty societies.

New Technology

CPT code 46948 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery Digestive System Anus <p>For incision of thrombosed external hemorrhoid, use 46083. For ligation of internal hemorrhoid(s), see 46221, 46945, 46946. AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 46945	Tracking Number E1	Original Specialty Recommended RVU: 3.69
		Presented Recommended RVU: 3.69
Global Period: 090	Current Work RVU: 2.21	RUC Recommended RVU: 3.69

CPT Descriptor: Hemorrhoidectomy, internal, by ligation other than rubber band; single hemorrhoid column/group, without imaging guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male with a single symptomatic column of internal hemorrhoids undergoes suture ligation of the hemorrhoidal tissue.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 36% , In the ASC 63%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 96% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 4%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Description of Pre-Service Work: The surgeon will select and order the appropriate antibiotic(s) and confirm timing and administration and confirm any necessary pre-operative adjustments to other medications. The patient will be examined, with an interval update to the prior H&P. Pre-admission testing will be reviewed. The indications for the procedure, as well as the operative risks and benefits, are explained to the patient and/or family/caregiver, and informed consent is obtained. The length and type of anesthesia is reviewed with the anesthesiologist. The availability of all necessary instruments and equipment is confirmed. The patient is placed in the prone jackknife position making sure that the all pressure points are well padded and the chest rolls are properly position and a safety strap is placed over the legs. The buttocks are effaced with silk tape to allow better exposure of the anus, then prepped and draped in standard fashion. The surgeon scrubs and gowns. A surgical "time out" with the operating surgical team out is performed. The surgeon injects local anesthesia around the anus and bilaterally into ischioanal fossa to block the pudendal nerves.

Description of Intra-Service Work: After induction of anesthesia, a digital rectal exam is performed. Next, a lubricated operative anoscope is placed in the anal canal. The anoscope is rotated 180° and the obturator is removed. Visual inspection is performed through the anoscope which identifies a single hemorrhoid column. Fecal matter is removed with suction. A Hill Ferguson anal retractor is placed to dilate the anus and the large friable internal hemorrhoid column is isolated. The hemorrhoid column is sutured at the apex, middle and distal portions of the column in order destroy the blood supply to the hemorrhoid (total of three interrupted sutures). Irrigation and suction are performed to remove any remaining blood. At completion of the procedure, the retractor is removed.

Description of Post-Service Work: A small gel foam pack that will be passed by the patient at a later time is placed internally to prevent bleeding. The surgeon assists with repositioning the patient supine. A brief operative note is written. After emergence from anesthesia, the surgeon will answer any patient/family questions and discuss activity restrictions and re-emphasize the use of sitz baths and a diet rich in fluids and fiber to prevent diarrhea and increased frequency of bowel movements that could cause an early disruption of the rectal sutures. The surgeon will write prescriptions for medications (eg, pain, stool softener), reconcile medications, and provide discharge instructions. The procedure, including relevant anatomic findings and follow-up treatment plan are documented in the medical chart with copy to the referring provider. At the first follow-up visit, the surgeon will perform an anoscopic exam (not separately reportable) to determine effectiveness

of treatment and to assess the treated area for infection or sepsis. At a second follow-up visit, the surgeon will perform a digital rectal exam. Scrupulous adherence to a dietary protocol is repeated at every office visit to prevent urinary retention and tenesmus that can be accompanied by a transient sensation of urge to defecate which can disrupt the sutures and cause bleeding. Postoperative care is also strongly directed toward the control of pain. The surgeon will answer any patient/family questions at each visit. The anoscopy findings, digital rectal exam and any changes to the treatment plan are discussed with the patient and documented in the medical chart with copy to the referring provider.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Category III code 0249T will be deleted and a new Category I code 46948 will be added to the CPT 2020 code set to describe a hemorrhoidectomy by transanal hemorrhoidal dearterialization of 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed. Current Cat I codes to report a hemorrhoidectomy of one column/group (46945) and 3 or more columns/groups (46946) were revised to indicate "without imaging guidance" to clearly distinguish these codes from 46948.

Compelling Evidence – Codes 46945 and 46946

Flawed Methodology of Previous Valuation in 1995

For the first 5 year review, codes 46945 and 46946 were nominated by the Contractor Medical Directors (CMD) as overvalued:

46945 Ligation of internal hemorrhoids; single procedure
1995 RVW: 3.06 CMD Recommended RVW: 1.90

46946 Ligation of internal hemorrhoids; multiple procedures
1995 RVW: 4.04 CMD Recommended RVW: 2.76

CMD Rationale for Change: This procedure appears overvalued in comparison to hemorrhoidectomy by simple ligature (code 46221, 1.38 RVWs). The Harvard study gives the intraservice and other work for 46221 as being of equal size.

However, as shown in the excerpt below from the Harvard Study, the Harvard pre/post work value for 46945 and 46946 were more than twice the work value for 46221. Similarly, the Harvard intra-work was not of "equal size."

CPT	DESCRIPTOR	Hvd glob	Hvd total work	Hvd Intra work	Hvd P/P work
46221	Ligation of hemorrhoid	010	161	80	81
46945	Ligation of hemorrhoid	090	307	120	187
46946	Ligation of hemorrhoid	090	353	163	190

Source: March 1992 (Harvard Study Phase 3D data) William C. Hsiao, Peter Braun, Daniel Dunn, Edmund Becker, Nancy L. Kelly, Douwe B. Yntema

At the time of review, the specialty society did not have the Harvard Study data above to refute the CMD rationale about the Harvard work values and agreed to the recommended reduction in work RVUs without conducting a survey. The RVW for 46945 was reduced by 38% and the RVW for 46946 by 32% for 1997. **We believe this was a flawed methodology: 1) Misrepresenting Harvard study data; and 2) Comparing total and pre/post work for 90-day global facility codes to the total and pre/post work for a 10-day office code.**

Flawed Methodology of Previous Valuation in 2000

In March 2000, the American College of Surgeons (ACS) submitted a list of 322 general surgery codes as potentially misvalued for review during the second 5 year review in 2000. An alternative approach was provided to review this large number of codes; including expert panel review, NSQIP data, building block methodology and benchmarking. The recommendations included recommendations for both increasing and

decreasing RVWs and also highlighted rank order anomalies. The comment letter and detailed process and recommendation files were forwarded to the RUC for consideration. After a presentation to the Workgroup charged with reviewing this set of codes, the ACS was directed to group the codes into families, choose two or more codes in each family, and conduct a full RUC survey for those codes to validate the RVW recommendations predicted by the proposed alternative methodology.

In August 2000, we submitted SoRs for 32 high volume codes that were surveyed using the traditional RUC survey and a table with data for 282 additional codes for which a mini-survey was performed. The codes that were grouped together were loosely based on similar anatomy and similar work RVWs.

Although we believed that the direction of the Workgroup to conduct full surveys and mini-surveys for groups of codes was meant to validate the recommendations for all codes, the Workgroup instead decided to review the codes that had a traditional full survey and then apply a percent change to all codes in the group based on the change determined for the code with the traditional full survey. Although we could clearly show that the groups were loosely put together and there were rank order anomalies within the groups, the Workgroup maintained that the traditional RUC survey was all they could accept and the application of a percentage change across other codes in the group would maintain relativity.

Codes 46945 and 46946 were included in a group of "Anus/Rectum – Hemorrhoids/Fistula" codes. The RVWs for both codes were decreased by 14% based on the Workgroup recommendation to decrease code 46262 from 8.73 to 7.50. This reduction resulted in a negative IWPOT (-0.04) for 46945 and a low IWPOT (0.03) for 46946. In addition, the Workgroup required that the data from the mini-surveys be used for the time/visit details, resulting in 46945 including two postop office visits and 46946 including only one postop office visit.

We believe applying percentage changes across groups of codes without considering the relativity of the final value both internally and against references was a flawed methodology.

Survey Process

A survey request was sent to a random selection of members from the membership databases of the American College of Surgeons (self-identified as general surgeons) and the American Society of Colon and Rectal Surgeons.

Recommendation - 46945

Work RVU: The survey 25th percentile work RVU of 3.69 is recommended for 46945.

Pre-time Package 3: Straightforward Patient/Difficult Procedure

The procedure is not typically reported with an E/M service.

Evaluation: Subtract 8 minutes to be consistent with the survey median.

Positioning: Add 7 minutes for prone positioning with padding and effacement of buttocks

Scrub, dress, and wait: Subtract 5 minutes to be consistent with the survey median.

Post-time Package 9b: General Anesthesia or Complex Regional Block/Complex Procedure

Subtract 18 minutes to be consistent with the survey median.

Postop Office Visits: 99213: In addition to an evaluation and management service, including (but not limited to) a discussion of pain, diet, and activity restrictions, an anoscopy (not separately reportable) will be performed to assess for postoperative complications which may include delayed bleeding, sepsis, urinary retention, urinary tract infection, and/or fecal impaction. Urinary retention is often due to pain that results in pelvic floor spasms. Sepsis or wound infection may require the removal of all or some of the ligature. All patients undergoing ligation are at potential risk, but it may be greater in those who are immunocompromised, diabetic, and neutropenic. Although this technique has the most postoperative discomfort and pain requiring

management, it has the best long term results with the lowest recurrence rates. 99212: In addition to an evaluation and management service, including (but not limited to) a discussion of pain, diet, and activity restrictions, a digital rectal exam will be performed to assess the wound.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 46945

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty colorectal surgery How often? Rarely

Specialty general surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 46946	Tracking Number E2	Original Specialty Recommended RVU: 4.50
		Presented Recommended RVU: 4.50
Global Period: 090	Current Work RVU: 2.63	RUC Recommended RVU: 4.50

CPT Descriptor: Hemorrhoidectomy, internal, by ligation other than rubber band; 2 or more hemorrhoid columns/groups, without imaging guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male with multiple symptomatic columns of internal hemorrhoids undergoes suture ligation the hemorrhoidal tissue.

Percentage of Survey Respondents who found Vignette to be Typical: 76%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 43% , In the ASC 57%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 91% , Overnight stay-less than 24 hours 6% , Overnight stay-more than 24 hours 3%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 67%

Description of Pre-Service Work: The surgeon will select and order the appropriate antibiotic(s) and confirm timing and administration and confirm any necessary pre-operative adjustments to other medications. The patient will be examined, with an interval update to the prior H&P. Pre-admission testing will be reviewed. The indications for the procedure, as well as the operative risks and benefits, are explained to the patient and/or family/caregiver, and informed consent is obtained. The length and type of anesthesia is reviewed with the anesthesiologist. The availability of all necessary instruments and equipment is confirmed. The patient is placed in the prone jackknife position making sure that the all pressure points are well padded and the chest rolls are properly position and a safety strap is placed over the legs. The buttocks are effaced with silk tape to allow better exposure of the anus, then prepped and draped in standard fashion. The surgeon scrubs and gowns. A surgical "time out" with the operating surgical team out is performed. The surgeon injects local anesthesia around the anus and bilaterally into ischioanal fossa to block the pudendal nerves.

Description of Intra-Service Work: After induction of anesthesia, a digital rectal exam is performed. Next, a lubricated operative anoscope is placed in the anal canal. The anoscope is rotated 180° and the obturator is removed. Visual inspection is performed through the anoscope which identifies three hemorrhoid columns; right anterior, left lateral and right posterior. Fecal matter is removed with suction. A Hill Ferguson anal retractor is placed to dilate the anus and the first large friable internal hemorrhoid column is isolated and sutured at the apex, middle and distal portions of the column in order destroy the blood supply to the hemorrhoid (total of three interrupted sutures). Irrigation and suction are performed to remove blood. The retractor is moved and this process is repeated on the other two columns. At completion of the procedure, the retractor is removed.

Description of Post-Service Work: A small gel foam pack that will be passed by the patient at a later time is placed internally to prevent bleeding. The surgeon assists with repositioning the patient supine. A brief operative note is written. After emergence from anesthesia, the surgeon will answer any patient/family questions and discuss activity restrictions and re-emphasize the use of sitz baths and a diet rich in fluids and fiber to prevent diarrhea and increased frequency of bowel movements that could cause an early disruption of the rectal sutures. The surgeon will write prescriptions for medications (eg, pain, stool softener), reconcile medications, and provide discharge instructions. The procedure, including relevant anatomic findings and follow-up treatment plan are documented in the medical chart with copy to the referring provider. At

the first follow-up visit, the surgeon will perform an anoscopic exam (not separately reportable) to determine effectiveness of treatment and to assess the treated area for infection or sepsis. At a second follow-up visit, the surgeon will perform a digital rectal exam. Scrupulous adherence to a dietary protocol is repeated at every office visit to prevent urinary retention and tenesmus that can be accompanied by a transient sensation of urge to defecate which can disrupt the sutures and cause bleeding. Postoperative care is also strongly directed toward the control of pain. The surgeon will answer any patient/family questions at each visit. The anoscopy findings, digital rectal exam and any changes to the treatment plan are discussed with the patient and documented in the medical chart with copy to the referring provider.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Category III code 0249T will be deleted and a new Category I code 46948 will be added to the CPT 2020 code set to describe a hemorrhoidectomy by transanal hemorrhoidal dearterialization of 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed. Current Cat I codes to report a hemorrhoidectomy of one column/group (46945) and 3 or more columns/groups (46946) were revised to indicate "without imaging guidance" to clearly distinguish these codes from 46948.

Compelling Evidence – Codes 46945 and 46946

Flawed Methodology of Previous Valuation in 1995

For the first 5 year review, codes 46945 and 46946 were nominated by the Contractor Medical Directors (CMD) as overvalued:

46945 Ligation of internal hemorrhoids; single procedure
1995 RVW: 3.06 CMD Recommended RVW: 1.90

46946 Ligation of internal hemorrhoids; multiple procedures
1995 RVW: 4.04 CMD Recommended RVW: 2.76

CMD Rationale for Change: This procedure appears overvalued in comparison to hemorrhoidectomy by simple ligation (code 46221, 1.38 RVWs). The Harvard study gives the intraservice and other work for 46221 as being of equal size.

However, as shown in the excerpt below from the Harvard Study, the Harvard pre/post work value for 46945 and 46946 were more than twice the work value for 46221. Similarly, the Harvard intra-work was not of "equal size."

CPT	DESCRIPTOR	Hvd glob	Hvd total work	Hvd Intra work	Hvd P/P work
46221	Ligation of hemorrhoid	010	161	80	81
46945	Ligation of hemorrhoid	090	307	120	187
46946	Ligation of hemorrhoid	090	353	163	190

Source: March 1992 (Harvard Study Phase 3D data) William C. Hsiao, Peter Braun, Daniel Dunn, Edmund Becker, Nancy L. Kelly, Douwe B. Yntema

At the time of review, the specialty society did not have the Harvard Study data above to refute the CMD rationale about the Harvard work values and agreed to the recommended reduction in work RVUs without conducting a survey. The RVW for 46945 was reduced by 38% and the RVW for 46946 by 32% for 1997. **We believe this was a flawed methodology: 1) Misrepresenting Harvard study data; and 2) Comparing total and pre/post work for 90-day global facility codes to the total and pre/post work for a 10-day office code.**

Flawed Methodology of Previous Valuation in 2000

In March 2000, the American College of Surgeons (ACS) submitted a list of 322 general surgery codes as potentially misvalued for review during the second 5 year review in 2000. An alternative approach was provided to review this large number of codes; including expert panel review, NSQIP data, building block methodology and benchmarking. The recommendations included recommendations for both increasing and

decreasing RVWs and also highlighted rank order anomalies. The comment letter and detailed process and recommendation files were forwarded to the RUC for consideration. After a presentation to the Workgroup charged with reviewing this set of codes, the ACS was directed to group the codes into families, choose two or more codes in each family, and conduct a full RUC survey for those codes to validate the RVW recommendations predicted by the proposed alternative methodology.

In August 2000, we submitted SoRs for 32 high volume codes that were surveyed using the traditional RUC survey and a table with data for 282 additional codes for which a mini-survey was performed. The codes that were grouped together were loosely based on similar anatomy and similar work RVWs.

Although we believed that the direction of the Workgroup to conduct full surveys and mini-surveys for groups of codes was meant to validate the recommendations for all codes, the Workgroup instead decided to review the codes that had a traditional full survey and then apply a percent change to all codes in the group based on the change determined for the code with the traditional full survey. Although we could clearly show that the groups were loosely put together and there were rank order anomalies within the groups, the Workgroup maintained that the traditional RUC survey was all they could accept and the application of a percentage change across other codes in the group would maintain relativity.

Codes 46945 and 46946 were included in a group of "Anus/Rectum – Hemorrhoids/Fistula" codes. The RVWs for both codes were decreased by 14% based on the Workgroup recommendation to decrease code 46262 from 8.73 to 7.50. This reduction resulted in a negative IWPOT (-0.04) for 46945 and a low IWPOT (0.03) for 46946. In addition, the Workgroup required that the data from the mini-surveys be used for the time/visit details, resulting in 46945 including two postop office visits and 46946 including only one postop office visit.

We believe applying percentage changes across groups of codes without considering the relativity of the final value both internally and against references was a flawed methodology.

Survey Process

A survey request was sent to a random selection of members from the membership databases of the American College of Surgeons (self-identified as general surgeons) and the American Society of Colon and Rectal Surgeons.

Recommendation - 46946

Work RVU: The survey 25th percentile work RVU of 4.50 is recommended for 46946.

Pre-time Package 3: Straightforward Patient/Difficult Procedure

The procedure is not typically reported with an E/M service.

Evaluation: Subtract 3 minutes to be consistent with the survey median.

Positioning: Add 7 minutes for prone positioning with padding and effacement of buttocks

Scrub, dress, and wait: Subtract 5 minutes to be consistent with the survey median.

Post-time Package 9b: General Anesthesia or Complex Regional Block/Complex Procedure

Subtract 18 minutes to be consistent with the survey median.

Postop Office Visits: 99213: In addition to an evaluation and management service, including (but not limited to) a discussion of pain, diet, and activity restrictions, an anoscopy (not separately reportable) will be performed to assess for postoperative complications which may include delayed bleeding, sepsis, urinary retention, urinary tract infection, and/or fecal impaction. Urinary retention is often due to pain that results in pelvic floor spasms. Sepsis or wound infection may require the removal of all or some of the ligature. All patients undergoing ligation are at potential risk, but it may be greater in those who are immunocompromised, diabetic, and neutropenic. Although this technique has the most postoperative discomfort and pain requiring

management, it has the best long term results with the lowest recurrence rates. 99212: In addition to an evaluation and management service, including (but not limited to) a discussion of pain, diet, and activity restrictions, a digital rectal exam will be performed to assess the wound.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 46946

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty colorectal surgery How often? Sometimes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 46948	Tracking Number E3	Original Specialty Recommended RVU: 5.57
		Presented Recommended RVU: 5.57
Global Period: 090	Current Work RVU:	RUC Recommended RVU: 5.57

CPT Descriptor: Hemorrhoidectomy, internal, by transanal hemorrhoidal dearterialization, 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old male with a long history of bright red rectal bleeding due to grade III internal hemorrhoids undergoes ultrasound-guided hemorrhoidal artery ligation with mucopexy as required.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 46% , In the ASC 54%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 97% , Overnight stay-less than 24 hours 3% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The surgeon will select and order the appropriate antibiotic(s) and confirm timing and administration and confirm any necessary pre-operative adjustments to other medications. The patient will be examined, with an interval update to the prior H&P. Pre-admission testing will be reviewed. The indications for the procedure, as well as the operative risks and benefits, are explained to the patient and/or family/caregiver, and informed consent is obtained. The length and type of anesthesia is reviewed with the anesthesiologist. The availability of all necessary instruments and equipment is confirmed. The patient is placed in the prone jackknife position making sure that the all pressure points are well padded and the chest rolls are properly position and a safety strap is placed over the legs. The buttocks are effaced with silk tape to allow better exposure of the anus, then prepped and draped in standard fashion. The surgeon scrubs and gowns. A surgical "time out" with the operating surgical team out is performed. The surgeon injects local anesthesia around the anus and bilaterally into ischioanal fossa to block the pudendal nerves.

Description of Intra-Service Work: After induction of anesthesia, a digital rectal exam is performed. Next, a lubricated n anoscope with an ultrasound probe attachment and equipped to deliver sutures is inserted into the anus. Visual inspection is performed. Using the ultrasound probe, hemorrhoid artery ligation is performed with figure-of-eight ligation using absorbably suture at six positions correlating with the odd numbers of the clock. After each suture is tied by the device, ultrasound is used to confirm artery ligation. If an ultrasound signal is detected after 6 ligations, then additional suture ligation is performed, up to a maximum of eight. If significant mucosal/hemorrhoidal prolapse is present, mucopexy may also be performed by running the suture previously tied in a proximal-to-distal fashion, stopping 1 cm above the dentate line. At this point, the suture is tied back to itself at the apex of the hemorrhoidal column (location of initial ultrasound signal), creating a mucopexy of any redundant hemorrhoidal tissue. This procedure is repeated for each of the six terminal branches of the superior rectal artery so that six ligations and pexy sutures are performed. At completion of the procedure, the anoscope with ultrasound probe attachment is removed.

Description of Post-Service Work: A small gel foam pack that will be passed by the patient at a later time is placed internally to prevent bleeding. The surgeon assists with repositioning the patient supine. A brief operative note is written. After emergence from anesthesia, the surgeon will answer any patient/family questions and discuss activity restrictions and re-emphasize the use of sitz baths and a diet rich in fluids and fiber to prevent diarrhea and increased frequency of bowel

movements that could cause an early disruption of the rectal sutures. The surgeon will write prescriptions for medications (eg, pain, stool softener), reconcile medications, and provide discharge instructions. The procedure, including relevant anatomic findings and follow-up treatment plan are documented in the medical chart with copy to the referring provider. At the first follow-up visit, the surgeon will perform an anoscopic exam (not separately reportable) to determine effectiveness of treatment and to assess the treated area for infection or sepsis. At a second follow-up visit, the surgeon will perform a digital rectal exam. Scrupulous adherence to a dietary protocol is repeated at every office visit to prevent urinary retention and tenesmus that can be accompanied by a transient sensation of urge to defecate which can disrupt the sutures and cause bleeding. Postoperative care is also strongly directed toward the control of pain. The surgeon will answer any patient/family questions at each visit. The anoscopy findings, digital rectal exam and any changes to the treatment plan are discussed with the patient and documented in the medical chart with copy to the referring provider.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Category III code 0249T will be deleted and a new Category I code 46948 will be added to the CPT 2020 code set to describe a hemorrhoidectomy by transanal hemorrhoidal dearterialization of 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed. Current Cat I codes to report a hemorrhoidectomy of one column/group (46945) and 3 or more columns/groups (46946) were revised to indicate "without imaging guidance" to clearly distinguish these codes from 46948.

Survey Process

A survey request was sent to a random selection of members from the membership databases of the American College of Surgeons (self-identified as general surgeons) and the American Society of Colon and Rectal Surgeons.

Recommendation – 46948

Work RVU: The survey 25th percentile work RVU of 5.57 is recommended for 46948.

Pre-time Package 3: Straightforward Patient/Difficult Procedure

The procedure is not typically reported with an E/M service.

Evaluation: Subtract 3 minutes to be consistent with the survey median.

Positioning: Add 7 minutes for prone positioning with padding and effacement of buttocks

Scrub, dress, and wait: Subtract 5 minutes to be consistent with the survey median.

Post-time Package 9b: General Anesthesia or Complex Regional Block/Complex Procedure

Subtract 18 minutes to be consistent with the survey median.

Postop Office Visits: 99213: In addition to an evaluation and management service, including (but not limited to) a discussion of pain, diet, and activity restrictions, an anoscopy (not separately reportable) will be performed to assess for postoperative complications which may include delayed bleeding, sepsis, urinary retention, urinary tract infection, and/or fecal impaction. Urinary retention is often due to pain that results in pelvic floor spasms. Sepsis or wound infection may require the removal of all or some of the ligature. All patients undergoing ligation are at potential risk, but it may be greater in those who are immunocompromised, diabetic, and neutropenic. Although this technique has the most postoperative discomfort and pain requiring management, it has the best long term results with the lowest recurrence rates. 99212: In addition to an evaluation and management service, including (but not limited to) a discussion of pain, diet, and activity restrictions, a digital rectal exam will be performed to assess the wound.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0249T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

Specialty colorectal surgery How often? Sometimes

Specialty general surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,100
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2018v2 RUC database utilization for 0249T multiplied by four. Rationale: Payers often deny claims for Category III codes. In 2016, over 400 claims were submitted to Medicare, but only 271 were paid. When the new Category I code is available for reporting, the paid claims will likely increase.

Specialty colorectal surgery	Frequency 440	Percentage 40.00 %

46945	Hemorrhoidectomy, internal, by ligation other than rubber band; single hemorrhoid column/group, without imaging guidance	090
46946	Hemorrhoidectomy, internal, by ligation other than rubber band; 2 or more hemorrhoid columns/groups, without imaging guidance	090
46948	Hemorrhoidectomy, internal, by transanal hemorrhoidal dearterialization, 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed	090

Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel: [The ASCRS and ACS Advisors reviewed the clinical aspects of these codes and facility practice expense inputs for 46945 and 46946.](#)
2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: [Facility inputs for 46945 and 46946 are referenced along with 10-day global code 46500, specifically for the inputs related to one postop visit. The PE SC and CMS approved the details for 46500 in 2014 and again in the recent CY 2019 proposed rule.](#)
3. Is this code(s) typically billed with an E/M service? [No](#)
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: [N/A](#)
5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: [When 46945 and 46946 were reviewed in 2003, the PE Subcommittee and the specialties did not report the time \(setting up and cleaning scope\), supplies related to anoscopy and equipment related to an anoscopy performed at a followup postop office visit. These details have since been established, in 2014 and more recently by CMS in the proposed rule for 2019 \(code 46500\).](#)
6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: [N/A](#)
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: [N/A](#)
8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: [N/A](#)
10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: [N/A](#)
11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

The first POV will be performed in a procedure room because an anoscopy will be performed.

The second POV will be performed in an exam room.

Therefore, the surgical light, anoscopy equipment and suction machine will be used during the first POV. At the second POV, the exam room will have an exam light, not a surgical light. For both visits, general and colorectal surgeons have power tables in all rooms - both procedure and exam.

Time for set-up and cleaning the scope equipment has been added where appropriate for the first POV.

			46945	46946	46948
EF014	light, surgical	Other Formula	=L87+L88-27	=P87+P88-27	=R87+R88-27

ES002	anoscope with light source	Other Formula	=L87+L88+L89-27	=P87+P88+P89-27	=R87+R88+R89-27
EQ235	suction machine (Gomco)	Other Formula	=L87+L88-27	=P87+P88-27	=R87+R88-27

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: [N/A](#)
13. If there is any other item on your spreadsheet that needs further explanation please include here: [A surgeon's office will typically have and use a non-disposable anoscope with light source equipment item for anoscopy procedures \(both diagnostic and therapeutic\) performed in the office. Therefore, we have recommended deleting the disposable anoscope and separate xenon light source with ES002 \(anoscope with light source\).](#)
14. Please include an explanation of each line item:

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT CODE / DESCRIPTOR	GLOBAL
46945 Hemorrhoidectomy, internal, by ligation other than rubber band; single hemorrhoid column/group, without imaging guidance	090
46946 Hemorrhoidectomy, internal, by ligation other than rubber band; 2 or more hemorrhoid columns/groups, without imaging guidance	090
46948 Hemorrhoidectomy, internal, by transanal hemorrhoidal dearterialization, 2 or more hemorrhoid columns/groups, including ultrasound guidance, with mucopexy when performed	090

Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel: The ASCRS and ACS Advisors reviewed the clinical aspects of these codes and claims data.

When the practice expense for codes 46945 and 46946 were last reviewed in March 2003, the code descriptors were not clear and many considered these codes similar if not synonymous with rubber band ligation, just for larger or multiple hemorrhoids. As such, codes 46945 and 46946 were reviewed in tandem with many procedures performed in an office setting and priced in the office setting.

For CPT 2010, the code descriptors for 46221 and 46945/46946 were revised to clarify that 46221 was to be reported for single or multiple banding using rubber bands (10-day global office-based procedure) and that code 46945/46946 were for ligation of column(s)/group(s) not using banding (90-day global facility-based procedures). Codes 46945/46946 were also moved to the excision subsection of Anus in CPT.

Despite the CPT coding changes in 2010 and several CPT Assistant "frequently asked question" articles, we believe there is miscoding of 46945 and 46946 in the office for procedures that should correctly be reported with codes for other techniques. This is based on a review of Medicare claims data that indicate almost 60% of the office based claims for both codes comes from only a few providers in New York and Florida. In fact a single provider submitted 193 office claims for 118 patients in one year. These are not procedures that would be "repeated."

Based on this research and expert panel discussion, along with the fact that these procedures will require sedation, most commonly general anesthesia but never just local anesthesia, ***we are not recommending pricing for the non-facility (office) setting.***

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: N/A
3. Is this code(s) typically billed with an E/M service? N/A
Is this code(s) typically billed with the E/M service in the nonfacility? N/A
(Please see provided data in PE Subcommittee folder)
4. What specialty is the dominant provider in the nonfacility? N/A
What percent of the time does the dominant provider provide the service(s) in the nonfacility? N/A

Is the dominant provider in the nonfacility different then for the global? N/A
(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: N/A
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time. N/A
7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: N/A
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:
N/A
9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*: N/A
10. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. N/A
11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: N/A
12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.
13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: N/A
14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: N/A
15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here: N/A
16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: N/A
17. If there is any other item on your spreadsheet that needs further explanation please include here: N/A
18. Please include an explanation of each line item: N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2018

Preperitoneal Pelvic Packing

In May 2018 the CPT Editorial Panel approved the addition of two codes for preperitoneal pelvic packing, removal and/or repacking for hemorrhage associated with pelvic trauma.

