

HOD ACTION: Council on Medical Education Report 4 adopted as amended, and the remainder of the report filed.

REPORT 4 OF THE COUNCIL ON MEDICAL EDUCATION (A-19)
Augmented Intelligence in Medical Education (Resolution 317-A-18)
(Reference Committee C)

EXECUTIVE SUMMARY

At the 2018 Annual Meeting of the American Medical Association (AMA), delegates adopted Policy H-480.940, “Augmented Intelligence in Health Care,” which established the AMA’s first official policy with respect to augmented intelligence (AI). Among other recommendations, the report called on the AMA to “encourage education for patients, physicians, medical students, other health care professionals, and health administrators to promote greater understanding of the promise and limitations of health care AI.”

Also during the 2018 Annual Meeting, Resolution 317-A-18, “Emerging Technologies (Robotics and AI) in Medical School Education,” was referred. This resolution called on the AMA to (1) encourage medical schools to evaluate and update as appropriate their curriculum to increase students’ exposure to emerging technologies, in particular those related to robotics and artificial intelligence; 2) encourage medical schools to provide student access to computational resources like cloud computing services; 3) reaffirm Policy H-480.988, which urges physicians to continue to ensure that, for every patient, technologies will be utilized in the safest and most effective manner by health care professionals; and 4) reaffirm Opinion 1.2.11 of the AMA Code of Medical Ethics and Policy H-480.996, which state the guidelines for the ethical development of medical technology and innovation in health care.

This report summarizes existing AMA policy related to AI; provides definitions of related terms; reviews current efforts related to AI in medical education; and provides recommendations for consideration by the AMA House of Delegates.

HOD ACTION: Council on Medical Education Report 4 adopted as amended, and the remainder of the report filed.

REPORT OF THE COUNCIL ON MEDICAL EDUCATION

CME Report 4-A-19

Subject: Augmented Intelligence in Medical Education (Resolution 317-A-18)

Presented by: Carol Berkowitz, MD, Chair

Referred to: Reference Committee C
(Nicole Riddle, MD, Chair)

1 INTRODUCTION

2
3 At the 2018 Annual Meeting of the American Medical Association (AMA), the AMA House of
4 Delegates (HOD) adopted Policy H-480.940, “Augmented Intelligence in Health Care,” which
5 established the AMA’s first official policy with respect to augmented intelligence (AI). Among
6 other recommendations, the report called on the AMA to “encourage education for patients,
7 physicians, medical students, other health care professionals, and health administrators to promote
8 greater understanding of the promise and limitations of health care AI.”¹

9
10 Also during the 2018 Annual Meeting, Resolution 317-A-18, “Emerging Technologies (Robotics
11 and AI) in Medical School Education,” introduced by the Maryland Delegation, was referred for
12 further study. This resolution called on the AMA to (1) encourage medical schools to evaluate and
13 update as appropriate their curriculum to increase students’ exposure to emerging technologies, in
14 particular those related to robotics and artificial intelligence; 2) encourage medical schools to
15 provide student access to computational resources like cloud computing services; 3) reaffirm
16 Policy H-480.988, which urges physicians to continue to ensure that, for every patient,
17 technologies will be utilized in the safest and most effective manner by health care professionals;
18 and 4) reaffirm Opinion 1.2.11 of the AMA Code of Ethics and Policy H-480.996, which state the
19 guidelines for the ethical development of medical technology and innovation in health care.
20 Testimony on this item in Reference Committee C was mostly supportive, and noted that medical
21 students will need access to new types of technology to be better prepared for practice. The need
22 for continued ethical guidance in this area also was referenced. Testimony in opposition argued that
23 the appropriate place for instruction in these new technologies should be at the graduate medical
24 education (GME), rather than undergraduate medical education (UME) level, as many of these
25 solutions are specialty specific. In light of the Council on Medical Education’s planned report to
26 the HOD regarding AI across the medical education continuum at the 2019 Annual Meeting,
27 Resolution 317-A-18 was referred for inclusion in this report.

28
29 DEFINITION OF ARTIFICIAL AND AUGMENTED INTELLIGENCE

30
31 The AMA’s Council on Long Range Planning and Development (CLRPD) defines artificial
32 intelligence as “the ability of a computer to complete tasks in a manner typically associated with a
33 rational human being—a quality that enables an entity to function appropriately and with foresight
34 in its environment. True [artificial intelligence] is widely regarded as a program or algorithm that
35 can beat the Turing Test, which states that an artificial intelligence must be able to exhibit
36 intelligent behavior that is indistinguishable from that of a human.”² Augmented intelligence,

1 meanwhile, is “an alternative conceptualization that focuses on [artificial intelligence’s] assistive
2 role, emphasizing the fact that its design enhances human intelligence rather than replaces it.”²

3
4 In its report that led to Policy H-480.940, the Board of Trustees further parsed these two related,
5 but distinct, terms: “Artificial intelligence constitutes a host of computational methods that produce
6 systems that perform tasks normally requiring human intelligence. These computational methods
7 include, but are not limited to, machine image recognition, natural language processing, and
8 machine learning. However, in health care a more appropriate term is ‘augmented intelligence,’
9 reflecting the enhanced capabilities of human clinical decision making when coupled with these
10 computational methods and systems.”¹

11
12 Examples of AI methods used in medicine include, but are not limited to, machine learning, deep
13 learning, neural networks, and natural language processing. Applications include, but are not
14 limited to, clinical decision support tools, diagnostic support tools, virtual reality, augmented
15 reality, simulation, gamification, and wearables that contribute data to physician decision-making.
16 These technologies can be understood to comprise areas of cognition (such as algorithms),
17 workflow (guidance regarding prioritization), quality (validation of algorithms), and monitoring
18 (peer review for machine learning).