49013 Preperitoneal pelvic packing for hemorrhage associated with pelvic trauma, including local exploration

The RUC reviewed the survey results from 38 surgeons, a majority of which had experience performing this procedure in the past 12 months. The RUC also noted that although this is a rare procedure, every trauma surgeon is trained to perform this procedure as part of the educational curriculum of trauma courses such as the American College of Surgeons' Committee on Trauma ASSET course. The RUC agreed on the following physician time components: 30 minutes of pre-service evaluation, 10 minutes of pre-service positioning, 10 minutes of pre-service scrub/dress/wait, 45 minutes of intra-service time, 60 minutes of immediate post-service time, for a total of 155 minutes. The RUC agreed with the reduction of 10 minutes to the pre-time package evaluation time to be consistent with the survey median and to acknowledge the urgent nature of this service. The RUC agreed with the specialty recommendation for an additional 7 minutes for positioning the patient. Although the patient will be supine, additional preparation of the entire torso for possible emergent chest or abdominal surgery will be required. In addition, a patient with pelvic trauma requiring this service will likely have a pelvic c-clamp for stabilization and other injuries that need to be considered while positioning the patient. Pre-service time for scrub, dress, wait was reduced from the pre-service package time of 20 minutes to 10 minutes to acknowledge the urgent nature of this service. Postoperatively, 27 minutes was added to the post-time package, for a total of 60 minutes. The postoperative time for this 000-day global code includes all postoperative until midnight on the day of the procedure. Postoperative, the patient will still be unstable and critical and their hemodynamic status will be monitored very closely for more than the 10 minutes included in the package for monitoring patient recovery. Significant coordination with other treating physicians, surgeons and ICU staff will be necessary. Time for this activity is not included in the post-operative package and the RUC agreed that 60 minutes of postoperative work on the day of this procedure is appropriate.

The RUC noted that code 49013 is not scheduled, but rather a rare emergency procedure. The RUC thoroughly discussed the atypical nature of this service and that a 000-day global service period is appropriate to avoid overlap with variable post-operative care that will be unpredictable because of the variability of the site of service (rural versus urban), in terms of the post-operative team available to treat the trauma patient. The injury requiring pelvic packing can be the result of a motor vehicle accident or a bomb.

The RUC thoroughly reviewed the recommended survey median work RVU of 8.35 and agreed that this value correctly estimates the amount of physician work involved. To justify a work RVU of 8.35, the RUC compared the survey code to the top key reference services, codes 37244 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation* (work RVU= 13.75, pre-service time of 31 minutes, intra-service time of 90 minutes, and post-service time of 45 minutes) and 31603 *Tracheostomy, emergency procedure*;

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

transtracheal (work RVU= 6.00, pre-service time of 45 minutes, intra-service time of 30 minutes, and post-service time of 30 minutes) and noted that the top key reference codes appropriately bracket the survey code in terms of total time and amount of physician work. Additionally, the RUC agreed that the intensity and complexity of the survey code is appropriately similar to code 37244 which is the alternative treatment for exactly the same patient and the intensity is appropriately less than code 31603, further justifying a recommended work RVU of 8.35. **The RUC recommends a work RVU of 8.35 for CPT code 49013.**

49014 Re-exploration of pelvic wound with removal of preperitoneal pelvic packing including repacking, when performed

The RUC reviewed the survey results from 38 surgeons and agreed on the following physician time components: 40 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait, 45 minutes of intra-service time, and 30 minutes of immediate post-service time. The RUC acknowledged that this procedure is not an emergency and will be scheduled when appropriate in concert with the work of other physicians and surgeons involved with the trauma patient. The RUC agreed with the reduction of 5 minutes to the scrub, dress, wait time and reduction of 3 minutes to the post-service time to be consistent with the survey median.

The RUC thoroughly reviewed the recommended survey median work RVU of 6.73 and agreed that this value correctly estimates the amount of physician work involved. To justify a work RVU of 6.73, the RUC compared the survey code to the top key reference codes as indicated by the survey respondents, 37193 *Retrieval (removal) of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU=7.10, pre-service time of 31 minutes, intra-service time of 45 minutes, and post-service time of 15 minutes) and 31600 *Tracheostomy, planned (separate procedure)*; (work RVU=5.56, pre-service time of 60 minutes, intra-service time of 30 minutes, and post-service time of 30 minutes) and noted that these reference codes appropriately bracket the survey code in the amount of physician work involved. The survey code and key reference codes are all scheduled procedures, typically in critically ill and complex patients. The RUC and specialties agreed that the surveyed code was less intense, but similarly complex given each patient's health status at the time the procedures are performed. The RUC also agreed that the recommended work RVU correctly ranked the surveyed code with the key reference codes. Additionally, the RUC also reviewed MPC code 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included)* (work RVU= 6.75, pre-service time of 53 minutes, intra-service time of 45 minutes, and post-service time of 20 minutes) and agreed that the relativity of both codes in terms of time and physician work further warrants a recommended work RVU of 6.73 for the survey code. **The RUC recommends a work RVU of 6.73 for CPT code 49014.**

Practice Expense

The RUC recommends the direct practice expense inputs as submitted by the specialty society.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery Digestive System Abdomen, Peritoneum, and Omentum Incision				
49000		<i>Exploratory laparotomy, exploratory celiotomy with or without biopsy(s) (separate procedure)</i> <i>(To report wound exploration due to penetrating trauma without laparotomy, use 20102)</i>		
49002		<i>Reopening of recent laparotomy</i> <i>(To report re-exploration of hepatic wound for removal of packing, use 47362)</i> <u><i>(To report re-exploration of pelvic wound for removal including repacking when performed, use 49014)</i></u>

Global Period: 000	Current Work RVU:	RUC Recommended RVU: 8.35

CPT Descriptor: Preperitoneal pelvic packing for hemorrhage associated with pelvic trauma, including local exploration

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male presents following pelvic trauma with evidence of continued active hemorrhage in the pelvis. Angiographic evaluation is not readily available and hypotension persists despite active resuscitation. Preperitoneal pelvic packing and local exploration is performed

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The surgeon will review any relevant labs and imaging available. The surgeon will then coordinate taking the patient to the operating room with anesthesia and other surgical specialties that may also be involved with this trauma patient, including orthopedic surgery, thoracic surgery and/or neurosurgery. This coordination will include a discussion of the sequence, timing, and scope of the procedures along with supportive measures that may be needed, such as massive transfusion protocols. The surgeon will order and confirm pre-operative antibiotics. The length and type of anesthesia are reviewed with the anesthesiologist, including the possibility for an emergent laparotomy or thoracotomy. The availability of all required instruments and supplies is verified, including instruments and supplies that may be needed for a potential thoracotomy or laparotomy. Assistance is provided in the transfer of the patient from the gurney to the operating table. The patient is positioned supine and the abdomen is marked and prepped from the groin to the clavicles in order to reach the thorax and abdomen if an emergent laparotomy or thoracotomy is needed. The surgeon scrubs and gowns. The surgical area is draped. A surgical time-out is performed with the operating surgical team and anesthesia team.

Description of Intra-Service Work: A Pfannenstiel low horizontal incision is made just above the pubic rim. The upper edge of the pubic bone is palpated, a low transverse incision with detachment of the rectus muscles from their insertion on the rami pubic is made, and dissection is then carried out until the urinary bladder is identified. Without opening the peritoneum, the urinary bladder is retracted to one side while blunt dissection is manually carried out onto the iliacus muscle. Identification of the extra-peritoneal bladder is critical as is a retraction of the urinary bladder to the contralateral side in order to directly approach the presacral vessels. Packing is directed downward and posteriorly while sliding down the urinary bladder directing the surgeon's fingers posteriorly and deep into the true pelvis, reaching posteriorly until the sacroiliac joint is palpated. Surgical abdominal pads are then firmly packed via this route down into the sacroiliac joint. The abdominal pads are directed toward the pelvic venous plexus and branches of the internal iliac artery, which are in close proximity to the sacrum and pelvic bones. Considerable pressure is mandatory in this packing maneuver, so that the abdominal pads are firmly packed on the pelvic ring from the sacrum to the pelvic rim, thus creating pressure directly onto the presacral vessels. The same maneuver is then repeated on the contralateral side of the bladder. Care is taken to avoid compression of the femoral vessels. After controlling the pelvic bleeding and once the patient's vital signs improve, drains are placed and the incision is closed with temporary sutures.

Description of Post-Service Work: Sterile dressings are applied. The patient is monitored during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough. Assistance is

provided in transfer of the patient from the operating table to a gurney. The patient is monitored for hemodynamic stability until and during transfer to the intensive care unit (ICU). Postoperative recovery care is discussed with ICU staff. Extensive postoperative orders for medications, imaging, and laboratory tests are written in the patient's chart. Procedure and outcome are discussed with family, if available. A brief operative note is written. A complete operative report is dictated. Monitoring for hemodynamic stability continues.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In 2014, the American College of Surgeons (ACS) and the U.S. Department of Defense Military Health System (MHS) formed the Military Health System Strategic Partnership American College of Surgeons (MHSSPACS) to improve educational opportunities, systems-based practices, and research capabilities in surgery. Although some trauma-related procedures are not common in the United States, members of the MHSSPACS have indicated that CPT codes are used

by the U.S. military medical personnel to indicate work performed at military bases and on the battle field around the world. For CPT 2020, the CPT Editorial Panel approved a new CPT Category I code to report preperitoneal pelvic packing without the need for a laparotomy. This procedure may be performed when angioembolization services are not available or not available in a timely manner. A second code was approved for removal that will occur on a subsequent day, if the patient survives.

Survey Process

A survey request was sent to: 1) A random selection of ACS members who self-designated as trauma or critical care surgeons; 2) A random selection of U.S. member of the American Association for the Surgery of Trauma; and 3) A random selection of members of the Excelsior Surgical Society (These surgeons are ACS members who are currently serving on active duty in a branch of the US Uniformed Medical Service; currently active or inactive Armed Forces Reserve or National Guard; or are retired or discharged under honorable conditions from a US Uniformed Medical Service after at least one year of service.) A majority of respondents had experience with these procedures in the past 12 months. Because preperitoneal pelvic packing has been widely disseminated as part of the educational curriculum of trauma courses such as the American College of Surgeons' Committee on Trauma ASSET course, those who did not have recent experience are likely familiar with the procedure.

Recommendation – 49013

Work RVU: The survey median work RVU of 8.35 is recommended for 49013.

Pre-time Package 4: Difficult Patient/Difficult Procedure

Evaluation: Subtract 10 minutes to be consistent with the survey median and to acknowledge the urgent nature of this service. This is the same evaluation time recently approved for a similarly urgent procedure (31603).

Positioning: Seven minutes has been added to the time for patient positioning. Although the patient will be supine, additional preparation of the entire torso for possible emergent chest or abdominal surgery will be required. In addition, a patient with pelvic trauma requiring this operation will likely have a pelvic c-clamp for stabilization and other injuries that need to be considered while positioning the patient.

Scrub, dress, and wait: Subtract 10 minutes to be consistent with the survey median and to acknowledge the urgent nature of this service. This is the same evaluation time recently approved for a similarly urgent procedure (31603).

Post-time Package 9b: General Anesthesia or Complex Regional Block/Complex Procedure

Add 27 minutes for a total of 60 minutes. Postoperatively, the patient's hemodynamic status will be monitored very closely for more than the 10 minutes included in the package for monitoring patient recover. Significant coordination with other treating physicians (eg, orthopaedic) and ICU staff will be necessary. Time for this activity is not included in the postop package. Order entry will take more than 5 minutes. Our expert panel agrees that 60 minutes of postoperative work on the day of this procedure is a minimum.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☒ Other reason (please explain) Critical care services may be separately reported, when performed. Also, depending on the patient presentation, other procedures and services may also be performed

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 48500

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. This will be a low volume code. We request assignment of "general surgery" as the single anticipated specialty.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 49014	Tracking Number F2	Original Specialty Recommended RVU: 6.73
		Presented Recommended RVU: 6.73
Global Period: 000	Current Work RVU:	RUC Recommended RVU: 6.73

CPT Descriptor: Re-exploration of pelvic wound with removal of preperitoneal pelvic packing including repacking, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male is returned to the operating room one or more days following initial preperitoneal packing for active hemorrhage to have the packing removed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The appropriate antibiotic(s) are selected and ordered, and timing and administration are confirmed. Recent lab tests and imaging are reviewed. The planned procedure and postoperative management are reviewed with the patient and family. Informed consent is obtained. The length and type of anesthesia are reviewed with the anesthesiologist. The availability of all required instruments and supplies is verified, including instruments and supplies that may be needed for a potential laparotomy. Assistance is provided in the transfer of the patient from the gurney to the operating table. The surgical area is prepped and draped. The surgeon scrubs and gowns. A surgical time-out is performed with operating surgical team and anesthesia team.

Description of Intra-Service Work: The previous incision is opened and the wound is debrided as needed. The packing is carefully removed, one pad at a time to confirm bleeding has been controlled. Local exploration and irrigation is performed with each pad removal. The wound is closed in layers with drains inserted as required.

Description of Post-Service Work: Sterile dressings are applied. The patient is monitored during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough. Assistance is provided in transfer of the patient from the operating table to a gurney. Postoperative recovery care is discussed with surgical floor staff. Postoperative orders for medications, imaging, and laboratory tests are written. Procedure and outcome are discussed with the family. A brief operative note is written. An operative report is dictated.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

In 2014, the American College of Surgeons (ACS) and the U.S. Department of Defense Military Health System (MHS) formed the Military Health System Strategic Partnership American College of Surgeons (MHSSPACS) to improve

educational opportunities, systems-based practices, and research capabilities in surgery. Although some trauma-related procedures are not common in the United States, members of the MHSSPACS have indicated that CPT codes are used by the U.S. military medical personnel to indicate work performed at military bases and on the battle field around the world. For CPT 2020, the CPT Editorial Panel approved a new CPT Category I code to report preperitoneal pelvic packing without the need for a laparotomy. This procedure may be performed when angioembolization services are not available or not available in a timely manner. A second code was approved for removal that will occur on a subsequent day, if the patient survives.

Survey Process

A survey request was sent to: 1) A random selection of ACS members who self-designated as trauma or critical care surgeons; 2) A random selection of U.S. member of the American Association for the Surgery of Trauma; and 3) A random selection of members of the Excelsior Surgical Society (These surgeons are ACS members who are currently serving on active duty in a branch of the US Uniformed Medical Service; currently active or inactive Armed Forces Reserve or National Guard; or are retired or discharged under honorable conditions from a US Uniformed Medical Service after at least one year of service.) A majority of respondents had experience with these procedures in the past 12 months. Because preperitoneal pelvic packing has been widely disseminated as part of the educational curriculum of trauma courses such as the American College of Surgeons' Committee on Trauma ASSET course, those who did not have recent experience are likely familiar with the procedure.

Recommendation – 49014

Work RVU: A survey median work RVU of 6.73 is recommended for 49014.

Pre-time Package 4: Difficult Patient/Difficult Procedure

Evaluation: Standard package time of 40 minutes.

Positioning: Standard package time of 3 minutes for supine positioning.

Scrub, dress, and wait: Subtract 10 minutes to be consistent with the survey median..

Post-time Package 9b: General Anesthesia or Complex Regional Block/Complex Procedure

Subtract 3 minutes to be consistent with the survey median.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 49999 Unlisted procedure, abdomen, peritoneum and omentum

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national utilization not available

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 25 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Less than 0.25% of the Medicare utilization for 49999 may be reported with new codes 490X1 and 490X2. High energy pelvic trauma is not typical for the Medicare-age population. The typical clinical scenario requiring this service includes motor vehicle accidents, acts of terrorism, and battlefield injuries. The technique for performing preperitoneal pelvic packing has been widely disseminated as part of the educational curriculum of trauma courses such as the American College of Surgeons' Committee on Trauma ASSET course.

****No direct practice expense inputs recommended****

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:
3. Is this code(s) typically billed with an E/M service?
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence:
6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:
8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.
9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:
10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:
11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:
13. If there is any other item on your spreadsheet that needs further explanation please include here:
14. Please include an explanation of each line item:

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

49014 Re-exploration of pelvic wound with removal of preperitoneal pelvic packing including repacking, when performed

Global Period: 000 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

The ACS convened an expert panel familiar with 49014 and similar services to determine appropriate practice expense inputs.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Code 31600 has been used as a reference—this is also the 2nd key reference service from the RUC survey. Similar to 49014, code 31600 is a planned major operation that will be performed on a patient who is already hospitalized and has a 0-day global assignment.

3. Is this code(s) typically billed with an E/M service? No
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Code 49014 is a planned major operation performed in an OR under general anesthesia. We recommend the 0-day standard package for extensive use of clinical staff minus the time for providing pre-service education and follow-up phone calls to the patient since the typical patient is already in the hospital. This is the same time (20 minutes) that was approved by the PEAC recently for reference code 31600.

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: N/A
6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: N/A
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: N/A
8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: N/A
10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: N/A
11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here: N/A
12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: N/A
13. If there is any other item on your spreadsheet that needs further explanation please include here: N/A
14. Please include an explanation of each line item: N/A

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor:

- | | |
|-------|---|
| 49013 | Preperitoneal pelvic packing for hemorrhage associated with pelvic trauma, including local exploration |
| 49014 | Re-exploration of pelvic wound with removal of preperitoneal pelvic packing including repacking, when performed |

Global Period: 000 Meeting Date: October 2018

****No direct practice expense inputs recommended****

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:
2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:
3. Is this code(s) typically billed with an E/M service?
Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)
4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different then for the global?
(Please see provided data in PE Subcommittee folder)
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.
7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:
9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly*

related to physician work time or Perform procedure/service---NOT directly related to physician work time:

10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:
12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.
13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:
14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:
15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:
16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:
17. If there is any other item on your spreadsheet that needs further explanation please include here:
18. Please include an explanation of each line item:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2018

Somatic Nerve Injection

In May 2018 the CPT Editorial Panel approved the revision of descriptors and guidelines for codes 64400- 64450 and deletion of 3 codes to clarify reporting (ie, separate reporting of imaging guidance, number of units, change of CPT codes 64421 from a 0-day global to ZZZ). Codes 64400-64450 describe the injection of an anesthetic agent(s) and/or steroid into a nerve plexus, nerve, or branch. These codes are reported once per nerve plexus, nerve, or branch as described in the descriptor regardless of the number of injections performed along the nerve plexus, nerve, or branch described by the code. Image guidance (ultrasound, fluoroscopy, CT) and localization may be reported separately. The physician work for this family of services varies based on the anatomic location of each nerve, whether the services is typically performed in the facility setting, the typical approach used by the dominant specialty to access the nerve that performs each service and whether the service involves continuous infusion by catheter.

64400 Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each branch (ie, ophthalmic, maxillary, mandibular)

The RUC reviewed the survey results from 56 physicians and agreed on the following physician time components: 7 minutes of pre-service evaluation, 1 minute of pre-service positioning, 1 minute of pre-service scrub/dress/wait, 6 minutes of intra-service time and 5 minutes of immediate post-service time. The RUC noted that the current times for this service are over 25 years old from the Harvard study and not valid for comparison. The IWP/UT for the current times is similar to scrub/dress/wait IWP/UT, which strongly implies the current times are highly inflated relative to the current work RVU and not valid for comparison to the new times.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents somewhat overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.14. To find an appropriate work RVU, the RUC reviewed the survey 25th percentile for only the neurologist survey respondents of 1.00, noting that neurology is the top performing specialty yet there were fewer survey responses from neurology than from anesthesiology. Neurology is 47 percent of the 2017 Medicare claims whereas anesthesiology is only 10 percent of the claims, the RUC noted that it would be appropriate to value the service at the Neurology 25th percentile of 1.00. To justify a work RVU of 1.00, the RUC compared the survey code to CPT code 31575 *Laryngoscopy, flexible; diagnostic* (work RVU = 0.94, intra-service time of 5 minutes) and noted that the reference code more intra-service time and involves slightly more physician work. The RUC also compared the survey code to MPC code 36620 *Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous* (work RVU = 1.00, intra-service time of 7 minutes, total time of 17 minutes) and noted that although the survey code has 1 minute less of intra-service time, it has 3 more minutes of total time and both services involve a similar amount of physician work. **The RUC recommends a work RVU of 1.00 for CPT code 64400.**

64408 Injection(s), anesthetic agent(s) and/or steroid; vagus nerve

The RUC reviewed the survey results from 37 physicians and agreed on the following physician time components: 7 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of intra-service time and 5 minutes of immediate post-service time.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 0.90. To justify a work RVU of 0.90, the RUC compared the survey code to CPT code 31575 *Laryngoscopy, flexible; diagnostic* (work RVU = 0.94, intra-service time of 5 minutes) and noted that both services have identical intra-service times and involve a similar amount of physician work, and therefore should be valued similarly. The RUC also compared the survey code to MPC code 36620 *Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous* (work RVU = 1.00, intra-service time of 7 minutes, total time of 17 minutes) and noted that the survey code involves 2 minutes less of intra-service time and it would be appropriate to value the survey code somewhat less as it involves somewhat less overall work. **The RUC recommends a work RVU of 0.90 for CPT code 64408.**

64415 Injection(s), anesthetic agent(s) and/or steroid; brachial plexus

The RUC reviewed the survey results from 57 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 1 minute of pre-service positioning, 4 minutes of pre-service scrub/dress/wait, 12 minutes of intra-service time and 10 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 1.42. To justify a work RVU of 1.42, the RUC compared the survey code to CPT code 64612 *Chemodenervation of muscle(s); muscle(s) innervated by facial nerve, unilateral (eg, for blepharospasm, hemifacial spasm)* (work RVU = 1.41, intra-service time of 10 minutes) and noted that the survey code involves slightly more intra-service time and slightly less total time and both services include a similar amount of physician work. The RUC also compared the survey code to CPT code 30903 *Control nasal hemorrhage, anterior, complex (extensive cautery and/or packing) any method* (work RVU = 1.54, intra-service time of 15 minutes, total time of 39 minutes) and noted that the survey code involves less intra-service time and valuing the survey code at 1.42 would maintain appropriate relativity with the reference code. **The RUC recommends a work RVU of 1.42 for CPT code 64415.**

64416 Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, continuous infusion by catheter (including catheter placement)

The RUC reviewed the survey results from 42 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 1 minute of pre-service positioning, 5 minutes of pre-service scrub/dress/wait, 20 minutes of intra-service time and 10 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 1.81. To justify a work RVU of 1.81, the RUC compared the survey

code to CPT code 32554 *Thoracentesis, needle or catheter, aspiration of the pleural space; without imaging guidance* (work RVU = 1.82, intra-service time of 20 minutes) and noted that both services involve identical intra-service time and have typically require a similar amount of physician work. **The RUC recommends a work RVU of 1.81 for CPT code 64416.**

64417 Injection(s), anesthetic agent(s) and/or steroid; axillary nerve

The RUC reviewed the survey results from 45 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 1 minute of pre-service positioning, 4 minutes of pre-service scrub/dress/wait, 10 minutes of intra-service time and 10 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting. The RUC noted that the current times for this service are over 25 years old from the Harvard study and not valid for comparison.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 1.27. To justify a work RVU of 1.27, the RUC compared the survey code to CPT code 49082 *Abdominal paracentesis (diagnostic or therapeutic); without imaging guidance* (work RVU = 1.24, intra-service time of 10 minutes) and noted that both services involve identical intra-service time and total time and a similar amount of physician work. The RUC also compared the code to CPT code 32562 *Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day* (work RVU = 1.24, intra-service time of 10) and noted that both services have identical intra-service times and involve a similar amount of physician work. The RUC noted that 64417 has appropriate relativity with the rest of the family. For example, 64415 and 64417 involve a similar work intensity and therefore the RUC recommendations for both services have similar IWPUTs. **The RUC recommends a work RVU of 1.27 for CPT code 64417.**

64420 Injection(s), anesthetic agent(s) and/or steroid; intercostal nerve, single level

The RUC reviewed the survey results from 60 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 1 minute of pre-service positioning, 5 minutes of pre-service scrub/dress/wait, 10 minutes of intra-service time and 5 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting. The RUC noted that the current times for this service are from the Harvard study more than 20 years ago; in 1994, the RVU for this service was lowered substantially but the intra-service time was not changed to reflect the decrease. Therefore, a reduction in time would not necessarily imply a reduction in work value as the previous times used a flawed methodology.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents somewhat overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.24. The RUC also reviewed the current value for this service of 1.18 and noted that would continue to be the appropriate value for this service. To verify a value of 1.18, the RUC compared the survey code to CPT code 49082 *Abdominal paracentesis (diagnostic or therapeutic); without imaging guidance* (work RVU = 1.24, intra-service time of 10 minutes) and noted that both codes involve identical intra-service time, whereas the reference code involves somewhat more total time and that the survey code should be valued somewhat lower. The RUC also compared the code to CPT code 32562 *Instillation(s), via chest tube/catheter, agent for*

fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day (work RVU = 1.24, intra-service time of 10) and noted that both services have identical intra-service times and involve a similar amount of physician work. The RUC noted that 64417 has appropriate relativity with the rest of the family. For example, 64420 and 64417 involve a similar work intensity and therefore the RUC recommendations for both services have similar IWPUs. **The RUC recommends a work RVU of 1.18 for CPT code 64420.**

64421 Injection(s), anesthetic agent(s) and/or steroid; intercostal nerves, each additional level (List separately in addition to code for primary procedure)

The RUC reviewed the survey results from 60 physicians and agreed on the following physician time components: 10 minutes of intra-service time. The RUC noted that the coding structure for 64421 changed when the code was revised by CPT; 64421 switched from a 000-day global code that code only be reported a single time to an add-on code for 64420. Furthermore, the current physician times for 64421 are over 25 years old and from the Harvard study.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.00. To find an appropriate work RVU crosswalk, the RUC compared the survey code to CPT code 77063 *Screening digital breast tomosynthesis, bilateral (List separately in addition to code for primary procedure)* (work RVU = 0.60, intra-service time of 8 minutes) and noted that although the survey code involves somewhat more intra-service time, both services require a very similar amount of physician work. Therefore, the RUC recommends a direct work RVU crosswalk from 77063 to 64421. **The RUC recommends a work RVU of 0.60 for CPT code 64421.**

64425 Injection(s), anesthetic agent(s) and/or steroid; ilioinguinal, iliohypogastric nerves

The RUC reviewed the survey results from 54 physicians and agreed on the following physician time components: 7 minutes of pre-service evaluation, 1 minute of pre-service positioning, 1 minute of pre-service scrub/dress/wait, 11 minutes of intra-service time and 5 minutes of immediate post-service time. The RUC noted that the current times for this service are over 25 years old from the Harvard study and not valid for comparison.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 1.19. To justify a work RVU of 1.19, the RUC compared the survey code to CPT code 49082 *Abdominal paracentesis (diagnostic or therapeutic); without imaging guidance* (work RVU = 1.24, intra-service time of 10 minutes) and noted that both services involve identical intra-service time and whereas the reference code involves somewhat more total time and it would be appropriate to value the survey code somewhat lower than the reference code at a value of 1.19. The RUC also compared the code to CPT code 32562 *Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day* (work RVU = 1.24, intra-service time of 10) and noted that both services have similar intra-service times and the survey code should be valued slightly less than the reference code to maintain appropriate relativity. **The RUC recommends a work RVU of 1.19 for CPT code 64425.**

64430 Injection(s), anesthetic agent(s) and/or steroid; pudendal nerve

The RUC reviewed the survey results from 67 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 5 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait, 10 minutes of intra-service time and 10 minutes of immediate post-service time. The specialty noted and the RUC agreed that this service requires more post-time than CPT code 64425 as the pudendal nerve is deeper. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting. The post-service time is longer for 64430 compared to 64435 because the approach involves going much deeper and the physician typically stays longer as the patient tends to have pelvic muscle weakness. Unlike for 64435, for 64430, the patient is then re-examined digitally to confirm pelvic stability and pelvic floor tonicity during the post-service period. The patient is then evaluated for safety in ambulation.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 1.15. To justify a work RVU of 1.15, the RUC compared the survey code to CPT code 49082 *Abdominal paracentesis (diagnostic or therapeutic); without imaging guidance* (work RVU = 1.24, intra-service time of 10 minutes) and noted that both services involve identical intra-service time and whereas the reference code involves somewhat more total time and it would be appropriate to value the survey code somewhat lower than the reference code at a value of 1.15. The RUC also compared the code to CPT code 32562 *Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day* (work RVU = 1.24, intra-service time of 10) and noted that both services have identical intra-service times and the survey code should be valued slightly less than the reference code to maintain appropriate relativity. **The RUC recommends a work RVU of 1.15 for CPT code 64430.**

64435 Injection(s), anesthetic agent(s) and/or steroid; paracervical (uterine) nerve

The RUC reviewed the survey results from 42 physicians and agreed on the following physician time components: 7 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 5 minutes of intra-service time and 5 minutes of immediate post-service time.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents appropriately valued the physician work involved in performing this service at the 25th percentile work RVU of 0.75. To justify a work RVU of 0.75, the RUC compared the survey code to top key reference code 20551 *Injection(s); single tendon origin/insertion* (work RVU = 0.75, intra-service time of 5, total time of 20 minutes) and noted that both services involve identical intra-service time and total time and the same amount of physician work. The RUC also compared the survey code to CPT code 31575 *Laryngoscopy, flexible; diagnostic* (work RVU = 0.94, intra-service time of 5 minutes) and noted that although both services have identical intra-service time, the reference code involves more total time, justifying a somewhat lower valuation for the survey code. **The RUC recommends a work RVU of 0.75 for CPT code 64435.**

64445 Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve

The RUC reviewed the survey results from 68 physicians and agreed on the following physician time components: 7 minutes of pre-service evaluation, 1 minutes of pre-service positioning, 1 minutes of pre-service scrub/dress/wait, 10 minutes of intra-service time and 5 minutes of immediate post-service time.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.30. To find an appropriate work RVU crosswalk, the RUC compared the survey code to CPT code 67810 *Incisional biopsy of eyelid skin including lid margin* (work RVU = 1.18, intra-service time of 13 minutes, total time of 27 minutes and noted that although the survey code involves somewhat less intra-service time, it involves somewhat more total time and a very similar amount of physician work. The RUC recommends a direct work RVU crosswalk from CPT code 67810 to CPT code 64445. The RUC also compared the code to CPT code 32562 *Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day* (work RVU = 1.24, intra-service time of 10) and noted that both services have identical intra-service times and whereas the survey code involves slightly more overall physician work. **The RUC recommends a work RVU of 1.18 for CPT code 64445.**

64446 *Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, continuous infusion by catheter (including catheter placement)*

The RUC reviewed the survey results from 48 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 1 minute of pre-service positioning, 5 minutes of pre-service scrub/dress/wait, 15 minutes of intra-service time and 6 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.80. To find an appropriate work RVU crosswalk, the RUC compared the survey code to CPT code 30903 *Control nasal hemorrhage, anterior, complex (extensive cautery and/or packing) any method* (work RVU = 1.54, intra-service time of 15 minutes, total time of 39 minutes) and noted that both services have identical intra-service time and total time and involve an identical amount of physician work. The RUC recommends a direct work RVU crosswalk from CPT code 30903 to CPT code 64446. **The RUC recommends a work RVU of 1.54 for CPT code 64446.**