19 20 THE NEED FOR POLICY RELATED TO ARTIFICIAL AND AUGMENTED INTELLIGENCE

21
22 Almost a decade ago, Peter Densen wrote:

23
24 It is estimated that the doubling time of medical knowledge in 1950 was 50 years; in 1980, 7
25 years; and in 2010, 3.5 years. In 2020 it is projected to be 0.2 years—just 73 days. Students
26 who began medical school in the autumn of 2010 will experience approximately three
27 doublings in knowledge by the time they complete the minimum length of training (7 years)
28 needed to practice medicine. Students who graduate in 2020 will experience four doublings in
29 knowledge. What was learned in the first 3 years of medical school will be just 6% of what is
30 known at the end of the decade from 2010 to 2020. Knowledge is expanding faster than our
31 ability to assimilate and apply it effectively; and this is as true in education and patient care as
32 it is in research. Clearly, simply adding more material and or time to the curriculum will not be
33 an effective coping strategy—fundamental change has become an imperative.³

34
35 Since Densen published his predictions, the pace of change in medical education has continued to
36 be a topic of focus and discussion and can be framed as a disruption to traditional instructional
37 methods and timelines. The AMA has long demonstrated a commitment to developing and
38 supporting disruptive advancements in medical education, both autonomously and in partnership
39 with others. This commitment can be seen in the Council on Medical Education’s contributions to
40 the 1910 Flexner Report, the establishment of many of the leading U.S. medical education
41 organizations that exist today, the groundbreaking Accelerating Change in Medical Education
42 Consortium, the newly launched Reimagining Residency initiative, and enhanced e-learning
43 content design and delivery. It is therefore appropriate that the AMA now begin work on a body of
44 policy and thoughtful guidance related to AI in medical education, especially as Policy H-480.940,
45 Resolution 317-A-18, and the CLRPD’s Primer on Artificial and Augmented Intelligence have
46 clearly demonstrated the urgent need for policy in this area.

1 DISCUSSION

2
3 As with many previously introduced technologies, the potential benefits, risks, and unknowns of
4 incorporating AI into medical education have yet to be fully revealed. The promise of AI in
5 medical education includes the potential for enhanced learning, ultimately resulting in benefit to
6 patients; efficiency gains achieved via a reallocation of physician time; further development of
7 physicians' emotional intelligence skills due to a reduced need to focus on automatable tasks; and
8 enhanced learner evaluations, including the ability to assess competencies prospectively,
9 accurately, and continuously, leading to greater facilitation of independent learning and an
10 elimination of the "stop and test" mindset. Just-in-time assessments and learning interventions may
11 assist with progression through competencies. In the context of the AMA's current focus on health
12 systems science, AI promises to enable more encompassing systems analyses and quality
13 improvement approaches and to introduce computational modeling that may replace cycles of
14 iterative improvements. Additionally, AI in medicine may aid instruction in and delivery of care to
15 rural or otherwise underserved locations.

16
17 Concerns, however, also exist, such as the possibility of physician de-skilling as more cognitive
18 tasks are performed by AI; an unintentional reinforcement of health disparities,⁴ both in terms of
19 patient health outcomes and for clinicians practicing in less resourced clinical environments; the
20 potential loss of physician humanism and further deterioration of physicians' bedside skills; and the
21 risk of overutilization of AI-delivered care, such as the use of technology for the sake of using
22 technology and the risk of adding to, rather than replacing items in, the curriculum.

23
24 Unknowns range from implications for learner wellness to concerns regarding exposure of gaps in
25 faculty knowledge. Incorporation of AI in medical education may streamline learning and clinical
26 workflow, gifting additional time to learners that can be used to focus on patients and self;
27 however, it also has the potential to do the opposite, disrupting and displacing traditional
28 instructional techniques without clear benefits to learners or patients. Other unknowns include the
29 effects of AI on the teaching/modeling of professional judgment; medicolegal and ethical concerns;
30 and rapidly changing regulatory modernization models.

31
32 The exposure of gaps in faculty knowledge of AI is already being documented; these gaps may be
33 inhibiting learners who have an active interest in AI applications but lack exposure to
34 knowledgeable faculty to help them understand, access, and apply them. For example, a 2015
35 publication⁵ noted that 30 percent of U.S. medical student survey respondents had interest in
36 clinical informatics, but were not able to identify training opportunities to assist in meeting this
37 desire to learn. These knowledge gaps, however, should not be solely characterized in a negative
38 fashion, as they also present important opportunities for professional development and pave the
39 way for the introduction of new types of instructors into the medical education environment.
40 Gonzalo et al.⁶ acknowledge these points, noting the importance of focusing not only on expanding
41 the knowledge base/skill set of current educators, but also of employing a new cohort of educators
42 with skills in new areas. The Council on Medical Education agrees with this characterization and
43 believes that institutional leaders and academic deans must proactively accelerate their inclusion of
44 nonclinicians, such as data scientists and engineers, onto their faculty rosters.

45
46 *Investments in AI*

47
48 Private funding of AI technologies has exploded in recent years. One source estimates that the AI
49 health market will grow to \$6.6 billion by 2021 and exceed \$10 billion by 2024.⁷ Another estimate
50 places AI-driven GDP growth at \$15.7 trillion by 2030.⁸

1 The U.S. House of Representatives' Committee on Oversight and Reform, Subcommittee on
2 Information Technology, has specifically noted that one of the benefits of increased U.S. funding
3 for AI research and development would be the ability to fund more graduate students, which in turn
4 would expand the future U.S. AI workforce. On February 11, 2019, President Donald J. Trump
5 issued an Executive Order on Maintaining American Leadership in Artificial Intelligence, which,
6 acknowledges that “[c]ontinued American leadership in AI is of paramount importance to
7 maintaining the economic and national security of the United States and to shaping the global
8 evolution of AI in a manner consistent with our Nation’s values, policies, and priorities,” and notes
9 that the United States “must train current and future generations of American workers with the
10 skills to develop and apply AI technologies to prepare them for today’s economy and jobs of the
11 future.” This training will be achieved through “apprenticeships; skills programs; and education in
12 science, technology, engineering, and mathematics (STEM), with an emphasis on computer
13 science, to ensure that American workers, including Federal workers, are capable of taking full
14 advantage of the opportunities of AI.”⁹

15
16 Additionally, the Centers for Medicare & Medicaid Services has recently committed to investment
17 in this area and has launched an Artificial Intelligence Health Outcomes Challenge,¹⁰ with the goal
18 of “exploring how to harness AI to predict health outcomes that are important to patients and
19 clinicians, and to enhance care delivery.”

20 21 *AI and Education*

22
23 At the practical level, it is important to distinguish between AI as a topic of study itself and in the
24 instruction of learners regarding use of existing tools and applications. Furthermore, it is important
25 to acknowledge that educating students and physicians in the practical use of specific AI
26 technologies is not necessarily equivalent to educating students and physicians to understand how
27 the technology works or how to evaluate its applicability, appropriateness, and effectiveness with
28 respect to patient care.

29
30 An additional consideration will be the need for learners and physicians to adjust their receptivity
31 to machine-recommended learning or clinical actions. The need for this receptivity may in turn
32 spark a discussion regarding the kind of student who should be recruited to enter the profession.
33 Traditionally, while multiple domains of ability have been valued, a premium has been placed on
34 individual mastery of knowledge. Learners who excel at this type of knowledge, however, may not
35 be the same kind of learners who interact effectively with AI systems. Even if learners are
36 receptive to this type of practice, a rise in learning and practice that is less supervised by human
37 instructors and colleagues and more interactive with non-human technologies may negatively
38 impact patient care if recruits to the profession are not able to maintain patient communication and
39 develop critical evaluation skills.

40
41 Recent scholarly work has documented this shift in thinking with respect to the goals of medical
42 education.¹¹ Newer thinking acknowledges the rapid pace of change and emphasizes the need for
43 physicians to analyze, categorize, contextualize, seek, find, and evaluate data and place these data
44 in clinical context, and highlights the position that critical reasoning skills are imperative. Wartman
45 and Combs argue that the physician of the future will require a shift in professional identity, which
46 must be embraced early on in medical education.¹¹ Furthermore, the dawn of precision medicine
47 introduces treatment possibilities that require physicians flexible enough to think beyond
48 established treatment protocols.¹¹ These changes require parallel changes in the way medical
49 students, residents, fellows, instructors, and practicing physicians are taught and, in turn, teach.

1 ACCREDITATION AND LICENSURE IMPLICATIONS

2
3 Profound changes to established medical educational content, as well as to methods of instruction,
4 necessitate considered and reflective responses from those organizations that focus on accreditation
5 and licensure. Yet the response in this area regarding the implications of AI in medical education
6 has been varied.

7
8 The Liaison Committee on Medical Education (LCME) does not specifically address AI, but
9 several of its standards relate to these concepts:

- 10
- 11 • Standard 4.1, Sufficiency of Faculty, requires that “A medical school has in place a
12 sufficient cohort of faculty members with the qualifications and time required to deliver the
13 medical curriculum and to meet the other needs and fulfill the other missions of the
14 institution.”
 - 15 • Standard 4.5, Faculty Professional Development, notes, “A medical school and/or its
16 sponsoring institution provides opportunities for professional development to each faculty
17 member in the areas of discipline content, curricular design, program evaluation, student
18 assessment methods, instructional methodology, and research to enhance his or her skills
19 and leadership abilities in these areas.”
 - 20 • Standard 5.4, Sufficiency of Buildings and Equipment, states that “A medical school has,
21 or is assured the use of, buildings and equipment sufficient to achieve its educational,
22 clinical, and research missions.”
 - 23 • Standard 5.6, Clinical Instructional Facilities/Information Resources, requires that “Each
24 hospital or other clinical facility affiliated with a medical school that serves as a major
25 location for required clinical learning experiences has sufficient information resources and
26 instructional facilities for medical student education.”
 - 27 • Standard 5.9, Information Technology Resources/Staff, states that “A medical school must
28 provide access to well-maintained information technology resources sufficient in scope to
29 support its educational and other missions.” Further, information technology staff must
30 have “sufficient expertise to fulfill its responsibilities and is responsive to the needs of the
31 medical students, faculty members, and others associated with the institution.”
 - 32 • Standard 6.3, Self-Directed and Life-Long Learning, requires that “The faculty of a
33 medical school ensure that the medical curriculum includes self-directed learning
34 experiences and time for independent study to allow medical students to develop the skills
35 of lifelong learning. Self-directed learning involves medical students’ self-assessment of
36 learning needs; independent identification, analysis, and synthesis of relevant information;
37 and appraisal of the credibility of information sources.”

38
39 Commission on Osteopathic College Accreditation (COCA) standards are similar:

- 40
- 41 • Standard 4, Facilities, states that “A COM [college of osteopathic medicine] must have
42 sufficient physical facilities, equipment, and resources for clinical, instructional, research,
43 and technological functions of the COM. These resources must be readily available and
44 accessible across all COM locations to meet its needs, the needs of the students consistent
45 with the approved class size, and to achieve its mission.”
 - 46 • Element 4.3, Information Technology, states that “A COM must ensure access to
47 information technology to support its mission.”
 - 48 • Element 4.4, Learning Resources, requires that “A COM must ensure access to learning
49 resources to support its mission.”

- 1 • Element 6.7, Self-Directed Learning, requires that “A COM must ensure that the
2 curriculum includes self-directed learning experiences and time for independent study to
3 allow students to develop skills for lifelong learning. Self-directed learning includes
4 students’ self-assessment of learning needs; independent identification, analysis, and
5 synthesis of relevant information; and appraisal of the credibility of sources of
6 information.”
- 7 • Element 7.1, Faculty and Staff Resources and Qualifications, states that “At all educational
8 teaching sites, including affiliated sites, a COM must have sufficient faculty and staff
9 resources to achieve the program mission, including part time and adjunct faculty, and
10 preceptors who are appropriately trained and credentialed. The physician faculty, in the
11 patient care environment, must hold current medical licensure and board certification/
12 board eligibility. The non-physician faculty must have appropriate qualifications in their
13 fields.”
- 14 • Element 7.6, Faculty Development, states that “A COM must develop and implement an
15 ongoing needs-based, assessment-driven, faculty development program that is in keeping
16 with the COM’s mission.”

17
18 Licensing exams of the National Board of Medical Examiners and the National Board of
19 Osteopathic Medical Examiners do not specifically cover AI.¹² However, the benefits of AI-driven
20 assessments for test preparation and scoring should be further explored, and their potential impacts
21 on costs and student travel/time calculated, in addition to consideration of their inclusion as a topic
22 area in exam content.

23
24 The Federation of State Medical Boards (FSMB) recently hosted a conference related to AI and
25 potential impacts on state medical boards. AI can potentially be used to improve physician
26 verification of licensing and credentials. Changes to state medical practice acts and/or model
27 legislation may need to be studied to prepare for AI-driven changes to the practice of medicine.

28
29 The Common Program Requirements of the Accreditation Council for Graduate Medical Education
30 (ACGME) do not specifically identify AI, but, as with UME standards from the LCME and COCA,
31 related topics are addressed. Section VI.A.1.b).(2) notes that “access to data is essential to
32 prioritizing activities for care improvement and evaluating success of improvement efforts.” Also,
33 Section VI.A.1.b).(2).(a) notes that “residents and faculty members must receive data on quality
34 metrics and benchmarks related to their patient populations.” Perhaps a more natural fit for
35 addressing AI at the GME level could be applied through the pathways framework of the
36 ACGME’s Clinical Learning Environment Review (CLER) program, which offers programmatic
37 feedback on the topics of patient safety, health care quality, care transitions, supervision, duty
38 hours and fatigue management/mitigation, and professionalism.¹³ Data science could be integrated
39 into pathways for each focus area to support learners’ exposure to AI-driven changes in clinical
40 practice. Additionally, individual specialty milestones may be an appropriate location for
41 introduction of artificial/augmented intelligence-driven technologies, many of which are specialty-
42 specific.

43
44 None of the member boards of the American Board of Medical Specialties (ABMS) currently
45 require education in AI activities for continuing certification credit. However, five boards¹⁴—the
46 American Board of Anesthesiology, American Board of Emergency Medicine, American Board of
47 Nuclear Medicine, American Board of Obstetrics and Gynecology, and American Board of
48 Pathology—do accept simulation-based activities for their continuing certification Improvement in
49 Medical Practice requirements (although it is important to note that simulation can be conducted
50 without AI algorithms). In addition, the American Board of Family Medicine has several optional
51 online simulated cases that can count toward meeting Lifelong Learning and Self-Assessment

1 activities. The American Board of Internal Medicine also recognizes some simulation activities for
2 Improvement in Medical Practice through a collaboration with the Accreditation Council for
3 Continuing Medical Education. Finally, the ABMS has established a new pathway for a
4 subspecialty fellowship in clinical informatics, which is hosted through the American Board of
5 Preventive Medicine.