64447 *Injection(s), anesthetic agent(s) and/or steroid; femoral nerve*

The RUC reviewed the survey results from 62 physicians and agreed on the following physician time components: 12 minutes of pre-service evaluation, 1 minute of pre-service positioning, 3 minutes of pre-service scrub/dress/wait, 6 minutes of intra-service time and 5 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.29. To find an appropriate work RVU crosswalk, the RUC compared the survey code to CPT code 31231 *Nasal endoscopy, diagnostic, unilateral or bilateral (separate procedure)* (work RVU = 1.10, intra-service time of 7 minutes, total time of 21 minutes) and noted that although the survey code involves slightly less intra-service time, it requires more total time and a very similar amount of physician work. The RUC recommends a direct work RVU crosswalk from CPT code 31231 to CPT code 64447. **The RUC recommends a work RVU of 1.10 for CPT code 64447.**

64448 *Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, continuous infusion by catheter (including catheter placement)*

The RUC reviewed the survey results from 51 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 1 minute of pre-service positioning, 5 minutes of pre-service scrub/dress/wait, 13 minutes of intra-service time and 6 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.78. To find an appropriate work RVU crosswalk, the RUC compared the survey code to CPT code 62322 *Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); without imaging guidance* (work RVU = 1.55, intra-service time of 11 minutes, total time of 39 minutes) and noted that the survey code involves somewhat more intra-service time whereas both services only differ on total time by 1 minute and require a very similar total amount of physician work. The RUC recommends a direct work RVU crosswalk from CPT code 62322 to CPT code 64448. The RUC also compared the survey code to MPC code 57452 *Colposcopy of the cervix including upper/adjacent vagina*; (work RVU = 1.50, intra-service time of 15 minutes, total time of 40 minutes) and noted that both services involve similar intra-service time and total time and should be valued similarly. **The RUC recommends a work RVU of 1.55 for CPT code 64448.**

64449 *Injection(s), anesthetic agent(s) and/or steroid; lumbar plexus, posterior approach, continuous infusion by catheter (including catheter placement)*

The RUC reviewed the survey results from 36 physicians and agreed on the following physician time components: 13 minutes of pre-service evaluation, 1 minutes of pre-service positioning, 5 minutes of pre-service scrub/dress/wait, 14 minutes of intra-service time and 5 minutes of immediate post-service time. This service is typically performed in the facility setting and requires more pre-service evaluation and scrub/dress/wait time than services in this family that are typically performed in the non-facility setting.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.80. To find an appropriate work RVU crosswalk, the RUC compared the survey code to CPT code 62322 *Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); without imaging guidance* (work RVU = 1.55, intra-service time of 11 minutes, total time of 39 minutes) and noted that the survey code involves somewhat more intra-service time whereas both services only differ on total time by 1 minute and require a very similar total amount of physician work. The RUC recommends a direct work RVU crosswalk from CPT code 62322 to CPT code 64449. The RUC also compared the survey code to MPC code 57452 *Colposcopy of the cervix including upper/adjacent vagina*; (work RVU = 1.50, intra-service time of 15 minutes, total time of 40 minutes) and noted that both services involve similar intra-service time and total time and should be valued similarly. The RUC noted that survey codes 64448 and 64449 have identical total times, only one minute difference in intra-service time and involve the same amount of physician work. **The RUC recommends a work RVU of 1.55 for CPT code 64449.**

64450 Injection(s), anesthetic agent(s) and/or steroid; other peripheral nerve or branch

The RUC reviewed the survey results from 88 physicians and agreed on the following physician time components: 7 minutes of pre-service evaluation, 1 minute of pre-service positioning, 1 minute of pre-service scrub/dress/wait, 5 minutes of intra-service time and 5 minutes of immediate post-service time.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents somewhat overvalued the work involved in performing this service, with a 25th percentile work RVU of 1.00. The RUC also reviewed the current value for this service of 0.75 and noted that would continue to be the appropriate value for this service. To justify a work RVU of 0.75, the RUC compared the survey code to CPT code 20551 *Injection(s); single tendon origin/insertion* (work RVU = 0.75, intra-service time of 5, total time of 20 minutes) and noted that both services involve identical intra-service time and very similar total time and the same amount of physician work. The RUC also compared the survey code to CPT code 31575 *Laryngoscopy, flexible; diagnostic* (work RVU = 0.94, intra-service time of 5 minutes) and noted that although both services have identical intra-service time, the reference code involves more total time and somewhat more intensity, justifying a somewhat lower valuation for the survey code. **The RUC recommends a work RVU of 0.75 for CPT code 64450.**

RUC Referral to CPT

During the October 2018 RUC presentation for this family of services, the specialty societies stated that codes 64415, 64416, 64417, 64446, 66447, and 64448 were reported with code 76942 *Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation* more than 50 percent of the time. Specifically, 76 percent with 64415, 85 percent with 64416, 68 percent with 64417, 77 percent with 64446, 77 percent with 66447, and 79 percent with 64448. The societies indicated they would submit a code change application to bundle 76942 into codes 64415, 64416, 64417, 64446, 64447, and 64448 for the 2021 cycle. This overlap was accounted for in the above RUC recommendations for these services. **The RUC refers CPT codes 64415, 64416, 64417, 64446, 64447 and 64448 to be bundled with ultrasound guidance, CPT code 76942 to the CPT Editorial Panel for CPT 2021.**

Practice Expense

The RUC reviewed and approved the direct practice expense inputs as approved by the Practice Expense Subcommittee, with the only revision to account for the reduction in procedure time for codes 64400 and 64450.

Work Neutrality

The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Affirmation of RUC Recommendations

The RUC affirmed the recent RUC recommendations for CPT codes 64405 (work RVU= 0.94, pre-evaluation time of 5 minutes, pre-positioning time of 1 minute, intra-service time of 5 minutes and post-service time of 5 minutes) and 64418 (work RVU= 1.10, pre-evaluation time of 6

minutes, pre-positioning time of 3 minutes, pre-scrub/dress/wait time of 3 minutes, intra-service time of 10 minutes, post-service time of 10 minutes). The relativity within the family remains correct.

Do Not Use to Validate for Physician Work

The RUC agreed that CPT codes 64400 and 64418 should be labeled in the RUC database with a flag that it should not be used to validate physician work.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<p>Nervous System Extracranial Nerves, Peripheral Nerves, and Autonomic Nervous System Introduction/Injection of Anesthetic Agent (Nerve Block), Diagnostic or Therapeutic</p> <p><i>(For destruction by neurolytic agent or chemodenervation, see 62280-62282, 64600-64681)</i></p> <p><i>(For epidural or subarachnoid injection, see 62320, 62321, 62322, 62323, 62324, 62325, 62326, 62327)</i></p> <p><i>(64400-64455, 64461, 64462, 64463, 64479, 64480, 64483, 64484, 64490-64495 are unilateral procedures. For bilateral procedures, use modifier 50)</i></p> <p>Somatic Nerves</p> <p><u>Codes 64400-64489 describe the introduction/injection of an anesthetic agent and/or steroid into the somatic nervous system for diagnostic or therapeutic purposes. For injection or destruction of genicular nerve branches, see 644X0, 644X1.</u></p> <p><u>Codes 64400-64450, 644X0 describe the injection of an anesthetic agent(s) and/or steroid into a nerve plexus, nerve, or branch. These codes are reported once per nerve plexus, nerve, or branch as described in the descriptor regardless of the number of injections performed along the nerve plexus, nerve, or branch described by the code. Image guidance (ultrasound, fluoroscopy, CT) and localization may be reported separately.</u></p>				

Image guidance (ultrasound, fluoroscopy, CT) and any injection of contrast are inclusive components of 644X0.

Codes 64455, 64479, 64480, 64483, 64484 are reported for a single or multiple injections at the same site. For 64479, 64480, 64483, 64484, image guidance (fluoroscopy or CT) and any injection of contrast are inclusive components and are not reported separately. For 64455, image guidance (ultrasound, fluoroscopy, CT) and localization may be reported separately.

Codes 64461, 64462, 64463 describe injection of a paravertebral block (PVB). Codes 64486, 64487, 64488, 64489 describe injection of a transversus abdominis plane (TAP) block. Image guidance and any injection of contrast are inclusive components of 64461, 64462, 64463 and 64486, 64487, 64488, 64489 and are not reported separately.

▲ 64400	H1	Injection(s), anesthetic agent(s) <u>and/or steroid</u> ; trigeminal nerve, <u>each any division or branch (ie, ophthalmic, maxillary, mandibular)</u>	000	1.00

Chicago, IL 60611

Re: Somatic Nerve Procedures

Dear Dr. Smith:

At its recent May 2018 meeting, the CPT Editorial panel approved new guidelines for the Somatic Nerve code family as well as minor edits to the code language for 64400-64450. Included within the code family are two codes that were recently reviewed by the RUC:

- 64405 Injection(s), anesthetic agent(s) and/or steroid; greater occipital nerve – RUC reviewed April 2017, values will go into effect January 2019.
- 64418 Injection(s), anesthetic agent(s) and or steroid; suprascapular nerve – RUC reviewed April 2016.

While these codes underwent minor editorial changes, there has been no change in the physician work for these two codes since they were last surveyed. We do not believe a re-survey of these codes is necessary. The joint societies therefore recommend that the current RUC values and inputs for codes 64405 (0.94 work RVU) and 64418 (1.10 work RVU) be re-affirmed at the October 2018 RUC meeting.

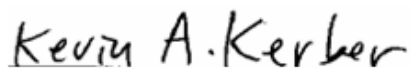

We look forward to presenting our recommendations for the Somatic Nerve code family at the upcoming RUC meeting. Please contact AAPM&R staff Carolyn Winter-Rosenberg at (847) 737-6024 or via email at cwinterrosenberg@aapmr.org if you have any questions.

Thank you for your consideration of this request.

Sincerely,

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64400	Tracking Number	Original Specialty Recommended RVU: 1.14
		Presented Recommended RVU: 1.10
Global Period: 000	Current Work RVU: 1.11	RUC Recommended RVU: 1.00

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each branch (ie, ophthalmic, maxillary, mandibular)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with a normal neurologic exam reports headaches that include pain in one or more branches of the trigeminal nerve (ophthalmic, maxillary, or mandibular). An injection of local anesthetic with or without a steroid is performed for nerve blockade.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed procedure is marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The provider prepares the skin with an antiseptic solution, applies sterile drapes and then performs the universal protocol ("time out") with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks bordering the procedure area are identified. A local anesthetic wheal is created and placed at the site of the injection. The provider penetrates the skin with the needle and injects the contents of the syringe along the course of the supraorbital nerve near the medial border of the eyebrow around the supraorbital notch. The needle is removed and the site is observed for bleeding and then covered with a sterile occlusive dressing.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and evidence of a successful block. A procedure note is dictated/written and medical record entries are made.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
62325	000	2.20	RUC Time

CPT Descriptor Injection(s), including indwelling catheter placement, continuous infusion or intermittent bolus, of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT)

SECOND HIGHEST KEY REFERENCE SERVICE:

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
64644	000	1.82	RUC Time

CPT Descriptor Chemodenervation of one extremity; 5 or more muscles

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
36620	000	1.00	RUC Time	577,293

CPT Descriptor 1 Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
36556	000	1.75	RUC Time	450,710

CPT Descriptor 2 Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
12002	000	1.14	RUC Time

CPT Descriptor Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 11 **% of respondents:** 19.6 %

Number of respondents who choose 2nd Key Reference Code: 8 **% of respondents:** 14.2 %

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64400 (Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each branch (ie, ophthalmic, maxillary, mandibular) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several

specialties to request a code change application to provide further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64400, is currently a Harvard-valued code that has not been previously surveyed. It is a 0-day global code. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA) and the American Academy of Neurology (AAN).

October 2018 RUC Meeting Recommendation Rationale

A total of 56 responses were received from a random sample of 7,147 clinicians (0.7 percent response rate). ASA and AAN convened an Expert Panel to review the survey data. ***The societies are recommending 1.10 wRVUs and time of pre (7/1/1), intra (15 min) and post (10 min).*** This results in an IWPUT of 0.046.

Vignette

The typical patient for code 64400 presents with a normal neurologic exam but reports headaches that include pain in one or more branches of the trigeminal nerve (ophthalmic, maxillary, or mandibular). An injection of local anesthetic with or without a steroid is performed for nerve blockade. 95% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64400			
Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.14	1.50	2.20
Pre		18/5/5	
Intra	5	15	20
Post		10	

After review of the reviewer comments of the societies original recommended wRVU of 1.14 and time inputs, the Expert Panel agreed to recommend the following revised work RVU and time recommendation:

- **wRVU**
 - 1.10 wRVUs; this value is less than the 25th percentile
- **Time**
 - Pre-time: Non-facility pre-service package #5 with an additional minute for positioning (7/1/1)
 - Intra-time: 15 minutes (survey median)
 - Post-time 10 minutes (survey median)

Crosswalk

The Expert Panel agreed to recommend as a value: 1.10 wRVU. The Expert Panel is basing its recommendation on a crosswalk to code **56605** (*Biopsy of vulva or perineum (separate procedure); 1 lesion*); with wRVU 1.10, with times 10/15/10 with resultant IWPUT 0.0435.

The Expert Panel also noted that the recommended value aligned with other reference code **12002** (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm*); with wRVU 1.14, with times 7/15/5 with resultant IWPUT 0.0590.

Current Value

- The current value of code 64400 is 1.11 wRVU
- The recommended wRVU of 1.10 is virtually and effectively identical

Comparison to Other Codes

The Expert Panel compared the recommendation for 64400 to other codes and identified other 0-day global codes with similar intra-time. These comparisons indicated the code was well aligned with other codes of similar time and value.

CPT Code	Long Desc	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
46614	Anoscopy; with control of bleeding (eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator)	000	1.00	15	0.0338	887
11042	Debridement, subcutaneous tissue (includes epidermis and dermis, if performed); first 20 sq cm or less	000	1.01	15	0.0369	1,816,207
45335	Sigmoidoscopy, flexible; with directed submucosal injection(s), any substance	000	1.04	15	0.0263	3,140
50431	Injection procedure for antegrade nephrostogram and/or ureterogram, complete diagnostic procedure including imaging guidance (eg, ultrasound and fluoroscopy) and all associated radiological supervision and interpretation; existing access	000	1.10	15	0.0193	9,546
56605	Biopsy of vulva or perineum (separate procedure); 1 lesion	000	1.10	15	0.0435	30,749
64400	Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each branch (ie, ophthalmic, maxillary, mandibular)	0	1.10	15	0.046	33,977
12002	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm	000	1.14	15	0.059	146,808
45331	Sigmoidoscopy, flexible; with biopsy, single or multiple	000	1.14	15	0.0345	36,331
36584	Replacement, complete, of a peripherally inserted central venous catheter (PICC), without subcutaneous port or pump, through same venous access	000	1.2	15	0.04	5,630
44385	Endoscopic evaluation of small intestinal pouch (eg, Kock pouch, ileal reservoir [S or J]); diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	000	1.2	15	0.037	1,359
57100	Biopsy of vaginal mucosa; simple (separate procedure)	000	1.2	15	0.0427	5,797
57500	Biopsy of cervix, single or multiple, or local excision of lesion, with or without fulguration (separate procedure)	000	1.2	15	0.06	7,650
12013	Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm	000	1.22	15	0.0644	50,886
40490	Biopsy of lip	000	1.22	15	0.0577	34,141

In summary, for CPT code 64400 (*Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each branch (ie, ophthalmic, maxillary, mandibular)*) **ASA and AAN recommend 1.10 wRVUs and 9/15/10 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64400

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty Anesthesiology How often? Commonly

Specialty Nurse Practitioners How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 101931

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Neurology	Frequency 47541	Percentage 46.64 %
Specialty Anesthesiology	Frequency 9928	Percentage 9.73 %
Specialty Nurse Practitioners	Frequency 6891	Percentage 6.76 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 33,977 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization data

Specialty Neurology	Frequency 15847	Percentage 46.64 %
Specialty Anesthesiology	Frequency 3309	Percentage 9.73 %
Specialty Nurse Practitioners	Frequency 2297	Percentage 6.76 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64400

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64408	Tracking Number	Original Specialty Recommended RVU: 0.94
		Presented Recommended RVU: 0.90
Global Period: 000	Current Work RVU: 1.41	RUC Recommended RVU: 0.90
CPT Descriptor: Injection, anesthetic agent; vagus nerve		

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female presents with a neurogenic cough. Injection of an anesthetic agent to the vagus nerve is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review history and physical findings, including prior tests. Discuss procedure with patient, and obtain informed consent. Ensure that necessary equipment is available and set up. After confirming correct injectant, remove disposable top from vial and clean medication top; then draw injectant. After patient is again examined and appropriate central and lateral neck landmarks are palpated, perform a time out; position patient in a partially recumbent position with head turned and neck extended; and place a shoulder roll if needed. Prep the neck using alcohol swabs.

Description of Intra-Service Work: Palpate the lateral neck landmarks. Guide spinal needle into paralaryngeal area. After aspiration for blood and air is performed to insure extraluminal and extravascular position, deliver the injectant solution. Remove injection needle then apply pressure to the injection site if needed to stop bleeding. Inspect the neck for signs of hematoma or other complications.

Description of Post-Service Work: Apply bandage. Return patient to sitting position. Observe the patient post-procedure for, any hemodynamic changes, new, unexpected neurologic deficits, vascular injury, or airway compromise. The physician communicates observation instructions with the nursing staff, patient, family, and other professionals (including written and telephone reports and orders). Document the procedure in the medical record, providing a detailed description of the placement of the injection and the patient's responses. After an appropriate period of monitoring for hemodynamic stability, mental orientation, and the neurovascular status of neck, reexamine the patient to confirm successful injection and adequate response. If the patient is stable, discharge her or him home after meeting all appropriate discharge criteria. Prior to discharge, remind the patient and family of signs and symptoms of potential complications, provide contact information to be used if such signs or symptoms develop, and discuss and arrange appropriate follow up.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Why is this code being reviewed?

A code change proposal was brought before the CPT Editorial Panel in May 2018 requesting modifications to the Somatic Nerve Injection family of codes. This included 64408. The entire family was then referred for survey at the September 2018 RUC meeting. No other specialties indicated an interest in this code, and Otolaryngology as the dominant user of the service elected to survey it. No changes were made at CPT to this CPT code.

Description of Random Survey Sample

Our physician work RVU recommendation was derived by conducting a targeted random survey of AAO-HNS members with a designation of laryngology in our database. The standard 000 global survey instrument was utilized. Surveys were sent to 568 Otolaryngologists. We received 37 responses.

Physician Time**Pre-Time**

Regarding physician time, we recommend using pre-service package 5 Procedure with minimal anesthesia care which includes 7 minutes of evaluation, 0 minutes of positioning, and 1 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that this procedure does not utilize local anesthesia.

Evaluation time: Our experts felt that the 21 minutes of evaluation time provided by respondents was excessive given the short overall time for the procedure, therefore, we reduced this down to the package's recommended 7 minutes of evaluation time.

Positioning time: Regarding time for positioning, our expert panel reviewed the 0 minutes of time assigned by package 5 and felt this was insufficient for this particular procedure. Time must be taken to position the patient, using the headrest in order to ensure a successful injection. This includes time to palpate and figure out the trajectory of the injection site. We believe the three minutes assigned for this work by survey respondents is appropriate and are requesting 3 minutes for positioning.

Scrub, Dress, and Wait time: Last, we recommend the package time of 1 minute for scrub, dress, and wait.

Total Pre-Time: These modifications result in an overall pre-service time recommendation of 7/3/1, totaling 11 minutes for 64408.

Intra Time

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 5 minutes for intra service work.

Immediate Post Time

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 6 minutes.

Physician Work

We are recommending our survey's 25th percentile of .90 for the physician work RVU. We believe the above recommendation is supported by the key reference codes, as well as crosswalk codes 64405 Injection, anesthetic agent; greater occipital nerve and 31575 Laryngoscopy, flexible; diagnostic. As the Panel is aware, 64405 is a part of this family of codes and serves as a strong comparator in work and time for 64408, we are asking that that value be reaffirmed at this meeting. In addition, 31575 is a service which has just been reviewed by the RUC and CMS and is provided by otolaryngology as the dominate specialty. We feel between these two codes survey respondents have a very clear understanding of these services and they serve as strong crosswalks for 64408. Survey respondents indicated this procedure was similar, and in many cases more, intense and complex than the selected KRS codes. We are also providing the following reference tables which include recently reviewed services which support our requested values for physician time and work for CPT 64408.

The table below compares the survey code to other RUC reviewed codes of similar time and work, providing further support that the recommended value for 64408 is appropriate.

CPT Code	Long Desc	Work RVU	Eval	Posit	SDW	Intra Time	Post Time	Total Time	RUC Review	IWPUT	MPC	2017 Utilization
20552	Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)	0.66	5	1	5	5	5	21	2016-01	0.0746	Yes	371780

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these

data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88 times in 2017 per the Medicare database.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 264

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is the 2017 Medicare volume multiplied by three in order to account for the national volume that may occur.

Specialty Otolaryngology Frequency 264 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 88 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the 2017 volume in the Medicare database.

Specialty Otolaryngology Frequency 88 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64415	Tracking Number	Original Specialty Recommended RVU: 1.42
		Presented Recommended RVU: 1.42
Global Period: 000	Current Work RVU: 1.48	RUC Recommended RVU: 1.42

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, single

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year old female has a 1-year history of tumor that is infiltrating her arm causing significant pain and interfering with her ability to complete activities of daily living. She has had poor control of her pain despite multiple medication trials and physical therapy. Due to her persistent, debilitating pain, a brachial plexus block is scheduled to relieve her pain and improve her function.

Percentage of Survey Respondents who found Vignette to be Typical: 44%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed procedure is marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The provider prepares the skin with an antiseptic solution, applies sterile drapes and then performs the universal protocol ("time out") with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks bordering the brachial plexus are identified. A local anesthetic skin wheal is created and placed at the site of injection. A needle is advanced towards the brachial plexus and correct position is confirmed. A local anesthetic and steroid is infiltrated into the fascial plane containing the brachial plexus using intermittent aspiration and injection. The needle is removed, and the site is observed for bleeding and then covered with a sterile occlusive dressing.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and evidence of a successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64415 (Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, single) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide

further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64415 is a 0-day global. It was previously surveyed by the RUC in 2009. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 57 responses were received from a random sample of 3,891 clinicians (1.4 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending 1.42 wRVUs (survey 25th) and time of pre (13/1/5), intra (12 min) and post (10 min).*** This results in an IWPOT of 0.070.

Vignette

The typical patient for code 64415 presents with persistent, debilitating pain interfering with the ability to complete daily activities. A brachial plexus block is performed to relieve her pain and improve her function.

The specialty did note that only 44% of the survey respondents found the vignette to be typical. The Expert Panel concluded that this was because while the vignette was for a female patient with pain in her arm, the code can be used for treatment for when the pain is throughout the brachial plexus which is a set of nerves that goes from the spinal cord in the neck down throughout the arm. The top diagnosis code reported in the 2018v2 RUC database is G89, Pain, not elsewhere classified. Survey respondents also indicated that the code is used for pre-operative pain as well as post-operative pain management for various types of orthopedic surgeries. Based on these factors the low typical vignette rate seemed reasonable.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64415 Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.42	1.70	2.0
Pre		20/4/4	
Intra	8	12	15
Post		10	

After a robust discussion the Expert Panel agreed to recommend:

- wRVU
 - 1.42 wRVUs (25th percentile)
- Time
 - Pre-time: Facility pre-service package #1 -adjusted (13/1/5)
 - Intra-time: 12 minutes (survey median)
 - Post-time 10 minutes (survey median)

The Expert Panel discussed how in general the treatment for pain conditions has become more complex as the opioid crisis has escalated, and treatment and coverage for other non-pharmacologic and non-interventional strategies has been limited. With worsening pain, this impacts mobility, and in general has led to a more sedentary population with increase in co-morbidities of diabetes, hypertension and obesity. These findings, particularly the increase in BMI, have led to increases in the technical skill and judgment necessary to perform the procedure as well as the associated psychological stress to reduce risk of complications, such as pneumothorax or intravascular complication.

The Expert Panel concluded that recommended wRVU value and times appropriately reflected how the service is currently performed and it aligns well within and outside of the code family.

In drafting their recommendations, the Expert Panel considered a number of factors.

Current Value

- The Expert Panel agreed that the 25th percentile of 1.42 was appropriate. It is slightly less than the current value of 1.48. The Expert Panel noted that this recommendation slightly raised the IWPUT to 0.070 from the current IWPUT of 0.0601. This was likely due to a slight decrease in the intra-service time (from 15 minutes to 12 minutes) but that this decrease of 3 minutes was accounted for in the decrease in the recommended wRVU from the current value.

Reference Code

- The Expert Panel also concluded that the recommendation aligned well with the top reference code, 62323 (*Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); with imaging guidance (ie, fluoroscopy or CT)*) which was surveyed in 2015, has a wRVU of 1.80, IWPUT of .0800 and intra time of 15 minutes. The reference code includes catheter placement, infusion and image guidance. Since none of these services are included in the surveyed code (64415), the Expert Panel agreed that the higher wRVU and IWPUT for the reference code was appropriate.

Other Code with Same wRVU Value and Similar Time

- The Panel identified one RUC-surveyed 0-day global code with wRVU of 1.42 and similar time. The Expert Panel noted the slightly higher IWPUT of 64415 compared to 43200, they believed this appropriately reflected the difference of intensity and complexity between the two procedures. The Expert Panel believed code 43200 aligned well with the surveyed code and that it supported the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
43200	Esophagoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	000	1.42	15	0.0506	6,488
64415	Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, single	000	1.42	15	0.0700	175,767

Other Codes in the Somatic Nerve Injection Family

- The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Code#	Description	Proposed wRVU
+64421	N block inj intercost sng, addl level	0.60

Rank Order

- The Expert Panel also considered other 0-day, RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned well with these codes and provided further evidence of the appropriateness of the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
67515	Injection of medication or other substance into Tenon's capsule	000	1.40	5	0.2083	26,441
43453	Dilation of esophagus, over guide wire	000	1.41	20	0.0326	1,861
43200	Esophagoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	000	1.42	15	0.0516	6,488
64415	Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, single	000	1.42	15	0.070	175,767
12004	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 7.6 cm to 12.5 cm	000	1.44	17	0.0697	22,716
65430	Scraping of cornea, diagnostic, for smear and/or culture	000	1.47	10	0.1067	4,674
51703	Insertion of temporary indwelling bladder catheter; complicated (eg, altered anatomy, fractured catheter/balloon)	000	1.47	15	0.0580	57,100
27096	Injection procedure for sacroiliac joint, anesthetic/steroid, with image guidance (fluoroscopy or CT) including arthrography when performed	000	1.48	11	0.0861	470,242
64487	Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by continuous infusion(s) (includes imaging guidance, when performed)	000	1.48	15	0.0661	314
15271	Application of skin substitute graft to trunk, arms, legs, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area	000	1.50	15	0.0609	103,189
46612	Anoscopy; with removal of multiple tumors, polyps, or other lesions by hot biopsy forceps, bipolar cautery or snare technique	000	1.50	16	0.0492	66

In summary, for CPT code CPT Code 64415 (*Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, single*) **ASA recommends 1.42 wRVUs and 19/12/10 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
☒ Multiple codes are used to maintain consistency with similar codes.
☒ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 76942-26 (Global: XXX; wRVUs: 0.67; Time: 7/15/5)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64415

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty Interventional Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 527301

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology Frequency 460650 Percentage 87.35 %

Specialty CRNA Frequency 50937 Percentage 9.65 %

Specialty Interventional Pain Management Frequency 4060 Percentage 0.76 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 175,767 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization data

Specialty Anesthesiology Frequency 153550 Percentage 87.35 %

Specialty CRNA Frequency 16979 Percentage 9.65 %

Specialty Interventional Pain Management Frequency 1353 Percentage 0.76 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64415

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64416	Tracking Number	Original Specialty Recommended RVU: 1.81
		Presented Recommended RVU: 1.81
Global Period: 000	Current Work RVU: 1.81	RUC Recommended RVU: 1.81

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, continuous infusion by catheter (including catheter placement)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54-year-old female has a 6-month history of tumor that is infiltrating her arm, causing constant trials and she has been unable to tolerate physical therapy or perform normal activities of daily living with her arm. Due to her persistent, debilitating pain, a brachial plexus block with a catheter and a continuous infusion of local anesthetic is scheduled to relieve her pain and allow her to participate in physical therapy to improve her function.

Percentage of Survey Respondents who found Vignette to be Typical: 55%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed procedure is marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injection is prepared. The provider prepares the skin with an antiseptic solution, applies sterile drapes and then performs the universal protocol ("time out") with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks bordering the brachial plexus are identified and placed at the site of injection. A local anesthetic skin wheal is created. A needle is advanced towards the brachial plexus and correct position is confirmed. A catheter is advanced to lie next to the brachial plexus and subsequently, a local anesthetic and steroid is infiltrated into the fascial plane containing the brachial plexus using intermittent aspiration and injection. The needle is removed, and the site is observed for bleeding and then covered with a sterile occlusive dressing.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and evidence of a successful block. A procedure note is dictated/written and medical record entries are made.

<ul style="list-style-type: none"> The risk of significant complications, morbidity and/or mortality Outcome depends on the skill and judgment of physician Estimated risk of malpractice suit with poor outcome 	11%	33%	56%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUP analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64416 (*Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, continuous infusion by catheter (including catheter placement)*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64416 is a 0-day global. It was previously surveyed by the RUC in 2008. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 42 responses were received from a random sample of 3,891 clinicians (1.0 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending 1.81 wRVUs (survey 25th) and time of pre (19/1/5), intra (20 min) and post (15 min).*** This results in an IWPOT of 0.049.

Vignette

The vignette in the survey described a typical patient for code 64416 as someone with persistent, debilitating pain interfering with the ability to complete daily activities. A brachial plexus block with continuous infusion of an anesthetic is performed to relieve her pain and improve her function.