6
7 At the continuing professional development level, AI offers great potential to create precision
8 education via further investments in the adaptive quizzing model, which builds upon current trends
9 in digital portfolios to support responsive assessments and prompts learners to assess specific skills
10 at desired time points. Tailored educational content can be delivered to clinicians at precise
11 moments in time, and AI-driven technologies may better identify the learning needs of busy
12 clinicians than the clinicians themselves.

13 14 AI IN MEDICAL EDUCATION: A CURRENT SNAPSHOT

15
16 An LCME survey from the 2016-2017 academic year included a question asking institutions to
17 indicate whether computer-based simulators (such as virtual dissection simulation) were used in
18 various disciplines to assist students in learning or reviewing relevant anatomy. Of 145
19 respondents, 78 indicated simulators were used in gross anatomy, 65 in
20 neuroanatomy/neurosciences, 42 in general surgery, 40 in obstetrics-gynecology, and 26 in surgical
21 subspecialties (respondents could select more than one option).

22
23 Multiple forms of AI have been incorporated into medical education training, ranging from basic
24 introductory courses in core data science and algorithm fundamentals to artificial intelligence
25 certificate programs and dual areas of study (MD/DO plus data science, programming, statistics,
26 informatics, or biomedical engineering). The overall extent to which these topics currently have
27 been incorporated into medical education, however, is more difficult to quantify. The following list
28 of examples, while not comprehensive, is meant to highlight the breadth and depth of
29 current/planned utilization of AI in medical education today.

- 30
- 31 • The Duke Institute for Health Innovation (DIHI), which includes an incubator for health
32 technology innovation, involves medical students in a program that joins clinical,
33 quantitative, and data expertise to create care-enhancement technologies. DIHI students
34 and instructors also work to ensure that AI innovations are not being applied to physicians,
35 but rather developed by and for physicians, and that such innovations support improved
36 models of care and incorporate machine learning into clinical processes. One example of
37 an AI application is early identification of disease progression (such as kidney failure or
38 sepsis).
 - 39
40 • The radiology department at the University of Florida has entered into a partnership with a
41 cancer-focused technology firm to develop computer-aided detection (CAD) tools for
42 mammographers. Radiologists, including resident physicians, will be involved in the
43 evaluation of trial technologies, which are intended to flag areas of interest in breast
44 imaging. Residents also will participate in training and validating algorithms.
 - 45
46 • The Carle Illinois College of Medicine in Urbana-Champaign, self-described as the first
47 engineering-based college of medicine, seeks to leverage technology by offering a
48 curriculum in which all courses are designed by a scientist, a clinical scientist, and an
49 engineer. Engineering and technology comprise components of all classes, and clinical
50 rounds are completed with both clinical and engineering faculty. The inaugural class will
51 graduate in 2022.

- 1 • The Sharon Lund Medical Intelligence and Innovation Institute (MI3) at Children’s
2 Hospital of Orange County (CHOC) seeks to cultivate artificial intelligence methodologies
3 and advances in genomic medicine, regenerative medicine, robotics, nanotechnology, and
4 medical applications/devices. The MI3 Summer Internship Program at CHOC offers
5 immersive experiences in genomic and personalized medicine, regenerative medicine and
6 stem cells, nanomedicine, robotics and robotic surgery, artificial intelligence and big data,
7 medical devices and mobile technology, and innovations in health care delivery. This
8 program directly supports the pipeline of clinicians with exposure to AI technologies by
9 inviting high school, college, graduate school, and medical school students to apply.
10
- 11 • The Institute for Innovations in Medical Education at New York University (NYU)
12 Langone Health supports a multidisciplinary team of educators, scientists, informaticians,
13 and software developers who apply informatics to teaching, learning, and assessment.
14 NYU’s technology-based Health Care by the Numbers curriculum trains students in the use
15 of “big data” to provide holistic, population health management that improves quality and
16 care coordination.
17
- 18 • The Machine Learning and Healthcare Lab at Johns Hopkins uses statistical machine
19 learning techniques to develop new diagnostic and treatment planning tools that provide
20 reliable inferences to help physicians make individualized care decisions.
21
- 22 • Stanford University’s Center for Artificial Intelligence in Medicine and Imaging develops,
23 assesses, and disseminates artificial intelligence systems to benefit patients. Graduates and
24 post-graduates are involved in solving imaging problems using machine learning and other
25 techniques. Stanford also offers a mini-curriculum leading to an Artificial Intelligence
26 Graduate Certificate.
27
- 28 • The Human Diagnosis Project, a partnership of the AMA, the ABMS, and multiple
29 academic centers, is an educational collaboration that sources knowledge via the
30 submission of clinical cases from international medical professionals to create models of
31 care that can be accessed by clinicians and learners worldwide.
32
- 33 • Addressing the paradigm shift in medical education, the University of Texas Dell Medical
34 School does not support a chair of radiology or pathology; rather, leadership has identified
35 and employed a chair of diagnostic medicine.
36
- 37 • The University of Virginia Center for Engineering in Medicine works, as stated in its
38 mission, to generate and translate innovative ideas at the intersection of engineering and
39 medicine. In this collaborative training environment, medical and nursing students are
40 embedded in engineering labs, and engineering students are embedded in clinical
41 environments.
42
- 43 • The College of Artificial Intelligence at the Massachusetts Institute of Technology focuses
44 on interdisciplinary artificial intelligence education in biology, chemistry, history,
45 linguistics, and ethics and is intended to bridge gaps between computer science and other
46 areas.
47
- 48 • The AMA is expanding its educational resources related to AI in medicine to offer an
49 [educational module](#) that provides the history, definitions, and components related to AI in
50 health care, as well as a newly developed and continuously evolving [website](#) related to

1 augmented intelligence in medicine, which provides resources, insights, and education.
2 Furthermore, the February 2019 Issue of the AMA's [Journal of Ethics](#) was devoted entirely
3 to the ethical implications of AI.
4

5 *International Attitudes*

6

7 Steps also are being taken internationally to support the use of AI in medical education. For
8 example, virtual patients are currently being used in medical schools in a number of European
9 countries,¹⁵ and individual schools offer programming in AI, such as the University of Toronto's
10 elective, 14-month Computing for Medicine certificate course.¹⁶
11

12 It is interesting and important to note that attitudes regarding and progress toward use of AI in
13 medical education and clinical treatment vary significantly internationally. Vayena et al. note a
14 recent United Kingdom survey reporting that "63% of the adult population is uncomfortable with
15 allowing personal data to be used to improve healthcare and is unfavorable to artificial intelligence
16 (AI) systems replacing doctors and nurses in tasks they usually perform. Another study, conducted
17 in Germany, found that medical students—the doctors of tomorrow—overwhelmingly buy into the
18 promise of AI to improve medicine (83%) but are more skeptical that it will establish conclusive
19 diagnoses in, for instance, imaging exams (56% disagree). When asked about the prospects of AI,
20 United States decision-makers at healthcare organizations are confident that it will improve
21 medicine, but roughly half of them think it will produce fatal errors, will not work properly, and
22 will not meet currently hyped expectations."¹⁷
23

24 According to a recent survey¹⁸ of general practitioners in the United Kingdom, 68 percent felt that
25 "future technology" would never fully replace human physicians in diagnosis of patients, 61
26 percent said this technology would never fully replace human physicians when referring to
27 specialists, 61 percent said this technology would never develop personalized treatment plans, and
28 94 percent said it would never deliver empathetic care. A higher percentage (80 percent) did
29 believe, however, that future technology would be able to replace human physicians to perform
30 documentation.
31

32 A 2018 survey of German medical students found that 68 percent were unaware of the specific
33 technologies being used in radiology AI; 56 percent thought AI would not perform well enough to
34 establish a definite diagnosis; 86 percent thought AI would improve radiology, and 83 percent
35 disagreed that AI would replace human radiologists (96.6 percent disagreed that AI would replace
36 human physicians generally). Further, 70.1 percent felt AI should be included in training
37 (interestingly, 20.5 percent mostly disagreed with this statement, and 4.9 percent disagreed
38 entirely).¹⁹
39

40 While European mores may not be translatable to faculty, learners, and patients in the United
41 States, these findings are excellent reminders that different populations—in terms of race, ethnicity,
42 gender, age, socioeconomic background, level of education, and geographic location—not only
43 may have different levels of familiarity and comfort with these new technologies, but also may
44 have different expectations and desires with regard to how or even whether these technologies
45 should be applied. Physicians will need to augment their communication skills to help patients
46 receive the best, personalized treatments that may be enhanced or delivered entirely by AI
47 technologies.

1 REVIEW OF ADDITIONAL RESEARCH

2

3 A paper regarding the biannual Artificial Intelligence in Medicine (AIME) conference in Europe,
4 established in 1985, analyzed the content of papers published in AIME’s proceedings; the first six
5 years the topic of knowledge engineering appeared most frequently. Post-2000, machine learning
6 and data mining were covered most frequently. Natural language processing was covered more
7 frequently moving towards 2010, as was research related to ontologies and terminologies.²⁰

8

9 Kolachalama and Garg note that between 2010 and 2017, relatively little research was published on
10 this topic related to UME and GME. They describe a combined search using the MeSH terms
11 “machine learning” and “graduate medical education” between 2010 and 2017, which resulted in
12 16 publications, and note, “Detailed review of these papers revealed that none of them were
13 actually focused on ML education for medical professionals.”¹²

14

15 More research can be found related to virtual reality and augmented reality. A 2016 paper²¹ found
16 that learning outcomes improved more for students utilizing an online three-dimensional interactive
17 learning tool (when compared to gross anatomy resources) for neuroanatomy education. Virtual
18 reality and augmented reality have been found to enhance neurosurgery residents’ skills while
19 reducing risk to patients, and are also helpful for preoperative planning. Virtual reality and
20 augmented reality also can increase learner engagement and enhance spatial knowledge.²²

21

22 RELEVANT AMA POLICY

23

24 At this time, the AMA has limited policy related to AI and medical education. Its most recent
25 policy, H-480.940, “Augmented Intelligence in Health Care,” asks our AMA to promote
26 development of thoughtfully designed, high-quality, clinically validated health care AI that
27 encourages education for patients, physicians, medical students, other health care professionals,
28 and health administrators to promote greater understanding of the promise and limitations of health
29 care AI.