The specialty did note that only 55% of the survey respondents found the vignette to be typical. The Expert Panel concluded that this was because while the vignette was for a female patient with pain in her arm, the code can be used for treatment for when the pain is throughout the brachial plexus which is a set of nerves that goes from the spinal cord in the neck down throughout the arm. The top diagnosis code reported in the 2018v2 RUC database is G89, Pain, not elsewhere classified. Survey respondents also indicated that the code is used for pre-operative pain as well as post-operative pain management for various types of orthopedic surgeries. Based on these factors the low typical vignette rate seemed reasonable.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64416			
Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.81	2.10	2.20
Pre		23/5/5	
Intra	15	20	24
Post		15	

After a robust discussion the Expert Panel agreed to recommend:

- wRVU
 - 1.81 wRVUs (25th percentile)
- Time
 - Pre-time: Facility pre-service package #2 -adjusted (19/1/5)
 - Intra-time: 20 minutes (survey median)
 - Post-time 15 minutes (survey median)

The Expert Panel discussed how in general the treatment for pain conditions has become more complex as the opioid crisis has escalated, and treatment and coverage for other non-pharmacologic and non-interventional strategies has been limited. With worsening pain, this impacts mobility, and in general has led to a more sedentary population with increase in co-morbidities of diabetes, hypertension and obesity. These findings, particularly the increase in BMI, have led to

increases in the technical skill and judgment necessary to perform the procedure as well as the associated psychological stress to reduce risk of complications, such as pneumothorax or intravascular complication.

The Expert Panel concluded that recommended wRVU value and times appropriately reflected how the service is currently performed and it aligns well within and outside of the code family.

In drafting their recommendations, the Expert Panel considered a number of factors.

Current Value

- The Expert Panel agreed that the 25th percentile of 1.81, which is also the current value of the code was appropriate. The Expert Panel also noted that the intra time of 20 minutes was the same for both the current survey as well as the previous survey conducted in 2008. This provides further evidence of the appropriateness of the recommendation.

Reference Code

- The Expert Panel also concluded that the recommendation aligned well with the top reference code, 62325 (*Injection(s), including indwelling catheter placement, continuous infusion or intermittent bolus, of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT)*) which has a wRVU of 2.20, IWPUT of 0.1066 and intra time of 15 minutes. The reference code includes catheter placement, infusion and image guidance. While code 64416 includes catheter placement and infusion it does not include image guidance. Additionally, code 62325 is reported for more complex neuraxial nerve blocks while 64416 is used for peripheral nerve blocks. The Expert Panel agreed that the higher wRVU and IWPUT for the reference code was appropriate.

Other Code with Same wRVU Value and Similar Time

- The Panel identified a recently RUC-surveyed (2017) 0-day global code with wRVU of 1.81 and similar time. The Expert Panel noted the similar IWPUTs of the two codes, they believe this appropriately reflected the similar intensity and complexity between the two procedures. The Expert Panel believed code 36514 (which is included on the MPC list) aligns well with the surveyed code and that it supports the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
36514	Therapeutic apheresis; for plasma pheresis	000	1.81	20	0.0412	28,945
64416	Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, continuous infusion by catheter (including catheter placement)	000	1.81	20	0.049	20,870

Other Codes in the Somatic Nerve Injection Family

- The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Code#	Description	Proposed wRVU
+64421	N block inj intercost sng, addl level	0.60
64435	N block inj paracervical	0.75
64450	N block other peripheral	0.84
64405	N block inj occipital	0.94
64408	N block inj vagus	0.94
64418	N block inj suprascapular	1.10
64400	N block inj trigeminal	1.14

64430	N block inj pudendal	1.15
64425	N block inj ilio-ing/hypogi	1.19
64420	N block inj intercost sng	1.24
64417	N block inj axillary	1.27
64447	N block inj fem single	1.40
64415	N block inj brachial plexus	1.42
64445	N block inj sciatic sng	1.47

64446	N blk inj sciatic cont inf	1.80
64449	N block inj lumbar plexus	1.80
64416	N block cont infuse b plex	1.81

Rank Order

- The Expert Panel also considered other 0-day, RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned well with these codes and provided further evidence of the appropriateness of the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization

36555	Insertion of non-tunneled centrally inserted central venous catheter; younger than 5 years of age	000	1.93	15	0.0842	38
62321	Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, cervical or thoracic; with imaging guidance (ie, fluoroscopy or CT)	000	1.95	15	0.0900	215,908

In summary, for CPT code CPT Code 64416 (*Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, continuous infusion by catheter (including catheter placement)*) **ASA recommends 1.81 wRVUs and 25/20/15 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☒ Multiple codes are used to maintain consistency with similar codes.
- ☒ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 76942-26 (Global: XXX; wRVUs: 0.67; Time: 7/15/5)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64416

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 62610

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology	Frequency 57733	Percentage 92.21 %
--------------------------	-----------------	--------------------

Specialty CRNA	Frequency 4189	Percentage 6.69 %
----------------	----------------	-------------------

Specialty Pain Management	Frequency 351	Percentage 0.56 %
---------------------------	---------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 20,870 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization data

Specialty Anesthesiology	Frequency 19244	Percentage 92.20 %
--------------------------	-----------------	--------------------

Specialty CRNA	Frequency 1396	Percentage 6.68 %
----------------	----------------	-------------------

Specialty Pain Management	Frequency 117	Percentage 0.56 %
---------------------------	---------------	-------------------

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64416

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64417	Tracking Number	Original Specialty Recommended RVU: 1.27
		Presented Recommended RVU: 1.27
Global Period: 000	Current Work RVU: 1.44	RUC Recommended RVU: 1.27

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; axillary nerve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male has a 3-year history of a painful mass in his deltoid that is interfering with his ability to complete activities of daily living. He has had poor control of his pain despite multiple medication trials and physical therapy. Due to his persistent, debilitating pain, an axillary nerve block is scheduled to relieve his pain and improve his function.

Percentage of Survey Respondents who found Vignette to be Typical: 53%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed procedure is marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The skin is cleansed with an antiseptic solution, sterile drapes are applied and then the universal protocol ("time out") is performed with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified and placed at the site of the injection. A local anesthetic skin wheal is created. A needle is advanced towards the axillary nerve and correct position is confirmed. A local anesthetic and steroid is infiltrated around the nerve using intermittent aspiration and injection. The needle is removed, and the site is observed for bleeding and then covered with a sterile occlusive dressing.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and evidence of a successful block. A procedure note is dictated/written and medical record entries are made.

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
64486	000	1.27	RUC Time

CPT Descriptor Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
62323	000	1.80	RUC Time

CPT Descriptor Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); with imaging guidance (ie, fluoroscopy or CT)

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
36620	000	1.00	RUC Time	577,293

CPT Descriptor 1 Arterial catheterization or cannulation for sampling, monitoring or transfusion (separate procedure); percutaneous

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
36556	000	1.75	RUC Time	450,710

CPT Descriptor 2 Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older

Other Reference CPT Code	Global	Work RVU	Time Source
62322	000	1.55	RUC Time

CPT Descriptor Injection(s), of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, including needle or catheter placement, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); without imaging guidance

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 15 % of respondents: 33.3 %

Number of respondents who choose 2nd Key Reference Code: 8 % of respondents: 17.7 %

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64417 (*Injection(s), anesthetic agent(s) and/or steroid; axillary nerve*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64417 is a 0-day global. It is currently a Harvard-valued code that has not been previously surveyed and was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 45 responses were received from a random sample of 3,891 clinicians (1.1 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending 1.27 wRVUs (survey 25th) and time of pre (13/1/5), intra (10 min) and post (10 min).*** This results in an IWPUT of 0.069.

Vignette

The vignette in the survey described a typical patient for code 64417 as someone with a painful mass in his deltoid that is interfering with his ability to complete activities of daily living. He has had poor control of his pain despite multiple medication trials and physical therapy. Due to his persistent, debilitating pain, an axillary nerve block is scheduled to relieve his pain and improve his function. The specialty did note that only 53% of the survey respondents found the vignette to be typical. Survey respondents indicated that the code is also used for pre-operative pain as well as post-operative pain management for various types of orthopedic surgeries. Based on these factors the low typical vignette rate seemed reasonable.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64417 Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.27	1.50	2.00
Pre		21/4/4	
Intra	5	10	18
Post		10	

After a robust discussion the Expert Panel agreed to recommend:

- wRVU
 - 1.27 wRVUs (25th percentile)
- Time
 - Pre-time: Facility pre-service package #1 -adjusted (13/1/5)
 - Intra-time: 10 minutes (survey median)
 - Post-time 10 minutes (survey median)

The Expert Panel discussed how in general the treatment for pain conditions has become more complex as the opioid crisis has escalated, and treatment and coverage for other non-pharmacologic and non-interventional strategies has been limited. With worsening pain, this impacts mobility, and in general has led to a more sedentary population with increase in co-morbidities of diabetes, hypertension and obesity. These findings, particularly the increase in BMI, have led to increases in the technical skill and judgment necessary to perform the procedure as well as the associated psychological stress to reduce risk of complications, such as pneumothorax or intravascular complication.

The Expert Panel concluded that recommended wRVU value and times appropriately reflect how the service is currently performed and it aligns well within and outside of the code family.

In drafting their recommendations, the Expert Panel considered a number of factors.

Current Value

- The Expert Panel agreed that the 25th percentile of 1.27 which is less than the current wRVU of 1.44 is appropriate. The Expert Panel noted that this recommendation did increase the IWPUT to 0.069 from the current IWPUT of 0.0451. This was largely due to a decrease in the intra-service time (from 19 minutes to 10 minutes). This decrease in intra-time is accounted for in the recommended wRVU decrease from the current value. Since the code was previously Harvard-valued, they felt the surveyed time more appropriately reflects current practice and the resulting IWPUT was appropriate. This position is consistent with the RUC comments on the CY 2019 NPRM for code 95970 where they state that Harvard time “holds zero validity for comparison.”

Reference Code

- The Expert Panel also concluded that the recommendation aligned well with the top reference code, 64486 (*Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)*) which was recently surveyed (2014), has a wRVU of 1.27, IWP/UT of 0.0781 and intra-time of 10 minutes. The Expert Panel noted that the codes had the same intra time but the reference code had a slightly higher IWP/UT. The reference code includes catheter placement, infusion and image guidance. They concluded it was appropriate for the two codes to be valued the same, at 1.27 wRVUs.

Other Code with Same wRVU Value and Similar Time

- The Panel identified three RUC-surveyed 0-day global codes with wRVU of 1.27 and similar time. The Expert Panel noted the similar IWP/UTs of the two codes, they believed this appropriately reflected the similar intensity and complexity between the two procedures.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWP/UT	2017 Utilization
58301	Removal of intrauterine device (IUD)	000	1.27	15	0.0473	1,496
64417	Injection(s), anesthetic agent(s) and/or steroid; axillary nerve	000	1.27	10	0.0690	13,923
64486*	Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)	000	1.27	10	0.0781	7,349
67505	Retrobulbar injection; alcohol	000	1.27	10	0.0781	181

* 64486 is also the top reference code

Other Codes in the Somatic Nerve Injection Family

- The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Code#	Description	Proposed wRVU
+64421	N block inj intercost sng, addl level	0.60
64435	N block inj paracervical	0.75
64450	N block other peripheral	0.84
64405	N block inj occipital	0.94
64408	N block inj vagus	0.94
64418	N block inj suprascapular	1.10
64400	N block inj trigeminal	1.14
64430	N block inj pudendal	1.15
64425	N block inj ilio-ing/hypogi	1.19
64420	N block inj intercost sng	1.24
64417	N block inj axillary	1.27
64447	N block inj fem single	1.40
64415	N block inj brachial plexus	1.42
64445	N block inj sciatic sng	1.47
64448	N block inj fem cont inf	1.78
64446	N blk inj sciatic cont inf	1.80

64449	N block inj lumbar plexus	1.80
64416	N block cont infuse b plex	1.81

Rank Order

- The Expert Panel also considered other 0-day, RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned well with these codes and provided further evidence of the appropriateness of the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization

64417	Injection(s), anesthetic agent(s) and/or steroid; axillary nerve	000	1.27	10	0.0690	13,923
64486	Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)	000	1.27	10	0.0781	7,349
67505	Retrobulbar injection; alcohol	000	1.27	10	0.0781	181
58301	Removal of intrauterine device (IUD)	000	1.27	15	0.0473	1,496
43450	Dilation of esophagus, by unguided sound or bougie, single or multiple passes	000	1.28	15	0.0363	72,504
46610	Anoscopy; with removal of single tumor, polyp, or other lesion by hot biopsy forceps or bipolar cautery	000	1.28	15	0.0378	166

In summary, for CPT code CPT Code 64417 (Injection(s), anesthetic agent(s) and/or steroid; axillary nerve) **ASA recommends 1.27 wRVUs and 19/10/10 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
☒ Multiple codes are used to maintain consistency with similar codes.
☒ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 76942-26 (Global: XXX; wRVUs: 0.67; Time: 7/15/5)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64417

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty Neurology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 41769

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology Frequency 33035 Percentage 79.08 %

Specialty CRNA Frequency 5309 Percentage 12.71 %

Specialty Neurology Frequency 1846 Percentage 4.41 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 13,923 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization data

Specialty Anesthesiology Frequency 11012 Percentage 79.09 %

Specialty CRNA Frequency 1770 Percentage 12.71 %

Specialty Neurology Frequency 615 Percentage 4.41 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION**

CPT Code: 64420	Tracking Number	Original Specialty Recommended RVU: 1.24
		Presented Recommended RVU: 1.18
Global Period: 000	Current Work RVU: 1.18	RUC Recommended RVU: 1.18

CPT Descriptor: Injection(s), anesthetic agent(s), and/or steroid; intercostal nerve, single level

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old female has a 2-year history of rib pain that is interfering with her ability to complete activities of daily living. She has had poor control of her pain despite multiple medication trials and physical therapy. Due to her persistent, debilitating pain, a trial of intercostal nerve block is scheduled to relieve her pain and improve her function.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed procedure is marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The provider cleans the skin with an antiseptic solution, applies a sterile drape, and then performs the universal protocol ("time out") with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified and placed at the site of the injection. A local anesthetic skin wheal is created. A needle is advanced at an angle of approximately 20° cephalad to the skin until the rib is contacted. With the same angle of insertion, the needle is walked off the inferior border of the rib and advanced 3 mm to place the tip in the space containing the neurovascular bundle between the internal and innermost intercostal muscles. After negative aspiration, a local anesthetic is injected. The needle is removed, and the site is observed for bleeding and covered with a sterile occlusive dressing.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and evidence of a successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64420 (*Injection(s), anesthetic agent(s) and/or steroid; intercostal nerve, single level*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64420 is currently a Harvard-valued code that has not been previously surveyed. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA), the American Academy of Pain Medicine (AAPM) and the American Academy of Physical Medicine & Rehabilitation (AAPM&R).

October 2018 RUC Meeting Recommendation Rationale

A total of 60 responses were received from a random sample of 2,452 clinicians (2.4 percent response rate). ASA, AAPM and AAPM&R convened an Expert Panel to review the survey data. ***The societies are recommending maintaining the current value of 1.18 wRVUs and time of pre (13/1/5), intra (10 min) and post (10 min).*** This results in an IWPUT of 0.060.

Vignette

The vignette described a typical patient for code 64420 as a 48-year-old female with a 2-year history of rib pain that is interfering with her ability to complete activities of daily living. She has had poor control of her pain despite multiple medication trials and physical therapy. Due to her persistent, debilitating pain, a trial of intercostal nerve block is scheduled to relieve her pain and improve her function. 97% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64420			
Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.24	1.50	1.86
Pre		25/5/5	
Intra	8	10	15
Post		10	

After review of the reviewer comments of the societies original recommended wRVU of 1.24 and time inputs, the Expert Panel agreed to recommend the following revised work RVU and time recommendation:

- wRVU
 - 1.18 wRVU (recommending maintaining the current value)
- Time
 - Pre-time: Facility pre-service package #1 -adjusted (13/1/5)
 - Intra-time: 10 minutes (survey median)
 - Post-time 10 minutes (survey median)

Crosswalk

Our recommended work RVU is supported by a crosswalk to code **67810** (*Incisional biopsy of eyelid skin including lid margin*); [wRVU=1.18; time=11/13/3; IWPUT=0.0688; RUC 2011].

The Expert Panel also concluded that recommended wRVU value and align well within and outside of the code family.

Current Value

- The current value of code 64420 is 1.18 wRVU
- The recommended wRVU of 1.18, which is less than the survey 25th percentile of 1.24, maintains this value

Comparison to Other Codes

- The Expert Panel compared the recommendation for 64420 to other codes and identified other 0-day global codes with similar intra-time. These comparisons indicated the code was aligned with other codes of similar time and value.

CPT Code	Long Desc	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
12002	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm	000	1.14	15	0.059	146,808
45331	Sigmoidoscopy, flexible; with biopsy, single or multiple	000	1.14	15	0.0345	36,331
64420	Injection(s), anesthetic agent(s) and/or steroid; intercostal nerve, single level	000	1.18	10	0.060	3,762
67810	Incisional biopsy of eyelid skin including lid margin	000	1.18	13	0.0688	30,330
46606	Anoscopy; with biopsy, single or multiple	000	1.2	11	0.0443	2,185
36584	Replacement, complete, of a peripherally inserted central venous catheter (PICC), without subcutaneous port or pump, through same venous access	000	1.2	15	0.04	5,630
44385	Endoscopic evaluation of small intestinal pouch (eg, Kock pouch, ileal reservoir [S or J]); diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	000	1.2	15	0.037	1,359
57100	Biopsy of vaginal mucosa; simple (separate procedure)	000	1.2	15	0.0427	5,797
57500	Biopsy of cervix, single or multiple, or local excision of lesion, with or without fulguration (separate procedure)	000	1.2	15	0.06	7,650
12013	Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm	000	1.22	15	0.0644	50,886
40490	Biopsy of lip	000	1.22	15	0.0577	34,141
32562	Instillation(s), via chest tube/catheter, agent for fibrinolysis (eg, fibrinolytic agent for break up of multiloculated effusion); subsequent day	000	1.24	10	0.0654	1,532
49082	Abdominal paracentesis (diagnostic or therapeutic); without imaging guidance	000	1.24	10	0.0654	12,016

In summary, for CPT Code 64420 (Injection(s), anesthetic agent(s) and/or steroid; intercostal nerve, single level) *ASA, AAPM, and AAPM&R recommend 1.18 wRVUs and 19/10/10 for time.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: After the initial intercostal nerve block, additional intercostal nerve blocks are performed at other levels. After cleaning the skin with an antiseptic solution, 1-2 mL of dilute local anesthetic is infiltrated subcutaneously at the planned injection site at the inferior border of the rib. A needle is advanced at an angle of approximately 20° cephalad to the skin till the rib is contacted. With the same angle of insertion, the needle is walked off the inferior border of the rib and advanced 3 mm to place the tip in the space containing the neurovascular bundle between the internal and innermost intercostal muscles. After negative aspiration, local anesthetic is deposited at each of the sites. The needle is removed, and the sites are covered with a sterile occlusive dressing.

Description of Post-Service Work: N/A

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
64462	<u>ZZZ</u>	1.10	<u>RUC Time</u>

CPT Descriptor Paravertebral block (PVB) (paraspinous block), thoracic; second and any additional injection site(s) (includes imaging guidance, when performed) (List separately in addition to code for primary procedure)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
64484	<u>ZZZ</u>	1.00	<u>RUC Time</u>

CPT Descriptor Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, each additional level (List separately in addition to code for primary procedure)

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
64484	<u>ZZZ</u>	1.00	<u>RUC Time</u>	450,460

CPT Descriptor 1 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, each additional level (List separately in addition to code for primary procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
64480	<u>ZZZ</u>	1.20	<u>RUC Time</u>	22,183

CPT Descriptor 2 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, each additional level (List separately in addition to code for primary procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
15274	000	0.80	<u>RUC Time</u>

CPT Descriptor Application of skin substitute graft to trunk, arms, legs, total wound surface area greater than or equal to 100 sq cm; each additional 100 sq cm wound surface area, or part thereof, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 17 **% of respondents:** 28.3 %

Number of respondents who choose 2nd Key Reference Code: 13 **% of respondents:** 21.6 %

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code +64421 (Injection(s), anesthetic agent(s) and/or steroid; intercostal nerves, multiple, regional block, each additional level (List separately in addition to code for primary procedure) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide

further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code +64421 is currently a Harvard-valued code 0-day global code. The new code has been changed to an add-on code reported with base code 64420. A ZZZ global period has been assigned to the new code. Code +64421 was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA), the American Academy of Pain Medicine (AAPM) and the American Academy of Physical Medicine & Rehabilitation (AAPM&R).

October 2018 RUC Meeting Recommendation Rationale

A total of 60 responses were received from a random sample of 2,452 clinicians (2.4 percent response rate). ASA, AAPM and AAPM&R convened an Expert Panel to review the survey data. ***The societies are recommending 0.60 wRVUs and 10 minutes of intra-time.*** This results in an IWPOT of 0.060.

Vignette

The typical patient presents with persistent, debilitating pain, and receives a trial of intercostal nerve blocks involving multiple intercostal spaces. 97% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

+64421 Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.00	1.24	1.50
Intra	8	10	15

After a robust discussion the Expert Panel agreed to recommend:

- wRVU
 - 0.60 wRVUs which is based on a crosswalk
- Time
 - 10 minutes intra time

The Panel noted that the survey intra-time for +64421 was the same as the surveyed intra-time for 64420. Similar intra-service time for the codes was appropriate since they both described a single injection of an intercostal nerve.

The Expert Panel discussed how in general the treatment for pain conditions has become more complex as the opioid crisis has escalated, and treatment and coverage for other non-pharmacologic and non-interventional strategies has been limited. With worsening pain, this impacts mobility, and in general has led to a more sedentary population with increase in co-morbidities of diabetes, hypertension and obesity. These findings, particularly the increase in BMI, have led to increases in the technical skill and judgment necessary to perform the procedure as well as the associated psychological stress to reduce risk of complications, such as pneumothorax or intravascular complication.

In drafting their recommendations, the Expert Panel considered a number of factors.

Crosswalk

- The Expert Panel selected the code 77063 (Screening digital breast tomosynthesis, bilateral (List separately in addition to code for primary procedure)) as the crosswalk. The ZZZ code has a wRVU of 0.60 wRVUs and intra-time of 8 minutes. It was reviewed by the RUC in 2014. The Expert Panel agreed that +64421 aligned well both for wRVU value and intensity/complexity factors.

Relationship to Base Code

- The Expert Panel tested the appropriateness of the recommended wRVU of 0.60 by backing out the pre and post time from the recommended wRVU for the base code of 64420. This resulted in a wRVU value of 0.67. While this value was a little higher than the recommended value, the Expert Panel found this to be additional evidence of the appropriateness of the recommended wRVU.
 - $1.24 - [(13 \times 0.0224) + (1 \times 0.0224) + (5 \times 0.0081) + (10 \times 0.0224)] = 0.67$

Reference Code

- The Expert Panel also concluded that the recommendation aligned well with the top reference code, +64462 (*Paravertebral block (PVB) (paraspinous block), thoracic; second and any additional injection site(s) (includes imaging guidance, when performed) (List separately in addition to code for primary procedure)*) which has a wRVU of 1.10, IWPUT of 0.0733 and intra time of 15 minutes. The Expert Panel noted that the reference code carries more intra time so the higher value was for the reference code was appropriate.

Other Codes in the Somatic Nerve Injection Family

- The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Code#	Description	Proposed wRVU
+64421	N block inj intercost sng, addl level	0.60
64435	N block inj paracervical	0.75
64450	N block other peripheral	0.84
64405	N block inj occipital	0.94
64408	N block inj vagus	0.94
64418	N block inj suprascapular	1.10
64400	N block inj trigeminal	1.14
64430	N block inj pudendal	1.15
64425	N block inj ilio-ing/hypogi	1.19
64420	N block inj intercost sng	1.24
64417	N block inj axillary	1.27
64447	N block inj fem single	1.40
64415	N block inj brachial plexus	1.42
64445	N block inj sciatic sng	1.47
64448	N block inj fem cont inf	1.78
64446	N blk inj sciatic cont inf	1.80
64449	N block inj lumbar plexus	1.80
64416	N block cont infuse b plex	1.81

Rank Order

- The Expert Panel also considered other ZZZ, RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned well with these codes and provided further evidence of the appropriateness of the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
+77002	Fluoroscopic guidance for needle placement (eg, biopsy, aspiration, injection, localization device) (List separately in addition to code for primary procedure)	ZZZ	0.54	15	0.0330	481,426
+96571	Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); each additional 15 minutes (List separately in addition to code for endoscopy or bronchoscopy procedures of lung and	ZZZ	0.55	15	0.0367	3

	gastrointestinal tract)					
+64421	Injection(s), anesthetic agent(s) and/or steroid; intercostal nerves, multiple, regional block, each additional level (List separately in addition to code for primary procedure)	ZZZ	0.60	10	0.060	17,692
+77003	Fluoroscopic guidance and localization of needle or catheter tip for spine or paraspinal diagnostic or therapeutic injection procedures (epidural or subarachnoid) (List separately in addition to code for primary procedure)	ZZZ	0.60	15	0.0370	68,387
+77063*	Screening digital breast tomosynthesis, bilateral (List separately in addition to code for primary procedure)	ZZZ	0.60	8	0.0750	2,777,164
+78020	Thyroid carcinoma metastases uptake (List separately in addition to code for primary procedure)	ZZZ	0.60	20	0.0300	1,056
+95887	Needle electromyography, non-extremity (cranial nerve supplied or axial) muscle(s) done with nerve conduction, amplitude and latency/velocity study (List separately in addition to code for primary procedure)	ZZZ	0.71	20	0.0355	14,162

* Also, selected as the crosswalk

In summary, for CPT Code +64421 (*Injection(s), anesthetic agent(s) and/or steroid; intercostal nerves, multiple, regional block, each additional level (List separately in addition to code for primary procedure)*) **ASA, AAPM, and AAPM&R recommend 0.60 wRVUs and 0/10/0 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 64420, Injection(s), anesthetic agent(s), and/or steroid; intercostal nerve, single level; 0-day global; 1.24 wRVU; time=19/10/10 (recommended at Oct 2018 RUC meeting)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64421

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty Interventional Pain Management How often? Commonly

Specialty Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 53076

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology Frequency 16799 Percentage 31.65 %

Specialty Interventional Pain Management Frequency 10483 Percentage 19.75 %

Specialty Pain Management Frequency 9787 Percentage 18.43 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 17,692 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology Frequency 5600 Percentage 31.65 %

Specialty Interventional Pain Management Frequency 3494 Percentage 19.74 %

Specialty Pain Management Frequency 3262 Percentage 18.43 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64421

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64425	Tracking Number	Original Specialty Recommended RVU: 1.19
		Presented Recommended RVU: 1.19
Global Period: 000	Current Work RVU: 1.75	RUC Recommended RVU: 1.19

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; ilioinguinal, iliohypogastric nerves

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old male has a 3-year history of pain in his groin following an open inguinal hernia repair that is interfering with his ability to complete activities of daily living. He has had poor control of his pain despite multiple medication trials and physical therapy. Due to persistent, debilitating pain, a trial of ilioinguinal /iliohypogastric nerve block is scheduled to relieve pain and improve function.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed procedure is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The skin is cleansed with an antiseptic solution, sterile drapes are applied and then the provider performs the universal protocol ("time out") with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. The anterior superior iliac spine is palpated and the target insertion site is marked 2 cm medial and 2 cm inferior to the anterior superior iliac spine. A local anesthetic skin wheal is created and then a needle is advanced through the external oblique muscle. A loss of resistance is appreciated as the needle passes through the muscle to lie between it and the internal oblique. After the initial loss of resistance, the needle is advanced again until a loss of resistance is encountered as the needle passes through the internal oblique muscle and is in the plane between the internal oblique and the transversus abdominus muscle. Following negative aspiration, a local anesthetic and steroid is injected. The needle is removed, and the site is observed for bleeding and covered with a sterile occlusive dressing.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64425 (*Injection(s), anesthetic agent(s) and/or steroid; ilioinguinal, iliohypogastric nerves*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64425 is currently a Harvard-valued code that has not been previously surveyed. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA), the American Academy of Pain Medicine (AAPM) and the American Academy of Physical Medicine & Rehabilitation (AAPM&R).

October 2018 RUC Meeting Recommendation Rationale

A total of 54 responses were received from a random sample of 2,452 clinicians (2.2 percent response rate). ASA, AAPM and AAPM&R convened an Expert Panel to review the survey data. ***The societies are recommending 1.19 wRVUs (survey 25th) and time of pre (7/0/1), intra (11 min) and post (10 min).*** This results in an IWPUT of 0.073.

Vignette

The typical patient was describes as experiencing persistent, debilitating pain, a trial of ilioinguinal /iliohypogastric nerve block is scheduled to relieve pain and improve function. 94% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64425 Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.19	1.30	1.59
Pre		24/5/5/	
Intra	10	11	15
Post		10	

After a robust discussion the Expert Panel agreed to recommend:

- wRVU
 - 1.19 wRVU (25th percentile)
- Time
 - Pre-time: Non-facility pre-service package #5 -adjusted (7/0/1)
 - Intra-time: 11 minutes (survey median)
 - Post-time 10 minutes (survey median)

The Expert Panel discussed how in general the treatment for pain conditions has become more complex as the opioid crisis has escalated, and treatment and coverage for other non-pharmacologic and non-interventional strategies has been limited. With worsening pain, this impacts mobility, and in general has led to a more sedentary population with increase in co-morbidities of diabetes, hypertension and obesity. These findings, particularly the increase in BMI, have led to increases in the technical skill and judgment necessary to perform the procedure as well as the associated psychological stress to reduce risk of complications, such as pneumothorax or intravascular complication.

The Expert Panel concluded that recommended wRVU value and times appropriately reflect how the service is currently performed and it aligns well within and outside of the code family.

In drafting their recommendations, the Expert Panel considered a number of factors.

Current Value

- The Expert Panel agreed that the 25th percentile of 1.19 wRVUs which is less than the current wRVU of 1.75 is appropriate. The Expert Panel noted that this recommendation decreased the IWPUT to 0.073 from the current IWPUT of 0.0928. Since the code was previously Harvard-valued, they felt the surveyed time more appropriately reflects current practice and the recommended wRVU and resulting IWPUT was appropriate. This position is consistent with the RUC comments on the CY 2019 NPRM for code 95970 where they state that Harvard time “holds zero validity for comparison.”

Reference Code

- The Expert Panel also concluded that the recommendation aligned well with the top reference code, 64486 (*Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)*) which was surveyed in 2014, has a wRVU of 1.27,

IWPUT of 0.0781 and intra time of 10 minutes. The Expert Panel noted that the codes had the same intra time and a slightly higher IWPUT. They concluded the reference code supported the recommendation of 1.19 wRVUs for code 64425.