30

31 Policy D-295.330, “Update on the Uses of Simulation in Medical Education,” encourages ongoing
32 research and assessment regarding the effectiveness of simulation in teaching and assessment, and
33 encourages accrediting bodies to ensure their policies are reflective of appropriate simulation use.

34

35 See the Appendix for a full list of relevant policies.

36

37 SUMMARY AND RECOMMENDATIONS

38

39 As stated in BOT Report 41-A-18, “To reap the benefits for patient care, physicians must have the
40 skills to work comfortably with health care AI. Just as working effectively with EHRs is now part
41 of training for medical students and residents, educating physicians to work effectively with AI
42 systems, or more narrowly, the AI algorithms that can inform clinical care decisions, will be
43 critical to the future of AI in health care.” While it is certainly true that physicians and physicians
44 in training must embrace the skills and attitudes that will allow them to care for patients with
45 assistive technologies, it is also true, as noted by Patel et al., that “[a]ll technologies mediate human
46 performance. Technologies, whether they be computer-based or in some other form, transform the
47 ways individuals and groups behave. They do not merely augment, enhance or expedite
48 performance, although a given technology may do all of these things. The difference is not one of
49 quantitative change, but one that is qualitative in nature. Technology, tools, and artifacts not only
50 enhance people’s ability to perform tasks but also change the way they perform tasks.”²³

1 The Council on Medical Education therefore recommends that the following recommendations be
2 adopted in lieu of Resolution 317-A-18 and the remainder of the report be filed:

- 3
- 4 1. That our American Medical Association (AMA) encourage accrediting and licensing bodies to
5 study how AI should be most appropriately addressed in accrediting and licensing standards.
6 (Directive to Take Action)
7
- 8 2. That our AMA encourage medical specialty societies and boards to consider production of
9 specialty-specific educational modules related to AI. (Directive to Take Action)
10
- 11 3. That our AMA encourage research regarding the effectiveness of AI instruction in medical
12 education on learning and clinical outcomes. (Directive to Take Action)
13
- 14 4. That our AMA encourage institutions and programs to be deliberative in the determination of
15 when AI-assisted technologies should be taught, including consideration of established
16 evidence-based treatments, and including consideration regarding what other curricula may
17 need to be eliminated in order to accommodate new training modules. (Directive to Take
18 Action)
19
- 20 5. That our AMA encourage stakeholders to provide educational materials to help learners guard
21 against inadvertent dissemination of bias that may be inherent in AI systems. (Directive to
22 Take Action)
23
- 24 6. That our AMA encourage the study of how differences in institutional access to AI may impact
25 disparities in education for students at schools with fewer resources and less access to AI
26 technologies. (Directive to Take Action)
27
- 28 7. That our AMA encourage enhanced training across the continuum of medical education
29 regarding assessment, understanding, and application of data in the care of patients. (Directive
30 to Take Action)
31
- 32 8. That our AMA encourage the study of how disparities in AI educational resources may impact
33 health care disparities for patients in communities with fewer resources and less access to AI
34 technologies. (Directive to Take Action)
35
- 36 9. That our AMA encourage institutional leaders and academic deans to proactively accelerate the
37 inclusion of nonclinicians, such as data scientists and engineers, onto their faculty rosters in
38 order to assist learners in their understanding and use of AI. (Directive to Take Action)
39
- 40 10. That Policy D-295.328, "Promoting Physician Lifelong Learning," be reaffirmed. (Reaffirm
41 HOD Policy)
42
- 43 11. That our AMA encourage close collaboration with and oversight by practicing physicians in
44 the development of AI applications. (Directive to Take Action)

Fiscal note: \$1,000.

APPENDIX: RELEVANT AMA POLICY

D-295.328, "Promoting Physician Lifelong Learning"

1. Our AMA encourages medical schools and residency programs to explicitly include training in and an evaluation of the following basic skills:
 - (a) the acquisition and appropriate utilization of information in a time-effective manner in the context of the care of actual or simulated patients;
 - (b) the identification of information that is evidence-based, including such things as data quality, appropriate data analysis, and analysis of bias of any kind;
 - (c) the ability to assess one's own learning needs and to create an appropriate learning plan;
 - (d) the principles and processes of assessment of practice performance;
 - (e) the ability to engage in reflective practice.
2. Our AMA will work to ensure that faculty members are prepared to teach and to demonstrate the skills of lifelong learning.
3. Our AMA encourages accrediting bodies for undergraduate and graduate medical education to evaluate the performance of educational programs in preparing learners in the skills of lifelong learning.
4. Our AMA will monitor the utilization and evolution of the new methods of continuing physician professional development, such as performance improvement and internet point-of-care learning, and work to ensure that the methods are used in ways that are educationally valid and verifiable.
5. Our AMA will continue to study how to make participation in continuing education more efficient and less costly for physicians.