Other Codes in the Somatic Nerve Injection Family

- The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Code#	Description	Proposed wRVU
+64421	N block inj intercost sng, addl level	0.60
64435	N block inj paracervical	0.75
64450	N block other peripheral	0.84
64405	N block inj occipital	0.94
64408	N block inj vagus	0.94
64418	N block inj suprascapular	1.10
64400	N block inj trigeminal	1.14
64430	N block inj pudendal	1.15
64425	N block inj ilio-ing/hypogi	1.19
64420	N block inj intercost sng	1.24
64417	N block inj axillary	1.27
64447	N block inj fem single	1.40
64415	N block inj brachial plexus	1.42
64445	N block inj sciatic sng	1.47
64448	N block inj fem cont inf	1.78
64446	N blk inj sciatic cont inf	1.80
64449	N block inj lumbar plexus	1.80
64416	N block cont infuse b plex	1.81

Rank Order

- The Expert Panel also considered other 0-day global codes, RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned well with these codes and provided further evidence of the appropriateness of the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
45305	Proctosigmoidoscopy, rigid; with biopsy, single or multiple	000	1.15	10	0.0549	668
44382	Ileoscopy, through stoma; with biopsy, single or multiple	000	1.17	20	0.0262	1,520
67810	Incisional biopsy of eyelid skin including lid margin	000	1.18	13	0.0688	30,330
64425	Injection(s), anesthetic agent(s) and/or steroid; ilioinguinal, iliohypogastric nerves)	000	1.19	11	0.073	7,404
46606	Anoscopy; with biopsy, single or multiple	000	1.20	11	0.0443	2,185
36584	Replacement, complete, of a peripherally inserted central venous catheter (PICC), without subcutaneous port or pump, through same venous access	000	1.20	15	0.0400	5,630

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
44385	Endoscopic evaluation of small intestinal pouch (eg, Kock pouch, ileal reservoir [S or J]); diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)	000	1.20	15	0.0370	1,359
57100	Biopsy of vaginal mucosa; simple (separate procedure)	000	1.20	15	0.0427	5,797
57500	Biopsy of cervix, single or multiple, or local excision of lesion, with or without fulguration (separate procedure)	000	1.20	15	0.0600	7,650

In summary, for CPT Code 64425 (*Injection(s), anesthetic agent(s) and/or steroid; ilioinguinal, iliohypogastric nerves*) **ASA, AAPM, and AAPM&R recommend 1.19 wRVUs and 8/11/10 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64425

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty Pain Management How often? Commonly

Specialty Interventional Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 22212

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology	Frequency 7923	Percentage 35.66 %
Specialty Pain Management	Frequency 2728	Percentage 12.28 %
Specialty Interventional Pain Management	Frequency 2619	Percentage 11.79 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,404
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology	Frequency 2641	Percentage 35.66 %
Specialty Pain Management	Frequency 909	Percentage 12.27 %
Specialty Interventional Pain Management	Frequency 873	Percentage 11.79 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64425

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 64430	Tracking Number H11	Original Specialty Recommended RVU: 1.15
		Presented Recommended RVU: 1.15
Global Period: 000	Current Work RVU: 1.46	RUC Recommended RVU: 1.15

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; pudendal nerve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old female has a 2-year history of pudendal neuralgia that is interfering with her ability to complete activities of daily living. She has had poor control of her pain despite multiple medication trials and physical therapy. Due to her persistent, debilitating pain, a trial of pudendal nerve block is scheduled to relieve her pain and improve her function.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The procedure is thoroughly explained to the patient ensuring the patient's understanding of the procedure and expected outcomes. The risks, benefits, and potential complications of the procedure are discussed. Informed consent is obtained and the appropriate instruments and materials are prepared. The patient changes into a gown and has a pelvic drape. The patient is placed in the dorsal lithotomy position and appropriate pelvic draping is completed.

Description of Intra-Service Work: A time out is performed. A bimanual examination is performed for determination of internal pelvic anatomy. Concentrated digital evaluation of the levator muscles, pelvic ligaments and the ischial spines is performed. The provider proceeds with povidone cleansing of the entire vaginal canal and cervix. The speculum is removed. A 10cc control syringe is filled with local anesthetic with or without epinephrine. A spinal needle is attached to the 10cc syringe. Sterile gloves are donned and the provider again palpates the ischial spine and sacrospinous ligament. Introduction of the needle guide / trumpet is performed aligning with the providers digital palpation of the injection site. The spinal needle is directed into the needle guide and an initial injection of the anesthetic is performed of the vaginal tissue. The needle is advanced through the vaginal epithelium to the sacrospinous ligament. Aspiration is performed to ensure no vascular perforation has occurred and further injection is performed. The needle is advanced again slightly monitoring for loss of resistance, signifying complete penetration of the sacrospinous ligament and entrance into the region of pudendal nerve. Aspiration is again performed to ensure no perforation of the major pelvic vessels. The anesthetic is injected slowly to monitor adverse effects of possible intravascular injection. The trumpet and needle are removed. A speculum is placed and hemostasis is confirmed at the injection site. The operator may choose to use more than 10cc of anesthetic and therefore the syringe may require refilling and repeat injection or a second syringe may be used. If bleeding is encountered, a large procto-swab is held in place to exert pressure on any bleeding sites. Proctoswabs are utilized for cleaning the posterior fourchette of any blood or extruded anesthetic.

Description of Post-Service Work: After the procedure is complete, the provider will evaluate the effects of the anesthetic on the nerve distribution. The provider monitors the patient for possible systemic reactions related to intravascular injection. Write post-procedure orders for care and pain medication. Create procedure note.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64430 is part of the larger Somatic Nerve Injection family, which represents revisions of descriptors and guidelines for codes 64400- 64450 and deletion of 3 codes to clarify reporting (ie, separate reporting of imaging guidance, number of units, change of CPT codes 64421 from a 0-day global to ZZZ).

Time

Pre-time package 1: Straightforward Patient/ Straightforward Procedure (No anesthesia care). Added five minutes for the Dorsal Lithotomy position (then reduced by one minute due to survey data). Reduced SDW one minute due to survey data.

Post-time package 7a: 7A Local Anesthesia/ Straightforward Procedure. Reduced time by eight minutes due to survey data.

Other Reference Code

We included 64483 as another reference code on the SOR. The survey respondents chose this code eight times, the same number of respondents that chose CPT Code 62323.

Billed Together

CPT Code 64430 is not typically billed with another service, nor is it typically billed with an E/M (23%).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64430

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty obstetrics/gynecology How often? Commonly

Specialty anesthesiology How often? Commonly

Specialty pain management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national number is not known.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,388

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Current RUC database indicates 3,388 Medicare claims in 2017.

Specialty obstetrics/gynecology	Frequency 949	Percentage 28.01 %
Specialty anesthesiology	Frequency 712	Percentage 21.01 %
Specialty pain management	Frequency 407	Percentage 12.01 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64435	Tracking Number H12	Original Specialty Recommended RVU: 0.75
		Presented Recommended RVU: 0.75
Global Period: 000	Current Work RVU: 1.45	RUC Recommended RVU: 0.75

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; paracervical (uterine) nerve

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 34-year-old female with an IUD presented for removal. The IUD string was not identified on exam and initial probing of the cervical canal was not tolerated by the patient. Cervical dilation under cervical anesthesia is required for retrieval.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The procedure is thoroughly explained to the patient ensuring the patient's understanding of the need for the procedure. The risks, benefits, and potential complications of the procedure are discussed. Informed consent is obtained and the appropriate instruments and materials are prepared. The patient is placed in the dorsal lithotomy position and appropriate draping is completed.

Description of Intra-Service Work: The provider places a speculum into the vagina. The speculum is positioned so that the cervix is centered in the operative field. The cervix and lateral vagina are cleaned with an appropriate solution. A 10cc syringe is filled with local anesthetic with or without epinephrine. The provider places a single tooth tenaculum at the 12 o'clock position of the cervix to stabilize the organ. A spinal needle is attached to the 10cc syringe. Initial aspirations and then injections of the anesthetic are placed into the cervix at the 3 and 9 o'clock position or the 2, 4, 8, and 10 o'clock positions. The anesthetic is injected slowly to ascertain infiltration of the stroma of the cervix. Hemostasis is confirmed at each injection site after injection. After the procedure, often bleeding is encountered from the injection site causing the need to hold pressure with pronto-swabs until stable. Once the procedure is complete, the operator will wait for complete anesthetic effect.

Description of Post-Service Work: After the procedure is complete, the provider will evaluate the effects of the anesthetic on the nerve distribution to observe possible untoward effects. The provider monitors the patient for possible systemic reactions related to intravascular injection and possible hematoma development in the retroperitoneal space. Write post-procedure orders for care and pain medication. Create procedure note.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64435 is part of the larger Somatic Nerve Injection family, which represents revisions of descriptors and guidelines for codes 64400- 64450 and deletion of 3 codes to clarify reporting (ie, separate reporting of imaging guidance, number of units, change of CPT codes 64421 from a 0-day global to ZZZ).

Time

CPT Code 64435 is typically performed in the non facility setting, with minimal anesthesia care. As such, we selected pre time package 5 and removed 1 minute for no anesthesia care. Three minutes were added to positioning to account for the dorsal lithotomy positioning (survey data was 3 minutes).

Billed Together

CPT Code 64435 is not typically billed with another service, nor is it typically billed with an E/M (0%).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64445	Tracking Number	Original Specialty Recommended RVU: 1.47
		Presented Recommended RVU: 1.30
Global Period: 000	Current Work RVU: 1.48	RUC Recommended RVU: 1.30

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, single

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old female has just undergone a right trimalleolar fracture open reduction and fixation, and the surgeon consults the anesthesiologist for pain management in the recovery room. The planned technique is a sciatic nerve block, to which the patient consents.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed injection is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The skin is cleansed with an antiseptic solution and sterile drapes are applied. A universal protocol ("time out") is performed with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. A local anesthetic skin wheal is created and placed at injection site. The skin at the proposed entry site is anesthetized with a small amount of local anesthetic via a small-gauge needle. An insulated stimulating needle is inserted through the skin in the gluteal region. A nerve stimulator is turned on and the patient is monitored for reports of paresthesia or appropriate muscle twitches in the leg in response to nerve stimulation. The current on the nerve stimulator is reduced to confirm proximity of the needle to the sciatic nerve and to reposition if necessary to maintain a muscle twitch in the appropriate distribution with a low current. Once correct needle position is obtained, the needle is aspirated to confirm the absence of blood. Following negative aspiration, administer a small test dose of local anesthetic, monitor the patient's VS, and question the patient about symptoms of intravascular local anesthetic injection. If there are no signs or symptoms of intravascular injection, inject local anesthetic in incremental doses with frequent aspiration to avoid intra-vascular injection. After completion of the injection, remove the needle. Observe the patient for any signs or symptoms of local anesthetic toxicity. After several minutes have passed, evaluate the initial effects of the sciatic nerve block by physical examination to determine if the patient is developing weakness, numbness, and relief of pain in the expected nerve distribution.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64445 (Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, single) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide

further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64445 was previously surveyed by the RUC in 2009. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA) and the American Academy of Physical Medicine & Rehabilitation (AAPM&R).

October 2018 RUC Meeting Recommendation Rationale

A total of 68 responses were received from a random sample of 6,346 clinicians (1.0 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending a value of 1.30 wRVUs (25th percentile) and time of pre (7/1/1), intra (10 min) and post (6 min).*** This results in an IWPUP of 0.098.

Vignette

The typical patient has just undergone a right trimalleolar fracture open reduction and fixation, and the surgeon consults the anesthesiologist for pain management in the recovery room. 85% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64445 Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.30	1.51	1.83
Pre		15/3.5/4	
Intra	6	10	13.25
Post		6	

After review of the reviewer comments of the societies original recommended wRVU of 1.47 and time inputs, the Expert Panel agreed to recommend the following revised work RVU and time recommendations as interim and to resurvey for the January 2019 RUC meeting:

- wRVU
 - 1.30 wRVU based on survey 25th percentile
- Time
 - Pre-time: Non-facility pre-service package #5 (7/1/1); 1 minute added for positioning
 - Intra-time: 10 minutes (survey median)
 - Post-time 6 minutes (survey median)

Survey 25th Percentile

The specialties societies' recommendation of 1.30 is based on the survey's 25th percentile.

In summary, for CPT code CPT Code 64445 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, single*) ***ASA and AAPM&R recommend 1.30 wRVUs and 7/10/6 for time.***

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64445

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty Internal Medicine How often? Commonly

Specialty General Practice How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 358560

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilizationnn

Specialty Anesthesiology	Frequency 132165	Percentage 36.85 %
Specialty Internal Medicine	Frequency 60382	Percentage 16.84 %
Specialty General Practice	Frequency 29079	Percentage 8.10 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

119,520 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilizationnn

Specialty Anesthesiology	Frequency 44055	Percentage 36.85 %
Specialty Internal Medicine	Frequency 20127	Percentage 16.83 %
Specialty General Practice	Frequency 9693	Percentage 8.10 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64445

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64446	Tracking Number	Original Specialty Recommended RVU: 1.80
		Presented Recommended RVU: 1.70
Global Period: 000	Current Work RVU: 1.81	RUC Recommended RVU: 1.54

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, continuous infusion by catheter (including catheter placement)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male suffers a crushed left foot in an automobile accident. He undergoes major reconstruction of his left foot and ankle under general anesthesia. The surgeon requests a block with continuous infusion to manage post-operative pain and facilitate rehabilitation. In order to provide post-operative pain control, a continuous sciatic nerve block is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. An intravenous infusion is initiated and supplemental oxygen is provided. The site of the proposed injection is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injection is prepared. The skin is cleansed with an antiseptic solution and sterile drapes are applied. A universal protocol ("time out") is performed with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. A local anesthetic skin wheal is created at the planned needle insertion site. A Touhy needle is advanced toward the sciatic nerve. A nerve stimulator is attached to the needle and the needle is advanced until it is close to the nerve. A brisk motor response in the ankle, foot or toes is noted with less than 0.4 mA stimulation. A catheter is then advanced through the Tuohy needle until it is 3 – 10 cm beyond its tip. The electrical connection is then transferred to the catheter and nerve stimulation is again evaluated to confirm that the catheter is lying next to the nerve. The Tuohy needle is removed, the catheter secured in place and 15-20 ml of a local anesthetic is injected through the catheter. Block of the sciatic nerve is then assessed over the next 15-30 minutes and an infusion of a dilute local anesthetic is started. Subcutaneous tunneling, affixation, and dressing of the catheter must be done carefully as this area is prone to bacterial contamination both during and after the procedure.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64446 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, continuous infusion by catheter (including catheter placement)*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency around the use of these

codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64446 was previously surveyed by the RUC in 2008. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 48 responses were received from a random sample of 3,894 clinicians (1.2 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending an interim value of 1.70 wRVUs and time of pre (13/1/5), intra (15 min) and post (6 min).*** This results in an IWPUT of 0.081.

The reviewers indicated that the code was surveyed more than 75% with imaging and recommended that the code should be sent back to CPT, imaging should be bundled and the code should be re-surveyed. The specialty agrees with this recommendation and is why they are recommending an interim value for this code. The interim recommended value is less than the survey 25th percentile.

Vignette

The typical patient is described as receiving a sciatic nerve block for post-operative pain control. 92% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64446			
Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.80	2.19	2.33
Pre		15/4/5	
Intra	10	15	19
Post		6	

After review of the reviewer comments, ASA is reducing its original recommendation of 1.80 wRVUs to:

- wRVU
 - 1.70 wRVUs
- Time
- Pre-time: Facility pre-service package #1 -adjusted (13/1/5)
- Intra-time: 15 minutes (survey median)
- Post-time 6 minutes (survey median)

Crosswalk

The interim recommended value is based on a crosswalk. Reviewers note that the intra-service time had decreased by 5 minutes from the previous RUC survey. The Expert Panel considered these comments and selected code **10035** (*Placement of soft tissue localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous, including image guidance, first lesion*) which has a wRVU of 1.70, time of 20/15/10, IWPUT of 0.0733 and 2015 RUC survey.

The Expert Panel noted that it provided a reasonable increment from 64445 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, single*) to account for the “continuous infusion by catheter.”

The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Other Comparison Codes

The Expert Panel also considered other 0-day RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned with these codes

CPT Code	Long Desc	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
-----------------	------------------	---------------	-----------------	-------------------	--------------	-------------------------

CPT Code: 64446						
53855	Insertion of a temporary prostatic urethral stent, including urethral measurement	000	1.64	15	0.0839	1,385
36569	Insertion of peripherally inserted central venous catheter (PICC), without subcutaneous port or pump; age 5 years or older	000	1.7	15	0.0757	148,430
43201	Esophagoscopy, flexible, transoral; with directed submucosal injection(s), any substance	000	1.72	15	0.0716	240
43202	Esophagoscopy, flexible, transoral; with biopsy, single or multiple	000	1.72	15	0.0716	2,369
36556	Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older	000	1.75	15	0.0841	450,710
57410	Pelvic examination under anesthesia (other than local)	000	1.75	15	0.0345	2,420

In summary, for CPT code CPT Code 64446 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, continuous infusion by catheter (including catheter placement)*) **ASA recommends 1.70 wRVUs and 19/15/6 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☒ Multiple codes are used to maintain consistency with similar codes.
- ☒ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 76942-26 (Global: XXX; wRVUs: 0.67; Time: 7/15/5)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64446

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 17631

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology	Frequency 16238	Percentage 92.09 %
Specialty CRNA	Frequency 829	Percentage 4.70 %
Specialty Pain Management	Frequency 291	Percentage 1.65 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,877
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology	Frequency 5413	Percentage 92.10 %
Specialty CRNA	Frequency 276	Percentage 4.69 %
Specialty Pain Management	Frequency 97	Percentage 1.65 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64447	Tracking Number	Original Specialty Recommended RVU: 1.40
		Presented Recommended RVU: 1.29
Global Period: 000	Current Work RVU: 1.50	RUC Recommended RVU: 1.10

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, single

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old male undergoes a right anterior cruciate ligament repair under general anesthesia. In order to provide postoperative pain control and increase mobility in his knee, a femoral nerve block is performed. This “block” will allow earlier discharge from the recovery room, decreased postoperative pain, and earlier ambulation.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The proposed site of the nerve block is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The skin is cleansed with an antiseptic solution and sterile drapes are applied. A universal protocol (“time out”) is performed with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. A local anesthetic skin wheal is created and placed at injection site. The skin at the proposed entry site is anesthetized with a small amount of local anesthetic via a small-gauge needle. An insulated stimulating needle is advanced through the skin in the groin. The nerve stimulator is turned on and the patient is monitored for reports of paresthesia or appropriate muscle twitches in the quadriceps in response to nerve stimulation. The current on the nerve stimulator is reduced to confirm proximity of the needle to the femoral nerve and the needle is repositioned if necessary to maintain a muscle twitch in the appropriate distribution with a low current. Once correct needle position is obtained, aspirate the needle to confirm the absence of blood. Following negative aspiration, administer a small test-dose of local anesthetic, monitor the patient’s VS, and question the patient about symptoms of intravascular local anesthetic injection. If there are no signs or symptoms of intravascular injection, inject local anesthetic in incremental doses with frequent aspiration to avoid intravascular injection. After completion of the injection, remove the needle. Observe the patient for any signs or symptoms of local anesthetic toxicity. After several minutes have passed, evaluate the initial effects of the femoral nerve block by physical examination to determine if the patient is developing weakness, numbness, and relief of pain in the expected nerve distribution.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64447 (*Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, single*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64447 was previously surveyed by the RUC in 2009. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 62 responses were received from a random sample of 3,894 clinicians (1.5 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending an interim value of 1.29 wRVUs (survey 25th) and time of pre (13/1/5), intra (6 min) and post (5 min).*** This results in an IWPUR of 0.137.

The reviewers indicated that the code was surveyed more than 75% with imaging and recommended that the code should be sent back to CPT, imaging should be bundled and the code should be re-surveyed. The specialty agrees with this recommendation and is why they are recommending an interim value for this code. The interim recommended value is less than the survey 25th percentile.

Vignette

The typical patient receives a femoral nerve block for postoperative pain control and to increase mobility in their knee. This “block” will allow earlier discharge from the recovery room, decreased postoperative pain, and earlier ambulation. 95% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64447 Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.29	1.51	1.80
Pre		12/3/3	
Intra	5	6	10
Post		5	

After review of the reviewer comments, ASA is reducing its original recommendation of 1.50 wRVUs to:

- wRVU
 - 1.29 wRVU based on survey 25th percentile
- Time
 - Pre-time: Facility pre-service package #1 - adjusted (13/1/5)
 - Intra-time: 6 minutes (survey median)
 - Post-time 5 minutes (survey median)

Survey 25th Percentile

The interim recommendation of 1.29 is based on the survey 25th percentile.

Comparison Codes

The Expert Panel also identified two codes as reasonable comparisons. The Expert Panel agreed with the survey respondents that the surveyed code is more intense and complex than these comparison codes. Therefore the recommendation for a slightly higher value for the surveyed code in comparison to the reference codes seemed appropriate.

Code #	Descriptor	2018 wRVU	2018 IWPUR	Intra Time (min)	2017 Utilization
64486	Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes	1.27	0.0781	10	7,349

	imaging guidance, when performed)				
67505	Retrobulbar injection; alcohol	1.27	0.0781	10	181

In summary, for CPT code CPT Code 64447 (*Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, single*) **ASA recommends an interim value of 1.29 wRVUs and 19/6/5 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☒ Multiple codes are used to maintain consistency with similar codes.
- ☒ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 76942-26 (Global: XXX; wRVUs: 0.67; Time: 7/15/5)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64447

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty Internal Medicine How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 676098

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology Frequency 523232 Percentage 77.38 %

Specialty CRNA Frequency 56522 Percentage 8.36 %

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64448	Tracking Number	Original Specialty Recommended RVU: 1.78
		Presented Recommended RVU: 1.60
Global Period: 000	Current Work RVU: 1.63	RUC Recommended RVU: 1.55

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, continuous infusion by catheter (including catheter replacement)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male undergoes a right total knee replacement (CPT code 27447) under general anesthesia. The surgeon requests a block with continuous infusion to manage postoperative pain and facilitate rehabilitation. In order to provide postoperative pain control and increased mobility in his knee, a continuous femoral nerve block is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. An intravenous infusion is initiated and supplemental oxygen is provided. The site of the proposed injection is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injection is prepared. The skin is cleansed with an antiseptic solution and sterile drapes are applied. A universal protocol ("time out") is performed with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. A local anesthetic skin wheal is created. An insulated Touhy needle is inserted through the skin and advanced towards the femoral nerve. Proper location of the needle is confirmed with the use of a nerve stimulator. A catheter is then advanced through the needle to lie next to the femoral nerve. Next, a local anesthetic is injected through the catheter with frequent aspiration and monitoring of the ECG and pulse oximeter to avoid the possibility of intravascular injection. The catheter is then secured in place and a sterile dressing is applied. Then a dilute local anesthetic infusion is initiated. Subcutaneous tunneling, affixation, and dressing of the catheter must be done carefully as this area is prone to bacterial contamination, both during and after the procedure.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64448 (*Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, continuous infusion by catheter (including catheter replacement)*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency around

the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64448 was previously surveyed by the RUC in 2008. It was surveyed for the October 2018 RUC meeting by the American Society for Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 51 responses were received from a random sample of 3,894 clinicians (1.3 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending an interim value of 1.60 wRVUs and time of pre (13/1/5), intra (13 min) and post (6 min).*** This results in an IWPUT of 0.086.

The reviewers indicated that the code was surveyed more than 75% with imaging and recommended that the code should be sent back to CPT, imaging should be bundled and the code should be re-surveyed. The specialty agrees with this recommendation and is why they are recommending an interim value for this code. The interim recommended value is less than the survey 25th percentile and the current value of 1.63 wRVUs.

Vignette

The typical patient femoral nerve block to manage postoperative pain and facilitate rehabilitation after a total knee replacement. 88% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64448			
Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.78	2.00	2.20
Pre		14/4/5	
Intra	8	13	16
Post		6	

- **After review of the reviewer comments, ASA is reducing its original recommendation of 1.78 wRVUs to:**
- **wRVU**
 - 1.60 wRVU; this recommendation is less than the survey 25th percentile of 1.78 wRVUs and just slightly less than the current value of 1.63 wRVUs
- **Time**
 - Pre-time: Facility pre-service package #1 - adjusted (13/1/5)
 - Intra-time: 13 minutes (survey median)
 - Post-time 6 minutes (survey median)

Crosswalk

The interim recommended value is based on a crosswalk. Reviewers note that the intra-service time had decreased by 2 minutes from the previous RUC survey. The Expert Panel considered these comments and selected code **64488** (*Transversus abdominis plane (TAP) (abdominal plane block, rectus sheath block) bilateral; by injections (includes imaging guidance when performed)*) which has a wRVU of 1.60, time of 20/15/10, IWPUT of 0.0733 and 2015 RUC survey.

The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

In summary, for CPT code CPT Code 64448 (*Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, continuous infusion by catheter (including catheter replacement)*) **ASA recommends 1.60 wRVUs and 19/13/6 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☒ Multiple codes are used to maintain consistency with similar codes.
- ☒ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. CPT code 76942-26 (Global: XXX; wRVUs: 0.67; Time: 7/15/5)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64448

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty CRNA How often? Commonly

Specialty Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 128265

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology Frequency 114566 Percentage 89.31 %

Specialty CRNA Frequency 12172 Percentage 9.48 %

Specialty Pain Management Frequency 834 Percentage 0.65 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

42,755 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology Frequency 38189 Percentage 89.32 %

Specialty CRNA Frequency 4057 Percentage 9.48 %

Specialty Pain management Frequency 278 Percentage 0.65 %

Do many physicians perform this service across the United States? Yes

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64449	Tracking Number	Original Specialty Recommended RVU: 1.80
		Presented Recommended RVU: 1.70
Global Period: 000	Current Work RVU: 1.81	RUC Recommended RVU: 1.55

CPT Descriptor: injection(s), anesthetic agent(s) and/or steroid; lumbar plexus, posterior approach, continuous infusion by catheter (including catheter placement)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old female undergoes a left total knee replacement (CPT code 27447) under general anesthesia. The surgeon requests a block with a continuous infusion to manage post-operative pain and facilitate rehabilitation. In order to provide post-operative pain control and increased mobility in her knee, a continuous lumbar plexus block is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 61%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. An intravenous infusion is initiated and supplemental oxygen is provided. The site of the proposed injection is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The low back is prepped with a topical antiseptic and sterile drapes are applied. A universal protocol ("time out") is performed with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. A local anesthetic skin wheal is created and placed at injection site. After infiltrating the skin and deeper tissues with local anesthetic using a small gauge needle, a Touhy needle designed to allow the introduction of a catheter is connected to a peripheral nerve stimulator and advanced to obtain stimulation of the lumbar plexus. At this point careful aspiration for blood and CSF is performed. A test dose of local anesthetic is administered to rule out IV or intrathecal injection. Between 15 and 30 ml of dilute local anesthetic is slowly injected through the needle, followed by insertion of an infusion catheter through the needle (about 5 cm past the tip of the needle). The patient is observed for signs of undesired epidural spread and associated hemodynamic changes, and for analgesia of the left leg and hip. The catheter is checked for intravascular and intrathecal placement and secured in place. Once correct function of the catheter is confirmed, a continuous infusion of a dilute local anesthetic is started.

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64449 (*Injection(s), anesthetic agent(s) and/or steroid; lumbar plexus, posterior approach, continuous infusion by catheter (including catheter placement)*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change application to provide further definition and descriptor transparency

around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64449 was previously surveyed by the RUC in 2008. It was surveyed for the October 2018 RUC meeting by the American Society of Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 36 responses were received from a random sample of 3,894 clinicians (0.90 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending a value of 1.70 wRVUs and time of pre (13/1/5), intra (14 min) and post (5 min).*** This results in an IWPUT of 0.088.

Vignette

The typical patient received a lumbar plexus block after knee surgery for post-operative pain management and to facilitate rehabilitation. 61% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64449			
Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.80	2.20	2.41
Pre		15/5/5	
Intra	8	14	20
Post		5	

After review of the reviewer comments, ASA is reducing its original recommendation of 1.80 wRVUs to:

- wRVU
 - 1.70 wRVU; this is less than the survey 25h percentile of 1.80 wRVUs and less than the current value of 1.81 wRVUs
- Time
 - Pre-time: Facility pre-service package #1 - adjusted (13/1/5)
 - Intra-time: 14 minutes (survey median)
 - Post-time 5 minutes (survey median)

Currently code 64446 (*Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, continuous infusion by catheter (including catheter placement)*) and code 64449 have the same value. This recommendation maintains the same value for both codes. Both codes also had similar survey times, providing evidence of the appropriateness of maintaining that relationship.

Crosswalk

The interim recommended value is based on a crosswalk. The Expert Panel selected code **10035** (*Placement of soft tissue localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous, including image guidance, first lesion*) which has a wRVU of 1.70, time of 20/15/10, IWPUT of 0.0733 and 2015 RUC survey.

The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Other Comparison Codes

The Expert Panel also considered other 0-day RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned with these codes.

CPT Code	Long Desc	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
53855	Insertion of a temporary prostatic urethral stent, including urethral measurement	000	1.64	15	0.0839	1,385

CPT Code: 64449						
36569	Insertion of peripherally inserted central venous catheter (PICC), without subcutaneous port or pump; age 5 years or older	000	1.7	15	0.0757	148,430
43201	Esophagoscopy, flexible, transoral; with directed submucosal injection(s), any substance	000	1.72	15	0.0716	240
43202	Esophagoscopy, flexible, transoral; with biopsy, single or multiple	000	1.72	15	0.0716	2,369
36556	Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older	000	1.75	15	0.0841	450,710
57410	Pelvic examination under anesthesia (other than local)	000	1.75	15	0.0345	2,420

In summary, for CPT code CPT Code 64449 (*Injection(s), anesthetic agent(s) and/or steroid; lumbar plexus, posterior approach, continuous infusion by catheter (including catheter placement)*) **ASA recommends 1.70 wRVUs and 19/14/5 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64449

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty Neurology How often? Commonly

Specialty Family Practice How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 6984

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology	Frequency 5826	Percentage 83.41 %
Specialty Neurology	Frequency 372	Percentage 5.32 %
Specialty Family Practice	Frequency 168	Percentage 2.40 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,328
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology	Frequency 1942	Percentage 83.41 %
Specialty Neurology	Frequency 124	Percentage 5.32 %
Specialty Family Practice	Frequency 56	Percentage 2.40 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64449

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64450	Tracking Number	Original Specialty Recommended RVU: 0.84
		Presented Recommended RVU: 0.84
Global Period: 000	Current Work RVU: 0.75	RUC Recommended RVU: 0.75

CPT Descriptor: Injection(s), anesthetic agent(s) and/or steroid; other peripheral nerve or branch

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old female complains of chronic burning pain and a tingling sensation in the plantar aspect of her right foot. Clinical examination is consistent with tarsal tunnel syndrome. The decision is made to perform a therapeutic injection about the posterior tibial nerve utilizing local anesthetic and a steroid.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The clinician obtains and reviews the medical record and any pertinent imaging studies, laboratory studies and medical information. The site of the proposed injection is identified and marked. The patient is moved to the procedure room. The clinician gowns, gloves and prepares supplies. The injectate is prepared. The skin is cleansed with an antiseptic solution and sterile drapes are applied. A universal protocol ("time out") is performed with the care team.

Description of Intra-Service Work: The appropriate skin and bony landmarks are identified. A local anesthetic skin wheal is created and placed at injection site. Palpate the posterior tibial artery. Direct the needle slightly posterior and inferior to the posterior tibial artery. Prior to injecting, aspirate the needle to ensure that vascular structures are not injected. Redirect the needle proximally and distally and repeat aspiration and injection. The needle is removed, and the site is observed for bleeding and covered with a sterile occlusive dressing. .

Description of Post-Service Work: The patient is observed for bleeding or any adverse effects and for evidence of successful block. A procedure note is dictated/written and medical record entries are made.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT Code 64450 (*Injection(s), anesthetic agent(s) and/or steroid; other peripheral nerve or branch*) is part of Tab 9 which includes changes and revisions to the Somatic Nerve Injection family (codes 64400- 64450). CPT staff, at the request of the Editorial Board of the *CPT Assistant*, reached out to several specialties to request a code change

application to provide further definition and descriptor transparency around the use of these codes. The new code family was approved at the May 2018 CPT Editorial Panel meeting and surveyed for the October 2018 RUC meeting.

Code 64450 was previously surveyed by the RUC in 2011. It was surveyed for the October 2018 RUC meeting by the American Academy of Neurology (AAN), the American Academy of Pain Medicine (AAPM), the American Academy of Physical Medicine & Rehabilitation (AAPM&R) and the American Society of Anesthesiologists (ASA).

October 2018 RUC Meeting Recommendation Rationale

A total of 88 responses were received from a random sample of 3,256 clinicians (2.7 percent response rate). ASA convened an Expert Panel to review the survey data. ***The society is recommending 0.84 wRVUs and time of pre (7/0/1), intra (10 min) and post (5 min).*** This results in an IWPUT of 0.056.

Vignette

The vignette describes a typical patient experiencing a chronic burning pain and a tingling sensation in the plantar aspect of her right foot. Clinical examination is consistent with tarsal tunnel syndrome. The decision is made to perform a therapeutic injection about the posterior tibial nerve utilizing local anesthetic and a steroid.

78% of the survey respondents found the vignette to be typical.

Survey Data: wRVU and Time

The Expert Panel reviewed the survey data.

64450			
Highlights from Survey Data			
	25th Percentile	Median	75th Percentile
Work	1.00	1.34	1.80
Pre		21/5/5	
Intra	5	10	15
Post		5	

The survey 25th percentile is higher than the current value of 0.75 wRVUs. The Expert Panel considered recommending the 25th percentile which they felt to be approximating a reasonable value for the service. They also noted that the intra-time doubled from 5 minutes to 10 minutes since the last survey. The Expert Panel concluded that this increase in intra-time supported a higher wRVU.

After a robust discussion the Expert Panel agreed to recommend:

- wRVU
 - 0.84 work RVUs based on a crosswalk to code 12001
- Time
 - Pre-time: Non-facility pre-service package #5 (7/0/1)
 - Intra-time: 10 minutes (survey median)
 - Post-time 5 minutes (survey median)

The Expert Panel discussed how in general the treatment for pain conditions has become more complex as the opioid crisis has escalated, and treatment and coverage for other non-pharmacologic and non-interventional strategies has been limited. With worsening pain, this impacts mobility, and in general has led to a more sedentary population with increase in co-morbidities of diabetes, hypertension and obesity. These findings, particularly the increase in BMI, have led to increases in the technical skill and judgment necessary to perform the procedure as well as the associated psychological stress to reduce risk of complications, such as pneumothorax or intravascular complication.

The Expert Panel concluded that these values and times appropriately reflected how the service is currently performed. In drafting their recommendations, the Expert Panel considered a number of factors.

Crosswalk

- The Expert Panel selected a value that was less than the survey 25th percentile of 1.00 wRVUs; crosswalking the recommendation of 0.84 wRVUs to code 12001 (*Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less*). This 0-day global code

was reviewed by the RUC in 2010 and also has 10 minutes intra-service. It has an IWPUT of 0.0585. The Expert Panel believes that this is an appropriate crosswalk not only because it matches intra-service time but also because of similarity in complexity and intensity. The Expert Panel does believe that the surveyed code 64450 is a somewhat more intense/complex than 12001.

Reference Code

- The Expert Panel also concluded that the recommendation aligned well with the top reference code 64486 (*Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)*) which has a wRVU of 1.27, IWPOT of 0.0781 and intra time of 10 minutes. The Expert Panel noted that the codes had the same intra time and the reference code had a slightly higher IWPOT. The recommended value represents an appropriate rank order and alignment.

Other Codes in the Somatic Nerve Injection Family

- The Expert Panel also concluded the recommendation maintained rank order in the Somatic Nerve Injection family.

Code#	Description	Proposed wRVU
+64421	N block inj intercost sng, addl level	0.60
64435	N block inj paracervical	0.75
64450	N block other peripheral	0.84
64405	N block inj occipital	0.94
64408	N block inj vagus	0.94
64418	N block inj suprascapular	1.10
64400	N block inj trigeminal	1.14
64430	N block inj pudendal	1.15
64425	N block inj ilio-ing/hypogi	1.19
64420	N block inj intercost sng	1.24
64417	N block inj axillary	1.27
64447	N block inj fem single	1.40
64415	N block inj brachial plexus	1.42
64445	N block inj sciatic sng	1.47
64448	N block inj fem cont inf	1.78
64446	N blk inj sciatic cont inf	1.80
64449	N block inj lumbar plexus	1.80
64416	N block cont infuse b plex	1.81

Rank Order

- The Expert Panel also considered other 0-day, RUC reviewed codes outside of the Somatic Nerve Injection family with similar intra-time and concluded that the recommendation aligned well with these codes and provided further evidence of the appropriateness of the recommendation.

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
20553	Injection(s); single or multiple trigger point(s), 3 or more muscles	000	0.75	10	0.0441	346,970

20604	Arthrocentesis, aspiration and/or injection, small joint or bursa (eg, fingers, toes); with ultrasound guidance, with permanent recording	000	0.89	10	0.0581	40,141

CPT Code	Long Descriptor	Global	Work RVU	Intra Time	IWPUT	2017 Utilization
	and reporting					
57160	Fitting and insertion of pessary or other intravaginal support device	000	0.89	15	0.0268	90,878

In summary, for CPT code CPT Code 64450 (*Injection(s), anesthetic agent(s) and/or steroid; other peripheral nerve or branch*) **the societies recommend 0.84 wRVUs and 8/10/5 for time.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Existing code 64450

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Commonly

Specialty Nurse Practitioners How often? Commonly

Specialty Pain Management How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 945589

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on relative volume of Medicare utilization

Specialty Anesthesiology	Frequency 248974	Percentage 26.33 %
Specialty Nurse Practitioners	Frequency 122927	Percentage 13.00 %
Specialty Pain Management	Frequency 115646	Percentage 12.23 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
 378,236 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
 Please explain the rationale for this estimate. Based on 2017 Medicare utilization

Specialty Anesthesiology	Frequency 99589	Percentage 26.32 %
Specialty Nurse Practitioners	Frequency 49171	Percentage 13.00 %
Specialty Pain Management	Frequency 46258	Percentage 12.22 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
 Procedures

BETOS Sub-classification:
 Minor procedure

BETOS Sub-classification Level II:
 Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64450

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. N/A

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each branch (ie, ophthalmic, maxillary, mandibular)

Global Period: 0 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The Expert Panel was composed of clinicians from across the US practicing in small and large private practices and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Using the current direct PE inputs of code 64400 as the reference code

3. Is this code(s) typically billed with an E/M service?

No.

Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)

No it is billed with an E/M office visit 32% of the time.

4. What specialty is the dominant provider in the nonfacility? *Neurology – 59%*
What percent of the time does the dominant provider provide the service(s) in the nonfacility? *67%*
Is the dominant provider in the nonfacility different then for the global? *No.*
(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

We are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies. Based on our Expert Panel review we identified a number of direct PE inputs (largely supplies) that are typically used when providing this service in the non-facility environment that are

not currently included. We have confirmed that the added PE clinical labor tasks, supplies, and equipment are not included in the current inputs or packages and that there is no duplication.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:

N/A

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code). *5 minutes*

The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here: *We recommend 5 minutes for obtaining vital signs. The following vital signs are collected: heart rate, blood pressure, body mass index, temperature, and oxidation level.*

9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:

Staff is present and assisting physician during the entire procedure. Staff supports the physician throughout the procedure by handing over the necessary supplies (syringes, gauzes etc.), acts as a second pair of hands during the procedure assisting with supplies/equipment or directly with the patient as needed, helps to make sure patient is comfortable and monitors the patient throughout the procedure.

10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

N/A

12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.

N/A

13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:

N/A

14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:

N/A

15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

Table, exam - default

16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: N/A

17. If there is any other item on your spreadsheet that needs further explanation please include here:
Consent is obtained in the pre-service period of the service period on the day of the procedure (CA011), in addition to being obtained in the pre-service period (CA004).

18. Please include an explanation of each line item:

Code	Supply	64400
SA041	pack, basic injection	For performing the procedure
SA048	pack, minimum multi-specialty visit	For day of procedure
SK075	skin marking pen, sterile (Skin Scribe)	For performing the procedure
SH023	chlorhexidine 0.12% (Peridex)	For sterile prep
SC028	needle, 18-26g 1.5-3.5in, spinal	For performing the procedure
SH021	bupivacaine 0.25% inj (Marcaine)	For performing the procedure
SC053	syringe 20ml	For performing the procedure
SA088	tray, surgical skin prep, sterile	For sterile prep
SJ081	swab, patient prep, 1.5 ml (chloraprep)	For sterile prep

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor: Injection(s), anesthetic agent(s) and/or steroid; brachial plexus, single

Global Period: 0 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The Expert Panel was composed of clinicians from across the US practicing in small and large private practices and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Using the current direct PE inputs of code 64415 as the reference code

3. Is this code(s) typically billed with an E/M service?

No.

Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)

No it is billed with an E/M office visit 1% of the time.

4. What specialty is the dominant provider in the nonfacility? *Neurology – 34%*
What percent of the time does the dominant provider provide the service(s) in the nonfacility? *This service is provided in the non-facility setting 2% of the time.*

Is the dominant provider in the nonfacility different then for the global? *Yes. For the global, the dominant specialty is Anesthesiology (87%)*

(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

We are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies. Based on our Expert Panel review we identified a number of direct PE inputs (largely supplies) that are typically used when providing this service in the non-facility environment that are

not currently included. We have confirmed that the added PE clinical labor tasks, supplies, and equipment are not included in the current inputs or packages and that there is no duplication.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code) *5 minutes*
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here: *We recommend 5 minutes for obtaining vital signs. The following vital signs are collected: heart rate, blood pressure, body mass index, temperature, and oxidation level.*
9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:

Staff is present and assisting physician during the entire procedure. Staff supports the physician throughout the procedure by handing over the necessary supplies (syringes, gauzes etc.), acts as a second pair of hands during the procedure assisting with supplies/equipment or directly with the patient as needed, helps to make sure patient is comfortable and monitors the patient throughout the procedure.
10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. *N/A*

Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Injection(s), anesthetic agent(s) and/or steroid; ilioinguinal, iliohypogastric nerves

Global Period: 0 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The Expert Panel was composed of clinicians from across the US practicing in small and large private practices and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Using the current direct PE inputs of code 64425 as the reference code

3. Is this code(s) typically billed with an E/M service?

No.

Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)

No it is billed with an E/M office visit 33% of the time.

4. What specialty is the dominant provider in the nonfacility? *Anesthesiology – 20%*
What percent of the time does the dominant provider provide the service(s) in the nonfacility? *61%*
Is the dominant provider in the nonfacility different then for the global? *No.*
(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

We are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies. Based on our Expert Panel review we identified a number of direct PE inputs (largely supplies) that are typically used when providing this service in the non-facility environment that are not currently included. We have confirmed that the added PE clinical labor tasks, supplies, and equipment are not included in the current inputs or packages and that there is no duplication.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code) *5 minutes*
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here: *We recommend 5 minutes for obtaining vital signs. The following vital signs are collected: heart rate, blood pressure, body mass index, temperature, and oxidation level.*
9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:

Staff is present and assisting physician during the entire procedure. Staff supports the physician throughout the procedure by handing over the necessary supplies (syringes, gauzes etc.), acts as a second pair of hands during the procedure assisting with supplies/equipment or directly with the patient as needed, helps to make sure patient is comfortable and monitors the patient throughout the procedure.
10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. *N/A*
11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*
12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. *N/A*
13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*
14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*
15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

Table, exam – default
Mayo stand - default
16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: *Consent is obtained in the pre-service period of the service period on the day of the procedure (CA011), in addition to being obtained in the pre-service period (CA004).*

17. If there is any other item on your spreadsheet that needs further explanation please include here: *N/A*

18. Please include an explanation of each line item:

Code	Supply	64425
SA041	pack, basic injection	For performing the procedure
SA048	pack, minimum multi-specialty visit	For day of procedure
SK075	skin marking pen, sterile (Skin Scribe)	For performing the procedure
SH023	chlorhexidine 0.12% (Peridex)	For sterile prep
SH047	lidocaine 1%-2% inj (Xylocaine)	For performing the procedure; more injectate is required for this procedure since with this injection a “loss of resistance technique” is used
SH022	bupivacaine 0.5% inj (Marcaine)	For performing the procedure; more injectate is required for this procedure since with this injection a “loss of resistance technique” is used
SC038	needle, epidural (RK)	For performing the procedure; this needle has a blunted end, which is safer for the “loss of resistance technique” used in the injection to avoid injury with an injection that goes too deep
SC051	syringe 10-12ml	For performing the procedure
SA088	tray, surgical skin prep, sterile	For sterile prep
SJ081	swab, patient prep, 1.5 ml (chloraprep)	For sterile prep

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor: Injection(s), anesthetic agent(s) and/or steroid; sciatic nerve, single

Global Period: 0 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The Expert Panel was composed of clinicians from across the US practicing in small and large private practices and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Using the current direct PE inputs of code 64445 as the reference code

3. Is this code(s) typically billed with an E/M service?

No.

Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)

No it is billed with an E/M office visit 29% of the time.

4. What specialty is the dominant provider in the nonfacility? *Internal Medicine – 28%*
What percent of the time does the dominant provider provide the service(s) in the nonfacility? *59%*
Is the dominant provider in the nonfacility different then for the global? *For the global, the dominant specialty is Anesthesiology (37%)*

(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

We are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies. Based on our Expert Panel review we identified a number of direct PE inputs (largely supplies) that are typically used when providing this service in the non-facility environment that are

not currently included. We have confirmed that the added PE clinical labor tasks, supplies, and equipment are not included in the current inputs or packages and that there is no duplication.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code) *5 minutes*
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here: *We recommend 5 minutes for obtaining vital signs. The following vital signs are collected: heart rate, blood pressure, body mass index, temperature, and oxidation level.*
9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:

Staff is present and assisting physician during the entire procedure. Staff supports the physician throughout the procedure by handing over the necessary supplies (syringes, gauzes etc.), acts as a second pair of hands during the procedure assisting with supplies/equipment or directly with the patient as needed, helps to make sure patient is comfortable and monitors the patient throughout the procedure.
10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. *N/A*
11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*
12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. *N/A*
13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*
14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*
15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:

Table, exam – default

Nerve stimulator (eg, for nerve block) – default

ECG, 3-channel (with SpO2, NIBP, temp, respt) – default

Mayo stand - default

16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: *N/A*

17. If there is any other item on your spreadsheet that needs further explanation please include here:
Consent is obtained in the pre-service period of the service period on the day of the procedure (CA011), in addition to being obtained in the pre-service period (CA004).

18. Please include an explanation of each line item:

Code	Supply	64445
SA041	pack, basic injection	For performing the procedure
SA048	pack, minimum multi-specialty visit	For day of procedure
SK075	skin marking pen, sterile (Skin Scribe)	For performing the procedure
SH023	chlorhexidine 0.12% (Peridex)	For sterile prep
SH022	bupivacaine 0.5% inj (Marcaine)	For performing the procedure
SC053	syringe 20ml	For performing the procedure
SA088	tray, surgical skin prep, sterile	For sterile prep
SD050	electrode needle, injectable (Myoject)	For performing the procedure
SJ081	swab, patient prep, 1.5 ml (chloraprep)	For sterile prep

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor: Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, single

Global Period: 0 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The Expert Panel was composed of clinicians from across the US practicing in small and large private practices and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Using the current direct PE inputs of code 64447 as the reference code

3. Is this code(s) typically billed with an E/M service?

No.

Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)

No it is billed with an E/M office visit 1% of the time.

4. What specialty is the dominant provider in the nonfacility? *Internal Medicine – 61%*
What percent of the time does the dominant provider provide the service(s) in the nonfacility? *This service is provided in the non-facility setting 13% of the time.*

Is the dominant provider in the nonfacility different then for the global? *For the global, the dominant specialty is Anesthesiology (77%)*

(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time. *N/A*

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code) *5 minutes*
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. CPT Code: 64450

Specialty Society AAN, AAPM, AAPM&R, ASA

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor: Injection(s), anesthetic agent(s) and/or steroid; other peripheral nerve or branch

Global Period: 0 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The Expert Panel was composed of clinicians from across the US practicing in small and large private practices and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Using the current direct PE inputs of code 64450 as the reference code

3. Is this code(s) typically billed with an E/M service?

No.

Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)

No it is billed with an E/M office visit 32% of the time.

4. What specialty is the dominant provider in the nonfacility? *Nurse Practitioners – 20%*
What percent of the time does the dominant provider provide the service(s) in the nonfacility? *63%*
Is the dominant provider in the nonfacility different then for the global? *For the global, the dominant specialty is Anesthesiology (26%)*

(Please see provided data in PE Subcommittee folder)

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*
6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

We are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies. Based on our Expert Panel review we identified a number of direct PE inputs (largely supplies) that are typically used when providing this service in the non-facility environment that are

not currently included. We have confirmed that the added PE clinical labor tasks, supplies, and equipment are not included in the current inputs or packages and that there is no duplication.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code) *5 minutes*
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. 7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. *N/A*

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

CPT Code: 64417
Specialty Society ASA

11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here: *N/A*
12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: *N/A*
13. If there is any other item on your spreadsheet that needs further explanation please include here: *N/A*
14. Please include an explanation of each line item: *N/A*

CPT Code: 64420
Specialty Society AAPM, AAPM&R, ASA

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs**

CPT Long Descriptor: Injection(s), anesthetic agent(s) and/or steroid; intercostal nerve, single level

Global Period: 0 Meeting Date: October 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

An Expert Panel of clinicians representing each specialty society involved in the RUC survey process for the code collaborated to develop and approve the PE recommendations. The Expert Panel was composed of clinicians from across the US practicing in small and large private practices and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

Using the current direct PE inputs of code 64420 as the reference code

3. Is this code(s) typically billed with an E/M service?

No.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: *N/A*

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: *N/A*

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: *N/A*

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: *N/A*

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. *N/A*

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: *N/A*

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor:

Global Period: 000 Meeting Date: September 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

Our specialties formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of oral and maxillofacial surgery and general otolaryngologists. The expert panel members also practice in settings that vary by size, geography, and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized the existing PE inputs as a reference for CPT Code 64408.

3. Is this code(s) typically billed with an E/M service? **No**
Is this code(s) typically billed with the E/M service in the nonfacility? **No**
(Please see provided data in PE Subcommittee folder)
4. What specialty is the dominant provider in the nonfacility? **Otolaryngology**
What percent of the time does the dominant provider provide the service(s) in the nonfacility? **91%**
Is the dominant provider in the nonfacility different then for the global? **No**
(Please see provided data in PE Subcommittee folder)
5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

Pre time: we are requesting five minutes in the non-facility to schedule space for the procedure. This is a necessary activity for staff to complete in order to ensure a time block in the facility to conduct the procedure.

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.

Pre time – see rationale above

Intra time – time requested is below existing

Post time – time requested is the same as existing

Supplies – we have removed the injection pack as it included materials not needed for the procedure. We replaced this with the individual items we do need such as the blunt tip needle to draw up the local anesthetic, an alcohol pad to clean the injection site, one spinal needle to inject, gauze to hold pressure after the injection, a Band-Aid for the injection site.

Equipment – is reduced from existing inputs

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**
8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

Staff must take the following vitals: Heart rate, blood pressure and pulse oximetry

9. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*:

Staff are present during the entire procedure, handing the physician the syringe, handing gauze and holding pressure to control bleeding and prevent a hematoma and passing the dressing supply.

10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived. **N/A**
11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

Existing PE was all lumped into the assist during procedure line item. We have divided out clinical staff activities for the necessary activities and assigned the standard time for those activities per the PE guidelines. The intra time for this procedure is only 5 minutes, so the prior 28 minutes for intra assisting was clearly not accounting for only directly assisting during the procedure.

12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. **N/A**
13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:

The only equipment recommended is the exam chair EF008. The formula chosen is the “default” PE formula, as it is not highly technical equipment.

16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: **N/A**

17. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**

18. Please include an explanation of each line item:

Line 33 – greet patient, gown them and ensure any records needed are available.

Line 34 – obtain 3 vitals: Heart rate, blood pressure and pulse oximetry

Line 35 – provide education and consent to patient prior to procedure.

Line 37 – prepare the room for the patient’s arrival and set up materials needed for procedure.

Line 49 – the staff are assisting directly during the entire 5 minute procedure handing the physician the syringe, handing gauze and holding pressure to control bleeding and prevent a hematoma and passing the dressing supply.

Line 60 – patients are monitored for 30 minutes after the procedure, so the standard time of 15 minutes per hour was reduced to accurately reflect 30 minutes of monitoring (7.5 rounded up).

Line 63 – staff clean the room and chair after the procedure.

Line 67 – check dressings, wounds – ensure there is no hematoma after procedure

Line 73 – review home care instructions – review potential signs to look for and what the patient will experience the days following procedure. Also when to remove bandaid and when they can shower, etc.

Line 84 – conducting phone calls a day or two after procedure to make sure the patient is doing well and no complications have arisen.

Line 103 – multi-specialty pack – used for prepping the room during procedure, gowning, and maintaining a safe environment (gloves).

Line 104 – spinal needle – used to inject the vagus nerve

Line 105 – needle, blunt tip – used to draw up the bupivacaine

Line 106 – syringe – used to draw up the bupivacaine

Line 107 – bupivacaine – local anesthetic to numb around the vagus nerve

Line 108 – alcohol swab – used to clean the injection site before and after the procedure.

Line 109 – Bandaid – used to cover the injection site after the procedure.

Line 110 – gauze non-sterile – used to apply pressure after the injection is complete.

Line 119 – exam chair – required for the procedure as the patient sits in it during the injection and the headrest is used for positioning the neck.

The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of oral and maxillofacial surgery and general otolaryngologists. The expert panel members also practice in settings that vary by size, geography, and represent both private and academic settings.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:

We utilized the existing PE inputs as a reference for CPT Code 64408.

3. Is this code(s) typically billed with an E/M service? **No**
4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: **N/A**
5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: **N/A**
6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**
7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

We are requesting the addition of 5 minutes of pre time for staff to schedule space in the facility for this procedure. We are also recommending removal of the 3 minutes for coordinating post procedure services and moving that time in the post period to conduct patient communications, as the staff call to check on the patient a few days after the procedure to ensure no complications have arisen.

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>. **N/A**

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**
11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here: **N/A**
12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: **N/A**
13. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**
14. Please include an explanation of each line item:

Line 17 – scheduling space in the facility requires staff time to ensure there is room to perform the procedure when performed in the facility setting.

Line 84 – conducting phone calls a day or two after procedure to make sure the patient is doing well and no complications have arisen.

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs**

Global Period: 000

REVISED

Meeting Date: October 2018

CPT Long Descriptor(s):

64430 *Injection, anesthetic agent; pudendal nerve*

64435 *Injection, anesthetic agent; paracervical (uterine) nerve*

-
- 1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:**

ACOG, ASA and AAPM convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these injection procedures.

- 2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:**

CPT Codes 64430 and 64435 are existing CPT codes. As such, we included the current direct practice expense inputs on the PE spreadsheet.

- 3. Is this code(s) typically billed with an E/M service?
Is this code(s) typically billed with the E/M service in the nonfacility?
(Please see provided data in PE Subcommittee folder)**

These services are not typically reported with E/M:

64430 – 23%

64435 – 0%

These services are not typically reported with E/M in the nonfacility:

64430 – 43%

64435 – 0%

- 4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different then for the global?
(Please see provided data in PE Subcommittee folder)**

OB/GYN is the dominant provider in the nonfacility:

64430 – 28%

64435 – 46%

OB/GYN is also the dominant provider for the globals in the nonfacility:

64430 – 39%

64435 – 67%

5. **If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:**

N/A

6. **If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), you must provide compelling evidence. Please explain if the increase can be entirely accounted for because of an increase in physician time.**

N/A

7. **If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here:**

N/A

8. **How much time was allocated to clinical activity, *obtain vital signs (CA010)* prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? (please use this time rather than 5 minutes in your reference code)**
The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

Prior to CMS increasing the vital signs to 5 minutes there were 3 minutes for obtain vital signs. We are recommending 5 minutes for obtain vital signs, based on the vital signs standards (4-6). The vital signs for these procedures include: height, weight, blood pressure and heart rate.

9. **Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time or Perform procedure/service---NOT directly related to physician work time:***

Nurse supplies physician with needed supplies and instruments. Assists with fluid management. Chaperone.

Note: Patient is in dorsal lithotomy position throughout the procedure.

- 10. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.**

N/A

- 11. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:**

N/A

- 12. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.**

N/A

- 13. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:**

We are recommending a new supply item, “Paracerv/Pudendal Block Tray, Sterile (Medline Item #BXT4540AH)” which is specifically designed for vaginal injection procedures. The needle guide is utilized to safely locate insertion of the needle for anesthetic delivery. It appears the existing CMS inputs do not describe this safety guide technology.

- 14. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:**

N/A

- 15. List all the equipment included in your recommendation and the equipment formula chosen (see document titled “Calculating equipment time”). If you have selected “other formula” for any of the equipment please explain here:**

EF023 table, exam – Default

EQ168 light, exam – Default

EF027 table, instrument, mobile - Default

**Note: Because we are using the default equipment formula, CA022 time is not included in the equipment formulas. However, the patient does recover in the room, so that time is not being captured.*

- 16. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:**

The patient recovers for approximately 15 minutes after the procedure, with the nurse coming to check in on the patient. We are requesting 3 minutes for post procedure monitoring (instead of 3.75 minutes).

**See note in #15.*

Post procedure phone call is to check on the effects of the medication, muscle weakness, etc.

CPT Code: 64430 (ACOG, ASA, AAPM)
64435 (ACOG)

17. If there is any other item on your spreadsheet that needs further explanation please include here:

N/A

18. Please include an explanation of each line item:

SA048	pack, minimum multi-specialty visit	Patient gown, exam table paper, pillow case
SA051	pack, pelvic exam	SJ032 lubricating jelly SK052 pad, mini SD118 specula, vaginal SJ052 swab, procto
SB006	drape, non-sterile, sheet 40in x 60in	Patient drape
SH021	bupivacaine 0.25% inj (Marcaine)	Anesthetic injected
SJ052	Swab, procto	Hemostasis and fluid management (2 additional from the SA051)
SJ043	Povidone swabsticks	Sterilization of the operative site
NEW	Paracerv/Pudendal Block Tray, Sterile	Kit includes: 20g 6" needle w/ 1/4" spacer, 10cc control syringe, 22g 1 1/2" needle, needle guide, gauze sponge and underpad

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs**

Global Period: 000

Meeting Date: October 2018

CPT Long Descriptor(s):

64430 *Injection, anesthetic agent; pudendal nerve*

64435 *Injection, anesthetic agent; paracervical (uterine) nerve*

- 1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:**

ACOG, ASA and AAPM convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these injection procedures.

- 2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here:**

CPT Codes 64430 and 64435 are existing CPT codes. As such, we included the current direct practice expense inputs on the PE spreadsheet.

- 3. Is this code(s) typically billed with an E/M service?**

These services are not typically reported with E/M:

64430 – 23%

64435 – 0%

- 4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:**

We are recommending 8 minutes of pre service time for these 000 day services.

- CA001 Complete pre-service diagnostic and referral forms – 3 min
Anesthesia requires CBC, pregnancy test
- CA004 Provide pre-service education/obtain consent – 5 min
Consent is completed in the office and sent to the hospital

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued – Utilization Over 30,000

April 2016

Injection Anesthetic Agent

In October 2015, AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on 2014 Medicare claims data and this service was identified.

64418 Injection, anesthetic agent; suprascapular nerve

The RUC reviewed the survey results from 139 physicians for CPT code 64418 and determined that the survey median and 25th percentile work RVUs did not adequately account for the work required to perform this service. Therefore, the RUC recommends crosswalking code 64418 to code 20611 *Arthrocentesis, aspiration and/or injection, major joint or bursa (eg, shoulder, hip, knee, subacromial bursa); with ultrasound guidance, with permanent recording and reporting* (work RVU = 1.10 and 10 minutes intra-service time).

The RUC reviewed the pre-service time for CPT code 66418 and agreed that pre-time package 6A (Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect) is appropriate. However, the RUC did not agree with the specialties recommended pre-time inputs and determined that the pre-time needed to be decreased further to account for overlap in time with an Evaluation and Management service that typically reported with this service. Therefore, the RUC recommends 6 minutes of evaluation time, 3 minutes of positioning time, 3 minutes of scrub dress and wait time, 10 minutes intra-service time and 10 minutes immediate post-service time. The RUC confirmed that 10 minutes of immediate post-service time is required to assess the patient for pain relief, respiratory, hemodynamic, mental orientation, and extremity vascular status changes; required as a result of the risk of intra-vascular injection or pneumothorax. The physician also assesses any impact on the patient's activities of daily living including eating, bathing, brushing teeth and hair and overhead activities. The physician performs both strength testing and functional assessments to evaluate weakness in the limb that was injected as a result of anesthetic response. The RUC noted that the majority of nerve block codes that were recently reviewed include 10 minutes of immediate post-service time.