D-295.313, "Telemedicine in Medical Education"

1. Our AMA encourages appropriate stakeholders to study the most effective methods for the instruction of medical students, residents, fellows and practicing physicians in the use of telemedicine and its capabilities and limitations.
2. Our AMA will collaborate with appropriate stakeholders to reduce barriers to the incorporation of telemedicine into the education of physicians and other health care professionals.
3. Our AMA encourages the Liaison Committee on Medical Education and Accreditation Council for Graduate Medical Education to include core competencies in telemedicine in undergraduate medical education and graduate medical education training.

D-295.330, "Update on the Uses of Simulation in Medical Education"

Our AMA will:

1. continue to advocate for additional funding for research in curriculum development, pedagogy, and outcomes to further assess the effectiveness of simulation and to implement effective approaches to the use of simulation in both teaching and assessment;

2. continue to work with and review, at five-year intervals, the accreditation requirements of the Liaison Committee on Medical Education (LCME), the Accreditation Council for Graduate Medical Education (ACGME), and the Accreditation Council for Continuing Medical Education (ACCME) to assure that program requirements reflect appropriate use and assessment of simulation in education programs;
3. encourage medical education institutions that do not have accessible resources for simulation-based teaching to use the resources available at off-site simulation centers, such as online simulated assessment tools and simulated program development assistance;
4. monitor the use of simulation in high-stakes examinations administered for licensure and certification as the use of new simulation technology expands;
5. further evaluate the appropriate use of simulation in interprofessional education and clinical team building; and
6. work with the LCME, the ACGME, and other stakeholder organizations and institutions to further identify appropriate uses for simulation resources in the medical curriculum.

H-315.969, "Medical Student Access to Electronic Health Records"

Our AMA:

- (1) recognizes the educational benefits of medical student access to electronic health record (EHR) systems as part of their clinical training;
- (2) encourages medical schools, teaching hospitals, and physicians practices used for clinical education to utilize clinical information systems that permit students to both read and enter information into the EHR, as an important part of the patient care team contributing clinically relevant information;
- (3) encourages research on and the dissemination of available information about ways to overcome barriers and facilitate appropriate medical student access to EHRs and advocate to the Electronic Health Record Vendors Association that all Electronic Health Record vendors incorporate appropriate medical student access to EHRs;
- (4) supports medical student acquisition of hands-on experience in documenting patient encounters and entering clinical orders into patients' electronic health records (EHRs), with appropriate supervision, as was the case with paper charting;
- (5) (A) will research the key elements recommended for an educational Electronic Health Record (EHR) platform; and (B) based on the research--including the outcomes from the Accelerating Change in Medical Education initiatives to integrate EHR-based instruction and assessment into undergraduate medical education--determine the characteristics of an ideal software system that should be incorporated for use in clinical settings at medical schools and teaching hospitals that offer EHR educational programs;
- (6) encourage efforts to incorporate EHR training into undergraduate medical education, including the technical and ethical aspects of their use, under the appropriate level of supervision;
- (7) will work with the Liaison Committee for Medical Education(LCME), AOA Commission on Osteopathic College Accreditation (COCA) and the Accreditation Council for Graduate Medical

Education (ACGME) to encourage the nation's medical schools and residency and fellowship training programs to teach students and trainees effective methods of utilizing electronic devices in the exam room and at the bedside to enhance rather than impede the physician-patient relationship and improve patient care; and

(8) encourages medical schools and residency programs to: (a) design clinical documentation and electronic health records (EHR) training that provides evaluative feedback regarding the value and effectiveness of the training, and, where necessary, make modifications to improve the training; (b) provide clinical documentation and EHR training that can be evaluated and demonstrated as useful in clinical practice; and (c) provide EHR professional development resources for faculty to assure appropriate modeling of EHR use during physician/patient interactions.

H-480.940, "Augmented Intelligence in Health Care"

As a leader in American medicine, our AMA has a unique opportunity to ensure that the evolution of augmented intelligence (AI) in medicine benefits patients, physicians, and the health care community.

To that end our AMA will seek to:

1. Leverage its ongoing engagement in digital health and other priority areas for improving patient outcomes and physicians' professional satisfaction to help set priorities for health care AI.
2. Identify opportunities to integrate the perspective of practicing physicians into the development, design, validation, and implementation of health care AI.
3. Promote development of thoughtfully designed, high-quality, clinically validated health care AI that:
 - a. is designed and evaluated in keeping with best practices in user-centered design, particularly for physicians and other members of the health care team;
 - b. is transparent;
 - c. conforms to leading standards for reproducibility;
 - d. identifies and takes steps to address bias and avoids introducing or exacerbating health care disparities including when testing or deploying new AI tools on vulnerable populations; and
 - e. safeguards patients' and other individuals' privacy interests and preserves the security and integrity of personal information.
4. Encourage education for patients, physicians, medical students, other health care professionals, and health administrators to promote greater understanding of the promise and limitations of health care AI.
5. Explore the legal implications of health care AI, such as issues of liability or intellectual property, and advocate for appropriate professional and governmental oversight for safe, effective, and equitable use of and access to health care AI.