The RUC noted that the recommended work RVU of 1.10 and 32 minutes of total time for CPT 66418 is relative compared to the top two key reference services 64450 *Injection, anesthetic agent; other peripheral nerve or branch* (work RVU = 0.75 and 20 minutes total time) and 64486 *Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)* (work RVU = 1.27 and 35 minutes of total time). The RUC noted that the recommendation is comparable to other nerve block codes 64405 *Injection, anesthetic agent; greater occipital nerve* (work RVU = 0.94 and 22 minutes total time) and 64415 *Injection, anesthetic agent; brachial plexus, single* (work RVU = 1.48 and 44 minutes total time). **The RUC recommends a work RVU of 1.10 for CPT code 64418.**

Practice Expense

One minor modification was made to correct the equipment minutes calculation. The Practice Expense Subcommittee reviewed the clinical staff time inputs to ensure that there were no duplicative times with the Evaluation and Management visit. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Work Neutrality

The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

64418	Injection, anesthetic agent; suprascapular nerve	000	1.10

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64418	Tracking Number	Original Specialty Recommended RVU: 1.20
		Presented Recommended RVU: 1.20
Global Period: 000		RUC Recommended RVU: 1.10
CPT Descriptor: Injection, anesthetic agent; suprascapular nerve		

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old woman with a frozen shoulder is unable to tolerate physical therapy due to pain. She is referred for a suprascapular nerve block to provide pain relief so that she can undergo physical therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 38%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 15%

Description of Pre-Service Work: Review records, communicate with other professionals, patient, and family; and obtain consent. Perform a focused History and Physical examination of the patient to confirm indications for procedure, potential contraindications, existing neurological deficits, and bleeding disorders. The pre-operative work also includes dressing, scrubbing, and waiting before the procedure; preparing the patient and equipment for the procedure; obtaining vital signs and positioning the patient in the sitting position.

Description of Intra-Service Work: Universal protocol is followed with confirmation of patient identifiers, procedure site, and laterality. The injection site overlying the scapular notch is identified. After sterile preparation of the skin, a local anesthetic skin wheal is placed at the site of injection. A needle is inserted toward the scapular notch. Once correct needle position is achieved, the needle is aspirated to confirm the absence of blood or air. Following negative aspiration, a small test-dose of local anesthetic is administered. The patient is queried about symptoms of intravascular local anesthetic injection. If there are no signs or symptoms of intravascular injection, the planned local anesthetic volume is injected in incremental doses with frequent aspiration to avoid intravascular injection. After completion of the injection, the needle is removed. The patient is evaluated for the initial effects of the block by physical examination to determine if the patient is developing weakness or numbness, and is evaluated for relief of pain in the expected nerve distribution.

Description of Post-Service Work: The patient is observed post-procedure for pain relief, respiratory, hemodynamic, mental orientation, or extremity vascular status changes. In addition, the limb that has received the nerve block is protected to prevent injury. The patient is provided education on the signs and symptoms of potential complications and the need to protect the anesthetized extremity. The physician communicates findings with the patient and other professionals (including written and telephone reports and orders).

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

In October 2015, AMA staff re-ran the Harvard valued codes with utilization over 30,000 based on 2014 Medicare claims data and this service was identified. The RUC determined that this service was to be placed on the next level of interest form to survey for April 2016.

Survey Sample and Process

The survey request was sent to a random selection from the membership database of the American Academy of Physician Medicine & Rehabilitation (AAPM&R). The American Society of Anesthesiologists (ASA) took a random sample of subspecialty pain medicine doctors from the ASA membership database. The standard RUC survey was conducted using a vignette drafted by the societies involved since 64418 had not previously been RUC reviewed. The Research Subcommittee reviewed and approved the vignette.

Pre-Service Time Package 6A

We recommend pre-time package 6A (NF Procedure w local/topical anesthesia care requiring wait time for anesthesia to take effect) as this procedure is performed in the physician's office 89% of the time according to the 2014 Medicare data. We recommend reducing the package pre-service evaluation time from 17 minutes to 8 minutes to account for overlap in time with an E/M service that is reported more than 50% of the time with 64418 on the same day. We also recommend increasing the package pre-service positioning time from 1 minute to 3 minutes. This is a reduction from the survey respondents' 5 minutes, as the Expert Panel indicated that 5 minutes overstated the positioning time, while the standard 1 minute in the pre-time package underestimates the time needed to position the patient. Additional positioning time is necessary because there is increased difficulty in identifying the target injection site, requiring manipulation of the patient's position to achieve the appropriate outcome. The Expert Panel agreed that the standard 5 minute scrub, dress and wait time in the pre-service package is appropriate.

Post-Service Time Package

We recommend post-service time package 7A (Local/Simple Procedure). We recommend reducing the package post-time from 18 minutes to 10 minutes, which corresponds with our survey data. In the post-service period the physician returns to the room following the initial injection to evaluate the patient for pain relief, respiratory, hemodynamic, mental orientation, and extremity vascular status changes; required as a result of the risk of intra-vascular injection or

pneumothorax. The physician must proceed with caution to protect the shoulder post injection as an injury to the suprascapular nerve will have an impact on the patient's activities of daily living including eating, bathing, brushing teeth and hair and overhead activities. Both strength testing and functional assessments are performed to evaluate weakness in the limb that was injected as a result of anesthetic response. The physician then evaluates for appropriateness of functional bracing of the shoulder.

Key Reference Codes

The recommended work RVU of 1.20 for 64418 fits well above the top key reference service (64450), since 64418 is more difficult to palpate the vessels around the suprascapular notch (compared to the posterior tibial vessels). Also, an injury to the suprascapular nerve will have a much greater impact on the patient than an injury to the posterior tibial nerve at the level of the ankle. It also fits well just below the second key reference code (64486). TAP block includes and is typically performed with image guidance. It also fits well with other injection codes and other codes in the RBRVS with similar IWPUTs, total time, and intra time.

MPC Comparison

MPC	Descriptor	RVW	IWPUT	Total Time	PRE	INTRA	POST

49082	Abdominal paracentesis (diagnostic or therapeutic); without imaging guidance	1.24	0.065	40	20	10	10
67505	Retrobulbar injection; alcohol	1.27	0.078	35	20	10	5
64486	Transversus abdominis plane (TAP) block (abdominal plane block, rectus sheath block) unilateral; by injection(s) (includes imaging guidance, when performed)	1.27	0.078	35	15	10	10

Recommendation

We recommend a work RVU of 1.20 for 64418. This value maintains the RUC and specialty accepted intensity/complexity rank order and relativity for code 64418 with many other injections codes requiring 10 minutes of intra-service time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☒ Other reason (please explain) Typically reported with an E&M service.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. For Medicare patients, 64418 is typically reported with an E&M service.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64418

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Anesthesiology How often? Sometimes

Specialty Physical Medicine and Rehabilitation How often? Sometimes

Specialty Interventional Pain Management & Pain Management How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 92955

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency is estimated at 3 times Medicare frequency.

Specialty Anesthesiology Frequency 26588 Percentage 28.60 %

Specialty Physical Medicine and Rehabilitation Frequency 11807 Percentage 12.70 %

Specialty Interventional Pain Management & Pain Medicine Frequency 20590 Percentage 22.15 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30,985 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2014 Data RUC Database

Specialty Anesthesiology	Frequency 8862	Percentage 28.60 %
Specialty Physical Medicine and Rehabilitation	Frequency 3957	Percentage 12.77 %
Specialty Interventional Pain Management and Pain Medicine	Frequency 6865	Percentage 22.15 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64418

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Practice Expense Summary of Recommendation
Facility Direct Inputs**

CPT Long Descriptor: Injection, anesthetic agent; suprascapular nerve

Global Period: 000

Meeting Date: April 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 64418 and made adjustments as appropriate.
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Current inputs for 64418 are used as reference.
3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A
5. Please describe in detail the clinical activities of your staff: N/A

Pre-Service Clinical Labor Activities:

Intra-Service Clinical Labor Activities:

Post-Service Clinical Labor Activities:

**AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs**

CPT Long Descriptor: Injection, anesthetic agent; suprascapular nerve

Global Period: 000 Meeting Date: April 2016

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The Advisors from the participating specialties reviewed the current PE details for 64418 and made adjustments as appropriate.
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Current inputs for 64418 are used as reference.
3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: Not applicable.
4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

Supplies

The Expert Panel that reviewed the supplies did not believe that this procedure required a pack, minimum multi-specialty visit.

Additionally, the Panel believed that the pack, basic injection, did not accurately reflect the supplies need for this procedure and we are recommending only the inputs that are necessary to perform this procedure in a sterile environment including:

- 5ml - bupivacaine 0.25% inj (Marcaine)
- 1 - cap, surgical
- 1 - mask, surgical
- 1 - gloves, sterile
- 1 - drape, sterile barrier 16in x 29in
- 1 - drape, sterile, for Mayo stand
- 1 - swab, patient prep, 1.5 ml (chloraprep)
- 1 - needle, 18-27g
- 1 - needle, 18-26g 1.5-3.5in, spinal
- 2 - syringe 5-6ml
- 5ml - lidocaine 1%-2% inj (Xylocaine)
- 1 - gauze, sterile 4in x 4in
- 1 - bandage, strip 0.75in x 3in (Bandaaid)

Equipment

Mayo stand - The removable instrument tray (mayo stand) is set adjacent to the injection; it provides a place for sterile instruments and supplies used during the injection.

Light, exam – The exam light is used to accurately visualize the injection site.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Period Clinical Labor Activities:

Service Period Clinical Labor Activities:

Pre-service

During the service period clinical staff will provide pre-service education, prepare the room, equipment, and supplies, and prepare and position patient. The 2 minutes included with an E/M service does not include setting up supplies for the injection which will include preparing the exam light and mayo stand with syringes, needles, drapes, and etc. to maintain a sterile field; 5 minutes additional time is recommended for these activities.

Intra-service

Clinical staff assists the physician for 100% of the intra-service time.

Post-service

Clinical staff provides 1:1 monitoring of the patient following the injection to monitor the patient for vasovagal response, mental status, and check vital signs. Clinical staff also fits the patient for the bracing and demonstrate proper use of the device. Finally, clinical staff will check the injection site, provide written and verbal post-injection and follow-up instructions on care of the injection site and activity restrictions.

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS 000-Day Global Typically Reported with an E/M

April 2017

Injection - Greater Occipital Nerve

In the Final Rule for 2017, CMS finalized the list of 000-day global services reported with an E/M 50 percent of the time or more, on the same day of service, same patient, by the same physician, that have not been reviewed in the last five years with Medicare utilization greater than 20,000. CPT code 64405 was identified on this list.

The RUC reviewed the survey results from 175 physicians from four different specialties and determined that it was appropriate to maintain the current work RVU of 0.94, which also represents the survey 25th percentile. The specialty societies recommended pre-time package 5, but reduced the package evaluation time by one minute to account for overlap because this service is typically reported with an E/M on the same day. The post-service time was reduced by 5 minutes in accordance with the survey results. The RUC carefully examined potential overlap with E/M services included in CPT 64405 and further reduced the pre-service evaluation time by 1 minute to 5 minutes. In addition, the RUC reduced the positioning time by 2 minutes and removed the 3 minutes of pre-service time for scrub/dress/wait because local anesthetic is not typical prior to this procedure but is included in the injection itself. The RUC recommends 5 minutes evaluation time, 1 minute positioning time, 5 minutes of intra-service time, and 5 minutes of immediate post-service time.

The RUC compared the survey code to the top two key reference services 20526 *Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel* (work RVU = 0.94) and 20552 *Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)* (work RVU = 0.66) and noted that the current work RVU of the survey code is appropriately equal to carpal tunnel and higher than the other injections. The 2nd key reference code 20526 represents identical overall work and total time. For additional support, the RUC compared the survey code to several multi-specialty point of comparison CPT codes: 67820 *Correction of trichiasis; epilation, by forceps only* (work RVU = 0.71), 12001 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less* (work RVU = 0.84), 51720 *Bladder instillation of anticarcinogenic agent (including retention time)* (work RVU = 0.87) and 20527 *Injection, enzyme (eg, collagenase), palmar fascial cord (ie, Dupuytren's contracture)* (work RVU = 1.00), and agreed that the survey 25th percentile of 0.94 places survey code 64405 in proper rank order. The RUC determined that the key reference services and comparable MPC codes support maintaining the current value for the survey code.

The RUC further agreed with the consensus of the specialty societies that the physician work for this service has not fundamentally changed since it was last reviewed in 2010 as part of the 4th Five-Year Review and recommends that the work RVU be maintained at the 25th percentile in accordance with the most recent survey. **The RUC recommends a work RVU of 0.94 for CPT code 64405.**

In addition, the RUC observed that there are inconsistencies in the Medicare Claims Processing Manual (Manual) related to reporting an E/M service on the same day as a minor procedure. While acknowledging the CMS staff citation from the manual, Chapter 12, Section 40.1, paragraph B, regarding reporting an E/M visit with a 000-day global code and the expectation that all of the focused evaluation work is included in the global period, the presenters noted that in two other sections of the same Manual chapter, the guidance provided is different. Specifically, Section 40.1 paragraph C and Section 40.2 paragraph A (#8) of the Manual confirm that it is permissible to report an E/M code on the same day as a minor surgical procedure when a significant, separately identifiable service is also performed. It is appropriate to append modifier 25 to the E/M code in instances where a significant, separately identifiable evaluation and management service is performed by same physician on the day of a procedure. The RUC also noted this Section of the Manual corresponds to CPT Modifier 25 instructions which state: "It may be necessary to indicate that on the day a procedure or service identified by a CPT code was performed, the patient's condition required a significant, separately identifiable E/M service above and beyond the other service provided or beyond the usual preoperative and postoperative care associated with the procedure that was performed. A significant, separately identifiable E/M service is defined or substantiated by documentation that satisfies the relevant criteria for the respective E/M service to be reported."

Practice Expense

The Practice Expense Subcommittee eliminated any clinical staff time and supplies that overlap with an evaluation and management service as the code is reported with an E/M more than 50% of the time. Additionally the RUC removed the exam light (EQ168) as it would not typically be used for this service and would not be in a standard room used for evaluation and management. The RUC recommends the direct practice expense inputs with modifications as reviewed and approved by the PE Subcommittee.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation
64405	Injection, anesthetic agent; greater occipital nerve	000	0.94 (No Change)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 64405	Tracking Number	Original Specialty Recommended RVU: 0.94
		Presented Recommended RVU: 0.94
Global Period: 000	Current Work RVU: 0.94	RUC Recommended RVU: 0.94
CPT Descriptor: Injection, anesthetic agent; greater occipital nerve		

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient with frequent headaches and a normal neurologic examination has tenderness over the left occipital notch, where palpation triggers the pain. For both diagnostic and therapeutic purposes, an injection of local anesthetic and anti-inflammatory is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is;
Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient's history to ensure she is suitable for the procedure (eg, not on anticoagulants and no history of allergic reaction to agents being used). Discuss the procedure with the patient, including alternatives and risks. Obtain informed consent. Palpate the upper cervical region near the lower extent of the skull dorsal to the mastoid process along the course of the greater occipital nerve and mark the proposed needle entry site. Examine the area of the scalp closely for infection. Clean the skin overlying the proposed injection site and prepare for injection. Prepare a syringe with a mix of a local anesthetic agent and an anti-inflammatory drug. Don gloves. Perform a pre-procedural time out.

Description of Intra-Service Work: Palpate the upper cervical region along the course of the greater occipital nerve. Penetrate the skin with the needle and inject the contents of the syringe along the course of the nerve following negative aspiration. Because of the significant vascularity of the scalp, make the injection with repeated, intermittent aspirations as the needle is repositioned along the course of the nerve.

Description of Post-Service Work: Apply pressure to the injection site to stop any bleeding after the injection, clean the injection area, and apply a bandage as necessary. Wait for the local anesthetic to work, inquiring if the patient has numbness in the distribution of the occipital nerve and if she has relief of her pain. Monitor the patient for any potential complications from the injection, including syncopal episode, intravascular injection, or evidence of distal particulate steroid injection. Discuss follow-up recommendations with the patient. Complete all appropriate medical records.

Outcome depends on the skill and judgment of physician	5%	37%	58%
Estimated risk of malpractice suit with poor outcome	16%	53%	32%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

The American Society of Anesthesiologists (ASA), the American Academy of Pain Management (AAPM), the American Association of Physical Medicine & Rehabilitation (AAPM&R), and the American Academy of Neurology (AAN), conducted joint surveys of their memberships in March 2017 for CPT code 64405. A joint ASA, AAPM, AAPM&R and AAN expert panel ("joint panel") consisting of physician advisors reviewed the survey work and time data and developed recommendations through participation in conference calls and e-mail discussions.

There were 175 responses (82 from ASA, 16 from AAPM, 27 from AAPM&R, 50 from AAN) to the survey request with a median performance rate of 25; 97% of the survey respondents found the vignette to be typical. The RUC summary contains a breakout of ASA, AAPM, AAPM&R, and AAN respondents. The number of responses meet RUC criteria and the vast majority of respondents perform this service.

Code 64405 was identified by CMS in the 2017 final rule on a list of 000-day global services reported with an E/M 50 percent of the time or more, on the same day of service, same patient, by the same physician. 2015 data reflect that 64405 is billed with an office E/M 50% of the time. It was last reviewed in 2010 and currently has times of 7/5/10/22 and an RVU of 0.94.

First, the joint panel reviewed the survey data. The survey median and 25th percentile RVU were 1.00 and 0.94 respectively. The total survey time for this service of 22 minutes (12/5/5) which is identical to the current time. The panel agreed this was appropriate because the service has not changed since the last survey. Based on the preservice times, the panel selected preservice time package 5.

Next, the panel reviewed the key reference service 20526, Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel, which was chosen by more than half the respondents. It has times of 6/5/5/16 and an RVU of 0.94. This RVU is identical to the 25th percentile of the survey.

The panel also reviewed several comparator codes (noted in the table below) and agree that the survey 25 fifth percentile of 0.94 places 64405 in proper rank order to all the codes reviewed. Most importantly, 64405 is most similar to 20526 and 20527 in intensity and has longer total time than both.

CPT Code	Description	RVU	Pre-service time	Intra-service time	Post-service time	Total time	RUC review
20522	Injection(s); single or multiple trigger point(s), 1 or 2 muscle(s)	0.66	11	5	5	21	2016
67820	Correction of trichiasis; epilation, by forceps only	0.71	8	5	2	15	2005
12001	Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less	0.84	7	10	5	22	2010
51720	Bladder instillation of antineoplastic agent (including retention time)	0.87	9	5	5	19	2016
20526	Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel	0.94	6	5	5	16	2002
64405	Injection, anesthetic agent; greater occipital nerve	0.94	12	5	5	22	2010

20527	Injection, enzyme (eg, collagenase), palmar fascial cord (ie, Dupuytren's contracture)	1.00	8	5	5	18	2011
-------	--	------	---	---	---	----	------

The joint panel note that 64405 is a more intense procedure than both 12001 and 67802 and has an identical total time to 12001 and is longer than 67820. Furthermore, the intensity / complexity measure responses from the survey further support the expert panel's recommendation of the survey 25th percentile because they are higher than both of the key reference services.

In summary, the main reference service and a review of other services with similar times and intensities, supports the survey 25th percentile RVU of 0.94. This is appropriate because the service has not changed since the last survey. This survey also provides strong validation for the 2010 survey. The joint panel reviewed the survey data by specialty and agreed it was remarkably consistent for both median time and median RVU across all specialties further supporting recommending the 25th percentile, thereby maintaining the current RVU.

Recommendations

In summary, we recommend the 25th percentile RVU of 0.94 and a preservice time of 12 minutes, an intra-service time of 5 minutes and a post-service time of 5 minutes for 64405.

SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☒ Other reason (please explain) According to the 2015 Medicare same day billing occurrences claims data, 64405 is reported with an office E/M code 50% of the time.

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64405

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty Pain Management / Interventional PM How often? Commonly

Specialty Anesthesiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 439188

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticipate 4 times the annual Medicare utilization; based on 2015 utilization data.

Specialty Neurology	Frequency 166892	Percentage 38.00 %
Specialty Pain Management / Interventional PM	Frequency 101014	Percentage 23.00 %
Specialty Anesthesiology	Frequency 65880	Percentage 15.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
109,797 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2015 Medicare utilization data from the RUC database.

Specialty Neurology	Frequency 41723	Percentage 38.00 %
Specialty Pain Management / Interventional PM	Frequency 25254	Percentage 23.00 %
Specialty Anesthesiology	Frequency 16470	Percentage 15.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Procedures

BETOS Sub-classification:

Minor procedure

BETOS Sub-classification Level II:

Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64405

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Non Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Injection, anesthetic agent; greater occipital nerve

Global Period: 000 Meeting Date: April 2017

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel: The joint societies convened a panel of experts, including advisors who are familiar with the service. The panel of experts reviewed and collaborated via email and phone call to review existing direct practice expense inputs for code 64405 and the key reference code, 20526. Based on this review and its expertise, the panel made modifications as necessary. The panel of experts is recommending a reduced total clinical staff time stemming in large part from the fact that we have reduced the preservice clinical staff time to zero from the current input of 8 minutes. The intraservice time has also been reduced from 36 minutes to 27 minutes. The panel also eliminated a number of the supplies currently attributed to this service as they were felt to not be necessary.
2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: The expert panel agreed that using the key reference service, 20526, as a reference code for comparison would provide a helpful reference point for practice expense review. The reference code describes a very similar procedure with identical intraservice clinical staff time.
3. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: N/A
4. Please provide rationale for the minutes you are recommending for clinical activities that do not have PE Subcommittee standards: The expert panel is recommending 5 minutes for CA018 assist physician or other qualified healthcare professional – directly related to physician work time (100% of physician intra-service time). The clinical staff assists the physician or qualified health care professional during the entirety of the injection in order to ensure the patient remains in the proper position and that the physician or qualified health care professional has access to necessary supplies. The expert panel is recommending 3 minutes for CA023 monitor patient following procedure/service, no multitasking. The patient must be closely monitored in the minutes immediately following the procedure to ensure the patient is not experiencing any abnormal responses to the injection.
5. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: The expert panel is recommending an increase in the number of needles from 1 to 2. One needle of a larger gauge is needed to draw up medication. A second, smaller gauge needle is used for comfort to perform the injection. The expert panel recommends adding an exam light, EQ168 for the procedure. The injection site for this procedure is often obstructed by hair. A light ensures that the site is visible so the physician can appropriately place the needle for the injection.
6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Spreadsheet Update Workgroup and listed in tab 2, please explain the difference here: N/A
7. Please describe in detail the clinical activities of your staff below:

Pre-Service Period Clinical Activities: (0 minutes)

There are no clinical activities performed by staff during the pre-service period.

Service Period Clinical Activities: (27 total minutes)

Pre-Service (of Service Period): (13 minutes) Clinical staff greets the patient and provides the patient with gowning. The appropriate medical records in reference to the planned injection are reviewed. Pre-service education is provided Clinical staff reviews the patient's understanding of the risks and benefits of the procedure, then obtains and documents patient consent. The patient's vital signs are taken, including temperature, blood pressure and pulse to ensure that the patient is in appropriate condition to receive the injection. The room is prepared and the appropriate injection equipment (sterile trays, needles and medications) is obtained.

Intra-Service (of Service Period): (5 minutes) The clinical staff is present for the entire procedure, assisting the physician by providing sterile supplies as appropriate. Clinical staff also provides reassurance and distraction to the patient as necessary.

Post-Service (of Service Period): (9 minutes) After the procedure, clinical staff observes the patient to verify that they are comfortable and the injection site is checked a few minutes following the injection to monitor the patient for an allergic reaction or vasovagal event. Following completion of the procedure by the physician, the room is cleaned and the instructions given by the physician are reviewed again with the patient. The patient is escorted out of the office. Relevant forms are completed and replacement supplies are ordered.

Post-Service Period Clinical Activities: (3 minutes) Although this code is a zero-day global service, an average of one phone call is received specific to the injection. The clinical staff answers this call and addresses questions.

8. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *Assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time*: The clinical staff helps to ensure that the patient's positioning remains consistent. The clinical staff also makes certain that all necessary supplies, including injectate and gauze are readily available to the physician or other qualified healthcare professional to ensure that the service can be provided without interruption.

9. If you have used a percentage of the physician intra-service work time other than 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

10. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities:

N/A

11. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at <http://www.bls.gov>.

N/A

12. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here:
N/A

13. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here:
N/A

14. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:
N/A

15. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here:

Rows 24, 54 and 94 of the PE spreadsheet reflect the current RUC database PE time for code 64405. This PE does not coincide with a RUC review, therefore detailed information about minutes attributed to specific tasks was not available. Please note that line 54 reflects the current PE minutes for the entire service period including pre, intra and post service (of service period).

16. If there is any other item on your spreadsheet that needs further explanation please include here:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2018

Genicular Injection and RFA

In May 2018 the CPT Editorial Panel approved the addition of two codes to report injection of anesthetic and destruction of genicular nerves by neurolytic agent.

In October 2018, the RUC facilitated this tab and thoroughly discussed the issues surrounding the survey of this family of services. The specialties noted their concern that many survey respondents appeared to be confused about the number of nerve branch injections involved with these three codes. The RUC supports the specialty societies' request for CPT codes 64454, 64640, and 64624 to be resurveyed and presented at the January 2019 RUC meeting. **The RUC recommends resurveying these services for January 2019.**

Practice Expense:

The RUC also discussed the practice expense and noted that the change in intra-service time for codes 64450 would need to also be made to the clinical labor time.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Nervous System Extracranial Nerves, Peripheral Nerves, and Autonomic Nervous System Introduction/Injection of Anesthetic Agent (Nerve Block), Diagnostic or Therapeutic <i>(For destruction by neurolytic agent or chemodenervation, see 62280-62282, 64600-64681)</i> <i>(For epidural or subarachnoid injection, see 62320, 62321, 62322, 62323, 62324, 62325, 62326, 62327)</i> <i>(64479-64487, 64490-64495 are unilateral procedures. For bilateral procedures, use modifier 50)</i> Somatic Nerves <i>64400 Injection, anesthetic agent; trigeminal nerve, any division or branch</i>				

(f)64450	G1	Injection, anesthetic agent; other peripheral nerve or branch	000	0.75 (See Tab 9 October 2018)
●64454	G2	Injection(s), anesthetic agent(s) and/or steroid; genicular nerve branches including imaging guidance, when performed (Do not report 64454 in conjunction with 64624) (64454 requires injecting all of the following genicular nerve branches: superolateral, superomedial, and inferomedial. If all three of these genicular nerve branches are not injected, report 64454 with modifier 52)	000	Resurvey for January 2019
Destruction by Neurolytic Agent (eg, Chemical, Thermal, Electrical or Radiofrequency), Chemodenervation <i>Codes 64600-64681 include the injection of other therapeutic agents (eg, corticosteroids). Do not report diagnostic/therapeutic injections separately. Do not report a code labeled as destruction when using therapies that are not destructive of the target nerve (eg, pulsed radiofrequency), use 64999. For codes labeled as chemodenervation, the supply of the chemodenervation agent is reported separately.</i> <i>(For chemodenervation of internal anal sphincter, use 46505)</i> <i>(For chemodenervation of the bladder, use 52287)</i> <i>(For chemodenervation for strabismus involving the extraocular muscles, use 67345)</i> <i>(For chemodenervation guided by needle electromyography or muscle electrical stimulation, see 95873, 95874)</i> Somatic Nerves 64600 <i>Destruction by neurolytic agent, trigeminal nerve; supraorbital, infraorbital, mental, or inferior alveolar branch</i>				
(f)64640	G3	Destruction by neurolytic agent; other peripheral nerve or branch	010	Resurvey for January 2019
●64624	G4	Destruction by neurolytic agent genicular nerve branches including imaging guidance, when performed (64624 requires the destruction of each of the following genicular nerve branches: superolateral, superomedial, and inferomedial. If a neurolytic agent for the purposes of destruction is not applied to all of these nerve branches, report 64624 with modifier 52) (Do not report 64624 in conjunction with 64454)	010	Resurvey for January 2019

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS/Other – Utilization over 30,000/ Harvard Valued – Utilization over 30,000

October 2018

Lower Gastrointestinal Tract Imaging

In October 2017, the RAW requested that AMA staff compile a list of CMS/Other codes with Medicare utilization of 30,000 or more. In January 2018, the RUC recommended to refer to CPT May 2018 to revise to condense this family of services and combine fluoroscopy. In May 2018, the CPT Editorial Panel approved the revision of nine codes, addition of two codes and deletion of five codes to conform to other families of radiologic examinations. The existing codes omitted key information regarding study types and provided inconsistent guidance on whether certain components are included in each code and the revisions will address these limitations and reflect the work inherent in each examination. The specialty society requested to delay survey of the upper GI codes in this family (CPT codes 74210, 74220, 74221, 74230, 74240, 74246, and 74248) until January 2019, as three of these codes for X-Ray Esophagus (74210, 74220, 74230), were already surveyed in April 2017 for the CPT 2019 cycle, thus their values are still pending. The specialty societies surveyed the lower GI codes (CPT codes 74250, 74251, 74270, 74280) for the October 2018 RUC meeting.

Compelling Evidence

The specialty societies presented compelling evidence for this family of codes based on flawed methodology and a change in patient population. The two codes identified on the screen, codes 74250 and 74270, are both CMS/Other sourced. Therefore, how the times and values were established are unknown or flawed. The RUC accepted compelling evidence for these two codes based on flawed methodology. The RUC also supported compelling evidence for CPT code 74251 as based on flawed methodology due to the devaluation by CMS of the original RUC recommendation in 1994. The RUC recommendation of 1.00 RVUs was arbitrarily reduced to 0.48 then raised to 0.69 in 1995.

CPT code 74280 was most recently reviewed in September 2011, and since that time, there have been advances in technology which have changed the typical patient. Most patients are typically first evaluated by colonoscopy and, increasingly, CT colonography. While previously used as a screening exam for the colon, that indication has seen a progressive decline and is now less than 6% of the claims. This code is now used for patients who fail either or both of those procedures or to problem-solve inconclusive findings on an initial examination. The RUC questioned whether this was the same argument as was made in 2011. The specialty indicated that the complexity of patients has been winnowed down to the most complex patients as demonstrated by the claims data. The RUC approved compelling evidence for the family based on change in patient population and a flawed previous methodology.

74250 Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; single-contrast (eg, barium) study

The RUC reviewed the survey results from 47 radiologists and determined that the survey 25th percentile work RVU of 0.81 accurately reflects the physician work necessary for this service. This is the only study in the family that does not include catheter placement as the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

contrast is ingested. The RUC agreed that the survey respondents maintained rank order within the family when considering the intensity of services. The RUC recommends 3 minutes pre-service time, 15 minutes intra-service time, and 5 minutes immediate post-service time.

The RUC compared CPT code 74250 to the top key reference code 74160 *Computed tomography, abdomen; with contrast material(s)* (work RVU = 1.27 and 15 minutes intra-service time) and noted that while the times are identical, the reference code includes IV contrast material and is therefore appropriately valued higher than the survey code. The small intestine study, CPT code 74250, is a more focused examination evaluating a specific problem or possible etiologies in one organ system. The CT abdomen with contrast includes a larger number of anatomic structures and a wider range of pathologic conditions and as a result appropriately has a higher IWPOT. The survey respondents indicated somewhat less intensity of code 74250 compared to code 74160.

For additional support, the RUC referenced the two MPC codes, CPT code 76700 *Ultrasound, abdominal, real time with image documentation; complete* (work RVU = 0.81 and 11 minutes intra-service time) and CPT code 92002 *Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; intermediate, new patient* (work RVU = 0.88 and 15 minutes intra-service time); these codes were strong comparators with similar amount of physician work and time. While CPT code 74250 requires slightly more intra-service time than CPT code 76700, as it includes periods of less intensive work, supporting the identical work RVU recommendation and lower IWPOT. Similarly, the survey code has similar times but overall less intense work when compared to evaluation of the eye, CPT code 92002, supporting a lower recommended work RVU and IWPOT. The RUC concluded that CPT code 74250 should be valued at the 25th percentile work RVU as supported by the survey. Further, the recommendation maintains relativity within the lower gastrointestinal tract family and greater RBRVS. **The RUC recommends a work RVU of 0.81 for CPT code 74250.**

74251 Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; double-contrast (eg, high-density barium and air via enteroclysis tube) study, including glucagon, when administered

The RUC reviewed the survey results from 47 radiologists and determined that the survey 25th percentile work RVU of 1.17 accurately reflects the physician work necessary for this service. The RUC recommends 5 minutes pre-service time, 22 minutes intra-service time, and 5 minutes immediate post-service time.

For this family of services, the RUC noted that the double-contrast small bowel examination codes require more work than the single-contrast counterpart. Additionally, all of the examinations (except for code 74250) require placement of a catheter into the enteric track, which increases the risk of perforation. The RUC clarified that CPT code 74251 is not currently reported together with a tube placement. Tube placement or advancement would be performed by the surgeon not the radiologist, and most of the patients (70%) are in-patient, and already have the tube in place. The RUC clarified that in 2020, there will be a parenthetical in place that states a separate code should be used for placement of enteroclysis tube.

The RUC compared CPT code 74251 to the top key reference code 74170 *Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections* (work RVU = 1.40 and 18 minutes intra-service time) and noted that the reference code includes without followed by contrast material and further sections, so it is appropriately valued higher than the survey code. The RUC also compared the survey

code to the second key reference service CPT code 74160 *Computed tomography, abdomen; with contrast material(s)* (work RVU = 1.27 and 15 minutes intra-service time) and noted that while both codes include contrast material, the reference code has a shorter intra-service time and is therefore more intense and appropriately valued higher than the survey code. While CPT code 74251 has a greater intra-service and total time, there are periods of less intense work compared to the top key reference services, resulting in an appropriately lower work RVU and IWP/UT. The small bowel examination is typically performed to evaluate for a specific disease process while both CT procedures involve evaluation of a larger number of organs and consideration of a greater potential number of disease processes.

For additional support, the RUC referenced the key MPC codes 70460 *Computed tomography, head or brain; with contrast material(s)* (work RVU = 1.13 and 12 minutes intra-service time) and 70470 *Computed tomography, head or brain; without contrast material, followed by contrast material(s) and further sections* (work RVU = 1.27 and 15 minutes intra-service time). CPT code 74251 is bracketed by the two radiology codes which both have less time but appropriately higher IWP/UTs, considering the intense work required to evaluate the brain and intracranial structures. The RUC concluded that CPT code 74251 should be valued at the 25th percentile work RVU as supported by the survey. Further, the recommendation maintains relativity within the lower gastrointestinal tract family and greater RBRVS. **The RUC recommends a work RVU of 1.17 for CPT code 74251.**

74270 Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study

The RUC reviewed the survey results from 47 radiologists and determined that the survey 25th percentile work RVU of 1.04 accurately reflects the physician work necessary for this service. The examination of the colon is more complex than the small bowel single-contrast study due to differences in patient positioning, placement of the catheter necessitated by the colon code, and the larger number of potential lesions and pathologies in evaluation of the colon. In addition, this code is now most frequently used to evaluate complex pre-operative anatomy, post-operative complications, or indeterminate CT findings. The RUC recommends 4 minutes pre-service time, 15 minutes intra-service time and 5 minutes immediate post-service time.

The RUC compared CPT code 74270 to the top key reference code 74160 *Computed tomography, abdomen; with contrast material(s)* (work RVU = 1.27 and 15 minutes intra-service time) and noted that the codes have identical intra times and similar total times. The X-ray colon study is a more focused examination evaluating a specific problem in one specific organ. The CT abdomen with contrast includes a larger number of anatomic structures and a wider range of pathologic conditions, supported by the higher work RVU and IWP/UT. The RUC also compared the survey code to the second key reference service CPT code 74170 *Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections* (work RVU = 1.40 and 18 minutes intra-service time) and noted that the recommended value and times are appropriately lower for the survey code. Both examinations are tailored to examine one specific disease process or focused differential; however, the CT abdomen without and with contrast includes a larger number of anatomic structures, a wider range of potential pathologic conditions and review of two entire CT examinations.

For additional support, the RUC referenced key MPC code 76805 *Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation, after first trimester (> or = 14 weeks 0 days), transabdominal approach; single or first gestation* (work RVU = 0.99 and 15

minutes intra-service time) and noted that the survey code has identical intra-service time and similar total time to CPT code 76805, but the invasive nature of this procedure accounts for the greater intensity and slightly higher work RVU and IWPUT. The RUC also compared the survey code to MPC code 70460 *Computed tomography, head or brain; with contrast material(s)* (work RVU = 1.13 and 12 minutes intra-service time) and noted that CPT code 74270 has slightly more time but is less intense than code 70460, which is a CT examination of the brain involving evaluation of a larger number of anatomic structures and consideration of a greater potential number of disease processes and complexity. The RUC concluded that CPT code 74270 should be valued at the 25th percentile work RVU as supported by the survey. Further, the recommendation maintains relativity within the lower gastrointestinal tract family and greater RBRVS. **The RUC recommends a work RVU of 1.04 for CPT code 74270.**

74280 Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (eg, high density barium and air) study, including glucagon, when administered

The RUC reviewed the survey results from 47 radiologists and determined that the survey 25th percentile work RVU of 1.26 accurately reflects the physician work necessary for this service. Per the compelling evidence argument, this code is decreasing in claims and is used on a more complex patient population. The RUC agreed with the survey respondents that this code with the installation of air and contrast has higher risk. The RUC recommends 4 minutes pre-service time, 20 minutes intra-service time and 5 minutes immediate post-service time.

The RUC compared CPT code 74280 to the top key reference codes 74170 *Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections* (work RVU = 1.40 and 18 minutes intra-service time) and 74160 *Computed tomography, abdomen; with contrast material(s)* (work RVU = 1.27 and 15 minutes intra-service time). While the survey respondents reported a greater intra-service and total time for CPT code 74280, there are periods of less intense work compared to the two CT of the abdomen procedures, resulting in an appropriately lower work RVU and IWPUT. The X-ray colon study is typically performed to evaluate for a specific disease process, while both of the CT procedures involve evaluation of a larger number of organs and consideration of a greater potential number of disease processes.

For additional support, the RUC referenced the key MPC codes 70470 *Computed tomography, head or brain; without contrast material, followed by contrast material(s) and further sections* (work RVU = 1.27 and 15 minutes intra-service time) and 70460 *Computed tomography, head or brain; with contrast material(s)* (work RVU = 1.13 and 12 minutes intra-service time). CPT code 74280 is bracketed by the two radiology codes which both have appropriately higher IWPUT when considering the longer intra-service period of 74280, which contains periods of overall less intense work compared to a CT examination of the brain involving evaluation of a larger number of anatomic structures and consideration of a greater potential number of disease processes and complexity. The RUC also compared CPT code 74280 to MPC code 99238 *Hospital discharge day management; 30 minutes or less* (work RVU = 1.28 and 20 minutes intra-service time) and noted that the survey code has identical intra-service time and higher IWPUT compared to the hospital discharge management code, which accounts for the invasive nature of the colon procedure. The RUC concluded that CPT code 74280 should be valued at the 25th percentile work RVU as supported by the survey. Further, the recommendation maintains relativity within the lower gastrointestinal tract family and greater RBRVS. **The RUC recommends a work RVU of 1.26 for CPT code 74280.**

Practice Expense

The PE Subcommittee added two minutes of clinical staff time in the non-facility for clinical activity, *confirm availability of prior images/studies* (CA006) and removed a few minutes from the highly technical equipment [EL014]. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 74250	Tracking Number J8	Original Specialty Recommended RVU: 0.81
		Presented Recommended RVU: 0.81
Global Period: XXX	Current Work RVU: 0.47	RUC Recommended RVU: 0.81

CPT Descriptor: Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; single-contrast (eg, barium) study

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 77-year-old male in the emergency department with a history of prior abdominal surgery presents with abdominal pain and distension. A single-contrast small intestine study is requested for evaluation of possible small bowel obstruction due to adhesions.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the reason for the examination and any pertinent clinical history. Confirm that single contrast only examination is appropriate. Determine the type of contrast to use. Review any prior applicable plain film or imaging studies. Provide patient with examination instructions and confirm understanding.

Description of Intra-Service Work: Position the patient. Direct the administration of oral contrast by the patient. After allowing time for contrast to reach the small bowel, take a spot radiograph of the abdomen. Evaluate proximal, mid, and distal small bowel segments under fluoroscopy and take multiple additional spot views. Continue to perform intermittent fluoroscopy and spot radiographs until the contrast has reached the colon. Direct the patient to various positions to better visualize small bowel loops in all four abdominal quadrants. Use paddle palpation to assist visualization of small bowel segments. Supervise the acquisition of overhead radiographs obtained by the technologist. Compare the current imaging to all pertinent available prior studies. Dictate a report.

Description of Post-Service Work: Review, edit, and sign report for the medical record. Discuss findings with the patient and referring provider as needed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT codes 74250 and 74270 were identified on the screen for CMS/Other codes with utilization over 30,000. The family was expanded to include three other x-ray codes pertaining to the lower gastrointestinal tract, 74251, 74260, and 74280. These codes were referred to the April 2018 CPT meeting. One of the codes, 74260 (*Duodenography, hypotonic*), was deleted, as it is an infrequently performed procedure. The descriptors for the remaining four codes were editorially revised to clarify the procedures, as shown below, and the family was surveyed for the October 2018 RUC.

- **74250** (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; single-contrast (eg, barium) study*),
- **74251** (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; double-contrast (eg, high-density barium and air via enteroclysis tube) study, including glucagon, when administered*),
- **74270** (*Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study*), and
- **74280** (*Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (eg, high density barium and air) study, including glucagon, when administered*).

Survey Process

The ACR surveyed a total of 1500 members (a random sample of 750 members and a separate random sample of 750 members who perform x-ray or gastrointestinal procedures).

Compelling Evidence:

The society is recommending compelling evidence for the entire family of codes to support the proposed wRVUs and times. The two codes identified on the screen, 74250 and 74270, are both CMS/Other, and were valued using flawed methodology. CPT code 74251 was most recently reviewed in July 1993, likely as part of the initial first 5-year review cycle. CPT code 74280 was most recently reviewed in September 2011, and since that time, there have been advances in technology which changed the typical patient. For all four codes in this family, there have been significant changes in the patient population and physician work over the past two decades as detailed below individually.

- **74250** – This is a CMS/Other code, and therefore, the times and values were established using a flawed methodology. Healthy, routine patients are increasingly evaluated with deep endoscopy and/or capsule endoscopy, while patients undergoing radiologic small bowel examinations are increasingly evaluated in the post-operative period to evaluate for both immediate and long-term surgical complications, frequently after multiple operations have been performed. This code is now more typically performed on a complicated patient in the hospital.
- **74251** – This code was most recently reviewed in July 1993, likely as part of the initial first 5-year review cycle. Since that time, healthy, routine patients are increasingly evaluated with deep endoscopy and/or capsule endoscopy, while patients undergoing radiologic small bowel examinations are increasingly evaluated in the post-operative period to evaluate for both immediate and long-term surgical complications, frequently after multiple operations have been performed. This code is now most often used for problem-solving chronic, unexplained symptoms when other investigations have been inconclusive, and is predominately performed in the inpatient setting (69% of claims).
- **74270** – This is a CMS/Other code, and therefore, the times and values were established using a flawed methodology. Many of these patients are now evaluated with CT and managed

accordingly. This code is now most frequently used to evaluate complex pre-operative anatomy, post-operative complications, or indeterminate CT findings.

- **74280** – This code was most recently reviewed in September 2011, and since that time, there have been advances in technology which changed the typical patient. Most patients are typically first evaluated by colonoscopy and, increasingly, CT colonography. This code is now used for patients who fail either or both of those procedures or to problem-solve inconclusive findings on an initial examination. While previously used as a screening exam for the colon, that indication is now less than 6% of the claims.

Work RVU Recommendation:

The expert panel recommends a work RVU of 0.81 for CPT code 74250, which is the 25th percentile survey value, and above the current CMS/Other value.

Time Recommendation:

The expert panel recommends the following median survey times: 3 minutes of pre-service time, 15 minutes of intra-service time, and 5 minutes of post-service time. This is a total time of 23 minutes compared to the existing CMS/Other total time of 10 minutes.

Key Reference Services

The most commonly chosen reference codes by survey participants are two CT of the abdomen procedures:

- **74160** (*Computed tomography, abdomen; with contrast material(s)*), chosen by 26% of respondents, and
- **74170** (*Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections*), chosen by 19% of respondents.

The recommended wRVU and survey times are appropriate compared to the most commonly chosen key reference service, 74160 (*Computed tomography, abdomen; with contrast material(s)*), which has identical times. The small intestine study is a more focused examination evaluating a specific problem or possible etiologies in one organ system. The CT abdomen with contrast includes a larger number of anatomic structures and a wider range of pathologic conditions supported by the higher IWPUR and survey respondents indicating somewhat less intensity of 74250 compared to 74160.

The recommended value and service times are also appropriately lower compared to the second key reference service, 74170 (*Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections*), which has 3 minutes more intra-service time. Both examinations are tailored to examine one specific disease process or focused differential; however, the CT abdomen without and with contrast includes a larger number of anatomic structures, a wider range of potential pathologic conditions, and review of two entire CT examinations.

CPT Code	Short Descriptor	wRVU	Total Time	Pre	Intra	Post	IWPUR	% chosen
74250	X-Ray, small intestine; single-contrast study	0.81	23	3	15	5	0.042	
74160	CT, abdomen; w/contrast	1.27	23	3	15	5	0.073	26%
74170	CT, abdomen; w/o & w/contrast	1.40	28	5	18	5	0.065	19%

MPC Codes

The surveyed code compares well with three MPC codes:

- **99231** (Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit.)
- **76700** (Ultrasound, abdominal, real time with image documentation; complete)
- **92002** (Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; intermediate, new patient)

CPT code 74250 has 5 more minutes of intra-service time compared to 99231, supporting the slightly higher recommended wRVU. While CPT code 74250 requires slightly more intra-service time than CPT code 76700, it includes periods of less intensive work, supporting the identical wRVU recommendation and lower IWP/UT. Similarly, the surveyed code has similar times but overall less intense work when compared to evaluation of the eye, CPT code 92002, supporting a lower recommended wRVU and IWP/UT. The relationships are summarized in the following table.

CPT Code	Short Descriptor	wRVU	Total Time	Pre	Intra	Post	IWP/UT
99231	Subseq. hospital care, per day, for E&M of pt w/MDM of low complexity. Typically, 15 minutes bedside with patient.	0.76	20	5	10	5	0.054
74250	X-Ray, small intestine; single-contrast study	0.81	23	3	15	5	0.042
76700	US, abdominal, real time with image documentation; complete	0.81	21	5	11	5	0.053
92002	Ophthalmological services: medical exam & eval w/initiation of dx and treatment program; intermed., new pt	0.88	25	5	15	5	0.044

Summary

The survey results and comparison with applicable codes support the 25th percentile survey value for 74250 (Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; single-contrast (eg, barium) study). The recommendation maintains relativity within the lower gastrointestinal tract family and greater RBRVS.

CPT Code	Short Descriptor	wRVU	Total Time	Pre	Intra	Post	IWP/UT
74250	X-Ray, small intestine; single-contrast study	0.81	23	3	15	5	0.042
74270	X-ray, colon; single-contrast study	1.04	24	4	15	5	0.056
74251	X-ray, small intestine; double-contrast study	1.17	32	5	22	5	0.043
74280	X-ray, colon; double-contrast study	1.26	29	4	20	5	0.053

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 74250

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 161007

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 74250 is estimated to be provided 161,007 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 154836 Percentage 96.16 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 53,669 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 74250 is estimated to be provided 53,669 times nationally in a one-year period to Medicare patients.

Specialty Diagnostic Radiology Frequency 51612 Percentage 96.16 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Imaging

BETOS Sub-classification:

Standard imaging

BETOS Sub-classification Level II:

Contrast Gastrointestinal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 74250

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 74251	Tracking Number J9	Original Specialty Recommended RVU: 1.17
		Presented Recommended RVU: 1.17
Global Period: XXX	Current Work RVU: 0.69	RUC Recommended RVU: 1.17

CPT Descriptor: Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; double-contrast (eg, high-density barium and air via enteroclysis tube) study, including glucagon, when administered

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male with abdominal pain and weight loss. Double-contrast small intestine study is requested for evaluation of suspected malabsorption syndrome.

Percentage of Survey Respondents who found Vignette to be Typical: 62%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the reason for the examination and any pertinent clinical history. Confirm that double contrast examination and enteroclysis tube placement are appropriate. Determine the type of contrast to use and if glucagon is indicated. Review any prior applicable plain film or imaging studies. Provide patient with examination instructions and confirm understanding.

Description of Intra-Service Work: Position the patient. Insert the enteric catheter. Monitor the advancement of the catheter under fluoroscopy until the catheter tip is positioned in the duodenum. Administer barium through the catheter using a syringe until barium reaches the distal small bowel. Administer air through the catheter using a pump. Evaluate proximal, mid, and distal small bowel loops under fluoroscopy and take multiple spot views. Continue to perform intermittent fluoroscopy and spot radiographs until the contrast has reached the colon. Direct the patient to various positions to better visualize small bowel segments through the abdomen and in any particular area of interest. Use paddle palpation to assist visualization and separation of bowel segments. Remove the enteric catheter. Supervise the acquisition of overhead radiographs obtained by the technologist. Compare the current imaging to all pertinent available prior studies. Dictate a report.

Description of Post-Service Work: Review, edit, and sign report for the medical record. Discuss the findings with the patient and referring provider as needed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT codes 74250 and 74270 were identified on the screen for CMS/Other codes with utilization over 30,000. The family was expanded to include three other x-ray codes pertaining to the lower gastrointestinal tract, 74251, 74260, and 74280. These codes were referred to the April 2018 CPT meeting. One of the codes, 74260 (*Duodenography, hypotonic*), was deleted, as it is an infrequently performed procedure. The descriptors for the remaining four codes were editorially revised to clarify the procedures, as shown below, and the family was surveyed for the October 2018 RUC.

- **74250** (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; single-contrast (eg, barium) study*),
- **74251** (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; double-contrast (eg, high-density barium and air via enteroclysis tube) study, including glucagon, when administered*),
- **74270** (*Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study*), and
- **74280** (*Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; double-contrast (eg, high density barium and air) study, including glucagon, when administered*).

Survey Process

The ACR surveyed a total of 1500 members (a random sample of 750 members and a separate random sample of 750 members who perform x-ray or gastrointestinal procedures).

Compelling Evidence:

The society is recommending compelling evidence for the entire family of codes to support the proposed wRVUs and times. The two codes identified on the screen, 74250 and 74270, are both CMS/Other, and were valued using flawed methodology. CPT code 74251 was most recently reviewed in July 1993, likely as part of the initial first 5-year review cycle. CPT code 74280 was most recently reviewed in September 2011, and since that time, there have been advances in technology which changed the typical patient. For all four codes in this family, there have been significant changes in the patient population and physician work over the past two decades as detailed below individually.

- **74250** – This is a CMS/Other code, and therefore, the times and values were established using a flawed methodology. Healthy, routine patients are increasingly evaluated with deep endoscopy and/or capsule endoscopy, while patients undergoing radiologic small bowel examinations are increasingly evaluated in the post-operative period to evaluate for both immediate and long-term surgical complications, frequently after multiple operations have been performed. This code is now more typically performed on a complicated patient in the hospital.
- **74251** – This code was most recently reviewed in July 1993, likely as part of the initial first 5-year review cycle. Since that time, healthy, routine patients are increasingly evaluated with deep endoscopy and/or capsule endoscopy, while patients undergoing radiologic small bowel examinations are increasingly evaluated in the post-operative period to evaluate for both immediate and long-term surgical complications, frequently after multiple operations have been performed. This code is now most often used for problem-solving chronic, unexplained symptoms when other investigations have been inconclusive, and is predominately performed in the inpatient setting (69% of claims).
- **74270** – This is a CMS/Other code, and therefore, the times and values were established using a flawed methodology. Many of these patients are now evaluated with CT and managed

accordingly. This code is now most frequently used to evaluate complex pre-operative anatomy, post-operative complications, or indeterminate CT findings.

- **74280** – This code was most recently reviewed in September 2011, and since that time, there have been advances in technology which changed the typical patient. Most patients are typically first evaluated by colonoscopy and, increasingly, CT colonography. This code is now used for patients who fail either or both of those procedures or to problem-solve inconclusive findings on an initial examination. While previously used as a screening exam for the colon, that indication is now less than 6% of the claims.

Work RVU Recommendation:

The expert panel recommends a work RVU of 1.17 for CPT code 74251, which is the 25th percentile survey value, and above the current value.

Time Recommendation:

The expert panel recommends the following median survey times: 5 minutes of pre-service time, 22 minutes of intra-service time, and 5 minutes of post-service time. This is a total time of 32 minutes compared to the existing time of 38 minutes.

Key Reference Services

The most commonly chosen reference codes by survey participants are two CT of the abdomen procedures:

- **74170** (*Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections*), chosen by 72% of respondents, and
- **74160** (*Computed tomography, abdomen; with contrast material(s)*), chosen by 9% of respondents.

While the survey respondents reported a greater intra-service and total time for 74251, there are periods of less intense work compared to the most commonly chosen key reference services, 74170 and 74160, resulting in an appropriately lower wRVU and IWP/UT. The small bowel examination is typically performed to evaluate for a specific disease process while both of the CT procedures involve evaluation of a larger number of organs and consideration of a greater potential number of disease processes.

CPT Code	Short Descriptor	wRVU	Total Time	Pre	Intra	Post	IWP/UT	% chosen
74251	X-ray, small intestine; double-contrast study	1.17	32	5	22	5	0.043	
74160	CT, abdomen; w/contrast	1.27	23	3	15	5	0.073	9%
74170	CT, abdomen; w/o & w/contrast	1.40	28	5	18	5	0.065	72%

MPC Codes

The surveyed code compares well with three MPC codes:

- **99213** (*Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 15 minutes are spent face-to-face with the patient and/or family.*)
- **70460** (*Computed tomography, head or brain; with contrast material(s)*)

- **70470** (*Computed tomography, head or brain; without contrast material, followed by contrast material(s) and further sections*)

CPT code 74251 is bracketed by two radiology MPC codes, 70460 and 70470, which both have less time but appropriately higher IWPUs, considering the intense work required to evaluate the brain and intracranial structures. CPT code 74251 also has more intra-service and overall time than MPC code 99213, supporting the higher wRVU recommendation. The relationships are summarized in the following table.

CPT Code	Short Descriptor	wRVU	Total Time	Pre	Intra	Post	IWPUT
99213	Office or OP visit for E&M of established pt w/MDM of low complexity. Typically, 15 minutes face-to-face with patient.	0.97	23	3	15	5	0.053
70460	CT, head or brain; w/contrast	1.13	22	5	12	5	0.076
74251	X-ray, small intestine; double-contrast study	1.17	32	5	22	5	0.043
70470	CT head or brain; w/o & w/contrast	1.27	25	5	15	5	0.070

Summary

The survey results and comparison with applicable codes support the 25th percentile survey value for 74251 (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; double-contrast (eg, high-density barium and air via enteroclysis tube) study, including glucagon, when administered*). The recommendation maintains relativity within the lower gastrointestinal tract family and greater RBRVS.

CPT Code	Short Descriptor	wRVU	Total Time	Pre	Intra	Post	IWPUT
74250	X-Ray, small intestine; single-contrast study	0.81	23	3	15	5	0.042
74270	X-ray, colon; single-contrast study	1.04	24	4	15	5	0.056
74251	X-ray, small intestine; double-contrast study	1.17	32	5	22	5	0.043
74280	X-ray, colon; double-contrast study	1.26	29	4	20	5	0.053

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.

- ☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 74251

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1005

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 74251 is estimated to be provided 1,005 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 948 Percentage 94.32 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 335

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 74251 is estimated to be provided 335 times nationally in a one-year period to Medicare patients.

Specialty Diagnostic Radiology Frequency 316 Percentage 94.32 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Contrast Gastrointestinal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 74251

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION**

CPT Code: 74270 Tracking Number J10

Original Specialty Recommended RVU: **1.04**Presented Recommended RVU: **1.04**Global Period: XXX Current Work RVU: **0.69**RUC Recommended RVU: **1.04**

CPT Descriptor: Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 81-year-old male presents to the emergency department with worsening abdominal pain, distension and melena. A single-contrast colon study is requested for evaluation of suspected colonic obstruction.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the reason for the examination and any pertinent clinical history. Confirm that single contrast only examination is appropriate. Determine the type of contrast to use. Review any prior applicable plain film or imaging studies. Provide patient with examination instructions and confirm understanding.

Description of Intra-Service Work: Position the patient. Review the scout abdominal radiograph(s) to ensure the colon is clear of stool. Perform a digital rectal examination to assess for rectal mass or stricture. Insert the rectal tube. With the patient in decubitus position, start the administration of barium under fluoroscopic visualization. Direct the patient to various positions to allow filling to the level of the cecum. Take multiple spot views including a lateral rectosigmoid view, the splenic and hepatic flexures, the cecum, and ileocecal region. Assess for reflux of barium into the terminal ileum. Use paddle palpation to assist visualization of the terminal ileum. Supervise the acquisition of overhead and decubitus films and post evacuation films obtained by the technologist. Compare the current imaging to all pertinent available prior studies. Dictate a report.

Description of Post-Service Work: Review, edit, and sign report for the medical record. Discuss the findings with the patient and referring provider as needed.

TIME ESTIMATES (Median)

	CPT Code: <u>74270</u>	Top Key Reference CPT Code: <u>74160</u>	2nd Key Reference CPT Code: <u>74170</u>
Median Pre-Service Time	4.00	3.00	5.00
Median Intra-Service Time	15.00	15.00	18.00
Median Immediate Post-service Time	5.00	5.00	5.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	24.00	23.00	28.00
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

<u>Top Key Reference Code</u>	<u>Much Less</u>	<u>Somewhat Less</u>	<u>Identical</u>	<u>Somewhat More</u>	<u>Much More</u>
Overall intensity/complexity	0%	19%	44%	19%	19%

Mental Effort and Judgment

	<u>Less</u>	<u>Identical</u>	<u>More</u>
<ul style="list-style-type: none"> The number of possible diagnosis and/or the number of management options that must be considered The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed Urgency of medical decision making 	38%	50%	13%

<u>Technical Skill/Physical Effort</u>	<u>Less</u>	<u>Identical</u>	<u>More</u>
Technical skill required	13%	19%	69%
Physical effort required	13%	0%	88%

<u>Psychological Stress</u>	<u>Less</u>	<u>Identical</u>	<u>More</u>
<ul style="list-style-type: none"> The risk of significant complications, morbidity and/or mortality Outcome depends on the skill and judgment of physician Estimated risk of malpractice suit with poor outcome 	25%	38%	38%

<u>2nd Key Reference Code</u>	<u>Much Less</u>	<u>Somewhat Less</u>	<u>Identical</u>	<u>Somewhat More</u>	<u>Much More</u>
Overall intensity/complexity	0%	15%	8%	54%	23%

<u>Mental Effort and Judgment</u>	<u>Less</u>	<u>Identical</u>	<u>More</u>
<ul style="list-style-type: none"> The number of possible diagnosis and/or the number of management options that must be considered The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed Urgency of medical decision making 	38%	23%	38%

<u>Technical Skill/Physical Effort</u>	<u>Less</u>	<u>Identical</u>	<u>More</u>
Technical skill required	23%	0%	77%
Physical effort required	8%	8%	85%

<u>Psychological Stress</u>	<u>Less</u>	<u>Identical</u>	<u>More</u>
<ul style="list-style-type: none"> The risk of significant complications, morbidity and/or mortality Outcome depends on the skill and judgment of physician Estimated risk of malpractice suit with poor outcome 	15%	23%	62%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

CPT codes 74250 and 74270 were identified on the screen for CMS/Other codes with utilization over 30,000. The family was expanded to include three other x-ray codes pertaining to the lower gastrointestinal tract, 74251, 74260, and 74280. These codes were referred to the April 2018 CPT meeting. One of the codes, 74260 (*Duodenography, hypotonic*), was deleted, as it is an infrequently performed procedure. The descriptors for the remaining four codes were editorially revised to clarify the procedures, as shown below, and the family was surveyed for the October 2018 RUC.

- **74250** (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; single-contrast (eg, barium) study*),
- **74251** (*Radiologic examination, small intestine, including multiple serial images and scout abdominal radiograph(s), when performed; double-contrast (eg, high-density barium and air via enteroclysis tube) study, including glucagon, when administered*),
- **74270** (*Radiologic examination, colon, including scout abdominal radiograph(s) and delayed image(s), when performed; single-contrast (eg, barium) study*), and
